Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the network elements. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions.

Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears. Click on the Yes button. The configuration mode of the policy is changed to Released.

6 Close the form.

7 Close the IPSec Transform form.

Procedure 35-3 To create an IPsec static security association

1 Choose Policies→ISA Policies→IPSec Static Security Association from the 5620 SAM main menu. The IPSec Static Security Association Policies form opens.

2 Click on the Create button. The IPsec Static Security Association (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Static SA Name
- Direction
- Protocol
- Authentication Algorithm
- Authentication Key Type
- Authentication Key
- Security Parameter Index
- Static SA Description

4 Click on the Apply button.

5 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the network elements. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions.

Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears. Click on the Yes button. The configuration mode of the policy is changed to Released.

6 Close the form.

7 Close the IPsec Static Security Association (Create) form.

Procedure 35-4 To create an IPsec tunnel template

1 Choose Policies→ISA Policies→IPSec Tunnel Template from the 5620 SAM main menu. The IPSec Tunnel Template Policies form opens.

2 Click on the Create button. The IPSec Tunnel Template (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Policy ID
- Description
- Reverse Route
- Replay Window

4 Click on the IPSec Transforms tab button.

5 Click on the Select button in the Transform ID 1 to Transform ID 4 panels. The Select Transform ID *1_4* IPSec Tunnel Template list form opens.

6 Choose an entry and click on the OK button. The Select Transform ID *1_4* IPSec Tunnel Template list form closes.

7 Click on the General tab button.

8 Click on the Apply button.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the network elements. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions.

Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears. Click on the Yes button. The configuration mode of the policy is changed to Released.

10 Close the form.

11 Close the IPSec Tunnel Template form.

Procedure 35-5 To create an IPsec security policy

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the list filter parameters and click on the Search button. A list of services appears at the bottom of the Manage Services form.
3. Choose a VPRN service.
4. Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.
5. Click on the Sites tab.
6. Choose an entry and click on the Properties button. The VPRN Site (Edit) form opens with the General tab displayed.
7. Click on the IPSec Security Policies tab button.
8. Click on the Create button. The IPSec Security Policy (Create) form opens with the General tab displayed.
9. Configure the parameters:
   - Auto-Assign ID
   - Security Policy ID
10. Click on the IPSec Security Policy Entries tab button.
11. Click on the Create button. The Security Policy Entry (Create) form opens.
12. Configure the Name parameter.
13. Configure the Local Address Option parameter.
14. Perform one of the following.
    a. If you set the Local Address Option parameter to IP Address in step 13, configure the following parameters:
       - IP Address
       - Prefix Length

    b. If you set the Local Address Option parameter to None or Any, go to step 15.
15. Configure the Remote Address Option parameter.
16. Perform one of the following.
    a. If you set the Remote Address Option parameter to IP Address in step 15, configure the following parameters:
       - IP Address
       - Prefix Length

    b. If you set the Remote Address Option parameter to None or Any, go to step 17.

17 Click on the OK button. The Security Policy Entry (Create) form closes.

18 Repeat steps 8 to 17 to add additional IPSec security policy entries.

19 Click on the OK button. The IPSec Security Policy (Create) form closes. A dialog box appears.

20 Click on the OK button.

21 Close the VPRN Site (Edit) form.

22 Close the VPRN (Edit) form.

23 Close the Manage Services form.

Procedure 35-6 To create a tunnel interface on a VPRN

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the list filter parameters and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

5 Click on the Tunnel Interfaces tab button.

6 Click on the Create button. The Tunnel Interface (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Configured IP MTU (Octets)

8 Configure a port for the interface.

i Click on the Port tab button.

ii Click on the Select button to choose a port to associate with the tunnel interface. The Select Terminating Port - Tunnel Interface form opens.

iii Specify a filter for the search, if required, and click on the Search button.

iv Select a port from the list and click on the OK button. The Select Terminating Port - Tunnel Interface form closes and the Tunnel Interface (Create) form reappears with the selected port information displayed.

v Configure the parameters:

- Auto-Assign ID
- Outer Encapsulation Value
- SAP Description
- SAP Administrative State

Note 1 — You can configure the 5620 SAM to automatically assign lowest unused outer encapsulation value by enabling the Auto-Assign ID parameter.

Note 2 — You can set the Auto-Assign ID parameter to be the default parameter for dot1 Q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form.

Note 3 — Private and public tunnel connection points support only dot1 Q encapsulation.

9 Assign ingress and egress QoS policies to the interface, if required.

i Click on the QoS tab button.

ii Configure the parameters:

- Use Shared Queue
- Use Multipoint Shared Queue

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - Tunnel Interface form opens.

iv Use the configurable filter and Search button to choose a policy, and click on the OK button. The Select Ingress Policy - Tunnel Interface form closes and the Tunnel Interface (Create) form reappears with the ingress QoS policy information displayed.

v Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - Tunnel Interface form opens.

vi Use the configurable filter and Search button to choose a QoS policy, and click on the OK button. The Select Egress Policy - Tunnel Interface form closes and the Tunnel Interface (Create) form reappears with the egress QoS policy information displayed.

10 Click on the Schedulers tab button to configure scheduling. Otherwise, go to step 12.

Note — The Schedulers tab is configurable only if you assign a port to the SAP in step 8.

11 Perform the following:

i Configure the Aggregate Rate Limit (kbps) parameter.

Note 1 — The Aggregate Rate Limit (kbps) parameter is configurable only when you enable the Assign Aggregate Rate Limit check box, and there is no scheduler specified in the Egress Scheduler panel.

Note 2 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

ii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - Tunnel Interface form opens.

iii Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - Tunnel Interface form closes, and the Tunnel Interface (Create) form refreshes with the ingress scheduler information displayed.

iv Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - Tunnel Interface form opens.

v Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - Tunnel Interface form closes, and the Tunnel Interface (Create) form refreshes with the egress scheduler information displayed.

vi Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy - Tunnel Interface form opens.

vii Choose an ingress policer control policy and click on the OK button. The Select Policer Control Policy - Tunnel Interface form closes and the Tunnel Interface (Create) form refreshes with the ingress policer information displayed.

viii Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy - Tunnel Interface form opens.

ix Choose an egress policer control policy and click on the OK button. The Select Policer Control Policy - Tunnel Interface form closes and the Tunnel Interface (Create) form refreshes with the egress policer information displayed.

x Go to step 12.

12 Assign ingress and egress ACL filters to the interface, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress IPv4 ACL filter. The Select Ingress Filter - Tunnel Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - Tunnel Interface form closes and the Tunnel Interface (Create) form reappears with the ingress IPv4 ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress IPv4 ACL filter. The Select Egress Filter - Tunnel Interface form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - Tunnel Interface form closes and the Tunnel Interface (Create) form reappears with the egress IPv4 ACL filter information displayed.

13 Assign an IP address to the tunnel interface.

i Click on the Addresses tab button.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The Tunnel Interface (Create) form reappears with the assigned IP addresses displayed.

14 Configure a GRE tunnel on the Tunnel Interface, if required.

i Click on the GRE Tunnels tab button.

ii Click on the Create button. The GRE Tunnel (Create) form opens.

iii Configure the parameters:

- Name
- Description
- DSCP
- Destination Address
- Remote Address
- Local Endpoint Address
- Backup Remote Address

iv Click on the Select button on the Delivery Service panel to choose a delivery service for the GRE tunnel. The Select Delivery Service - GRE Tunnel form opens.

v Select a delivery service and click on the OK button. The Select Delivery Service - GRE Tunnel formcloses and the GRE Tunnel (Create) form reappears with the delivery service information displayed.

vi Click on the States tab button and configure the Administrative State parameter.

vii Click on the OK button. The GRE Tunnel (Create) form closes, and a dialog box appears.

viii Click on the OK button. The Tunnel Interface (Create) form reappears with the assigned GRE tunnel displayed.

15 Specify queue overrides by clicking on the Override Policy Items tab button. See chapter 47 for information about how to set queue overrides.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

16 Click on the OK button. A dialog box appears.

17 Click on the OK button. The Tunnel Interface (Create) form closes, and the VPRN Service (Create) form reappears.

18 Repeat steps 6 to 16 to create another tunnel interface for the VPRN service.

Procedure 35-7 To create an IPsec gateway on an IES or VPRN

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the list filter parameters and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Select an IES or VPRN.

4 Click on the Properties button. The properties form for the service opens with the general properties of the service displayed on the General tab.

5 Click on the L3 Access Interfaces tab button.

6 Click on the Search button. A list of L3 access interfaces appears.

7 Choose the L3 access interface on which you want to create the IPsec gateway and click on the Properties button. The *Service* L3 Access Interface (Edit) form opens with the General tab displayed.

Note — The port configured on the L3 access interface must be a Tunnel Group SAP. This is the public-facing interface for an IPsec tunnel.

8 Click on the IPSec Gateway tab button.

9 Click on the Create button. The IPSec Gateway (Create) form opens with the General tab displayed.

10 Configure the parameters:

- Name
- Pre Shared Key

11 Click on the Select button in the IKE Policy panel to associate an IKE policy with the IPSec gateway. The Select IKE Policy - IPSec Gateway list form opens.

12 Specify a filter for the search, if required, and click on the Search button. A list of IKE policies appear.

13 Choose a policy and click on the OK button. The Select IKE Policy - IPSec Gateway list form closes.

14 Click on the Select button in the IPSec Tunnel Template panel to associate an IPsec tunnel template with the IPsec gateway. The Select IPSec Tunnel Template - IPSec Gateway list form opens.

15 Specify a filter for the search, if required, and click on the Search button. A list of IPsec tunnel templates appear.

16 Choose an IPsec tunnel template and click on the OK button. The Select IPSec Tunnel Template - IPSec Gateway list form closes.

17 Select the VPRN service site to which you are creating the IPsec tunnel from the IES or VPRN by performing the following:

i Click on the Select button in the Secure Service Id panel. The Select Secure Service Id - IPSec Gateway list form opens.

ii Specify a filter for the search, if required, and click on the Search button. A list of VPRN services appears.

iii Choose an entry and click on the OK button. The Select Secure Service Id - IPSec Gateway list form closes.

18 Select the tunnel interface on the VPRN service site to which you are creating the IPsec tunnel from the IES or VPRN by performing the following:

i Click on the Select button in the Tunnel Interface Name panel. The Select Tunnel Interface Name - IPSec Gateway list form opens.

ii Click on the Search button. A list of tunnel interfaces appears.

iii Choose an entry and click on the OK button. The Select Tunnel Interface Name - IPSec Gateway list form closes.

19 Configure the Local Gateway Address parameter.

20 Click on the States tab button.

21 Configure the Administrative State parameter.

22 Click on the OK button. The IPSec Gateway (Create) form closes. A dialog box appears.

23 Click on the OK button to close the dialog box. The *Service* L3 Access Interface (Create) form reappears.

24 Click on the OK button to save the configuration and close the form.

25 A dialog box appears. Click on the OK button to close the dialog box.

26 Click on the OK button. A dialog box appears.

27 Click on the Yes button. The properties form for the service closes.

Procedure 35-8 To create an IPsec tunnel on a VPRN tunnel interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the list filter parameters and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

5 Click on the Tunnel Interfaces tab button.

6 Choose a tunnel interface and click on the Properties button. The Tunnel Interface (Edit) form opens.

7 Click on the IPsec Tunnels tab button.

Note — You must first assign a port to the tunnel interface for the IPsec Tunnels tab to appear.

8 Click on the Create button. The IPSec Tunnel (Create) form opens with the General tab displayed.

9 Configure the parameters:

- Name
- Description
- Replay Window
- Keying
- Local Gateway Address
- Remote Gateway Address

10 Click on the Select button beside the Security Policy ID parameter. The Select Security Policy - IPSec Tunnel list form opens.

11 Specify a filter for the search, if required, and click on the Search button. A list of policies appears.

12 Choose an entry and click on the OK button. The Select Security Policy - IPSec Tunnel form closes.

13 Click on the Select button beside the Name parameter. The Select Service Name - IPSec Tunnel list form opens.

14 Specify a filter for the search, if required, and click on the Search button. A list of services appears.

15 Choose an entry and click on the OK button. The Select Service Name - IPSec Tunnel form closes.

16 Perform one of the following.

a If you set the Keying parameter to None in step 9, go to step 19.

b If you set the Keying parameter to Dynamic in step 9, go to step 17.

c If you set the Keying parameter to Manual in step 9, go to step 18.

17 Configure dynamic keying.

i Click on the Dynamic Keying tab button.

ii Click on the Select button beside the following parameters:

- Transform ID 1
- Transform ID 2
- Transform ID 3
- Transform ID 4

The Select Transform ID - IPSec Tunnel form opens.

iii Specify a filter for the search, if required, and click on the Search button. A list of policies appears.

iv Choose an entry and click on the OK button. The Select Transform ID - IPSec Tunnel form closes.

v Click on the Select button beside the IKE Policy parameter. The Select IKE Policy - IPSec Tunnel list form opens.

vi Specify a filter for the search, if required, and click on the Search button. A list of policies appears.

vii Choose an entry and click on the OK button. The Select IKE Policy - IPSec Tunnel form closes.

viii Configure the parameters:

- Pre Shared Key
- Auto Establish

ix Go to step 19.

18 Configure manual keying.

i Click on the Manual Keying tab button.

ii Click on the Create button. The IPSec Security Association (Create) form opens.

iii Click on the Select button in the Security Policy Entry panel. The Select Security Policy Entry - IPSec Security Association list form opens.

iv Click on the Search button. A list of policy entries appears.

v Choose an entry and click on the OK button. The Select Security Policy Entry - IPSec Security Association list form closes.

vi Configure the parameters:

- Direction
- Encryption Key
- Authentication Key
- SPI

vii Click on the Select button in the Transform panel. The Select Transform - IPSec Security Association list form opens.

viii Click on the Search button. A list of transform policies appears.

ix Choose an entry and click on the OK button. The Select Transform - IPSec Security Association list form closes.

x Click on the OK button. The IPSec Security Association (Create) form closes.

19 Click on the States tab button.

20 Configure the Administrative State parameter.

21 Click on the BFD tab button.

22 Configure the parameters:

- Designated
- Enabled

If you set the Enabled parameter to Enabled, go to step 23. Otherwise, go to step 28.

23 Click on the Select button beside the Service Name parameter. The Select BFD Service - IPsec Tunnel BFD form opens.

24 Configure the filter, if required, and choose a BFD service. The BFD service information appears for the Service Name, Service ID, and Site ID parameters.

25 Click on the Select button beside the Name parameter. The Select Interface - IPsec Tunnel BFD form opens.

26 Configure the filter, if required, and choose an interface. The interface name appears for the Name parameter.

27 Configure the Destination Address parameter.

28 Click on the OK button. The IPSec Tunnel (Create) form closes. A dialog box appears.

29 Click on the OK button.

30 Repeat steps 8 to 29 to add additional IPsec tunnels.

Procedure 35-9 To enable BFD for a static LAN-to-LAN IPsec tunnel

Note — BFD can only be enabled for the 7750 SR.

1. On the private side, use the CLI to specify a tunnel as the BFD tunnel and enable BFD on the tunnel. For example:

   ```
   config>service>vprn>ipsec-if>sap>tun>
   ```

   ```
   [no]bfd-enable [service-id] interface interface-name dst-ip
   ip-addr
   ```

   ```
   [no]bfd-designated
   ```

   See the 7750 SR documentation for more information about the CLI commands.

2. On the public side, use the CLI to configure the transmit interval. For example:

   ```
   config>service>vprn>if>
   ```

   ```
   bfd transmit-interval [receive receive-interval] [multiplier
   multiplier] [echo-receive echointerval]
   ```

   See the 7750 SR documentation for more information about the CLI commands.

3. Create a VPRN service. See chapter 74 for more information.

4. Create two VPRN L3 access interfaces. See chapter 74 for more information.

5. Create a tunnel interface on a VPRN, as described in Procedure 35-6.

6. Create an IPsec tunnel on a VPRN tunnel interface, as described in Procedure 35-8.

35.8 IPsec VPN procedures

The following procedures describe how to perform 5620 SAM IPsec configuration tasks using the IPsec VPN step forms.

Procedure 35-10 To create an IPsec VPN

Note — The 5620 SAM does not support the creation of IPsec VPNs when language localization is active. See "Localized language support" for more information about language localization.

1 Configure a corporate service. Table 35-2 lists where to find information about each corporate service type.

Table 35-2 Corporate service types

Corporate service	See chapter
Apipe	70
Cpipe	
Fpipe	
Ipipe	
VPLS	71
IES	73
VPRN	74
VLAN	69

2 If required, configure one or more service templates. Table 35-2 lists where to find more information.

3 Choose Create→IPsec VPN from the 5620 SAM main menu. The Create IPsec VPN step form opens.

4 Configure the parameters:

- Auto-Assign ID
- IPsec VPN Name
- Description
- Service Type
- Link Corporate and Secured Service

5 To select a corporate service, perform the following, otherwise, go to step 6.

  i Click on the Select button beside the Corporate Service ID parameter. The Select Corporate Service - IPsec VPN form opens. Only the specific service type, as set by the Service Type parameter, is listed.

  ii Filter the corporate services, if required, and select a corporate service.

  iii Click on the OK button to close the Select Corporate Service - IPSec VPN form. The Corporate Service ID and Corporate Service Name parameters display the service ID and service name for the selected corporate service on the Create IPsec VPN step form.

6 Click on the Next button on the Create IPsec VPN step form. The Select Service Sites step form opens. Perform Procedure 35-11 to select the service sites.

Procedure 35-11 To select a service NE site for an IPsec VPN

This procedure selects the NE site for the IPsec VPN.

1 Perform Procedure 35-10 to create an IPsec VPN.

2 Perform one of the following:

  a To choose an existing service site, configure the filter and click on the Search button. A list of service sites appears. Go to step 7.

  b To create a service site, go to step 3.

3 Click on the Create button. The Manage Equipment form opens.

4 Configure the filter, if required, and click on the Search button. A list of NEs appears.

5 Select a NE and click on the OK button. The NE appears in the Select Service Sites step form.

6 Repeat steps 3 to 5 to add another NE site.

7 Select an NE site and click on the Next button. The Create/Select Secure VPRN Service step form opens. Perform Procedure 35-12 to:

- select a service
- create a service
- create a service from a template

Procedure 35-12 To create or select a secure VPRN service for an IPsec VPN

1 Perform Procedures 35-10 and 35-11.

2 Perform one of the following:

a To select a service, go to step 3.

b To create a service, go to step 7.

c To create a service from a template, go to step 12.

Note — The template must be configured for one site. The template cannot be used if the template is configured for multiple sites.

3 Click on the Select Service button. The Select Service form opens.

4 Configure the filter, if required, and click on the Search button. A list of services appear.

5 Select a service and click on the OK button. The service appears in the Create/Select Secure VPRN Service step form.

6 Click on the Service Site tab button and configure the parameters:

- Description
- Administrative State

Go to step 15.

7 Click on the Create Service button.

8 Click on the Select button beside the Customer parameter. The Select Customer form opens.

9 Filter the customers, if required, and select a customer from the list.

10 Click on the OK button.

11 Configure the parameters:

- Service Name
- Description
- Service Tier
- Administrative State

Go to step 6.

12 Click on the Create Service From Template button. The Create Service From Template appears.

13 Filter the services, if required, and click on the Search button.

14 Select a service from the list and click on the OK button. Go to step 6.

15 Click on the Next button. The Create/Select Delivery Service(s) step form opens. Perform Procedure 35-13.

Procedure 35-13 To create or select a delivery service for an IPsec VPN

1 Perform Procedures 35-10 to 35-12.

2 Perform one of the following:

- a To select a delivery service, go to step 3.
- b To create a delivery service, go to step 8.
- c To create a service from a template, go to step 13.

Note — The template must be configured for one site. The template cannot be used if the template is configured for multiple sites.

- d To remove a service, go to step 17.

3 Click on the Select Service button. The Select Service form opens.

4 Choose IES Service (IES) or VPRN Service (VPRN) from the drop-down menu, choose a filter, if required, and click on the Search button.

5 Select a service from the list and click on the OK button. The service appears in the Create/Select Delivery Service(s) list.

6 Click on the Service Site tab button and configure the parameters:

- Description
- Administrative State

7 Repeat steps 3 to 6 to select another service. Go to:

- a step 8 to create a service
- b step 13 to create a service from a template
- c step 17 to remove a service
- d step 18 to select a tunnel group

8 Click on the Create Service button and choose VPRN or IES. The service appears in the Create/Select Delivery Service(s) list.

9 Click on the Select button beside the Customer parameter. The Select Customer form opens.

10 Choose a customer and click on the OK button.

11 Configure the parameters:

- Service Name
- Description
- Service Tier
- Administrative State

12 Repeat steps 8 to 11 to create another service. Go to:

a step 13 to create a service from a template

b step 17 to remove a service

c step 18 to select a tunnel group

13 Click on the Create Service From Template button and choose VPRN or IES. The Create Service Form Template appears.

14 Configure the filter, if required, and click on the Search button. A list of services appears.

15 Select a service template and click on the OK button.

16 Repeat steps 13 to 15 to create another service. Go to:

a step 17 to remove a service

b step 18 to select a tunnel group

17 If you perform this step, the service is removed without confirmation and there is no undo. Select a service in the Create/Select Delivery Service(s) list and click on the Remove Service button.

18 Click on the Next button. The Tunnel Group Selection step form opens. Perform Procedure 35-14.

Note — The Next button is not enabled until you perform steps 9 and 10 for each delivery service in the Create/Select Delivery Service(s) step form.

Procedure 35-14 To select a tunnel group for an IPsec VPN

1 Perform Procedures 35-10 to 35-13.

2 Select a service and configure the parameters by clicking in the panel and entering values or choosing an option:

Note 1 — The parameters are not part of the XML. In OSSI, you can create the ServiceSiteStructs and in the ServiceSiteStructs, you can create the IPsec VPN objects.

Note 2 — If the tunnel type is static, the parameters that require configuration are:

- Delivery Service Interface Address
- Local Gateway Address
- Remote Gateway Address
- Static Route Address
- Static Route Prefix

If the tunnel type is dynamic site-site, the parameters that require configuration are:

- Delivery Service Interface Address
- Local Gateway Address

If the tunnel type is dynamic soft client, the parameters that require configuration are:

- Secure Service Interface Address
- Delivery Service Interface Address
- Local Gateway Address

- ISA-Tunnel Group
- Tunnel Type
- Secure Service Interface Address
- Delivery Service Interface Address
- Local Gateway Address
- Remote Gateway Address
- Static Route Address
- Static Route Prefix

3 Click on the Service Site tab button and configure the parameters:

- Description
- Administrative State

4 Repeat steps 2 and 3 for each service.

5 Click on the Next button. The Create Policy step form opens.

Perform Procedure 35-15 if you chose Dynamic (Site-to-Site) for the Tunnel Type parameter in step 2.

Perform Procedure 35-16 if you chose Dynamic (Soft Client) for the Tunnel Type parameter in step 2.

Perform Procedure 35-17 if you chose Static for the Tunnel Type parameter in step 2.

Note — The Next button is not enabled until you perform step 2 for each tunnel group in the Tunnel Group Selection step form.

Procedure 35-15 To assign policies and configurations for a dynamic site-to-site IPsec VPN

This procedure assumes you chose Dynamic (Site-to-Site) for the Tunnel Type parameter in step 2 of Procedure 35-14.

1 Perform Procedures 35-10 to 35-14.

2 Click on the Select button beside the IPsec Tunnel Template Policy ID parameter in the IPsec Tunnel Template panel. The Select IPsec Tunnel Template - IPsec VPN form opens.

3 Perform one of the following:

- **a** To select an IPsec tunnel template from the list, go to step 4.
- **b** To create an IPsec tunnel template, go to step 5.

4 Configure the filter, if required, click on the Search button. Go to step 10.

5 Click on the Create button. The IPsec Tunnel Template form opens. Perform steps 3 to 11 in Procedure 35-4.

6 Click on the Select button beside the Policy ID parameter in the IKE Policy panel. The Select IKE Policy - IPsec VPN form opens.

7 Perform one of the following:

- **a** To select an IKE Policy from the list, go to step 9.
- **b** To create an IKE Policy, go to step 8.

8 Click on the Create button and perform steps 3 to 12 in Procedure 35-1.

9 Select a Policy and click on the OK button.

10 Configure the Pre Shared Key parameter.

11 Click on the Finish button.

If there is a configuration problem, the Problems Encountered form opens. Fix the problem and click on the Finish button.

If there are no configuration problems, a completed message appears. The 5620 SAM performs the following:

- a secure VPRN service and sites are created (see Code 35-1)
  - an access interface is created
  - a tunnel interface is created
  - the service name is configured
- the IES or VPRN delivery service and sites are created (see Code 35-2)
  - an access interface is created
  - the IP address of the SAP is configured
  - a tunnel group with an auto-generated outer encapsulation as a public SAP is assigned
  - an IPsec gateway is created
  - the secure service is assigned
  - the tunnel interface of the secure service is assigned
  - the tunnel template is assigned
  - the IKE policy is assigned
  - the local gateway address is configured
  - the Pre Shared key is configured
  - the service name is configured
- if the Link Corporate and Secure Service parameter is enabled, a composite service is created that contains the corporate and secure service

You can click on the View the newly created IPSec Secured VPN button. The IPsec VPN form opens.

Code 35-1: Secure VPRN service example

```
vprn 254 customer 2 create
            ipsec-interface "sam-auto-ipsec-intf-1" create
                sap ipsec-2.private:9 create
                exit
            exit
            service-name "VPRN service-310 CPM_132_A (38.120.169.132)"
            no shutdown
        exit
```

Code 35-2: VPRN delivery service example

```
vprn 255 customer 2 create
            interface "sam-auto-access-intf-1" create
                address 33.33.3.3/24
                sap ipsec-2.public:11 create
                    ipsec-gw "sam-auto-gateway-1"
                        default-secure-service 254 ipsec-interface
"sam-auto-ipsec-intf-1"
                        default-tunnel-template 1
                        ike-policy 1
                        local-gateway-address 33.33.3.2
                        pre-shared-key "Test"
                        no shutdown
                    exit
                exit
            exit
```

```
    service-name "VPRN service-311 CPM_132_A (38.120.169.132)"
    no shutdown
exit
```

Procedure 35-16 To assign policies and configurations for a dynamic soft client IPsec VPN

This procedure assumes that you chose Dynamic (Soft Client) for the Tunnel Type parameter in step 2 of Procedure 35-14.

1 Perform Procedures 35-10 to 35-14.

2 Perform steps 2 to 9 in Procedure 35-15.

3 Click on the Select button beside the Displayed Name parameter. The Select Subscriber Authentication Policy - IPsec VPN form opens.

4 Perform one of the following:

- **a** To select a subscriber authentication policy from the list, go to step 6.
- **b** To create a subscriber authentication policy, go to step 5.

5 Click on the Create button. The Subscriber Authentication Policy (Create) form opens. See chapter 21 for information about creating a Subscriber Authentication Policy.

6 Select a subscriber authentication policy from the list and click on the OK button.

7 Click on the Finish button.

If there is a configuration problem, the Problems Encountered form opens. Fix the problem and click on the Finish button.

If there are no configuration problems, a completed message appears. The 5620 SAM performs the following:

- a secure VPRN service and sites are created (see Code 35-3)
    - an access interface is created
    - a tunnel interface is created
    - the IP Address of the SAP is configured
    - the service name is configured
- the IES or VPRN delivery service and sites are created (see Code 35-4)
    - an access interface is created
    - the IP address of the SAP is configured
    - the RADIUS authentication policy is assigned
    - a tunnel group with an auto-generated outer encapsulation as a public SAP is assigned
    - an IPsec gateway is created
    - the tunnel template is assigned
    - the IKE policy is assigned
    - the local gateway address is configured
    - the Pre Shared key is configured
    - the service name is configured
- if the Link Corporate and Secure Service parameter is enabled, a composite service is created that contains the corporate and secure service

You can click on the View the newly created IPSec Secured VPN button. The IPsec VPN form opens.

Code 35-3: Secure VPRN service example

```
vprn 260 customer 2 create
            ipsec-interface "sam-auto-ipsec-intf-4" create
                address 9.9.9.9/24
                sap ipsec-1.private:47 create
                exit
            exit
            service-name "VPRN service-316 CPM_132_A (38.120.169.132)"
            no shutdown
        exit
```

Code 35-4: VPRN delivery service example

```
vprn 261 customer 2 create
            interface "sam-auto-access-intf-4" create
                address 40.1.1.2/24
                authentication-policy "test"
                sap ipsec-1.public:42 create
                    ipsec-gw "sam-auto-gateway-4"
                        default-tunnel-template 1
                        ike-policy 2
                        local-gateway-address 40.1.1.1
                        pre-shared-key "Test"
                        no shutdown
                    exit
                exit
            exit
```

```
    service-name "VPRN service-317 CPM_132_A (38.120.169.132)"
    no shutdown
exit
```

Procedure 35-17 To assign policies and configurations for a static IPsec VPN

This procedure assumes that you chose Static for the Tunnel Type parameter in step 2 of Procedure 35-14.

1 Perform Procedures 35-10 to 35-14.

2 Perform steps 3 to 6 in Procedure 35-15.

3 Configure the parameters:

- Pre Shared Key
- Replay Window
- Keying

If you set the Keying parameter to Manual, go to step 4. If you set the Keying parameter to Dynamic, go to step 6.

4 Configure the Manual Keying - Inbound parameters:

- Keying Type
- Encryption Key
- Authentication Key
- SPI Inbound

5 Configure the Manual Keying - Outbound parameters:

- Keying Type
- Encryption Key
- Authentication Key
- SPI Outbound

6 Perform one of the following:

a To select an IPsec transform policy from the list, go to step 8.

b To create an IPsec transform policy, go to step 7.

7 Click on the Create button and perform steps 3 to 12 in Procedure 35-1.

8 Select an IPsec transform policy and click on the OK button.

9 Configure the Auto Establish parameter.

Note — The Auto-Establish parameter is only configurable if dynamic keying is selected.

10 Click on the Finish button.

If there is a configuration problem, the Problems Encountered form opens. Fix the problem and click on the Finish button.

If there are no configuration problems, a completed message appears. The 5620 SAM performs the following:

- a secure VPRN service and NE sites are created (see Code 35-5)
    - the IPsec security policy is created
    - a tunnel interface is created
    - a tunnel group with an auto-generated outer encapsulation as a private SAP is assigned
    - the IPsec tunnel is created
    - the security policy is assigned to the tunnel
    - the local and remote gateway addresses are configured
    - the delivery service is configured
    - the replay window is configured
    - the keying is configured
    - if set, auto establish is enabled
    - the static route is configured
    - the service name is configured
- the IES or VPRN delivery service and NE sites are created (see Code 35-6)
    - an access interface is created
    - a tunnel group with an auto -generated outer encapsulation as a public SAP is assigned
    - the IP address of the SAP is configured
    - the service name is configured
- if the Link Corporate and Secure Service parameter is enabled, a composite service is created that contains the corporate and secure service

You can click on the View the newly created IPSec Secured VPN button. The IPsec VPN form opens.

Code 35-5: Secure VPRN service example - Keying parameter set to Dynamic

```
vprn 252 customer 2 create
            ipsec
                security-policy 1 create
                    entry 1 create
                        local-ip any
                        remote-ip any
                    exit
                exit
            exit
            ipsec-interface "sam-auto-ipsec-intf-32" create
```

```
                sap ipsec-1.private:46 create
                    tunnel "sam-auto-tunnel-32" create
                        security-policy 1
                        local-gateway-address 40.1.1.2 peer 2.2.2.2 delivery-service
253
                        replay-window 64
                        dynamic-keying
                            ike-policy 1
                            pre-shared-key "Test"
                            transform 1
                        exit
                        no shutdown
                    exit
                exit
            exit
            static-route 3.3.3.3/32 ipsec-tunnel "sam-auto-tunnel-32"
            service-name "VPRN service-308 CPM_132_A (38.120.169.132)"
            no shutdown
        exit
```

Code 35-6: VPRN delivery service example

```
vprn 253 customer 2 create
            interface "sam-auto-access-intf-32" create
                address 40.1.1.1/24
                sap ipsec-1.public:41 create
                    collect-stats
                exit
            exit
            service-name "VPRN service-309 CPM_132_A (38.120.169.132)"
            no shutdown
        exit
```

36 — ISA-Video

36.1 ISA-Video overview

The 5620 SAM allows the equipment and services configuration of the following enhancements to multicast video service provided by the ISA-Video MDA module:

- Reliable Delivery/Retransmisson (RT) Proxy
- Fast Channel Change (FCC)
- Ad Insertion (ADI)

These features are supported on the 7750 SR and 7450 ESS, Release 7.0 R4 or later.

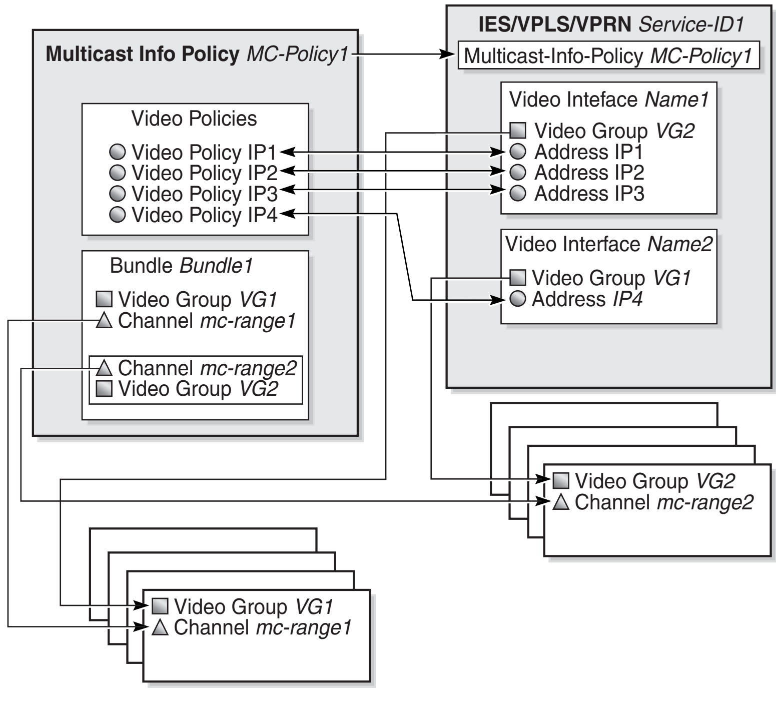
You can use the 5620 SAM to configure the required ISA-Video Groups and Members, as well as the associated multicast info policies. VPRN, IES, and VPLS services can then be configured for the customer video delivery.

These enhancements are provisioned in 5620 SAM in following three areas:

- A Video Group configuration to manage the ISA resources and service grouping.
- Multicast Information policy configuration parameters and objects to handle the RT, FCC and Ad insertion capabilities, including:
    - A Video Policy configuration under the Multicast Information Policy
    - Video parameters added to Multicast Bundles, Channels and Channel override configurations
- Video Interface configurations are added under VPRN/IES/VPLS services sites.

Figure 36-1 shows the relationship of these various elements and how they are associated through configuration.

Figure 36-1 ISA-Video configuration elements



A Video Interface within a service site can have up to eight IP addresses. The IP addresses assigned to a Video Interface determine which MultiCast Info Policy is applied. The Video Group you assign to the Video Interface determines which bundle/channel configuration inside the Multicast Info policy is applied to the interface. You also configure the ingress and egress QOS policies for the Video Interface using the Video Group.

If a request is received on a Video Interface for a channel not serviced by the Video Group associated with that specific Video Interface, then the request is considered invalid and is dropped. For example, in Figure 36-1, a request for mc-range2 received on IP1, IP2, or IP3 is invalid. A request for mc-range2 is only valid on IP4.

A Video Group manages the ISA-Video MDA resource and the configurations of the enhanced video functionality. You can assign a Video Group (for example, VG1 in Figure 36-1) for each Bundle, and this is the default Video Group for all of the channels in that Bundle. You can then apply specific configuration overrides for each channel within a Video Group assignment.

Up to four Video Groups (ID 1-4) can be configured on a single node. Each Video Group in turn, can have multiple primary video ISAs assigned to provide load balancing and redundancy protection. However, any specific video ISA can only be bound to one Video Group. The binding of a video ISA to the Video Group is referred as a Video Group Member.

Additional considerations for the Ad Insertion functionality:

- Ingress Ad Insertion channels are configured on the Video Interface configuration form.
- If Ad Insertion functionality is enabled on a Video Group, then the group can only have one Video Group Member.
- You can configure Zone Channels for egress Ad Insertion on each Ad Insertion channel configuration.
- Ad Insertion channels are not applicable to VPLS.

36.2 Workflow to configure and manage an ISA-Video configuration

1. Provision the ISA-Video MDA. See chapters 16 and 17 for more information about ISA-Video MDA equipment configuration.

2. Create or configure ISA-Video Groups and add members under the Video Groups. See Procedure 18-11 for more information.

3. Configure and distribute a global Multicast Information policy. Configure the channel bundle, channel range, channel overrides, and video interface for the node. See Procedure 49-4 for more information.

4. Create and enable a video interface for the VPLS, IES, or VPRN service. See procedures 36-1, 36-2, and 36-3 for more information.

36.3 ISA-Video procedures

The following procedures describe how to perform 5620 SAM ISA-Video configuration tasks.

Procedure 36-1 To add a Video interface to a VPRN site

The 7710 SR and 7750 SR support the configuration of a video interface in a VPRN service.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2. Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3. Choose the required VPRN service and click on the Properties button. The VPRN (Edit) form opens with the General tab displayed.

4. On the navigation tree, click on the site to which you want to add the video interface; expand the entries for that site.

5. Right-click on the Video Interfaces and choose Create Video Interface. The Video Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description
- Administrative State
- Group Number
- Associated Multicast Service ID
- RT Client Address
- ADI Administrative Status
- SCTE 30 Control Address
- SCTE 30 Data Address

After you choose a Group Number, the following selectable fields are also displayed:

- Ingress QoS Policy
- Egress QoS Policy
- Ingress IP Filter
- Egress IP Filter

Choose the required policies and filters by clicking on the Select button beside the corresponding fields. You can perform a search or choose the entry from the list that appears for each of these items.

7 Click on the Security tab.

8 Click on the Select button and choose the required NE DoS Protection Policy from the list. You can also perform a search from this form.

9 Click on the Addresses tab and click on the Create button. The IP Address (Create) form opens.

10 Configure the parameters:

- IP Address
- Address Type
- Prefix Length

11 Go to step 12 if you are configuring ad insertion. Otherwise go to step 25.

12 Click on the ADI Channels tab and click on the Create button. The Video ADI Channel (Create) form opens with the General tab displayed.

13 Configure the parameters:

- Name
- Description
- Multicast Channel IP Address
- Unicast Source IP Address
- SCTE 35 Action

14 Click on the Zone Channels tab and click on the Create button. The Video ADI ZoneChannel (Create) form opens.

15 Configure the parameters:

- Name
- ADI Zone Multicast Address
- ADI Zone Unicast Source Address

16 Click on the OK button. The Video ADI ZoneChannel (Create) form closes, and a dialog box appears.

17 Click on the OK button. The Video ADI Channel (Create) form reappears, with the newly-configured Zone Channels displayed in the list.

18 Repeat steps 14 to 17 to configure additional Zone Channels, if required.

19 Click on the OK button. The Video ADI Channel (Create) form closes, and a dialog box appears.

20 Click on the OK button. The Video Interface (Create) form reappears with the newly-configured ADI Channels displayed in the list.

21 Click on the ADI (SCTE 30) Server tab and click on the Create button. The ADI (SCTE 30) Server (Create) form opens.

22 Configure the Server Address parameter.

23 Click on the OK button. The ADI (SCTE 30) Server (Create) form closes and a dialog box appears.

24 Click on the OK button. The ADI (SCTE 30) Server form reappears with the newly-configured ADI (SCTE 30) Server displayed in the list.

25 Click on the OK button. The Video Interface (Create) form closes and a dialog box appears.

26 Click on the OK button. The newly-configured Video Interface is displayed for the site.

27 Close the Manage Services form.

Procedure 36-2 To add a Video interface to an IES site

The 7710 SR and 7750 SR support the configuration of a video interface in an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose the required IES service and click on the Properties button. The IES (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the video interface and expand the entries for that site.

5 Right-click on the Video Interfaces and choose Create Video Interface. The Video Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description
- Administrative State
- Group Number
- Associated Multicast Service ID
- RT Client Address
- ADI Administrative Status
- SCTE 30 Control Address
- SCTE 30 Data Address

After you select a Group Number, the following selectable fields are also displayed:

- Ingress QoS Policy
- Egress QoS Policy
- Ingress IP Filter
- Egress IP Filter

Choose the required policies and filters by clicking on the Select button adjacent to the corresponding fields. You can conduct a search or choose the required entry from the list that appears for each of these items.

7 Click on the Security tab.

8 Click on the Select button to select the required NE DoS Protection Policy from the list displayed in the form. You can also conduct a search from this form.

9 Click on the Addresses tab and click on the Create button. The IP Address (Create) form opens.

10 Configure the parameters:

- IP Address
- Address Type
- Prefix Length

11 Go to step 12 if you are configuring ad insertion. Otherwise go to step 25.

12 Click on the ADI Channels tab and click on the Create button. The Video ADI Channel (Create) form opens with the General tab displayed.

13 Configure the parameters:

- Name
- Description
- Multicast Channel IP Address
- Unicast Source IP Address
- SCTE 35 Action

14 Click on the Zone Channels tab and click on the Create button. The Video ADI ZoneChannel (Create) form opens.

15 Configure the parameters:

- Name
- ADI Zone Multicast Address
- ADI Zone Unicast Source Address

16 Click on the OK button. The Video ADI ZoneChannel (Create) form closes and a dialog box appears.

17 Click on the OK button. The Video ADI Channel (Create) form reappears, with the newly-configured Zone Channels displayed in the list.

18 Repeat steps 14 to 17 to configure additional Zone Channels, if required.

19 Click on the OK button. The Video ADI Channel (Create) form closes and a dialog box appears.

20 Click on the OK button. The Video Interface (Create) form reappears with the newly-configured ADI Channels displayed in the list.

21 Click on the ADI (SCTE 30) Server tab and click on the Create button. The ADI (SCTE 30) Server (Create) form opens.

22 Configure the Server Address parameter.

23 Click on the OK button. The ADI (SCTE 30) Server (Create) form closes and a dialog box appears.

24 Click on the OK button. The ADI (SCTE 30) Server form reappears with the newly-configured ADI (SCTE 30) Server displayed in the list.

25 Click on the OK button. The Video Interface (Create) form closes and a dialog box appears.

26 Click on the OK button. The newly-configured Video Interface is displayed for the site.

27 Close the Manage Services form.

Procedure 36-3 To add a Video interface to a VPLS site

The 7710 SR and 7750 SR support the configuration of a video interface in a VPLS.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose the required VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the video interface and expand the entries for that site.

5 Right-click on the Video Interfaces and select Create Video Interface. The Video Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description
- Administrative State
- Group Number
- Associated Multicast Service ID
- RT Client Address
- Gateway Address

After you select a Group Number, the following selectable fields are also displayed:

- Ingress QoS Policy
- Egress QoS Policy
- Ingress IP Filter
- Egress IP Filter
- Ingress Mac Filter
- Egress Mac Filter

Choose the required policies and filters by clicking on the Select button adjacent to the corresponding fields. You can conduct a search or choose the required entry from the list that appears for each of these items.

7 Click on the Security tab.

8 Click on the Select button to select the required NE DoS Protection Policy from the list displayed in the form. You can also conduct a search from this form.

9 Click on the Addresses tab and click on the Create button. The IP Address (Create) form opens.

10 Configure the parameters:

- IP Address
- Address Type
- Prefix Length

11 Click on the OK button. The Video Interface (Create) form closes, and a dialog box appears.

12 Click on the OK button. The newly-configured Video Interface is displayed for the site.

13 Close the Manage Services form.

37 — Alarm management

37.1 Alarm management overview

The 5620 SAM converts SNMP traps from NEs and 5620 SAM events to alarms that are associated with the managed equipment, configured services and policies.

The alarm-based fault management system provides the following:

- the conversion of SNMP traps from NEs to alarms using the X.733 standard
- the correlation of alarms with equipment- and service-affecting faults
- updates to the managed-object operational status in near-real-time
- alarm policy control that allows a network administrator to specify how to process alarms and how to create and store the alarm logs
- point-and-click alarm management using the 5620 SAM GUI dynamic alarm list and object properties forms
- the ability to log the actions taken to correct the associated fault by adding notes to the alarm
- an alarm history for performing trend analysis

Figure 37-1 shows how the 5620 SAM manages alarms.

Figure 37-1 Alarm management

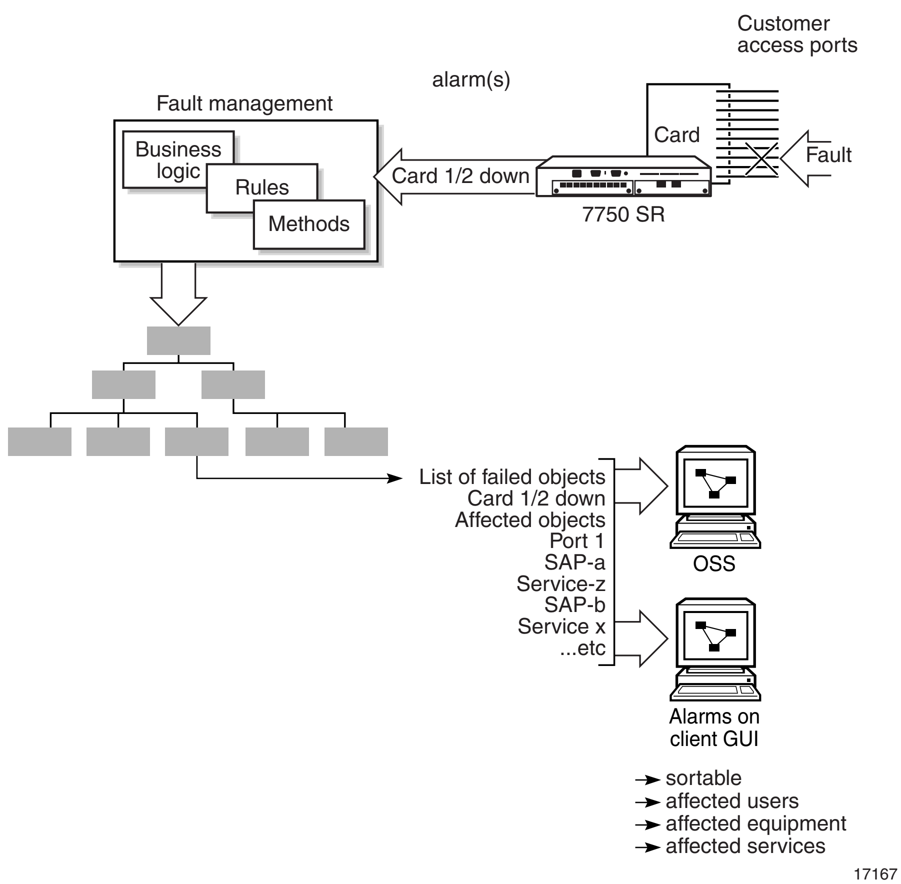


Figure 37-2 shows the following related alarm objects in the 5620 SAM GUI:

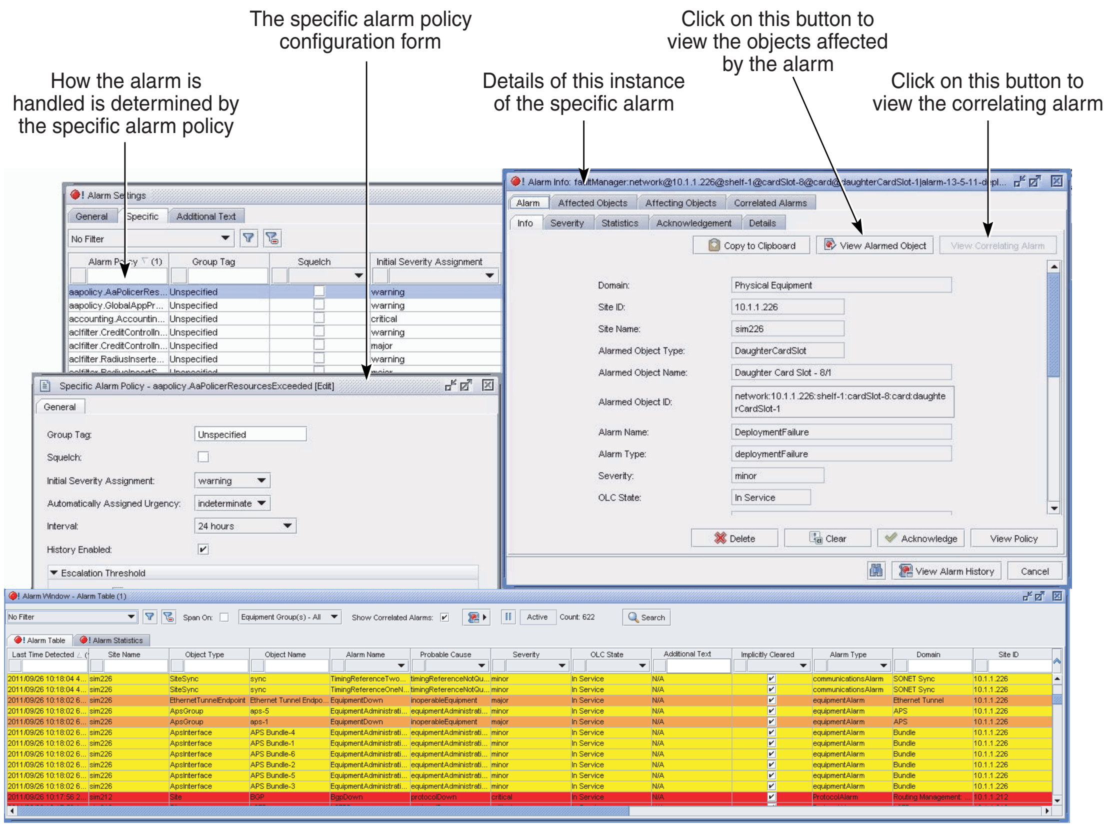
- an incoming alarm in the dynamic alarm list
- the alarm policy
- the alarm information form

Figure 37-2 Alarm relationships on the GUI



19620

You can view the history of one or more alarms using a 5620 SAM menu option, from the Alarm Info form, and using the View Alarm(s) History contextual menu option in the Alarm Window. From the Alarm Window, you can use the Historical Alarms button to open the Historical Alarms form, and can view the alarm history of an object by choosing the View Object(s) Alarm History contextual menu option.

Note — The View Alarm(s) History and View Object(s) Alarm History menu options are unavailable when more than 20 alarms are selected.

The following information is displayed on an Alarm Info form.

- Alarm tab—contains alarm information that includes the object, severity, statistics, and acknowledgement status.
- Affected Objects tab—contains a list of objects that are affected by the alarm. All alarms list the affected objects, even when correlation alarm suppression is enabled. See Figure 37-3 for how affected objects are determined.
- Affecting Objects tab—contains a list of objects that directly affect the object in alarm. See Figure 37-3 for how affecting objects are determined.
- Correlated Alarms tab—contains a list of correlated alarms. Correlated alarms are raised against other objects that are dependent on the alarmed object.

Alarm status, severity, and aggregation

Alarm status for the network is indicated in the navigation tree, the dynamic alarm list, and on the topology maps. You can use the navigation tree to view the status of an alarm raised against a specific object and to view the aggregated alarm status. The aggregated alarm status is also available on the Faults tab of an object property form.

Alarms are considered related or affecting when there is a relationship between objects. The 5620 SAM business logic determines that, for example, if a port goes down and the port is used by a SAP, a customer is affected by the port down alarm.

Figure 37-3 shows how aggregation, affecting, and affected alarms are determined.

Figure 37-3 Aggregation, affecting, and affected alarm inheritance

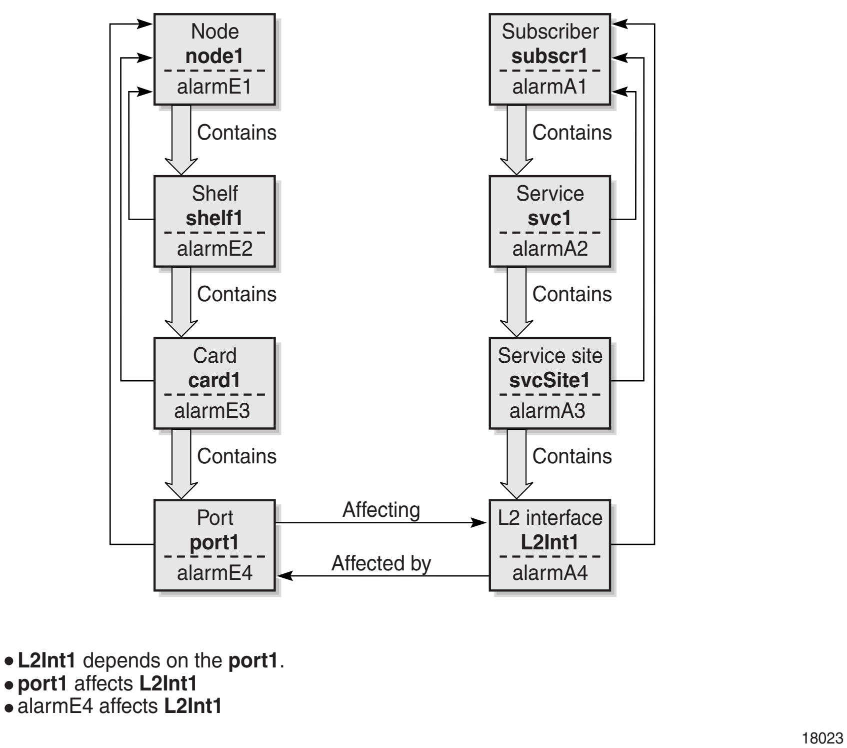


Table 37-1 shows the alarm relationships based on the example in Figure 37-3.

Table 37-1 Alarm relationships

Object	Object alarms	Affecting alarms	Aggregated alarms	Related object alarms
NE1	alarmE1	—	alarmE2 alarmE3 alarmE4	—
shelf1	alarmE2	—	alarmE3 alarmE4	—
card1	alarmE3	—	alarmE4	—
port1	alarmE4	—	—	alarmA4
subscr1	alarmA1	—	alarmA2 alarmA3 alarmA4	—
svc1	alarmA2	—	alarmA3 alarmA4	—
svcSite1	alarmA3	—	alarmA4	—
L2Int1	alarmA4	alarmE4	—	—

The 5620 SAM GUI uses color to indicate alarm severity. The color code is used consistently throughout the GUI, for example, in the navigation tree, dynamic alarm list, and topology maps. Table 37-2 lists the default alarm colors.

Table 37-2 Default 5620 SAM alarm colors

Alarm severity	Default color
Critical	Red
Major	Orange
Minor	Yellow
Warning	Cyan
Condition	Mocha
Cleared/Normal	Green
Indeterminate	White
Information	Light blue

The following tabs are on the Faults tab of an object properties form.

- Object Alarms—contains information about the alarm as viewed from the dynamic alarm list. For example, shelf1 is the object, and alarmE2 is the object alarm.
- Affecting Alarms—contains information about the alarms on objects that are directly affecting this object. For example, alarmE4 on object port1 is affecting object L2Int1, because of the relationship between the L2 interface and port1.

- Aggregated Alarms—contains alarm information for objects below the listed object in the containment hierarchy. For example, object shelf1 contains two propagated alarms, alarmE3 and alarmE4, because the shelf contains card1 and port1.
- Alarms on Related Objects—contains information about the alarms that have an indirect relationship with the object. For example, alarmA4 is displayed in the Alarms on Related Objects tab for port1, because it is related to the fault condition on port1.

Figure 37-4 shows the alarm status information for an object in the navigation tree, the object properties form, and the associated alarm information form. You can use the alarm information form to view the affected objects, the affecting objects, and the correlated alarms.

Note — In the navigation tree, an aggregated alarm may be present when no child object in the tree has an alarm. This is because the navigation tree is a filter for different views. When you change the view using the drop-down menu; for example, from Equipment to Network, the aggregated alarm on the child object may appear.

Figure 37-4 Alarm status information in the navigation tree

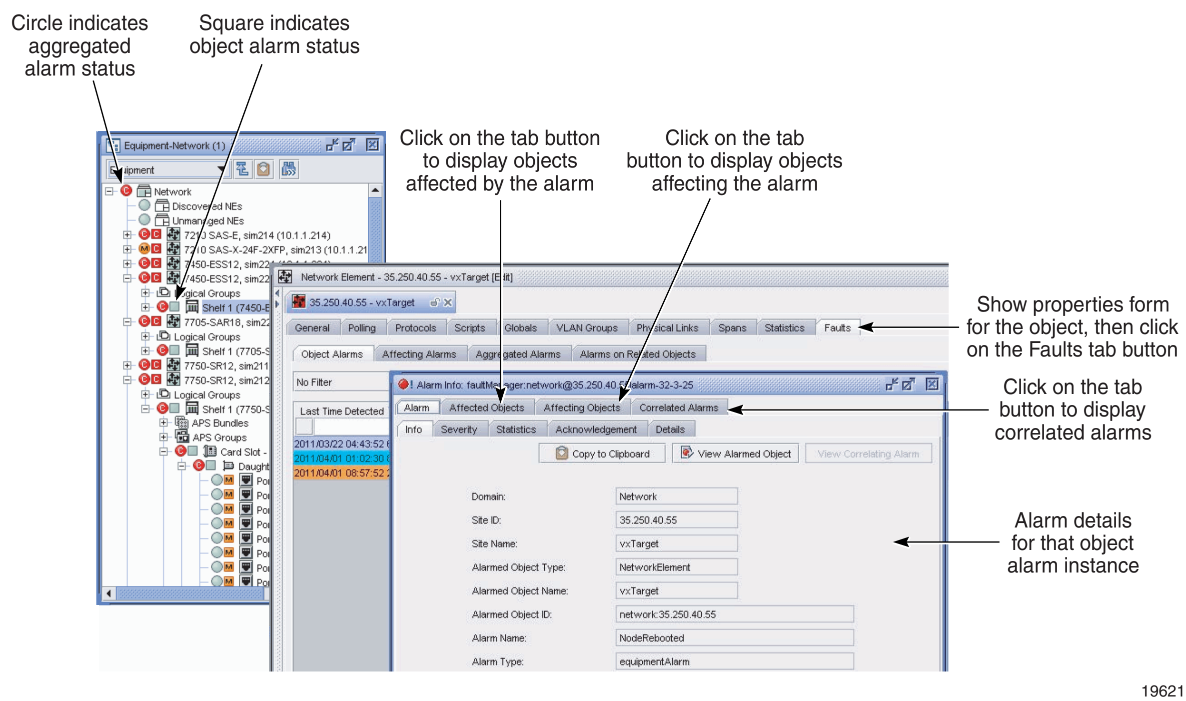

Figure 37-5 shows alarm and status information on a topology-map icon. See the *5620 SAM Troubleshooting Guide* for information about using topology maps for alarm management.

Figure 37-5 Alarm and status information on topology map icons

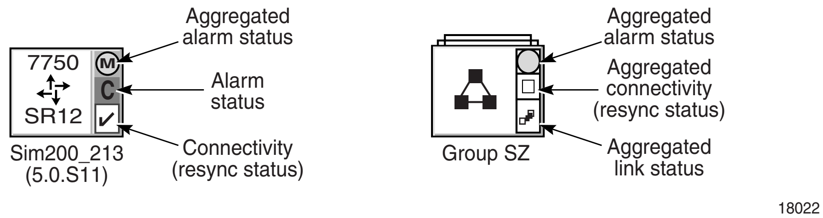

Figure 37-6 shows how to navigate from the aggregated or object alarms in the navigation tree to the Faults tab of an object properties form.

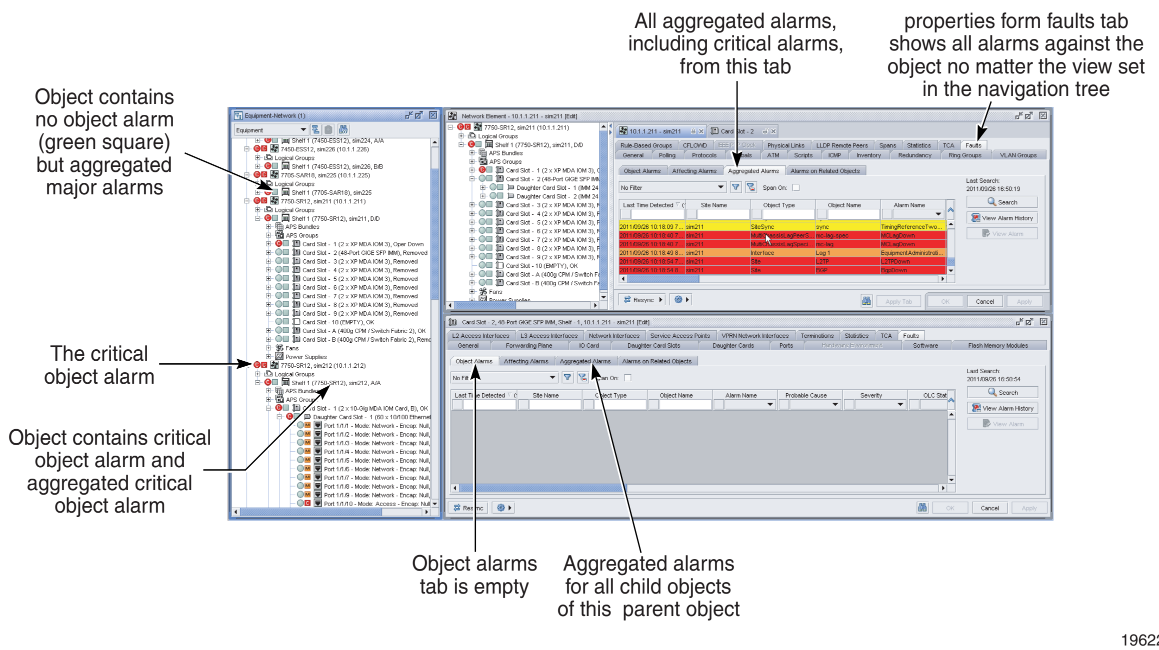
Figure 37-6 Navigating from the navigation tree to Faults tab on a properties form

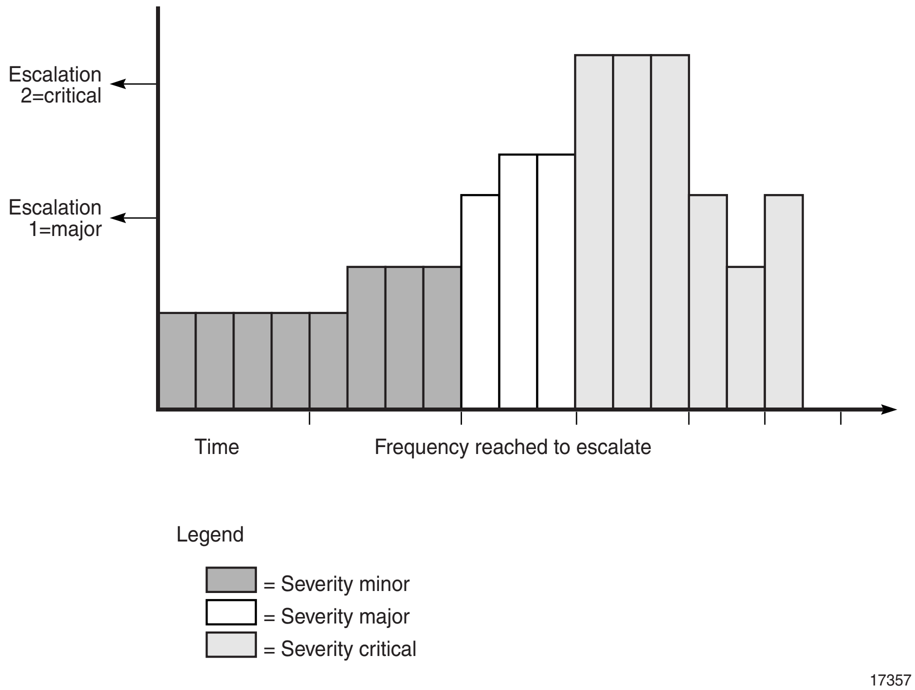


Alarm thresholds

The 5620 SAM provides tools to escalate and de-escalate the severity of alarms using alarm threshold measures that are configurable using specific alarm parameters, as described in Procedure 37-2.

Figure 37-7 shows an example of what happens when an alarm threshold escalation is reached, and a policy is applied. Figure 37-8 shows two escalation and two de-escalation policies applied to an alarm.

Figure 37-7 Alarm thresholds without de-escalation policies

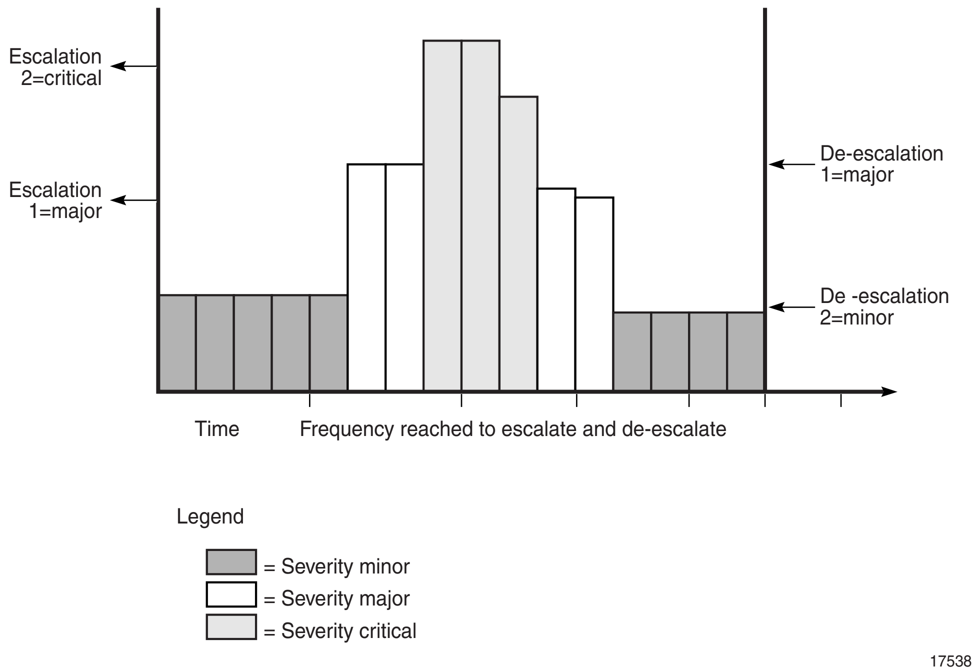


The preceding figure shows two escalation policies applied to an alarm. Escalation rules are applied when the number of instances of the alarm, also called the frequency, reaches the configured value. De-escalation rules are applied when the number of instances of the alarm drops below the configured frequency value. When the escalation value is reached, the alarm is escalated to the configured value. As shown in the figure, the first escalation is to major priority and then to critical priority. When the appropriate frequency to escalate and de-escalate is reached, the alarm is first escalated in severity and then de-escalated. However, if the alarm is deleted, then the frequency calculation is affected.

Note — When no de-escalation policy is applied, escalated alarms are not de-escalated once the frequency of the alarm drops below the alarm escalation threshold.

Figure 37-8 shows two escalation and two de-escalation policies applied to an alarm.

Figure 37-8 Alarm thresholds with de-escalation policies



Escalation policies are affected by the auto parameter of the global alarm deletion policy. See Procedure 37-1 for more information. When an escalation policy uses the “default when cleared” option, the escalation policy does not work. You must configure the parameter to a value other than “when cleared” to ensure the escalation policy is successful.

Alarm suppression

The 5620 SAM is designed to not raise alarms when numerous SNMP traps are sent in quick succession for the same type of event. This prevents alarm storms during intermittent outages in the network caused by bouncing NEs; for example, when links go up and down rapidly. The 5620 SAM continues to resynchronize the network, and if the bouncing NEs continue to send down state SNMP traps, the 5620 SAM eventually receives the trap and generates the appropriate alarm.

To indicate how often an alarm is raised, the number of occurrences of each instance of the alarm is tracked within the alarm record of the initial alarm. Click on the Statistics tab of an individual Alarm Info form to see how often the alarm was raised.

To cause alarm severity to escalate if an alarm reoccurs a specific number of times, use the threshold crossing alert functionality, as described in Procedure 37-2 using the Escalation parameter or the De-escalation parameter.

The 5620 SAM uses a process called trap throttling to prevent the 5620 SAM system from being overloaded with traps when a failure occurs. Trap throttling does not affect the sequencing of traps. The trap throttling process allows the 5620 SAM software to process traps when it has the time. As a result, the 5620 SAM software knows which traps the software missed and resynchronizes only those traps. Trap throttling is supported and configured through the CLI on each Alcatel-Lucent NE. See the Alcatel-Lucent NE System Management Guides for configuration instructions.

Correlated alarms

The 5620 SAM raises a correlated alarm when a fault condition on one object causes an alarm condition on another object. For example, when a port goes down, an alarm is raised against the port, which is the affected object, and each service that uses the port generates an alarm. The alarm information for the affected object includes the correlated alarms.

The 5620 SAM automatically adjusts the severity of correlating alarms to match the severity of correlated alarms. For example, in a case where a major correlating port alarm has one or more critical correlated service alarms, the 5620 SAM adjusts the severity of the correlated port alarm to critical. The correlating alarm cannot have a severity that is lower than the severity of the correlated alarms, however, the severity that is defined by a specific alarm policy takes precedence over the correlated severity. The 5620 SAM does not decrease the severity of correlating alarms when correlated alarms are cleared.

Note — Alarm correlation does not affect the severity of HIP alarms, or alarms that originate from an external EMS.

When the event that triggers an affected-object alarm is corrected and the alarm clears, the correlated alarms also clear. If a correlated alarm does not clear after the affected-object alarm clears, the source of the correlated alarm is an event other than the trigger event. In this case, the alarm correlation is removed and the alarm is displayed in the dynamic alarm list. See Procedure 37-9 for information about viewing correlated alarms.

You can enable or disable the display of correlated alarms in order to reduce the number of alarms that appear in the dynamic alarm list. Correlated alarms are displayed by default and can be enabled or disabled for individual 5620 SAM clients. See Procedure 37-7 for more information.

Note — The display of correlated alarms in the Alarm Window does not affect the alarm status displayed in the navigation tree and topology map.

You can configure the 5620 SAM to automatically delete correlated alarms when the correlating alarm is deleted. You can also configure 5620 SAM alarm settings to specify whether a user notification is displayed when one or more correlated alarms is about to be deleted. See Procedure 37-1 for information about configuring the automatic deletion of correlated alarms.

Note — A correlated alarm remains after the deletion of the correlating alarm if there is another correlating alarm associated with it. For this reason, the number of correlated alarms that are automatically deleted may be fewer than the number stated in the warning notification presented to a GUI operator.

Service and transport alarm correlation

The 5620 SAM provides limited service and transport alarm correlation. When an LSP goes out of service, the 5620 SAM raises an alarm against the LSP and raises a correlated alarm against each LSP path that is a child object of the LSP. The LSP alarm is listed as an aggregated alarm for each SDP that uses the LSP. A 5620 SAM operator can use the aggregated LSP alarm for SDP troubleshooting.

Because there is not necessarily a direct relationship between an LSP and the SDPs that use it, for example, when LDP over RSVP is the transport mechanism, the 5620 SAM does not correlate SDP alarms with LSP alarms.

Automatic purging of alarms

Large numbers of outstanding alarms can affect system performance. Therefore, outstanding alarms are purged based on the severity, correlation status, and age of the alarm. If the system limit of 60 000 is reached, alarms are purged to the historical alarm log until the alarm count drops to 45 000. Other automatic purging of alarms is not necessary when historical alarm logging and purging policies are configured, as described in Procedure 37-4.

The alarm purge algorithm sorts alarms based on the following criteria:

- correlated alarms are deleted before the root alarms are deleted
- lower severity alarms are deleted before higher severity alarms are deleted
- oldest alarms are deleted first

When alarm policies are not configured, the system purges alarms in this sequence:

1. When the outstanding alarm count reaches 50 000, non-critical and non-root alarms are purged to the historical alarm log until the alarm count drops to 45 000.
2. An alarm is raised to indicate an alarm purge is in process.
3. When the outstanding alarm count reaches 60 000, alarms are purged to the historical alarm log until the alarm count drops to 45 000.
4. An alarm is raised to indicate an alarm purge.

To ensure purged alarms are logged, you must set up historical alarm logging, as described in Procedure 37-4.

37.2 Workflow to manage alarms

1 Set up the managed NEs to send SNMP traps of managed NE faults and events to the 5620 SAM. See the appropriate NE documentation for more information.

2 Configure alarm policies on the 5620 SAM using Administration→Alarm Settings.

i Configure global policies for incoming alarms. See Procedure 37-1 for more information.

ii Configure specific policies for each alarm type. See Procedure 37-2 for more information.

iii Configure additional text policies. See Procedure 37-3 for more information.

iv Configure alarm history database behavior for the storage of historical alarm records. See Procedure 37-4 for more information.

3 Configure alarm user preferences. See Procedures 37-5, 37-6, and 37-7 for more information.

4 Monitor alarms:

i For SLAs by monitoring SAP and service alarms from the appropriate properties form or manage services form. See Procedure 37-8 for more information.

ii For each piece of equipment or logical component using the Faults tab button from each equipment form, logical component form, or from the navigation tree equipment view. See Procedure 37-9 for more information.

iii For the network from the dynamic alarm list. See Procedures 37-11, 37-12, 37-13, 37-14, 37-15, and 37-16 for more information.

iv For incoming SNMP traps from managed NEs by viewing logs.

For information about troubleshooting using alarms see the *5620 SAM Troubleshooting Guide*.

5 Review historical alarm records in the alarm history log database for trends and store the alarms for record-keeping. See Procedures 37-17 and 37-18 for more information.

6 View the object against which an alarm logged to the alarm history database was raised. See Procedure 37-19 for more information.

7 Reload alarms to ensure the alarm service cache is refreshed, as required by the system administrator. This step can only be performed by a user with an account that is assigned the administrator scope of command role or a scope of command role with write access permissions to the fm.FaultManager class, and should only be done when necessary. See Procedure 37-20 for more information.

37.3 Alarm management procedures

Use the following procedures to perform fault management tasks.

Procedure 37-1 To configure global alarm policies

Global alarm policies affect all network alarms and can be set by users who are assigned an account with either the administrator scope of command role or a scope of command role with write access permissions to the fm.GlobalPolicy class.

1 Choose Administration→Alarm Settings from the 5620 SAM main menu. The Alarm Settings form opens with the General tab displayed.

2 Click on the Alarm Behavior tab button.

3 Set the severity policies by clicking on the Severity tab button.

i Enable the Severity Alterable parameter to enable setting the severity parameters. When you enable severity alterable functionality, you can specify whether to allow automatic changes to severity based on individual alarm policies or manual changes to severity based on operator actions.

Severity settings cannot be altered unless the check box is enabled.

ii Configure the parameters.

- manual severity alterations
- severity promotion
- severity demotion
- clearing (if self-clearing alarm)
- automatic severity alterations
- implicit severity promotion
- implicit severity demotion
- escalation (defined by specific policy)
- De-escalation (defined by specific policy)

4 Set the deletion policies by clicking on the Deletion tab button:

i Enable the Alarm deletion parameter to allow the creation of a deletion policy.

Deletion policies cannot be changed unless the check box is enabled.

ii Choose the appropriate deletion policy. When you enable deletion functionality, you can specify whether to allow operators to delete alarms or allow the automatic deletion of alarms.

Configure the parameters.

- manual
- auto
- automatic deletion of correlated alarms

Caution — Deleting an alarm resets the frequency of an alarm to 1. This may cause conflicts with configured alarm escalation and de-escalation policies.

5 Click on the Apply button to save the changes. A dialog box appears.

6 Click on the Yes button to proceed.

7 Click on the Cancel button to close the form.

Procedure 37-2 To configure specific alarm policies

A specific alarm policy allows you to modify the behavior of a specific type of alarm, if you want that alarm to behave differently than the default.

1 Choose Administration→Alarm Settings from the 5620 SAM main menu. The Alarm Settings form opens.

2 Click on the Specific tab button. A list of alarm types appears.

3 Choose an alarm type. Alternatively, you can select multiple alarms at the same time.

The alarm types are listed by *domain.alarm name*.

4 Click on the Properties button. The Specific Policy form for that alarm type opens.

5 Configure the general alarm type parameters.

- Group Tag
- Squelch
- Initial Severity Assignment
- Automatically Assigned Urgency
- Interval
- History Enabled

6 Configure the alarm type escalation parameters. Select the Escalation or De-escalation check boxes to escalate or de-escalate the severity of an alarm based on how frequently that alarm is processed by the 5620 SAM.

i Select the Escalation parameter or the De-escalation parameter.

ii Click on the Add button.

iii Configure the Frequency parameter. This is the threshold in a 24-hour period of how often the alarm must arrive before the severity is escalated or de-escalated.

The alarms are analyzed at faster, non-configurable intervals to verify whether the Frequency value is reached.

iv Configure the Severity parameter to specify the new severity applied against the alarm if the escalation or de-escalation threshold is reached.

v Click on the OK button.

The new escalation or de-escalation policy is applied to the alarm.

7 Click on the OK button to save the changes and close the Specific Policy form. A dialog box appears.

8 Click on the Yes button to proceed.

Procedure 37-3 To create additional text policies

Create an additional text policy to display specific information about an alarmed object in the additional text field of the dynamic alarm list and on the Alarm Info form.

1 Choose Administration→Alarm Settings from the 5620 SAM main menu. The Alarm Settings form opens with the General tab displayed.

2 Click on the Additional Text tab button.

3 Configure the additional text policies. Perform the following steps:

i Click on the Create button. The Additional Text Policy (Create) form opens with the General tab displayed.

ii Click on the Select button beside the Domain parameter. The Select affected object's domain form opens.

iii Select a domain from the list and click on the OK button. The Select affected object's domain form closes and the Additional Text Policy (Create) form reappears.

iv Click on the Select button beside the Object Type parameter. The Select affected object's object type form opens.

v Select an object type from the list and click on the OK button. The Select affected object's object type form closes and the Additional Text Policy (Create) form reappears.

vi Configure the parameters:

- Description
- Overwrite existing

4 Configure the additional text attributes. Perform the following steps:

   i Click on the Additional Text Attributes tab button.

   ii Click on the Create button. The Additional Text Attribute (Create) form opens.

   iii Click on the Select button beside the Attribute Name parameter. The Select affected object attribute form opens.

   iv Select an object attribute from the list and click on the OK button. The Select affected object attribute form closes and the Additional Text Attribute (Create) form reappears.

   v Configure the Order parameter.

   vi Click on the OK button. The Additional Text Attribute (Create) form closes and a dialog box appears.

   vii Click on the OK button to confirm the action.

   viii Click on the OK button to save the configuration. The Additional Text Policy (Create) form closes and the text policy appears in the list on the Alarm Settings form.

5 Close the form.

Procedure 37-4 To configure alarm history behavior

The 5620 SAM stores new and old alarms in the alarm history database for record-keeping and trend analysis. You can specify how alarms are stored in the database.

1 Choose Administration→Alarm Settings from the 5620 SAM main menu. The Alarm Settings form opens with the General tab displayed.

2 Click on the Alarm History DB Behavior tab button.

3 Set the alarm history behavior.

a Configure the parameters.

- Max 24hr Partition Log Size (records)
- Administrative State
- Log On Change
- Log On Deletion

Note — Alcatel-Lucent recommends enabling the Log on Deletion parameter to ensure historical log records of all deleted alarms exists.

b Purge alarms from the historical alarm database by clicking on the More Actions button and choosing Purge All or Purge Range. The Purge Range option can be used when a filter policy is applied by choosing the Set Purge Range option.

Caution — Using the Purge All option removes all alarm history records from the historical alarm database.

i Click on the More Actions button and choose Set Purge Range. The Alarms Settings Filter form appears.

ii Specify a filter that to be used as the purge criteria. For example, to purge the alarm history database of all minor alarms, set the Severity filter to equal minor.

iii Click on the OK button. The Alarms Settings Filter form closes.

iv Click on the More Actions button and choose Purge Range.

v A dialog box appears. Click on the Yes button to proceed.

The historical alarm database is purged of those alarm history records which met the purge criteria.

When the maximum number of alarms allowed in the alarm history database is reached, the oldest alarms are deleted. If you want to save information about those alarms, save a file containing the alarm log information, as described in Procedure 37-18.

Procedure 37-5 To configure audible alarms

1. Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.
2. Configure the Turn on Audible Alarms parameter.
3. Click on the OK button. The User Preferences form closes, and the audible alarm option is applied.

Procedure 37-6 To configure alarm flags

The Monitoring Flag panel under the Alarm Table tab indicates the number of alarms, color-coded by severity, that have been detected since the flag was reset. The time the last alarm for that severity was detected is also displayed. You can show or hide alarm flags the Monitoring Flag panel using the User Preferences form.

1. Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.
2. Configure the Show Alarm Flags parameter.
3. Click on the OK button. The User Preferences form closes, and the Monitoring Flag panel appears in the dynamic alarm list Alarm Window.

Procedure 37-7 To enable or disable the display of correlated alarms

Note 1 — The display of correlated alarms may slow GUI performance while the 5620 SAM adds the alarms to the dynamic alarm list.

Note 2 — When you disable the display of correlated alarms in the dynamic alarm list, the correlated alarms are still listed in the Correlated Alarms tab of the Alarm Info form.

Note 3 — You can configure the Show Correlated Alarms parameter on a per-session basis. The display of correlated alarms is automatically updated by the Show Correlated Alarms by Default parameter when the 5620 SAM client application loads.

1 Enable or disable the default display of correlated alarms in the alarms window. Perform the following steps.

- **i** Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.
- **ii** Configure the Show Correlated Alarms by Default parameter.
- **iii** Click on the OK button. The User Preferences form closes and the display of correlated alarms in the Alarms Window is updated.

2 Enable or disable the display of correlated alarms in the Alarm Window. Perform the following steps.

- **i** Choose Application→Alarm Window from the 5620 SAM main menu, if required. The Alarm Window is displayed.
- **ii** Configure the Show Correlated Alarms parameter. Correlated alarms are displayed in the Alarm Window.

Note — The Alarm Window title bar displays Correlated Alarms Not Shown when correlated alarm display is disabled.

Procedure 37-8 To view alarms raised against equipment, logical components, and services

Alarms raised against network objects allow you to view faults on each NE in the network down to the service, path, or port level. The 5620 SAM analyzes all incoming alarms to ensure that the alarms are listed against the appropriate equipment or service. This feature is useful when you troubleshoot an equipment or service problem.

Objects that can have alarms issued against them contain a Faults tab button. The tables in the Faults tab button list the alarms issued against the specific equipment or service. For some forms, the Faults tab is further broken down into the Object Alarms, Affecting Alarms, Aggregated Alarms, and Alarms on Related Objects tabs. These tabs show alarms against specific objects, such as ports, and related problems, such as services that use the ports.

1 Choose a menu that displays a path, logical component or service form. For example:

  a Choose Manage→Equipment→Equipment. The Manage Equipment form opens.

  b Choose an NE from the drop-down list and click on the Properties button. The Network Element (Edit) form opens.

2 Click on the Faults tab button. A list of alarms appears under the appropriate tabs. Click on an appropriate tab button to display alarms of interest.

3 Review the alarm information. See Table 37-3 for the type of information available in an alarm. Scroll across each line to view the information contained in the alarm.

4 To view a specific alarm, double-click on the line or click on the View Alarm button to open the Alarm Info form. See Table 37-3 for the alarm information available under all tabs in the form.

5 Click on the View Alarmed Object button to open the properties form for the alarmed object.

6 Handle alarms according to your fault management policies. For information about troubleshooting using alarm information guidelines see the *5620 SAM Troubleshooting Guide*.

Procedure 37-9 To view alarm information

Alarm information is available from:

- the dynamic alarm list
- the navigation tree
- policy, service, and other properties form Fault tabs
- the Manage Services and service properties forms, to use in conjunction with the service ID to determine which customer is affected by which service alarms
- the Alarm Info form that opens when you double-click on a row in the alarm list

You must ensure that you are on the correct form to view alarms. For example, you cannot view ping management connection alarms from the Discovery Manager configuration form even through that is the form on which you perform the pings, or the NE discovery control form, even though that is the form on which you choose the ping policy. You must navigate to the appropriate object form to find the alarms, which, in this example, is an NE properties form.

1 Click on the Faults tab button of an NE properties form to list the alarms.

2 Click on the appropriate fault tab button.

The fault tabs contain other tabs that list alarms against the specific object, alarms on objects that are directly affecting the object, aggregated alarms, and alarms against related objects that affect the specific object.

3 Open a listed alarm by selecting the alarm entry and clicking on the View Alarm button. Alternatively, you can double-click on the alarm entry.

Note — When sorting alarms, sorting more than 15 000 outstanding or logged alarms may slow GUI performance. Use filters to return a reasonable number of alarms. Creating search filters for network alarms is described in Procedure 37-12.

4 Review the alarm information.

a View the alarm information in each tab and respond according to your alarm-handling policies.

Table 37-3 lists the types of alarm information available to users from the Alarm Info form. For information about troubleshooting using alarm information guidelines see the *5620 SAM Troubleshooting Guide*.

Table 37-3 Alarm Info form fields

Field	Information
Alarm tab on Alarm Info form, Info tab displayed	
Domain	The general area of the 5620 SAM software that is affected by the alarm. This is of specific interest and use to those monitoring alarms using the XML OSS interface. See the *5620 SAM XML OSS Interface Developer Guide* for more information.
Application domain	
Site ID	IP address of the NE that raises the alarm
Site Name	Name of the NE
Object Type	Type of object
Alarmed Object Type	
Object Name	Name of the object
Alarmed Object Name	
Object Id	Unique string identifying the object down to the lowest level, for example, network ID #, chassis #, slot #, daughterCardSlot #
Alarmed Object Id	

(1 of 3)

Field	Information
Alarm	Name of the alarm
Alarm Name	
Time Detected	When the alarm was raised
Type	Vendor-specific and X.733 standards for the event type of the alarm
Alarm Type	
Severity	Vendor-specific, TMN, and X.733 standards for severity of the alarm
Alarm Severity	
OLC State	Configured OLC state
Cause	Vendor-specific and X.733 standards for the probable cause of the alarm
Probable Cause	
Ack	Whether the alarm has been acknowledged by an operator (true) or not (false)
Acknowledged	
Acknowledged By	Name of operator that acknowledged the alarm
Cleared By	Name of operator that last cleared the alarm
Urgency	Urgency setting of the alarm
Additional text	Any extra text included with the alarm
First Time Detected	Time of the first recorded instance of the alarm
Last Time Detected	Time of the last recorded instance of the alarm. This field provides useful information when multiple instances of the same alarm are raised. As each new instance of the alarm is raised, the number of occurrences statistic increases, and Last Time Detected shows the time that the last instance of the alarm was raised.
Number of correlated alarms	Number of correlated alarms
Correlating Alarm ID	Unique string that identifies the correlating alarm object down to the lowest level
Alarm tab on Alarm Info form, Severity tab displayed	
Severity details Cleared details Promoted details Escalated details	Information about alarm severity. You can modify the alarm severity by clicking on the View Policy button. You can delete, clear to the historical database, acknowledge, or view the history of the alarm.
Alarm tab on Alarm Info form, Statistics tab displayed	
Frequency Number of Occurrences Number of Occurrences Since Clear Number of Occurrences Since Acknowledged	You can modify the alarm frequency by clicking on the View Policy button and modifying the individual alarm settings. How often the alarm has been raised, based on the specified scenarios. As each new instance of the alarm is raised, the number of occurrences statistic increases, and the Last Time Detected field shows the time that the last instance of the alarm was raised. You can delete, clear to the historical database, acknowledge, or view the history of the alarm.

(2 of 3)

Field	Information
Acknowledgement tab on Alarm Info form, Acknowledgement Info tab displayed	
Acknowledged Acknowledged by Last Time Acknowledged Previously Acknowledged Assigned Urgency Urgency Assigned By	Information about when the alarm was acknowledged, the user that acknowledged the alarm, and the user that set the urgency. You can modify the acknowledgement and urgency by clicking on the View Policy button and modifying the individual alarm settings. The Previously Acknowledged parameter specifies that the alarm had been previously acknowledged. You can delete, clear to the historical database, acknowledge, or view the history of the alarm.
Acknowledgement tab on Alarm Info form, Notes tab displayed	
View button Properties button New button Note tab button Revision History tab button	Create notes by clicking on the New button and entering the note. You can edit or view notes from the same form. Information about the note, including the time created and the name of the user who created the note, are displayed in rows for each note entered. Click on the Revision History tab button to view all notes created for the alarm. Select a note from the list and click on the View button to view the note.
Alarm tab on Alarm Info form, Details tab displayed	
Description Raising Condition Clearing Condition	A description of the alarm. Raising condition for the alarm. Clearing condition for the alarm.
Affected Objects tab on Alarm Info form	
Search button Properties button	Lists the objects that are affected by the alarm. Choose an affected object from the list and click on the Properties button to open the properties form for the object.
Affecting Objects tab on Alarm Info form	
Search button Properties button	Lists the objects that directly affect the object in alarm. Choose an affecting object from the list and click on the Properties button to open the properties form for the object.
Correlated Alarms tab on Alarm Info form	
Search button Properties button	Lists the objects that directly affect the object in alarm. Choose a correlated alarm from the list and click on the Properties button to open the Alarm Info form for the correlated alarm.

(3 of 3)

b Click on the Affected Objects tab button to view other network objects that are affected by this alarm. Choose an object and click on the Show Object(s) button to open the properties form for the affected object.

For example, a service tunnel alarm is raised. From the Alarm Info form, click on the View Alarmed Object button to go directly to the properties form for that service tunnel. The properties form opens. Click on the Faults tab button to see the same alarm listed under the Object Alarms tab button.

c Click on the Affecting Objects tab button to view other network objects that affect this object. Choose an object and click on the Show Object(s) button to open the properties form for the affecting object.

d Click on the Correlated Alarms tab button to view correlated alarms. Choose an alarm and click on the Show Alarm(s) button to open the Alarm Info form.

5 Handle the alarm according to your alarm-handling policy.

a Click on the Delete button to delete the alarm, if you have permissions to delete alarms. Click on the Yes button to confirm the action, and then click on the OK button.

Caution — You cannot recover a deleted alarm, unless deleted alarms are configured to be logged in the alarm history database, as described in Procedure 37-4.

b Click on the Clear button to clear the alarm. Click on the Yes button to confirm the action, and then click on the OK button. The alarm is cleared from the list, and is added to the alarm log as an alarm history record, if configured.

Note — Some alarms are self-clearing, which means that they are automatically cleared from the alarm list after the condition that triggered the alarm is no longer present. The dynamic alarm list contains an Implicitly Cleared attribute that identifies the self-clearing alarms.

c Click on the Acknowledge button to acknowledge the alarm.

i From the Notes tab, modify the urgency and assigned severity of the alarm, if required. You need permissions to modify the alarm.

ii From the Notes tab, add a note to the alarm, if required.

You can also choose a note from the list, click on the Properties button, and modify the note by setting the Reason for change and Detailed Text parameters.

iii Click on the Apply button to save the changes and acknowledge the alarm. If you added a note, the note appears in the list of notes.

When you view the alarm again, the acknowledgement information is updated to include:

- the user that acknowledged the alarm
- when the alarm was acknowledged
- whether the alarm had already been previously acknowledged
- any changes to the assigned urgency of the alarm

iv If required, you can click on the Revision History tab button and view a revised note. The revised note information includes:

- date modified
- user that modified the note
- reason for the note change
- an explanation of the note change
- contents of the note before and after the modification

d Click on the View Policy button. The Specific Policy form opens for that alarm type. You can view the policy configured for the alarm type, as described in Procedure 37-2.

e Click on the View Alarm History button to view the alarm history for this type of alarm. An Alarm History form appears with the Alarm Name filter equal to the type of alarm you are viewing.

i Click on the Search button. A list of alarm history records appears based on the filter.

ii Choose the record from the alarm history database log, as described in Procedure 37-17.

Procedure 37-10 To copy alarm information to a buffer

The alarm information copied to the local clipboard buffer can be pasted in other applications. This function helps you share the alarm information for troubleshooting purposes.

1 Click on the Faults tab button of an NE properties form to list the alarms.

2 Click on the appropriate fault tab button.

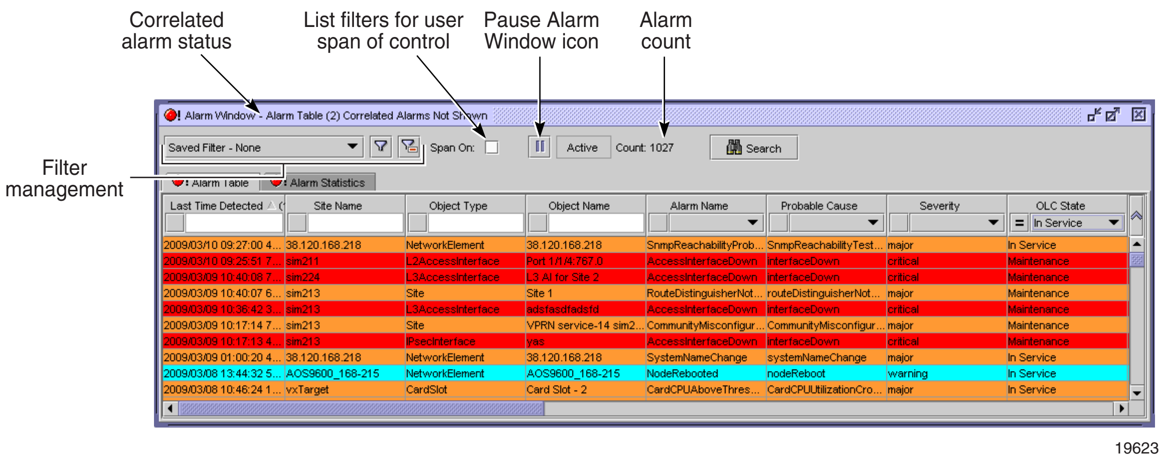
3 Open a listed alarm by selecting the alarm entry and clicking on the View Alarm button. Alternatively, you can double-click on the alarm entry.

4 Click on the Copy to Clipboard button. You can also use the contextual menu in the Alarm Window to copy the alarm information to the clipboard.

Procedure 37-11 To view all network alarms using the dynamic alarm list

The dynamic alarm list Alarm Window allows you to monitor incoming faults from the NEs and 5620 SAM software. This feature is most useful when monitoring the network. Figure 37-9 shows the dynamic alarm list Alarm Window.

Figure 37-9 Dynamic alarm list Alarm Window



1 Click on the Alarm Table tab button in the Alarm Window. The dynamic list of incoming network alarms appears.

Note — You can open and view up to six alarm windows. This is useful when you need to view multiple filtered incoming network alarms.

2 Filter the alarms, if required.

Note — Sorting more than 15 000 outstanding or logged alarms may slow GUI performance. Use filters to return a reasonable number of alarms.

a Choose a filter from the Save Filter drop-down list.

b Create a filter. See Procedure 37-12 for more information.

c Choose an OLC filter from the OLC Filter drop-down menu.

d Choose a severity filter from the Severity Filter drop-down menu.

3 Right-click on one or more alarms in the list. The contextual menu appears.

4 Choose:

a Show Alarm(s) to view the Alarm Info form for each selected alarm. Table 37-3 lists the alarm information displayed.

b Show Affected Object to display the configuration or property form for the object or objects against which the alarm or alarms is raised.

c Acknowledge Alarm(s) to open the alarm acknowledgement form for the alarm or alarms. Enter acknowledgement text, if required, and click on the OK button. Confirm the action. The acknowledgement information is added to the alarm info form, and any acknowledgement text is added to the Notes tab. The Acknowledged By column in the Alarm table indicates the user who acknowledges the alarm.

d Assign Severity to change the severity policy of the alarm using the Assigned Severity parameter. Click on the OK button. Confirm the action.

e Assign the OLC State to the alarm.

f Delete Alarm(s) to delete an alarm or alarms. Confirm the action to delete the alarm or alarms. The alarm or alarms are deleted and added to the alarm history database log as an alarm history record, if configured.

Caution — You cannot recover a deleted alarm, unless the alarm is configured to be logged on deletion, as described in Procedure 37-4.

g Clear Alarm(s) to clear the alarm or alarms. Confirm the action to clear the alarm or alarms. The alarm or alarms are cleared and added to the alarm history database log as an alarm history record, if configured.

h NE Sessions→*option* to start a SSH or Telnet session with the managed equipment that generated the alarm.

i Show Sorting to determine the sort order of how alarm information is displayed:

i Use the left, right, up, and down arrows to resequence the alarm fields as required.

ii Click on the Sort Ascending and Sort Descending buttons to specify the order of displayed alarms.

iii Click on the Close button to return to the dynamic alarm list.

j Copy to Clipboard to copy the alarm information to the clipboard buffer.

5 Handle the alarm(s) according to your fault management policies. Alarm handling is described in Procedure 37-9. For information about troubleshooting using alarm information guidelines see the *5620 SAM Troubleshooting Guide*.

Procedure 37-12 To create search filters for network alarms

You can create and select filters to view specific network alarms in the dynamic alarm list. You can save multiple filters and view the alarm information by opening up to 6 alarm windows. The name of the filter appears in the alarm window title of each alarm window that is open. Viewing network alarms using the dynamic alarm list is described in Procedure 37-11. Figure 37-9 shows the location of the Manage Filters icon in the alarm window.

Note — The FDN extension of a generic NE alarm is not appended to the Alarm Name field in the 5620 SAM GUI, but is included in the Additional Text field. To create a filter for generic NE alarms that have FDN extensions, you must filter on the Additional Text field.

1 Choose Application→Alarm Window. The Alarm Window opens.

2 Click on the Filter icon beside the filter drop-down list. The Alarm Window filter form opens.

3 Configure the filter criteria.

4 Click on the Add button. The Save Filter form opens.

5 Click on the Save button. The Save Filter form opens.

6 Configure the parameters:

- Filter Name
- Description
- Public

7 Click on the Save button. The Save Filter form closes and the Alarm Window filter form reappears.

8 Close the Alarm Window filter form.

9 Click on the filter drop-down list. The saved filter is shown in the list.

10 Click on the saved filter to load and view the results of the filtered search in the dynamic alarm list. The number of alarms associated with the selected search filter appears in the Count field, as shown in Figure 37-9.

Procedure 37-13 To change the severity filter from the alarm window

1 Click on the Alarm Table tab button in the Alarm Window. The dynamic list of incoming network alarms appears.

2 If required, click on the filter icon to create a filtered list of alarms. See chapter 3 for more information about creating search filters.

3 Right-click on the alarm, a drop down menu appears.

4 Choose Assign Severity. A Severity Assignment window opens.

5 Choose one of the following options. The alarm table panel is refreshed with a filtered list of alarms.

- Severity Filter - None
- cleared
- indeterminate
- info
- condition
- warning
- minor
- major
- critical

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Severity Assignment window closes.

Procedure 37-14 To pause the dynamic alarm listing

New incoming alarms are added to the dynamic alarm list, with the most recent alarm shown first. If you are viewing an alarm from the dynamic alarm list, new incoming alarms may cause the alarm list to scroll automatically. You can pause the dynamic alarm list to prevent this. Figure 37-9 shows the location of the Pause Alarm Window icon in the Alarm Window.

1 View alarms from the dynamic alarm list, as described in Procedure 37-11.

2 Click on the Pause Alarm Window icon. The icon changes to indicate that the dynamic alarm list Alarm Window is locked for viewing. The icon box changes to red and the text changes to Paused.

Incoming alarms are not added for the duration of the pause.

3 Click on the Pause Alarm Window icon to unlock the dynamic alarm list Alarm Window. The icon changes to indicate the dynamic alarm list Alarm Window is active. The icon box changes to gray and the text changes to Active. Any alarms that occurred during the pause appear in the dynamic alarm list.

Note — You can also scroll lock the dynamic alarm list by highlighting a specific alarm. New incoming alarms appear above the selected alarm, but the selected alarm continues to be selected in the dynamic alarm list. Use the down scroll bar to find the selected alarm.

Procedure 37-15 To view network alarm statistics

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Click on the Alarm Statistics tab button in the Alarm window. The alarm statistics table appears.

2 View the alarm statistics information.

The Alarm Statistics table lists the number of network alarms sorted in columns by acknowledged and unacknowledged status, and then by the number of critical, major, minor, warning, condition, info, indeterminate, and cleared alarms.

Procedure 37-16 To view current and historical alarms

Use this procedure to view current and historical alarms for a given time period. This consolidated view of all relevant alarms will facilitate troubleshooting.

1 Click on the Alarm Table tab button in the Alarm Window. The dynamic list of incoming network alarms appears.

2 Select one or more alarms in the list.

3 Click on the Historical Alarms button and choose Current and Historical Alarms Snapshot. The Current and Historical Alarms Snapshot form opens, displaying current and historical alarms for the time period specified by the First Time Detected (minus buffer time) and Last Time Detected (plus buffer time) of the selected alarms.

4 If required, modify the Display Buffer Time (minutes) parameter.

5 Double-click on an alarm in the list to view alarm information, as described in Procedure 37-9.

6 Close the Current and Historical Alarms Snapshot form.

Procedure 37-17 To review historical alarm records

Alarms are logged as historical alarm records in an alarm log database.

1 Choose Tools→Historical Alarms from the 5620 SAM main menu. The Alarm History form opens.

2 If required, specify a filter to narrow the range of historical alarms displayed.

> **Note —** When sorting alarms, sorting more than 50 000 outstanding or logged alarms may slow GUI performance. Use filters to return a reasonable number of alarms. Creating search filters for network alarms is described in Procedure 37-12.

3 Click on the Search button. The list of historical alarm records appears based on the filtering criteria.

4 Select an alarm history record from the list.

5 Click on the Properties button to review the alarm. The alarm history object form appears.

Table 37-3 lists the information displayed for each historical alarm record. Table 37-4 lists the additional historical alarm information available from the alarm history form for logged alarms.

Table 37-4 Alarm information from the Alarm History Object form

Alarm field	Information
Info tab on Alarm History Object form	
Alarm Status	Reason the alarm was logged to the historical alarm database
Last Time Acknowledged	Last time the alarm was acknowledged
Deleted By	Name of operator that deleted the alarm
Time Logged	Timestamp when alarm was moved to the historical alarm database
Highest Severity	The most severe status assigned to the alarm. Alarm severity can change due to escalation policies
Number Of Occurrences	How often the alarm was raised
Severity tab on Alarm History Object form	
Detected details Urgency details	Information about the alarm severity

6 Manage the logged historical alarm records.

i Click on the Cancel button to close the Alarm History Object form. The Alarm History form reappears.

ii Choose an alarm history record from the list.

iii Click on the Properties button. The AlarmHistoryObject form opens.

iv Click on the View Policy button to view the Specific Policy form. See Procedure 37-2 for more information.

v Click on the Purge Filtered button to purge alarms that meet the purging criteria. Click on the Yes button to confirm the action.

Caution — You cannot recover alarms purged from the historical alarm database log. If you want to save information about those alarms, save a file containing the alarm history database log details, as described in Procedure 37-18.

7 Close the Alarm History form.

When the maximum number of alarms allowed in the alarm log is reached, the oldest alarms are deleted. If you want to save information about those alarms, save a file containing the alarm log details, as described in Procedure 37-18.

Procedure 37-18 To save lists of logged historical alarm records

1 Choose Tools→Historical Alarms from the 5620 SAM main menu. The Alarm History form opens.

2 If required, choose a filter to narrow the range of historical alarms displayed.

3 Click on the Search button. The list of logged historical alarm records appears.

4 Sort the list of logged historical alarm records, as required.

5 Right-click on a list column heading and choose Save To File from the contextual menu. The Save form opens.

6 Save the list according to your company practices. You can:

- choose a directory to save the listed information using the Save In parameter
- create a filename of any length using the File Name parameter
- choose a format for the output file: HTML or comma-delimited CSV

7 Click on the Save button. The information is saved in the appropriate file format.

Procedure 37-19 To view the object against which an alarm logged to the alarm history database was raised

You can view the object that was the source of the historical alarm.

1 Choose Tools→Historical Alarms from the 5620 SAM main menu. The Alarm History form opens.

2 If required, choose a filter to narrow the range of historical alarms displayed.

3 Click on the Search button. The historical alarm records appear based on the filtering criteria.

4 Double-click on an alarm in the list. The alarm history record opens.

5 Click on the View Alarmed Object button. The configuration form, properties form, or other appropriate form opens. This is the form for the object that was the source of the original alarm.

Procedure 37-20 To reload all alarms

The 5620 SAM uses an alarm service to cache alarm information. To ensure the cache is current with all alarms stored in the database, administrators can reload all alarms from the database.

Caution — After the procedure is complete, client GUI users viewing open alarm forms and windows may have out-of-date information. Operators should close all open windows and forms, then relaunch them. This includes windows and forms displaying alarm status information, for example, the navigation tree.

1 Log in to a 5620 SAM client GUI with a user account that is assigned the administrator scope of command role or a scope of command role with write access permissions to the fm.FaultManager class. Enter and confirm the password and click on the OK button.

2 Choose Administration→Reload Alarm Information from the 5620 SAM main menu.

3 Clicking on the OK button to confirm that you are aware of all of the other users that will be affected by the alarm reload.

Alarm information is reloaded, and all active client GUIs are updated with the confirmation message that the alarms have been reloaded. Client GUI users can close then reopen windows as required, to refresh the alarm information.

4 Click on the OK button to confirm the message.

5 Close then reopen any open windows or forms, if required.

Procedure 37-21 To perform a 9500 MPR error recovery

This procedure applies to cleaning up inconsistencies created due to MIB population failures which can occur during service creation on 9500 MPR NEs. Inconsistencies on these NEs can be detected during full NE synchronization or on opening the NE properties form. The user will be notified by an implicitly cleared alarm with a Warning severity level on the NE.

1 Right-click on a 9500 MPR NE instance, and select Properties from the drop-down menu. A Network Element (Edit) form opens.

2 If there are NE inconsistencies, a Cleanup Inconsistencies option will appear under the More Actions button.

3 Click on the More Actions button and choose Cleanup Inconsistencies.

4 Click on the Faults tab button of the Network Element (Edit) form to check for any remaining NE inconsistency alarms.

Note — For failures during 9500 MPR service creation the user should, after clearing the deployer, perform the following:

- A full resynch of the NEs on which service creation failure has occurred in order to restore existing NE entries
- Perform Procedure "To perform a 9500 MPR error recovery" to clean up inconsistencies.
- Complete the service by clicking on the Complete Service button.
- It is recommended that the inconsistencies be cleaned up prior to any new service creation.

38 — OAM diagnostic tests

38.1 OAM diagnostic tests overview

The proper delivery of services requires that a number of operations must occur correctly at different levels in the service. For example, operations such as the association of packets to a service, VC labels to a service, and each service to a service tunnel, must be performed successfully for the service to pass traffic to subscribers as agreed to according to SLAs.

Even when tunnels are operating correctly and are correctly bound to services, incorrect information may cause connectivity issues.

To verify that a service is operational and that configuration information is correct, a set of configurable in-band or out-of-band, packet-based OAM tools is available.

For in-band, packet-based testing, the OAM packets closely resemble customer packets to effectively test the forwarding path. However, these packets are distinguishable from customer packets, so they are kept within the service provider network and not forwarded to the customer. For out-of-band testing, OAM packets are sent across a portion of the transport network, for example, across LSPs to test reachability.

You can configure and manage OAM tests:

- from the properties forms of network objects, for example, LSP pings from the LSP properties form
- from the Manage Tests form
- from the service and composite service flat topology maps

You can create and schedule the execution of test suites that contain groups of OAM tests using the 5620 SAM Service Test Manager, or STM. See chapter 78 for information about the STM. See chapter 79 for information about scheduled tasks. See chapter 5 for information about managing tests and test results using service flat topology maps.

Table 38-1 lists the supported OAM test types, the objects against which the tests can be performed, the test types, and the network layer being tested.

Table 38-1 OAM test types and test objects

Network level	Test type	Network object or service component for test
Application (level 7)	DNS lookup	DNS
	DHCP lookup [2]	DHCP

(1 of 3)

Network level	Test type	Network object or service component for test
Ethernet	CFM Loopback	Ports
	CFM Global MEG	
	CFM Link trace	
	CFM Continuity Check	
	CFM One Way Delay	
	CFM Two Way Delay	
	CFM Eth test	
	CFM Single Ended Loss	
	CFM Two Way Synthetic Loss Measurement (SLM)	
Service (level 6)	VPRN ping	VPRN site
	VPRN trace	
	ICMP ping	
	ICMP trace	
	CPE ping	VPLS site Epipe VLL site
	MFIB ping	
	ANCP loopback	Network element
	VCCV ping	VLL
	VCCV trace	VLL
	MAC populate	VPLS site Epipe VLL site VLL MEF MAC Ping is only supported on 7250 SAS-ES and 7250 SAS-ESA, Release 3.0 VPLS sites.
	MAC ping	
	MAC trace	
	MAC purge	
	MEF MAC ping[1]	
Service transport binding (level 5)	Service site ping	Network element
Service transport (level 4)	MTU ping	Service tunnel (SDP)
	SDP ping	
Transport (level 3)	LSP ping	LSP LSP path
	LSP trace	
	P2MP LSP ping	P2MP LSP P2MP path
	P2MP LSP trace	
	LDP ping [2]	MPLS site LDP site
	LDP trace [2]	
	LDP tree trace	

(2 of 3)

Network level	Test type	Network object or service component for test
Routed network (level 2)	ICMP ping	IP unicast traffic
	ICMP traceroute	
	OmniSwitch ping and traceroute[4]	
	Multicast trace	IP multicast traffic
	Multicast stat [3]	
	Multicast router information	
Layer 1 or Layer 2 (level 1)	MAC ping [3]	Ethernet
	MAC traceroute [3]	
	ATM ping	ATM PVC connection

(3 of 3)

Notes

(1) Supported only on 7250 SAS-ES and 7250 SAS-ESA, Release 3.0.

(2) Cannot be performed using the 5620 SAM or using CLI on devices.

(3) Not yet supported using the 5620 SAM but is supported using CLI on devices.

(4) Implemented using user-defined scripts

Ethernet CFM

Ethernet Connectivity Fault Management (CFM) supports end-to-end service management in an L2 network. CFM tools provide path discovery and fault detection, isolation, and notification. See chapter 46 for more information about how to configure an IEEE 802.1ag-enabled network for Ethernet CFM.

The following CFM diagnostic tests detect connectivity failure.

CFM continuity check

CFM continuity check, or CC, messages, are multicast messages that a MEP transmits periodically to remote MEPs in the same MEG. CC tests are used to discover a remote end point, check the health of a site, and detect cross-connect misconfigurations. The loss of three consecutive CCM messages, or the receipt of a CCM with incorrect information, indicates a fault.

Note 1 — If a service is modified after you associate it with an MD, for example, a new site is added, you must manually add new MEPs, as required.

Note 2 — If a CFM continuity check test is running on a service when you add a new MEP to the service, you must stop the test and execute it again to make the new MEP active.

Note 3 — When a service is modified after a CFM continuity check is created, for example, a new B-VPLS site is added to the service, you must manually add a virtual MEP to the site.

CFM dual-ended loss

A CFM dual-ended loss test functions as an optional extension of a CC test. It applies only to Y.1731 MEPs. This type of test is used to calculate the rate of frame loss in each direction for Ethernet packets sent between two MEPs. When a CC test is executed with the dual-ended loss option enabled, the option is replicated on all participating MEPs that support the test, along with the accompanying alarm threshold values. If a MEP detects that the local or remote frame loss ratio has exceeded the alarm threshold for a remote MEP, the MEP raises an alarm against the remote MEP.

CFM single-ended loss

The CFM single-ended loss test applies only to Y.1731 MEPs. This one-way test originates on a source MEP and terminates on a destination MEP. The target of a single-ended loss test is a destination MAC address. The test is used to calculate the rate of frame loss in each direction for Ethernet packets sent between the two MEPs.

CFM loopback

CFM loopback messages are sent to a unicast destination MAC address. The MEP at the destination responds to the loopback message with a loopback reply. A MEP or a MIP can reply to a loopback message if the destination MAC address matches the MAC address of the MEP or MIP. CFM loopback tests verify connectivity to a specific MEP or MIP.

CFM link trace

CFM link trace messages that contain a target unicast MAC address are sent to multicast destination MAC addresses. Each MIP at the same MD level replies with a link trace response. Messages are forwarded to the next hop until they reach the destination MAC address. The originating MEP collects the replies to determine the path.

CFM one-way delay

The CFM one-way delay test applies only to Y.1731 MEPs. The test originates on one MEP and terminates on a target MEP. The results are read from the target MEP. In the test, frame delay is defined as the time elapsed since the start of transmission of the first bit of the frame by a source site until the frame is received by the destination site. The frame delay represents the one-way trip time between the source and destination sites.

CFM two-way delay

The CFM two-way delay test applies only to Y.1731 MEPs. In this test, the frame delay is defined as the time elapsed since the start of transmission of the first bit of the frame by the source site until the frame is received by the same site after passing through the destination site. The frame delay represents the round-trip time between the source and destination sites.

CFM Eth

The CFM Eth test applies only to Y.1731 MEPs. This one-way test originates on a source MEP and terminates on a destination MEP. The target of a CFM Eth test is a MAC address. The test is used to perform one-way in-service diagnostics that include verifying bandwidth throughput, frame loss, and bit errors. To perform the test, a MEP inserts frames with Eth-test information that includes specific throughput, frame size, and transmission patterns. A MIP is transparent to Eth-test frames.

CFM two-way SLM

The CFM two-way SLM test provides Synthetic Loss Measurement and it is used to check the packet loss.

MTU ping OAM

The MTU Ping OAM diagnostic tool, which is called sdp-mtu in the CLI, provides a tool for service providers to determine the exact frame (MTU) size that is supported on a service tunnel (also called an SDP), to within one byte. Use the MTU ping OAM to:

- determine the maximum frame size supported between the service ingress and the service termination point
- solve troubleshooting issues that are related to equipment used across the network core that may not be able to handle large frame sizes

In a large network, network devices can support a variety of packet sizes, up to a limit, that are transmitted across its interfaces. This size limit is referred to as the MTU of network interfaces. You must consider the MTU of the entire service tunnel end-to-end when you provision services, especially for VLL services in which the service must support the ability to transmit the largest customer packet.

Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the MTU Ping OAM tool use the T-LDP local LSR ID as the source IP address. Previously the NE’s system interface address was used for this purpose.

Tunnel ping OAM

The Tunnel Ping OAM tool, which is called sdp-ping in the CLI, performs in-band unidirectional or bidirectional connectivity tests on service tunnels (also called an SDP). The OAM packets are sent in-band in the tunnel encapsulation, so they follow the same path as the service traffic. The response can be received out-of-band in the control plane or in-band using the data plane for a bidirectional test.

For a unidirectional test, tunnel ping OAM tests:

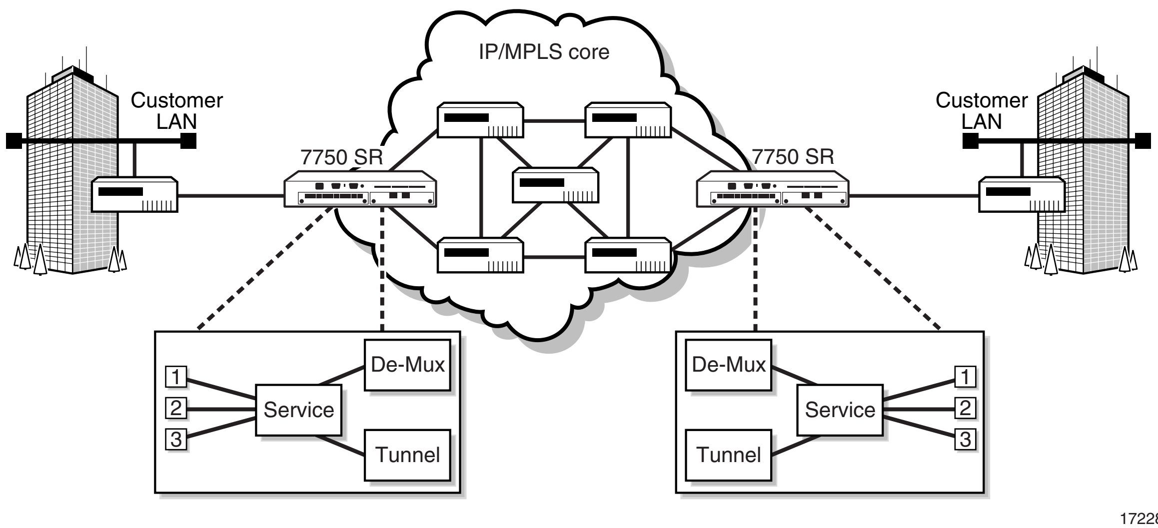
- egress service tunnel ID encapsulation
- whether the packet can reach the far-end IP address destination of the service tunnel ID within its encapsulation

- whether a packet of the specified size goes to the far-end IP address of the service tunnel ID within its encapsulation
- forwarding class mapping to ensure that the test packet is treated the same as the customer traffic
- determine whether SLA delay metrics are met

For a bidirectional test, tunnel OAM uses a local egress service tunnel ID and an expected remote service tunnel ID, so the user can specify where the returned messages should be sent from based on the far-end tunnel ID.

Figure 38-1 shows how a tunnel OAM packet can be inserted to test the connectivity between two customer LANs across the IP/MPLS core.

Figure 38-1 Sample OAM diagnostic



Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the Tunnel Ping OAM tool use the T-LDP local LSR ID as the source IP address. Previously the NE's system interface address was used for this purpose.

Service site ping OAM

The Service Site Ping OAM diagnostic tool, which is called svc-ping in the CLI and was formerly called the circuit ping, provides end-to-end connectivity testing for an individual service. This diagnostic operates at a higher level than the tunnel OAM ping because it verifies connectivity for an individual service rather than connectivity across the service tunnel. This allows you to isolate a problem within the service rather than at the port, which is the endpoint of the service tunnel.

The diagnostic tests a service ID for correct and consistent provisioning between two service endpoints. The following information can be obtained from a service site ping OAM:

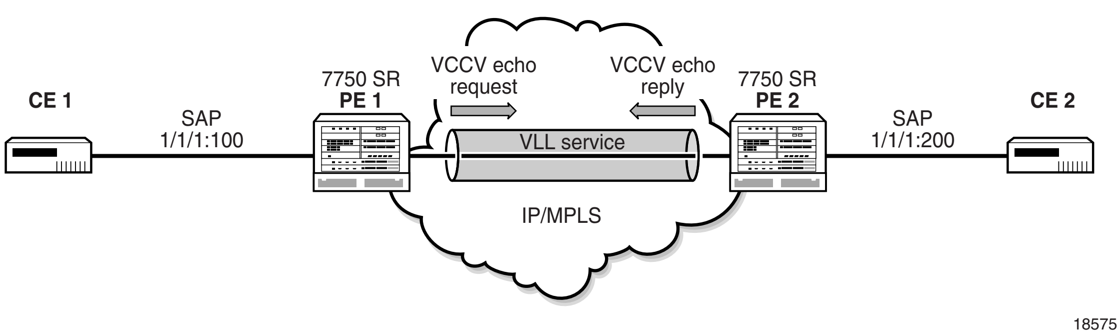
- verification that the local and remote service sites exists
- verification of the current state of the local and remote service sites
- ensuring that the local and remote service types are correlated
- ensuring that the same customer is associated with the local and remote service sites
- ensuring that there is a service-to-circuit association at both the local and remote service sites using the Use Local Tunnel and Use Remote Tunnel options, to check the circuit between service sites
- verification that the local and remote ingress and egress service labels match

Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the Service Site Ping OAM tool use the T-LDP local LSR ID as the source IP address. Previously the NE's system interface address was used for this purpose.

VCCV Ping OAM

The VCCV Ping OAM diagnostic tool, which is called vccv-ping in the CLI, performs in-band VLL connectivity tests. It can be used for all types of VLLs and supports cross-circuit tests as long as the circuit types match; for example, an epipe to epipe connector. The purpose of the ping is to determine that the destination PE device is the egress for the L2 FEC. Figure 38-2 shows a VCCV Ping.

Figure 38-2 VCCV Ping OAM diagnostic



In this example, the ping test packet or packets are sent with the destination IP address of PE 2. The request is encapsulated in a VLL packet and is forwarded to PE 2. PE 2 replies to the source device IP address. The packets are sent using the same encapsulation and along the same path as user packets in the VLL. This test provides a check of both the control plane and the data plane.

Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the VCCV Ping OAM tool use the T-LDP local LSR ID as the source IP address. Previously the NE's system interface address was used for this purpose.

VCCV trace OAM

The VCCV Trace OAM diagnostic tool, which is called vccv-trace in the CLI, displays the hop-by-hop path used by the VLL. VCCV trace can trace the entire path of a PW with a single command issued at the T-PE or at an S-PE. It is an iterative process by which the ingress T-PE or T-PE sends successive VCCV-Ping messages with incrementing the TTL value, starting from TTL=1. The process is terminated when the reply is from the egress T-PE or when a timeout occurs.

Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the VCCV Trace OAM tool use the T-LDP local LSR ID as the source IP address. Previously the NE's system interface address was used for this purpose.

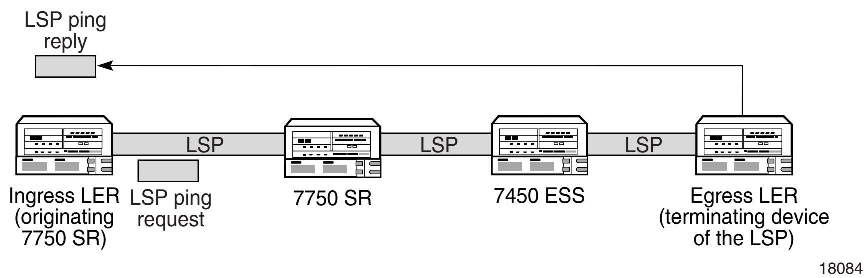
LSP Ping OAM

The LSP Ping OAM diagnostic tool, which is called lsp-ping in CLI, performs in-band LSP connectivity tests. The following information can be determined from the test:

- detect data plane failures in LSPs and with LSP connectivity
- test whether the LSP tunnels are working in both directions

In an LSP ping, the originating router creates an MPLS echo request packet for the LSP and MPLS path to be tested. The MPLS echo request packet is sent and awaits an MPLS echo reply packet from the router that terminates the LSP. The status of the LSP is displayed when the MPLS echo reply packet is received. Figure 38-3 shows an LSP ping.

Figure 38-3 LSP Ping diagnostic



Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the LSP Ping use the T-LDP local LSR ID as the source IP address. Previously the NE's system interface address was used for this purpose.

LSP Trace OAM

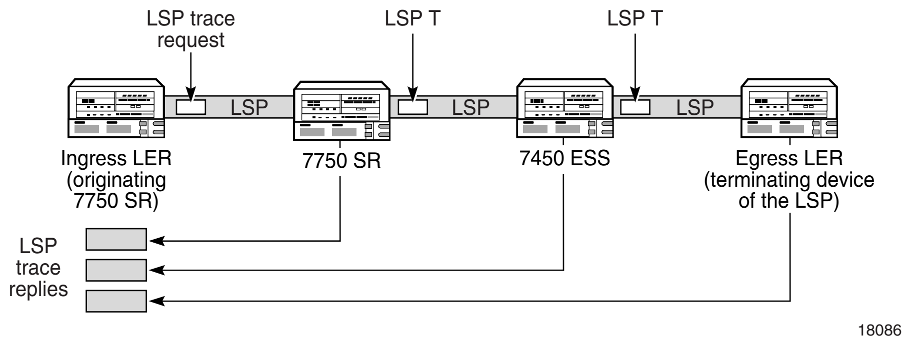
The LSP Trace OAM diagnostic tool, which is called lsp-trace in CLI, displays the hop-by-hop route used by the LSP. The following information can be determined from the test:

- hop-by-hop path for an LSP
- destination path of the packets

In an LSP trace, the originating router creates an MPLS echo request packet for the LSP to be tested. The packet contains increasing TTL values. The MPLS echo request packet is sent and awaits a TTL exceeded response or the MPLS echo reply packet from the router that terminates the LSP. The devices along the hop-by-hop route reply to the MPLS echo request packets with TTL and MPLS echo reply information.

Figure 38-4 shows an LSP trace.

Figure 38-4 LSP Trace diagnostic



Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the LSP Trace use the T-LDP local LSR ID as the source IP address. Previously the NE's system interface address was used for this purpose.

P2MP LSP Ping OAM

The PSMP LSP Ping OAM diagnostic tool, which is called p2mp-lsp-ping in CLI, performs in-band LSP connectivity tests.

The echo request message is sent on the active P2MP instance and is replicated in the data path over all branches of the P2MP LSP instance. By default, all egress LER nodes which are leaves of the P2MP LSP instance will reply to the echo request message.

You can reduce the scope of the echo reply messages by explicitly entering a list of addresses for the egress LER nodes that are required to reply. A maximum of 5 addresses can be specified in a single run of the p2mp-lsp-ping command. If all 5 egress LER nodes are 7x50 nodes, they will be able to parse the list of Egress LER addresses and will reply. The p2mp-lsp-ping command specifies that only the top address in the P2MP Egress Identifier TLV must be inspected by an egress LER. When interoperating with other implementations, an 7x50 egress LER will respond if its address is anywhere in the list. Furthermore, if another vendor implementation is the egress LER, only the egress LER matching the top address in the TLV may respond.

If you enter the same Egress LER address more than once in a single p2mp-lsp-ping command, the head-end node displays a response to a single one and displays a single error warning message for the duplicate ones. When queried over SNMP, the head-end node issues a single response trap and issues no trap for the duplicates.

P2MP LSP Trace OAM

The PSMP LSP Trace OAM diagnostic tool, which is called p2mp-lsp-trace in CLI, performs in-band LSP connectivity tests.

The LSP trace capability allows you to trace the path of a single S2L path of a P2MP LSP. Its operation is similar to that of the p2mp-lsp-ping command, but the sender of the echo reply request message includes the Downstream Mapping TLV to request the downstream branch information from a branch LSR or BUD LSR. The branch LSR or BUD LSR will then also include the Downstream Mapping TLV to report the information about the downstream branches of the P2MP LSP. An egress LER must not include this TLV in the echo response message.

The parameter probe-count operates in the same way as in the LSP Trace on a P2P LSP. It represents the maximum number of probes sent per TTL value before giving up on receiving the echo reply message. If a response is received from the traced node before reaching maximum number of probes, then no more probes are sent for the same TTL. The sender of the echo request then increments the TTL and uses the information it received in the Downstream Mapping TLV to start sending probes to the node downstream of the last node which replied. This continues until the egress LER for the traced S2L path replied.

LDP Tree Trace OAM

The LDP Tree Trace OAM diagnostic tool, which is called ldp-treetrace in OAM level of the CLI, is used to detect and discover the ECMP routing paths for a LSP between egress and ingress routers. The following information is determined from the test:

- number of ECMP paths
- number of failed hops

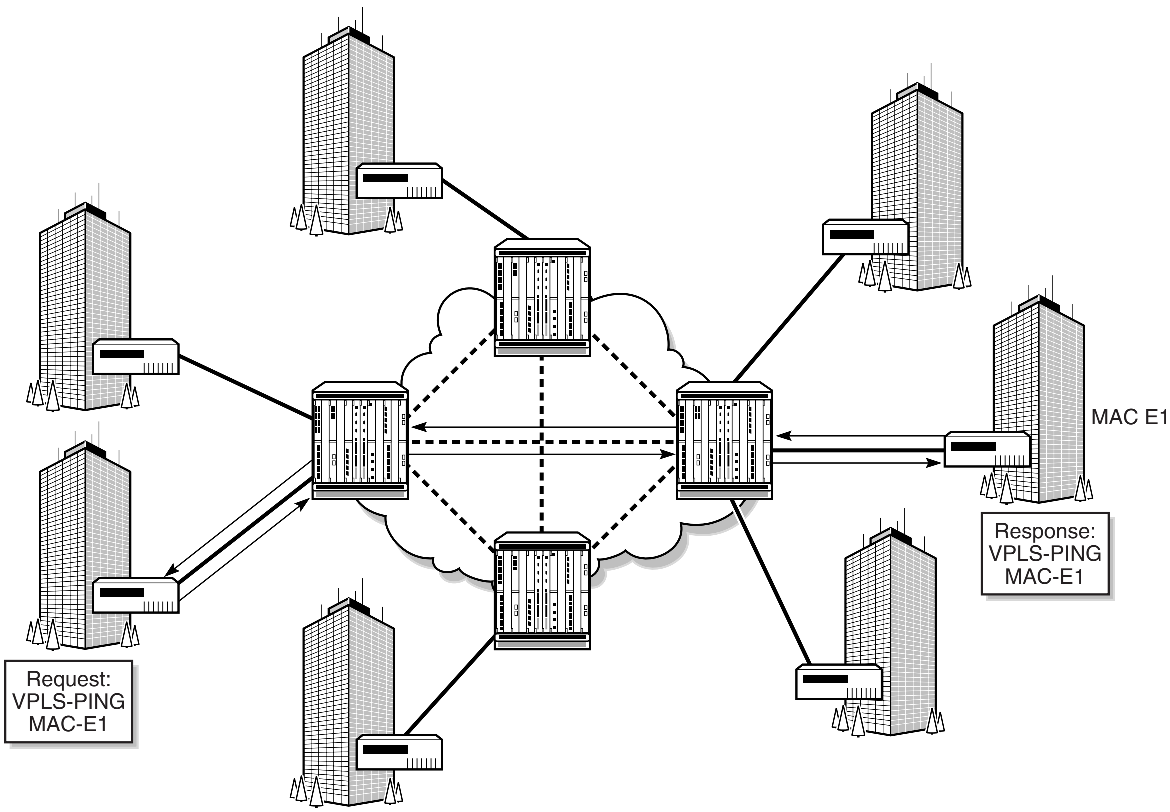
In an LDP tree trace, the originating router creates an MPLS echo request packet. The packet contains a set of IP header destination addresses. Routers along the path reply to the request with information about themselves and neighboring routers in the downstream path. The originating router uses this information to probe the downstream routers until it discovers a bit map setting common to all routers along the path. The result is a tree of available routers that the originating router can use for next hops. After discovery, the paths are tested using LSP ping and LSP trace.

Note — The OAM messages which operate over an LDP LSP, and/or over a PW signalled by T-LDP, and which require a response using the IP path, must use a source IP address which is reachable within the same routing domain as that of the LSR ID of the LDP or T-LDP session. The messages of the LDP Tree Trace use the T-LDP local LSR ID as the source IP address. Previously the NE’s system interface address was used for this purpose.

MAC ping OAM

The MAC ping OAM tool, which is called mac-ping in CLI, is used to test connectivity in a VLL or VPLS by verifying a remote MAC address at the far end of a service. Figure 38-5 shows a sample MAC ping from one end of a service to the far-end MAC address of the service.

Figure 38-5 Sample MAC ping diagnostic



The MAC ping determines the existence of the far-end egress point of the service. MAC pings can be sent in-band or out-of-band. You must specify either:

- the target (far-end) MAC address
- the broadcast address

In a MAC ping that is out-of-band, the ping is forwarded along the flooding domain when no MAC address bindings exist or is sent along the bindings if MAC address bindings exist. A response ping is sent from the far-end device when there is an egress binding for the service.

In a MAC ping that is in-band, the ping is sent with a VC label TTL of 255. The ping packet goes across each hop, and when it reaches the egress router, it is identified by the OAM label and the response is sent back along the management plane.

MEF MAC ping

Use the MEF MAC ping OAM tool to test connectivity in a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, VPLS site. The MEF MAC ping verifies a remote MAC address at the far end of the service.

MEF MAC ping must run simultaneously in both directions between the VPLS sites being tested.

MAC trace OAM

The MAC trace OAM tool, which is called mac-trace in CLI, displays the hop-by-hop route of MAC addresses used to reach the target MAC address at the far end of a service. MAC traces can be sent in-band or out-of-band.

You must specify either:

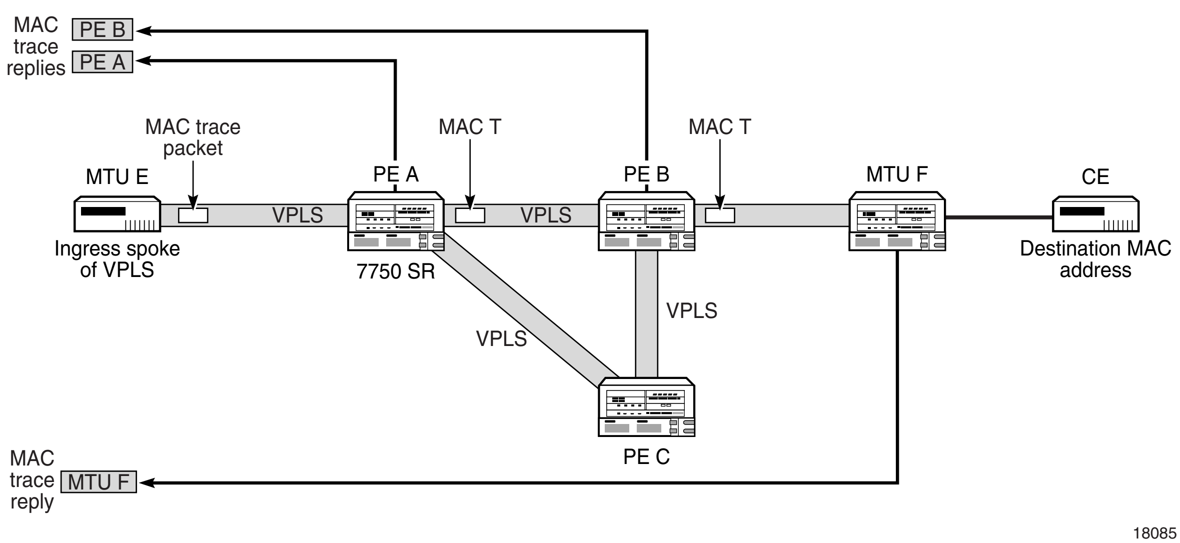
- the target (far-end) MAC address
- the broadcast address

In a MAC trace that is out-of-band, the destination IP address is specified by mapping the destination MAC address. If the destination MAC address is known to be a specific site, the far-end IP address of the service tunnel is used. If the destination MAC address is not known, the packet is sent to all service tunnels in the service.

In a MAC trace that is in-band, the trace request contains tunnel encapsulation, VC label, OAM, and other information. If the destination MAC address is known, the appropriate tunnel encapsulation and VC label is used. If the destination MAC address is not known, the packet is sent to all service tunnels, including all necessary tunnel encapsulation and egress VC labels for each bound service tunnel.

Figure 38-6 shows a MAC trace.

Figure 38-6 MAC trace diagnostic



MAC populate OAM

The MAC populate OAM tool, which is called mac-populate in CLI, is used to:

- Know whether the FIB table is accurate by testing forwarding plan correctness. This is done by populating a service FIB with an OAM-tagged MAC entry. This MAC entry indicates that the node is the egress node for the MAC address of a service. You can then use the FIB manager to see the OAM-tagged MAC entry.
- Send a message through the flooding domain to learn a MAC address, as if a customer packet with that source MAC address had flooded the domain from that ingress point of the service.

You can:

- force an existing MAC address to become OAM-tagged
- distinguish, in the FIB manager, MAC addresses that are OAM-tagged
- age an OAM-tagged MAC address

In a MAC populate, the OAM-tagged MAC address is populated on the egress point of the service. You can specify whether to flood this OAM-tagged MAC address to other devices so that the same OAM-tagged entry is added to the FIB tables of other devices.

MAC purge OAM

The MAC purge OAM tool, which is called mac-purge in CLI, is used to delete an OAM-tagged entry from a FIB, which was generated using the MAC populate OAM tool. This clears the FIB of any learned information for a specific MAC address, allows the FIB to be populated only by a MAC populate request, and can be used to flush all devices in a service domain.

CPE ping

The CPE ping tool, which is called cpe-ping in the CLI, is used to trace the end-to-end switching of specified MAC addresses of customer premises equipment. This ping extends the functionality of the MAC ping beyond the egress (customer-facing) port by allowing a ping to the SAP of a VPLS.

ANCP loopback

The ANCP loopback test, which is called oam ancp in the CLI, is used to send DSL OAM commands to complete an OAM test from a centralized point or when operational boundaries prevent direct access to the DSLAM. The ANCP loopback test raises an alarm that generates a log event displaying both successful and failed results.

VPRN ping and VPRN trace

The VPRN ping and VPRN trace OAM tools are enabled from the VRF site of the subscriber’s VPRN service. The VPRN ping determines the existence of the far-end egress point of the service. This allows testing of whether a specific destination can be reached. VPRN pings can be sent in-band or out-of-band.

The VPRN trace displays the hop-by-hop path for a destination IP address within a VPRN service. This allows operators to know the destination path of customer traffic. VPRN traces can be sent in-band or out-of-band.

ATM OAM ping

The ATM OAM ping tool, which is called atmoam-ping in CLI, performs an ATM ping on an existing ATM PVC from the PVC endpoint using ATM OAM loopback cells. An ATM ping tests VC integrity and endpoint connectivity for PVCs using OAM loopback capabilities.

Multicast FIB ping

The multicast FIB ping OAM tool, which is called mfib-ping in CLI, identifies the SAPs that egress an IP multicast stream within a VPLS. This diagnostic can also be used to display the SAPs that are operationally up in the VPLS.

Multicast router information

The multicast router information OAM tool, which is called mrinfo in CLI, identifies VPRN multicast information for the target router. The information includes details that are related to adjacent routers, supported protocols, traffic metrics, and time-to-live thresholds. Administrators can use this information to identify bidirectional adjacency relationships.

Multicast trace

The multicast trace OAM tool, which is called mtrace in CLI, identifies the hop-by-hop route used by VPRN multicast traffic to reach the target router. This diagnostic gathers the hop address, routing error conditions, and packet statistics at each hop. The 5620 SAM attempts to trace the receiver-to-sender route for the traffic. The destination of the diagnostic can be any PIM-enabled interface in the routing instance.

ICMP ping

The ICMP ping OAM tool, which is called icmp-ping in CLI, identifies the reachability of a remote host across the IP network. The tool is used with ICMP trace to detect and localize faults in IP networks.

The ICMP ping OAM tool can also be enabled from the VRF site of the subscriber's VPRN service. An ICMP ping determines the existence of the far-end egress point of the service. This allows testing of whether a specific destination can be reached. ICMP pings can be sent in-band or out-of-band.

ICMP trace

The ICMP trace OAM tool, which is called icmp-trace in CLI, identifies the diagnostic used to trace the ICMP traceroute control table. The tool is used with ICMP ping to detect and localize faults in IP networks.

ICMP trace displays the hop-by-hop path for a destination IP address within a VPRN service. This allows operators to know the destination path of subscriber traffic. ICMP traces can be sent in-band or out-of-band.

OmniSwitch ping and traceroute

The 5620 SAM supports OmniSwitch ping and traceroute by using user-defined CLI scripts. See Procedure 38-38 for information about creating an OmniSwitch OAM script. See Procedures 38-40 and 38-41 for information about configuring and running OmniSwitch OAM scripts.

DNS ping

The DNS ping OAM tool, which is called dns-ping in CLI, identifies the diagnostic used to ping the DNS name, if DNS name resolution is configured.

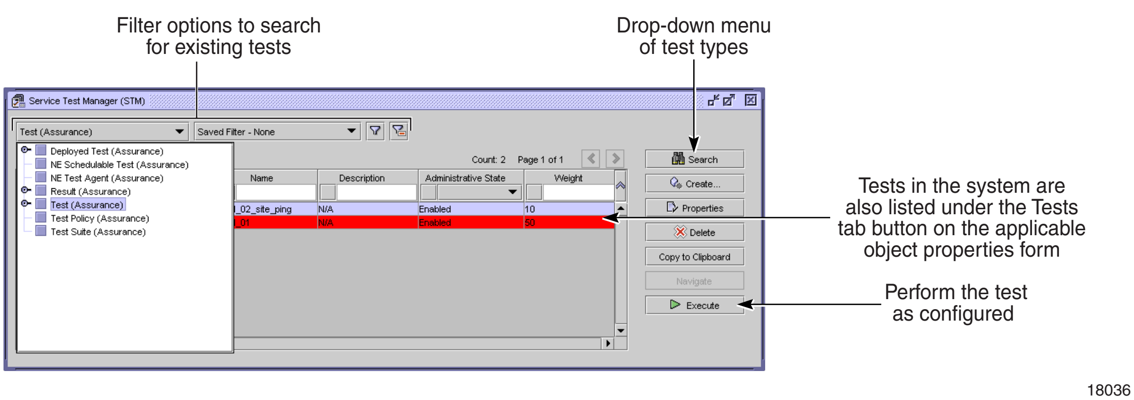
Service assurance test management and configuration

There are two main types of forms for the service assurance test manager.

- Browse and list manager, to generate lists of OAM diagnostics and to run OAM diagnostics
- Configuration form, to create or modify service assurance tests and review the results of service assurance tests

Figure 38-7 shows the browse and list manager form.

Figure 38-7 Service assurance test manager browse and list form



Each service assurance test configuration form contains multiple tabs. Figure 38-8 shows a sample service assurance OAM test with the General tab displayed.

Figure 38-8 Service assurance OAM test configuration form - General

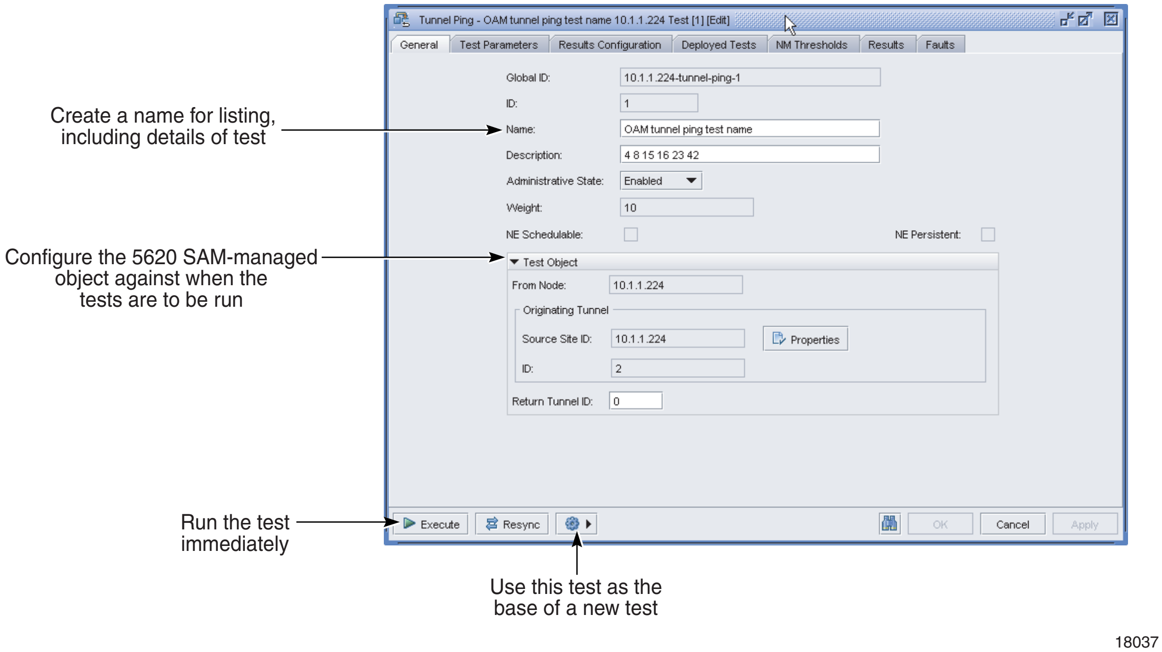


Figure 38-9 shows the same sample service assurance OAM test with the Test Parameters tab displayed.

Figure 38-9 Service assurance OAM test configuration form - Test Parameters tab

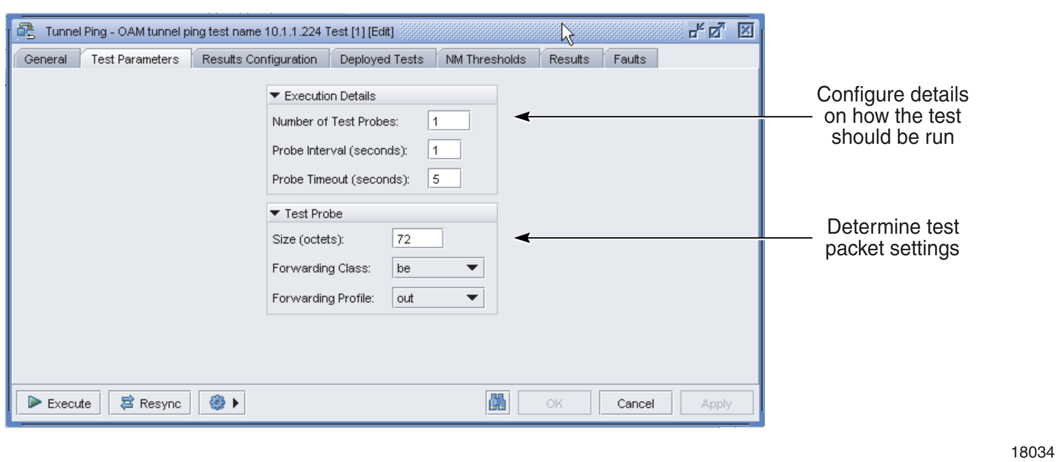

Figure 38-10 shows the same sample service assurance OAM test with the Results Configuration tab displayed.

Figure 38-10 Service assurance OAM test configuration form - Results Configuration

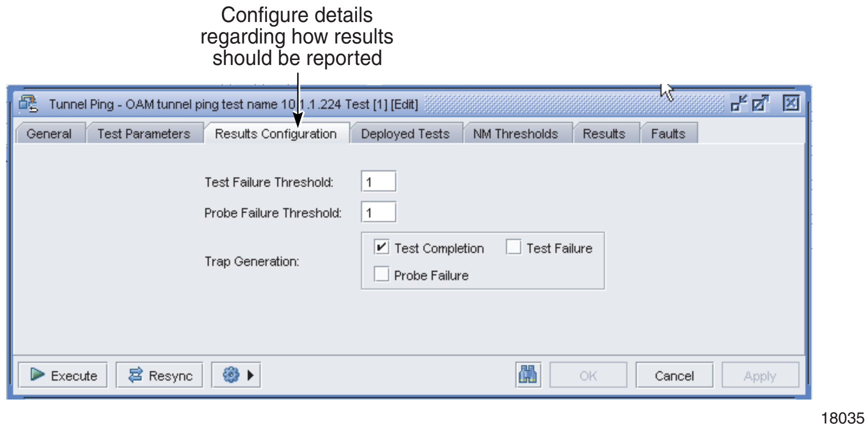

Figure 38-11 shows the same sample service assurance OAM test with the Results tab displayed. Selecting the Results tab button opens an additional form, which provides detailed test results, including OAM test packet details, when the OAM test involves sending test packets.

Figure 38-11 Service assurance OAM test configuration form - Results

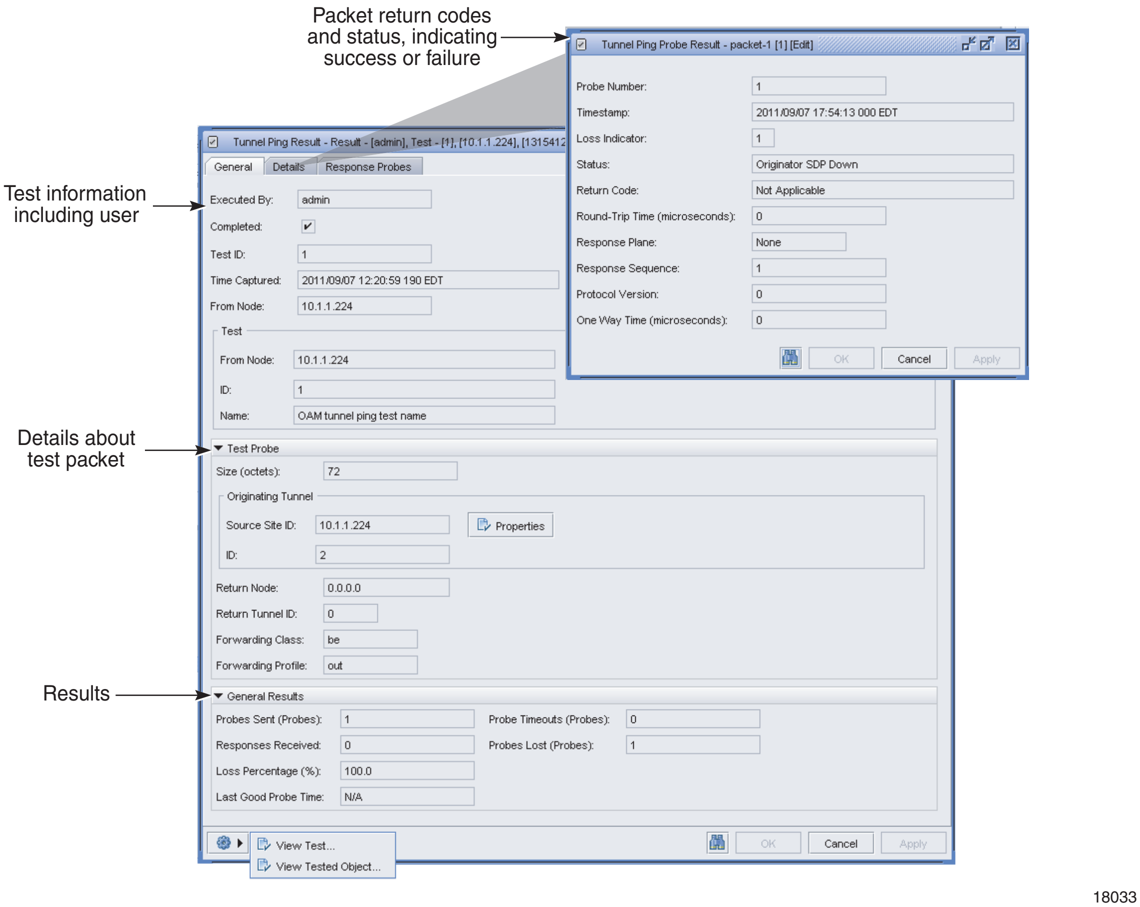

Figure 38-12 shows the information from a sample MAC trace. Trace probe information is available from the Detailed Results tab. Continue to navigate down from the trace requests to view result information.

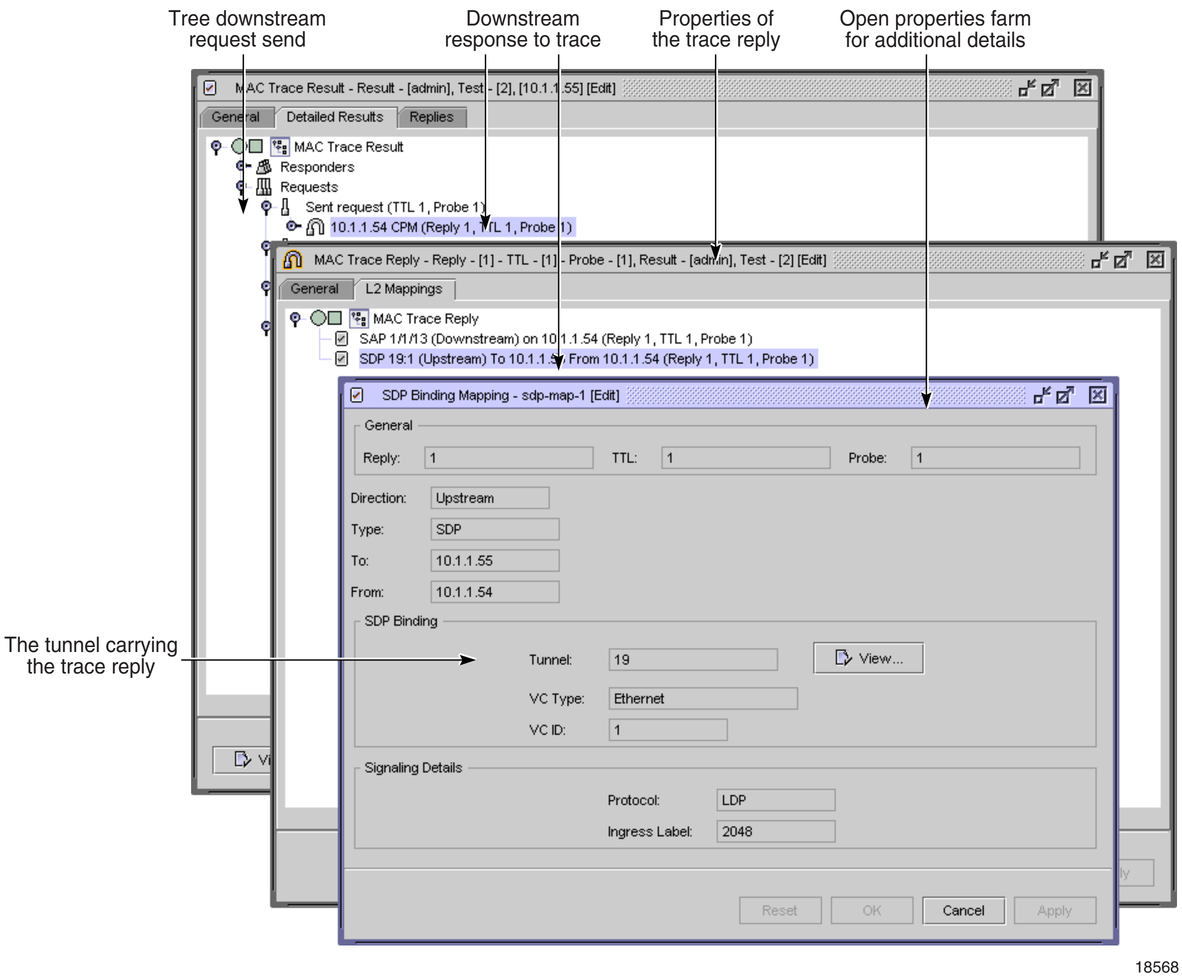
Figure 38-12 Service assurance OAM test probe and trace results details



38.2 Sample OAM diagnostic test configuration

Figure 38-13 shows a sample OAM diagnostic sequence, illustrating how you can use multiple OAM tests to verify service creation and diagnose service problems. This sample shows a VPLS.

Figure 38-13 Sample OAM diagnostic sequence for a VPLS

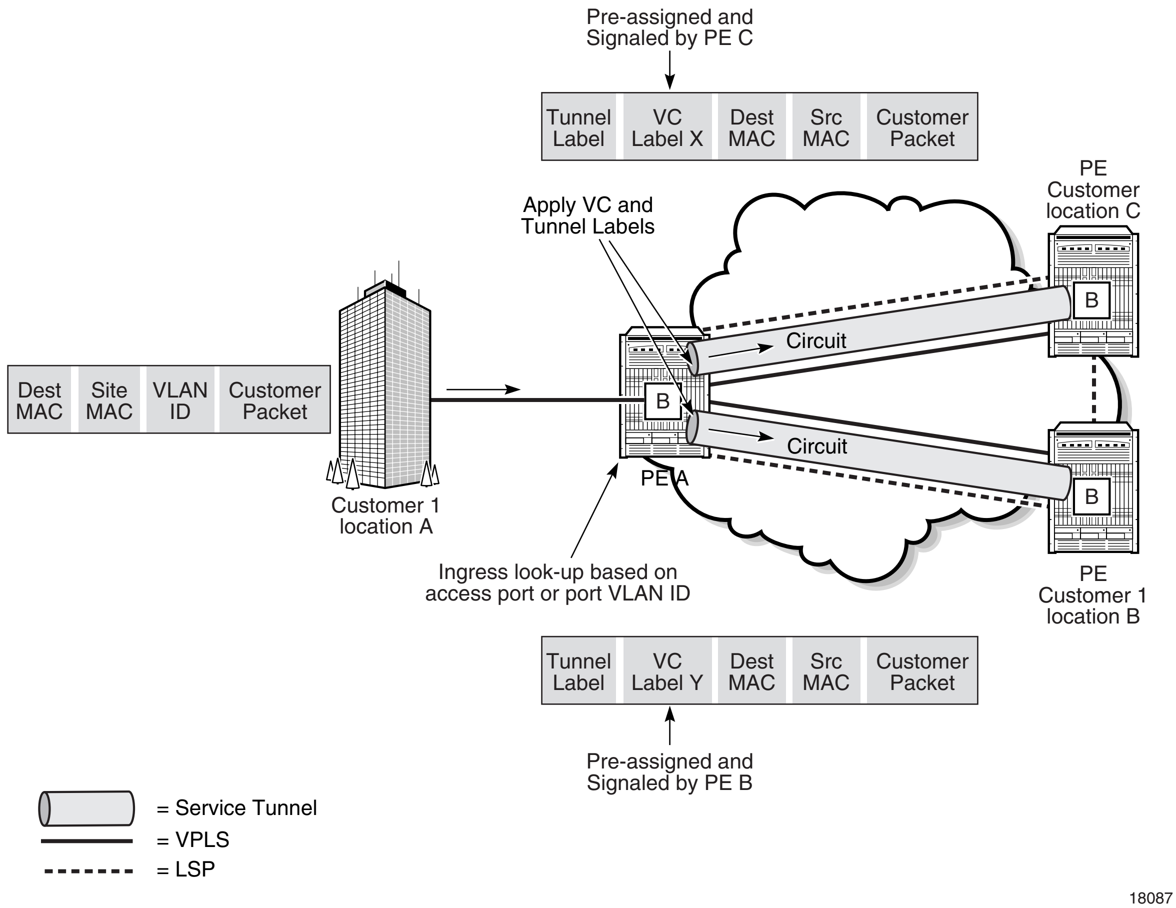


Table 38-2 lists the high-level tasks necessary to configure this sample.

Table 38-2 Sample OAM diagnostic configuration for a service

Task	Description
Service creation and OAM validation	
1. MPLS and LSP creation	Create an MPLS network and LSPs for use by the service tunnels connecting the VPLS sites. Test the validity of the LSPs using LDP tree trace or LSP ping. If the results indicate a problem with the path, use LSP trace to check the specific MPLS path for the device causing the ping failure.
2. Service tunnel creation	Create a service tunnel that uses the MPLS LSP created earlier and perform a tunnel ping on the service tunnel to verify tunnel connectivity. Create all tunnels necessary to interconnect the VPLS sites, and repeat the tunnel ping to ensure tunnel connectivity. After all of the tunnels are created, use the tunnel ping remote tunnel option and specify the return tunnel path. Verify bidirectional tunnel connectivity.

(1 of 2)

Task	Description
3. Service creation	Create a service using the service tunnels to interconnect the VPLS sites, either using mesh or spoke service tunnel bindings. Use a service site ping between each VPLS site device and its neighboring sites to verify service configuration consistency.
4. MAC diagnostics	Connect the CPE devices to the VPLS and verify traffic. Use MAC trace from the edge devices to verify MAC address learning by the VPLS sites and to ensure that the correct associations are made between MAC addresses and the service tunnels or SAPs to which they are bound. Use MAC ping against an unknown MAC address to verify that no response is returned. Use MAC populate to create an OAM-specific MAC address. Use MAC ping and MAC trace against the created MAC address to verify that customer traffic is not affected by the additional MAC address. Use MAC purge to remove the created OAM MAC address.
Service OAM diagnostics	
1. Diagnose traffic flow problems at a specific MAC address	Use MAC ping against the MAC address to which traffic is not flowing. Use the source and destination MAC address to simulate customer traffic routes as closely as possible. Use MAC trace to pinpoint the location of the traffic failure. Check for MAC filter rules or MAC table sizes to identify possible causes of the failure, for example, incorrect configurations.
2. Diagnose the components of the service	Use service site ping to test the potential next hops to ensure consistent configuration. Use tunnel ping to the far end of the tunnel using the remote tunnel option and specify the return tunnel path. Verify bidirectional tunnel connectivity. Use LSP ping to determine if the tunnel is working. Use an LSP trace to determine if an intervening device is down.

(2 of 2)

38.3 Workflow to use OAM diagnostic tests

1 Create the transport network and customer services.

2 Monitor customer services or troubleshoot the transport network before you commission, according to your company's policies.

3 When the creation of a tunnel needs to be tested, or a customer service is compromised, use the service assurance tools to troubleshoot the problem.

Note 1 — All of the tests mentioned in this workflow are used on an as-required basis.

Note 2 — Not all service assurance tools are applicable to every NE managed by the 5620 SAM.

i Use MTU ping to troubleshoot and resolve tunnel and service problems that are related to frame size across all equipment that is used by the service or tunnel. See Procedures 38-1 and 38-2 for more information.

ii Use tunnel ping to troubleshoot and resolve tunnel and service problems that are related to issues that circuits may have transmitting traffic across the GRE or MPLS network. See Procedures 38-3 and 38-4 for more information.

iii Perform Ethernet CFM tests to provide path discovery and fault detection, isolation, and notification in an L2 network. As required, perform any of the following tests:

- CFM Global MEG OAM; see Procedure 38-5.
- CFM CC OAM; see Procedure 38-6.
- CFM loopback; see Procedure 38-7.
- CFM link trace; see Procedure 38-8.
- CFM Eth test; see Procedure 38-9.
- CFM one-way delay; see Procedure 38-10.
- CFM two-way delay; see Procedure 38-11.
- CFM single-ended loss; see Procedure 38-12.
- CFM two-way SLM; see Procedure 38-13.

iv Use service site ping to troubleshoot and resolve service problems that are related to the end-to-end connectivity of a customer service within the provider network. See Procedure 38-22 for more information.

v Use VCCV ping and VCCV trace to troubleshoot and resolve issues that are related to VLL services. See Procedures 38-23 and 38-24 for more information.

vi Use LDP tree trace to detect and discover available routers for ECMP routing. See Procedure 38-29 for more information.

vii Use LSP ping and LSP trace to troubleshoot and resolve problems that are related to MPLS LSPs, LDPs, and MPLS paths. See Procedures 38-25 and 38-26 for more information.

viii Use P2MP LSP Ping and P2MP LSP Trace to perform in-band LSP connectivity tests. See Procedures 38-27 and 38-28 for more information.

ix Use MAC ping (Procedure 38-17), MEF MAC Ping (Procedure 38-18), MAC trace (Procedure 38-19), MAC populate (Procedure 38-15), MAC purge (Procedure 38-16), and CPE ping (Procedure 38-20) to troubleshoot and resolve problems that are related to FIBs and MAC addressing. The tests are used in combination; for example, MAC populate to inject a MAC address into the network, MAC ping to determine where the address was learned, MAC trace to determine the path, CPE ping to test the VPLS, and MAC purge to remove the injected MAC address.

x Use ANCP loopback to send OAM messages to the access node. See Procedure 38-21 for more information.

xi Use VPRN ping, VPRN trace, ICMP ping and ICMP trace to troubleshoot and resolve problems with a VPRN service. See Procedures 38-14, 38-35, and 38-36 for more information.

xii Use ATM ping and ATM loopback to test ATM PVC connections. See Procedures 38-33 and 38-34 for more information.

xiii Use multicast FIB ping to troubleshoot and resolve problems with the multicast component of a VPLS. See Procedure 38-32 for more information.

xiv Use multicast router information and multicast trace to troubleshoot and resolve problems with the multicast component of a VPRN service. See Procedures 38-30 and 38-31 for more information.

xv Use ICMP ping (Procedure 38-35), ICMP trace (Procedure 38-36), and DNS ping (Procedure 38-37) to troubleshoot and resolve problems with IP reachability.

xvi Use Procedure 38-42 to configure an 802.3ah EFM diagnostic at the NE or port level.

xvii (OmniSwitch only) Use OmniSwitch ping and traceroute scripts to troubleshoot and resolve problems with IP reachability on an OmniSwitch. See Procedures 38-38, 38-40, and 38-41 for more information.

xviii (OmniSwitch only) Use OmniSwitch advanced loopback to troubleshoot and resolve problems on an OmniSwitch port. See Procedure 38-39 for more information.

xix (OmniSwitch only) Use Procedure 38-43 to configure an 802.3ah EFM diagnostic on an OmniSwitch at the NE or port level.

4 Use Procedures 38-46 and 38-47 to configure NM threshold-crossing alarms for OAM tests that are NE-schedulable and non-NE-schedulable, respectively.

5 Use Procedure 38-50 to set STM managed device test limits.

6 Use the OAM tool diagnostic response messages and results form information to resolve the customer service problem. See Procedures 38-44 and 38-45 for more information.

7 Use Procedures 38-48 and 38-49 to edit or delete an OAM diagnostic test, respectively.

38.4 OSS OAM Test Results file retrieval

OSSI clients can use the <registerSasLogToFile> method to receive OAM logs that are based on specific class types. Clients must register to receive the logs, and if no client registers, no logs are created. Refer to the *5620 SAM XML OSS Interface Developer Guide* for detailed information on OSSI client operations.

OAM data is exported to the file after the data is read from the NE. The file is saved to a specified directory on the 5620 SAM server.

Prior to enabling OSSI clients to receive Test Results files, you should configure the Default Test Result Storage, Log Retention Time (minutes), and Log Rollover Time (minutes) parameters as required. These are accessed by clicking Administration→System Preferences and then clicking the Test Manager tab.

Note — The 5620 SAM server verifies the connectivity of the 5620 SAM-O client that is specified in the registerSasLogtoFile method using the jmsClientId input parameter. The server deregisters the LogToFile request and the 5620 SAM-O client if the JMS session is disconnected.

Alcatel-Lucent recommends that you run the registerSasLogToFile method every time the 5620 SAM-O client establishes a JMS session.

Table 38-3 describes the input parameters of the <registerSasLogToFile> method.

Table 38-3 <registerSasLogToFile> method input parameters

Input parameter	Description	Values
fullClassName	Package qualified class name in dot separated format.	A comma-separated list of OAM results
compress	Specifies if export files should be compressed when created. A value of true saves files with gzip compression and a filename extension of gz. The default is false. This parameter is optional.	—
continueOnFailure	Specifies whether or not to continue processing requests in this stream if an exception occurs. A value of true continues processing the requests. The default is false. This parameter is optional.	OSSI requests can be sent with this option set to true.
dirName	The relative path to the subdirectory where the log files are to be saved. The path is relative to the OSS XML export directory /opt/5620sam/server/xml_output	—
jmsClientId	The JMS client ID that is notified when a new export file is created for the specified parameters. A notification message is sent to each client that registers for OAM logs every time an export file is created that is related to that client.	See the *5620 SAM XML OSS Interface Developer Guide* for more information about JMS client ID formats.
resultFilter	(Optional) Specifies the attributes that are to be included in the exported OAM log. You can use the resultFilter parameter to reduce the size of the export file.	<attribute>*attribute_name*</attribute>

The OAM log files are created on the 5620 SAM main server. Export file names are unique and are created under the directory that you specify in the registration request. For example:

/opt/5620sam/server/xml_output/oam/<dir_name>

OAM log retrieval example using the <registerSasLogToFile> method

Code 38-1 shows a sample request for an OAM log file using the <registerSasLogToFile> method.

Code 38-1: Sample request to export OAM logs to an XML file using a filter

```
<registerSasLogToFile xmlns="xmlapi_1.0">
         <fullClassName>
          sas.TestResult,
          sas.TraceHop
         </fullClassName>
         <dirName>jmsclientdir</dirName>
         <jmsClientId>oam@1001</jmsClientId>
    <resultFilter>
       <attribute>testSuiteId</attribute>
       <attribute>testId</attribute>
       <attribute>fromNodeId</attribute>
       <attribute>neTestRunIndex</attribute>
       <attribute>resultStatus</attribute>
    </resultFilter>
</registerSasLogToFile>
```

38.5 OAM diagnostic tests procedures

Use the following procedures to create and execute OAM diagnostic tests.

Procedure 38-1 To create and run an MTU ping OAM diagnostic from a service tunnel

Use the MTU ping diagnostic to find the largest valid frame size.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Filter to list only the source and destination routers of the service tunnel and click on the Search button. The list of service tunnels appears.

3 Double-click on a service tunnel from the list. The Tunnel (Edit) form opens.

4 Click on the Tests tab button.

5 Click on the MTU Ping tab button.

6 Click on the Create button. The MTU Ping (Create) form opens with the General tab displayed. The form displays information about the service tunnel being tested and the originating tunnel ID.

7 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent

8 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- MTU Start Size (octets)
- MTU End Size (octets)
- MTU Step Size (octets)

Note — If the step size is small but the end message size is large, the amount of time to complete the MTU ping may be many minutes. Ensure that you have an appropriate step size that reflects the range of MTU packet sizes you want to test.

9 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

10 Click on the Apply button to save the changes.

11 Perform the MTU ping.

i Click on the Execute button in the MTU Ping (Edit) form. The MTU ping diagnostic starts. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results. The diagnostic is complete.

ii Click on the Results tab button. The list of MTU ping OAM probes sent is displayed.

iii Click on the row(s) as appropriate to view diagnostic information.

iv Click on the Properties button. The OAM results form opens. The diagnostic information includes:

- source and destination of the diagnostic
- timestamp of when the test was completed
- time to complete the diagnostic, in milliseconds
- frame size sent
- OAM diagnostic status
- diagnostic code returned

See Procedure 38-45 for more information about the diagnostic status messages. Use the status message to interpret the diagnostic results. For example, the status message Response Received indicates that the MTU OAM diagnostic completed successfully.

v Close the form.

12 Close the Tunnel (Edit) form when the OAM diagnostics are complete.

Procedure 38-2 To create an MTU ping OAM diagnostic from the test manager

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Service Transport→Create MTU Ping from the Create contextual menu. The MTU Ping (Create) form opens.

4 Configure the parameters described in Procedure 38-1. You must additionally configure the source of the service tunnel.

i Click on the Select button beside the Source Site ID parameter. The Select Originating Tunnel form opens.

ii Click on the Search button.

iii Select a tunnel from the list.

iv Click on the OK button. The MTU Ping (Create) form reappears with the IP address and ID of the selected service tunnel.

5 Click on the Apply button to save the changes.

6 Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

7 Click on the Execute button to start the ping. A deployed test is created and run.

8 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-3 To create and run a tunnel ping OAM diagnostic from a service tunnel

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Filter to list only the source and destination routers of the service tunnel and click on the Search button. The list of service tunnels opens.

3 Double-click on a service tunnel from the list. The Tunnel (Edit) form opens.

4 Click on the Tests tab button.

5 Click on the Tunnel Ping tab button.

6 Click on the Create button. The Tunnel Ping (Create) form opens with the General tab displayed. The form displays information about the circuit being tested, including the originating tunnel ID.

7 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Return Tunnel

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

8 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Forwarding Class
- Forwarding Profile

The Probe Interval (seconds) parameter has an effect only when multiple probes are to be sent.

Ensure that you configure the Forwarding Class parameter to work with the services that use the tunnel.

9 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

10 Click on the Apply button to save the changes.

11 Confirm the action. The created tunnel ping test appears in the list of tests on the Tunnel Ping tab of the Tunnel (Edit) form.

12 Perform the tunnel ping OAM diagnostic:

i Click on the Execute button in the Tunnel Ping (Edit) form. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results. The diagnostic is complete.

ii Click on the Results tab button. The list of tunnel ping OAM packets sent is displayed.

iii Click on the row(s) as appropriate to view diagnostic information.

iv Click on the Properties button. The OAM results form opens. The diagnostic information includes:

- source and destination of the diagnostic
- timestamp of when the test was completed
- time to complete the diagnostic, in milliseconds
- OAM diagnostic status
- diagnostic code returned

See Procedure 38-45 for more information about the diagnostic status messages. Use the status message to interpret the diagnostic results.

v Close the form.

13 Close the Tunnel (Edit) form when the OAM diagnostics are complete.

Procedure 38-4 To create a tunnel ping OAM diagnostic from the test manager

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Service Transport→Create SDP Ping from the Create contextual menu. The Tunnel Ping (Create) form opens.

4 Configure the parameters described in Procedure 38-3. You must additionally configure the source of the service tunnel.

i Click on the Select button beside the Source Site ID parameter. The Select Originating Tunnel form opens.

ii Configure the filter criteria.

iii Click on the Search button.

iv Select a tunnel from the list.

v Click on the OK button. The Tunnel Ping (Create) form reappears with the IP address and ID of the selected service tunnel.

5 Click on the Apply button to save the changes.

6 Click on the Execute button to start the tunnel ping. A deployed test is created and run.

7 Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

8 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-5 To create and execute a CFM Global MEG OAM diagnostic

Perform this procedure to manually create and execute a CFM Global MEG test.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button and choose Ethernet CFM→CFM Global MEG from the menu. The Global Maintenance Entity Group, Test (Create) form opens.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State

4 To configure parameters in the Maintenance Domain tab, Maintenance Entity Group and Initial MEG configuration, see Procedure 80-1 for more information.

5 Click on the Apply button. The form displays additional buttons and tabs.

6 To execute the test, click on the Test tab and select the Test to be executed. Select the test and click on the Properties button, the CFM Continuity Check (Edit) form.

7 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

8 Close the CFM Continuity Check Test (Edit) form.

Procedure 38-6 To create and execute a CFM CC OAM diagnostic

Perform this procedure to manually create and execute a CFM CC test.

Note — The 5620 SAM automatically creates a CFM CC test when you create an MD and global MEG. You can execute an automatically created test using the STM, or from the Tests tab of a MEG.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button and choose Ethernet CFM→CFM Continuity Check from the menu. The CFM Continuity Check Test (Create) form opens.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State
- Duration (minutes)

4 If you are configuring the test for a 7705 SAR, configure the parameters in the Initial Dual Ended Loss Test Options panel:

- Enable Test
- Alarm Threshold (%)
- Alarm Clearing Threshold (%)

5 Click on the Select button. The Select Maintenance Entity Group form opens.

6 Specify a search filter, if required, and click on the Search button. A list of MEGs is displayed.

7 Select a MEG in the list and click on the OK button. The Select Maintenance Entity Group form closes, and the MEG is displayed on the CFM Continuity Check Test (Create) form.

8 Click on the Apply button. The form displays additional buttons and tabs.

9 To execute the test, click on the Execute button on the CFM Continuity Check (Edit) form.

10 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

11 Close the CFM Continuity Check Test (Create) form.

Procedure 38-7 To create and execute a CFM loopback diagnostic

Perform this procedure to manually create and execute a CFM loopback test. You can create multiple CFM loopback tests for an originating MEP.

Note — The maximum number of continuous CFM loopback tests that can be executed is 300, provided that the SAA packet per second rate of 200 pps is not exceeded. The total number of continuous tests must share this maximum rate of 200 pps.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM Loopback from the contextual menu. The CFM Loopback Test (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State
- NE Schedulable

Note — If the NE Schedulable parameter is enabled, two additional tabs are displayed for the form, Test Parameters and Results Configuration.

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM Loopback form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM Loopback form closes, and the CFM Loopback (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM Loopback form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM Loopback form closes, and the CFM Loopback (Create) form displays the MEP information.

11 Perform one of the following:

a Select a MEP as the test destination. Perform the following steps.

i Click on the Select MEP button beside the Target MAC Address parameter to select the destination MEP. The Select MEP - CFM Loopback form opens.

ii Select an entry and click on the OK button. The Select MEP - CFM Loopback form closes, and the CFM Loopback (Create) form refreshes.

b Select a MIP as the test destination. Perform the following steps.

i Click on the Select MIP button beside the Target MAC Address parameter to select the destination MIP. The Select MIP - CFM Loopback form opens.

ii Select an entry and click on the OK button. The Select MIP - CFM Loopback form closes, and the CFM Loopback (Create) form refreshes.

Note — MIP selection is not supported for OmniSwitch NEs.

c Select an unmanaged MEP as the test destination. Perform the following steps.

i Click on the Select Unmanaged MEP button beside the Target MAC Address parameter to select the destination MEP. The Select Unmanaged MEP - CFM Loopback form opens.

ii Select an entry and click on the OK button. The Select Unmanaged MEP - CFM Loopback form closes, and the CFM Loopback (Create) form refreshes.

12 If the NE Schedulable parameter was enabled in step 4 then go to step 15. Otherwise, go to step 13.

13 Configure the MEP Transmit LBM Information parameters:

- Data Size
- VLAN Priority
- Number of Loopback Sent
- VLAN Drop Enable

14 Go to step 17.

15 Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Size (octets)
- Continuous Execution

16 Click on the Results Configuration tab and configure the parameters:

- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation
- Accounting Files
- Test Result Storage

The Trap Generation parameter is only configurable when the Accounting Files parameter is disabled.

The Test Result Storage parameter is only configurable when the Accounting Files parameter is enabled.

17 Click on the Apply button to save the changes.

18 To execute the test, click on the Execute button.

19 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-8 To create and execute a CFM link trace diagnostic

Note — The maximum number of continuous CFM link trace tests that can be executed is 300, provided that the SAA packet per second rate of 200 pps is not exceeded. The total number of continuous tests must share this maximum rate of 200 pps.

However, it is recommended that number of continuous CFM link trace tests executed should be kept well below the maximum allowed limit.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM Link Trace from the Create contextual menu. The CFM Link Trace (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State
- NE Schedulable

Note — If the NE Schedulable parameter is enabled, two additional tabs are displayed for the form, Test Parameters and Results Configuration.

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM Link Trace form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM Link Trace form closes, and the CFM Link Trace (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM Link Trace form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM Link Trace form closes, and the CFM Link Trace (Create) form displays the MEP information.

11 Perform one of the following:

a Select a MEP as the test destination. Perform the following steps.

i Click on the Select MEP button beside the Target MAC Address parameter to choose the destination MEP. The Select MEP - CFM Link Trace form opens.

ii Select an entry and click on the OK button. The Select MEP - CFM Link Trace form closes, and the CFM Link Trace (Create) form refreshes.

b Select a MIP as the test destination. Perform the following steps.

i Click on the Select MIP button beside the Target MAC Address parameter to choose the destination MIP. The Select MIP - CFM Link Trace form opens.

ii Select an entry and click on the OK button. The Select MIP - CFM Link Trace form closes, and the CFM Link Trace (Create) form refreshes.

c Select an unmanaged MEP as the test destination. Perform the following steps.

i Click on the Select Unmanaged MEP button beside the Target MAC Address parameter to select the destination MEP. The Select Unmanaged MEP - CFM Link Trace form opens.

ii Select an entry and click on the OK button. The Select Unmanaged MEP - CFM Link Trace form closes, and the CFM Link Trace (Create) form refreshes.

12 If the NE Schedulable parameter was enabled in step 4 then go to step 15. Otherwise, go to step 13.

13 Configure the MEP Transmit LTM Information TTL parameter.

14 Go to step 17.

15 Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- TTL
- Continuous Execution

16 Click on the Results Configuration tab and configure the parameters:

- Maximum Failures
- Trap Generation
- Accounting Files
- Test Result Storage

The Trap Generation parameter is only configurable when the Accounting Files parameter is disabled.

The Test Result Storage parameter is only configurable when the Accounting Files parameter is enabled.

17 Click on the Apply button to save the changes.

18 To execute the test, click on the Execute button.

19 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-9 To create and execute a CFM Eth test diagnostic

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM Eth Test from the Create contextual menu. The CFM Eth Test (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM Eth Test form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM Eth Test form closes, and the CFM Eth Test (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM Eth Test form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM Eth Test form closes, and the CFM Eth Test (Create) form displays the MEP information.

11 Perform one of the following.

a Select a MEP as the test destination. Perform the following steps.

i Click on the Select MEP button beside the Target MAC Address parameter to select the destination MEP. The Select MEP - CFM Eth Test form opens.

ii Select an entry and click on the OK button. The Select MEP - CFM Eth Test form closes, and the CFM Eth Test (Create) form refreshes.

b Select a MIP as the test destination. Perform the following steps.

i Click on the Select MIP button beside the Target MAC Address parameter to choose the destination MIP. The Select MIP - CFM Eth Test form opens.

ii Select an entry and click on the OK button. The Select MIP - CFM Eth Test form closes, and the CFM Eth Test (Create) form refreshes.

c Select an unmanaged MEP as the test destination. Perform the following steps.

i Click on the Select Unmanaged MEP button beside the Target MAC Address parameter to select the destination MEP. The Select Unmanaged MEP - CFM Eth Test form opens.

ii Select an entry and click on the OK button. The Select Unmanaged MEP - CFM Eth Test form closes, and the CFM Eth Test (Create) form refreshes.

12 Configure the MEP Transmit LBM Information parameters:

- Data Size (octets)
- VLAN Priority

13 Click on the Apply button. The form displays additional buttons and tabs.

14 To execute the test, click on the Execute button.

15 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-10 To create and execute a CFM one-way delay diagnostic

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM One Way Delay Test from the Create contextual menu. The CFM One Way Delay Test (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM One Way Delay form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM One Way Delay form closes, and the CFM One Way Delay (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM One Way Delay Test form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM One Way Delay Test form closes, and the CFM One Way Delay Test (Create) form displays the MEP information.

11 Perform one of the following:

- **a** Select a MEP as the test destination. Perform the following steps.
  - **i** Click on the Select MEP button beside the Target MAC Address parameter to choose the destination MEP. The Select MEP - CFM One Way Delay form opens.
  - **ii** Select an entry and click on the OK button. The Select MEP - CFM One Way Delay form closes, and the CFM One Way Delay Test (Create) form refreshes.
- **b** Select a MIP as the test destination. Perform the following steps.
  - **i** Click on the Select MIP button beside the Target MAC Address parameter to choose the destination MIP. The Select MIP - CFM One Way Delay form opens.
  - **ii** Select an entry and click on the OK button. The Select MIP - CFM One Way Delay form closes, and the CFM One Way Delay Test (Create) form refreshes.
- **c** Select an unmanaged MEP as the test destination. Perform the following steps.
  - **i** Click on the Select Unmanaged MEP button beside the Target MAC Address parameter to select the destination MEP. The Select Unmanaged MEP - CFM One Way Delay form opens.
  - **ii** Select an entry and click on the OK button. The Select Unmanaged MEP - CFM One Way Delay form closes, and the CFM One Way Delay (Create) form refreshes.

12 Configure the Priority parameter in the MEP Transmit LBM Information panel.

13 Click on the Apply button. The form displays additional buttons and tabs.

14 To execute the test, click on the Execute button.

15 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-11 To create and execute a CFM two-way delay diagnostic

Note — The maximum number of continuous CFM two-way delay tests that can be executed is 300, provided that the SAA packet per second rate of 200 pps is not exceeded. The total number of continuous tests must share this maximum rate of 200 pps.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM Two Way Delay Test from the Create contextual menu. The CFM Two Way Delay Test (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State
- NE Schedulable

Note — If the NE Schedulable parameter is enabled, two additional tabs are displayed for the form, Test Parameters and Results Configuration.

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM Two Way Delay form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM Two Way Delay form closes, and the CFM Two Way Delay (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM Two Way Delay Test form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM Two Way Delay Test form closes, and the CFM Two Way Delay Test (Create) form displays the MEP information.

11 Perform one of the following:

a Select a MEP as the test destination. Perform the following steps.

i Click on the Select MEP button beside the Target MAC Address parameter to choose the destination MEP. The Select MEP - CFM Two Way Delay form opens.

ii Select an entry and click on the OK button. The Select MEP - CFM Two Way Delay form closes, and the CFM Two Way Delay Test (Create) form refreshes.

b Select a MIP as the test destination. Perform the following steps.

i Click on the Select MIP button beside the Target MAC Address parameter to choose the destination MIP. The Select MIP - CFM Two Way Delay form opens.

ii Select an entry and click on the OK button. The Select MIP - CFM Two Way Delay form closes, and the CFM Two Way Delay Test (Create) form refreshes.

Note — MIP selection is not supported on OmniSwitch NEs.

c Select an unmanaged MEP as the test destination. Perform the following steps.

i Click on the Select Unmanaged MEP button beside the Target MAC Address parameter to select the destination MEP. The Select Unmanaged MEP - Two Way Delay form opens.

ii Select an entry and click on the OK button. The Select Unmanaged MEP - CFM Two Way Delay form closes, and the CFM Two Way Delay (Create) form refreshes.

12 If the NE Schedulable parameter was enabled in step 4 then go to step 15. Otherwise, go to step 13.

13 Configure the MEP Transmit DMM Information VLAN Priority parameter.

14 Go to step 17.

15 Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Continuous Execution

16 Click on the Results Configuration tab and configure the parameters:

- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation
- Accounting Files
- Test Result Storage

The Trap Generation parameter is only configurable when the Accounting Files parameter is disabled.

The Test Result Storage parameter is only configurable when the Accounting Files parameter is enabled.

17 Click on the Apply button to save the changes.

18 To execute the test, click on the Execute button.

19 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-12 To create and execute a CFM single-ended loss diagnostic

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM Single Ended Loss Test from the Create contextual menu. The CFM Single Ended Loss Test (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM Single Ended Loss Test form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM Single Ended Loss Test form closes, and the CFM Single Ended Loss Test (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM Single Ended Loss Test form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM Single Ended Loss Test form closes, and the CFM Single Ended Loss Test (Create) form displays the MEP information.

11 Choose a destination MEP:

  i Click on the Select MEP button beside the Target MAC Address parameter. The Select MEP - CFM Single Ended Loss Test form opens.

  ii Double-click on an entry in the list, or choose an entry and click on the OK button. The Select MEP - CFM Single Ended Loss Test form closes, and the CFM Single Ended Loss Test (Create) form refreshes.

12 Configure the following parameters in the MEP Transmit LMM Information panel:

- Priority
- Count
- Interval

13 Click on the Apply button. The form displays additional buttons and tabs.

14 To execute the test, click on the Execute button.

15 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-13 To create and execute a CFM two-way SLM (Synthetic Loss Measurement) diagnostic

Note — The maximum number of continuous CFM two-way SLM tests that can be executed is 300, provided that the SAA packet per second rate of 200 pps is not exceeded. The total number of continuous tests must share this maximum rate of 200 pps.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Ethernet CFM→CFM Two Way SLM from the Create contextual menu. The CFM Two Way SLM Test (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NM Administrative State
- NE Schedulable

Note — If the NE Schedulable parameter is enabled, two additional tabs are displayed for the form, Test Parameters and Results Configuration.

5 Click on the Select button beside the Global ID field to choose a global MEG. The Select Global MEG - CFM Two Way SLM Test form opens.

6 Specify a search filter, if required, and click on the Search button. A list of global MEGs is displayed.

7 Select an entry and click on the OK button. The Select Global MEG - CFM Two Way SLM Test form closes, and the CFM Two Way SLM Test (Create) form displays the global MEG.

8 Click on the Select button beside the ID field to choose an originating MEP. The Select Originating MEP - CFM Two Way SLM Test form opens.

9 Specify a search filter, if required, and click on the Search button. A list of MEPs is displayed.

10 Select a MEP in the list and click on the OK button. The Select Originating MEP - CFM Two Way SLM Test form closes, and the CFM Two Way SLM Test (Create) form displays the MEP information.

11 Perform one of the following:

a Select a MEP as the test destination. Perform the following steps.

i Click on the Select MEP button beside the Target MAC Address parameter to choose the destination MEP. The Select MEP - CFM Two Way SLM form opens.

ii Select an entry and click on the OK button. The Select MEP - CFM Two Way SLM form closes, and the CFM Two Way SLM Test (Create) form refreshes.

b Select a MIP as the test destination. Perform the following steps.

i Click on the Select MIP button beside the Target MAC Address parameter to choose the destination MIP. The Select MIP - CFM Two Way SLM form opens.

ii Select an entry and click on the OK button. The Select MIP - CFM Two Way SLM form closes, and the CFM Two Way SLM Test (Create) form refreshes.

Note — MIP selection is not supported on OmniSwitch NEs.

c Select an unmanaged MEP as the test destination. Perform the following steps.

i Click on the Select Unmanaged MEP button beside the Target MAC Address parameter to select the destination MEP. The Select Unmanaged MEP - Two Way SLM form opens.

ii Select an entry and click on the OK button. The Select Unmanaged MEP - CFM Two Way SLM form closes, and the CFM Two Way SLM (Create) form refreshes.

12 If the NE Schedulable parameter was enabled in step 4 then go to step 15. Otherwise, go to step 13.

13 In the MEP Transmit SLM Information panel, configure the following parameters:

- Priority
- Interval (seconds)
- Timeout (seconds)
- Data Size (octets)
- Send Count (packets)

14 Go to step 17.

15 Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Size (octets)
- Continuous Execution

16 Click on the Results Configuration tab and configure the parameters:

- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation
- Accounting Files
- Test Result Storage

The Trap Generation parameter is only configurable when the Accounting Files parameter is disabled.

The Test Result Storage parameter is only configurable when the Accounting Files parameter is enabled.

17 Click on the Apply button to save the changes.

18 To execute the test, click on the Execute button.

19 Click on the Results tab button to view the test results. See Procedure 38-44 for information about test results.

Procedure 38-14 To configure and run VPRN OAM diagnostics from a service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Service Manager form opens.

2 Filter to list only the services on which you want to perform OAM diagnostics and click on the Search button.

3 Choose a service from the list and click on the Properties button. The Service (Edit) form opens.

4 Click on the Sites tab button.

5 Choose a site or sites from the list and click on the Properties button. The Site (Edit) form opens.

6 Click on the Tests tab button.

7 Configure and run a VPRN ping or VPRN trace OAM diagnostic.

a To configure and run a VPRN ping:

i Click on the VPRN Ping tab. A list of VPRN diagnostics appears.

ii Double-click on a row in the list to edit an existing test, or click on the Create button to create a new test. The VPRN ping form opens with the General tab displayed.

iii Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

iv Click on the Select button to select a VPRN site. The Select VPRN Site - VPRN Ping form appears.

v Click on the Search button.

vi Select a VPRN site and click on the OK button. The Select VPRN Site - VPRN Ping form closes.

vii Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Source IP Address
- Target IP Address
- Time To Live
- Reply Via Control Plane
- Forwarding Profile
- Forwarding Class

viii Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

ix Click on the Apply button to save the changes.

x Confirm the action.

xi Click on the Execute button. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

b To configure and run a VPRN trace:

i Click on the VPRN Trace tab. A list of VPRN trace diagnostics appears.

ii Double-click on a row in the list to edit an existing test, or click on the Create button to create a new test. The VPRN Trace (Create) form opens with the General tab displayed.

iii Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

iv Click on the Select button to select a VPRN site. The Select VPRN Site - VPRN Trace form appears.

v Click on the Search button.

vi Select a VPRN site and click on the OK button. The Select VPRN Site - VPRN Trace form closes.

vii Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Source IP Address
- Target IP Address
- Initial Time to Live
- Maximum Time to Live
- DiffServ Field
- Reply Via Control Plane
- Forwarding Profile
- Forwarding Class

viii Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

ix Click on the Apply button to save the changes.

x Confirm the action.

xi Choose the diagnostic from the list.

xii Click on the Execute button. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

8 Configure and run an ICMP ping or ICMP trace OAM diagnostic.

a To configure and run ICMP ping:

i Click on the ICMP Ping tab. A list of ICMP diagnostics appears.

ii Double-click on a row in the list to edit an existing test, or click on the Create button to create a new test. The ICMP Ping form opens with the General tab displayed.

iii Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- From IP Address
- Target IP Address
- Next Hop Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

iv Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Rapid
- Time To Live
- Data Pattern
- Positional Data Pattern
- DiffServ Field
- Egress Interface Index
- Bypass Routing
- Do Not Fragment

v Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

vi Click on the Apply button to save the changes.

vii Click on the Execute button. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

b To configure and run ICMP trace:

i Click on the ICMP Trace tab. A list of ICMP trace diagnostics appears.

ii Double-click on a row in the list to edit an existing test, or click on the Create button to create a new test. The ICMP Trace form opens with the General tab displayed.

iii Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- From IP Address
- Target IP Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

iv Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Maximum Time to Live
- DiffServ Field
- Time To Wait (milliseconds)

v Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

vi Click on the Apply button to save the changes.

vii Choose the diagnostic from the list.

viii Click on the Execute button. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

9 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Note — Results of individually run ICMP Trace tests are viewed on the Results tab. The Results tab displays only the result of the last individually run ICMP Trace test, any previous individually run test results are overwritten.

Results from ICMP Trace tests that are scheduled or part of a test suite are also stored on the Results tab. The number of scheduled test results stored corresponds to the value configured in the Probe History Size (rows) parameter. Scheduled ICMP Trace test results do not overwrite individually run test results or previously run scheduled test results.

Procedure 38-15 To configure and run MAC populate OAM diagnostics

You can also perform the diagnostic from the Tests tab of a VPLS or Epipe VLL service form.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→Create MAC Populate from the Create contextual menu. The MAC Populate (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Target Type
- Target MAC Address
- Send Via Control Plane
- Flood
- Force OAM
- Age (seconds)
- Service Name
- Name

When the Service Name parameter is configured, you can configure the Name parameter for the site.

5 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

6 Click on the OK button to save the changes.

7 Choose the created test from the list of OAM diagnostics.

8 Click on the Execute button to start the MAC populate diagnostic. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

9 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-16 To configure and run MAC purge OAM diagnostics

You can also perform the diagnostic from the Test tab of a VPLS or an Epipe VLL.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→Create MAC Purge from the Create contextual menu. The MAC Purge (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Target Type
- Target MAC Address
- Send Via Control Plane
- Inhibit Learning
- Flood
- Service Name
- Name

When the Service Name parameter is configured, you can configure the Name parameter for the site.

5 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

6 Click on the OK button to save the changes.

7 Choose the created test from the list of OAM diagnostics.

8 Click on the Properties button.

9 Click on the Execute button to start the MAC purge diagnostic. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-17 To configure and run MAC ping OAM diagnostics

You can also perform the diagnostic from the Test tab of a VPLS or an Epipe VLL.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→ MAC Ping from the Create contextual menu. The MAC Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- Target MAC Address
- Source MAC Address
- Service Name
- Name

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

When the Service Name parameter is configured, you can configure the Name parameter for the site.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile
- Reply Control
- Control Plane

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the OK button to save the changes.

8 Choose the created test from the list of OAM diagnostics.

9 Click on the Properties button.

10 Click on the Execute button to start the MAC ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

11 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-18 To configure and run MEF MAC ping OAM diagnostics

You can also perform the diagnostic from the Test tab of a VPLS.

Note — MEF MAC Ping must run simultaneously in both directions between the source and destination VPLS sites. Configure a test from the source VPLS site to the destination VPLS site and from the destination VPLS site to the source VPLS site.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→Create MEF MAC Ping from the Create contextual menu. The MEF MAC Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent
- Target Type
- Target MAC Address

5 Choose a VPLS service.

  i Click on the Select button in the Service panel. The Select Service - MEF MAC Ping form opens.

  ii Configure the filter criteria and click on the Search button. A list of VPLSs appears.

  iii Choose a VPLS and click on the OK button. The Select Service - MEF MAC Ping form closes.

6 When you choose a VPLS, the Site panel appears on the form. Choose a VPLS site that belongs to the selected VPLS.

  i Click on the Site panel Select button. The Select Site - MEF MAC Ping form opens.

  ii Configure the filter criteria and click on the Search button. A list of VPLS sites appears.

  iii Choose a VPLS site and click on the OK button. The Select Site - MEF MAC Ping form closes.

7 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)

8 Click on the Results Configuration tab button and configure the parameters:

- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

9 Click on the OK button to save the changes.

10 Choose the created test from the list of OAM diagnostics.

11 Click on the Execute button to start the MEF MAC ping. A deployed test is created and run. Click on the Deployed Tests tab button to open the deployed test and view the current state of the test. When the test is complete, the deployed test is removed and you can view the results.

12 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- round trip jitter
- round trip latency
- round trip frame loss

Procedure 38-19 To configure and run MAC trace OAM diagnostics

You can also perform the diagnostic from the Test tab of a VPLS or an Epipe VLL.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→Create MAC Trace from the Create contextual menu. The MAC Trace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- Target MAC Address
- Source MAC Address
- Initial Time to Live
- Maximum Time to Live
- Service Name
- Name

When the Service Name parameter is configured, you can configure the Name parameter for the site.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Profile
- Forwarding Class

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

7 Click on the Apply button to save the changes.

8 Choose the created test from the list of OAM diagnostics.

9 Click on the Execute button to start the MAC trace. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-20 To configure and run CPE ping OAM diagnostics

You can also perform this diagnostic from the Test tab of a VPLS.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→Create CPE Ping from the Create contextual menu. The CPE Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Service Name
- Name
- Destination Path Address
- Source IP Address
- Source MAC Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

When the Service Name parameter is configured, you can configure the Name parameter for the site.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- VC's Label Time Live
- Send Via Control Plane
- Reply Via Control Plane
- Forwarding Profile
- Forwarding Class

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the OK button to save the changes.

8 Click on the Search button to display the list of OAM diagnostics.

9 Double-click on the created test from the list of OAM diagnostics.

10 Click on the Execute button to start the CPE ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

11 View the test results on the Results tab.

12 To display the test results, select the test from the CPE Ping Result list and click on the Properties button. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-21 To configure and run ANCP loopback diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L2 Service→Create ANCP Loopback from the Create contextual menu. The ANCP Loopback (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent

5 Click on the Select button beside the System ID (Loopback Ip Address) parameter. The Select Originating Node - ANCP Loopback form opens.

6 Configure the filter criteria.

7 Click on the Search button.

8 Double-click on an entry in the list, or select an entry and click on the OK button. The Select Originating Node - ANCP Loopback form closes, and the ANCP Loopback (Create) form refreshes.

9 Click on the Test Parameters tab button and perform one of the following steps.

  a Configure the ANCP loopback diagnostic for a subscriber ID.

    i Set the Target Type parameter to Subscriber Ident String.

    ii Configure the Subscriber Ident String parameter.

  b Configure the ANCP loopback diagnostic for an ANCP string.

    i Set the Target Type parameter to ANCP String.

    ii Configure the ANCP String parameter.

10 Configure the parameters:

- Count
- Timeout (seconds)

11 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

12 Click on the Apply button to save changes.

13 Click on the Execute button to start the ANCP loopback diagnostic. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete you can view the results.

14 Click on the Results tab to view the test results.

15 Select the test from the ANCP Loopback Result list and click on the Properties button. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-22 To configure and run service site ping OAM diagnostics

1. Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2. Click on the Create button.

3. Choose Service→ Service Site Ping from the Create contextual menu. The Service Site Ping (Create) form opens with the General tab displayed.

4. Configure the parameters:

   - ID
   - Auto-Assign ID
   - Name
   - Description
   - Administrative State
   - System ID (Loopback Ip Address)

5. Click on the Test Parameters tab button and configure the parameters:

   - Target IP Address
   - Service ID
   - Use Local Tunnel
   - Use Remote Tunnel

   When you set the target IP address, then choose a service ID, only service IDs from the selected site are available. When you set the Use Local Tunnel and Use Remote Tunnel parameters, the test becomes a ping that tests the service tunnel bindings between the service sites.

6. Click on the Results Configuration tab button and configure the parameters:

   - Probe History Size (rows)
   - Test Failure Threshold
   - Probe Failure Threshold
   - Trap Generation

7. Click on the OK button to save the changes.

8. Choose the created test from the list of OAM diagnostics and click on the Properties button.

9. Click on the Execute button to start the service site ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10. View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

    - Number of Probes Sent
    - Time Last Response
    - Number of Responses Received

Procedure 38-23 To configure and run VCCV ping OAM diagnostics

You can also perform a VCCV ping from a VLL service form.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Service→Create VCCV Ping from the Create contextual menu. The VCCV Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

5 Click on the Select button in the First Spoke SDP Binding panel. The Select First Spoke SDP Binding - VCCV ping form appears.

6 Click on the Search button.

7 Select the first spoke SDP binding and click on the OK button. The Select First Spoke SDP Binding - VCCV ping form closes.

8 Click on the Select button in the Downstream SDP Binding panel. The Select downstream spoke SDP Binding - VCCV ping form appears.

9 Click on the Search button.

10 Select the downstream spoke SDP binding and click on the OK button. The Select downstream spoke SDP Binding - VCCV ping form closes.

11 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Forwarding Class
- Forwarding Profile
- Reply Type parameter

12 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

13 Click on the OK button to save the changes.

14 Choose the created test from the list of OAM diagnostics.

15 Click on the Execute button to start the VCCV ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

16 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- IP address of the destination and far-end device
- Time Last Response
- Number of Responses Received
- Response Time
- Loss indicator, a value of 0 indicates that the test packet was received and a value of 1 indicates that the test packet was lost

Procedure 38-24 To configure and run VCCV Trace OAM diagnostics

You can also perform a VCCV Trace test from a VLL service form.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Service→Create VCCV Trace from the Create contextual menu. The VCCV Trace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

5 Click on the Select button in the First Spoke SDP Binding panel. The Select First Spoke SDP Binding - VCCV Trace form appears.

6 Click on the Search button.

7 Select the first spoke SDP binding and click on the OK button. The Select First Spoke SDP Binding - VCCV Trace form closes. The parameters in the First Spoke SDP Binding block are populated.

8 Configure the parameters:

- Initial Time to Live
- Maximum Time to Live

9 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Forwarding Class
- Forwarding Profile
- Reply Type parameter

10 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

11 Click on the OK button to save the changes. The VCCV Trace (Create) form closes.

12 Click on the Test (Assurance) item in the Service Test Manager form and then click the Search button.

13 Choose the created test from the list of tests in the Test (Assurance) block.

14 Click on the Execute button to start the VCCV Trace test. A deployed test is created and run.

15 Click on the Properties button. The VCCV Trace (Edit) form opens with the General tab displayed.

16 Click on the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

17 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- information about the configuration test, including the configured parameter values
- number of probes to be issued
- time of last response
- source and response IP addresses
- number of hops
- probe responses from nodes in path

Procedure 38-25 To configure and run LSP Ping OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose MPLS→Create LSP Ping from the Create contextual menu. The LSP Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- Site ID
- IP Address
- LDP Prefix
- LDP Prefix Length
- Destination Path Address
- Next Hop Interface Name
- Next Hop Interface Address
- Return LSP

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

The parameters in the Source IP Address, LDP, and Details panels can only be configured when the Target Type parameter is set to Any LSP and when the LDP Site ID is configured.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

When you set the target IP address, then choose a service ID, only service IDs from the selected site are available.

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the OK button to save the changes. The Service Test Manager form opens.

8 Double-click on the created test from the list of OAM diagnostics.

9 Click on the Execute button to start the LSP ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-26 To configure and run LSP Trace OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose MPLS→Create LSP Trace from the Create contextual menu. The LSP Trace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- Site ID
- IP Address
- LDP Prefix
- LDP Prefix Length
- Destination Path Address
- Probe Failure Threshold
- Next Hop Interface Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

The parameters in the Source IP Address, LDP, and Details panels can only be configured when the Target Type parameter is set to Any LSP and when the LDP Site ID is configured.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Initial Time to Live
- Maximum Time to Live
- Forwarding Class
- Forwarding Profile

When you set the target IP address, then choose a service ID, only service IDs from the selected site are available.

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

7 Click on the OK button to save the changes. The Service Test Manager form opens.

8 Choose the created test from the list of OAM diagnostics and click on the Properties button.

9 Click on the Execute button to start the LSP trace. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

Procedure 38-27 To configure and run P2MP LSP Ping OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose MPLS→Create P2MP LSP Ping from the Create contextual menu. The P2MP LSP Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State

5 Click the Select button in the P2MP Dynamic Lsp panel to choose the P2MP Dynamic LSP you want to test.

6 Click the Select button in the P2MP Instance panel to choose the P2MP Instance you want to test.

7 Configure the Select All S2L Paths parameter.

If you enabled the parameter, go to step 10.

8 Click on the S2L Paths tab.

9 Select the S2L paths that you want to test. A maximum of five can be selected.

10 Click on the Test Parameters tab and configure the parameters:

- Probe Timeout (seconds)
- Probe Interval (seconds)
- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

11 Click on the Results Configuration tab and configure the parameters:

- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

12 Click on the NM Thresholds tab to configure threshold-crossing alarms, as required.

Refer to Procedure 38-47 for details.

13 Click on the OK button to save the changes. The Service Test Manager form opens.

14 Choose the created test from the list of OAM diagnostics and click on the Properties button.

The P2MP LSP Ping (Edit) form opens, with the General tab displayed.

15 Click on the Execute button to start the P2MP LSP ping. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

Note — When this test is performed on an existing Point-to-Multipoint LSP, up to five S2L paths can be selected. If none are selected, all available paths up to the limit of five will be pinged.

16 Click on the Results tab in the P2MP LSP Ping (Edit) form.

If you enabled the Select All S2L Paths parameter in step 7, the Results tab will show an entry for each path tested.

17 Select the test from the list and click on Properties. The P2MP LSP Ping Result form opens, with the General tab displayed.

The General tab displays the test parameters you configured, along with time the test was executed, its status, and the following test information:

- Number of Probes Sent
- Probe Timeouts
- Number of Responses Received
- Probes Lost

Note — The test results depend on the type of test you run. Refer to Procedure 38-44 for more information.

18 Click on the Details tab.

19 View the test results for the:

- Round Trip Time
- Outbound One Way Time
- Inbound One Way Time

20 Click on the Response Probes tab.

21 Select a response probe from the list and click on Properties. The P2MP LSP Ping Probe Result form opens.

Note — The test results depend on the type of test you run. Refer to Procedure 38-44 for more information.

22 View details on the response probe, including:

- Status
- Round-Trip Time
- Response sequence

23 Repeat steps 17 to 22 for all tested S2L paths.

Note — Refer to the Service assurance test management and configuration in Section 38.1 and to Chapter 78 for more information on viewing test results.

Procedure 38-28 To configure and run P2MP LSP Trace OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose MPLS→Create P2MP LSP Trace from the Create contextual menu. The P2MP LSP Trace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent

5 Click the Select button in the P2MP Dynamic Lsp panel to choose the P2MP Dynamic LSP you want to test.

6 Click the Select button in the P2MP Instance panel to choose the P2MP Instance you want to test.

7 Click the Select button in the S2L Destination Address panel to choose the S2L Destination Address you want to test.

8 Click on the Test Parameters tab and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Initial Time to Live
- Maximum Time to Live
- Forwarding Class
- Forwarding Profile

9 Click on the Results Configuration tab and configure the parameters:

- Maximum Failures
- Trap Generation

10 Click on the NM Thresholds tab to configure threshold-crossing alarms, as required.

Refer to Procedure 38-47 for details.

11 Click on the OK button to save the changes. The Service Test Manager form opens.

12 Choose the created test from the list of OAM diagnostics and click on the Properties button.

The P2MP LSP Trace (Edit) form opens, with the General tab displayed.

13 Click on the Execute button to start the P2MP LSP trace. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

14 Click on the Results tab.

15 Select the test from the list and click on Properties. The P2MP LSP Trace Result form opens, with the General tab displayed.

The General tab displays the test parameters you configured, along with time the test was executed and its status.

Note — The test results depend on the type of test you run. Refer to Procedure 38-44 for more information.

16 Click on the Hops and Probes tab.

A tree view of the Hops and Probes associated with this test is provided.

17 Right-click on a Hop from the tree view and click on Properties.

The P2MP LSP Trace Hop (Edit) form is displayed, showing the General tab.

18 View the test results for the:

- Response Probe
- Round Trip Details
- Outbound One Way Trip Details
- Inbound One Way Trip Details

19 Right-click on a Probe from the tree view and click on Properties.

The P2MP LSP Trace Probe (Edit) form is displayed, showing the General tab.

20 View details on the probe, including:

- Response Probe
- LSP Details

21 Repeat this test for all required S2L paths. The test only evaluates one S2L path per execution.

Note — Refer to the Service assurance test management and configuration in Section 38.1 and to Chapter 78 for more information on viewing test results.

Procedure 38-29 To configure and run LDP Tree Trace OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button. The test options are displayed in a drop-down menu.

3 Choose MPLS→Create LDP Tree Trace from the Create contextual menu. The LDP Tree Trace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Site ID
- LDP Prefix
- LDP Prefix Length

5 Click on the Test Parameters tab button and configure the parameters:

- Maximum Time to Live
- Timeout (seconds)
- Retry Counter
- Forwarding Class
- Profile
- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

7 Click on the OK button to save the changes. The Service Test Manager form opens.

8 Choose the created test from the list of OAM diagnostics and click on the Properties button.

9 Click on the Execute button to start the LDP tree trace. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 Click on the Results tab. A list of LDP tree trace tests appears.

11 Choose a LDP tree trace from the list and click on the Properties button.

12 View the test results. The results depend on the type of test. See Procedure 38-44.

Procedure 38-30 To configure and run multicast router information OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Multicast→Create Mrinfo from the Create contextual menu. The mrinfo (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent
- Target Type
- Site ID

5 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

6 Click on the Select button to choose a PIM interface. The Select PIM Interface form opens.

7 Select a PIM interface in the list and click on the OK button. The Select PIM Interface form closes, and the interface information is displayed on the mrinfo (Create) form.

8 Click on the OK button to save the changes.

9 Choose the created test from the list of OAM diagnostics.

10 Click on the Execute button to start the diagnostic request for multicast router information. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

11 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44.

Procedure 38-31 To configure and run multicast trace OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Multicast→Create Mtrace from the Create contextual menu. The mtrace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent
- Target Type
- Site ID
- Source Address
- Destination Address
- Response Address

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Initial Time to Live
- Maximum Number of Hops

When you set the target IP address, then choose a service ID, only service IDs from the selected site are available.

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

7 Click on the OK button to save the changes.

8 Choose the created test from the list of OAM diagnostics.

9 Click on the Execute button to start the multicast trace. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44.

Procedure 38-32 To configure and run multicast FIB ping OAM diagnostics

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Multicast→Create Mfib Ping from the Create contextual menu. The MFIB Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent
- Service Name
- Multicast Source
- Multicast Group
- Name

When the Service Name parameter is configured, you can configure the Name parameter for the site.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Time To Live
- Timeout (seconds)
- Reply Via Control Plane

When you set the target IP address, then choose a service ID, only service IDs from the selected site are available.

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the OK button to save the changes.

8 Choose the created test from the list of OAM diagnostics.

9 Click on the Execute button to start the multicast FIB ping. A deployed test is created and run. Open the deployed test to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

10 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44.

Procedure 38-33 To configure and run an ATM OAM ping

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose L1/L2→Create ATM Ping from the Create contextual menu. The ATM Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent
- ATM Interface ID

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Loopback Location (hex)
- Destination Type

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the Apply button to save the settings. A confirmation window opens.

8 Click on the Yes button.

9 Choose the created test from the list of OAM diagnostics.

10 Click on the Execute button to start the ATM ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

11 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Number of Probes Sent
- Time Last Response
- Number of Responses Received

12 To configure another ATM OAM ping, click on the Clear button and repeat steps 5 to 11. Otherwise, go to step 13.

13 Click on the Cancel button to close the form.

Procedure 38-34 To configure an ATM OAM loopback

ATM OAM loopback settings are configured globally on supported devices. However, a loopback must be enabled on an IES or VPRN SAP.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an ATM OAM loopback and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the ATM tab button.

4 Configure the parameters:

- ATM OAM Loopback Location ID
- ATM OAM Loopback Period
- Number of Tries for Up State
- Number of Tries for Down State

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 38-35 To configure and run an ICMP ping

You can also perform an ICMP ping from the Test tab of a VPRN or EIS service configuration form.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose ICMP→ ICMP Ping from the Create contextual menu. The ICMP Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- System ID (Loopback Ip Address)
- From IP Address
- Source IP Address
- Target IP Address
- Next Hop Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

Note — The NE Persistent test is not supported on OmniSwitch NEs.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Rapid
- Time To Live
- Data Pattern
- Positional Data Pattern
- DiffServ Field
- Egress Interface Index
- Bypass Routing
- Do Not Fragment
- Forwarding Class
- Forwarding Profile

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the Apply button to save the settings.

8 Click on the Execute button to start the ICMP ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

9 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Average Round-Trip Time
- Maximum Round-Trip Time
- Minimum Round-Trip Time
- Round-Trip Jitter

10 To configure another ICMP ping, click on the Clear button and repeat steps 5 to 9. Otherwise, go to step 11.

11 Click on the Cancel button to close the form.

Procedure 38-36 To configure and run an ICMP trace

You can also perform an ICMP trace from the Test tab of a VPRN or EIS.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose ICMP→Create ICMP Trace from the Create contextual menu. The ICMP Trace (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- System ID (Loopback Ip Address)
- From IP Address
- Source IP Address
- Target IP Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Maximum Time to Live
- DiffServ Field
- Time To Wait (milliseconds)

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Maximum Failures
- Trap Generation

7 Click on the Apply button to save the settings.

8 Click on the Execute button to start the ICMP trace. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

9 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Current Hop Count
- Current Probe Count
- Minimum Round-Trip Time
- Round-Trip Jitter

Note — Results of individually run ICMP Trace tests are viewed on the Results tab. The Results tab displays only the result of the last individually run ICMP Trace test, any previous individually run test results are overwritten.

Results from ICMP Trace tests that are scheduled or part of a test suite are also stored on the Results tab. The number of scheduled test results stored corresponds to the value configured in the Probe History Size (rows) parameter. Scheduled ICMP Trace test results do not overwrite individually run test results or previously run scheduled test results.

10 To configure another ICMP trace, click on the Clear button and repeat steps 5 to 9. Otherwise, go to step 11.

11 Click on the Cancel button to close the form.

Procedure 38-37 To configure and run a DNS ping

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose ICMP→Create DNS Ping from the Create contextual menu. The DNS Ping (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Schedulable
- NE Persistent
- Target Type
- System ID (Loopback Ip Address)
- From IP Address
- Source IP Address
- DNS Server Type
- DNS Name
- DNS Server Address

The NE Schedulable parameter is configurable only if the NE Persistent parameter is not enabled.

The NE Persistent parameter is configurable only if the NE Schedulable parameter is not enabled.

5 Click on the Test Parameters tab button and configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)

6 Click on the Results Configuration tab button and configure the parameters:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Trap Generation

7 Click on the Apply button to save the settings.

8 Click on the Execute button to start the DNS ping. A deployed test is created and run. Open the deployed test from the Deployed Tests tab button to view its current state. When the test is complete, the deployed test is removed, and you can view the results.

9 View the test results on the Results tab. The results depend on the type of test. See Procedure 38-44. Result information includes:

- Average Round-Trip Time
- Maximum Round-Trip Time
- Minimum Round-Trip Time
- Round-Trip Jitter
- Sum of Squares Round-Trip Time

10 To configure another DNS ping, click on the Clear button and repeat steps 5 to 9. Otherwise, go to step 11.

11 Click on the Cancel button to close the form.

Procedure 38-38 To create an OmniSwitch OAM CLI script

Warning — Scripts that are not correctly created or applied can cause serious damage to the network. Alcatel-Lucent recommends that system administrators clearly define user responsibilities for CLI script usage, and ensure that scripts are verified and validated before they are executed on devices in a live network.

Perform this procedure to create an OmniSwitch OAM CLI script using the sample scripts in Code 38-2 and Code 38-3.

1 Choose Tools→Scripts from the 5620 SAM main menu. The Script Manager form opens.

2 Choose CLI Script (Scripting) from the object drop-down list and click on the Create button. The CLI Script (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Script ID
- Name
- Description
- Type
- Use Latest Version
- Starting Point
- Continue On Command Failure
- Content Type

Enable the Use Latest Version parameter to associate all of the targets of the script with the latest version of the CLI script.

You must set the Content Type parameter to Velocity.

4 Perform the following steps to specify the script target types.

i Click on the Add button in the NE Types panel. The Select Property - CLI Script form opens.

ii Select one or more OmniSwitch NE types in the list and click on the OK button. The Select Property - CLI Script form closes, and the NE types are listed on the CLI Script (Create) form.

5 Click on the Apply button to apply the configuration.

6 Click on the Versions tab button.

7 Create the script by clicking on the Create button. The Script Editor *script_name* form opens.

8 Create the CLI script text by performing one of the following steps.

a Import an existing text file with a CLI script. You can create a text file by copying and pasting the text from the sample OmniSwitch ping shown in Code 38-2 or the sample traceroute script shown in Code 38-3 into a text editor.

i Choose File→Import from the Editor menu. The Import dialog box appears.

ii Choose the file to be imported and click on the Import button. The script appears in the script manager editor workspace.

iii Modify the script as required.

b Enter or copy and paste the CLI script text from the sample OmniSwitch ping shown in Code 38-2 or the sample traceroute script shown in Code 38-3 into the script manager editor workspace. .

The following ping and traceroute scripts are sample CLI scripts that can be used to run ping and traceroute tests. See the *5620 SAM Scripts and Templates Developer Guide* for information about creating, configuring, and using scripts.

Code 38-2: Sample OmniSwitch OAM ping script

9 Perform one of the following.

a Save the script to the script manager.

i Choose File→Save from the Editor menu or click on the Save button. The Comment form opens.

ii Configure the parameters:

- Network Element Version Information
- Bundle ID

iii Click on the OK button.

b Export the script to a local or network text file.

i Choose File→Export from the Editor menu, or click on the Export button. A dialog box appears and prompts you to choose a file storage location in the network.

ii Scroll to the location in which you want to save the text file, and enter a filename in the appropriate field.

iii Click on the Export button. The script version text file is saved in the specified location.

10 Choose File→Close from the Editor menu. The Script Editor form closes, and the CLI Script (Edit) form reappears with the Version tab displayed. The new version of the script appears in the list.

11 Close the CLI Script (Edit) form.

12 Close the Script Manager list form.

See procedures 38-40 and 38-41 for information about configuring and running OmniSwitch ping and traceroute OAM scripts.

Procedure 38-39 To configure an advanced loopback test on an OmniSwitch port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

Note 1 — Only one test profile per port can be created, up to a maximum of 8 ports on an NE.

Note 2 — The test profile cannot be created on a port that is part of a LAG.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the device where you want to configure an advanced loopback test and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Click on the Advanced Loopback tab button. Click on the Create button. The AOS Advanced Loopback (Create) form appears.

7 Configure the parameters:

- Test Name
- Source MAC Address
- Destination MAC Address
- VLAN
- Traffic Type
- SAP Id (OS 6250 only, see Note 1 and Note 2)

Note 1 — For OS 6250 NEs, if the Traffic Type parameter value is "Outward", the user will be provided with an option to specify the SAP Id, provided the SAP Id already exists on the NE.

Note 2 — If a loopback profile is created with a Traffic Type value of "Outward", the SAP Id option will be provided with the default value of "0". If the loopback profile is created with SAP Id, then the SAP Id must exist on the NE.

8 Click on the OK button. A dialog box appears.

9 Click on the OK button. The AOS Advanced Loopback (Create) form closes.

10 Choose a test entry on the Physical Port (Edit) form. Click on the Apply button.

11 A dialog box appears. Click on the Yes button.

12 Choose a test entry on the Physical Port (Edit) form. Click on the Properties button.

13 The AOS Advanced Loopback (Edit) form opens. Configure the Status parameter.

14 Click on the OK button. The AOS Advanced Loopback (Edit) form closes.

15 Click on the OK button of the Physical Port (Edit) form. A dialog box appears.

16 Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 38-40 To configure and run an OmniSwitch OAM ping

Warning — Scripts that are not correctly created or applied can cause serious damage to the network. Alcatel-Lucent recommends that system administrators clearly define user responsibilities for CLI script usage, and ensure that scripts are verified and validated before they are executed on devices in a live network.

The following procedure describes how to configure and run an OmniSwitch ping test using the script created using Procedure 38-38.

1 Ensure that the mediation policy for each OmniSwitch target is configured with the correct user name and password for CLI communication. See Procedure 14-4.

2 Choose Tools→Scripts from the 5620 SAM main menu. The Script Manager form opens.

3 Choose CLI Script (script) from the object drop-down list.

4 Configure the filter criteria. A list of scripts appears at the bottom of the Script Manager form.

5 Double-click on the OmniSwitch ping script that you created using Procedure 38-38. The CLI Script (Edit) form opens with the General tab displayed.

6 Click on the Targets tab button.

7 Click on the Create button. The Target Configuration form opens.

8 Click on the Create button. The Select Network Elements form opens.

9 Choose one or more OmniSwitch devices and click on the OK button. The Select Network Elements form closes, and the OmniSwitch nodes are listed on the Target Configuration form.

10 Configure the test parameters.

i Choose a target from the Target List panel.

ii Configure the parameters:

- IP Address
- Count
- Packet Size (octets)
- Interval (seconds)
- Timeout

iii Click on the Apply To Selected button.

iv Repeat steps 10i to 10iii to configure additional targets, if required.

v Click on the OK button to close the Target Configuration form. The CLI Script (Edit) form opens with the Targets tab displayed.

11 To run the script on specified targets, choose one or more entries from the list.

12 Click on the Execute button. The results of the test appear in the form.

13 Perform one of the following to view the results of the scripts:

a Choose a target from the list. The results of the script that was run on the specified target appears in the panel below the list.

i Click on the Save Result button to save the results to the result manager. A dialog box appears. Click on the OK button.

Note — You can save the results of multiple scripts to the result manager simultaneously; choose the entries in the list and click on the Save Result button.

ii Export the results to a local or network text file.

iii Click on the Export button. A dialog box appears and prompts you to choose a file storage location on the network.

iv Scroll to the location in which you want to save the text file, and enter a filename in the appropriate field.

v Click on the Export button. The results text file is saved in the specified location.

b Choose one or more entries from the list and click on the View Selected button. The View Selected form opens and displays the results of the script. The results for each target are separated by a comment that indicates the script version, associated target, script status, run time and date, and script parameters.

i Export the results of the script to a local or network text file. Choose File→Export from the Editor menu, or click on the Export button. A dialog box appears and prompts you to choose a file storage location in the network. Scroll to the location in which you want to save the text file, and enter a filename in the appropriate field. Click on the Export button. The results text file is saved in the specified location.

ii Choose File→Close from the View Selected form to close the View Selected form.

14 Click on the OK button or Cancel button to close the CLI Script (Edit) form.

15 Close the Script Manager form.

Procedure 38-41 To configure and run an OmniSwitch OAM traceroute

Warning — Scripts that are not correctly created or applied can cause serious damage to the network. Alcatel-Lucent recommends that system administrators clearly define user responsibilities for CLI script usage, and ensure that scripts are verified and validated before they are executed on devices in a live network.

The following procedure describes how to configure and run an OmniSwitch traceroute using the script created using Procedure 38-38.

1 Ensure that the mediation policy for each OmniSwitch target is configured with the correct user name and password for CLI communication. See Procedure 14-4.

2 Choose Tools→Scripts from the 5620 SAM main menu. The Script Manager list form opens.

3 Choose CLI Script (script) from the object drop-down list.

4 Configure the filter criteria. A list of scripts appears at the bottom of the Script Manager form.

5 Double-click on the OmniSwitch traceroute script that you created using Procedure 38-38. The CLI Script (Edit) form opens with the General tab displayed.

6 Click on the Targets tab button.

7 Click on the Add button. The Target Configuration form opens.

8 Click on the Add button in the target list to add an OmniSwitch to the list. The Select Network Elements form opens with a list of OmniSwitch nodes.

9 Choose one or more OmniSwitch nodes and click on the OK button. The Select Network Elements form closes, and the OmniSwitch nodes appear in the target list panel of the Target Configuration form.

10 Configure the test parameters.

  i Choose a target from the Target List panel.

  ii Configure the parameters:

  - IP Address
  - Maximum Hop

  iii Click on the Apply To Selected button.

  iv Repeat steps 10i to 10iii to configure additional targets.

  v Click on the OK button to close the Target Configuration form. The CLI Script (Edit) appears with the Targets tab displayed.

11 To run the script on the specified targets, choose one or more entries from the list.

12 Click on the Execute button. The test results appear.

13 Perform one of the following to view the results of the scripts:

a Choose a target from the list. The results of the script that was run on the specified target appears in the panel below the list.

i Click on the Save Result button to save the results to the result manager. A dialog box appears. Click on the OK button.

Note — You can save the results of multiple scripts to the result manager simultaneously; choose the entries in the list and click on the Save Result button.

ii Export the results to a local or network text file.

iii Click on the Export button. A dialog box appears and prompts you to choose a file storage location on the network.

iv Scroll to the location in which you want to save the text file, and enter a filename in the appropriate field.

v Click on the Export button. The results text file is saved in the specified location.

b Choose one or more entries from the list and click on the View Selected button. The View Selected form opens and displays the results of the script. The results for each target are separated by a comment that indicates the script version, associated target, script status, run time and date, and script parameters.

i Export the results of the script to a local or network text file. Choose File→Export from the Editor menu, or click on the Export button. A dialog box appears and prompts you to choose a file storage location in the network. Scroll to the location in which you want to save the text file, and enter a filename in the appropriate field. Click on the Export button. The results text file is saved in the specified location.

ii Choose File→Close from the View Selected form to close the View Selected form.

14 Click on the OK button or Cancel button to close the CLI Script (Edit) form.

15 Close the Script Manager form.

Procedure 38-42 To configure an 802.3ah EFM OAM diagnostic

EFM OAM, which is described in 802.3ah, clause 57, defines the Ethernet OAM sublayer, which provides mechanisms for monitoring link operation, such as remote fault indication and remote loopback control.

The OAM information is transported in slow protocol frames, which are called OAMPDUs. OAMPDUs contain the appropriate control and status information that is used to monitor, test, and troubleshoot OAM-enabled links. OAMPDUs traverse a single link, that is passed between peer OAM entities.

802.3ah EFM OAM supports:

- EFM OAM capability discovery
- active and passive modes
- remote failure indication
- local and remote loopbacks
- EFM OAMPDU tunneling
- high-resolution EFM OAM timers

The 5620 SAM supports EFM OAM diagnostic configuration on Ethernet ports in network mode on the 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR.

For OmniSwitch NEs, see Procedure 38-43.

Caution — Performing an 802.3ah diagnostic is service-affecting. Ensure that you consider the implications of performing this test before you proceed.

Note — In order for the 802.3ah diagnostic to be successful, the local and peer ports must support the 802.3ah protocol, and be operationally and administratively up.

When a port is in loopback mode, service mirroring does not work if the port is a mirror source or a mirror destination.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an 802.3ah EFM OAM diagnostic and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the Ethernet tab button. The Ethernet port configuration form opens with the General tab displayed.

6 Click on the 802.3ah tab button. The 802.3ah form opens.

7 Configure the parameters:

- Administrative State
- Tunneling
- Mode
- Transmit Interval
- Multiplier (Intervals)
- Received Remote Loopback Requests
- Set Remote Loopback
- Set Local Loopback
- Hold Time (s)

8 Click on the Apply button. A dialog box appears.

9 Click on the Yes button.

10 Click on the Resync button.

11 The 802.3ah form is updated with the results of the 802.3ah diagnostic. The values that are displayed on the form depend on the configuration of the local and peer ports.

Tables 38-4, 38-5, and 38-6 describe the displayed information.

Table 38-4 802.3ah EFM OAM results

Parameter	Value	Description
Operational Status (dot3OamOperStatus)	Disabled	The Administrative State parameter on the local port is set to Disabled.
	Active Send Local	The Mode parameter is set to Active and the local port is discovering the peer port EFM OAM capabilities.
	Passive Wait	The Mode parameter is set to Passive and the local port is waiting to receive OAMPDUs from the peer device.
	Send Local and Remote	The local port discovered the peer but has not yet accepted or rejected the configuration of the peer. The local port may determine that the peer port is not compatible and decline OAM peering.
	OAM Peering Locally Rejected	The local port declined OAM peering.
	Send Local and Remote Ok	The local port accepted OAM peering.
	OAM Peering Remotely Rejected	The remote port declined OAM peering.
	Operational	The local and remote ports accepted the OAM peering.
	Non-operational Half Duplex	The Administrative State parameter is set to Enabled but the local port is in half-duplex mode.
	Link Fault	The link detected a fault and is transmitting OAMPDUs with a link fault indication.

(1 of 2)

Parameter	Value	Description
Max. PDU Size (dot3OamMaxOamPduSize)	PDU size	The largest OAMPDU size, in bytes, that is supported by the local port: Minimum is 64 Maximum is 1518 Default is 1514
Configuration Revision (dot3OamConfigRevision)	0 to 65 535	The configuration revision of the OAM entity obtained from the latest OAMPDU sent by the OAM entity. The value is used by OAM entities to indicate that configuration changes occurred that may require the peer OAM entity to re-evaluate whether OAM peering is allowed.
Functions Supported (dot3OamFunctionsSupported)	Event Support	The port can send and receive event notification OAMPDUs.
	Loopback Support	The port can initiate and respond to loopback commands.
	Unidirectional Support	The port supports the transmission of OAMPDUs on links that operate in unidirectional mode.
	Variable Support	The port can send and receive variable request and response OAMPDUs.
Loopback Status (dot3OamLoopbackStatus)	No Loopback	The port is not in a loopback condition.
	Initiating Loopback	The local device initiated a loopback, sent a loopback OAMPDU and is waiting for a response from the peer port.
	Remote Loopback	The peer port is in loopback mode.
	Terminating Loopback	The local port is in the process of terminating a loopback on the peer port.
	Local Loopback	The peer port has put the local port into loopback mode.
	Unknown	An OAMPDU that contains an unexpected message was received by the local port.

(2 of 2)

Table 38-5 802.3ah EFM OAM Statistics

Statistics	Displayed Value	Description
Frames Lost Due to OAM(dot3OamFramesLostDueToOam)	*Number of frames*	The number of frames that were dropped by the OAM multiplexer. Discontinuities of this counter can occur under some conditions.
Information Rx (dot3OamInformationRx)	*Number of OAMPDUs*	The number of information OAMPDUs received on this interface
Information Tx (dot3OamInformation Tx)	*Number of OAMPDUs*	The number of information OAMPDUs transmitted on this interface. Discontinuities of this counter can occur can occur under some conditions.
Loopback Control Rx (dot3OamLoopbackControlRx)	*Number of OAMPDUs*	The number of loopback control OAMPDUs received on this interface

(1 of 2)

Statistics	Displayed Value	Description
Loopback Control Tx (dot3OamLoopbackConrolTx)	*Number of OAMPDUs*	The number of loopback control OAMPDUs transmitted on this interface
Unsupported Codes Rx (dot3OamUnsupportedCodesRx)	*Number of OAMPDUs*	The number of OAMPDUs received on this interface with an unsupported opcode
Unsupported Codes Tx (dot3OamUnsupportedCodesTx)	*Number of OAMPDUs*	The number of OAMPDUs transmitted on this interface with an unsupported opcode

(2 of 2)

Table 38-6 802.3ah EFM OAM peer information

Peer Information	Displayed Value	Description
Peer MAC Address (dot3OamPeerMacAddress)	*MAC address*	The MAC address of the peer port. The MAC address is contained in the received OAMPDU.
Peer Vendor OUI (dot3OamPeerVendorOui)	*OUI*	The OUI of the OAM peer. The OUI is part of the peer MAC address contained in the received OAMPDU. The OUI can be used to identify the vendor of the remote OAM device.
Peer Vendor Info (dot3OamPeerVendorInfo)	*Vendor information text*	The vendor information field is in the local information TLV, and can be used to determine additional information about the peer device.
Peer Mode (dot3OamPeerMode)	Active or Passive	See Mode
Peer Max PDU Size (dot3OamPeerMaxOamPduSize)	*PDU size*	The largest OAMPDU value, in bytes, that is supported by the peer port. Minimum is 64 Maximum is 1518 Default is 1514
Peer Configuration Revision (dot3OamPeerConfigRevision)	0 to 65 535	The configuration revision of the OAM device as identified in the latest OAMPDU sent by the OAM peer. The configuration revision is used by OAM devices to indicate that configuration changes have occurred which might require the peer OAM device to re-evaluate whether OAM peering is allowed.
Peer Functions Supported (dot3OamPeerFunctSupported)	Event Support	The peer port can send and receive Event Notification OAMPDUs.
	Loopback Support	The peer port can initiate and respond to loopback commands.
	Unidirectional Support	The peer port supports the transmission of OAMPDUs on links that are operating in unidirectional mode.
	Variable Support	The peer port can send and receive Variable Request and Response OAMPDUs.

12 Close the 802.3ah form when you have completed the EFM OAM diagnostic.

Procedure 38-43 To configure an 802.3ah EFM OAM diagnostic on an OmniSwitch at the NE or port level

EFM OAM, which is described in 802.3ah, clause 57, defines the Ethernet OAM sublayer, which provides mechanisms for monitoring link operation, such as remote fault indication and remote loopback control.

The OAM information is transported in slow protocol frames, which are called OAMPDUs. OAMPDUs contain the appropriate control and status information that is used to monitor, test, and troubleshoot OAM-enabled links. OAMPDUs traverse a single link, that is passed between peer OAM entities.

802.3ah EFM OAM supports:

- EFM OAM capability discovery
- active and passive modes
- remote failure indication
- local and remote loopbacks
- high-resolution EFM OAM timers

The EFM OAM diagnostic is supported at the NE level or at the Ethernet port level on the Ethernet ports in network mode.

Caution 1 — Performing an 802.3ah diagnostic is service-affecting. Ensure that you consider the implications of performing this test before you proceed.

Caution 2 — Link OAM (802.3ah) is not supported on mirroring ports.

Caution 3 — When a port is in loopback mode, service mirroring does not work if the port is a mirror source or a mirror destination.

Note — In order for the 802.3ah diagnostic to be successful, the local and peer ports must support the 802.3ah protocol, and be operationally and administratively up.

To configure Link OAM at the NE level, go to Step 1.To configure Link OAM and 802.3ah EFM OAM diagnostics at the port level, go to Step 6.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the OmniSwitch device where you want to configure an 802.3ah EFM OAM diagnostic and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on the Globals tab button.

5 Click on the 802.3ah tab button. The 802.3ah form opens.

6 Configure the parameters:

- Administrative Status
- Multiple PDU Count
- Statistics
- Log-history

7 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

8 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

9 Click on the Ethernet tab button. The Ethernet port configuration form opens with the General tab displayed.

10 Click on the 802.3ah tab button. The 802.3ah form opens.

11 Configure the parameters:

- Administrative State
- Mode
- Transmit Interval
- Received Remote Loopback Requests
- Set Local Loopback
- Set Local Loopback
- Hold Time (s)
- Dying Gasp Notify
- Critical Event Notify
- Statistics
- Log-history
- Errored Frame Window (dsec)
- Errored Frame Period Window (frames)
- Errored Frame Seconds Summary Window (dsec)
- Threshold (frames)
- Period Threshold (frames)
- Seconds Summary Threshold (framesec)
- Notify
- Period Notify
- Seconds Summary Notify
- Number of Frames
- Frames Delay (ms)
- Start L1-Ping

12 Click on the Apply button. A dialog box appears.

13 Click on the Yes button.

14 The 802.3ah form is updated with the results of the 802.3ah diagnostic. The values that are displayed on the form depend on the configuration of the local and peer ports.

Tables 38-7, 38-8, and 38-9 describe the displayed information.

Table 38-7 802.3ah EFM OAM results

Parameter	Value	Description
Operational Status (dot3OamOperStatus)	Disabled	The Administrative State parameter on the local port is set to Disabled.
	Active Send Local	The Mode parameter is set to Active and the local port is discovering the peer port EFM OAM capabilities.
	Passive Wait	The Mode parameter is set to Passive and the local port is waiting to receive OAMPDUs from the peer device.
	Send Local and Remote	The local port discovered the peer but has not yet accepted or rejected the configuration of the peer. The local port may determine that the peer port is not compatible and decline OAM peering.
	OAM Peering Locally Rejected	The local port declined OAM peering.
	Send Local and Remote Ok	The local port accepted OAM peering.
	OAM Peering Remotely Rejected	The remote port declined OAM peering.
	Operational	The local and remote ports accepted the OAM peering.
	Non-operational Half Duplex	The Administrative State parameter is set to Enabled but the local port is in half-duplex mode.
	Link Fault	The link detected a fault and is transmitting OAMPDUs with a link fault indication.
Max. PDU Size (dot3OamMaxOamPduSize)	PDU size	The largest OAMPDU size, in bytes, that is supported by the local port: Minimum is 64 Maximum is 1518 Default is 1514
Configuration Revision (dot3OamConfigRevision)	0 to 65 535	The configuration revision of the OAM entity obtained from the latest OAMPDU sent by the OAM entity. The value is used by OAM entities to indicate that configuration changes occurred that may require the peer OAM entity to re-evaluate whether OAM peering is allowed.
Functions Supported (dot3OamFunctionsSupported)	Event Support	The port can send and receive event notification OAMPDUs.
	Loopback Support	The port can initiate and respond to loopback commands.
	Unidirectional Support	The port supports the transmission of OAMPDUs on links that operate in unidirectional mode.
	Variable Support	The port can send and receive variable request and response OAMPDUs.

(1 of 2)

Parameter	Value	Description
Loopback Status (dot3OamLoopbackStatus)	No Loopback	The port is not in a loopback condition.
	Initiating Loopback	The local device initiated a loopback, sent a loopback OAMPDU and is waiting for a response from the peer port.
	Remote Loopback	The peer port is in loopback mode.
	Terminating Loopback	The local port is in the process of terminating a loopback on the peer port.
	Local Loopback	The peer port has put the local port into loopback mode.
	Unknown	An OAMPDU that contains an unexpected message was received by the local port.

(2 of 2)

Table 38-8 802.3ah EFM OAM Statistics

Statistics	Displayed Value	Description
Frames Lost Due to OAM(dot3OamFramesLostDueToOam)	*Number of frames*	The number of frames that were dropped by the OAM multiplexer. Discontinuities of this counter can occur under some conditions.
Information Rx (dot3OamInformationRx)	*Number of OAMPDUs*	The number of information OAMPDUs received on this interface
Information Tx (dot3OamInformation Tx)	*Number of OAMPDUs*	The number of information OAMPDUs transmitted on this interface. Discontinuities of this counter can occur can occur under some conditions.
Loopback Control Rx (dot3OamLoopbackControlRx)	*Number of OAMPDUs*	The number of loopback control OAMPDUs received on this interface
Loopback Control Tx (dot3OamLoopbackConrolTx)	*Number of OAMPDUs*	The number of loopback control OAMPDUs transmitted on this interface
Unsupported Codes Rx (dot3OamUnsupportedCodesRx)	*Number of OAMPDUs*	The number of OAMPDUs received on this interface with an unsupported opcode
Unsupported Codes Tx (dot3OamUnsupportedCodesTx)	*Number of OAMPDUs*	The number of OAMPDUs transmitted on this interface with an unsupported opcode

Table 38-9 802.3ah EFM OAM peer information

Peer Information	Displayed Value	Description
Peer MAC Address (dot3OamPeerMacAddress)	*MAC address*	The MAC address of the peer port. The MAC address is contained in the received OAMPDU.
Peer Vendor OUI (dot3OamPeerVendorOui)	*OUI*	The OUI of the OAM peer. The OUI is part of the peer MAC address contained in the received OAMPDU. The OUI can be used to identify the vendor of the remote OAM device.
Peer Vendor Info (dot3OamPeerVendorInfo)	*Vendor information text*	The vendor information field is in the local information TLV, and can be used to determine additional information about the peer device.
Peer Mode (dot3OamPeerMode)	Active or Passive	See Mode
Peer Max PDU Size (dot3OamPeerMaxOamPduSize)	*PDU size*	The largest OAMPDU value, in bytes, that is supported by the peer port. Minimum is 64 Maximum is 1518 Default is 1514
Peer Configuration Revision (dot3OamPeerConfigRevision)	0 to 65 535	The configuration revision of the OAM device as identified in the latest OAMPDU sent by the OAM peer. The configuration revision is used by OAM devices to indicate that configuration changes have occurred which might require the peer OAM device to re-evaluate whether OAM peering is allowed.
Peer Functions Supported (dot3OamPeerFunctSupported)	Event Support	The peer port can send and receive Event Notification OAMPDUs.
	Loopback Support	The peer port can initiate and respond to loopback commands.
	Unidirectional Support	The peer port supports the transmission of OAMPDUs on links that are operating in unidirectional mode.
	Variable Support	The peer port can send and receive Variable Request and Response OAMPDUs.

15 Close the 802.3ah form when you have completed the EFM OAM diagnostic.

Procedure 38-44 To view OAM diagnostic test results

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Navigate to the test results.

The navigation path is Result (Assurance)→Test Result (Assurance). The ActionResult (Assurance), Ping Result (Assurance), and Trace Result (Assurance) objects contain the test results.

3 Select a filter option. Use the configurable filters choices and properties options on the Service Test Manager form and click on the Search button. The list of test results that meet the filter criteria are displayed.

4 Choose a test result from the list and click on the Properties button. The appropriate OAM diagnostic test results form opens with the General tab displayed.

5 Click on the form tabs to view the test results for the OAM diagnostic. You can click on the View button beside an object and open the properties form for the object.

a CFM Continuity Check OAM diagnostic information includes:

- identifies the MD and MEG involved in the test
- MEP creation on a SAP
- MEP creation on a SDP
- intervals (seconds) between continuity checks
- MHF creation

b CFM loopback OAM diagnostic information includes:

- originating node
- originating MEP
- destination MAC addresses
- data size
- VLAN priority
- number of messages sent

c CFM link trace OAM diagnostic information includes:

- originating node
- originating MEP
- target MAC addresses
- TTL

d CFM One Way OAM diagnostic information includes:

- originating node
- originating MEP
- destination MAC addresses
- priority

e CFM Two Way OAM diagnostic information includes:

- originating node
- originating MEP
- destination MAC addresses
- VLAN priority

f CFM Single Ended Loss OAM diagnostic information includes:

- originating node
- originating MEP
- destination MAC addresses
- test duration, in seconds
- number of LMR frames received
- number of frames transmitted by the far end
- number of frames received by the near end
- number of frames lost at the near end
- percentage of frames lost at the near end
- number of frames transmitted by the near end
- number of frames received by the far end
- number of frames lost at the far end
- percentage of frames lost at the far end

g CFM Eth Test OAM diagnostic information includes:

- originating node
- originating MEP
- destination MAC addresses
- data size
- VLAN priority

h CFM Two Way SLM diagnostic information includes:

- Global Maintenance Entity Group
- Originating MEP

i MTU ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- source and destination site IP addresses
- originating tunnel ID
- administrative and operational states
- information about previous diagnostics, including the start and finish sizes of the MTU datagram (packet)
- ID of the service being diagnosed
- name of the service being diagnosed
- MTU response size, indicating the largest packet size that the tunnel can transport

j Tunnel ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- source and destination site IP addresses
- originating and return tunnel IDs
- administrative state
- operational state
- probes to be issued information
- message size
- forwarding class used by the service
- ID of the service being diagnosed
- name of the service being diagnosed
- average, minimum, and maximum one-way time values, in microseconds, with a value of 0 indicating that no one-way trip measurement is available
- sum-of-squares one-way time for all ping responses received, used to enable a standard deviation calculation
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available

k VPRN ping diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- service ID and name
- number of probes to be issued
- operational size
- number of responses
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- inner and outer encapsulation value of the SAP supporting the requested ping response, when the address type is a SAP and in the case that the inner encapsulation value is from a 5620 SAM-managed device

l VPRN trace diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- service ID and name
- number of probes to be issued
- operational size
- number of responses

m VPRN ICMP ping diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- operational size
- number of responses
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available

n VPRN ICMP trace diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target IP addresses
- operational size
- number of responses
- initial and maximum time to live
- time to wait (microseconds)

o MAC ping diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source MAC addresses
- service ID and name
- number of probes to be issued
- administrative and operational states
- information about previous diagnostics
- average, minimum, and maximum round-trip time values, in microseconds, with a value of 0 indicating no round-trip measurement is available
- sum-of-squares round-trip time for all ping responses received, used to enable a standard deviation calculation

p MEF MAC Ping diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target MAC address
- service ID and name
- number of probes to be issued
- round trip jitter
- round trip latency
- round trip frame Loss

q MAC trace diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source MAC addresses
- service ID and name
- number of probes to be issued
- administrative and operational states
- information about previous diagnostics

r Service site ping OAM diagnostic information includes:

- target and source IP addresses
- service ID and name
- probes to be issued information
- check mark buttons to specify whether a local tunnel, remote tunnel, or local and remote tunnel is performed
- information about previous service site OAM diagnostics, including probes sent and responses received, loss percentage, packet timeouts, and last good packet time
- ID of the service being diagnosed

s VCCV ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- IP address of the destination and far-end devices
- time of last response
- number of responses received
- response time
- loss indicator, with a value of 0 indicating that the test packet was received and a value of 1 indicating that the test packet was lost
- sum-of-squares one-way trip time for all ping responses received, used to enable a standard deviation calculation

t VCCV trace OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- number of probes to be issued
- time of last response
- source and response IP addresses
- number of hops
- probe responses from nodes in path

u LSP ping diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- service ID and name
- number of probes to be issued
- operational size
- number of responses
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- average, minimum, and maximum one-way trip time values, in microseconds, with a value of 0 indicating that no one-way trip measurement is available
- sum-of-squares one-way trip time for all ping responses received, used to enable a standard deviation calculation

v P2MP LSP ping diagnostic information includes:

- information about the configuration test, including the configured parameter values
- test probe: size, Time to Live, Forwarding Class, Forwarding Profile
- results: probes sent, responses received, probe timeouts, probes lost
- probe result status
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- average, minimum, and maximum outbound and inbound one-way trip time values, in microseconds, with a value of 0 indicating that no one-way trip measurement is available
- sum-of-squares one-way trip time for all ping responses received, used to enable a standard deviation calculation

w P2MP LSP trace diagnostic information includes:

- information about the configuration test, including the configured parameter values
- trace attempt: size, Initial Time to Live, Forwarding Class, Forwarding Profile
- probe result status
- number of probes sent
- responses received
- timeouts
- failures
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- average, minimum, and maximum outbound and inbound one-way trip time values, in microseconds, with a value of 0 indicating that no one-way trip measurement is available
- sum-of-squares one-way trip time for all ping responses received, used to enable a standard deviation calculation

x LDP Tree Trace Result diagnostic information includes:

- information about the configuration test, including the configured parameter values
- number and IP address of hops included in the test
- destination IP address of the path associated with the hop
- next hop IP address
- a display of available hops in a tree format

y Multicast router OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- status of diagnostic
- number of sent, received, and lost packets
- packet loss percentage
- number of packet timeouts
- time for last successful contact with the target IP address

z Multicast trace OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- source and group multicast addresses
- destination and response IP addresses
- virtual router ID
- number of hops in path
- response from nodes in path
- number of trace attempts
- number of successful traces
- time for last successful trace
- identifier if multicast path changed from last successful trace

aa Multicast FIB ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- service ID and name
- number of probes to be issued
- operational size
- number of responses
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- average, minimum, and maximum one-way trip time values, in microseconds, with a value of 0 indicating that no one-way trip measurement is available
- sum-of-squares one-way trip time for all ping responses received, used to enable a standard deviation calculation

ab ICMP ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- target and source IP addresses
- virtual router ID
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- average, minimum, and maximum round-trip time values, in microseconds, with a value of 0 indicating that no round-trip measurement is available
- sum-of-squares one-way trip time for all ping responses received, used to enable a standard deviation calculation

ac ICMP trace OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- source and target IP addresses
- virtual router ID
- number of hops
- probe responses from managed devices
- number of trace probe attempts
- number of successful traces
- time for last successful trace
- initial and maximum time to live values

ad DNS ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- average, minimum, and maximum round-trip time values, in microseconds, with a value of 0 indicating that no round-trip measurement is available
- sum-of-squares round-trip time for all ping responses received, used to enable a standard deviation calculation
- round-trip jitter, in microseconds, for a ping probe, with a value of 0 indicating that no measurement is available
- the IP Address for the requested DNS name, as reachable by the DNS server, shown for IPv4 addresses in dotted-decimal format
- status, including response received to indicate a successfully completed diagnostic

ae ANCP ping OAM diagnostic information includes:

- information about the configuration test, including the configured parameter values
- source and destination site IP addresses
- administrative and operational states
- ID of the circuit being diagnosed
- information about previous ANCP OAM diagnostics, including packet history size, probes sent and responses received, and packet failure

Procedure 38-45 To interpret OAM diagnostic results

1 Perform the OAM diagnostic, as described in Procedure 38-1 to Procedure 38-33.

2 Perform Procedure 38-44 to view OAM diagnostic test results.

3 The General and Response Packets tabs display the key information about OAM diagnostic results. When there is no packet information required, as for an OAM ping, the information appears on the Packets Results form without any tab buttons. For example, status and return code information appears directly on the Packets Results form. You can view test packet information by performing the following actions:

i Click on the Response Packets tab button. A list of test objects appears.

ii Choose an object from the display and click on the Properties button. The Packets Results form opens.

4 Interpret the results, based on the status and return code information.

a For MTU OAM diagnostics, the key information is how many frames were sent and incrementally increased in size before the frames could not be sent. When the frame cannot be sent because it is too large, that results in a request timeout message. The largest frame that was sent is the last frame size with an associated success response.

b For tunnel OAM diagnostics, the key information is the result of the diagnostic, displayed in the status message. Table 38-10 lists the displayed messages and descriptions.

Table 38-10 Tunnel OAM diagnostics results

Displayed message	Description
Request Timeout	The request timed out with a reply.
Orig-SDP Non-Existent	The request was not sent because the originating SDP does not exist.
Orig-SDP Admin-Down	The request was not sent because the originating SDP administrative state is operationally down.
Orig-SDP Oper-Down	The request was not sent because the originating SDP operational state is down.
Request Terminated	The operator terminated the request before a reply could be received or before the timeout of the request could occur.
Far End: Originator-ID Invalid	The request was received by the far end, but the far end indicates that the originating SDP ID is invalid.
Far End: Responder-ID Invalid	The request was received by the far end, but the responder ID is not the same destination SDP ID that was specified.
Far End:Resp-SDP Non-Existent	The reply was received, but the return SDP ID used to respond to the request does not exist
Far End:Resp-SDP Invalid	The reply was received, but the return SDP ID used to respond to the request is invalid.
Far End:Resp-SDP Down	The reply was received, but the return SDP ID indicates that the administrative or operational state of the SDP is down.
Success	The tunnel is in service and working as expected. A reply was received without any errors.

c For service site OAM diagnostics, the key information is the result of the diagnostic, which is displayed in the status message and with the other records from the General tab.

As the diagnostic traverses the service across the originating and destination IP addresses, the service tunnels, and the used VCs, the status of each portion of the service is displayed. Table 38-11 lists the displayed messages and descriptions.

Table 38-11 Service site OAM diagnostics results

Displayed message	Description
Sent - Request Timeout	The request timed out with a reply.
Sent - Request Terminated	The request was not sent because the diagnostic was terminated by the operator.
Sent - Reply Received	The request was sent and a successful reply message was received.
Not Sent - Non-Existent Service-ID	The configured service ID does not exist.
Not Sent - Non-Existent SDP for Service	There is no SDP for the service being tested.
Not Sent - SDP For Service Down	The SDP for the service is down.
Not Sent - Non-Existent Service Egress Label	There is a service label mismatch between the originator and responder.

d For MAC, VPRN, and multicast FIB ping OAM diagnostics, the key information is the result of the diagnostic. Table 38-12 lists the displayed messages, the return code, and descriptions.

Table 38-12 MAC, VPRN, multicast FIB ping OAM diagnostics results

Displayed message (return code)	Description
notApplicable (0)	The OAM diagnostic message does not apply to the OAM diagnostic performed.
fecEgress (1)	The replying router is an egress for the FEC.
fecNoMap (2)	The replying router has no mapping for the FEC.
notDownstream (3)	The replying router is not a downstream router.
downstream (4)	The replying router is a downstream router, and the mapping for this FEC on the router interface is the specified label.
downstreamNotLabel (5)	The replying router is a downstream router, and the mapping for this FEC on the router interface is not the specified label.
downstreamNotMac (6)	The replying router is a downstream router, but it does not have the specified MAC address.
downstreamNotMacFlood (7)	The replying router is a downstream router, but it does not have the specified MAC address and cannot flood the request to other routers.
malformedEchoRequest (8)	The received echo request is malformed.

(1 of 2)

Displayed message (return code)	Description
tlvNotUnderstood (9)	One or more TLVs were not understood.
downstreamNotInMFib (10)	The replaying router is a downstream router, but it is not part of the MFIB.
Downstream mapping mismatched (11)	The downstream mapping is mismatched.
Upstream interface index unknown (12)	The upstream interface index is unknown.
Label switched but no MPLS forwarding at stack-depth (13)	The label switched successfully but MPLS forwarding did not occur at stack-depth.
No label entry at stack-depth (14)	The label entry at stack-depth did not occur.
Protocol not associated with interface at FEC stack-depth (15)	The protocol is not associated with the interface at FEC stack-depth.
Premature termination of ping due to label stack shrinking to a single label (16)	The ping was terminated prematurely due to the label stack shrinking to a single label.

(2 of 2)

e For multicast router OAM diagnostics, the key information includes information that is related to adjacent routers, supported protocols, traffic metrics, and time-to-live thresholds. Administrators can use this information to identify bidirectional adjacency relationships.

f For multicast trace OAM diagnostics, the key information is the result of the diagnostic, displayed in the status message. Table 38-13 lists the displayed messages and descriptions.

Table 38-13 Multicast trace OAM diagnostics results

Displayed message	Description
No Error	No error.
Wrong Interface	The router not forwarding the multicast source or group traffic because the router is not part of the multicast path.
Prune Sent	The router sent a prune request upstream that impacts the multicast source and group in the trace request.
Prune Received	The router stopped forwarding traffic for the multicast source and group in response to a request from the next hop router.
Scoped	The multicast group is subject to administrative scoping.
No Route	The router has no route for the multicast source or group and no way to determine a potential route.
Wrong Last Hop	The router is not the correct last-hop router.
Not Forwarding	The router is not forwarding the multicast source or group traffic for an unspecified reason.
Reached RP or Core	Request arrived on the rendezvous point or core.
Request on RPF	The request arrived on the expected RPF interface.
No Multicast	The request arrived on an interface that is not enabled for multicast traffic.
Hops Hidden	One or more hops are hidden from the trace.
Fatal Error	Fatal error.
No Space	There is insufficient room to insert another response data block in the packet.
Old Router	The previous router hop cannot process the multicast trace request.
Admin. Prohibited	The multicast trace was administratively prohibited.
Unknown	—

g For most diagnostics, some common return codes are used. The return codes indicate the status of OAM tests, usually when there was a problem performing the test. Table 38-14 lists the messages, return codes, and descriptions.

Table 38-14 OAM diagnostics return codes

Displayed message (return code)	Description
responseReceived (1)	A response was received on the device to the OAM diagnostic performed.
unknown (2)	The OAM diagnostic failed for an unknown reason.
internalError (3)	An internal error on the device caused the diagnostic to not be performed.
maxConcurrentLimit Reached (4)	The device cannot perform the OAM diagnostics because there are too many OAM diagnostic operations already running.
requestTimedOut (5)	The OAM diagnostic could not be completed because no reply was received within the allocated timeout period.
unknownSDPOrigin (6)	Indicates an invalid or non-existent originating service tunnel.
downOrigSdpId (7)	The originating service tunnel is operationally down.
requestTerminated (8)	The OAM diagnostic was cancelled before the timeout or reply period was reached.
invalidOriginatorId (9)	The far-end device replied indicating that the originating ID was invalid.
invalidResponderId (10)	The far-end device replied with an invalid responding ID.
unknownRespSdpId (11)	The far-end device replied with an invalid response service tunnel ID.
downRespSdpId (12)	The responding service tunnel with the given ID is operationally or administratively down.
invalidServiceId (13)	An invalid or non-existent service ID.
invalidSdp (14)	An invalid or non-existent service tunnel for the service.
downServiceSdp (15)	The service tunnel bound to the service is down.
noServiceEgressLabel (16)	The egress label for the service does not exist.
invalidHostAddress (17)	The IP address for the host is invalid, for example, in the case of a broadcast or multicast IP address.
invalidMacAddress (18)	The MAC address specified in the OAM diagnostic is invalid.
invalidLspName (19)	The LSP name specified in the OAM diagnostic is invalid.
macIsLocal (20)	The MAC address is the local SAP or device MAC address, not the MAC address of the downstream SAP or device, therefore the MAC ping or trace cannot be sent.
farEndUnreachable (21)	No route is available to the far-end GRE service tunnel.
downOriginatorId (22)	The originating ping device is operationally down.
downResponderId (23)	The device responding to the ping is operationally down.
changedResponderId (24)	The ID of the device responding to the ping has changed.
downOrigSvcId (25)	The originating service identified by the ID is operationally down.
downRespSvcId (26)	The service responding to the ping identified by the ID is operationally down.
noServiceIngressLabel (27)	The ingress label for the service does not exist.
mismatchCustId (28)	The subscriber ID identified with the service differs from the originating device compared to the responding device.
mismatchSvcType (29)	The service type identified with the service differs from one device to another.
mismatchSvcMtu (30)	The service MTU size associated with the service differs from the originating device compared to the responding device.
mismatchSvcLabel (31)	The service label identified with the service differs from the originating device compared to the responding device.

(1 of 4)

Displayed message (return code)	Description
noSdpBoundToSvc (32)	There is no service tunnel bound to the service.
downOrigSdpBinding (33)	The service tunnel associated with the originating device's service is operationally down.
invalidLspPathName (34)	The LSP path name specified in the OAM diagnostic is invalid.
noLspEndpointAddr (35)	There is no LSP endpoint address specified in the OAM diagnostic.
noActiveLspPath (36)	There is no active LSP path.
downLspPath (37)	The far end of the LSP is operationally down.
invalidLspProtocol (38)	The LSP protocol is not valid or is not supported.
invalidLspLabel (39)	The LSP label is invalid.
routeIsLocal (40)	For a VPRN ping, the route is a local route.
noRouteToDest (41)	For a VPRN ping, there is no route available to the destination of the OAM diagnostic.
localExtranetRoute (42)	For a VPRN ping, the route is a local extranet route.
srcIpInBgpVpnRoute (43)	For a VPRN ping, the source IP address belongs to a BGP VPN route.
srcIpInvalid (44)	For a VPRN ping, the source IP address is invalid or no route is available to the source IP address.
bgpDaemonBusy (45)	For a VPRN trace, the BGP routing process is busy on the device, and VPRN route target information cannot be retrieved.
mcastNotEnabled (46)	Multicast is not enabled on the device, so the diagnostic cannot be performed.
mTraceNoSGFlow (47)	—
mTraceSysIpNotCfg (48)	The system IP address is not configured. The address is required for a response to a multicast trace.
noFwdEntryInMfib (49)	No forwarding entry could be found for the specified source and destination addresses in the MFIB.
dnsNameNotFound (50)	The domain name specified in the dns query does not exist
noSocket (51)	For icmp-ping, unable to get socket.
socketOptVprnIdFail (52)	For icmp-ping, unable to set SO_VPRNID for socket.
socketOptIfInexFail (53)	For icmp-ping, unable to set IP_IFINDEX for socket.
socketOptNextHopFail (54)	For icmp-ping, unable to set IP_NEXT_HOP for socket.
socketOptMtuDiscFail (55)	For icmp-ping, unable to set IP_MTU_DISC for socket.
socketOptSndbufFail (56)	For icmp-ping, unable to set SO_SNDBUF for socket.
socketOptHdrincFail (57)	For icmp-ping, unable to set IP_HDRINCL for socket.
socketOptTosFail (58)	For icmp-ping, unable to set IP_TOS for socket.
socketOptTtlFail (59)	For icmp-ping, unable to set IP_TTL for socket.
bindSocketFail (60)	For icmp-ping, unable to bind socket.
noRouteByIntf (61)	For icmp-ping, no route to destination via the specified interface.
noIntf (62)	For icmp-ping, no interface specified.
noLocalIp (63)	For icmp-ping, unable to find local ip address.
sendtoFail (64)	For icmp-ping, sendto function failed.

(2 of 4)

Displayed message (return code)	Description
rcvdWrongType (65)	For icmp-ping, received packet of wrong icmp type.
noDirectInterface (66)	For icmp-ping, no direct interface to reach destination.
nexthopUnreachable (67)	For icmp-ping, unable to reach the next-hop.
socketOptHwTimeStampFail (68)	For icmp-ping, unable to set IP_TIM_TIME for socket.
noSpokeSdpInVll (69)	For vccv-ping, unable to find spoke-sdp given SdpId:vc-id
farEndVccvNotSupported (70)	For vccv-ping, far end does not support the VCCV options.
noVcEgressLabel (71)	For vccv-ping, no Vc egress label to send vccv-ping
socketOptIpSessionFail (72)	For icmp-ping, unable to set IP_SESSION for socket.
rcvdWrongSize (73)	For icmp-ping, received packet of wrong size.
dnsLookupFail (74)	For icmp-ping, dns lookup failed.
noIpv6SrcAddrOnIntf (75)	For icmp-ping, no ipv6 source on the interface.
multipathNotSupported (76)	For lsp-trace, downstream node does not support multipath.
nhIntfNameNotFound (77)	For lsp-ping/trace, Given next-hop interface name not found.
msPwInvalidReplyMode (78)	For vccv-ping, MS-PW switching node supports ip-routed reply mode only.
ancpNoAncpString (79)	ANCP string unknown to the system.
ancpNoSubscriber (80)	Subscriber unknown to the system.
ancpNoAncpStringForSubscriber (81)	Subscriber has no associated ANCP string.
ancpNoAccessNodeforAncpString (82)	No access node is found for the given ANCP string.
ancpNoAncpCapabilityNegotiated (83)	ANCP capability not negotiated with the involved DSLAM.
ancpOtherTestInProgress (84)	Another ANCP test is running for this ANCP string.
ancpMaxNbrAncpTestsInProgress (85)	Maximum number of concurrent ANCP tests reached.
spokeSdpOperDown (86)	For vccv-ping, spoke-sdp is operationally down.
noMsPwVccvInReplyDir (87)	Switching node in MS-PW with no vccv support in echo reply direction.
p2mpLspNameOrInstInvalid (88)	P2MP LSP name or instance provided is not valid.
p2mpLspS2LPathDown (89)	LSP path to S2L is down.
p2mpLspS2LAddressInvalid (90)	One or more S2L address is not valid.
p2mpLspNotOperational (91)	P2MP LSP is operationally down.
p2mpLspTrMultipleReplies (92)	Probe returned multiple responses. Result may be inconsistent.
invalidMepId (93)	The user-configured MEP identifier is not valid.
multipleReplies (94)	More than one reply received, when one was expected.
packetSizeTooBig (95)	Packet size is too big.
gtpPingError (96)	General GTP Ping Error.
gtpPingRsrcUnavailable (97)	GTP Path management resource unavailable.
gtpPingDupRequest (98)	Duplicate request for the same peer.

(3 of 4)

Displayed message (return code)	Description
gtpPingCleanUpInProg (99)	GTP Path management clean up in progress.
invalidInterface (100)	The egress interface specified does not exist.

(4 of 4)

Procedure 38-46 To configure threshold-crossing alarms on NE-schedulable OAM tests

You can configure threshold-crossing alarms for OAM tests that are NE-schedulable. An alarm is raised when a threshold is crossed, either because the value rose above or fell below the configured level.

You can also configure threshold-crossing alarms on test definitions within a test policy. See Procedure 78-6 for additional information.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Test (Assurance) icon from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of tests is displayed.

5 Choose an NE-schedulable test from the list and click on the Properties button. The Test (Edit) form opens with the General tab displayed.

6 Click on the Threshold Alarms tab.

7 Click on the Create button. The NE Threshold Event (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Type
- Generate Alarm on Rising Threshold
- Clear Alarm on Falling Threshold
- Update Test Result Status
- Include Falling Threshold

9 Click on the Rising Threshold tab.

10 Configure the Threshold Value parameter.

11 Click on the Falling Threshold tab.

Note — The Falling Threshold tab can be accessed only when the Include Falling Threshold parameter is enabled on the General tab of the NM Threshold Event (Create) form.

12 Configure the Threshold Value parameter.

13 Click on the OK button. The NE Threshold Event (Create) form closes.

14 Repeat steps 7 to 13 to configure threshold events on additional tests.

15 Select a test from the list and click on the Execute button. A threshold-crossing alarm appears on the dynamic alarm list if the threshold rises above or falls below the configured level.

16 Close the Test (Edit) form. The Service Test Manager form reappears.

17 Close the Service Test Manager form.

Procedure 38-47 To configure NM threshold-crossing alarms on non-NE-schedulable OAM tests

You can configure NM threshold-crossing alarms for OAM tests that are non-NE-schedulable. NM threshold-crossing alarms are not configurable for service site ping, VPRN trace, MTU ping, Mrinfo and Mtrace tests. An alarm is raised when an NM threshold is crossed, either because the value rose above or fell below the configured level. The type of NM threshold-crossing event available for selection depends on the test type.

Non-NE-schedulable OAM tests can be configured as NE persistent. NE persistent tests are deployed to the network node after the first execution and remain on the node each time the test is executed.

You can also configure NM threshold-crossing alarms on test definitions within a test policy. See Procedure 78-7 for additional information.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Test (Assurance) icon from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of tests is displayed.

5 Choose a non-NE-schedulable test from the list and click on the Properties button. The Test (Edit) form opens with the General tab displayed.

6 Click on the NM Threshold Alarms tab.

7 Click on the Create button. The NM Threshold Event (Create) form opens with the General tab displayed.

8 Configure the parameters.

- Type
- Generate Alarm on Rising Threshold
- Clear Alarm on Falling Threshold
- Update Test Result Status
- Include Falling Threshold

Note — If you are configuring an NM threshold-crossing alarm for an NE persistent test, the type of NM threshold-crossing event available for configuration depends on the test type.

9 Click on the NM Rising Threshold tab.

10 Configure the Threshold Value parameter.

11 Click on the NM Falling Threshold tab.

Note — The NM Falling Threshold tab can be accessed only when the Include Falling Threshold parameter is enabled on the General tab of the NM Threshold Event (Create) form.

12 Configure the Threshold Value parameter.

13 Click on the OK button. The NM Threshold Event (Create) form closes, and a dialog box appears.

14 Click on the OK button.

15 Click on the Apply button on the Test (Edit) form. A dialog box appears.

16 Confirm the action. The test appears on the list.

17 Repeat steps 7 to 16 to configure NM threshold events on additional tests.

18 Select a test from the list and click on the Execute button. A threshold-crossing alarm appears on the dynamic alarm list if the threshold rises above or falls below the configured level.

19 Close the Test (Edit) form. The Service Test Manager form reappears.

20 Close the Service Test Manager form.

Procedure 38-48 To edit an OAM diagnostic test

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Test (Assurance) icon from the object drop-down list.

3 Configure the filter criteria.

4. Click on the Search button. A list of tests is displayed.
5. Choose one or more OAM diagnostic tests from the results list and click on the Properties button. The appropriate edit form opens.
6. Change any configurable parameter for the test.
7. Click on the OK button to save the changes. A dialog box appears.
8. Confirm the action. The modified test or tests are shown in the list.

Procedure 38-49 To delete an OAM diagnostic test

1. Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.
2. Choose Test (Assurance) icon from the object drop-down list.
3. Configure the filter criteria.
4. Click on the Search button. A list of tests is displayed.
5. Choose one or more OAM diagnostic tests from the results list and click on the Properties button. The appropriate edit form opens.
6. Choose one or more OAM diagnostic tests from the results list and click on the Delete button. A dialog box appears.
7. Confirm the action. The test or tests are deleted from the list of available OAM diagnostic tests.

Procedure 38-50 To set STM managed device test limits

You can configure the maximum number of pings and traces allowed to be performed from the 5620 SAM by the managed devices, or you can limit the number of tests performed. The default is to allow an unlimited number of tests.

Note 1 — You must enable debug STM mode before you perform this procedure. See Procedure 78-3 for more information.

Note 2 — Limiting the number of tests does not raise an alarm on 5620 SAM or an SNMP trap on the managed device. The indication that the limit has been reached is no returned test results.

1. Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.
2. Choose NE Test Agent (Assurance) from the object drop-down list.
3. Click on the Search button. A list of NE Test Agent policies appears, one for each managed device.

4 Choose on one or more policies from the list and click on the Properties button. The configuration form opens.

5 You can set the number of tests allowed for individual managed devices, or for all managed devices, using the following parameters:

- Unlimited Concurrent Pings
- Unlimited Concurrent Traces
- Maximum Concurrent Pings
- Maximum Concurrent Traces

6 Click on the Apply button to save the changes. A dialog box appears.

7 Click on the Yes button to confirm the action.

39 — VRRP

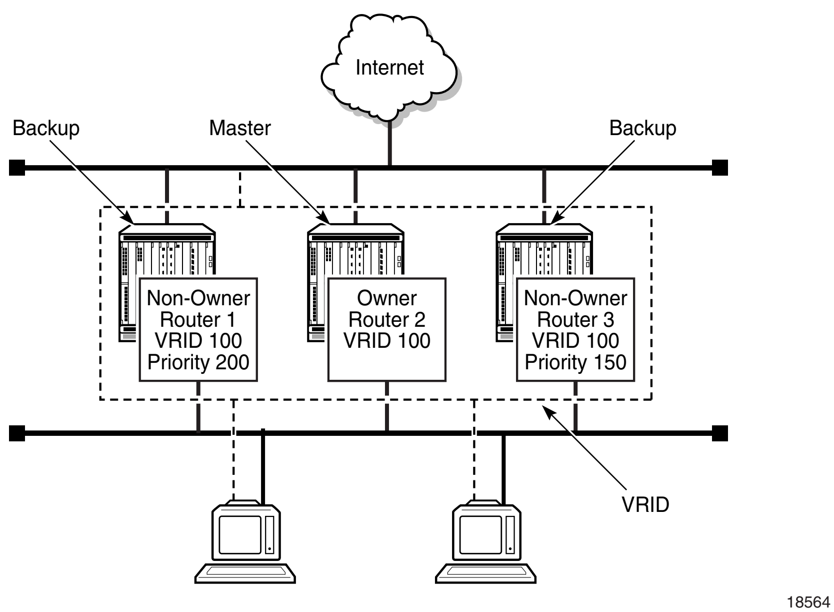
39.1 VRRP overview

The 5620 SAM supports VRRP management. VRRP creates a redundant routing system that takes over packet transmission on a common LAN segment when a router fails. VRRP designates alternative routing paths in the form of virtual routers, or VRs, without changing the IP or MAC address of a protected router.

A VRRP protected router owns the IP address of the VR. The VRRP owner forwards packets using the default gateway. When the owner router fails, packet-forwarding responsibilities are transferred to a designated backup router. This router becomes the master and forwards packets using the VR IP address.

Figure 39-1 shows a basic VR that acts in parallel with the real network. Router 2 is the owner with the address from which packets are forwarded. If Router 2 fails, Router 3, which has been configured to route using the master address in a backup role, begins to forward packets using this IP address. Router 1 is also a backup router, but because its priority number is higher, it ranks below Router 3.

Figure 39-1 VR concepts

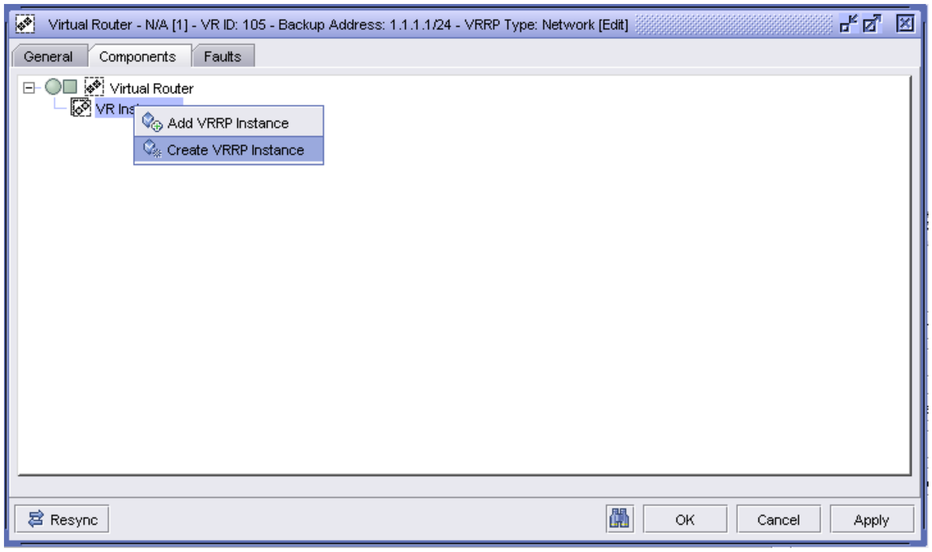


The 5620 SAM supports the configuration of VRs for network interfaces and for L3 access interfaces.

VRRP in an IES involves interfaces from separate IESs. VRRP in a VPRN requires interfaces that are in the same VPRN service. The 5620 SAM supports on-demand, but not scheduled, statistics collection for VRRP in a VPRN. Certain VRRP SNMP traps do not apply to VPRN; see the appropriate NE documentation for information.

You can configure the VR through another set of tabbed forms and a navigation tree, which allows you to add VRRP instances IP owner and non-owner router interfaces, as shown in Figure 39-2.

Figure 39-2 Adding or creating a VRRP instance

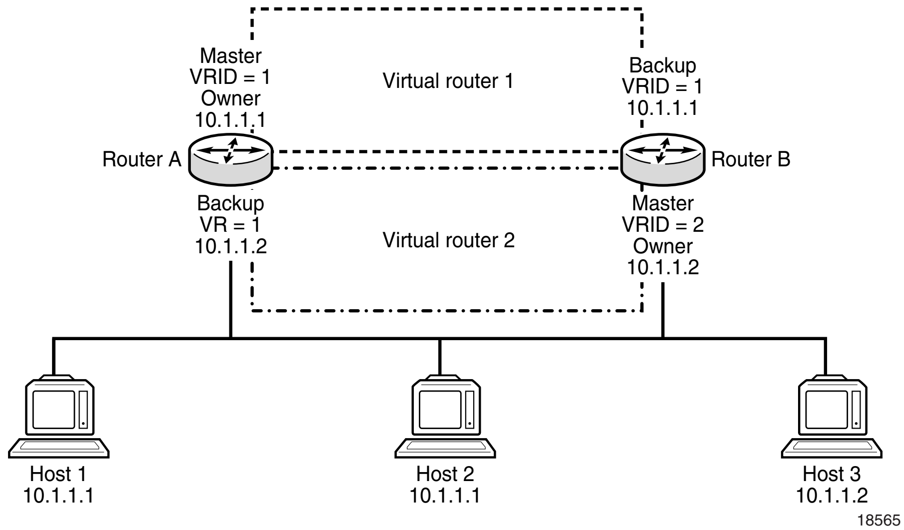


VR

A VR is a logical entity, managed by VRRP, that acts as a default router for hosts on a shared LAN. The VR consists of a VRID and a subnet (that is, ip_address/mask). A VRRP router can back up one or more VRs. The purpose of supporting multiple IP addresses in a single VR is for multi-netting. This common mechanism allows multiple local subnet attachments on a single routing interface. Up to four VRs are allowed on a single Alcatel-Lucent IP interface. The VRs must be in the same subnet.

Figure 39-3 shows a common VR setup in which associated routers provide mutual backup using VRRP. Router A forwards packets on IP address 10.1.1.1 to Hosts 1 and 2 on its default gateway. Router B forwards packets on IP address 10.1.1.2 to Host 3 on its default gateway. If Router A fails, VRID 1 uses IP address 10.1.1.1 to forward packets from Router B to Hosts 1 and 2. At the same time, the Router B interface is still configured to deliver packets on IP address 10.1.1.2 to Host 3. If Router B fails, VRID 2 forwards these packets through backup Router A.

Figure 39-3 Sample VRs



Master router

The VRRP master router, in either a normal or a failover situation, routes all IP packets into the LAN using the physical MAC address for the IP interface as the Layer 2 source MAC address. ARP packets also use the parent IP interface MAC address as the Layer 2 source MAC address.

Owner and non-owner VRRP instances

A VRRP instance is configured in either an owner or non-owner mode.

The owner instance controls the IP address of the VR and is responsible for forwarding packets sent to this IP address. The IP address of the owner VRRP instance is the same as the real interface IP address of the router. The owner assumes the role of the master VR when it is functioning normally in the network. Only one VRRP instance in the domain is configured as the owner. All other instances participating in the domain are non-owners and must have the same VRID.

A backup router becomes the master router after a failover and continues to use the IP address of the original master. As a result, the new master router is the IP address non-owner.

The most important parameter to define for a non-owner VRRP instance is the priority. The priority defines for a VR the selection order. The priority value and the preempt mode combine to determine which VR has the highest priority and becomes the master.

The base priority is used to derive the in-use priority of the VRRP instance as modified by an optional VRRP priority-control policy. VRRP priority-control policies are used to either override or adjust the base priority value depending on events or conditions in the node. See chapter 51 for more information.

VRRP types

When you create a VR, you specify the VRRP type, for example, network or L3 service, and the VR instance is restricted to the specified VRRP type. Configuring a VR using a mix of network and service interfaces through CLI raises a configuration mismatch alarm.

Primary addresses

A primary IP address is an address that is selected from the set of real interface addresses on the VR. VRRP advertisements between master and backup VRRP instances are sent using the primary IP address as the source of the IP packet.

The 7450 ESS or 7750 SR IP interface must always have an assigned primary IP address for VRRP to operate on the interface. The primary IP address of the VR and the primary address on the IP interface are always the same.

Backup addresses

A maximum of 16 IP addresses (for either IPv4 or IPv6) in different subnets can be configured for a VRRP instance. One backup address is permitted for a subnet. The number of backup addresses is limited to the number of primary and secondary addresses configured on the IP interface.

The backup IP addresses for the owner VRRP instance must match the primary address or one of the secondary addresses on the IP interface. If the VRRP instance is not the owner, the backup addresses must be in the subnets of the primary and secondary addresses of the IP interface.

The 5620 SAM includes only eligible IP addresses in the search list.

VRRP message authentication

The type of authentication used by the VR in VRRP advertisement is specified during VRRP instance creation. The current master router uses the configured authentication type when sending VRRP advertisements to backup routers, which authenticate the messages.

39.2 Workflow to configure VRRP

1. Before you create a VR, ensure that a primary IP address is configured for the network or L3 service interface. Each interface must have a primary IP address. See Procedure 30-9 for more information.

2. Configure the VRRP priority-control policy for a non-owner VRRP instance. See chapter 51 for more information about VRRP priority-control policy events.

3. Create the VR. See Procedure 39-1 for more information.

4. As required, create VRRP instances in the VR. See Procedure 39-2 for more information.

39.3 VRRP management procedures

Use the following procedures to perform VR creation and VRRP management tasks.

Procedure 39-1 To create a VR

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Click on the Create button. The Virtual Router (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Virtual Router ID
- Backup Address
- Name
- Description
- VRRP Type
- Subnet Mask

If you are creating an IPv6 VR, the Backup Address parameter value that you specify must be an IPv6 address.

4 Click on the OK button. The Virtual Router (Create) form closes.

Procedure 39-2 To create and configure a VRRP instance

Before you create a VRRP instance on an interface, ensure that the L3 service or network interface is configured with a primary IP address. The backup IP address that is configured in Procedure 39-1 must belong to the same subnet as the primary IP address of the owner VRRP instance created in this procedure. The 5620 SAM automatically configures a backup address using the IP address of the VR. A search of interface IDs in step 7 of this procedure displays the interface IDs that are eligible for the creation of a VRRP instance for the VR.

You can configure up to a total of four VRRP instances (IPv4 plus IPv6) on one IP interface. However, only one IPv6 instance can be included in this total. The maximum number of mixed IPv4 and IPv6 VRRP instances on an NE is 1024.

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Configure the filter criteria. A list of VRs is displayed at the bottom of the Manage VRRP Virtual Routers form.

3 Choose a VR and click on the Properties button. The Virtual Router (Edit) form opens with the General tab displayed.

4 Click on the Components tab button.

5 Select and right-click on VR Instances and choose Create VRRP Instance from the contextual menu. The VRRP Instance (Create) form opens with the General tab displayed.

Note — If the Backup Address parameter value that you specified in step 3 of Procedure 39-1 is an IPv6 address, then the contextual menu item is Create VRRP IPv6 Instance, and the VRRP IPv6 Instance (Create) form opens.

6 Click on the Select button in the Interface panel. The Select Interface - VRRP Instance or Select Interface - VRRP IPv6 Instance form opens, depending on whether you are creating an IPv4 or IPv6 VRRP Instance respectively.

7 Use the configurable filter and Search button to choose an interface, and click on the OK button. The Select Interface - VRRP Instance (or Select Interface - VRRP IPv6 Instance) form closes and the VRRP Instance (Create) (or VRRP IPv6 Instance (Create)) form reappears with the interface information displayed.

8 Configure the parameters:

- Owner
- Administrative State
- Base Priority

9 If the Owner parameter in step 8 is set to true, you cannot configure the Administrative State and Base Priority parameters and you cannot associate a policy with this VRRP instance. Go to step 11.

10 Assign a VRRP policy to the instance, if required.

Note — The same VRRP policy can be applied to both IPv4 VRRP instances and IPv6 VRRP instances.

- Click on the Select button in the Policy panel. The Select VRRP Policy form opens.
- Choose a VRRP policy and click on the OK button. The Select VRRP Policy form closes and the VRRP Instance (Create) form reappears with the VRRP policy information displayed.

11 Click on the Behavior tab button.

12 Configure the parameters:

- MAC Address
- Message Interval (seconds)
- Message Interval (milliseconds)
- Init Delay (seconds)
- Master Inherit Interval
- Ping Reply
- Telnet Reply
- Standby Forwarding
- Preempt Mode
- SSH Reply
- Traceroute Reply

13 If you require bi-directional forwarding detection for the VRRP instance, configure the Enable BFD Interface parameter, and then complete the following substeps:

i Click on the BFD Interface tab button.

ii Click on the Select button next to the Sevice Name parameter and choose a service from the Select Service - BFD Interface window.

iii Click on the Select button next to the Interface Name parameter and choose a service from the Select Interface - BFD Interface window.

iv Configure the Destination Address parameter.

14 Click on the Authentication tab button.

Note — The Authentication Key is not supported for Release 7.0 R1 VRRP IPv6 Instances. If you are creating an VRRP IPv6 Instance on a Release 7.0 R1 NE, the Authentication tab is not displayed.

15 Configure the parameters:

- Type
- Init Delay (seconds)

16 Click on the Backup Addresses tab button.

17 Click on the Create button. The Backup Address (Create) form opens.

18 Perform one of the following to configure backup addresses:

a Enter an IPv4 address (for an IPv4 VR) or IPv6 address (for an IPv6 VR) manually in the IP Address field in the Backup Address section.

b Select the IP address from a list:

i Click the Choose IP Address button adjacent to the IP Address field. The Select IP Address form opens.

ii Click on the Search button.

iii Choose the desired entry from the list.

iv Click on OK.

The Select IP Address form closes and the IP Address parameter is populated with your selection.

v Click on the Add Link Local Address button. The Admin Link Local Address defined for the network L3 access interface appears in the IP Address field.

Note — If you need to add the Link Local Address as a backup address, then the Admin Link Local Address must be configured and the Admin Link Local Address Preferred parameter must be enabled for the network L3 access interface that you are using. See Procedure 30-7 for more information.

19 Click on OK to save your changes and close the Backup Address (Create) form.

20 Click on the OK button. The Virtual Router (Edit) form reappears with the VRRP instances displayed in the VR instances tree.

Procedure 39-3 To add a VRRP instance

A VRRP instance that you add to the VR must have an IP address with the same VRID and subnet as those of the VR.

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Configure the filter criteria. A list of VRs is displayed at the bottom of the Manage VRRP Virtual Routers form.

3 Choose a VR and click on the Properties button. The Virtual Router (Edit) form opens with the General tab displayed.

4 Click on the Components tab button.

5 Right-click on VR Instances and choose Add VRRP Instance.

> **Note —** If you chose an IPv6 VR in step 3, the contextual menu item is Add VRRP IPv6 Instance, and the Select VRRP IPv6 Instance form opens.

The Select VRRP Instance form opens with a list of eligible instances.

6 Select an instance and click on the OK button. The Select VRRP Instance (or Select VRRP IPv6 Instance) form closes and the Virtual Router (Edit) form reappears with the interface information displayed.

Procedure 39-4 To modify a VR or VRRP instance

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Configure the filter criteria. A list of VRs is displayed at the bottom of the Manage VRRP Virtual Routers form.

3 Choose a VR and click on the Properties button. The Virtual Router (Edit) form opens with the General tab displayed.

4 Configure the VR parameters.

To configure parameters for a VRRP instance, click on the Components tab, select and right-click on the VRRP instance, and choose Properties from the contextual menu. Using the contextual menu, you can also:

- Configure the NE associated with the VRRP instance
- Configure the interface associated with the VRRP instance

5. Click on the Properties button in the Instance panel. The VRRP Instance (Edit) form opens with the General tab displayed.

6. The following tabs list the VRRP instance properties that you can select and configure:

   - General—associations between the VRRP instance and NEs, network interfaces, and policies (non-owner VRRP instances only).
   - Behavior—a virtual MAC address that must be the same for all participating VRRP instances
   - Authentication—enables authentication of VRRP advertisements among participating VRRP instances in the VR. For more information, see "VRRP message authentication" in section 39.1.

   Note — Authentication is not supported for Release 7.0 R1 VRRP IPv6 Instances. When you modify a Release 7.0 R1 VRRP IPv6 Instance, the Authentication tab is not displayed.

   - Backup Addresses—lists backup addresses, whose configuration options you can access by selecting a site and clicking on the Properties button. For more information, see "Backup addresses" in section 39.1.
   - VR Instances—lists VRs, whose configuration options you can access by selecting a VR and clicking on the Properties button. For more information, see "Owner and non-owner VRRP instances" in section 39.1.

7. Modify the parameters for the VRRP instance as required.

8. Click on the OK button. A dialog box appears.

9. Click on the Yes button to confirm the action. The VRRP Instance (Edit) form closes and the VR Instance (Edit) form reappears.

10. Click on the Close button to close the VR Instance (Edit) form.

Procedure 39-5 To view the status of a VR

The status of a VR informs you of potential problems, such as problems involving VR preconditions and operational states. You can view the following virtual status information:

- Aggregated Operational State—indicates the collective operational states of the VRRP instances in the VR, such as whether all instances are up, all instances are down, or one or more is down
- Number Of VRRP Instances—the number of owner and non-owner VRRP instances in the current VR

- Multiple Owners configured—one owner for each VR
- VR Instance(s) Down—one or more VRs are not working
- Backup Address Mismatch—the backup address for a VRRP instance does not match the primary IP address of the owner, and so does not match the VR IP address
- Only one instance configured—only one VR instance exists, either a master or backup; both are required
- Subnet Mismatch—the IP addresses of the owner and non-owner routers do not belong to the same subnet
- No Owner configured—an IP address owner is not assigned to the current VR

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Configure the filter criteria. A list of VRs is displayed at the bottom of the Manage VRRP Virtual Routers form.

3 Choose a VR and click on the Properties button. The Virtual Router (Edit) form opens with the General tab displayed. Status information is in the Status panel.

4 Click on the Close button to close the Virtual Router (Edit) form.

Procedure 39-6 To delete a VRRP instance

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Configure the filter criteria. A list of VRs is displayed at the bottom of the Manage VRRP Virtual Routers form.

3 Choose a VR and click on the Properties button. The Virtual Router (Edit) form opens with the General tab displayed.

4 Click on the Components tab button.

5 Select and right-click on a VR instance and choose Delete from the contextual menu. A dialog box appears.

6 Click on the Yes button to confirm the action. The VR is deleted and removed from the VR instances tree.

7 Click on the Close button to close the Virtual Router (Edit) form.

Procedure 39-7 To delete a VR

1 Choose Manage→Networking→VRRP Virtual Routers from the 5620 SAM main menu. The Manage VRRP Virtual Routers form opens.

2 Configure the filter criteria. A list of VRs is displayed at the bottom of the Manage VRRP Virtual Routers form.

3 Choose a VR from the list.

4 Click on the Delete button. A dialog box appears.

5 Click on the Yes button to confirm the action. The VR is removed from the list.

6 Click on the Close button to close the Manage VRRP Virtual Routers form.

40 — APS

40.1 APS overview

APS protects SONET/SDH lines from linear bidirectional failures. The NEs in a SONET/SDH network constantly monitor the health of the network. When a failure is detected, the network proceeds to transfer, or switch over, live traffic from the active, or working line, to the standby, or protection line. The transfer occurs quickly to minimize traffic loss. The traffic remains on the protection line until the fault on the working line clears, at which time the traffic can optionally revert to the working line.

In a 1+1 APS architecture, the active OC-*n* signal is transmitted to both the working and protection ports, so the same payloads are transmitted identically to the working and protection ports in the egress direction. The working and protection signals are selected independently in the ingress direction.

Caution — An NE transmits data only on the working line. For a single failure, this configuration can cause a delay of up to 100 ms during an APS switch.

In the 5620 SAM, the main APS elements are the following:

- APS groups

  An APS group is an aggregation of one or two SONET/SDH ports and the associated logical ports, known as APS channels. The first port is known as the working channel and must be configured in the APS group. The second port is the protection channel, which is optionally configurable. In a 1+1 optimized APS group, the protection channel is replaced with a second working channel.
- APS channels

  APS channels are logical and model the physical ports. The set of associated data for an APS channel includes the corresponding physical port identifier, the role, which is working or protection, and the name of the APS group to which the port belongs. If a protection channel is configured, it carries the traffic of the failed working channel. If the protection channel fails, the working channel carries the traffic.
- APS bundles

  APS bundles protect multilink PPP and IMA bundles on channelized ASAP MDAs. All the members of a working or protection APS bundle must belong to the same working or protection line of the APS group.
- APS common port configurations

  All SONET/SDH port parameters on the working and protection channels in an APS group must be identical except for the following:
  - Clock Source
  - Loopback
  - Report Alarms
  - BER Signal Degradation Threshold
  - BER Signal Failure Threshold
  - SONET Section Trace Mode

- APS commands

  Each APS channel has one APS operational command associated with it. The APS operational command is determined by the last command that is issued to both APS channels and the signal condition of the working and protection ports. APS commands affect the APS operational states but do not affect the configuration. The operational state does not persist through an NE restart.

Table 40-1 describes the events that affect 1+1 protection and their relative priority.

Table 40-1 Events affecting 1+1 protection

Priority	Event	Event type
1	Lockout of protection	User initiated
2	Signal failure on protection line	Automatically initiated
3	Forced switch	User initiated
4	Signal failure on working line	Automatically initiated
5	Signal degradation	Automatically initiated
6	Manual switch	User initiated
7	WTR time (revertive switching only)	User initiated (state request)
8	No reversion (non-revertive switching only)	User initiated (state request)

Consider the following when configuring APS.

- A port can belong to only one APS group.
- Two ports that belong to the same APS group must be of the same port type and have the same traffic speed.
- An APS group has one set of APS channels. The set can contain one or two APS channels.
- An APS channel can belong to only one APS group.
- A SONET/SDH port can either belong to only one APS channel.

Bidirectional mode

In 1+1 system bidirectional mode, a signal failure in either direction causes both the near-end and far-end NEs to switch to the protection channels. The highest-priority local request is compared with a remote request; the request that has the greater priority is selected. See Table 40-1 for the list of events that affect 1+1 protection.

Unidirectional mode

In a 1+1 system unidirectional mode, the working interface switches to the protection interface only for the direction in which a signal failure occurs. For example, if there is a signal failure in the transmit direction, the working interface switches to the protection interface for transmission but not for the receipt of data.

Switching modes

The following 1+1 system switching modes are available:

- non-revertive (default)
- revertive

In non-revertive switching, a switch to the protection channel is maintained even after the working line has recovered from a failure or a manual switch is cleared.

In revertive switching, the traffic is switched back to the working channel after the working line has recovered from a failure or a manual switch is cleared.

For revertive switching, you can define a period of time that the system must wait before it can restore traffic from the protection line to the working line. This delay, or WTR time, prevents frequent automatic switches from occurring as a result of intermittent failures.

In case of failure on both the working and protection lines, the line that has the less severe error remains active. If there is a signal degradation on both lines, the active line that failed last remains active. If there is a signal failure on both lines, the working line always remains active because a signal failure on the protection line is a higher priority than a signal failure on the working line.

MLPPP

MLPPP provides a way to distribute data across multiple links within an MLPPP APS bundle to achieve high bandwidth. MLPPP allows for a single frame to be fragmented and transmitted across multiple links. This reduces latency and allows for a higher maximum received recovery unit, or MRU.

MLPPP is supported in MC APS groups. See section “MC APS” for more information about MC APS.

Multiclass MLPPP

Multiclass MLPPP is an extension of the MLPPP standard which allows multiple classes of service to be transmitted over an MLPPP bundle.

Multiclass MLPPP changes the MLPPP header to include either two or four class bits to allow for up to either four or 16 classes of service. This allows multiple classes of services over a single MLPPP connection. The highest priority traffic is transmitted over the MLPPP bundle with minimal delay, regardless of the order in which packets are received.

Multiclass MLPPP is useful in mobile network deployments where multiple types of traffic, each with its own priority level, travel across a single MLPPP link bundle between the base station router and the aggregation router in the point of presence (POP) mobile operator.

Note — Multiclass MLPPP allows for several classes of services to be transmitted over an MLPPP bundle. Link fragmentation and interleaving, however, allows for only two classes of service to be transmitted. Multiclass MLPPP and link fragmentation and interleaving are mutually exclusive.

APS port configurations

A 7710 SR or 7750 SR network or access port can be connected to another 7710 SR or 7750 SR with both the working and protection channels on different IOMs in a single NE, or with the working channel on one NE and the protection channel on another.

Note — Mirroring parameters configured on a specific port or service are maintained during an APS failover.

All SONET/SDH MDAs support APS functionality. Table 40-2 lists the possible port pairings to provide APS protection. Both ports must be of the same type and have the same traffic speed.

Table 40-2 APS port configurations

MDA type—Working channel	MDA type—Protection channel
16 × OC12/OC3 SFP	8 × OC12/OC3 SFP or 16 × OC12/OC3 SFP
8 × OC12/OC3 SFP	8 × OC12/OC3 SFP or 16 × OC12/OC3 SFP
16 × OC3 SFP	8 × OC3 SFP or 16 × OC3 SFP
8 × OC3 SFP	8 × OC3 SFP or 16 × OC3 SFP
4 × OC48 SFP	2 × OC48 SFP or 4 × OC48 SFP
2 × OC48 SFP	2 × OC48 SFP or 4 × OC48 SFP
1 × OC192	1 × OC192
16 × ATM OC3 SFP	16 × ATM OC3 SFP
4 × ATM OC12/OC3 SFP	4 × ATM OC12/OC3 SFP
4 × Channelized OC3 ASAP	4 × Channelized OC3 ASAP
1 × Channelized OC12 ASAP	1 × Channelized OC12 ASAP
1 × Channelized OC3 CES	4 × Channelized OC3 CES
4 × Channelized OC3 CES	1 × Channelized OC3 CES
1 × Channelized OC12 CES	1 × Channelized OC12 CES

Note — The working and protection channels for the following MDA port pairs are set to the same traffic speed based on the APS group speed configuration:

- 16 × OC12/OC3 SFP and 16 × OC12/OC3 SFP
- 16 × OC12/OC3 SFP and 8 × OC12/OC3 SFP
- 8 × OC12/OC3 SFP and 16 × OC12/OC3 SFP
- 8 × OC12/OC3 SFP and 8 × OC12/OC3 SFP
- 4 × ATM OC12/OC3 SFP and 4 × ATM OC12/OC3 SFP

SC APS

1+1 APS can be implemented on a port-by-port basis. If all ports on an MDA or IOM need to be protected, the ports must be individually configured.

The working and protection lines are capable of being connected to:

- two ports on the same MDA
- two ports on different MDAs, and the MDAs are on the same IOM
- two ports on different MDAs on different IOMs

If the working channel and protection channel are on the same MDA, protection is limited to the physical port and the media that connect the two NEs. If different IOMs are used, protection extends to failure of each IOM.

Working and protection lines can be connected to a 7450 ESS, 7710 SR, or 7750 SR, and serve as an access port that provides one or more services to the NE. The access port can be a single channel or multiple channels; each channel must support PPP. In the case of the ATM MDA, each channel must support ATM.

The end NE transmits a valid data signal to both the working and protection lines. The signal on the protection line is ignored until the working channel fails or degrades to the degree that requires a switchover to the protection channel. When the switchover occurs, all services, including all service QoS and filter policies, are activated on the protection channel.

The working channel on a 7750 SR, 7450 ESS, or 7710 SR must connect to the working channel on a peer NE, and the protection channel on a 7750 SR, 7450 ESS, or 7710 SR must connect to the protection channel on a peer NE.

1+1 optimized

You can configure an SC APS group with a 1+1 optimized configuration. A 1+1 optimized APS group is optimized for networks which rely primarily on 1+1 bidirectional switching. A 1+1 optimized APS group is configured with two working channels, as opposed to one working channel and one protection channel. In a 1+1 optimized configuration, one working channel acts as the primary channel, through which the traffic will always default. A 1+1 optimized APS group always operates in bidirectional and nonrevertive modes.

MC APS

You can use APS to protect against NE failure by configuring the working channel of an APS group on one 7750 SR or 7710 SR, and configuring the protection channel of the same APS group on a different 7750 SR or 7710 SR. The two NEs connect using an IP link that is used to establish a signaling path between them.

The working channel on the near-end NE must connect to the working channel on a peer NE, and the protection channel on the far-end NE must connect to the protection channel on a peer NE.

When an MC APS group is configured, the 5620 SAM automatically creates a container which aggregates the MC APS group configurations of each NE.

Multi-chassis APS configuration is supported for ATM clear channel interfaces.

APS on channelized ASAP MDAs

You can protect a channelized SONET/SDH port on a channelized ASAP MDA with a protection port of the same speed on a different channelized ASAP MDA in the same NE. The APS configuration on a channelized ASAP MDA provides protection against a port, MDA, or IOM failure. All SONET/SDH paths and TDM channels in a SONET/SDH port are protected.

Consider the following when you configure APS protection on a deep channel on a channelized ASAP MDA:

- Both SONET and SDH channels are supported.
- Up to three common configuration SONET channels can be created in an APS configuration.

APS on channelized CES MDAs

You can protect a channelized SONET/SDH port on a channelized CES MDA with a protection port of the same speed on a different channelized CES MDA in the same NE. The APS configuration on a channelized CES MDA provides protection against a port, MDA, or IOM failure. All SONET/SDH paths and TDM channels in a SONET/SDH port are protected.

Consider the following when you configure APS protection on a deep channel on a channelized CES MDA:

- Both SONET and SDH channels are supported.
- Up to three common configuration SONET channels can be created in an APS configuration.

APS on multilink bundles

APS on multilink bundles consists of a working and protection bundle which provide bidirectional APS protection to each other. The members of a working or protection multilink bundle must belong to the same working or protection line of the APS group. User traffic is not sent on the protection line.

The 5620 SAM supports APS on MLPPP and IMA bundles. In IMA bundles, IMA cells are sent on the protection line as a keep-alive signal during an APS switchover.

APS 1+1 configuration on the channelized MDA provides protection to all the channels on the protected SONET/SDH port and to all of the multilink bundles with member that links reside on the protected SONET/ SDH port.

APS bundles on multiple NEs

You can configure APS bundles to provide bidirectional APS protection across multiple NEs. MC APS bundles are supported on the 7750 SR and 7710 SR.

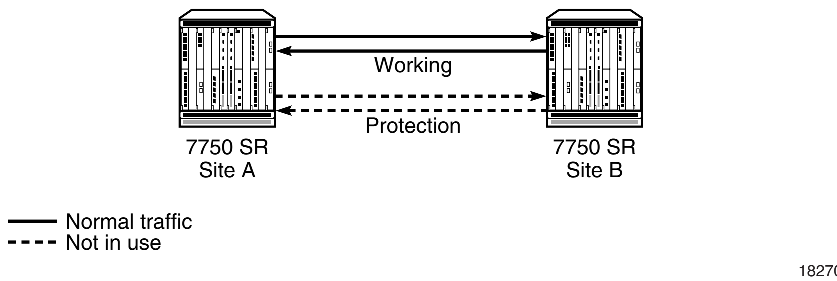
You can use APS to protect against failure by configuring the working bundle on one NE, and configuring the protection bundle of the same APS bundle group on a different NE. The two NEs connect to each other with an IP link that is used to establish a signaling path between them.

1+1 APS configuration example

Figures 40-1 and 40-4 show an example of 1+1 APS for two 7750 SRs that are configured for 1+1 APS in bidirectional and non-revertive modes.

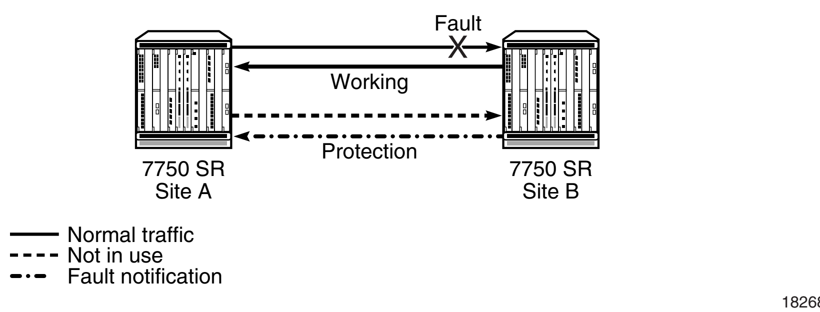
Figure 40-1 shows normal operations between two 7750 SRs. There are no faults on the working line, and the protection line is not in use.

Figure 40-1 Normal operations between two 7750 SRs



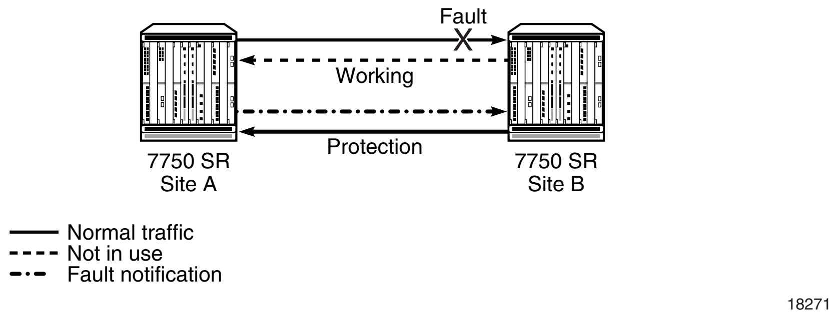
The working line degrades in the direction from site A to site B. Site B detects the fault and notifies site A of the fault using the protection line. Figure 40-2 shows the fault on the working line and site B notifying site A of the fault.

Figure 40-2 Site B detects the fault and notifies site A



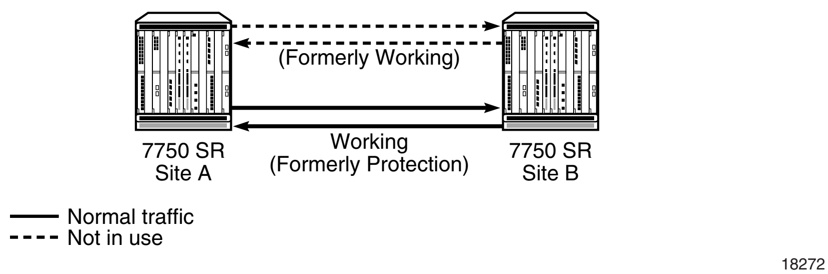
Site B automatically switches to the protection line. Site A receives the fault notification from site B and detects the fault on the working line. Site A acknowledges the fault and notifies site B that it is switching to the protection line. Figure 40-3 shows site B switching to the protection line and site A acknowledging the fault.

Figure 40-3 Site B switches to the protection line and site A acknowledges the fault



Site B receives the notification from site A and site A automatically switches to the protection line. Figure 40-4 shows normal operations resuming on the protection line between site A and site B. The protection line becomes and remains the working line since 1+1 APS is configured for non-revertive switching in this example.

Figure 40-4 Normal operations resume on the protection line



Configuring SAPs on APS-protected ports

You can use APS-protected ports to create SAPs for 5620 SAM services. The SAP list of a service creation form displays the APS-group SONET channels with all other SONET channels, but uses a different port ID format. An example of an APS group port ID is Channel aps-1.sts3-1. To create a SAP that uses an APS group, you must first configure the SONET channels in the APS group.

40.2 Workflow to manage APS

1 Create a 1+1 APS configuration on SONET/SDH ports:

i As required, create an SC APS group or MC APS group using SONET/SDH ports. Configure the operational state for each APS channel. See Procedures 40-1 and 40-2 for more information.

ii As required, create an SC APS IMA or MLPPP bundle or MC APS MLPPP bundle. See Procedures 40-3 and 40-4 for more information.

2 As required, change the operational state of an APS channel. See Procedure 40-5 for more information.

40.3 APS management procedures

Use the following procedures to perform APS management tasks.

Procedure 40-1 To create an SC APS group using SONET/SDH ports

Note — When a multiservice site is configured on an IOM, the working and protection ports must be configured on the same IOM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure APS and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the APS Groups object and choose Create APS Group from the contextual menu. The SC APS Group (Create) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Click on the APS Group tab button.

7 Configure the parameters:

- Auto-Assign ID
- Group Number
- APS Mode
- Direction
- Revert Mode
- Wait To Restore (seconds)
- Annex B Command Switch

8 Click on the States tab button.

9 Configure the Administrative State parameter.

Note — When a working channel or protection channel is added to an APS group, the channel inherits the current administrative state of the APS group. After the channel is added to the APS group, the administrative state of the physical port can be changed independently.

10 Click on the Apply button. An SC APS Group icon appears under the APS Groups object in the navigation tree.

11 Click on the APS Group tab button.

12 Configure the parameters:

- APS Mode
- Direction
- Revert Mode
- Wait To Restore (seconds)
- Annex B Command Switch
- Hold Time for Line Signal Degradation (100s of milliseconds)
- Hold Time for Line Signal Failure (100s of milliseconds)
- RDI Alarm Generation

13 Perform the following steps to configure the working and protection channels.

i Click on the APS Channels tab button.

ii Click on the Create button. The APS Channel (Create) form opens.

iii Configure the Channel Role parameter.

Note — If you are creating a 1+1 SC APS group, you must create the working channel before you create the protection channel.

iv Click on the Select button. The Select Port - APS Channel form opens.

v Click on the Search button. A list of available ports is displayed.

vi Select a port in the list and click on the OK button. The Select Port - APS Channel form closes.

vii Click on the OK button. The APS Channel (Create) form closes and a dialog box appears.

viii Click on the OK button. The channel is listed on the SC APS Group (Edit) form.

ix Click on the Create button. The APS Channel (Create) form opens.

x Repeat steps iii to viii to add the protection channel or second working channel.

xi Click on the Apply button.

14 Configure the operational state of the working and protection channels. Perform the following steps:

i Choose a channel from the list and click on the Properties button. The APS Channel - *Type* (Edit) form opens with the APS Channel tab displayed.

ii Configure the Command Switch parameter.

iii Click on the OK button. The APS Channel - *Type* (Edit) form closes.

15 Configure the APS common configuration parameters for the working and protection channels. Perform the following steps:

i Right-click on the SC APS Group icon in the navigation tree and choose Create APS SONET Channel from the contextual menu. The Sts*n* SONET Channel (Create) form opens with the General tab displayed.

ii Configure the channel as described in chapter 20.

iii Create all channels as described in chapter 20.

Procedure 40-2 To create an MC APS group using SONET/SDH ports

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC APS Group (APS) from the object drop-down list.

3 Click on the Create button. The MC APS Group (Create) form opens.

4 Configure the Group Number parameter.

5 Click on the Select button to configure the Site Id parameter in the First Element panel. The Select a Network Element list form opens.

6 Select an NE and click on the OK button. The Select a Network Element list form closes and the MC APS Group (Edit) form displays the system ID of the first NE in the MC APS group.

7 Click on the Select button to configure the Network Interface parameter in the First Element panel, if required. The Select a Network Element list form opens.

Note 1 — Only numbered IPv4 interfaces are listed.

Note 2 — The default interface is the NE system interface.

8 Click on the Select button to configure the Site Id parameter in the Second Element panel. The Select a Network Element list form opens.

9 Select an NE and click on the OK button. The Select a Network Element list form closes and the MC APS Group (Edit) form displays the system ID of the second NE in the MC APS group.

10 Click on the Select button to configure the Network Interface parameter in the Second Element panel, if required. The Select a Network Element list form opens.

Note 1 — Only numbered IPv4 interfaces are listed.

Note 2 — The default interface is the NE system interface.

11 Click on the Apply button. An MC APS Group Member icon appears under the APS Groups object in the navigation tree of the selected First Element and Second Element NEs.

12 Click on the Members tab button to configure each MC APS group member.

13 Select a group member in the list and click on the Properties button. The MC APS Group Member (Edit) form opens with the General tab displayed.

14 Configure the Description parameter.

15 Click on the APS Group tab button.

16 Configure the parameters:

- Revert Mode
- Wait To Restore (seconds)

Note — The Wait To Restore (seconds) parameter is configurable when the Revert Mode parameter is set to revertive.

17 Click on the States tab button.

18 Configure the Administrative State parameter.

Note — When a working channel or protection channel is added to the APS group, the channel inherits the current administrative state of the APS group. After the channel is added to the APS group, the administrative state of the physical port can be changed independently.

19 Click on the Multi Chassis tab button.

20 Configure the parameters:

- Advertise Interval (100s of milliseconds)
- Hold Time (100s of milliseconds)

21 Perform the following steps to configure an APS channel on the NE.

i Click on the APS Channels tab button.

ii Click on the Create button. The APS Channel (Create) form opens.

iii Configure the Channel Role parameter. If you have already created a working channel on the other MC APS group member, set this parameter to Protection. Otherwise, set this parameter to Working.

iv Click on the Select button. The Select Port - APS Channel form opens.

v Click on the Search button.

vi Select a port in the list and click on the OK button. The Select Port - APS Channel form closes.

vii Click on the OK button. The APS Channel (Create) form closes and a dialog box appears.

viii Click on the OK button. The channel is listed on the form.

ix Click on the Apply button.

x Select the channel and click on the Properties button. The APS Channel - *Role* (Edit) form opens with the APS Channel tab displayed.

xi Configure the Command Switch parameter.

xii Click on the OK button. The APS Channel - *Role* (Edit) form closes.

xiii Click on the OK button. A dialog box appears.

xiv Click on the Yes button. The MC APS Group Member (Edit) form closes.

22 Repeat steps 13 to 21 to configure an APS channel on the other NE in the MC APS group.

23 Click on the OK button. The MC APS Group (Edit) form closes.

24 Close the Manage Node Redundancy form.

25 Perform the following steps to configure the MC APS parameters that are common to the working and protection channels.

i Right-click on the MC APS Group Member icon in the navigation tree and choose Create APS SONET Channel from the right-click contextual menu. The Sts*n* SONET Channel (Create) form opens with the General tab displayed.

ii Configure the SONET or SDH channels, as described in chapter 20.

Procedure 40-3 To create an SC APS IMA or MLPPP bundle

Perform this procedure to create an APS bundle using IMA or MLPPP links on one NE. Consider the following when you add a DS0 channel that is a member of an APS group to an APS bundle:

- An APS channel can be a member of an APS bundle only, not of an IMA or multilink PPP bundle.
- All members of a working bundle must belong to a working channel of the same APS group.
- All members of a protection bundle must belong to a protection channel of the same APS group.

- You must create the working bundle before you can add an APS member to the APS bundle. If the member has a protection port, you must create the protection bundle before you can add the member to the APS bundle.
- You cannot delete the working port member of an APS bundle until you remove the member from the APS bundle.

The rules for adding a member to a bundle that is part of an APS bundle also apply to adding a member to a non-APS protected multilink bundle. See Procedures 19-28 and 19-30 for more information.

The following restrictions apply when adding a DS0 channel to an IMA bundle:

- The Clock Source parameter must be set to Node Timed.
- The encapsulation type of the DS0 channel must be ATM.

The following restrictions apply when adding a DS0 channel to a PPP bundle:

- All time slots on the DS0 channel must be selected.
- The encapsulation type of the DS0 channel must be IPCP.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure APS bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the APS Bundles object and choose Create Bundle from the contextual menu. The APS Bundle Display form opens.

5 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description

6 Click on the Next button.

7 Configure the parameters:

- Bundle Type

a If you set the Bundle Type parameter to IMA Group, configure the following parameters:

- Red Diff Delay (milliseconds)
- Minimum Links
- IMA Version
- ATM Interface Cell Format
- ATM Minimum VPI Value
- Test Pattern
- Link Activation Timer
- Link Deactivation Timer
- Maximum Links

b If you set the Bundle Type parameter to PPP, configure the following parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)
- Bundle MRRU (bytes)
- Short Sequence
- Link Fragmentation and Interleaving

8 Click on the Finish button.

9 Click on the Close button. The APS Bundle Display form closes.

10 If the Bundle Type parameter is set to PPP in step 7, perform the following steps to configure the MLPPP bundle for multiclass service transmission.

Note — Consider the following when you configure MC MLPPP.

- MC MLPPP is supported only on channelized ASAP MDAs in a 7750 SR or 7710 SR.
- You must configure MC MLPPP before you add bundle members.
- MC MLPPP is configured on the main APS bundle and the parameters are propagated to the working and protection bundles.

i Right-click on the SC APS Bundle object in the navigation tree and choose Properties from the contextual menu. The APS Bundles (Edit) form opens.

ii Click on the MLPPP tab button.

iii Configure the parameters:

- End Point ID
- End Point Class ID
- Class Count
- Magic Number
- Stateless Aps Switchover

iv Click on the Select button in the MLPPP Ingress QoS Profile or MLPPP Egress QoS Profile panel to choose a QoS profile, if required. If a profile is already selected, click on the Clear button to clear the selection and enable the Select button. The Select MLPPP Ingress QoS Profile or Select MLPPP Egress QoS Profile form opens.

Note — You can only apply QoS profiles to an MC MLPPP bundle when the Class Count parameter is set to 4.

v Select a profile and click on the OK button. The Select MLPPP Ingress QoS Profile or Select MLPPP Egress QoS Profile form closes.

11 Click on the States tab button.

12 Configure the Administrative State parameter.

Note — You must configure the End Point ID parameter on the APS PPP group before you set the Administrative State parameter to Up on the working and protection bundles.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The APS Bundles (Edit) form closes.

15 To configure the APS working and protection bundles, perform the following steps.

Note — You must create the working bundle before you create the protection bundle.

i Right-click on the SC APS Bundle icon in the navigation tree and choose Create APS Working Bundle from the contextual menu. The Create APS Working/Protecting Bundle form opens.

ii Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description
- Daughter Card CLI Name
- Administrative State

iii Click on the Next button to view the configured bundle parameters.

iv Click on the Finish button.

v Click on the Close button. The Create APS Working/Protecting Bundle form closes.

vi Right-click on the SC APS Bundle icon in the navigation tree and choose Create APS Protection Bundle from the contextual menu. The Create Working/Protecting Bundle form opens.

vii Repeat steps ii to v to create the APS protection bundle.

16 To configure the administrative state of the APS working and protection bundles, perform the following steps.

Note — You must configure the End Point ID parameter on the APS PPP group before you change the working or protection bundle state.

i Right-click on the working bundle object below the SC APS Bundle object in the navigation tree and choose Properties from the contextual menu. The Multilink Bundle (Edit) form opens.

ii Click on the States tab button.

iii Configure the Administrative State parameter.

iv Click on the OK button. A dialog box appears.

v Click on the Yes button. The Multilink Bundle (Edit) form closes.

vi Right-click on the protection bundle object below the SC APS Bundle object in the navigation tree. and choose Properties from the contextual menu. The Multilink Bundle (Edit) form opens.

vii Repeat steps ii to v.

17 To add members to the APS bundle, perform the following steps.

i Right-click on the SC APS Bundle icon in the navigation tree and choose Create Bundle Members from the contextual menu. The Add Bundle Member form opens.

ii Click on the Next button to add DS0 channel groups to the bundle. The Select Channels form opens.

iii Select a compatible channel from the list.

Note 1 — When initially adding bundle members, you must first add one channel group and then repeat the procedure to select up to seven additional channel groups.

Note 2 — Only compatible channels are listed. If you want to configure and use a channel that is currently incompatible, you can click on the Back button, deselect the Show Only Compatible Channels parameter, click on the Next button, select the channel, click on the Properties button.

Note 3 — The channel group with the lowest Port ID is the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member Encap Type for the member to be compatible.

iv Click on the Finish button and confirm the action. The Add Bundle Member form closes.

v Click on the Apply button.

vi Click on the Add button. The Add Bundle Member form opens.

vii Configure the Show Only Compatible Channels parameter.

viii Click on the Next button. The Select Channels form opens.

ix Select up to seven additional channels from the list.

x Click on the Finish button. A dialog box appears.

xi Click on the Yes button. The Add Bundle Members form closes.

xii Click on the Finish button.

xiii Click on the Close button. The Add Bundle Member form closes.

Procedure 40-4 To create an MC APS MLPPP bundle

Perform this procedure to create an APS bundle using IMA or MLPPP links on two NEs.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC APS Bundles (Bundle) from the object drop-down list.

3 Click on the Create button. The MC APS Bundles (Create) form opens.

4 Configure the Bundle Number parameter.

5 Click on the Select button beside the First Network Element parameter. The Select a Network Element list form opens.

6 Select an NE in the list and click on the OK button. The Select a Network Element list form closes.

7 Click on the Select button beside the Second Network Element parameter. The Select a Network Element list form opens.

8 Select an NE in the list and click on the OK button. The Select a Network Element form closes.

9 Click on the OK button. An MC APS Bundle object appears in the navigation tree under the APS Bundles object of each specified NE.

10 Close the Manage Node Redundancy form.

11 Configure the MLPPP bundle for multiclass service transmission. Perform the following steps.

Note — Consider the following when you configure MC MLPPP.

- You must configure MC MLPPP before you add bundle members.
- MC MLPPP is configured on the main APS bundle and the parameters are propagated to the working and protection bundles.

i Right-click on the new MC APS Bundle object in the navigation tree and choose Properties from the contextual menu. The APS Bundles (Edit) form opens.

ii Click on the MLPPP tab button.

iii Configure the parameters:

- End Point ID
- End Point Class ID
- Class Count
- Magic Number
- Stateless Aps Switchover

iv Click on the Apply button. A dialog box appears.

v Click on the Yes button.

12 Click on the States tab button.

13 Configure the Administrative State parameter.

Note — You must configure the End Point ID parameter on the APS PPP group before you set the Administrative State parameter to Up on the working and protection bundles.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The APS Bundles (Edit) form closes.

16 Perform the following steps to configure the MC APS working and protection bundles.

i Right-click on the MC APS Bundle object created in step 6 in the navigation tree and choose Properties from the contextual menu. The APS Bundles (Edit) form opens.

ii Click on the Protection and Working Bundles tab button.

iii Click on the Create button. The Create APS Working/Protecting Bundle form opens.

iv Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description
- Administrative State

v Click on the Select button beside the Daughter Card CLI Name parameter. The Select Daughter Card - Multilink Bundle list form opens.

vi Select a daughter card in the list and click on the OK button. The Select Daughter Card - Multilink Bundle list form closes.

vii Click on the Next button.

viii Configure the parameters.

- Bundle Type
- Protection Type

  The working bundle must be on the same NE as the APS working channel and the protection bundle must but on the same NE as the APS protection channel.

ix Click on the Finish button.

x Click on the Close button. The Create APS Working/Protecting Bundle form closes.

xi Close the APS Bundles (Edit) form.

xii Repeat steps i to xi to configure the MC APS protection bundle created in step 8.

17 Perform the following steps to configure the administrative state of the MC APS working and protection bundles.

i Right-click on the working bundle object in the navigation tree and choose Properties from the contextual menu. The Multilink Bundle (Edit) form opens.

ii Click on the States tab button.

iii Configure the Administrative State parameter.

iv Click on the OK button. A dialog box appears.

v Click on the Yes button. The Multilink Bundle (Edit) form closes.

vi Right-click on the protection bundle object in the navigation tree and choose Properties from the contextual menu. The Multilink Bundle (Edit) form opens.

vii Repeat steps ii to v.

18 To add multilink bundle members, perform the following steps.

i Right-click on the MC APS Bundle object on either NE in the navigation tree and choose Properties from the contextual menu. The APS Bundles (Edit) form opens.

ii Click on the Bundle Members tab button.

iii Click on the Add button. The Add Bundle Member form opens.

iv Configure the Show Only Compatible Channels parameter.

v Click on the Next button. The Select Channels form opens.

vi Select a channel in the list.

Note 1 — When initially adding bundle members, you must first add one channel group and then repeat the procedure to select up to seven additional channel groups.

Note 2 — Only compatible channels are listed. If you want to configure and use a channel that is currently incompatible, you can click on the Back button, deselect the Show Only Compatible Channels parameter, click on the Next button, select the channel, click on the Properties button.

Note 3 — The channel group with the lowest Port ID is the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member Encap Type for the member to be compatible.

vii Click on the Finish button. A dialog box appears.

viii Click on the Yes button. The Add Bundle Members form closes.

ix Click on the Apply button.

x Click on the Add button. The Add Bundle Member form opens.

xi Configure the Show Only Compatible Channels parameter.

xii Click on the Next button. The Select Channels form opens.

xiii Select up to seven additional channels from the list.

xiv Click on the Finish button A dialog box appears.

xv Click on the Yes button. The Add Bundle Members form closes.

xvi Click on the OK button. The APS Bundles (Edit) form closes.

Procedure 40-5 To change the operational state of an SC APS channel

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to modify the APS channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon fully.

4 Right-click on the APS Channel object. The APS Channel (Edit) form opens.

5 Configure the Command Switch parameter.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The operational state of the APS channel changes and the APS Channel (Edit) form closes.

Procedure 40-6 To delete an SC APS group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to delete an APS group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the APS Group object and choose Delete from the contextual menu. A dialog box appears.

Caution — Removing an APS group removes the working and protection channels and associated ports from the APS group, and deletes the APS group ID. Ensure that you select the correct APS group.

5 Click on the View Dependencies button. A dialog box appears.

6 Click on the OK button.

7 Select the I understand the implications of this action check box.

8 Click on the Yes button. The 5620 SAM deletes the SC APS group.

Procedure 40-7 To delete an SC APS bundle

Perform this procedure to permanently remove an SC APS bundle from the 5620 SAM and NE configurations.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to delete an APS bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the APS Bundle object and choose Delete from the contextual menu. A dialog box appears.

5 Click on the View Dependencies button. A dialog box appears.

6 Click on the OK button to proceed.

7 Select the I understand the implications of this action check box.

8 Click on the Yes button. The 5620 SAM deletes the SC APS bundle.

Procedure 40-8 To delete an MC APS group or bundle

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Perform one of the following.

   a Choose MC APS Group (APS) from the object drop-down list.

   b Choose MC APS Bundles (APS) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC APS groups or MC APS bundles appears.

4 Select an entry in the list and click on the Delete button. A dialog box appears.

5 Click on the View Dependencies button. A dialog box appears.

6 View the dependency information.

7 Click on the OK button.

8 Select the I understand the implications of this action check box.

9 Click on the Yes button. The 5620 SAM deletes the MC APS group or bundle and the corresponding configuration on each member site.

41 — MC peer groups

41.1 MC peer groups overview

An MC peer group is a 5620 SAM object that defines the relationship between two peer NEs to provide system redundancy in an Ethernet network. An MC peer group configuration includes a list of protocols and objects with state information that is to be synchronized between the peers.

The 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7210 SAS-X24F2XFP, 7450 ESS, 7710 SR, and 7750 SR each support the creation of up to 20 MC peer groups using Ethernet ports in access mode. An MC peer group can contain one or more of the following child group objects:

- MC endpoint group—see chapter 42
- MC LAG group—see chapter 43
- MC synchronization group—see chapter 44
- MC ring group—see chapter 45

Note — Only the 7450 ESS, 7710 SR, and 7750 SR support the creation of MC endpoint groups.

When you create a child group object, the 5620 SAM automatically creates the child group members using the peer objects in the MC peer group.

The 5620 SAM automatically discovers MC peers that are configured on managed NEs and creates an MC peer group if the source address of each peer matches the peer address of the other. If an MC peer address on an NE is changed after discovery, for example, using a CLI, the 5620 SAM deletes the MC peer group but does not delete the peer configuration on either NE. When the mismatch is corrected, the 5620 SAM recreates the MC peer group.

When the MC peer addresses match but the 5620 SAM detects another MC peer group configuration mismatch, the 5620 SAM raises an alarm and displays a check mark beside the Asymmetrical Configuration Detected indicator on the General tab of the MC Peer Group properties form. The alarm information includes the type of configuration mismatch. When the mismatch is corrected, the alarm and check mark clear.

41.2 Workflow to manage MC peer groups

1. Create an MC peer group. See Procedure 41-1 for more information.
2. As required, configure an MC peer within an MC peer group. See Procedure 41-2 for more information.
3. As required, perform an on-demand protocol synchronization between MC peer group members. See Procedure 41-3 for more information.

41.3 MC peer groups management procedures

Use the following procedures to perform MC peer group management tasks.

Procedure 41-1 To configure an MC peer group

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Peer Group (Multi-Chassis) from the object drop-down list.

3 Perform one of the following:

   a Configure an existing MC peer group. Perform the following:

      i Configure the filter criteria and click on the Search button. A list of MC peer groups is displayed.

      ii Select an MC peer group and click on the Properties button. The MC Peer Group (Edit) form opens with the General tab displayed.

      iii Go to step 4.

   b Create an MC peer group by performing the following:

Note — At least one MC peer must be a 5620 SAM-managed NE. The 5620 SAM raises an alarm when an MC peer group contains an unmanaged NE.

      i Click on the Create button. The MC Peer Group (Create) form opens with the General tab displayed.

      ii Click on the Select button in the First Element panel to choose the first site for the peer group. The Select Site Info form opens.

      iii Select an NE in the list and click on the OK button. The Select Site Info form closes, and the site name and system IP address are displayed on the MC Peer Group (Create) form.

      iv To specify an interface other than the NE system interface for MC peer communication, click on the Select button beside the Source Address parameter. The Select a virtual router interface form opens.

Note 1 — Only numbered, non-multicast IPv4 interfaces are listed.

Note 2 — You can also enter a valid interface IP address.

      v Select an interface in the list and click on the OK button. The interface address is listed on the MC Peer Group (Create) form.

      vi Click on the Select button in the Second Element panel to choose the second site for the peer group. The Select Site Info form opens.

vii Select an NE in the list and click on the OK button. The Select Site Info form closes, and the site name and system IP address are displayed on the MC Peer Group (Create) form.

viii To specify an interface other than the NE system interface for MC peer communication, click on the Select button beside the Source Address parameter. The Select a virtual router interface form opens.

Note 1 — Only numbered, non-multicast IPv4 interfaces are listed.

Note 2 — You can also enter a valid interface IP address.

ix Select an interface in the list and click on the OK button. The interface address is listed on the MC Peer Group (Create) form.

4 Configure the following parameters in the First Element panel:

- Source Address
- Peer Name
  If Peer Name parameter is not configured, the peer IP address is used by the MC endpoint.
- Description
- Authentication Key
- Administrative State

5 Configure the following parameters in the Second Element panel:

- Source Address
- Peer Name
  If Peer Name parameter is not configured, the peer IP address is used by the MC endpoint.
- Description
- Authentication Key
- Administrative State

6 Click on the Peer Synchronization tab button.

7 Configure the parameters:

- Sync Administrative State
- IGMP
- IGMP Snooping
- Subscriber IPoE Management
- Subscriber PPPoE Management
- SRRP
- MC Ring
- MLD Snooping
- MC Ring

8 Click on the Apply button.

9 Click on the Associated Groups tab button.

10 Create an MC LAG, if required.

i Right-click on the MC LAG object in the components tree and choose Create MC LAG from the contextual menu. The MC LAG (Create) form opens.

ii Perform steps 7 to 11 in Procedure 43-1.

11 Create an MC synchronization group, if required.

i Right-click on the MC Sync Group object in the components tree and choose Create MC Sync Group from the contextual menu. The MC Sync Group (Create) form opens.

ii Perform steps 6 to 12 in Procedure 44-1.

12 Create an MC Ring Group, if required.

i Right-click on the MC Ring Group object in the components tree and choose Create MC Ring Group from the contextual menu. The MC Ring Group (Create) form opens.

ii Configure the Name parameter.

iii Click on the Select button beside the Synchronization Tag parameter. The Select Multi-Chassis Sync Group form opens.

iv Choose an MC synchronization group from the list and click on the OK button. The Select Multi-Chassis Sync Group form closes and the MC synchronization group is displayed on the MC Ring Group (Create) form.

13 Create an MC endpoint group, if required.

i Right-click on the MC Endpoint Group object in the components tree and choose Create Endpoint Group from the contextual menu. The MC Endpoint Group (Create) form opens.

ii Perform steps 2 to 5 in Procedure 42-1.

14 Click on the OK button. The MC Peer Group (Create) form closes.

15 Close the Manage Node Redundancy form.

Procedure 41-2 To configure an MC peer

Perform this procedure to modify an existing MC peer when there is a configuration mismatch with the other peer in an MC peer group.

Note — The MC peer parameters are configurable only when there is a configuration mismatch, which is indicated when the Neighbor Match check box on the MC Peer (Edit) form is unselected.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Peer Group (Multi-Chassis) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC peer groups is displayed.

4 Select an MC peer group and click on the Properties button. The MC Peer Group (Edit) form opens with the General tab displayed.

5 Click on the Members tab button.

6 Select an entry in the list and click on the Properties button. The MC Peer (Edit) form opens with the General tab displayed.

7 Configure the parameters:

- Description
- Source Address
- Authentication Key
- Administrative State

8 Perform the following to configure the MC LAG group parameters.

i Click on the MC LAG tab button.

ii Configure the parameters:

- Keep-Alive Interval (deciseconds)
- Lost Connection Wait Interval
- Administrative State

9 Perform the following to configure the MC synchronization group parameters.

i Click on the Synchronization Protocol tab button.

ii Select an entry in the list and click on the Properties button. The MC Peer Sync (Edit) form opens.

iii Configure the parameters:

- Synchronize IGMP
- Synchronize IGMP-Snooping
- Synchronize Subscriber Management
- Synchronize SRRP
- Synchronize MC Ring
- Synchronize MLD Snooping
- Synchronize Subscriber Host Tracking

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The MC Peer Sync (Edit) form closes.

12 Close the MC Peer (Edit) form.

13 Close the MC Peer Group (Edit) form.

14 Close the Manage Node Redundancy form.

Procedure 41-3 To perform an on-demand protocol synchronization between MC peer group members

Perform this procedure to distribute the most recent protocol synchronization configuration to each member of an MC peer group. This is required when the configurations do not match, for example, after the configuration is changed locally on only one MC peer using a CLI. When the peer configurations do not match, the 5620 SAM raises an alarm and displays a check mark beside the Asymmetrical Configuration Detected indicator on the General tab of the MC Peer Group properties form.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Peer Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of MC peer groups is displayed.

3 Select an MC peer group in the list and click on the Properties button. The MC Peer Group (Edit) form opens with the General tab displayed.

4 Click on the Peer Synchronization tab button.

5 Click on the Resync button. The member configurations are synchronized.

6 Close the MC Synchronization (Edit) form.

7 Close the Manage Node Redundancy form.

Procedure 41-4 To delete an MC peer group

Caution — Deleting an MC peer group removes all of the MC configurations that are associated with the MC peer group, such as the following:

- MC LAG groups
- MC synchronization groups
- MC ring groups

Ensure that you specify the correct MC peer group for deletion in this procedure.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Peer Group (Multi-Chassis) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC peer groups is displayed.

4 Select one or more MC peer groups in the list and click on the Delete button. A dialog box appears.

5 Click on the View Dependencies button. A Warning form opens.

6 View the dependency information.

7 Select the I understand the implications of this action check box.

8 Click on the Yes button. The 5620 SAM deletes the MC peer group and the corresponding configuration on each member site.

9 Close the Manage Node Redundancy form.

42 — MC endpoint groups

42.1 MC endpoint groups overview

An MC endpoint group consists of two MC endpoint peers that are configured as peers in a pair of sites. Multiple VPLS endpoints can use the MC endpoint peer. The endpoints must be on a 7450 ESS, 7710 SR, or 7750 SR, and must support PW redundancy. Each endpoint can be associated with different destinations, with a maximum of two spoke SDPs for each endpoint. The endpoints communicate with each other to get the associated status of the spoke SDPs, which ensures that only one spoke SDP is active at any time; the other spoke SDPs have a standby status. The grouping of multiple spoke SDPs that are associated with the two MC endpoint peers eliminates traffic loops in a VPLS or B-VPLS.

An MC endpoint group includes:

- two MC endpoint peers that can be used by a spoke SDP, which is under mc-endpoint and relies on mc-ep-peer in the CLI
- an MC protocol that is used for:
    - determination of which MC endpoint peers are active or standby
    - synchronization of the pseudo-wire information that is between the MC endpoint peers
    - fault detection using centralized BFD. The MC endpoint protocol contains a keep-alive mechanism because BFD cannot detect whether an MC endpoint peer is shut down or if there is a configuration problem.
- T-LDP signaling, which is used to communicate whether the pseudo-wire is active or standby to other gateway pairs. The other gateway pairs may not have an MC endpoint.

An MC peer group that is managed by the 5620 SAM contains two MC peers. Each MC peer is configured as the peer of the other MC peer. An MC peer group must be created before you create MC endpoint group. See chapter 41 for more information about MC peer groups.

BFD

The MC endpoint protocol uses the keep-alive mechanisms. The MC endpoint protocol also supports BFD to eliminate traffic loops. See Procedure 42-1 for information about how to configure an MC endpoint group for BFD.

42.2 Workflow to manage MC endpoint groups

1. Create an MC peer group, as described in chapter 41.
2. Create an MC endpoint group. See Procedure 42-1 for more information.
3. Create and configure the VPLS. See chapter 71 for more information.
4. As required, create an MC LAG group. See chapter 43 for more information.
5. As required, create an MC synchronization group. See chapter 44 for more information.
6. As required, create an MC ring group. See chapter 45 for more information.

42.3 MC endpoint groups management procedures

Use the following procedures to perform MC endpoint group management tasks.

Procedure 42-1 To configure an MC endpoint group

1 Create an MC peer group, as described in steps 1 to 13 of Procedure 41-1.

2 Configure the Description parameter.

3 Configure the parameters for the MC Endpoint on First Site:

- System Priority
- Keep-Alive Interval (deciseconds)
- Hold On Neighbor Failure
- Administrative State
- Passive Mode Enabled
- BFD Enabled
- Boot Timer

4 Configure the parameters for the MC Endpoint on Second Site:

- System Priority
- Keep-Alive Interval (deciseconds)
- Hold On Neighbor Failure
- Administrative State
- Passive Mode Enabled
- BFD Enabled
- Boot Timer

5 Click on the OK button.

6 Create a VPLS, site, and VPLS endpoint, as described in steps 1 to 21 of Procedure 71-1.

Note — In step 21iii of Procedure 71-1, set the Endpoint Type parameter to Multi Chassis and perform steps 21iv to 21x.

7 Click on the Yes button.

8 Perform one of the following:

a Create a redundant spoke SDP binding under an endpoint, as described in steps 4 to 43 of Procedure 71-5.

b Create a spoke SDP binding for the site, as described in steps 9 to 43 of Procedure 71-5.

Procedure 42-2 To modify an MC endpoint group

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Endpoint Group (Multi-Chassis) from the Select Object Type drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC endpoint groups is displayed.

4 Choose an MC endpoint group and click on the Properties button. The MC Endpoint Group (Edit) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Configure the parameters for the MC Endpoint on First Site:

- System Priority
- Keep-Alive Interval (deciseconds)
- Hold On Neighbor Failure
- Administrative State
- Passive Mode Enabled
- BFD Enabled
- Boot Timer

7 Configure the parameters for the MC Endpoint on Second Site:

- System Priority
- Keep-Alive Interval (deciseconds)
- Hold On Neighbor Failure
- Administrative State
- Passive Mode Enabled
- BFD Enabled
- Boot Timer

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The MC Endpoint Group form closes.

Procedure 42-3 To delete an MC endpoint group

Caution — When you perform this procedure, the MC endpoint group is deleted from the 5620 SAM and member NE configurations. In addition, deleting an MC endpoint group removes all of the MC configurations that are associated with the MC peer group.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Endpoint Group (Multi-Chassis) from the object list.

3 Configure the filter criteria and click on the Search button. A list of MC endpoint groups is displayed.

4 Choose one or more MC endpoint groups in the list and click on the Delete button. A dialog box appears.

5 Click on the View Dependencies button. A warning form opens.

6 View the dependency information.

7 Select the I understand the implications of this action check box.

8 Click on the Yes button. The 5620 SAM deletes the MC endpoint group and the corresponding configuration for each member site.

If there are MC endpoints that use the MC endpoint group, you cannot delete the MC endpoint group. Remove the MC endpoints from the MC endpoint group and repeat steps 1 to 9.

9 Close the Manage Node Redundancy form.

43 — MC LAG groups

43.1 MC LAG groups overview

A LAG is a group of physical ports that form one logical link between two NEs to increase bandwidth, allow load balancing, and provide seamless redundancy. LAG support over multiple devices provides node-level redundancy in addition to link-layer redundancy using a switchover function. An MC LAG configuration provides redundant L2 access connectivity that extends beyond link-layer protection by allowing two devices to share a common LAG end point.

An MC LAG configuration includes one active member NE and one standby member NE. The active and standby NEs synchronize the link state information to facilitate link-layer messaging between an access node and each NE. This active and standby NE coupling provides a synchronized forwarding plane to and from the access node. LACP is used to manage the active and standby states of the available LAG links; only the links of one member NE at a time are active.

The 7450 ESS, 7710 SR, and 7750 SR support the creation of MC LAG groups using Ethernet ports in Access mode.

Note — You can create an MC LAG group only from within an existing MC peer group. See chapter 41 for more information about MC peer groups.

When you use the 5620 SAM to change the MC LAG configuration on an NE, the 5620 SAM automatically updates the MC LAG configuration on the other NE. When you change the MC LAG configuration on an NE using, for example, a CLI, the 5620 SAM detects the configuration mismatch between the NEs and raises an alarm. The alarm information includes the type of configuration mismatch.

MC synchronization

When subscriber management is enabled on an NE in an MC LAG configuration, the NE maintains dynamic state information for each subscriber host. The active and standby NEs synchronize this information to ensure uninterrupted service delivery in the case of an MC LAG switchover.

See chapter 44 for more information about MC synchronization.

43.2 Workflow to manage MC LAG groups

1. Create one or more LAGs using Ethernet access ports, as required. See chapter 18 for more information.
2. Create an MC peer group. See chapter 41 for more information.
3. Create an MC LAG group. See Procedure 43-1 for more information.
4. As required, configure MC LAG group members. See Procedure 43-2 for more information.

43.3 MC LAG groups management procedures

Use the following procedures to perform MC LAG management tasks.

Procedure 43-1 To create an MC LAG group

Perform this procedure to create an MC LAG group or to modify an existing MC LAG group. Consider the following before you create an MC LAG group:

- You can create an MC LAG member only on an Ethernet MDA.
- MC LAG member ports must be in Access mode.
- The 5620 SAM assigns the same LACP key, system ID, and system priority to each MC LAG member.
- MC LAGs are not supported when MAC subnetting is enabled.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Peer Group (Multi-Chassis) from the object drop-down list.

3 Click on the Search button. A list of MC peer groups is displayed.

4 Select an MC peer group in the list and click on the Properties button. The MC Peer Group (Edit) form opens.

5 Click on the Associated Groups tab button.

6 Right-click on the MC Lag object in the navigation tree and choose Create MC LAG Group. The MC LAG Group (Create) form opens.

7 Configure the parameters:

- LACP Key
- System ID
- System Priority
- Description

8 Configure the PBB Source Backbone MAC LSB parameters:

- Use LACP Key
- MAC LSB (hex)

Note 1 — The parameters are only configurable on the 7750 SR, 7750 SR-c12, and 7450 ESS. The NE must also be configured with an IOM 3 MDA.

Note 2 — An MC LAG has two members. The parameters can be configured only when both peers are PBB-capable; for example, if the peers are either the 7750 SR, 7750 SR-c12, or 7450 ESS. If both peers are PBB-incapable, the PBB parameters are not displayed.

9 Perform the following steps to choose the LAG for the first MC LAG member.

   i Click on the Select button beside the LAG ID parameter in the First Site panel. The Select LAG form opens.

   ii If no LAGs are listed, you can create a LAG by clicking on the Create button and performing steps 5 to 24 of Procedure 18-13.

   iii Select a LAG in the list and click on the OK button. The Select LAG form closes and the MC LAG (Create) form displays the LAG information.

10 Perform the following steps to choose the LAG for the first MC LAG member.

> **Note —** If you are configuring access dual-homing with local switching over PBB tunnels, the L2 access interfaces must be on LAGs that participate in the MC LAG. See Procedure 70-13 to configure L2 access interfaces.

   i Click on the Select button beside the LAG ID parameter in the Second Site panel. The Select LAG form opens.

   ii If no LAGs appear in the list, you can create a LAG by clicking on the Create button and performing steps 5 to 24 of Procedure 18-13.

   iii Select a LAG in the list and click on the OK button. The Select LAG form closes and the MC LAG (Create) form displays the LAG information.

11 Click on the OK button. The MC LAG (Create) form closes, and the new MC LAG object is displayed below the MC LAG object in the navigation tree on the MC Peer Group (Edit) form.

12 Close the MC Peer Group (Edit) form.

13 Close the Manage Node Redundancy form.

Procedure 43-2 To configure an MC LAG group member

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC LAG Group (Multi-Chassis) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC LAGs is displayed.

4 Select an MC LAG in the list and click on the Properties button. The MC LAG Group (Edit) form opens with the General tab displayed.

5 Configure the MC LAG parameters that are common to each member, if required:

- LACP Key
- System ID
- System Priority
- Description

6 Click on the States tab button.

7 Click on the Properties button beside the Administrative State field in the MC Peer Communication section of the First Site panel. The MC Peer (Edit) form opens with the General tab displayed.

8 Configure the MC LAG member by performing the following steps.

i Click on the MC LAG tab button. The General tab is displayed.

ii Configure the parameters:

- Keep-Alive Interval (deciseconds)
- Lost Connection Wait Interval
- Administrative State

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The MC Peer (Edit) form closes.

9 Click on the Properties button beside the Administrative State field in the MC Peer Communication section of the Second Site panel. The NE Synchronization (Edit) form opens with the General tab displayed.

10 Repeat step 8.

11 Close the MC LAG Group (Edit) form.

12 Close the Manage Node Redundancy form.

Procedure 43-3 To delete an MC LAG group

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC LAG Group (Multi-Chassis) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC LAG groups is displayed.

4 Select one or more MC LAG groups in the list and click on the Delete button. A dialog box appears.

5 Click on the View Dependencies button. An information dialog box appears.

6 View the dependency information.

7 Click on the OK button.

8 Click on the Yes button. The 5620 SAM deletes the MC LAG group and the corresponding configuration on each member site.

Note — If you change the default values of the Keep-Alive Interval (deciseconds) and Lost Connection Wait Interval parameters in step 8ii of Procedure 43-2, the MC LAG group configuration of the member sites is not removed. You can view the MC LAG member information under the LAG icon in the network view of the navigation tree.

9 Close the Manage Node Redundancy form.

44 — MC synchronization groups

44.1 MC synchronization groups overview

When subscriber management is enabled on an NE, the NE maintains dynamic subscriber-host state information. The state information must be synchronized between the active and standby NEs in a redundant configuration to ensure that service delivery is uninterrupted if a switchover occurs.

The 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7210 SAS-X24F2XFP, 7450 ESS, 7710 SR, and 7750 SR support the creation of MC synchronization groups using Ethernet ports in Access mode.

Note — You can create an MC synchronization group only from within an existing MC peer group. See chapter 41 for more information about MC peer groups.

MC synchronization can be used to ensure that the following dynamic state information is synchronized:

- Basic and enhanced subscriber management
- IGMP snooping in VPLS
- IGMP on IES or VPRN group interfaces
- SRRP in VPRN

You create an MC synchronization group inside an MC peer group using a unique synchronization tag to define the pair of NEs and the two ports or LAGs on which the dynamic state information is synchronized. The synchronization is applied to all SAPS on the port or LAG that have the same synchronization tag.

A synchronization tag can be applied to a specified VLAN range on a port or LAG. All of the SAPs in the VLAN range are assigned the synchronization tag. The SAPs that are not in the VLAN range are not synchronized.

Note 1 — Only ports and LAGs that use dot1q or Q in Q encapsulation support MC synchronization.

Note 2 — MC synchronization group VLAN ranges are configurable only after MC synchronization group creation.

Note 3 — If the 5620 SAM detects a port or VLAN range configuration mismatch in an MC synchronization group during NE discovery, the 5620 SAM raises an alarm.

MC synchronization and dual-homed L2/L3 CO

MC synchronization is typically used in a dual-homed L2 or L3 CO configuration. For example, an access node that aggregates several subscriber lines can be dual-homed to a redundant pair of NEs. Dynamic subscriber-host state information on the NE must be synchronized with the redundant peer to ensure that service delivery in unaffected if a switchover occurs. See chapters 73 and 74 for more information about L2 and L3 CO dual homing.

MC synchronization for dual homing requires the configuration of protocol synchronization on the MC peer group that defines the redundant pair of NEs. See Procedure 41-1 for more information about configuring protocol synchronization on an MC peer group.

44.2 Workflow to manage MC synchronization groups

1. Create an MC peer group. See chapter 41 for information about MC peer groups.
2. Create an MC synchronization group, including MC peer synchronization ports or VLAN ranges. See Procedure 44-1 for more information.
3. Configure protocol synchronization for the MC synchronization group. See Procedure 44-2 for more information.

44.3 MC synchronization groups managment procedures

Use the following procedures to perform MC synchronization management tasks.

Procedure 44-1 To create an MC synchronization group

1. Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.
2. Choose MC Peer Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of MC peer groups is displayed.
3. Select an MC peer group in the list and click on the Properties button. The MC Peer Group (Edit) form opens with the General tab displayed.
4. Click on the Associated Groups tab button.
5. Right-click on the MC Sync Group object in the navigation tree and choose Create MC Sync Group from the drop-down menu. The MC Sync Group (Create) form opens.
6. Configure the parameters:
   - Synchronization Tag
   - Description
   - Sync Tag Config Level
7. Specify the port or LAG on the first NE.

   Click on the Select button beside the Port/LAG Name parameter in the First Element panel. The Select Port/LAG - MC Sync Group form opens.

   Note — If you set the Sync Tag Config Level parameter to VLAN Range Level, only dot1q and Q in Q-encapsulated Ethernet ports or LAGs in Access mode are listed.

8 Select a port or LAG in the list and click on the OK button. The Select Port/LAG - MC Sync Group form closes, and the port or LAG information is displayed on the MC Sync Group (Create) form.

9 Specify the port or LAG on the second NE.

Click on the Select button beside the Port/LAG Name parameter in the Second Element panel. The Select Port/LAG - MC Sync Group form opens.

Note — Only ports or LAGs that have the same encapsulation type as the port or LAG on the first NE are listed.

10 Select a port or LAG in the list and click on the OK button. The Select Port/LAG - MC Sync Group form closes, and the port or LAG information is displayed on the MC Sync Group (Create) form.

11 If you set the Sync Tag Config Level parameter to VLAN Range Level, perform the following steps to specify the VLAN ranges that the MC synchronization group is to monitor.

Note — The VLAN ranges that you configure are applied to the configuration of each site in the MC synchronization group.

i Click on the Apply button. The form displays additional tabs.

ii Click on the First Site VLAN Entries tab button.

iii Click on the Create button. The VLAN Range (Create) form opens.

iv Configure the parameters:

- Minimum Outer Encap Value
- Maximum Outer Encap Value
- Minimum Inner Encap Value
- Maximum Inner Encap Value

The Minimum Inner Encap Value and Maximum Inner Encap Value parameters are configurable only when the encapsulation type of the associated ports or LAGs is Q in Q.

v Click on the OK button. The VLAN Range (Create) form closes.

vi Repeat steps 11 iii to v to add another VLAN range, if required.

12 Close the MC Sync Group (Create) form.

13 Close the MC Peer Group (Edit) form.

14 Close the Manage Node Redundancy form.

Procedure 44-2 To configure protocol synchronization between MC peer group members

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Peer Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of MC peer groups is displayed.

3 Select an MC peer group in the list and click on the Properties button. The MC Peer Group (Edit) form opens with the General tab displayed.

4 Click on the Synchronize Protocols tab button.

5 Configure the parameters:

- Sync Administrative State
- IGMP
- IGMP Snooping
- Subscriber Management
- SRRP
- MC Ring
- MLD Snooping
- MC Ring

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The MC Synchronization (Edit) form closes.

8 Close the Manage Node Redundancy form.

Procedure 44-3 To delete an MC synchronization group

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Sync Group (Multi-Chassis) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of MC synchronization groups is displayed.

4 Select one or more MC synchronization groups in the list and click on the Delete button. A dialog box appears.

Caution — Deleting an MC synchronization group that is associated with an MC ring group disables the protocol synchronization between the member sites in the MC ring group.

5 Click on the Yes button. The 5620 SAM deletes the MC synchronization group and the corresponding configuration on each member site.

6 Close the Manage Node Redundancy form.

45 — MC ring groups

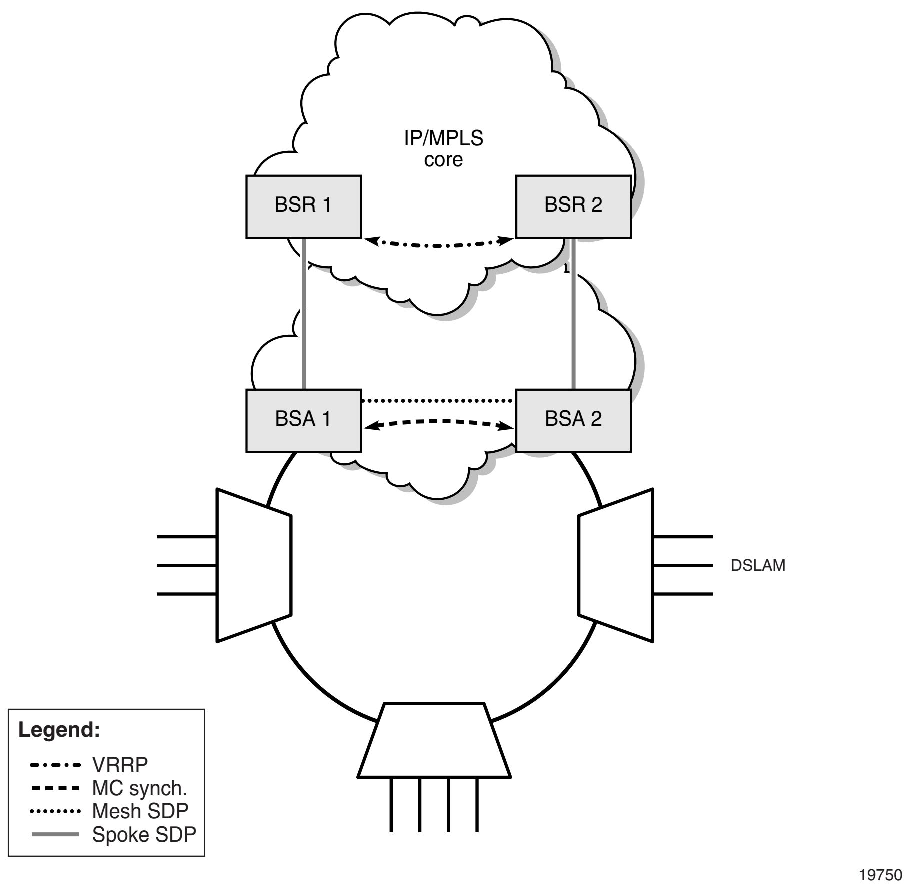
45.1 MC ring groups overview

5620 SAM MC ring groups are an extension of the dual-homing support available in TPSDA networks. MC ring groups provide aggregation redundancy in networks that have multiple access nodes, called ring nodes in the context of MC ring groups, connected in a single ring.

The 7210 SAS-M, 7450 ESS, 7710 SR, and 7750 SR support the creation of MC ring groups using Ethernet ports in Access mode.

Figure 45-1 shows a simple subscriber aggregation network in which a single ring of access nodes, such as DSLAMs, is connected to a BSA in a VPLS. Each BSA is connected to an IES or VPRN L3 interface on a BSR using a spoke SDP. Each BSR L3 interface aggregates the subscriber traffic in one subnet.

Figure 45-1 Simple subscriber aggregation network



Note 1 — BTV distribution is typically implemented in a separate VPLS that uses one SAP per access node.

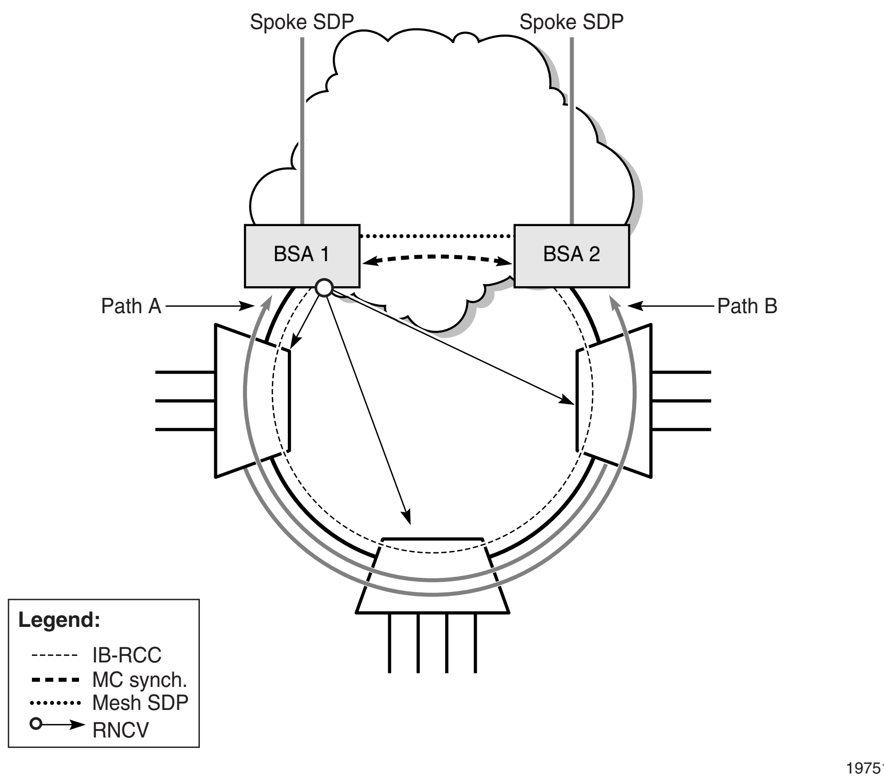
Note 2 — An MC ring group does not support a ring that has more than one break.

Steady-state condition

When an MC ring group is configured, the operation of a typical dual-homed ring is as shown in Figure 45-2. A steady-state condition is defined by the following.

- The participating BSAs have matching MC ring configurations.
- The In-Band Ring Control Connection, or IB-RCC, is operationally up.
- The MC ring is operationally up.

Figure 45-2 Dual-homed ring, steady-state condition



The IB-RCC is set up using a BFD session between IES or VPRN IP interfaces on BSA 1 and BSA 2. This connection requires a separate ring VLAN.

Note — You can create an MC ring group only from within an existing MC peer group. See chapter 41 for more information about MC peer groups.

In the steady state, the ring is fully closed and each ring node has two paths to the VPLS core; these are shown as Path A and Path B. To prevent a communication loop, a ring node can use only one path for VLAN traffic. The VLAN range can be explicitly assigned to Path B on each BSA; by default, the SAP uses Path A. The VLAN range assignment for each path must be the same on each BSA. A SAP in the conflict range is assigned to Path A, regardless of the local configuration.

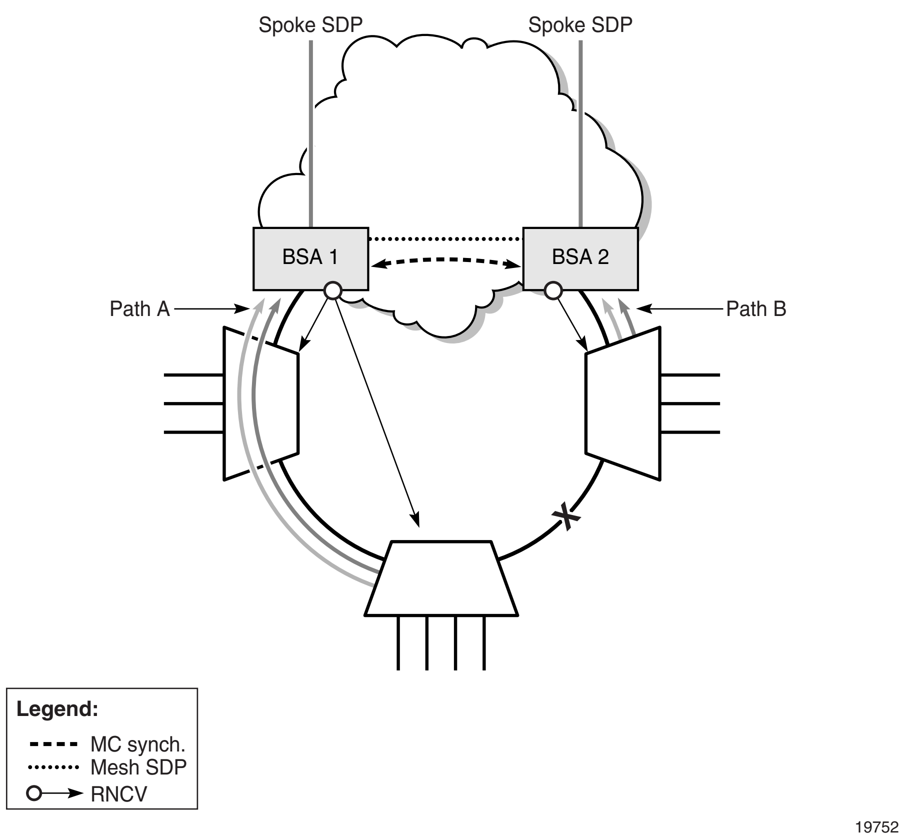
Each SAP in the path that ends on the master BSA is operationally up. Each subscriber-host forwarding database entry associated with the SAP points to the SAP. Each SAP in the path that ends on the standby BSA is operationally down. Each subscriber-host forwarding database entry associated with the SAP points to the mesh SDP that connects to the master BSA.

The master BSA periodically performs a Ring Node Connectivity Verification, or RNCV, check. The loss of connectivity to a ring node does not automatically trigger a switchover to the other path; if the IB-RCC BFD session is up, the ring is considered closed, and the master and standby BSA roles do not change.

Broken ring condition

A broken ring condition occurs when there is a link failure or ring node failure, as shown in Figure 45-3. In this condition, the IB-RCC is operationally down. Each ring node has only one path to the VPLS core.

Figure 45-3 Dual-homed ring, broken-ring condition



Each BSA becomes the master for the ring nodes that it can reach, and performs as described in the steady-state condition. Each L2 SAP on each BSA is operationally up, except the SAPs that are explicitly excluded from the MC ring control.

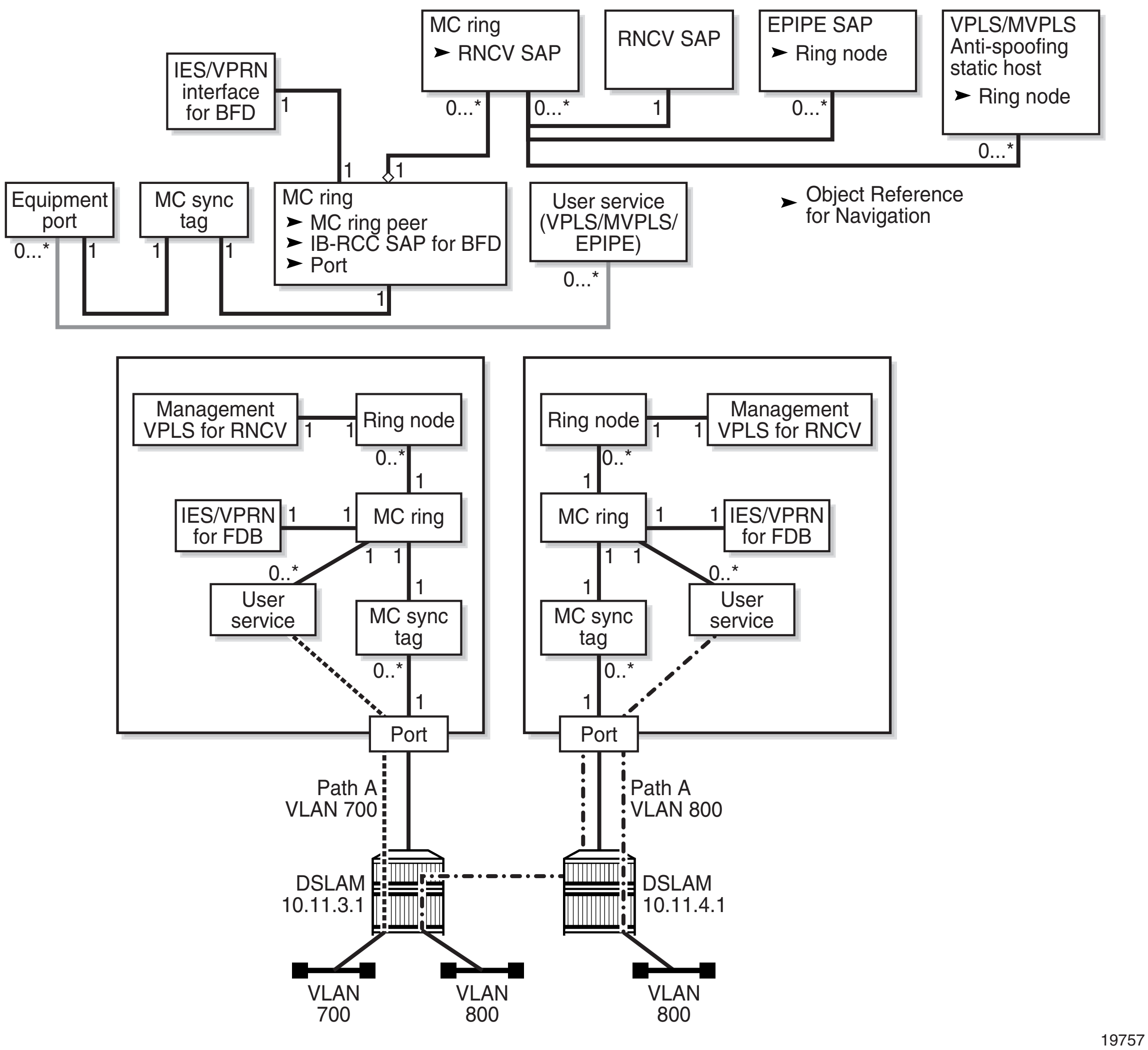
In the broken-ring condition, each BSA performs an RNCV check because each is a master. The forwarding database entry for each subscriber host behind a unreachable ring node points to the mesh SDP.

When the MC ring connectivity is restored, one BSA is the master for Path A and the other BSA is the master for Path B.

Object relationships

Figure 45-4 shows the MC ring and ring node object relationships with equipment and service objects.

Figure 45-4 MC ring group object relationships



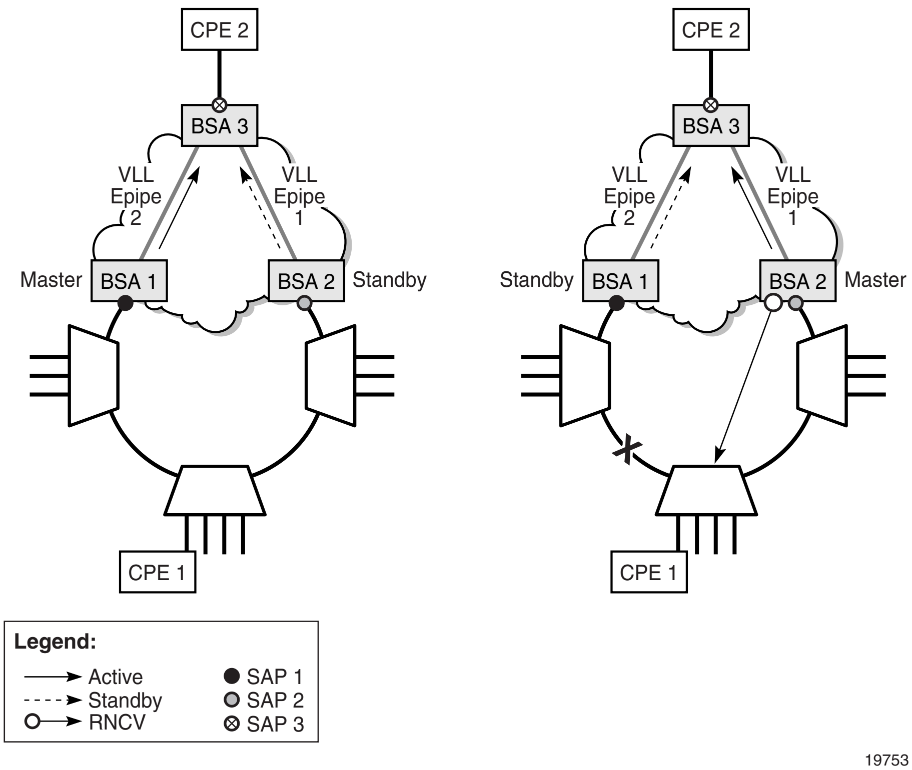
An MC ring has a one-to-one relationship with an MC synchronization tag. An MC ring uses one IES or VPRN service for IB-RCC. An MC ring can have multiple ring nodes, and each ring node can use only one SAP for RNCV.

When an MC ring group is correctly configured, each BSA L2 SAP is protected by the ring. The service that contains these protected SAPs is referred to as the user service. The service that is used for RNCV is an MVPLS that can also contain user SAPs and be a user service.

MC ring group and redundant VLL Epipe access operation

An MC ring group can connect to a VLL SAP to support redundant VLL Epipe access. Figure 45-5 shows a sample configuration using a VLL Epipe.

Figure 45-5 Dual-homed VLL Epipe configuration



CPE 1 connects to a ring node that has access to each BSA through a VLAN that is provisioned on each ring node. The SAP on each BSA uses the same VLAN tag.

In the closed ring on the left, BSA 1 is the master and sends an active status notification to BSA 3 on a VLL Epipe. BSA 2, the standby, sends a standby status notification. Based on this information, BSA 3 chooses a path to reach CPE 2.

In the broken ring on the right, the BSA that can use RNCV to reach CPE 1 becomes the master and sends an active status notification to BSA 3 on a VLL Epipe.

In each scenario, only one SAP is operationally up at a time, and each Epipe must be operationally up. If the ring node of CPE 1 is operationally down, neither BSA can reach the ring node, so each SAP and Epipe is operationally down.

MC ring groups and subscriber hosts

Each subscriber host on a SAP that is protected by an MC ring group must be associated with a ring node to determine whether the subscriber host is reachable by the BSA. Each VLL Epipe used for forwarding from an MC ring group must be explicitly configured with the name of a ring node in the MC ring. See Procedure 45-3 for information about configuring VLL Epipes for use with an MC ring group.

When subscriber management is enabled on a VPLS SAP, each dynamic subscriber host is automatically associated with a ring node. Static hosts on a VPLS SAP require explicit configuration. The following must be true before you can turn up an MC ring on a VPLS SAP that has one or more static hosts, or turn up a static host on a VPLS SAP in an operational MC ring:

- Subscriber management is enabled.
- The following are configured on the static host:
    - the name of a ring node in the MC ring group
    - subscriber identification
    - a subscriber profile
    - an SLA profile

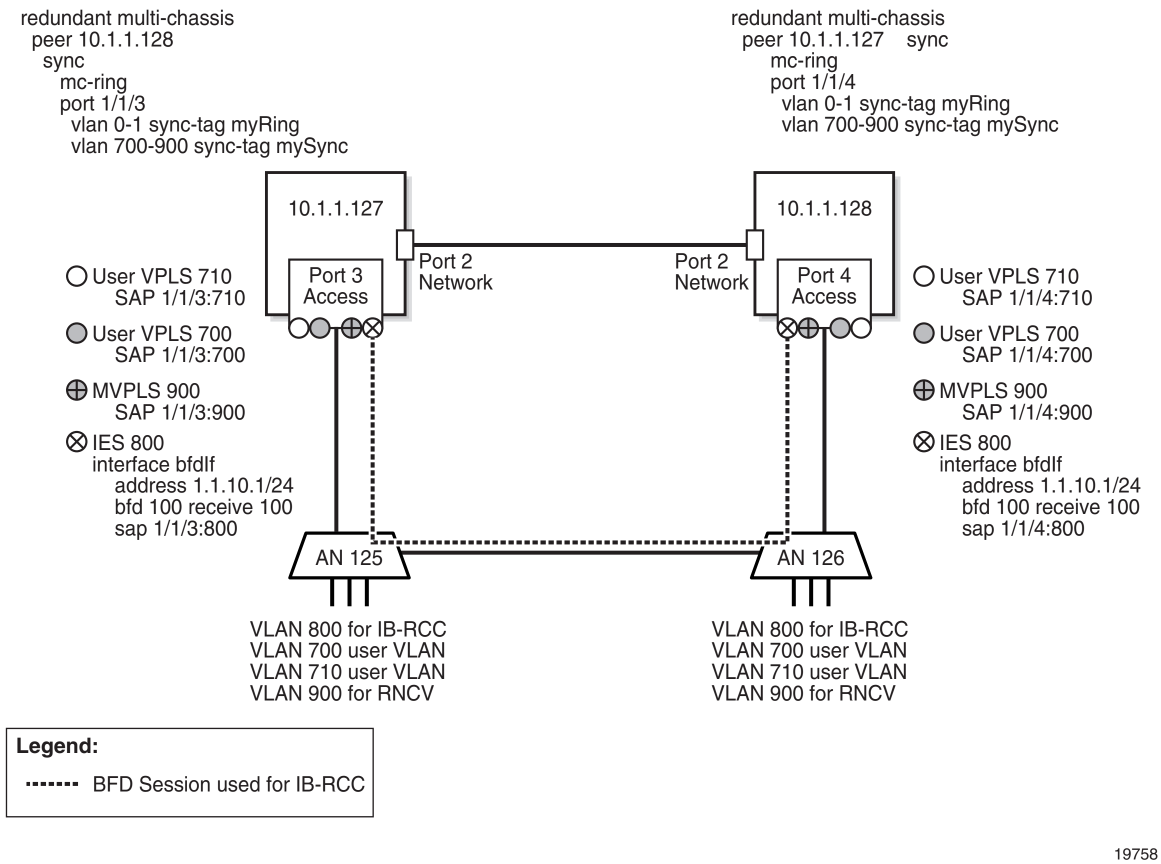
45.2 Workflow to manage MC ring groups

The following are the high-level steps required to perform MC ring group management.

NE preconfiguration

1 Configure physical connectivity between the two BSAs and the ring nodes, as shown in Figure 45-6. Each port must be operationally up.

Figure 45-6 MC ring group preconfiguration



2 Configure a routing protocol on each BSA to enable IP communication. See chapter 31 for information about configuring routing protocols.

3 Configure an MVPLS for RNCV on the BSAs. See chapter 71 for information about configuring MVPLS.

4 Create an MC peer group that has the two BSAs as members and has MC ring synchronization enabled. See chapter 41 for information about MC peer groups.

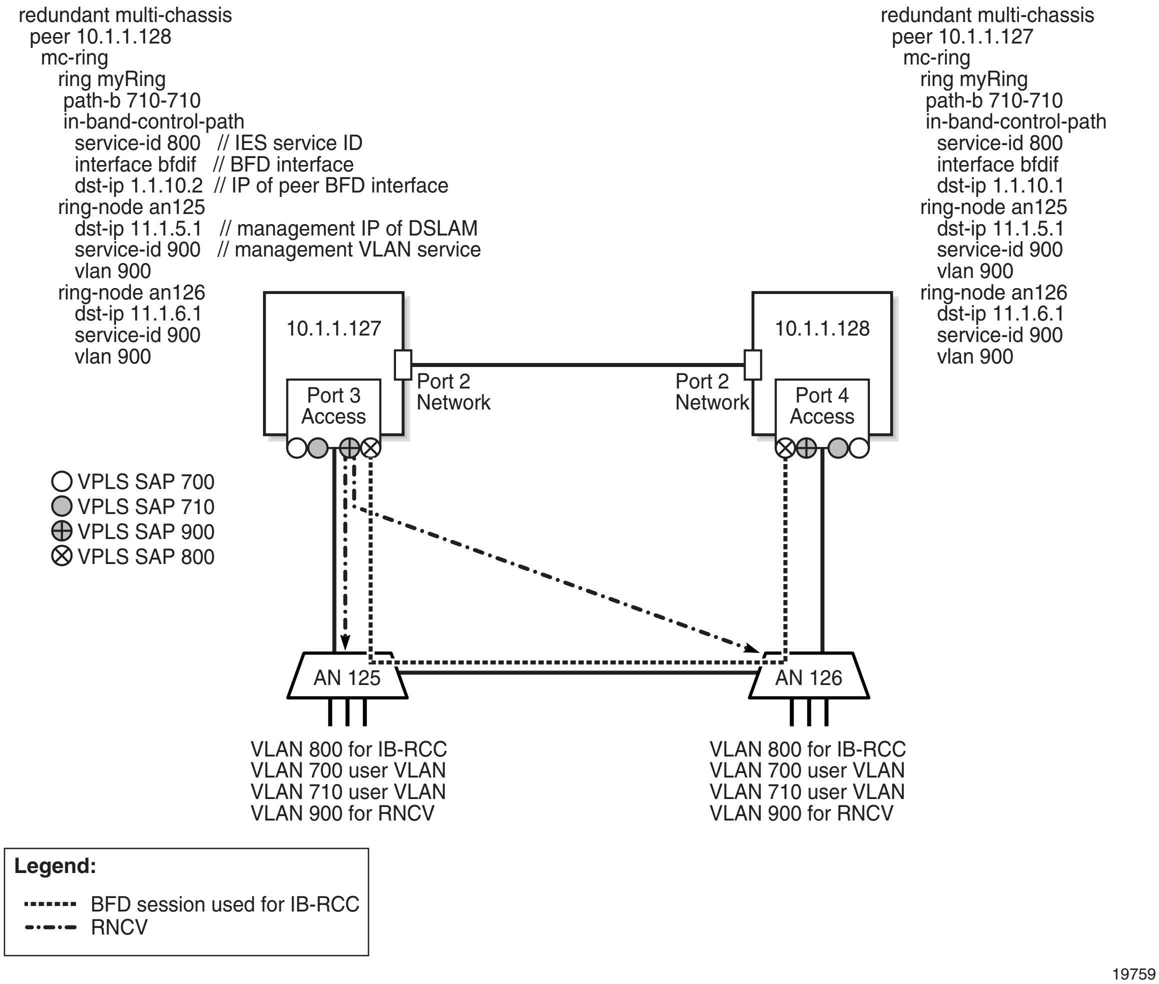
5 In the MC peer group, create an MC synchronization group that specifies each BSA access port. The MC synchronization group can synchronize the port or a VLAN range. See chapter 44 for information about MC synchronization groups.

6 Configure each ring node with the VLAN tag used for BFD to enable BFD communication through the ring. After this, each BSA SAP should be operational.

MC ring group configuration

7 Create an MC ring group that contains the BSAs (shown as 10.1.1.127 and 10.1.1.128 in Figure 45-7). For each ring node within the ring group, you must specify the management IP address of a ring node as the destination IP address and assign one VLAN for connectivity checking, shown in Figure 45-7 as VLAN 900. See Procedure 45-1 for more information.

Figure 45-7 MC ring configuration



8 Create the user VPLS and assign a SAP to each of the two BSA access ports. You can configure a protecting SAP on each BSA to provide SAP-level redundancy, if required. See chapter 71 for more information.

9 If the VPLS is to send traffic to an IES or a VPRN service, perform the following steps.

   i Create a spoke SDP from each VPLS site in the MC ring group to the IES or VPRN service.

   ii Configure traffic forwarding to the IES or VPRN service. See Procedure 45-2 for more information.

10 If the VPLS is to send traffic to redundant VLL Epipes, perform the following steps.

   i Create a redundant VLL Epipe from each VPLS site in the MC ring group to the BSA that is the common endpoint of the VLL Epipes.

   ii Configure traffic forwarding to each VLL Epipe service. See Procedure 45-3 for more information.

11 If the VPLS is to send traffic to an IES or a VPRN service, create a spoke SDP from the VPLS to the IES or VPRN service. See Procedure 45-2 for information about configuring the spoke SDP to send traffic from the MVPLS to an IES or a VPRN service.

12 Turn up the MC ring.

At this point, the following statements apply to the Figure 45-7 configuration.

- VPLS SAP 700 is operationally up on BSA 10.1.1.127 and operationally down on BSA 10.1.1.128.
- VPLS SAP 710 is operationally down on BSA 10.1.1.127 and operationally up on BSA 10.1.1.128.
- The operational state of the ring is Connected.

To test the configuration, you can shut down an access-node port in the ring to break the ring. As a result, the BSA SAPs should remain operationally up, but the operational state of the ring changes to Broken.

45.3 MC ring groups management procedures

Use the following procedures to perform MC ring group management tasks.

Procedure 45-1 To create an MC ring group

Note — You cannot create an MC ring SAP on a VPLS site that is the endpoint of redundant spoke SDPs.

1 Perform the NE preconfiguration steps in the workflow of this chapter.

2 Before you can deploy an MC ring to the participating BSAs, you must create an MC synchronization group. Perform Procedure 44-1 to create an MC synchronization group for the BSAs.

3 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

4 Choose MC Peer Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of previously created MC peer groups is displayed. See chapter 41 for information about creating MC peer groups.

5 Select an MC peer group in the list and click on the Properties button. The MC Peer Group (Edit) form opens.

6 Click on the Associated Groups tab button.

7 Right-click on the MC Ring Group object and choose Create MC Ring Group from the drop-down menu. The MC Ring Group (Create) form opens.

8 Configure the parameters:

- Name
- Synchronization Tag

9 Click on the Apply button. The form displays additional tabs.

10 Click on the Properties button in the Multi-Chassis Ring on First Site panel. The MC Ring (Edit) form opens with the General tab displayed.

11 Configure the parameters:

- Interface Name
- Service ID
- Destination IP Address

12 Perform the following steps to create a ring node.

i Click on the Components tab button.

ii Right-click on the MC Ring object and choose Create MC Ring Node. The MC Ring Node (Create) form opens.

iii Configure the parameters:

- Ring Node Name
- SAP Service ID
- SAP Outer Encapsulation Value
- SAP Inner Encapsulation Value
- Source IP Address
- Destination IP Address
- Source MAC Address
- Interval (minutes)

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The MC Ring Node (Create) form closes.

vi Repeat steps 12 ii to v to create an additional ring node, if required.

13 To configure a VLAN range for traffic that is to use the non-default path through the MC ring, perform the following steps.

i Click on the Path B VLAN Range tab button.

ii Click on the Create button. The Path B VLAN Range (Create) form opens.

iii Configure the parameters:

- Start VLAN Value
- End VLAN Value

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The VLAN range entry is displayed on the MC Ring (Edit) form.

14 To configure a VLAN range for traffic that is not to be protected by the MC ring, perform the following steps.

- **i** Click on the Exclude VLAN Range tab button. The Exclude VLAN Range (Create) form opens.
- **ii** Click on the Create button. The Path B VLAN Range (Create) form opens.
- **iii** Configure the parameters:
  - Start VLAN Value
  - End VLAN Value
- **iv** Click on the OK button. A dialog box appears.
- **v** Click on the OK button. The VLAN range entry is displayed on the MC Ring (Edit) form.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The MC Ring (Edit) form closes.

17 Click on the Properties button in the Multi-Chassis Ring on Second Site panel. The MC Ring (Edit) form opens with the General tab displayed.

18 Repeat steps 11 to 16.

19 Close the MC Ring Group (Create) form.

Procedure 45-2 To configure L3 forwarding from a VPLS or MVPLS to an IES or VPRN service

Perform this procedure to configure MC ring group traffic forwarding through a BSA spoke SDP to a BSR L3 access interface in an IES or VPRN service, as shown in Figure 45-1. See chapter 71 for information about creating and configuring VPLS and MVPLS services.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services is displayed.

3 Select the appropriate VPLS or MVPLS in the list and click on the Properties button. The service properties form opens.

4 On the navigation tree, click on a site. The site properties form opens.

5 Click on the Default Gateway tab button.

6 Configure the parameters, which specify the IP and MAC address of the default gateway to which the VPLS is to forward L3 traffic.

7 Click on the OK button. The site properties form closes.

8 Click on the OK button. The service properties form closes.

Procedure 45-3 To configure an MC ring group for redundant VLL Epipe access

Perform this procedure to configure traffic forwarding from a BSA SAP in an MC ring group through a VLL Epipe to a BSA SAP outside the ring group, as shown in Figure 45-5. See chapter 70 for information about creating and configuring VLL Epipe services.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services is displayed.

3 Select the appropriate VLL Epipe service in the list and click on the Properties button. The Epipe Service (Edit) form opens.

4 On the navigation tree, right-click on an L2 access interface. The L2 Access Interface (Edit) form opens with the General tab displayed.

5 Perform one of the following to specify a ring node in the ring group that terminates on the port associated with the L2 access interface.

- **a** Perform the following steps to select the ring node from a list.
  - **i** Click on the Select button in the MC Redundancy panel. The Select form opens.
  - **ii** Select a ring node in the list and click on the OK button. The Select form closes, and the ring node name is displayed on the L2 Access Interface (Edit) form.
- **b** Type the name of the ring node in the MC Ring Node field.

6 Click on the OK button. The L2 Access Interface (Edit) form closes, and a dialog box appears.

7 Click on the OK button. The Epipe Service (Edit) form reappears.

8 Click on the OK button.A dialog box appears.

9 Click on the Yes button. The Epipe Service (Edit) form closes.

Procedure 45-4 To turn up the MC rings in an MC ring group

Note 1 — You cannot administratively enable an MC ring group in one operation; you must turn up the MC rings in the MC ring group individually.

Note 2 — If a Problems Encountered form is displayed when you try to turn up an MC ring, you can perform one or both of the following to view information about the problem.

- Select the listed problem and click on the Properties button.
- View the Operational State and Failure Reason fields on the State tab of the MC ring properties form.

The 5620 SAM performs a series of checks to determine whether an MC ring can be turned up. The checks include verifying the following:

- The synchronization tag is configured on the BSA.
- The VLAN-level synchronization tag is valid.
- The IES or VPRN interface for the IB-RCC is configured.
- BFD is enabled on the IB-RCC interface.
- The IES or VPRN interface is operationally up.
- The IB-RCC interface is not in use by another MC ring.
- The IB-RCC interface is on the port used for MC synchronization.
- The IB-RCC destination IP address is configured.
- The IB-RCC destination IP address is not the same as the IB-RCC source IP address.
- The IB-RCC destination IP address is not in the same subnet as the IB-RCC source IP address.
- The MVPLS or VPLS site is not configured as an endpoint for redundant spoke SDPs.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Ring Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of MC ring groups is displayed.

3 Select an MC ring group in the list and click on the Properties button. The MC Ring Group (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a Turn up the MC ring using the MC ring properties form.

Note — Using this method enables you to view real-time MC ring status information while the 5620 SAM turns up the MC ring.

i Click on the Properties button beside the Site ID parameter in the Multi-Chassis Ring on First Site panel. The MC Ring (Edit) form opens.

ii Click on the State tab button.

iii Set the Administrative State parameter to Up.

iv Click on the Apply button. A dialog box appears.

v Click on the Yes button. The 5620 SAM tries to turn up the MC ring.

vi View the dynamically updated information in the Operational State field.

vii Close the MC Ring (Edit) form.

viii Click on the Properties button beside the Site ID parameter in the Multi-Chassis Ring on Second Site panel. The MC Ring (Edit) form opens.

ix Repeat steps 4 a ii to vii.

b Turn up the MC ring using the navigation tree. Perform the following steps.

i Click on the Components tab button.

ii Right-click on the first site object and choose Turn Up from the contextual menu. A dialog box appears.

iii Click on the Yes button. The 5620 SAM tries to turn up the MC ring.

iv Right-click on the second site object and click on the Turn Up button. A dialog box appears.

v Click on the Yes button. The 5620 SAM tries to turn up the MC ring.

5 Close the MC Ring Group (Edit) form.

Procedure 45-5 To view the operational status of MC ring group components

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Ring Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of MC ring groups is displayed.

3 Select an MC ring group in the list and click on the Properties button. The MC Ring Group (Edit) form opens with the General tab displayed.

4 Click on the Properties button beside a site that hosts an MC ring. The MC Ring (Edit) form opens.

5 Click on the State tab button.

6 View the dynamically updated information in the Operational State field. The Operational State is one of the following:

- Unknown—the 5620 SAM cannot determine the operational state
- Shut Down—the MC ring is administratively down
- Config Error—the MC ring has a configuration error
- No Peer—the peer MC ring is not configured
- Connected—the MC ring is operational
- Broken—the RNCV check fails
- Local Broken—the MC ring site cannot connect to a ring node
- Conflict—the MC ring configuration conflicts with another configuration
- Testing Ring—an RNCV check is in progress
- Peer Down—the peer MC ring site is inoperable
- Waiting For Peer—the peer MC ring site is initializing

7 Click on the Components tab button.

8 Right-click on a ring node object and choose Properties from the contextual menu. The MC Ring Node (Edit) form opens with the General tab displayed.

9 Click on the State tab button.

10 View the dynamically updated information in the Local Operational State and Remote Operational State fields. The Operational State is one of the following:

- Unknown—the 5620 SAM cannot determine the operational state
- Not Provisioned—the ring node configuration is incomplete
- Config Error—the ring node is misconfigured
- Not Tested—no RNCV check result is available
- Testing—an RNCV check is in progress
- Connected—the ring node is operational
- Disconnected—the ring node cannot be reached

11 Close the MC Ring Node (Edit) form.

12 Close the MC Ring (Edit) form.

13 Close the MC Ring Group (Edit) form.

Procedure 45-6 To delete an MC ring group

Caution — Deleting an MC ring group removes all of the child objects that are associated with the MC ring group, such as the following:

- MC rings
- ring nodes

Ensure that you specify the correct MC ring group for deletion in this procedure.

Note 1 — You must set the administrative state of an MC ring to Down before you can delete the MC ring.

Note 2 — Before you can set the administrative state of an MC ring to Down, you must administratively disable each VPLS or MVPLS SAP in the ring, regardless of the path they use.

1 Choose Manage→Redundancy→Node Redundancy from the 5620 SAM main menu. The Manage Node Redundancy form opens.

2 Choose MC Ring Group (Multi-Chassis) from the object drop-down list and click on the Search button. A list of MC ring groups is displayed.

3 Select an MC ring group in the list and click on the Properties button. The MC Ring Group (Edit) form opens with the General tab displayed.

4 Click on the Properties button beside the Site ID parameter in the Multi-Chassis Ring on First Site panel. The MC Ring (Edit) form opens.

5 Click on the State tab button.

6 Set the Administrative State parameter to Down.

7 Click on the Apply button. A dialog box appears.

8 Click on the Yes button. The 5620 SAM shuts down the MC ring.

9 Close the MC Ring (Edit) form.

10 Click on the Properties button beside the Site ID parameter in the Multi-Chassis Ring on Second Site panel. The MC Ring (Edit) form opens.

11 Repeat steps 5 to 9.

12 Select the MC ring group in the list and click on the Delete button. A dialog box appears.

13 Click on the View Dependencies button. A Warning form opens.

14 View the dependency information.

15 Select the I understand the implications of this action check box.

16 Click on the Yes button. The 5620 SAM deletes the MC ring group and the corresponding configuration on each member site.

17 Close the Manage Node Redundancy form.

Policy management

62 — NAT policies

63 — Format and range policies

46 — Policies overview

46.1 Policies overview

The 5620 SAM supports the template-based creation of rules. These rules are called policies. The types of policies are:

- service management
- routing management
- network management
- 7250 SAS and Telco
- OmniSwitch QoS
- OmniSwitch Ethernet services

A 5620 SAM operator can distribute or delete policies on sites and NEs that are within their span of control.

Policies are global or local in scope. Global policies are created using the 5620 SAM. Local policies are instances of global policies that are assigned to individual NEs. Depending on the distribution mode of a local policy, when you modify a global policy using the 5620 SAM, the local instance is also updated to ensure that the policy instances are synchronized. If a local policy differs from the corresponding global policy because of changes to the global policy, a warning alarm is raised against the local policy. After a global policy is updated and distributed to the participating NEs, the 5620 SAM clears the mismatch alarms associated with the local policy.

To identify local and global policy mismatches, you can perform a policy audit that compares the local and global instances of a policy, and then review the differences. An audit can be performed on local policies of NEs that are in the user span of control and policies that the user license supports.

You can audit all policies in the network or on selected NEs in the following ways:

- by policy group
- by policy type
- by global policy

If there is a mismatch between a local policy instance and the global instance, an alarm is raised against the local policy. The 5620 SAM clears the alarms from previous audits if the mismatch condition no longer exists.

Warning — Alcatel-Lucent recommends that you change a policy on an NE using only the 5620 SAM or an OSS client. This ensures that there is no mismatch in policy IDs or policy configurations between the managed NEs and the 5620 SAM.

Creating or modifying a policy using a CLI may lead to inconsistencies in the policy configuration throughout the network. See Procedure 46-8 for information about identifying policy discrepancies using a policy audit.

Depending on the results of an audit, the mode of the local policy may change. If the audit discovers differences between the local and global policies, you can change the mode to allow only local configuration. When the audit discovers that the local policy and global policy match, the local mode can be changed to synchronize with global policies. For example, when you need the 5620 SAM to discover new NEs, set the mode parameter to local configuration only to ensure that unique policies are not modified when a global policy is updated. The audit results can be reviewed to determine whether a policy should remain local.

The 5620 SAM supports the partial distribution of global policies. Before a global policy is distributed to the NEs, the 5620 SAM determines whether the global policy, policy properties, and the policy entries are applicable for each NE to which the policy is to be applied. If an NE does not support the policy, property, or entry defined in a global policy, the policy is partially distributed to the NE. The inapplicable policy, property, or entry is not distributed to the NE. An alarm is not raised if a policy is partially distributed. When you use the 5620 SAM GUI or OSS, failure of distribution to an NE does not affect distribution to other NEs.

Global policies are created in draft mode. This allows operators to verify that the policy is correctly configured before they distribute the policy to the NEs. The 5620 SAM creates a global policy in draft mode for newly discovered local policies. When the policy is approved for distribution, you can change the mode to released, which also distributes the policy to existing local definitions. The 5620 SAM saves the latest released version of the global policy. You can monitor policy distribution using the Task Manager. See Procedure 3-15 for information about the Task Manager.

When there is no global policy associated with a local policy, the 5620 SAM automatically creates a global policy that is identical to the first discovered local policy. If the local policy is incomplete, the 5620 SAM creates an incomplete global policy. The following read-only parameters describe the initialization phases of a global policy:

- Discovery State
    - In Progress—The global policy is created as part of a specific NE resynchronization during the full NE resynchronization or NE discovery. The global policy does not yet match any local policy and is waiting for completion.
    - Completed—At the end of the full NE resynchronization, when the resynchronization is successful, the global policy is completely updated from the first discovered local policy.
    - Failed—At the end of the full NE resynchronization, if the resynchronization is not successful, the global policy is not updated from the first discovered local policy. A failed global policy is updated during the next successful full NE resynchronization, or the policy can be manually synchronized with a specific local policy. The global policy remains in the Failed state after a 5620 SAM server failure or activity switch.
    - Initialize—The global policy is created by SNMP trap notification. The global policy may need to be manually synchronized with the specific local policy.
    - N/A (default)—The global policy is created or modified by a 5620 SAM user.

- Origin
  - Site ID—The global policy is created as part of a specific NE resynchronization or by SNMP notification.
  - User Name—The global policy is created by a 5620 SAM user.

Note 1 — If you attempt to modify a global policy with an "In Progress" Discovery State, the following occurs:

- When discovery or full resynchronization of the NE is ongoing, the modification fails.
- When discovery or full resynchronization of the NE is completed, modifications using OSS proceed, although a warning appears and allows you to cancel the modification. If the modification is not cancelled, the Discovery State is changed to N/A, and the global policy is not updated to match the local policy.
- When a global policy is modified, the Discovery State is reset to N/A.

Note 2 — At any time during discovery or a full resynchronization, you can use the SyncTo method from OSS or synchronize the global policy from any local policy.

When a discovery or full resynchronization of an NE fails and there is no 5620 SAM server failure or activity switch, all global policies that are waiting for completion are changed to Failed for the Discovery State. If you start another full resynchronization of the failed NE, the 5620 SAM tries again to complete the global policies from the NE that is part of the resynchronization and which has the Failed or In Progress Discovery State. The 5620 SAM also attempts completion of the synchronization of global policies that have a Failed or an In Progress State until a server failure or an activity switch occurs.

Table 46-1 describes the recommended operator actions to recover global policies when the Discovery State remains In Progress or Failed.

Table 46-1 Actions to recover global policies

Discovery State	5620 SAM server failure	NE state	Recovery action
In Progress/Failed	No	Resync Failed	Retry a full resynchronization or synchronization from another local policy
In Progress/Failed	No/Yes	Removed/Unmanaged	Synchronization from another local policy
In Progress/Failed	Yes	Resync Completed	Synchronization from another local policy
In Progress/Failed	Yes	Resync Failed	Retry a full resynchronization and synchronization from another local policy

The 5620 SAM supports the ability to scale policy deployment. If you release a large global policy to multiple NEs using one deployer, you may degrade system performance. An operator can configure the maximum number of objects that a deployer can send. The 5620 SAM uses this value to calculate how many NEs can be deployed per deployer. The default value is 10 000 objects per deployer. Table 46-2 provides an example of possible parameter settings to deploy a global policy that contains 1000 objects.

In the example below, there is one deployer per site. When the parameter setting is less than the number of entries in the policy, the 5620 SAM does not use more than one deployer for one site. If the parameter setting is too high, the 5620 SAM uses one deployer for all sites which may impact system performance. See Procedure 46-10 for more information about configuring the maximum number of objects per deployer.

Table 46-2 Example of policy deployment

Policy distribution maximum number of objects per deployer	number of objects in a global policy	Maximum number of sites per deployer
0	—	All sites
1	—	1 site
500	1000	1 site
1000	1000	1 site
5000	1000	5 sites
10 000	1000	10 sites
100 000	1000	100 sites

Service management policies specify how service traffic is handled by network resources such as interfaces, ports, daughter cards, and circuits. The policies can be used by multiple resources on multiple services. Service management policies include access ingress, access egress, MSAP policies, and network policies.

Routing management policies specify routing configuration according to specifically defined parameters. The 5620 SAM supports the following routing management policy types:

- routing
- MPLS administrative group
- VRRP priority control

Service and routing management policies are globally and seamlessly distributed to devices when they are used by resources on the device. They can also be manually distributed to devices. Subsequent changes to policies are distributed and affect all participating resources. Policy configurations can also be changed locally when you configure a network resource, for example, during service configuration or modification. These changes do not affect the global policy.

Network management policies specify how the 5620 SAM communicates with network resources, handles alarms, manages statistics, and stores information. Examples of network management policies are alarm, mediation, and accounting policies.

7250 SAS and Telco policies specify how 7250 SAS and Telco devices are configured and used to provide BTV VLAN, L2 VPN VLANs, and super-VLAN Internet services.

OmniSwitch QoS and Ethernet service policies specify how OmniSwitch devices are configured and used to provide VLAN and SVLAN services.

Time of day policies consist of time range policies and time of day suite policies. Time range policies specify multiple schedules (start and end dates and times) that you can assign to time of day suites or to ACL filter entries. A time of day suite policy is a collection of policies, such as ACL filters, access ingress and egress, and QoS schedulers, to which a time range policy has been assigned. In addition, you can assign time of day suite policies to aggregation schedulers and L2 and L3 access interfaces.

Table 46-3 describes the policies that are configured using the 5620 SAM. Unless otherwise stated in the table, the policies are described in more detail in this volume.

Table 46-3 5620 SAM Policy Types

Policy	Applied to	Description	Menu option
7210 Access Egress	Access port	Defines up to eight forwarding class queues and queue parameters for traffic classification. Defines forwarding class to remarking values. Maps forwarding classes to the queues.	Policies→QoS→SROS QoS→Access Egress→7210 Access Egress. See Procedure 47-5.
7210 Access Ingress	Access SAP	Defines up to 18 forwarding class meters and meter parameters for traffic classification. Defines match criteria to map flows to the meters based on any one of the criteria (IP or MAC).	Policies→QoS→SROS QoS→Access Ingress→7210 Access Ingress. See Procedure 47-2.
7210 Network	Uplink port	Defines ingress Dot1p to forwarding class mapping and profile state. Defines the egress queuing parameters associated with each forwarding class.	Policies→QoS→SROS QoS→Network→7210 Network. See Procedure 47-7.
7210 Network [(1)]	Network port [(1)]	Defines ingress Dot1p or DSCP value mapping to forwarding classes. Defines unicast meters. Only unicast meters with range 1-8 are allowed. Defines the egress forwarding class to Dot1p or DSCP value markings. Remarking of QoS bits.	Policies→QoS→SROS QoS→Network→7210 Network. See Procedure 47-7.

(1 of 7)

Policy	Applied to	Description	Menu option
	Network interface (1)	Defines ingress LSP-Exp value mapping to forwarding classes. Defines forwarding class to meter mapping. Defines unicast or multicast meter. Multicast meters are only supported for interface type policy. Defines the egress forwarding class to LSP-Exp value markings. Remarking of QoS bits.	
7210 Network Queue	Uplink port	Defines forwarding class mappings to network queues and queue characteristics for the queues	Policies→QoS→SROS QoS→Network Queue→7210 Network Queue. See Procedure 47-13.
7210 Port Scheduler	Access and uplink ports	Defines the parameters for the port scheduler	Policies→QoS→SROS QoS→Scheduler→7210 Port Scheduler. See Procedure 47-19.
7210 Slope	Access and uplink ports	Enables or disables the high-slope and low-slope parameters in the egress pool	Policies→QoS→SROS QoS→Slope→7210 Slope. See Procedure 47-9.
7250 SAS and Telco Node QoS Level	7250 SAS and Telco devices and ports	Defines QoS policies applied to a 7250 SAS or Telco device.	Policies→QoS→7250 SAS and Telco QoS. See Procedure 47-35.
7250 SAS and Telco ACL Standard IP	7250 SAS and Telco devices and ports	Controls network traffic on 7250 SAS or Telco VLANs based on IP address and subnet mask matching criteria.	Policies→Filter→7250 SAS and Telco ACL Standard IP Filter. See Procedure 48-4.
7250 SAS and Telco ACL Extended IP	7250 SAS and Telco devices and ports	Controls network traffic on 7250 SAS or Telco VLANs based on several IP matching criteria.	Policies→Filter→7250 SAS and Telco ACL Extended IP Filter. See Procedure 48-5.
7250 SAS and Telco ACL IGMP	7250 SAS and Telco devices and ports	Manages how BTV host devices access multicast BTV streams.	Policies→Filter→7250 SAS and Telco ACL IGMP Filter. See Procedure 48-6.
7250 SAS and Telco ACL MAC	7250 SAS and Telco devices and ports	Controls network traffic on 7250 SAS or Telco VLANs based on MAC matching criteria.	Policies→Filter→7250 SAS and Telco ACL MAC Filter. See Procedure 48-7.
7705 SAR Fabric	Daughter cards on the 7705 SAR	7705 SAR Fabric Profile policies specify the fabric shaping rate (kb/s) to the daughter card in the slot specified by the rate.	Policies→QoS→SROS QoS→7705 SAR Fabric. See Procedure 47-24.
802_1X	Ethernet ports	Defines the RADIUS server authentication policy for Ethernet ports	Policies→Ethernet→802_1x. See Procedure 54-1.
9500 MPR QoS	Access interface	Defines ATM classification, policing, and marking	Policies→QoS→9500 MPR QoS→9500 ATM QoS. See Procedure 47-32.
Accounting	Network interface Access interface Circuit	Manages accounting policies.	Tools→Statistics→Accounting. See the *5620 SAM Statistics Management Guide* for more information.
Access Egress	Access interface	Defines egress classification, policing, shaping, and marking on the egress side of the interface	Policies→QoS→SROS QoS→Access Egress→Access Egress. See Procedure 47-3.

(2 of 7)

Policy	Applied to	Description	Menu option
Access Ingress	Access interface	Defines ingress classification, policing, shaping, and marking on the ingress side of the interface	Policies→QoS→SROS QoS→Access Ingress→Access Ingress. See Procedure 47-1.
ACL IP Filter	Network interface Access interface Circuit	Controls network traffic into or out of an interface or circuit based on IPv4 matching criteria	Policies→Filter→ACL IP Filter. See Procedure 48-1.
ACL IPv6 Filter	Network interface Access interface Circuit	Controls network traffic into or out of an interface or circuit based on IPv6 matching criteria	Policies→Filter→ACL IPv6 Filter. See Procedure 48-2.
ACL MAC Filter	Access interface Circuit	Controls network traffic into or out of an interface or circuit based on MAC matching criteria	Policies→Filter→ACL MAC Filter. See Procedure 48-3.
Admin Group (MPLS)	MPLS interfaces LSPs LSP paths	Configures MPLS administrative groups and defines the groups to which an MPLS interface, LSP, or LSP path belongs.	Policies→MPLS→ Administrative Group. See Procedure 30-17.
Alarm	Alarm logs Alarms	Defines how the 5620 SAM handles individual incoming alarms, and how alarm logs are created and stored.	Administration→Alarm Settings. See Procedures 37-1, 37-2, 37-3 and 37-7.
ATM QoS	Access interface	Defines ATM ingress and egress classification, policing, shaping, and marking	Policies→QoS→SROS QoS→ATM QoS. See Procedure 47-31.
BGP Peering	Residential subscriber host	Applies BGP peering configuration to residential subscriber host.	Policies→Residential Subscriber. See Procedure 68-10.
Connection Profile	ATM channel	Defines a list of VPI/VCI pairs	Policies→ATM→Connection Profile. See Procedure 57-1.
Diameter	Residential Subscriber	Specifies common diameter protocol parameters to be inherited by associated diameter peers.	Policies→Residential Subscriber. See Procedure 68-11.
Egress Multicast Group	VPLS instance	Creates an EMG to which SAPs can be applied on the access port of a VPLS	Policies→Multicast→Egress Multicast Group. See Procedure 49-1.
Egress Queue Group Template	Access interface	Used for Access Egress Queue Group and Network Egress Queue Group creations on Ethernet ports	Policies→QoS→SROS QoS→Queue Group→Egress Template. See Procedure 47-23.
Ethernet CFM	Ethernet services	Defines the Maintenance Domain for Ethernet services (VPLS, EPIPE, VPRN and IES) including SAP and SDP bindings	Tools→Ethernet CFM→Maintenance Domain. See Procedure 80-1.

(3 of 7)

Policy	Applied to	Description	Menu option
Ethernet Service	SAPs and UNI ports	A SAP is associated with a stacked VLAN service. A SAP profile defines values for ingress bandwidth sharing, rate limiting, customer VLAN tag processing (translate or preserve), and priority mapping (inner to outer tag or fixed value). A UNI profile is associated with a UNI port and configures how a variety of protocol control packets are processed on the UNI port. Processing actions include Tunnel, Drop, Peer, and MAC Tunnel.	Policies→Ethernet→AOS Ethernet Service. See Procedures 56-1 and 56-2
File	—	Manages files on the device. See the *5620 SAM Statistics Management Guide* for more information.	Tools→Statistics→File Policies See the *5620 SAM Statistics Management Guide* for more information.
Format Policy	All services, LSPs, L2 and L3 access interfaces	Specifies the text format of names and descriptions of services, LSPs, L2 and L3 access interfaces. Format policies must be associated with users and user groups.	Administration→Format and Range. See Procedure 63-1.
IGMP	Subscriber profile	Associates subscriber profiles with static multicast group and static source IP addresses.	Policies→Residential Subscriber. See Procedure 68-9.
IKE Policy	IPsec tunnels IPsec gateways	Create and configure IKE policies.	Policies→ISA Policies→IKE. See Procedure 35-1.
Ingress Queue Group Template	Access interface	Used for Access Ingress Queue Group creation on Ethernet access ports	Policies→QoS→SROS QoS→Queue Group→Ingress Template. See Procedure 47-22.
ISA-IPSec Transform and IPsec security	IPsec tunnels IPsec security associations IPsec tunnel templates	Create and configure IPsec transform policies and IPsec security policy.	Policies→ISA Policies→IPSec Transform. See Procedures 35-2, 35-4, and 35-5.
ISA-IPSec Static Security Association	OSPFv3 interfaces Virtual links	Create and configure IPsec static security association policies.	Policies→IPSec Static Security Association. See Procedure 35-3.
ISA-IPSec Tunnel Template	IPsec gateways	Create and configure IPsec transform policies.	Policies→IPSec Tunnel Template. See Procedure 35-4.
LSP Template MVPN (MPLS)	P2MP LSPs	Configures and manages P2MP LSPs.	Policies→MPLS→LSP Template MVPN. See Procedure 32-23.
Manage auto tunnel rules	—	Create and configure auto-tunnel rules	Policies→Auto Tunnels→Auto Tunnel Rules. See Procedures 52-2, 52-3, 52-4, 52-5, 52-6, 52-7, 52-8 and 52-9.
Manage rule-based tunnels	—	Create and configure rule-based tunnel policies	Policies→Auto Tunnels→Rule-Based Groups. See Procedure 52-1.
Mediation	5620 SAM	Defines how the 5620 SAM polls the network.	Administration→Mediation. See Procedure 14-4.

(4 of 7)

Policy	Applied to	Description	Menu option
MCFR Ingress QoS Profile	MLFR bundles	Create and configure user-defined ingress QoS profiles for MLFR bundles.	Policies→QoS→SROS QoS→MCFR→Ingress QoS Profile. See Procedure 47-42.
MCFR Egress QoS Profile	MLFR bundles	Create and configure user-defined egress QoS profiles for MLFR bundles.	Policies→QoS→SROS QoS→MCFR→Egress QoS Profile. See Procedure 47-43.
MC MLPPP Ingress QoS Profile	APS and ASAP MLPPP bundles	Create and configure user-defined ingress QoS profiles for MC MLPPP bundles.	Policies→QoS→SROS QoS→MLPPP→Ingress QoS Profile. See Procedure 47-40.
MC MLPPP Egress QoS Profile	APS and ASAP MLPPP bundles	Create and configure user-defined egress QoS profiles for MC MLPPP bundles.	Policies→QoS→SROS QoS→MLPPP→Egress QoS Profile. See Procedure 47-41.
MSAP	Capture SAPs L2 access interfaces MSAPs L2 and L3 access interfaces	Specifies how parameters are applied in the creation of an MSAP.	Policies→Residential Subscriber. See Procedure 68-5.
Multicast Package	Broadcast TV VLAN services	Defines the set of broadcast channels that are multicast across a ring group in a BTV VLAN.	Policies→Multicast→Multicast Package. See Procedure 49-9.
Multicast Package	VPLS instance	Assigns a common set of multicast groups to all 7450 ESSs or 7750 SRs in an MVR VPLS.	Policies→Multicast→Multicast Package. See Procedure 49-9.
NAT	Routing instances	Create and configure NAT for use in IES and VPRN services.	Policies→ISA Policies→NAT Policy. See Procedure 62-1.
Named Pool Buffer	Network daughter card and network port	Allows the operator to override the default pool allocation behavior	Policies→QoS→SROS QoS→Buffer Pool→HSMDA Pool. See Procedure 47-27. Policies→QoS→SROS QoS→Buffer Pool→Named Buffer Pool. See Procedures 47-21 and 47-28.
NE Deployment, Backup, Software Upgrade	5620 SAM	Defines how the 5620 SAM communicates with the network.	Administration→NE Maintenance. See Section 23.1 for more information.
Network	Network interface	Defines egress QoS marking and ingress QoS interpretation for traffic on core network IP interfaces	Policies→QoS→SROS QoS→Network→Network. See Procedure 47-6.
Network Queue	Network daughter card Network port	Defines the default burst allocations for queues based on the queue's forwarding class	Policies→QoS→SROS QoS→Network Queue→Network Queue. See Procedure 47-12.
PBB MRP	Ethernet ports	Limits the scope of MMRP advertisements to a specific network domain using ISID-based filters for both the MMRP control plane and the B-VPLS data plane	Policies→Ethernet→PBB MRP. See Procedure 55-1.
Policer Control	Ingress or egress SAPs Subscriber Contexts	Provides control hierarchy for policer objects configured on SAPs or subscriber contexts	Policies→QoS→SROS QoS→Scheduler→Policer Control. See Procedure 47-20.

(5 of 7)

Policy	Applied to	Description	Menu option
Policy Sync Group	AA Group Policy	Designate an AA group policy as the master policy and add one or more AA group policies to Policy Sync Group members. Overwrite or add the contents of the master policy to one or more of its members.	Policies→Policy Sync Group. See Procedure 77-4.
Port Scheduler	Egress ports and channels	Defines hierarchical bandwidth allocation and scheduling at the egress port level.	Policies→QoS→SROS QoS→Scheduler→Port Scheduler. See Procedure 47-18.
PW Template	PE routers used for VPLS services	Enables a VPLS PE router to discover the other PE routers that are part of the same VPLS domain or in another BGP VPLS.	Manage→Service→Service PW Template Policies.
QoS	VLAN and stacked VLAN services	QoS policies are used for traffic prioritization, bandwidth shaping, and Layers 2, 3, and 4 filtering.	Policies→QoS→AOS QoS Policies. See Procedures 47-36, 47-37, 47-38 and 47-39 for more information.
RADIUS Accounting Policy	Subscriber profiles	Sends accounting information to the RADIUS server when a subscriber logs in or logs out of a session	Policies→RADIUS Based Accounting. See Procedure 53-1.
Range Policy	All services, LSPs, L2 and L3 access interfaces	Specifies the ID number range for services, LSPs, L2 and L3 access interfaces. Range policies must be associated with users and user groups.	Administration→Format and Range. See Procedure 63-2.
RCA Audit Policy	VLL, VPLS, and VPRN services and physical links	Associates RCA audit policies to VPRN, VPLS, and VLL services and to physical links.	Policies→Network and Service Audits. See Procedure 81-1.
Remote Network Monitoring	5620 SAM	Maps remote network monitoring events to information alarms in the 5620 SAM GUI.	Tools→Remote Network Monitoring (RMON). See Procedure 60-1.
Routing	Routing instance	Manages route policies.	Policies→Routing→Statement. See Procedure 30-11. Policies→Routing→Prefix List. See Procedures 30-12 and 30-16 Policies→Routing→Community. See Procedures 30-13 and 30-16. Policies→Routing→Damping. See Procedures 30-14 and 30-16. Policies→Routing→AS Path. See Procedure 30-15.
Scheduler	Access ingress interface Access egress interface	Defines hierarchical rate limiting and scheduling to govern queue scheduling	Policies→QoS→SROS QoS→Scheduler→Scheduler. See Procedures 47-15 and Section 64.5. Policies→QoS→SROS QoS→Scheduler→HSMDA Scheduler. See Procedure 47-16.

(6 of 7)

Policy	Applied to	Description	Menu option
Shared Queue	Network daughter card	Defines distribution of traffic over core network	Policies→QoS→SROS QoS→Shared Queue. See Procedure 47-14.
Shared Risk Link Group (MPLS)	MPLS interfaces LSP paths	Configures Shared Risk Link Groups and associates the groups to one or more MPLS interfaces.	Policies→MPLS→ Shared Risk Link Group. See Procedures 30-18 and 30-19.
Slope	Access port Network daughter card Network port	Defines RED slope behavior	Policies→QoS→SROS QoS→Slope→WRED Slope. See Procedure 47-8. Policies→QoS→SROS QoS→Slope→HSMDA WRED Slope. See Procedure 47-10.
Subscriber identification	SAP	Associates residential subscriber hosts with subscribers for the allocation of network resources.	Policies→Residential Subscriber. See Procedure 68-15.
Time of Day Suite	Aggregation scheduler policies and L2 and L3 access interfaces	A collection of policies, such as ACL filters, access ingress and egress, and QoS schedulers, to which time range policies have been assigned	Policies→Time of Day→Time Of Day Suite. See Procedure 50-2.
Time Range	Time of day suite policy entries and ACL filter policy entries	Specifies multiple schedules that can be used by time of day suite policies or ACL filter policies	Policies→Time of Day→Time Range. See Procedure 50-1.
VRRP	VRRP instance	Applies a VRRP priority-control policy to non-owner VRRP instances in a virtual router.	Policies→VRRP. See Procedure 51-1.

(7 of 7)

Note

(1) Applies to the 7210 SAS-M24F, Release 1.1 R4 or later, 7210 SAS-M24F2XFP, and 7210 SAS-M24F2XFP [ETR].

You can apply policies to resources during service creation or modification. You can also apply policies to resources before or after configuring the service by choosing and modifying the resource from the Manage Equipment or Manage Services form.

Policy distribution

The 5620 SAM supports the template-based creation of rules which are called policies. The types of policies are:

- service management
- routing management
- network management
- 7250 SAS and Telco
- OmniSwitch QoS
- OmniSwitch Ethernet services

Policy overrides

With some policy types, you can use the 5620 SAM to configure a policy override that allows you to change or override the default settings associated with the policy.

For policy types that allow multiple overrides to be configured, the Override Policy Items tab on the policy creation form displays all of the subordinate override policies that are configured on the policy. Each override policy is displayed on their own sub-tabs under the Override Policy Items tab. The override policies that appear on the GUI are dynamic, based on the policy type to be configured.

The following policy types aggregate all subordinate override policies on the Override Policy Items tab.

- SLA Profile policies
- Subscriber Profiles policies
- Port policies
- Services (SAP) policies
- HSMDA Scheduler policies

46.2 Workflow to create and assign policies

1. Create the required policies. Table 46-3 describes the policies that are configured using the 5620 SAM.
2. Distribute the policies. See Procedure 46-1 for more information.

Note 1 — You do not need to explicitly distribute a policy; a policy is distributed to a device when it is assigned to a resource on the device.

Note 2 — When you distribute a policy to a 7705 SAR, all values within that policy must be supported by that 7705 SAR; otherwise, the distribution of the policy to that 7705 SAR is blocked.

3. Assign policies to resources during service configuration or modification. See Chapter 64 for more information.

46.3 Policies procedures

Use the following procedures to perform 5620 SAM policies tasks.

Procedure 46-1 To distribute a policy

Use this procedure to manually distribute policies used by network resources and to configure the distribution mode of local policies. Policies are also distributed to a device when the policy is assigned to a resource on that device.

When you distribute a global policy, local policies using the Sync With Global distribution mode allow the NE to receive the policy.

Note — Local policies using the Local Edit Only distribution mode do not allow the NE to receive the distribution of a global policy. You must ensure that the policy distribution mode for the local policy is set to Sync With Global if you want the NE to receive the distribution of a global policy.

1 Choose Policies→*Policy Type* from the 5620 SAM main menu, where *Policy Type* is the type of policy that you want to distribute. The appropriate policies manager form opens.

2 Choose Global from the Policy scope drop-down menu.

3 Click on the Search button.

4 Choose the policy or policies that you want to distribute.

5 When the policy is in draft configuration mode, the Distribution button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution by performing one of the following:

- **a** To release a from a *Policy_Type* Global (Edit) form, click on the Properties button. The *Policy_Type* Global (Edit) form opens.
- **b** To release a policy from a policies manager form, click on the Release button. Go to step 10.
- **c** If the policy has previously been released, go to step 10.

Warning — When you switch the configuration mode of the global policy to released, the policy is distributed to existing local definitions.

6 Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears.

7 Click on the Yes button. The policy configuration mode changes to Released.

8 View the local policy, if necessary, by clicking on the Local Definitions tab button and double-clicking on the local policy in the list.

9 Close the local policy form.

10 Click on the More Actions button and choose Distribute. The Distribute form opens.

11 Select one or more rows in the Available Nodes list.

12 Click on the right arrow button. The chosen site or sites move to the Selected Nodes panel on the right side of the form.

13 Click on the Distribute button. The policy is distributed to the site or sites.

A progress bar at the lower right of the GUI displays the overall percentage of distribution progress completion to the selected sites. Distribution states (In Progress, Succeeded, or Failed) for individual sites are shown in the Status column for the Selected Nodes.

Note — Distribution failures are reported in a pop-up message. You can view the error message to determine the cause of the failure and which NE or NEs were affected. Distribution failures are also reported using JMS.

14 Close the Distribute form. The policy manager form reappears.

15 View the devices to which a policy is distributed.

- **i** Choose the policy.
- **ii** Click on the Properties button. The policy form opens.
- **iii** Click on the Local Definitions tab button. The device information for the chosen policy is displayed.

16 Configure the distribution mode of the local definitions by performing the following:

- **i** Click on the More Actions button and choose Distribution Mode. The Distribution Mode - *Policy* form opens.
- **ii** Choose Sync With Global, Local Edit Only, or All from the Distribution Mode parameter drop-down menu. The sites that are configured with the selected distribution mode are listed.
- **iii** Choose one ore more rows from the Available Nodes list.
- **iv** Click on the right arrow button. The chosen site or sites move to the Selected Nodes panel on the right side of the form.
- **v** Depending on the distribution mode of the chosen site or sites, perform one of the following steps:
    - Click on the Sync With Global button.
    - Click on the Local Edit Only button.
- **vi** Close the Distribution Mode - *Policy* form. The policy manager form reappears.

17 To distribute additional policies, perform steps 4 to 15.

Procedure 46-2 To modify a policy

Use this procedure to change existing policies and entries within policies using the 5620 SAM client GUI. Alternatively, you can use the CLI. The changes are applied immediately to all resources where the policy is applied.

When you modify policy match criteria, for example, the IP match criteria for an access ingress policy, click on the Refresh button to ensure that the 5620 SAM client GUI displays the latest set of match criteria.

1 Choose Policies→*Policy Type* from the 5620 SAM main menu, where *Policy Type* is the type of policy that you want to edit.

The Manage *Policy Type* form opens.

2 Choose Global from the Policy scope drop-down menu.

3 Click on the Search button. A list of search results is displayed on the form.

4 Choose the policy that you want to edit.

5 Click on the Properties button. The policy configuration form opens.

6 Perform one of the following:

a If the configuration mode of the policy is set to Released, go to step 7

b If the configuration mode of the policy is set to Draft, configure the parameters, as required, and go to step 13.

7 Configure the parameters, if required. When you modify the configuration, the 5620 SAM changes the configuration mode of the policy to Draft.

8 When you modify filter entries for policies with filters, click on the appropriate tab button and click on the Refresh button to list the filter entries.

9 Click on the Apply button. A dialog box appears.

10 Click on the Yes button.

11 Perform one of the following steps:

a Compare the global policy with the existing local definitions to verify whether you need to reset the policy configuration to the previously released global policy configuration. Perform steps 8 to 10 of Procedure 46-9.

b Go to step 12.

12 Perform one of the following steps:

a Click on the Action button and choose Reset to Released to reset the global policy configuration to the last released configuration of the policy and to cancel any modifications you entered in step 7. Go to step 15.

b Go to step 13.

13 Click on the Switch Mode button beside the Configuration Mode parameter to release the policy for distribution, if required. A dialog box appears.

14 Click on the Yes button. The policy is distributed to existing local definitions.

15 Click on the Local Definitions tab button to view the local instances of the global policy.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The policy configuration form closes and the policy manager form reappears.

18 Close the policy manager form.

Procedure 46-3 To delete a policy

Each service SAP and network interface is associated, by default, with the appropriate ingress, egress, or network policy (ID 1). You can replace the default policy with a customer-configured policy, but you cannot entirely remove a QoS policy. When you remove a QoS policy from a SAP or IP interface, the policy association reverts to the default policy (ingress or egress policy ID 1). The default policy cannot be deleted.

A QoS, ACL, or an AA transit IP policy cannot be deleted until it is removed from the all SAPs or network ports where it is applied. When a policy is deleted, it is removed from the 5620 SAM, including the database and all devices.

Do not delete a routing policy from an NE that is associated with one or more services. Multiple services on the NE may use the policy.

1 Choose Policies→*Policy Type* from the 5620 SAM main menu, where *Policy Type* is the type of policy that you want to delete.

The Manage *Policy Type* form opens.

2 Choose Local or Global from the Policy scope drop-down menu. When you set it to Local, you can specify the Local Node IP Address parameter and choose a device by using the Select button and selecting a device in the list.

3 Click on the Search button. A list of search results is displayed in the bottom panel of the form.

4 Choose the policy that you want to delete.

5 Click on the Delete button. A dialog box appears.

6 Click on the Yes button. The policy configuration form closes and the policy manager form reappears. The policy is removed from the policy list.

Procedure 46-4 To copy or overwrite a policy

You can copy an existing QoS policy, rename the policy with a new QoS policy ID, or overwrite an existing policy ID.

1 Choose Policies→*QoS*→*Policy Type* from the 5620 SAM main menu, where *Policy Type* is the type of policy that you want to copy or overwrite.

The Manage *Policy Type* form opens.

2 Choose Local or Global from the Policy scope drop-down menu. When you set it to Local, you can specify the Local Node IP Address parameter and choose a device by using the Select button and selecting a device in the list.

3 Click on the Search button. A list of search results is displayed.

4 Choose the policy that you want to copy or overwrite.

5 Click on the Properties button. The Policy Type (Edit) form opens.

6 Click on the Action button and choose Copy. The Policy Type (Create) form opens.

7 Configure the parameters as required.

8 Click on the Ok button. The Policy Type (Create) form closes and the Policy Type (Edit) reappears.

9 Close the Policy Type (Edit) form. The Manage *Policy Type* form reappears. The new policy is displayed in the list.

10 Close the Manage *Policy Type* form.

Procedure 46-5 To synchronize a policy

You can use the synchronize function to specify the local policy entry as global and redistribute it across all deployed associations. For example, if a policy is distributed to a wide range of devices and on one of these devices the policy was changed, you can use the synchronize command to synchronize the policy on the device and on the 5620 SAM. You must then distribute the policy to all participating devices, as described in Procedure 46-1.

Note — When you synchronize a policy that is in draft mode, the policy is not distributed to existing local definitions. When you synchronize a policy that is in released mode, the 5620 SAM sets the policy to draft mode. You must set the Configuration Mode parameter to Released to distribute the policy to existing local definitions. Only local policies that have the Distribution Mode parameter set to Sync With Global are affected.

1 Choose Policies→*Policy Type* from the 5620 SAM main menu, where *Policy Type* is the type of policy that you want to synchronize.

The Manage *Policy Type* form opens.

2 Choose Local or Global from the Policy scope drop-down menu. When you set it to Local, you can specify the Local Node IP Address parameter and choose a device by using the Select button and selecting a device in the list.

3 Click on the Search button. A list of search results is displayed.

4 Choose the policy or policies that you want to synchronize.

5 Click on the Synchronize button. The Synchronize form opens.

6 Choose the device to which the policy is to be synchronized from the Available Nodes list.

7 Click on the right arrow button. The chosen device moves to the panel on the right side of the form.

8 Click on the Synchronize button.

9 Click on the Cancel button to close the form.

Procedure 46-6 To perform a policy audit for policy groups and types

An audit compares all local policies with the associated global policies. A policy audit can be performed on all NEs in the network, or limited to a specific NE or group of NEs. All NEs are included in the audit unless they are explicitly chosen. A policy audit can be performed on policy groups and policy types. A policy audit cannot be started when another policy audit is in progress.

Caution — If policy types, global policies are not specified, all policies for which the user has licensing permissions are included in the policy audit.

If NEs are not specified, all NEs that are in the user's span of control are included in the policy audit.

Performing a policy audit may take one or more hours to complete.

Note — Validation is performed to prevent policies from being audited if licensing and span of control prohibits.

If a user performs an audit on objects that are not within their span of control, or they do not have licensing permissions, the audit is aborted and a error message opens. The error message indicates which objects are prohibited.

1 Choose Tools→Policies Audit from the 5620 SAM main menu. The Policy Audit - audit status (Edit) form opens with the General tab displayed.

2 Configure the parameters:

- Include Non Applicable Attributes
- Set to "Local Edit Only" upon finding of differences
- Set to "Sync with Global" upon finding of no differences

Note — The Set to "Local Edit Only" upon finding of differences and Set to "Sync with Global" upon finding of no differences parameters are configurable when the Include Non Applicable Attributes parameter is set to disabled.

3 Perform one of the following steps:

   a To choose policy groups and policy types to be included in the audit, go to 4.

   b If all policy groups and policy types are included in the audit, go to step 10 to set which NEs to include in the audit.

   c If all policy groups and policy types and the entire network is included in the audit, go to step 11.

4 Click on the Policy Group Selection tab button.

5 Right-click on the Policy Audit icon and choose Select Policy Groups from the contextual menu. The Select Policy Groups form opens.

6 Select policy groups as required and click on the OK button. The chosen policy group keys appear below the Policy Audit icon.

7 Perform one of the following steps:

   a If all policy types within the selected groups are included in the audit, go to step 10.

   b To choose which policy types within the selected groups are included in the audit, go to step 8.

8 Right-click on a policy group icon and choose Select Policy types from the contextual menu. The Select Policy types - Policy Audit form opens.

9 Select policy types as required and click on the OK button. The chosen policy type icons appear below the Policy Audit icon.

10 Select NEs to include in the audit, if required.

   i Click on the Network Element Selection tab to select an NE, or group of NEs to be audit.

   ii Click on the Add button. The Select Site form opens.

   iii Click on the Search button. A list of NEs is displayed.

   iv Click on the NEs to be included in the audit.

   v Click on the OK button. The Policy Audit *audit_status* (Edit) form refreshes to display a list of NEs.

11 Click on the Start Audit button.

To interrupt the audit while it is in progress, click on the Stop Audit button.

12 Close the Policy Audit form after the audit finishes.

13 A discrepancy between a global policy and a local instance of the policy generates an alarm. Monitor the dynamic alarm form to view alarms that are generated as a result of the policy audit.

Note — The distribution mode of a local policy may change depending on the parameters set in step 2.

14 Double-click on the alarm in the alarm form. The Alarm Info form opens.

15 Click on the View Alarmed Object button. The Global Policy (Edit) form opens.

16 Perform steps 8 and 12 of Procedure 46-9 to locate the discrepancies between the local and global policies.

17 Close the local and global *Policy_type* (Edit) forms.

Procedure 46-7 To perform a policy audit for multiple global policies with same type

An audit compares all local policies with the associated global policies. A policy audit can be performed on all NEs in the network, or limited to a specific NE or group of NEs. All NEs are included in the audit unless they are explicitly chosen. A policy audit can be performed on one or multiple global policies with the same type. A policy audit cannot be started when another policy audit is in progress.

Caution — If NEs are not specified, all NEs that are in the user's span of control are included in the policy audit.

Note — Validation is performed to prevent policies from being audited if licensing and span of control prohibits.

If a user performs an audit on objects that are not within their span of control, or they do not have licensing permissions, the audit is aborted and a error message opens. The error message indicates which objects are prohibited.

1 Choose Policies→ *Policy_Type* from the 5620 SAM main menu, where *Policy_Type* is the type of policy that you want to audit. The appropriate policies manager form opens.

2 Click on the Search button. A list of policies is displayed.

3 Choose one or multiple policies in the list.

4 Click on the Policy Audit button. A Policy Audit (Edit) form opens with the Global Policy Selection tab displayed and the selected policies listed.

5 Click on the Add button. The Select Policies form opens, displaying a list of global policies to be audited.

6 Select a policy or multiple policies in the list.

7 Click on the OK button. The Policy Audit (Edit) form is refreshed with the selected policies.

8 Click on the General tab button.

9 Configure the parameters:

- Include Non Applicable Attributes
- Set to “Local Edit Only” upon finding of differences
- Set to “Sync with Global” upon finding of no differences

Note — The Set to “Local Edit Only” upon finding of differences and Set to “Sync with Global” upon finding of no differences parameters are configurable when the Include Non Applicable Attributes parameter is set to disabled.

10 Perform one of the following:

a To audit selected global policies on the entire network, go to step 12.

b To audit selected global policies on selected NEs go to step 11.

11 Select NEs to include in the audit, if required.

i Click on the Network Element Selection tab to select an NE, or group of NEs to be audit.

ii Click on the Add button. The Select Site form opens.

iii Click on the Search button. A list of NEs is displayed.

iv Click on the NEs to be included in the audit.

v Click on the OK button. The Policy Audit (Edit) form refreshes to display a list of NEs.

12 Click on the Start Audit button to proceed with the policy audit.

To interrupt the audit while it is in progress, click on the Stop Audit button.

13 A discrepancy between a global policy and a local instance of the policy generates an alarm. Monitor the dynamic alarm window to view alarms that are generated as a result of the policy audit.

14 Double-click on the alarm in the alarm window. The Alarm Info form opens.

15 Click on the View Alarmed Object button. The Global Policy (Edit) form opens.

16 Perform steps 8 and 12 of Procedure 46-9 to locate the discrepancies between the local and global policies.

17 Close the local and global *Policy_type* (Edit) forms.

Procedure 46-8 To perform a policy audit for global policy

An audit compares all local policies with the associated global policy. A policy audit can be performed on all NEs in the network, or limited to a specific NE or group of NEs. All NEs are included in the audit unless they are explicitly chosen. A policy audit cannot be started when another policy audit is in progress.

Caution — If NEs are not specified, all NEs that are in the user's span of control are included in the policy audit.

Note — Validation is performed to prevent policies from being audited if licensing and span of control prohibits.

If a user performs an audit on objects that are not within their span of control, or they do not have licensing permissions, the audit is aborted and a error message opens. The error message indicates which objects are prohibited.

1 Choose Policies→ *Policy_Type* from the 5620 SAM main menu, where *Policy_Type* is the type of policy that you want to audit. The appropriate policies manager form opens.

2 Click on the Search button. A list of policies is displayed.

3 Select a policy in the list.

4 Click on the Properties button. The *Policy_Name* Global Policy (Edit) form opens.

5 Click on the Local Definitions tab button. A list of local policies is displayed.

6 Perform one of the following:

a To audit a specific local policy or a group of local policies, go to step 7.

b If all local policies in the list are included in the audit, go to step 8.

7 Select one or multiple local policies that you want to include in the audit.

8 Click on the Policy Audit button. A Policy Audit (Edit) form opens with the Network Element Selection tab displayed and a list of NEs corresponding to the selected local policies.

9 Click on the General tab button.

10 Configure the parameters:

- Include Non Applicable Attributes
- Set to "Local Edit Only" upon finding of differences
- Set to "Sync with Global" upon finding of no differences

Note — The Set to "Local Edit Only" upon finding of differences and Set to "Sync with Global" upon finding of no differences parameters are configurable when the Include Non Applicable Attributes parameter is set to disabled.

11 Click on the Start Audit button. To interrupt the audit while it is in progress, click on the Stop Audit button.

12 A discrepancy between a global policy and a local instance of the policy generates an alarm. Monitor the dynamic alarm window to view alarms that are generated as a result of the policy audit.

13 Double-click on the alarm in the alarm window. The Alarm Info form opens.

14 Click on the View Alarmed Object button. The Global Policy (Edit) form opens.

15 Perform steps 8 and 12 of Procedure 46-9 to locate the discrepancies between the local and global policies.

16 Close Global Policy *Policy_type* (Edit) form.

Procedure 46-9 To identify differences between a global and local policy or two local policies

Note — You can cancel the local audit at any time by clicking on the Action button and choosing Local Audit Off on the *Policy_type* (Edit) form.

1 Choose Policies→*Policy_type* from the 5620 SAM main menu, where *Policy_type* is the type of policy that you want to open and search for global and local differences. The Manage *Policy_type* form opens.

2 Choose Local from the Policy scope drop-down menu.

3 Click on the Select button beside the Local Node IP Address parameter. The Select a Network Element form opens.

4 Select a device in the list and click on the OK button. The Select a Network Element form closes and the Manage *Policy_type* form is updated with the NE IP address.

5 Click on the Search button. A list of search results is displayed.

6 Choose the local policy that you want to compare with another policy.

7 Click on the Properties button. The *Policy_type* (Edit) form opens.

8 Click on the More Actions button and choose Local Audit On. The Local Audit form opens.

9 From the Policy scope drop-down menu:

a Choose Global and go to step 10.

b Choose Local and perform the following:

i Click the Select button to choose an NE. The Select a Network Element form opens.

ii Select the required NE from the list and click on the OK button. The Select a Network Element form closes and the Local Node IP Address parameter is configured with the address of the selected NE.

10 Click on the OK button. The Local Audit form closes and the appropriate global or local policy opens for comparison, based on your selection in step 9.

11 Perform one of the following steps, as applicable:

a View the differences between the policies by clicking on the tab buttons that are highlighted with an arrow icon to indicate that differences exist on the policy forms. An arrow icon beside a property indicates that the property is modified. In lists, new entries are highlighted in pink and modified entries are highlighted in purple.

Note — Global policies can be distributed to many varying NE types. Local policy audits are performed based on absolute database records. In some cases, this means that when you audit a local policy, a change may be indicated on the associated global policy that does not apply specifically to this local policy. The changed global property may simply not be relevant to the NE associated with this local policy.

For example, a Subscriber Profile global policy contains an HSMDA QoS tab. If a change has been made to a property on this tab in the global policy, but the local policy you are auditing applies to an NE that does not support HSMDA, then the following will occur. When you perform the local audit against the global policy, the global policy form will indicate that there is a difference between the two by displaying an arrow icon on its HSMDA QoS tab. However, since the local policy's NE does not support HSMDA, the local policy form will not even display an HSMDA tab for you to compare with. Any such indicated global changes are irrelevant to the local policy and can be ignored.

b For certain policy types, you can click on a Tree tab button on the local or global policy form. New items are highlighted in pink text. Modified items in the tree are highlighted in purple text.

12 Close the local and global *Policy_type* (Edit) forms.

Procedure 46-10 To configure the maximum policy objects per deployer

Perform this procedure to specify the maximum number of NEs to which a policy is distributed by one deployer.

1. Log in to the 5620 SAM main server station as the samadmin user.

2. Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3. Create a backup copy of the nms-server.xml file.

4. Open the nms-server.xml file using a plain-text editor.

5. Search for the following XML tag:

   ```
   <policyConfig policyDistributionMaxObjectsPerDeployer="10000"/>
   ```

6. Change the number, as required. A zero value or a negative number specifies one deployer or all sites, respectively. A one value specifies one deployer per site. The default is 10 000. Alcatel-Lucent recommends that you configure the value between 2000 and 100 000.

   If the <numberOfObjectsPerPolicy> is greater than or equal to the <policyDistributionMaxObjectsPerDeployer> one deployer per site is used.

   If the <numberOfObjectsPerPolicy> is less than the <policyDistributionMaxObjectsPerDeployer> the maxNumberOfSitesPerDeployer is calculated by policyDistributionMaxObjectsPerDeployer divided by the numberOfObjectsPerPolicy.

7. Save and close the nms-server.xml file.

47 — QoS policies

47.1 QoS policies overview

QoS policies define how network traffic is shaped and queued on one or more NEs. You can use the 5620 SAM to create QoS policies that regulate data throughput on the following:

- equipment, for example, ports and MDAs
- routing and forwarding points, for example, access and network interfaces

Access ingress policies

Access ingress policies are applied to access interfaces and specify QoS on ingress.

Access ingress policies define ingress service forwarding class queues and map flows to those queues. When an access ingress policy is created, it always has two queues defined that cannot be deleted: one for the default unicast traffic and one for the default multipoint traffic. These queues exist within the definition of the policy. The queues only get instantiated in hardware when the policy is applied to an access interface. In the case where the service does not have multipoint traffic, the multipoint queue is not instantiated.

In the simplest access ingress policy, all traffic is treated as a single flow and mapped to a single queue, and all flooded traffic is treated with a single multipoint queue.

The required access ingress policy elements include:

- a unique access ingress policy ID
- an exclusive scope for one-time use, or a template scope for use with multiple SAPs and interfaces
- at least one default unicast forwarding class queue
- at least one multipoint forwarding class queue

The optional access ingress policy elements include:

- additional unicast queues up to a total of 8 for each of the 8 forwarding classes
- 8 HSMDA queues that are automatically created when the policy is created; HSMDA queues are only used by HSMDA SAPs
- additional multipoint queues up to 3 per forwarding class for each type of multipoint traffic (broadcast, multicast and destination unknown unicast)
- QoS policy match criteria to map packets to a forwarding class
- A policer to control traffic flow rate.

Each queue can have unique queue parameters to allow individual policing and rate shaping of the flow mapped to the forwarding class. Mapping flows to forwarding classes is controlled by comparing each packet to the match criteria in the policy.

There is one default access ingress policy. The default policy gives all traffic equal priority with the same chance of being sent or dropped during periods of congestion.

Note — The 5620 SAM supports the configuration of HQoS scheduling mechanisms. HQoS provides the ability to rate limit across multiple queues from either single or multiple access interfaces for a specific customer. The building blocks for HQoS include access ingress, access egress, and scheduler policies.

See section 64.4 for a sample service configuration using HQoS.

Policy override

You can override some or all settings associated with an access ingress policy on an L2 or L3 access interface, SLA profile, or subscriber profile.

Note — You can override Access Ingress policies that have the Scope parameter set to template. See Procedure 47-1 for more information.

Forwarding classes

The 5620 SAM supports the configuration of eight forwarding classes and class-based queuing or policing on the managed devices. Each forwarding class is only important in relation to other forwarding classes. A forwarding class provides NEs with a method to determine the relative importance of one packet over another packet in a different forwarding class.

Queues are created for a specific forwarding class to determine how the queue output is scheduled into the switch fabric and the type of parameters that the queue accepts. The forwarding class of the packet, and the in-profile and out-of-profile states, determine how the packet is queued and handled at each hop along its path to a destination egress point. Forwarding classes may also be associated with policers instead of queues. Eight forwarding classes are supported. Table 47-1 lists the default definitions for the supported forwarding classes.

Although all forwarding classes support profile marking, it is a good network engineering practise to ensure that all high priority forwarding classes are in-profile (CIR=PIR) and all low priority forwarding classes are out-of-profile (PIR > CIR=0). This way, distinguishing packets as in-profile or out-of-profile only occurs for assured class types.

Table 47-1 Forwarding classes

Forwarding class ID	Forwarding class name	Forwarding class designation	DiffServ name	Class type	Intended
7	Network control	nc	nc2	High priority	For network control traffic
6	High-1	h1	nc1		For a second network control class or delay/jitter sensitive traffic
5	Expedited	ef	ef		For delay/jitter sensitive traffic
4	High-2	h2	h2		For delay/jitter sensitive traffic
3	Low-1	l1	af2	Assured	For assured traffic; default priority for network management traffic
2	Assured	af	af1		For assured traffic
1	Low-2	l2	cs1	Best effort	For best effort traffic
0	be	be			

Forwarding subclasses

You can use forwarding subclasses for additional access ingress packet classification. One or more subclasses can be associated with each forwarding class. The designations for forwarding subclasses are the same as those for the forwarding classes listed in Table 47-1. Each subclass assumes the behavior of its parent forwarding class. and in combination with the forwarding class provides a greater range of access ingress QoS classification possibilities.

Policers

You can add a policer to an access ingress policy to provide traffic flow limiting. Policers are associated with the forwarding classes defined in the access ingress policy. Policers can also be linked to a policer control policy, which maintains a hierarchy of multiple policer objects in the 5620 SAM system. Policers are linked to policer control policies by means of an arbiter. For more information, see "Policer control policies".

Traffic mapping

You can specify how you want to configure the mapping between the ingress traffic and ingress queue. Mapping is optional and can be based on combinations of customer QoS marking (Dot1p, DSCP, EXP, and precedence), and IP criteria or MAC criteria. Table 47-2 describes the options.

Adding an LspExp rule to a policy forces packets that match the specified MPLS LSP EXP criteria to override the existing forwarding class and enqueuing priority, based on the parameters specified in the LspExp rule. This functionality allows geographically distributed ISP sites to establish site-to-site interconnection service through a backbone network using VPLS/VLL. Each ISP site PE router connects to a 7x50 Ethernet L2 SAP in the backbone network, and traffic is encapsulated in a VPLS/VLL service tunnel. A maximum of eight LspExp rules are allowed on a single access ingress policy.

Table 47-2 Access ingress policy traffic mapping configuration options

Tab button	Use
Dot1p	Maps the Dot1p value of the ingress traffic to the ingress queue ID.
Dscp	Maps the DSCP value of the ingress traffic to the ingress queue ID.
LspExp	Maps the EXP value of the ingress traffic to the ingress queue ID.
Precedence	Maps the precedence value of the ingress traffic to the ingress queue ID.
IP Match Criteria	Maps the IP Match Criteria of the ingress traffic to the ingress queue ID.
MAC Match Criteria	Maps the MAC Match Criteria of the ingress traffic and ingress queue ID.

Access egress policies

Access egress policies are applied to access egress interfaces and specify QoS on egress.

Access egress policies define egress service queues and map forwarding class flows to queues. In the simplest access egress policy, all forwarding classes are treated like a single flow and mapped to a single queue.

The required access egress policy elements include:

- a unique access egress policy ID
- at least one defined default queue
- an exclusive scope for one-time use, or a template scope for use with multiple SAPs and interfaces

The optional egress policy elements include:

- additional queues up to a total of 8 separate queues for each of the 8 supported forwarding classes
- IEEE 802.1p priority value remarking based on forwarding class
- A policer to control traffic flow rate

Each queue in a policy is associated with one or more of the supported forwarding classes. Each queue can have its individual queue parameters allowing individual rate shaping of the forwarding classes mapped to the queue. More complex service queuing models are supported, where each forwarding class is associated with a dedicated queue.

The forwarding class determination per service egress packet is determined at ingress. If the packet ingresses the service on the same managed device, the service ingress classification rules determine the forwarding class of the packet. If the packet was received over a service tunnel, the forwarding class is marked in the tunnel transport encapsulation.

There is one default access egress policy. The default policy gives all traffic equal priority with the same chance of being sent or dropped during periods of congestion.

Policy override

You can override some or all settings associated with an access egress policy on an L2 or L3 access interface, SLA profile, or subscriber profile. See Procedure 47-44 for more information.

Note — You can override Access Egress policies that have the Scope parameter set to template. See Procedure 47-3 for more information.

Policers

You can add a policer to an access egress policy to provide traffic flow limiting. Policers are associated with the forwarding classes defined in the access ingress policy. Policers can also be linked to a policer control policy, which maintains a hierarchy of multiple policer objects in the 5620 SAM system. Policers are linked to policer control policies by means of an arbiter. For more information, see "Policer control policies".

Traffic mapping

You can specify how you want to configure the mapping between the egress traffic and egress queue. Mapping is optional and can be based on combinations of customer QoS marking (DSCP and precedence), and IP criteria. Table 47-3 describes the options.

Table 47-3 Access egress policy traffic mapping configuration options

Tab button	Use
Dscp	Maps the DSCP value of the ingress traffic to the ingress queue ID.
Precedence	Maps the precedence value of the ingress traffic to the ingress queue ID.
IP Match Criteria	Maps the IP Match Criteria of the ingress traffic to the ingress queue ID.

Network policies

Network policies are applied to network interfaces or access uplink ports and specify QoS on egress and ingress.

On ingress, a network policy maps incoming DSCP and EXP values to forwarding class and profile state for traffic received from the core network. On egress, the policy maps forwarding class and profile state to DSCP and EXP values for traffic to be transmitted into the core network.

Network queue policies

Network queue policies are applied to network ports, uplink ports, or daughter cards.

Network queue policies determine:

- the default burst allocations for queues based on the queue's forwarding class
- the CIR, PIR, and burst size parameters for the queue

You cannot use the same policy on devices of different releases. For example, if the 5620 SAM is managing a Release 8.0 7750 SR and a Release 9.0 7750 SR, you must create two network queue policies and distribute one to the Release 8.0 7750 SR and one to the Release 9.0 7750 SR.

For network egress, a network burst policy is associated with the network port buffer pool. For network ingress, the network burst policy is associated the network ingress buffer pool of the daughter card.

Network queue policies support multipoint queues and a variable number of forwarding classes. When you want to deploy a network queue policy to devices of different types, you may need to create an instance of the policy for each NE type. Policies that are configured for multipoint queues and a variable number of forwarding classes are deployed only to devices that support the functionality. Modification of an existing policy results in automatic deployment to participating NEs, so must be done with consideration of the policy features and devices involved.

Slope policies

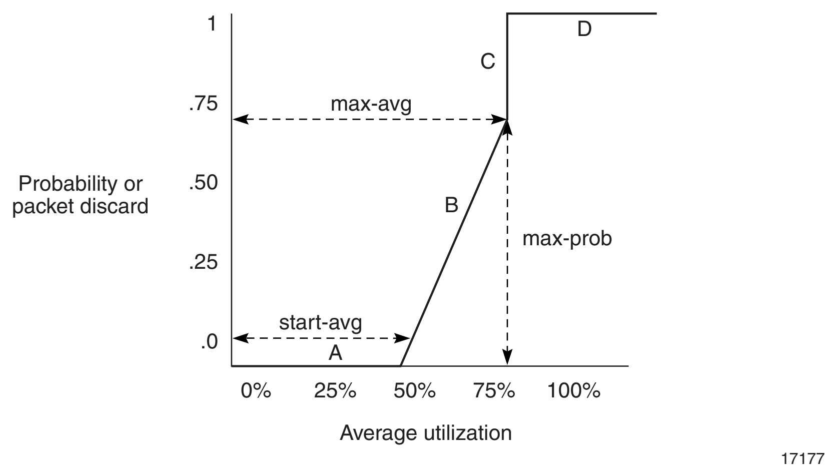
Slope policies are applied to access ports, network ports, and network daughter cards.

Slope policies define weighted RED slope characteristics for buffer pools. Low-priority and high-priority slopes are specified when you configure a slope policy. If a slope policy is not explicitly specified, a default policy is applied.

Each buffer pool supports a high-priority and a low-priority RED slope. The high-priority RED slope manages access to the shared portion of the buffer pool for the high-priority or in-profile packets. The low-priority RED slope manages access to the shared portion of the buffer pool for low-priority or out-of-profile packets. By default, the high-priority and low-priority slopes are disabled.

A RED slope is a graph with an X (horizontal) and Y (vertical) axis. The X axis plots the percentage of shared buffer utilization, from 0 to 100%. The Y axis plots the probability of packet discard marked from 0 to 1. The slope is defined as four sections, as shown in Figure 47-1.

Figure 47-1 RED slope characteristics



Section A is (0, 0) to (start-avg, 0). For this part of the slope, the packet discard value is always zero, which prevents the RED function from discarding packets when the shared buffer average utilization falls between 1 and start-avg.

Section B is (start-avg, 0) to (max-avg, max-prob). This part of the slope is linear where packet discard probability increases from zero to max-prob.

Section C is (max-avg, max-prob) to (max-avg, 1). This part of the slope shows the instantaneous increase of packet discard probability from max-prob to one. A packet discard probability of one results in an automatic discard of the packet.

Section D is (max-avg, 1) to (100%, 1). On this part of the slope, the shared buffer average utilization value of max-avg to 100% results in a packet discard probability of one.

HSMDA slope policies

The HSMDA slope policy controls the management of the HSMDA queue depth. The polices are applied to queues defined in the SAP ingress and SAP egress QoS to provide congestion control. Congestion control includes a defined maximum depth that the queue can reach when packets and RED of congestion and slope-based discards based on queue depth are accepted.

Note — The 5620 SAM does not support HSMDA slope policies on the 7710 SR, 7450 ESS-1, or 7750 SR-1.

Shared-queue policies

A shared-queue policy can be applied to daughter cards for optional use by SAPs. The 5620 SAM provides one shared-queue policy for all eight default queues. Each queue is associated with a default forwarding class.

Shared-queue QoS policies can be implemented to facilitate queue consumption on a daughter card; for example, when VPLS, IES, and VPRN services are scaled on one card. Instead of allocating multiple hardware queues for each unicast queue that is defined in an access ingress policy, SAPs with the shared-queuing feature enabled only allocate one hardware queue for each unicast queue.

However, the total amount of traffic throughput at ingress is reduced because ingress packets that are serviced by a shared-queuing SAP are recirculated for additional processing. This can reduce the available bandwidth by half. Shared queuing can also add latency. Network planners should consider these restrictions when they try to scale services on one daughter card.

Table 47-4 lists the queue IDs used by the 5620 SAM to identify the shared-queue types.

Table 47-4 Shared queue types

Shared-queue ID	Shared-queue type
1 to 8	Unicast
9 to 16	Multicast
17 to 25	Broadcast
26 to 32	Unknown

Note — Queue IDs 9 to 32 are also known as multipoint shared queues.

Shared policer output queue

To support hierarchical policing, a default policer-output-queues policy is applied automatically to each IOM that supports ingress policing. In SAM, this shared policer output queue is modeled in the same manner as the existing default shared queue, except that it has only 16 queues.

Multipoint shared-queue policies

Multipoint shared queues minimize the number of multipoint queues that are created for the following:

- ingress VPLS, IES, or VPRN SAPs
- ingress subscriber SLA profiles

Typically, ingress multipoint packets are handled by multipoint queues that are created for each SAP or subscriber SLA profile instance. In some cases, the number of SAPs or SLA profile instances are sufficient for the in-use multipoint queues to represent many thousands of queues on an ingress forwarding plane. If multipoint shared queuing is enabled for the SAPs or SLA profile instances on the forwarding plane, the multipoint queues are not created. Instead, the ingress multipoint packets are handled by the unicast queue that is mapped to the forwarding class of the multipoint packet.

Multipoint shared queues are a superset of shared queuing. With shared queuing on a SAP or SLA profile instance, only unicast packets are processed twice; once for the initial service-level queuing and a second time for switch fabric destination queuing. Shared queuing does not affect multipoint packet handling. Multipoint packet handling in normal service queuing is the same as shared queuing. Shared queuing for unicast packets is automatically enabled when you enable multipoint shared queuing.

The 5620 SAM supports multipoint shared-queue policies for the following services on the 7750 SR, 7450 ESS, 7710 SR:

- Layer 2: VPLS and MVPLS
- Layer 3: IES and VPRN

See the following chapters for more information about enabling multipoint shared queues for a service:

- chapter 71 for VPLS and MVPLS
- chapter 73 for IES
- chapter 74 for VPRN

You can also enable multipoint shared queues in an existing shared-queue policy. See the procedures in this chapter for more information about editing shared-queue policies.

Scheduler policies

Scheduler policies determine the order in which queues are serviced. All ingress and egress queues operate within the context of a scheduler. Multiple queues share the same scheduler. Schedulers control the data transfer between the following queues and destinations:

- service ingress queues to switch fabric destinations
- service egress queues to access egress ports
- network ingress queues to switch fabric destinations
- network egress queues to network egress interfaces

The are two types of scheduler policies:

- single-tier, in which queues are scheduled based on the forwarding class of the queue and the operation state of the queue relative to the queue CIR and PIR
- hierarchical or multi-tier, which allow the creation of a hierarchy of schedules where queues or other schedulers are scheduled by superior schedulers

Scheduler policies are applied to access ingress and access egress interfaces.

Single tier schedulers

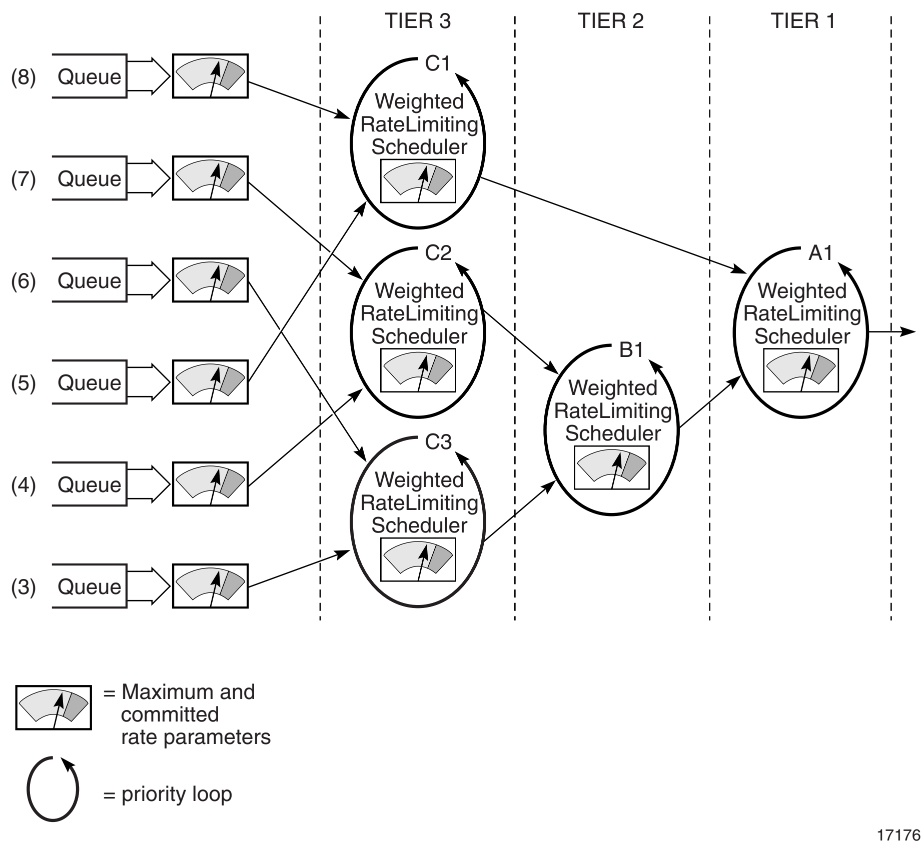
Single-tier scheduling is the default method of scheduling queues. Queues are scheduled with single-tier scheduler policies when no explicit hierarchical scheduler policy is defined or applied. In single-tier scheduling, queues are scheduled based on the forwarding class of the queue and the operational state of the queue relative to the queue CIR and PIR.

Hierarchical schedulers

Hierarchical scheduler policies are used for access ingress and access egress queues. Hierarchical scheduler policies allow you to create a hierarchy of schedulers where queues and other schedulers are scheduled by superior schedulers.

Virtual schedulers are created within the context of a hierarchical scheduler policy. A hierarchical scheduler policy defines the hierarchy and parameters for each scheduler. A scheduler is defined in the context of a tier. The tier level determines the scheduler’s position in the hierarchy. Three tiers of virtual schedulers are supported, as shown in Figure 47-2.

Figure 47-2 Hierarchical scheduler and queue association



Tier 1 schedulers are defined without a parent scheduler. A scheduler can enforce a maximum rate of operation for all child queues and associated schedulers.

You can create a tier 2 scheduler without a parent tier 1 scheduler or a tier 3 scheduler without a parent tier 2 scheduler.

Policy override

You can override some or all settings associated with an ingress or egress scheduler policy on an L2 or L3 access interface or subscriber profile.

HSMDA scheduler policies

The HSMDA scheduler policy controls the scheduling of a set of HSMDA scheduler classes. The policies are assigned to egress HSMDA ports, and the ingress control scheduler between the HSMDA and ingress forwarding plane. The policies assigned to HSMDA egress ports define how all queues associated with the egress port are scheduled. Scheduler policies assigned to the ingress control scheduler between the HSMDA and ingress forwarding plane define how all ingress queues on the HSMDA, regardless of the ingress port, are scheduled.

Note — The 5620 SAM does not support HSMDA scheduler policies on the 7710 SR, 7450 ESS-1, or 7750 SR-1.

Port scheduler policies

Port scheduler policies determine the virtual scheduling of egress ports by allocating HQoS bandwidth based on the available bandwidth at the egress port level. A port scheduler is defined in the context of a tier. The tier level determines the position of the port scheduler in the hierarchy.

The first tier of the scheduling hierarchy manages the total frame bandwidth that the port scheduler allocates to the eight priority levels. The second tier receives bandwidth from the first tier in two priorities—a within-CIR distribution, and an above-CIR distribution. The within-CIR distribution of the second tier provides bandwidth to the third tier within-CIR distributions for each of the eight priority levels. The above-CIR distribution of the second tier provides bandwidth to the above-CIR distribution of the third tier for each of the eight priority levels.

Up to eight groups can be defined within each port scheduler policy. A group has a rate, an optional cir-rate, and inherits the highest scheduling priority of its member levels. In essence, a group receives bandwidth from the port and distributes it within the member levels of the group according to the weight of each level. Each level will compete for bandwidth within the group based on its weight under congestion situation. If there is no congestion, a priority level can achieve up to its rate (cir-rate) worth of bandwidth. One or more levels can map to the same group.

Note — When the agg-rate-limit is applied to queues of a subscriber which are mapped to different priority levels in the same weighted scheduler group, the bandwidth distribution to the queues will be based on the priority of the level.

Orphan queues or schedulers that are not explicitly associated with the port scheduler receive bandwidth after all parented queues and schedulers are allocated bandwidth.

Port scheduler policies are configured on ports and channels.

Policy override

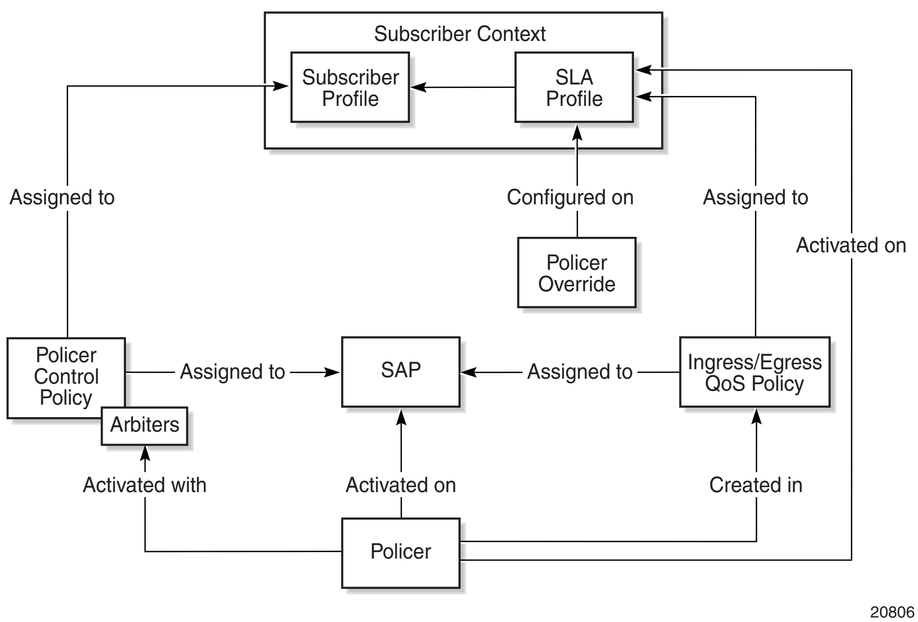
You can override some or all port scheduler settings associated with an access egress queue policy on an L2 or L3 access interface or SLA profile.

Policer control policies

Policer control policies allow you to create a control framework, under which policer objects associated with SAPs or subscriber contexts are configured with traffic control parameters. The policer object is applied to the SAP or subscriber context as part of an access ingress policy or access egress policy. The policer control policy is also applied to the SAP or subscriber context. The policer control policy provides the control framework, and policers are associated with the framework by means of arbiters.

When a policer control policy is applied to a SAP or subscriber context, the system creates a parent policer that is bandwidth limited by the policy's maximum bandwidth rate, as defined under the root arbiter. In addition to the root arbiter, the policy may also contain user defined child arbiters that provide bandwidth control for subsets of child policers.

Figure 47-3 Policer association with SAPs and user contexts under policer control hierarchy



A policer is created as part of an access ingress or access egress policy. The policer is configured with a parent arbiter name. When a policy containing a policer is applied to a SAP, the system scans the available arbiters on the SAP. If an arbiter exists with a name that matches the Parent Arbiter parameter on the policer, a policer to arbiter association is established and the policer becomes part of the policer control hierarchy.

In the case of subscriber contexts, the policer control policy is applied to the sub profile used by the subscriber. The system creates a unique policer control hierarchy for each subscriber associated with the sub profile. An access ingress or access egress policy containing a policer is applied to the subscriber SLA profile. The combination of the sub profile and SLA profile at the subscriber level provides the system with the information required to create the policer control hierarchy instance for the subscriber context.

Section 47.2 shows a sample workflow to configure a policer control hierarchy.

Named buffer pool policies

Named buffer pool policy is a QoS policy used to manage named pools. It allows you to create named pools to override the default buffer pool behavior by creating and allocating ingress and egress queues. Named pools are configured in the named buffer pool policy and are applied at the MDA and/or port ingress and egress level.

Named pools can be further defined in Q1 pools configuration. You can configure and assign queue pools to the following policies:

- Access Ingress
- Access Egress
- Network Queue
- Shared Queue

When a policy is associated at the MDA level, named pools defined in the policy allow queues from any port to be associated. When a policy is associated at the port level, named pools are only available to queues associated with that port. A named pool policy that is currently applied to a MDA or port can be deleted after all association between the policy and the MDA or port have been removed.

When buffer pools are created, renamed or deleted, queues mapped to the pools are moved to default pools. When a queue is moved, traffic that was destined for the queue is temporarily moved to a fail over queue. After the old queue is drained, and the new queue is created and associated with the buffer pool, the saved stats are loaded to the new queue and traffic is moved from the fail over queue to the new queue.

Section 47.3 describes a sample workflow to configure Named Buffer Pools and Q1 pools.

Queue Group Template policies

Queue Group Template policies allow you to define the queuing and parenting structure for queue groups on Ethernet ports. The policy defines the number and types of queues within the port queue group, and provides the default queue parameters.

There are two types of Queue Group Template policies: Ingress Queue Group Template policy and Egress Queue Group Template policy.

- Ingress Queue Group Template policies are used for Access Ingress Queue Group creation on Ethernet access ports
- Egress Queue Group Template policies are used for Access Egress Queue Group and Network Egress Queue Group creations on Ethernet ports

Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

Queue Group Template policies are used in the following network applications:

- Access SAP queue group applications
- Network port queue groups for network interfaces

See chapter 65 for more information about queue groups, the associated network components, and typical applications.

Default policer queue group

The system maintains a special default egress queue group template policy that is applied automatically to all Ethernet ports. The default policer-output-queues policy is configured with two queues:

- Queue 1: configured with a forwarding class value of Best Effort.
- Queue 2: configured with a forwarding class value of Expedite.

All other parameters are default. You cannot delete the default policer-output-queues policy.

7705 SAR fabric profiles

Each daughter card in a 7705 SAR can have two assigned fabric profiles, one for access ingress and one for network ingress. These policies are assigned from the Daughter Card tab of a daughter card slot properties form.

A 7705 SAR fabric profile includes a mode, which cannot be changed after profile creation, and one or more shaping rates. The mode types are Aggregate and Destination. In Aggregate mode, one rate defines the maximum fabric shaping rate that is distributed to each daughter card slot. In Destination mode, there is one fabric shaping rate for each daughter card slot.

In Destination mode, there is also a multi-point shaping rate that is distributed to each daughter card slot.

HSMDA pool policies

The HSMDA pool policy is a QoS policy type that applies to the HSMDA. The policy can be assigned to an ingress or egress HSMDA to control how buffers are distributed between HSMDA queues. HSMDA pool policies do not apply to ports.

Note — The 5620 SAM does not support HSMDA pool policies on the 7710 SR, 7450 ESS-1, or 7750 SR-1.

ATM QoS policies

ATM QoS policies are used to specify how ATM traffic is managed by using ATM traffic descriptors, such as service category and shaping. You can create up to 2000 ATM QoS policies per router. ATM QoS policies are applied to access interfaces.

Note — For the 9500 MPR (ETSI 1.3), the maximum number of ATM traffic descriptors that are configurable on an NE is 1536, which is twice the maximum number of configurable VPs multiplied by the maximum number of ASAP cards that can be hosted (2x 128 x6).

MC MLPPP ingress and egress QoS profiles

MC MLPPP ingress QoS profiles are used to configure the reassembly timeout for each of the four MLPPP classes. You can create up to 128 ingress QoS profiles per NE.

MC MLPPP egress QoS profiles are used to specify queue and queue scheduling parameters for each of the four MLPPP classes.

MCFR ingress and egress QoS profiles

MCFR ingress QoS profiles are used to configure the reassembly timeout for each of the four MLFR classes. You can create up to 128 ingress QoS profiles per NE.

MCFR egress QoS profiles are used to specify queue and queue scheduling parameters for each of the four MLFR classes.

7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco policies

7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco policies are used to create and apply QoS policies to these NEs and ports.

Note — The 5620 SAM supports the distribution of policies on the 7450 ESS, 7750 SR, 7710 SR, Release 6.3 or earlier Telco devices, and on the 7250 SAS and 7250 SAS-ES, prior to Release 2.0.

When a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco ACL IGMP packet filter policy entry is created from a multicast package policy, the multicast source IP address is used to specify the multicast source IP address portion of the IGMP packet filter.

OmniSwitch QoS policies

OmniSwitch QoS provides a way to control traffic flows through the switch based on configured policies. The control may be simple such as allowing or denying traffic, or complicated such as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

The OmniSwitch supports the following types of QoS policies:

- basic QoS—to control traffic prioritization and bandwidth shaping
- ACLs—for Layer 2, 3, and 4 filtering

A QoS policy contains a condition and an action. The condition specifies parameters that the switch checks in incoming traffic flows, such as the destination address or ToS bits. The action specifies what the switch does with traffic that matches the condition; for example, the switch may queue the traffic flow with a higher priority or reset the ToS bits.

Ethernet service policies are used to create UNI and SAP profiles. The profiles are applied to stacked VLAN SAPs and UNIs to control traffic and specify options to manage certain traffic types.

7210 SAS QoS policies

The main types of 7210 SAS QoS policies are:

- QoS policies for classification, defining metering and queuing attributes, and marking
- slope policies that define default buffer allocations and RED slope definitions
- port scheduler policies that determine how queues are scheduled

The 5620 SAM supports the following types of 7210 SAS QoS policies:

- 7210 Access Ingress
- 7210 Port Access Egress
- 7210 Access Egress
- 7210 Network
- 7210 Network Queue
- 7210 Slope
- 7210 Queue Management
- 7210 Port Scheduler
- 7210 Remarking
- 7210 MPLS LSP-Exp Map

Table 47-5 lists the types of 7210 SAS QoS policies and describes the policy characteristics.

Table 47-5 7210 SAS QoS policies

Policy type	Applied to	Traffic type affected	Description
7210 Access Ingress	Access port SAP	Ingress	• supports only policing using meters, not rate shaping
7210 Port Access Egress	Access port SAP	Egress	• defines the SLA for service packets as they egress on the SAP
7210 Access Egress	Access port	Egress	• eight queues per port, each forwarding class mapped to a queue • remarking is always turned on • only supports dot1p remarking
7210 Network	Uplink port, network port, or network interface [1]	Ingress and egress	• only supports ingress rate limiting using meters • eight forwarding classes per port • traffic mapping to forwarding classes based on Dot1p, DSCP, or LSP-Exp value markings [2] • supports srTCM, trTCM, trTCM (RFC 2698), and trTCM (RFC 4115)
7210 Network Queue	Uplink port	Egress	• eight hardware queues per port • fixed mapping of forwarding class to queues
7210 Slope	Access or uplink port	Egress	• only supports simple RED • low slope drops out-of-profile packets • high slope drops in-profile packets
7210 Queue Management		Egress	• defines slope parameters that determine a WRED profile for each queue
7210 Port Scheduler	Access or uplink port	Egress	• defines scheduling among the queues and the weight proportion for each queue
7210 Remarking	Access or uplink port	Egress	• configures the remarking behavior for the NE at the egress of the access SAPs, ports, and IP interfaces
7210 MPLS LSP-Exp Map	Network interfaces	MPLS packets	• allows separate mappings of profiles and forwarding classes on network interfaces

Notes

(1) The 7210 SAS-E supports the use of QoS policies on uplink ports. The 7210 SAS-M, Release 1.1 R4 or later, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, and 7210 SAS-X 24F 2XFP support the use of QoS policies on network ports and network interfaces.

(2) Dot1p and DSCP apply only to network ports. LSP-Exp applies only to network interfaces.

See the 7210 SAS-E OS Quality of Service Guide for more information about 7210 SAS QoS and QoS policies.

47.2 Workflow to configure policer control hierarchy

This workflow assumes that the following components already exist:

- a policer control policy
- an access ingress or access egress policy
- a subscriber
- an access interface or SAP

1 Configure arbiters in a policer control policy. See Procedure 47-20 for more information.

i Create arbiters.

ii Configure parent/child relationships between arbiters to build a policer control hierarchy.

2 Configure a policer in an access ingress or access egress policy. See Procedures 47-1 and 47-2 for more information.

i Create a policer to configure traffic control parameters.

ii Assign a parent arbiter to the policer to associate it with the hierarchy configured in the policer control policy.

3 Assign the policer control policy to a subscriber that is configured with an access ingress or access egress policy that includes a policer. See Procedure 68-14 for more information.

4 As required, assign the policer control policy to an access interface or SAP that is configured with an access ingress or access egress policy that includes a policer.

a For an IES L3 access interface, see Procedure 73-1 for more information.

b For an IES SAP, see Procedure 73-8 for more information.

c For a VPLS L2 access interface, see Procedure 71-3 for more information.

d For a VPLS B-L2 access interface, see Procedure 71-13 for more information.

e For a VPLS I-L2 access interface, see Procedure 71-14 for more information.

f For a VPRN L3 access interface, see Procedure 74-2 for more information.

g For a VPRN SAP, see Procedure 74-13 for more information.

47.3 Workflow to configure 5620 SAM named buffer pools

1 Configure a named pool buffer Policy. See Procedure 47-21 for more information.

2 Enable named pool to be configured for a port or MDA. See Procedure 19-18 for more information.

3 Apply a named pool policy to an MDA. See Procedure 19-24 for more information.

4 Apply a named pool policy to a port. See Procedure 20-1 for more information.

5 Configure Q1 pools. See Procedure 47-28 for more information.

6 Assign Q1 pools to access ingress policies. See Procedure 47-1 for more information.

7 Assign Q1 pools to access egress policies. See Procedure 47-3 for more information.

8 Assign Q1 pools to network queue policies. See Procedure 47-12 for more information.

9 Assign Q1 pools to shared queue policies. See Procedure 47-14 for more information.

47.4 QoS policies procedures

This section contains procedures relating to the configuration and maintenance of QoS policies.

Procedure 47-1 To configure an access ingress policy

1 Choose Policies→QoS→SROS QoS→Access Ingress→Access Ingress from the 5620 SAM main menu. The Manage Access Ingress Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Access Ingress Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- ID
- Displayed Name
- Description
- Scope
- Priority
- MAC Criteria Type
- Default FC

The packets that are received on an ingress SAP using this policy are classified to the specified default forwarding class. See Table 47-1 for more information about forwarding classes.

4 Click on the Queues tab button.

The two default queues that cannot be deleted are displayed—the default unicast traffic queue (ID 1) and the default multipoint traffic queue (ID 11).

i Click on the Create button. The Queue form opens with the General tab displayed.

ii Configure the parameters:

- ID
- Displayed Name
- Description
- Pool Name
- Multipoint
- Scheduler button
- Mode
- Expedite

Note 1 — You can use the Select button beside the Pool Name parameter to configure the parameter.

Note 2 — Before you can configure the Pool Name parameter, you must create a Q1 pool using Procedure 47-28.

iii Click on the Select button in the Slope Policy panel to choose a slope policy. The Select Slope Policy search form opens.

iv Select a policy in the list and click on the OK button. The Select Slope Policy form closes and the policy information is displayed on the Queue (Edit) form.

v Click on the CIR/PIR tab button.

vi Configure the parameters:

- Rate Type
- Policed
- CIR (kbps)
- PIR (kbps)
- CIR (%)
- PIR (%)
- CIR Adaptation
- PIR Adaptation

The CIR (kbps) and PIR (kbps) are displayed when the Rate Type is set to kbps. The CIR (%) and PIR (%) are displayed when the Rate Type is not set to kbps.

Ensure that the CIR value is lower than the PIR value.

vii Click on the Burst Size tab button.

viii Configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- Burst Limit (kb)

The parameters are configurable when the Default check box above each is deselected.

Ensure that the Committed Burst Size (kb) value is lower than the Maximum Burst Size (bytes) value.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Access Ingress Policy (Create) form reappears.

xi To configure additional queues, return to step i. You can add up to 32 queues.

5 Click on the Policer tab button.

i Click on the Create button. The Access Ingress Policer form opens.

ii On the General tab, configure the parameters:

- ID
- Description
- Parent Arbiter
- Stats Mode
- Packet Byte Offset

iii Click on the CIR/PIR tab button and configure the parameters:

- Rate Type
- CIR (kbps)
- PIR (kbps)
- CIR (%)
- PIR (%)
- CIR Adaptation
- PIR Adaptation

The CIR (kbps) and PIR (kbps) are displayed when the Rate Type is set to kbps. The CIR (%) and PIR (%) are displayed when the Rate Type is set to Percent Local Limit.

Ensure that the CIR value is lower than the PIR value.

iv Click on the Burst Size tab button and configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- Burst Limit (kb)

v Click on the OK button to save the changes. A dialog box appears.

vi Click on the OK button. The Access Ingress Policer form closes, and the Access Ingress Policy form reappears.

6 Click on the Forwarding Classes tab button. You can create one entry for each of the eight forwarding class types.

i Click on the Create button. The Forwarding Class (Create) form opens with the General tab displayed.

ii Configure the Forwarding Class parameter.

iii Perform any of the following:

- If you need to configure a queue group for some or all traffic types, complete steps iv and v.
- If you need to configure queues for some or all traffic types, complete step v.
- If you need to configure policers for some or all traffic types, complete step v.

iv On the Traffic Control panel, configure the Use Queue Group parameter for any of the Unicast, Broadcast, Multicast, and Unknown traffic types.

On the Queues panel, click on the Select button beside the Queue Group Template Policy parameter and select a queue group template policy from the Select Queue Group Template Policy form.

Note — If the Use Queue Group parameter is enabled for the global policy, the Queue ID, Multipoint Queue ID, Broadcast Queue ID, and Unknown Queue ID, if selected, are validated against the specified Queue Group Template Policy. When the global policy is distributed to an NE that does not support queue groups, for example, an NE at Release 7.0 R1 or R2, the 5620 SAM ignores the queue group-related parameters. The Queue ID is validated against the local queues for each local policy instance.

v On the Queues panel, configure the parameters:

- Queue ID
  The parameter must be set to a unicast ID. Set the parameter to 0 if you want the default queue ID to be used.
- Multipoint Queue ID
  The parameter must be set to a multicast ID. Set the parameter to 0 if you want the default queue ID to be used.
- Broadcast Queue ID
  The parameter must be set to a multicast ID. Set the parameter to 0 if you want the default queue ID to be used.
- Unknown Queue ID
  The parameter must be set to a multicast ID. Set the parameter to 0 if you want the default queue ID to be used.

vi On the Traffic Control panel, configure the Use Policer parameter for any of the Unicast, Broadcast, Multicast, and Unknown traffic types.

vii On the Policers panel, for each traffic type configured with the Use Policer parameter, configure the appropriate Policer ID parameter:

- Policer ID
- Multipoint Policer ID
- Broadcast Policer ID
- Unknown Policer ID

Click on the Select button beside each Policer ID parameter and select a policer from the list in the Select Policer form. The policer must be preexisting on the access ingress policy (see step 5).

viii Configure the parameters:

- In Remark
- Out Remark
- In Precedence
  The In Precedence parameter is configurable when the In Remark parameter is set to precedence.
- Out Precedence
  The Out Precedence parameter is configurable when the Out Remark parameter is set to precedence.
- In DSCP
  The In DSCP parameter is configurable when the In Remark parameter is set to dscp.
- Out DSCP
  The Out DSCP parameter is configurable when the Out Remark parameter is set to dscp.
- Profile
- Mark DE bit 1 as Out of Profile

The Multicast, Broadcast, and Unknown IDs must be set to multicast IDs. The default ID for multicast, broadcast, and unknown queues is 11.

ix Click on the Sub Classes tab button.

x Click on the Create button. The Forwarding SubClass form opens.

xi Configure the parameters:

- Displayed Name
- In Remark
- Out Remark
- In Precedence

  The In Precedence parameter is configurable when the In Remark parameter is set to precedence.
- Out Precedence

  The Out Precedence parameter is configurable when the Out Remark parameter is set to precedence.
- In DSCP

  The In DSCP parameter is configurable when the In Remark parameter is set to dscp.
- Out DSCP

  The Out DSCP parameter is configurable when the Out Remark parameter is set to dscp.
- Profile
- Mark DE bit 1 as Out of Profile

xii Click on the OK button. A dialog box appears.

xiii Click on the OK button. The Forwarding SubClasses form closes and the Forwarding Class form reappears.

xiv Click on the OK button. A dialog box appears.

xv Click on the OK button. The Forwarding Class (Create) form closes and the Access Ingress Policy form reappears.

7 Click on the Dot1p tab button.

i Click on the Create button. The Dot1p form opens.

ii Configure the parameters:

- Dot1p
- Forwarding Class
- Priority

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The Dot1p form closes and the Access Ingress Policy form reappears.

8 Click on the DSCP tab button.

i Click on the Create button. The DSCP form opens.

ii Configure the parameters:

- DSCP
- Forwarding Class
- Priority

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The DSCP form closes and the Access Ingress Policy form reappears.

9 Click on the Precedence tab button.

i Click on the Create button. The Precedence form opens.

ii Configure the parameters:

- Precedence
- Forwarding Class
- Priority

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The Precedence form closes and the Access Ingress Policy form reappears.

10 Click on the IP Match Criteria tab button to configure IPv4 match criteria.

i Click on the Create button. The IP Match form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Forwarding Class
- Priority
- Protocol
- Fragment
- Source IP
- Src Mask
- Destination IP
- Dst Mask
- DSCP
- Source Port
- Destination Port

The Source Port and Destination Port parameters appear only when the Protocol parameter value is TCP, UDP, or UDPTCP (*).

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The IP Match form closes and the Access Ingress Policy form reappears.

11 Click on the MAC Match Criteria tab button.

i Click on the Create button. The MAC Match form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Forwarding Class
- Priority
- Frame Type
- Source MAC
- Mask
- Destination MAC
- ATM VCI
- Mask
- Dot1p
- Mask
- Inner Tag Value
- Inner Tag VID Mask
- Outer Tag Value
- Outer Tag VID Mask
- DSAP
- DSAP Mask
- SSAP
- SSAP Mask
- SNAP OUI
- SNAP PID
- Ether Type

The Source MAC, Destination MAC, Dot1p, and Mask parameters are configurable when the check box for each parameter is selected.

The Inner Tag Value, Inner Tag VID Mask, Outer Tag Value, and Outer Tag VID Mask parameters are configurable when the MAC Criteria Type parameter is set to VID and the Frame Type parameter is set to Ethernet II.

The DSAP, DSAP Mask, SSAP, and SSAP Mask parameters are configurable when the Frame Type parameter value is e802dot2LLC.

The SNAP OUI and SNAP PID parameters are configurable when the Frame Type parameter value is e802dot2SNAP.

The Ether Type parameter is configurable only when the Frame Type parameter value is Ethernet II.

The ATM VCI parameter is configurable only when the Frame Type parameter value is ATM.

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The MAC Match form closes and the Access Ingress Policy form reappears.

12 Click on the IPv6 Match Criteria tab button.

i Click on the Create button. The IPv6 Match form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Forwarding Class
- Priority
- Protocol
- Source IP
- Src Mask
- Destination IP
- Dst Mask
- DSCP
- Source Port
- Destination Port

The Source Port and Destination Port parameters appear only when the Protocol parameter value is TCP, UDP, or UDPTCP (*).

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The IPv6 Match form closes and the Access Ingress Policy form reappears.

13 Click on the Lsp Exp tab button.

i Click on the Create button. The Lsp Exp Create form opens.

ii Configure the parameters:

- LspExp
- Forwarding Class
- Priority

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The Lsp Exp Create form closes and the Access Ingress Policy form reappears.

14 Click on the Apply button to save the policy. The Access Ingress Policy form is refreshed with additional buttons.

15 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

16 Close the Access Ingress Policy form. The Manage Access Ingress Policies form reappears.

17 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-2 To configure a 7210 SAS access ingress policy

1 Choose Policies→QoS→SROS QoS→Access Ingress→7210 Access Ingress from the 5620 SAM main menu. The Manage 7210 Access Ingress Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Access Ingress Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Scope
- Number of Qos Classifiers
- Default FC

The packets that are received on an ingress SAP using this policy are classified to the specified default forwarding class. See Table 47-1 for more information about forwarding classes.

4 Click on the Meter tab button.

i Click on the Create button. The Meter (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ID
- Rate Mode
- MultiPoint

iii Click on the CIR/PIR tab and configure the parameters.

- CIR Adaptation
- PIR Adaptation
- CIR (kbps)
- PIR (kbps)

iv Click on the Burst Size tab button and configure the parameters:

- Committed Burst Size (kbps)
- Maximum Burst Size (kbps)

v Click on the OK button to save the changes. A dialog box appears.

vi Click on the OK button.

5 Click on the Forwarding Classes tab button.

i Click on the Create button. The Forwarding Class (Create) form opens.

ii Configure the parameters:

- Forwarding Class
- Meter ID
- Multicast Meter ID
- Broadcast Meter ID
- Unknown Meter ID

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button.

6 Click on the IP Match Criteria tab button to configure IP match criteria.

i Click on the Create button. The IP Match (Create) form opens.

ii Configure the parameters:

- ID
- Displayed Name
- Description
- Forwarding Class
- DSCP

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button.

7 Click on the MAC Match Criteria tab button.

i Click on the Create button. The MAC Match (Create) form opens.

ii Configure the parameters:

- ID
- Displayed Name
- Description
- Forwarding Class
- Frame Type
- Source MAC
- Mask
- Destination MAC
- Mask
- Dot1p
- Mask
- Ether Type

The Source MAC, Destination MAC, Dot1p, and Mask parameters are configurable when the check box for each parameter is selected.

On 7210 SAS devices, the Frame Type parameter is set to a value of Ethernet II.

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button.

8 Click on the Apply button to save the policy. The 7210 Access Ingress Policy form is refreshed with additional buttons.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the 7210 Access Ingress Policy form. The Manage 7210 Access Ingress Policies form reappears.

Procedure 47-3 To configure an access egress policy

1 Choose Policies→QoS→SROS QoS→Access Egress→Access Egress from the 5620 SAM main menu. The Access Egress Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Access Egress Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Scope
- Packet Byte Offset
- Low Burst Max Class

4 If you are creating a 7705 SAR MC MLPPP access egress policy, configure the Use As Multiclass MLPPP Policy For 7705 SAR parameter. Otherwise, go to step 8.

5 Click on the Select button in the WRR Policy panel to choose a WRR policy. The Select WRR Policy search form opens.

6 Select a policy in the list and click on the OK button. The Select WRR Policy form closes and the policy information is displayed on the Access Egress Policy form.

7 Click on the Apply button.

8 Click on the HSMDA Queues tab button. Eight default queues are displayed on the form.

i Select a queue and click on the Properties button. The Access Egress HSMDA Queue (Create) form opens with the General tab displayed.

ii Modify the parameters, if required:

- Displayed Name
- Description

iii Click on the Select button in the Slope Policy panel to choose a slope policy. The Select Slope Policy search form opens.

iv Select a policy in the list and click on the OK button. The Select Slope Policy form closes and the policy information is displayed on the Access Egress HSMDA Queue (Create) form.

v Click on the PIR/Burst Size tab button.

vi Configure the parameters:

- PIR (kbps)
- PIR Adaptation
- Maximum Burst Size (bytes)
- Burst Limit (bytes)

You must deselect the associated MAX check box to configure the PIR (kbps) parameter.

You must deselect the associated Default check box to configure the Maximum Burst Size (bytes) or Burst Limit (bytes) parameter.

vii Click on the OK button. The Access Egress Policy (Create) form reappears.

9 Click on the Queues tab button. One default queue is displayed on the form.

i Click on the Create button. The Queue (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ID
- Displayed Name
- Description
- Pool Name
- Expedite
- Port Average Overhead (%)
- Scheduler button
- Level
- Weight
- CIR Level
- CIR Weight
- Port Parent
- Level
- Weight
- CIR Level
- CIR Weight
- Use WRED Queue
- Packet Byte Offset

Note 1 — You can use the Select button beside the Pool Name parameter to configure the parameter.

Note 2 — Before you can configure the Pool Name parameter, you must create a Q1 pool using Procedure 47-28.

The Scheduler button, Level, Weight, CIR Level, and CIR Weight parameters in the Parent Scheduler panel are not configurable when the Port Parent parameter in the Port Parent panel is set to true.

iii Click on the Select button in the Slope Policy panel to choose a slope policy. The Select Slope Policy search form opens.

iv Select a policy in the list and click on the OK button. The Select Slope Policy form closes and the policy information is displayed on the Queue form.

v Click on the CIR/PIR tab button.

vi Configure the parameters:

- Rate Type
- CIR (kbps)
- PIR (kbps)
- CIR (%)
- PIR (%)
- CIR Adaptation
- PIR Adaptation

The CIR (kbps) and PIR (kbps) are displayed when the Rate Type is set to kbps. The CIR (%) and PIR (%) are displayed when the Rate Type is not set to kbps.

vii Click on the Burst Size tab button.

viii Configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- Burst Limit (kb)

Ensure that the Committed Burst Size (kb) value is lower than the Maximum Burst Size (bytes) value.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Access Egress Policy (Create) form reappears.

xi To create additional queues, go to step i. You can create up to eight queues.

10 Click on the Policer tab button.

i Click on the Create button. The Access Egress Policer form opens.

ii On the General tab, configure the parameters:

- ID
- Description
- Parent Arbiter
- Stats Mode
- Packet Byte Offset

iii Click on the CIR/PIR tab button and configure the parameters:

- Rate Type
- CIR (kbps)
- PIR (kbps)
- CIR (%)
- PIR (%)
- CIR Adaptation
- PIR Adaptation

The CIR (kbps) and PIR (kbps) are displayed when the Rate Type is set to kbps. The CIR (%) and PIR (%) are displayed when the Rate Type is set to Percent Local Limit.

iv Click on the Burst Size tab button and configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved

v Click on the OK button to save the changes. A dialog box appears.

vi Click on the OK button. The Access Egress Policer form closes, and the Access Ingress Policy form reappears.

11 Click on the Forwarding Classes tab button.

i Click on the Create button. The Forwarding Class (Create) form opens.

ii Configure the Forwarding Class parameter.

iii Configure the HSMDA Queue ID parameter, if required.

iv Complete one of the following for each Forwarding Class you create:

- If you need to configure a queue from a queue group, set the Traffic Control parameter to the Use Queue Group option and complete steps v and vi, then go to step viii.
- If you need to configure a local queue, set the Traffic Control parameter for the Use Queue option and complete step vi, then go to step viii.
- If you need to configure a policer, set the Traffic Control parameter for the Use Policer option and complete steps v (optionally) and vi (optionally), and then step vii.

v Perform this step only if you intend to use a queue from a queue group. On the Queue Group panel, click on the Select button beside the Queue Group Template Policy parameter. Select the required queue group template policy from the list and click OK.

vi Configure the Queue ID parameter by clicking on the Select button to open the Select Queue - Forwarding Class - Access Egress Policy list form.

The queue you can select here is dependent on your Traffic Control parameter setting, as follows:

- Use Queue: If you specified this, then you can only select one of the locally-defined queues. The local queue in this context is either the default queue or one you created for this policy in step 9. The local queue you select here must be set to a unicast ID. The default ID for unicast queues is 1. Alternatively, you can manually enter 0 if you want the default Queue ID to be used.
- Use Queue Group: If you specified this, then you can only select one of the queues defined in the queue group template policy you chose in step v.

Note — If the Use Queue Group option is enabled for the global policy, then the Queue ID you select is validated against the specified Queue Group Template Policy. If the global policy is distributed to an NE that does not support queue groups, for example, an NE at Release 7.0 R1 or R2, the 5620 SAM ignores the queue group-related parameters. The Queue ID is validated against the local queues for each local policy instance.

- Use Policer: If you specified this, then you can select one of the queues defined in the queue group template policy you chose in step v. If you want to select a local queue instead, then first clear any selection that appears in the Queue Group Template Policy field.

If you are not configuring a policer, proceed to step viii.

vii On the Policers panel, configure the Policer ID parameter by clicking on the Select button. The Select Policer - Forwarding Class - Access Egress Policy list form opens. Select a policer from the list and click OK.

Note — If you specified a local queue Queue ID at step vi, or a queue from the Queue Group Template Policy (steps v and vi) for use with this policer, then traffic will flow through the selected policer and subsequently through the specified queue.

viii Configure the parameters. You can create one entry for each of the eight forwarding class types. The parameters include:

- In Profile
- Out Profile
- In Precedence
- Out Precedence
- In DSCP
- Out DSCP
- Mark DE bit
- Force DE value

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Forwarding Class (Create) form closes and the Access Egress Policy (Create) form reappears with a list of the newly created forwarding classes displayed.

12 Click on the IP Match Criteria tab button.

i Click on the Create button. The IP Match form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Protocol
- Fragment
- HSMDA Counter Override
- Forwarding Class
- Source IP
- Src Mask
- Destination IP
- Dst Mask
- DSCP
- Source Port
- Destination Port
- Profile

The Source Port and Destination Port parameters appear only when the Protocol parameter value is TCP, UDP, or UDPTCP (*).

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The IP Match form closes and the Access Egress Policy form reappears.

13 Click on the DSCP tab button.

i Click on the Create button. The DSCP form opens.

ii Configure the parameters:

- DSCP
- HSMDA Counter Override
- Forwarding Class
- Profile

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The DSCP form closes and the Access Egress Policy form reappears.

14 Click on the Precedence tab button.

i Click on the Create button. The Precedence form opens.

ii Configure the parameters:

- Precedence
- HSMDA Counter Override
- Forwarding Class
- Profile

iii Click on the OK button to save the changes. A dialog box appears.

iv Click on the OK button. The Precedence form closes and the Access Egress Policy form reappears.

15 Click on the Apply button to save the policy. The Access Egress Policy form is refreshed with additional buttons.

16 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

17 Close the Access Egress Policy form. The Access Egress Policies form reappears.

18 Click on the Search button to display the newly-created policy or policies in the bottom panel of the form.

Procedure 47-4 To configure a 7210 SAS port access egress policy

The 7210 SAS port access egress policy defines the SLA for service packets as they egress on the SAP. Eight queues are defined in the 7210 SAS policy. A 7210 SAS queue management policy can be associated with a queue to manage the buffer allocation for in-profile and out-of-profile packets. A 7210 SAS remarking policy with the type DOT1P or DOT1P-LSP-EXP SHARED can be associated with a 7210 SAS port access egress policy. The 7210 SAS port access egress policy can be associated with an Epipe or VPLS SAP.

1 Choose Policies→QoS→SROS QoS→Access Egress→7210 Port Access Egress from the 5620 SAM main menu. The Manage 7210 Access Egress Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Port Access Egress Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Scope
- Remarking Type
- Egress Remark

The Remarking Type parameter is only configurable on a 7210 SAS-M Release 4.0 R1 and later.

4 If working on a 7210 SAS-X Release 4.0 R1 and later, bind a Remarking Policy:

i Click on the Select button in the Remarking Policy panel to choose a remarking policy. The Select Remarking Policy form opens.

ii Choose a remarking policy in the list and click on the OK button. The Select Remarking Policy form closes and the information is displayed.

5 Click on the Queues tab button. Eight default queues are displayed on the form.

i Choose a queue and click on the Properties button. The PortAccessEgressQueue (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ID
- Displayed Name
- Description

iii Click on the CIR/PIR tab button.

iv Configure the parameters:

- CIR (kbps)
- PIR (kbps)
- CIR Adaptation
- PIR Adaptation

v Click on the OK button. A dialog box appears.

vi Click on the OK button.

6 Click on the Forwarding Classes tab button.

i Click on the Create button. The 7210 Network Egress Forwarding Class form opens.

ii Configure the parameters. You can create one entry for each of the eight forwarding class types.

- Forwarding Class
- In Profile
- Out Profile
- DSCP In Profile
- DSCP Out Profile

The DSCP In Profile and DSCP Out Profile parameters are only configurable on a 7210 SAS-M Release 4.0 R1 and later

iii Click on the OK button to close the 7210 Network Egress Forwarding Class (Create) form. A dialog box appears.

iv Click on the OK button.

v Repeat steps 6 i to 6 iv if you need to create additional rules. You can configure up to eight rules for one policy.

7 Click on the Apply button to save the policy. The 7210 Port Access Egress Policy form is refreshed with additional buttons.

8 Close the 7210 Port Access Egress Policy form. The Manage 7210 Port Access Egress Policies form reappears.

9 Click on the Distribute button to distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

Procedure 47-5 To configure a 7210 SAS access egress policy

1 Choose Policies→QoS→SROS QoS→Access Egress→7210 Access Egress from the 5620 SAM main menu. The Manage 7210 Access Egress Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Access Egress Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Scope
- Remarking

4 Click on the Select button in the Remarking Policy panel to choose a remarking policy. The Select Remarking Policy form opens.

5 Choose a remarking policy in the list and click on the OK button. The Select Remarking Policy form closes and the information is displayed.

6 Click on the Queues tab button. Eight default queues are displayed on the form.

i Choose a queue and click on the Properties button. The QueueEntry - 7210 Access Egress Policy (Create) form opens with the General tab displayed.

ii Modify the parameters, if required:

- ID
- Displayed Name
- Description
- Port Parent
- Weight
- CIR Level

iii Click on the Select button in the Queue Management Policy panel. The Select Queue Management Policy form opens.

iv Choose a queue management policy and click on the OK button. The Select Queue Management Policy form closes and the information is displayed.

v Click on the CIR/PIR tab button.

vi Configure the parameters:

- CIR (%)
- PIR (%)
- CIR Adaptation
- PIR Adaptation

vii Click on the OK button. A dialog box appears.

viii Click on the OK button.

7 Click on the Apply button to save the policy. The 7210 Access Egress Policy form is refreshed with additional buttons.

8 Close the 7210 Access Egress Policy form. The Manage 7210 Access Egress Policies form reappears.

9 Click on the Distribute button to distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

Procedure 47-6 To configure a network policy

1 Choose Policies→QoS→SROS QoS→Network→Network from the 5620 SAM main menu. The Manage Network Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Network Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Displayed Name
- Description
- Auto-Assign ID
- Default FC
- Default FC Profile
- LER Use DSCP
- Remark
- Force DSCP Remark

The Force DSCP Remark Remark parameter is set to true.

4 Click on the Egress Forwarding Classes tab button. Eight default objects based on the eight forwarding classes, as described in Table 47-1, are displayed on the form. Configure the forwarding class parameters as required.

5 Double-click on a forwarding class. The network forwarding class form opens.

6 Configure the parameters:

- Use Queue Group
- Queue ID
- DSCP In Profile
- LSP Exp In Profile
- Dot1p In Profile
- Mark DE bit
- DSCP Out Profile
- LSP Exp Out Profile
- Dot1p Out Profile
- Force DE value

The Queue ID parameter is configurable only if the Use Queue Group is enabled. The Queue ID must be specified in the queue group template policy.

Note — If the Use Queue Group parameter is enabled for the global policy, the Queue ID is validated against the specified Queue Group Template Policy. When the global policy is distributed to an NE that does not support queue groups, for example, an NE at Release 7.0 R1 or R2, the 5620 SAM ignores the queue group-related parameters.

7 Click on the OK button. The Forwarding Class (Create) form closes and a dialog box appears.

8 Click on the OK button. The Forwarding Class (Create) form closes and the Network Policy (Create) form reappears.

9 Specify how you want to configure the mapping between the ingress traffic and ingress queue by clicking on the appropriate tab button. Mapping is optional and can be based on combinations of customer QoS marking for LSP EXP Bits and Ingress DCSP. Table 47-6 describes the options.

Table 47-6 Network policy traffic-mapping configuration options

Tab button	Use
Ingress LSP EXP Bits	Maps the LSP EXP Bits of the ingress traffic to the ingress queue ID.
Ingress DCSP	Maps the DSCP of the ingress traffic to the ingress queue ID.
Ingress Dot1p	Maps the Dot1p tag of the ingress traffic to the ingress queue ID.

Perform the following substeps for each mapping that you want to configure.

i Click on the appropriate tab button.

ii Click on the Create button. A Create form opens.

iii Configure the parameters:

- LSP Exp
- DSCP
- Dot1p
- Forwarding Class
- Profile

The Forwarding Class and Profile parameters appear on all forms. The LSP Exp, DSCP, and Dot1p parameters appear only on the form with the same name as the parameter.

iv Click on the OK button to close the form. The policy form reappears with the newly created object displayed.

10 Click on the Apply button to save the policy. The Network Policy form is refreshed with additional buttons.

11 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

12 Close the Network Policy form. The Manage Network Policies form reappears.

13 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-7 To configure a 7210 SAS network policy

The network QoS policy consists of an ingress and egress component. The ingress component defines how Dot1p, DSCP, or LSP-Exp bits are mapped to an internal forwarding class and a profile state. The ingress component also defines how the forwarding classes are mapped to meters, and defines the meters of the QoS. The egress component performs remarking, which is enabled by default but can be configured. You can associate a 7210 SAS remarking policy with a 7210 SAS network policy. You can associate a 7210 SAS remarking policy with a 7210 SAS network policy.

1 Choose Policies→QoS→SROS QoS→Network→7210 Network from the 5620 SAM main menu. The Manage 7210 Network Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Network Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Nw Mgr ID
- Policy Id
- Auto-Assign ID
- Displayed Name
- Description
- Scope
- Type
- Default FC
- Default FC Profile
- Remarking

4 Click on the Select button in the Remarking Policy panel. The Select Remarking Policy form opens.

5 Choose a remarking policy and click on the OK button. The Select Remarking Policy form closes and the information is displayed.

6 If configuring a Network Interface type Network Policy on a 7210 SAS-M Release 4.0 R1 and later, or a 7210 SAS-X Release 4.0 R1 and later, perform the following:

i Configure the Meter Color Mode parameter.

ii Click on the Select button in the MPLS EXP-LSP Profile panel. The Select MPLS LSP-EXP Profile form opens.

iii Choose an MPLS LSP-EXP Profile and click on the OK button. The Select MPLS LSP-EXP Profile form closes and the information is displayed.

7 Click on the Egress Forwarding Classes tab button. Eight default objects based on the eight forwarding classes, as described in Table 47-1, are displayed on the form. Configure the forwarding class parameters, as required.

8 Double-click on a forwarding class. The 7210 Network Egress Forwarding Class (create) form opens.

9 Configure the parameters:

- Dot1p In Profile
- Dot1p Out Profile
- LSP Exp In Profile
- LSP Exp Out Profile
- DSCP In Profile
- DSCP Out Profile

Note — The 7210 SAS-M Uplink access node does not support DSCP In Profile and DSCP Out Profile in Egress Forwarding Classes.

10 Click on the OK button. The 7210 Network Egress Forwarding Class (create) form closes and a dialog box appears.

11 Click on the OK button.

12 Configure the mapping between the ingress traffic and ingress queue by clicking on the appropriate tab button. Table 47-7 describes the options.

Table 47-7 7210 SAS network policy traffic-mapping configuration options

Tab button	Use
Ingress LSP EXP Bits	Maps the LSP EXP Bits of the ingress traffic to the ingress queue ID.
Ingress DSCP	Maps the DSCP of the ingress traffic to the ingress queue ID.
Ingress Dot1p	Maps the Dot1p tag of the ingress traffic to the ingress queue ID.

Perform the following substeps for each mapping that you want to configure.

i Click on the appropriate tab button.

ii Click on the Create button. A Create form opens.

iii Configure the parameters:

- LSP Exp
- DSCP
- Dot1p
- Forwarding Class
- Profile

The Forwarding Class and Profile parameters appear on all forms. The LSP Exp, DSCP, and Dot1p parameters appear only on the form with the same name as the parameter.

iv Click on the OK button to close the form. The policy form reappears with the newly created object displayed.

13 Repeat step 12 for each new rule that you need to add. You can configure up to eight rules.

14 Click on the Ingress Meter tab button.

15 Click on the Create button. The Network Ingress Meter (Create) form opens with the General tab displayed.

16 Configure the parameters:

- ID
- MultiPoint
- Mode

Note — The 7210 SAS-M Uplink access node supports ingress meters from 1 to 12 and the Multipoint is set to true.

17 Click on the CIR/PIR tab button.

18 Configure the parameters:

- CIR Adaptation
- PIR Adaptation
- CIR (kbps)
- PIR (kbps)

19 Click on the Burst Size tab button.

20 Configure the parameters:

- Committed Burst Size (kbps)
- Maximum Burst Size (kbps)

21 Click on the Apply button. A dialog box appears.

22 Click on the OK button.

23 Repeat steps 16 to 22 if you need to create additional ingress meter rules.

24 Click on the Cancel button to close the NetWork Ingress Meter (Create) form.

25 Click on the Ingress FCMeter tab button.

26 Click the Create button. The 7210 Network Ingress Forwarding Class (Create) form opens.

27 Configure the parameters:

- Forwarding Class
- Meter
- MultiCast-Meter

Note — The MultiCast-Meter option is supported for the 7210 SAS-M Uplink access node. Meters range from 1 to 12.

28 Click on the Apply button. A dialog box appears.

29 Click on the OK button.

30 Repeat steps 27 to 29 to add additional forwarding class mapping rules.

31 Click on the Cancel button to close the 7210 Network Ingress Forwarding Class (create) form.

32 Click on the Apply button. A dialog box appears.

33 Click on the OK button.

34 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

Procedure 47-8 To configure a WRED slope policy

1 Choose Policies→QoS→SROS QoS→Slope→WRED Slope from the 5620 SAM main menu. The Manage Slope Policies form opens.

2 Perform one of the following:

- **a** Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.
- **b** Click on the Create button. The Slope Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

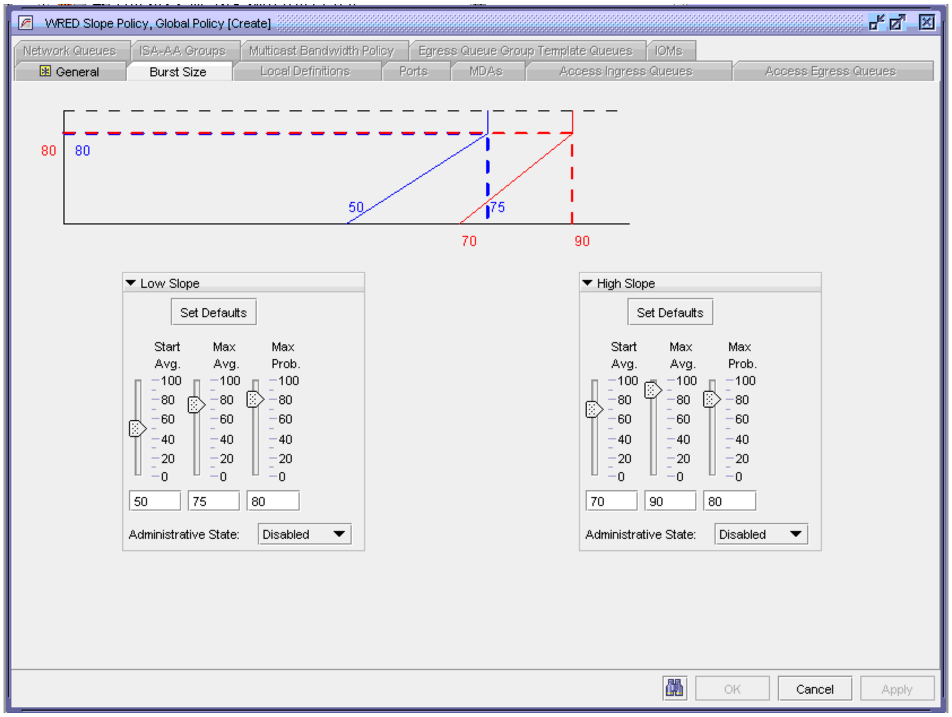
- Displayed Name
- Description
- Time Average Factor (weight)

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

When packets are queued, shared buffer average utilization is calculated using the Time Average Factor for the buffer pool. The time average factor specifies the weighting between the previous shared buffer average utilization result and the new shared buffer utilization to determine the new shared buffer average utilization.

4 Click on the Burst Size tab button. The Burst Size form opens, as shown in Figure 47-4.

Figure 47-4 Slope policy form - Burst Size



Each buffer pool supports a high-priority RED slope and a low-priority RED slope. The high-priority RED slope manages access to the shared portion of the buffer pool for high-priority or in-profile packets. The low-priority RED slope manages access to the shared portion of the buffer pool for low-priority or out-of-profile packets. See "Slope policies" in this chapter for more information.

5 Configure the parameters for the Low Slope and the High Slope:

- Start Average
- Max Avg.
- Max Prob.
- Administrative State

6 Click on the Apply button to save the policy. The Slope Policy form is refreshed with additional buttons.

7 Click on the Action button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

8 Close the Slope Policy form. The Manage Slope Policies form reappears.

9 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-9 To configure a 7210 SAS slope policy

The 7210 SAS supports SRED queue management. Default buffer pools are associated with each port. Each port has two associated buffer pools:

- access egress pool
- access uplink egress pool

Each pool is associated with a default slope policy that disables the low and high slopes within the pool.

1 Choose Policies→QoS→SROS QoS→Slope→7210 Slope from the 5620 SAM main menu. The Manage 7210 Slope Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Slope Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description

Note — You cannot use a colon in the Displayed Name value. The 5620 SAM uses colons as separators for the object full name.

4 If you are configuring a 7210 SAS-D 6F 4T ETR, go to step 7.

5 Click on the Burst Size tab button.

6 Configure the Low Slope and High Slope parameters:

- Administrative State
- Start Threshold
- Queue1 Drop Rate
- Queue2 Drop Rate
- Queue3 Drop Rate
- Queue4 Drop Rate
- Queue5 Drop Rate
- Queue6 Drop Rate
- Queue7 Drop Rate
- Queue8 Drop Rate

7 Click on the Queue Slope tab button. Eight default queues are displayed on the form.

8 Choose a queue and click on the Properties button. The QueueSlope, 7210 Slope Policy (Create) form opens.

9 Configure the Time Average Factor parameter.

10 Configure the parameters for the high slope:

- Administrative State
- Start Average
- Max Average
- Max Probability

11 Configure the parameters for the low slope:

- Administrative State
- Start Average
- Max Average
- Max Probability

12 Configure the parameters for the non-TCP slope:

- Administrative State
- Start Average
- Max Average
- Max Probability

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The QueueSlope, 7210 Slope Policy (Create) form closes.

15 Click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

16 Close the Slope Policy form. The Manage 7210 Slope Policies form reappears.

17 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-10 To configure an HSMDA WRED slope policy

1 Choose Policies→QoS→SROS QoS→Slope→HSMDA WRED Slope from the 5620 SAM main menu. The Manage HSMDA Slope Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The HSMDA Slope Policy (Create) form opens with the General tab displayed.

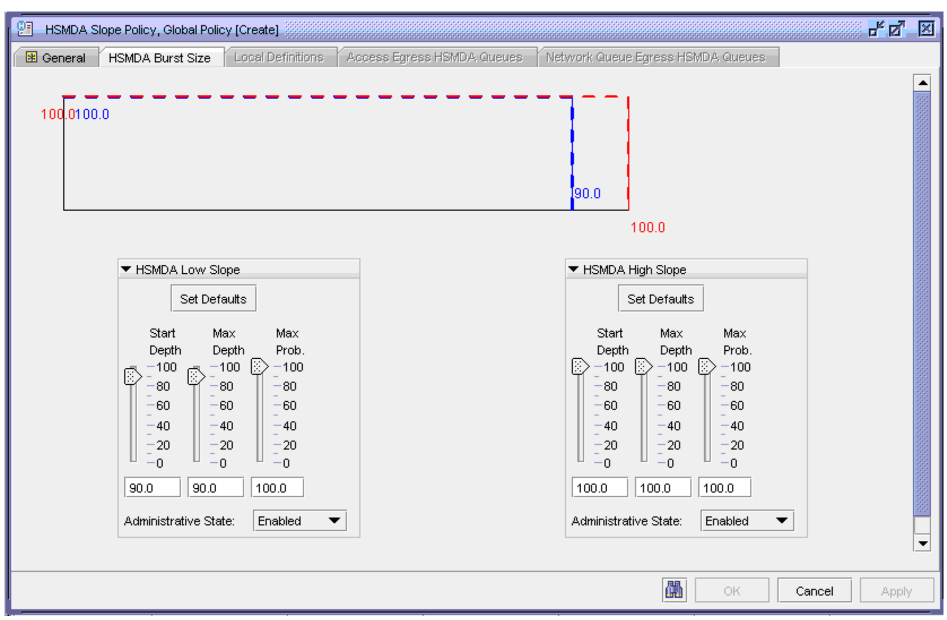
3 Configure the parameters:

- Displayed Name
- Description
- Queue MBS (bytes)

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the HSMDA Burst Size tab button. The Burst Size form opens, as shown in Figure 47-5.

Figure 47-5 HSMDA Slope Policy form - Burst Size



Each buffer pool supports a high-priority RED slope and a low-priority RED slope. The high-priority RED slope manages access to the shared portion of the buffer pool for high-priority or in-profile packets. The low-priority RED slope manages access to the shared portion of the buffer pool for low-priority or out-of-profile packets. See "Slope policies" in this chapter for more information.

5 Configure the parameters for the Low Slope and the High Slope:

- Start Depth
- Max Depth
- Max Probability
- Administrative State

6 Click on the Apply button to save the policy. The HSMDA Slope Policy form is refreshed with additional buttons.

7 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

8 Close the HSMDA Slope Policy form. The Manage HSMDA Slope Policies form reappears.

9 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-11 To configure a 7210 SAS queue management policy

Use a 7210 SAS queue management policy to configure slope parameters that specify a WRED profile for each queue. WRED is used to manage buffers during periods of congestion.

Note 1 — You can assign a 7210 SAS queue management policy to the queues of the following 7210 SAS policies:

- network queue policy
- access egress policy

Note 2 — You cannot modify a default 7210 SAS queue management policy.

1 Choose Policies→QoS→SROS QoS→Slope→7210 Queue Management from the 5620 SAM main menu. The Manage 7210 Queue Management Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Queue Management Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Scope
- Time Average Factor

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Configure the parameters for the burst size:

- Committed Burst Size (kbps)
- Maximum Burst Size (kbps)

5 Configure the parameters for the high slope:

- Administrative State
- Start Average
- Max Average
- Max Probability

6 Configure the parameters for the low slope:

- Administrative State
- Start Average
- Max Average
- Max Probability

7 Click on the Apply button. The 7210 Queue Management Policy (Edit) form is refreshed with additional tab buttons.

8 Click on the following tab buttons to view information about a 7210 SAS queue management policy:

- Network Queues
- SAP Egress Queues
- Local Definitions
- Tree
- Faults

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the 7210 Queue Management Policy form. The Manage 7210 Queue Management Policies form reappears.

11 Click on the Search button to display the newly created policies in the bottom panel of the form.

Procedure 47-12 To configure a network queue policy

You cannot use the same policy on devices of different releases. For example, if the 5620 SAM manages a Release 8.0 7750 SR and a Release 9.0 7750 SR, you must create two network queue policies and distribute one to the Release 8.0 7750 SR and one to the Release 9.0 7750 SR.

1 Choose Policies→QoS→SROS QoS→Network Queue→Network Queue from the 5620 SAM main menu. The Manage Network Queue Policies form opens.

2 Perform one of the following:

  a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

  b Click on the Create button. The Network Queue Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

  - Displayed Name
  - Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Configure the Packet Byte Offset parameter in the Egress HSMDA panel.

5 Click on the Select button in the WRR Policy panel to choose a WRR policy. The Select WRR Policy search form opens.

6 Select a policy in the list and click on the OK button. The Select WRR Policy form closes and the policy information is displayed on the Network Queue Policy form.

7 Click on the Apply button.

8 Click on the Egress HSMDA Queues tab button. Eight default queues are displayed on the form.

9 Double-click on a queue in the list to configure a default Egress HSMDA queue. The Network Queue Egress HSMDA Queue (Edit) form opens with the General tab displayed.

10 Configure the WRR Weight parameter.

Note — The WRR Weight parameter is only displayed and configurable for Egress HSMDA Queues 1, 2, and 3.

11 Click on the Select button in the Slope Policy panel to choose a slope policy. The Select Slope Policy search form opens.

12 Select a policy in the list and click on the OK button. The Select Slope Policy form closes and the policy information is displayed on the Network Queue Egress HSMDA Queue form.

13 Click on the PIR/Burst SIze tab button.

14 Configure the parameters:

- PIR (%)
- PIR Adaptation
- Maximum Burst Size (bytes)
- Burst Limit (bytes)

You must deselect the associated Default check box to configure the Maximum Burst Size (bytes) or Burst Limit (bytes) parameter.

15 Click on the OK button. The Network Queue Egress HSMDA Queue configuration form closes and the Network Queue Policy (Create) form reappears with a list of the Egress HSMDA Queues displayed.

16 Click on the Queues tab button. Two default queues are displayed on the form.

17 Perform one of the following:

a To configure a default queue, double-click on a queue in the list. The Entry, Network Queue Policy (Edit) form opens with the General tab displayed.

b To create a new queue, click on the Create button. The Entry, Network Queue Policy (Create) form opens with the General tab displayed.

18 Configure the parameters:

- ID
- Displayed Name
- Description
- Pool Name
- Multipoint
- Expedite
- Port Average Overhead (%)
- Port Parent
- Level
- CIR Level
- Weight
- CIR Weight

19 Click on the Select button in the Slope Policy panel to choose a slope policy. The Select Slope Policy search form opens.

20 Select a policy in the list and click on the OK button. The Select Slope Policy form closes and the policy information is displayed on the Network Queue Policy form.

21 Click on the CIR/PIR tab button.

22 Configure the parameters:

- CIR (%)
- PIR (%)
- CIR Adaptation
- PIR Adaptation

23 Click on the Burst Size tab button.

24 Configure the parameters:

- High Priority Reserved (%)
- Committed Burst Size (%)
- Maximum Burst Size (%)

25 Click on the OK button. A dialog box appears.

26 Click on the OK button. The Entry, Network Queue Policy configuration form closes and the Network Queue Policy (Create) form reappears with a list of the network queues displayed.

27 Click on the Forwarding Classes tab button.

28 Perform one of the following:

a To configure an existing forwarding class, click the Search button and then double-click on a forwarding class in the list. The Forwarding Class, Network Queue Policy (Edit) form opens with the General tab displayed.

b To create a new forwarding class, click on the Create button. The Forwarding Class, Network Queue Policy (Edit) form opens.

29 Configure the parameters:

- Forwarding Class
  The Forwarding Class parameter can be configured only when you are creating a forwarding class network queue policy.
- Queue ID
- Multipoint Queue ID
- Egress HSMDA Queue ID

30 Click on the OK button to close the forwarding class configuration form.

31 Click on the OK button in the dialog box that appears.

32 Click on the Apply button.

33 Click on Yes in the dialog box that appears.

34 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. The Distribute - Network Queue form opens.

> **Note 1 —** When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.
>
> **Note 2 —** Policies are also automatically distributed to devices when they are used by resources on the device.
>
> **Note 3 —** The 5620 SAM automatically distributes an updated policy to a device when the policy is in use on the device.

i Select the devices in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The devices move to the Selected Nodes panel.

ii Click on the Distribute button. The Distribute - Network Queue form closes.

When the Policy has been successfully distributed, the selected devices will appear on the list under the Local Definitions tab button.

35 Policy parameters for a specific local device can be modified by selecting the device from the Local Definitions list and clicking on Properties. The Network Queue Policy (Edit) form for the device opens. Any changes you make here will only affect the selected device.

36 Click OK to close the Network Queue Policy form. The Manage Network Queue Policies form reappears.

37 Click on the Search button to display the newly-created policy or policies in the list panel of the form.

Procedure 47-13 To configure a 7210 SAS network queue policy

1 Choose Policies→QoS→SROS QoS→Network Queue→7210 Network Queue from the 5620 SAM main menu. The Manage 7210 Network Queue Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The 7210 Network Queue (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description

4 Click on the Queues tab button. Eight default queues are displayed on the form.

5 Double-click on a queue in the list. The NQueueEntry (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Displayed Name
- Description

7 Click on the Select button in the Queue Management Policy panel. The Select Queue Management Policy form opens.

8 Choose a queue management policy and click on the OK button. The Select Queue Management Policy form closes and the information is displayed.

9 Configure the parameters in the Port Parent panel:

- Port Parent
- Weight
- CIR Level

10 Click on the CIR/PIR tab button.

11 Configure the parameters:

- CIR (%)
- CIR Adaptation
- CIR (%)
- PIR Adaptation

12 Click on the OK button. The NQueueEntry (Create) form closes and a dialog box appears.

13 Click on the OK button. The 7210 Network Queue (Create) form reappears with a list of the network queues displayed.

14 Click on the Forwarding Classes tab button. Eight default objects based on the eight forwarding classes, as described in Table 47-1, are displayed on the form.

15 Click on the Cancel button to close the NQueueForwardingClass (View) form.

16 Click on the OK button to save the settings and close the 7210 Network Queue (Create) form.

17 Click on the Distribute button to manually distribute the policy locally to devices. The Distribute - Network Queue for 7210 form opens.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

18 Click on the Apply button.

19 Close the Manage 7210 Network Queue Policies form.

Procedure 47-14 To modify a shared-queue policy

You cannot create shared-queue policies. Instead, you modify the existing default policy (default or policer-output-queues). Modification of shared-queue policies is supported on the 7750 SR and 7450 ESS.

Table 47-8 shows the default queue number, forwarding class, PIR, CIR, and CBS values for each shared queue.

Table 47-8 Shared queue default values

Queue #	FC	PIR (%)	CIR (%)	High priority reserved	CBS (%)	MBS (%)
1	be	100	0	10	3	25
2	l2	100	25	10	3	25
3	af	100	20	10	3	25
4	l1	100	25	10	10	50
5	h2	100	100	10	10	50
6	ef	100	100	10	10	50
7	h1	100	10	10	3	50
8	nc	100	10	10	1	50

The default behavior automatically chooses the expedited or non-expedited nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1 or h2), the queue is treated as an expedited queue by the hardware schedulers. When any non-expedited forwarding classes are mapped to the queue (be, af, l1 or l2), the queue is treated as best effort (be) by the hardware schedulers.

1 Choose Policies→QoS→SROS QoS→Shared Queue from the 5620 SAM main menu. The Manage Shared Queue Policies form opens.

2 Choose Local or Global from the Policy scope drop-down menu. When you set it to Local, you can specify the Local Node IP Address parameter and choose a device by using the Select button and selecting a device in the list.

3 Click on the Search button. The default shared-queue policy is listed.

4 Choose the policy in the list and click on the Properties button. The Shared Queue Policy (Edit) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Click on the Queues tab button.

Table 47-9 list the queue IDs that are used by the 5620 SAM to identify the shared queue types.

Table 47-9 Shared queue types

Shared queue ID	Shared queue type
1 to 8	Unicast
9 to 16	Multicast
17 to 25	Broadcast
26 to 32	Unknown

There are 32 default queues are displayed on the form. Configure the queues as required. Only 16 queues are available for the policer-output-queues policy.

i Double-click on a queue in the list. The Queue configuration form opens with the General tab displayed.

ii Configure the Expedite and Pool Name parameters.

Note — Before you can configure the Pool Name parameter, you must create a Q1 pool using Procedure 47-28.

iii Click on the CIR/PIR tab button.

iv Configure the parameters:

- CIR (%)
- PIR (%)

v Click on the Burst Size tab button.

vi Configure the parameters:

- High Priority Reserved (%)
- Committed Burst Size (%)
- Maximum Burst Size (%)

vii Click on the OK button. The queue configuration form closes and a dialog box appears.

viii Click on the OK button.

7 Click on the Forwarding Classes tab button.

Eight default objects based on the eight forwarding classes, as described in Table 47-8, are displayed on the form. You cannot associate different forwarding classes with the shared queues.

8 Click on the L2 Interfaces or L3 Interfaces tab button. (Applies to default shared queue policy only.)

9 Select an interface in the list and click on the Properties button. The L2 or L3 Access Interface form opens with the General tab displayed.

10 Click on the QoS tab button. (Applies to default shared queue policy only.)

11 Configure the Use Multipoint Shared Queue parameter.

12 Click on the OK button. The Shared Queue Policy form reappears.

13 Click on the Apply button to save the policy. The Shared Queue Policy (Edit) form refreshes.

To modify a local instance of the shared-queue policy, complete steps 1 to 5. Click on the Local Definitions tab. The shared-queue policies for each managed device are listed. Select a shared-queue policy in the list and click on the Properties button to modify the local instance of the policy. Complete steps 6 to 13.

Procedure 47-15 To configure a scheduler policy

1 Choose Policies→QoS→SROS QoS→Scheduler→Scheduler from the 5620 SAM main menu. The Manage Scheduler Policies form opens.

2 Perform one of the following:

   a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

   b Click on the Create button. The Scheduler Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Frame Based Accounting

4 Click on the Apply button.

5 Click on the Schedulers tab button.

   The scheduler defines bandwidth control that limits each child (other schedulers and queues) that are associated with the scheduler.

6 Click on the Create button. The Entry, Scheduler Policy (Create) form opens.

7 Configure the parameters:

- Displayed Name
- Description
- Tier

  The Tier parameter identifies the level of hierarchy with which a group of schedulers is associated. A parent is tier 1. Children are tier 2. Grandchildren are tier 3. You can create a tier 2 child scheduler without creating a parent tier 1 scheduler, and you can create a grandchild tier 3 scheduler without creating a child tier 2 scheduler.
- Summed CIR
- PIR (kbps)
- CIR (kbps)
- Parent Scheduler

  Click on the Select button to display a list of valid parent schedulers.
- Level
- CIR Level
- Weight
- CIR Weight
- Port Parent
- Level
- Weight
- CIR Level
- CIR Weight

The Parent Scheduler, Level, CIR Level, Weight, and CIR Weight parameters appear only when the Tier parameter is set to 2 or 3 and the Port Parent parameter is set to false.

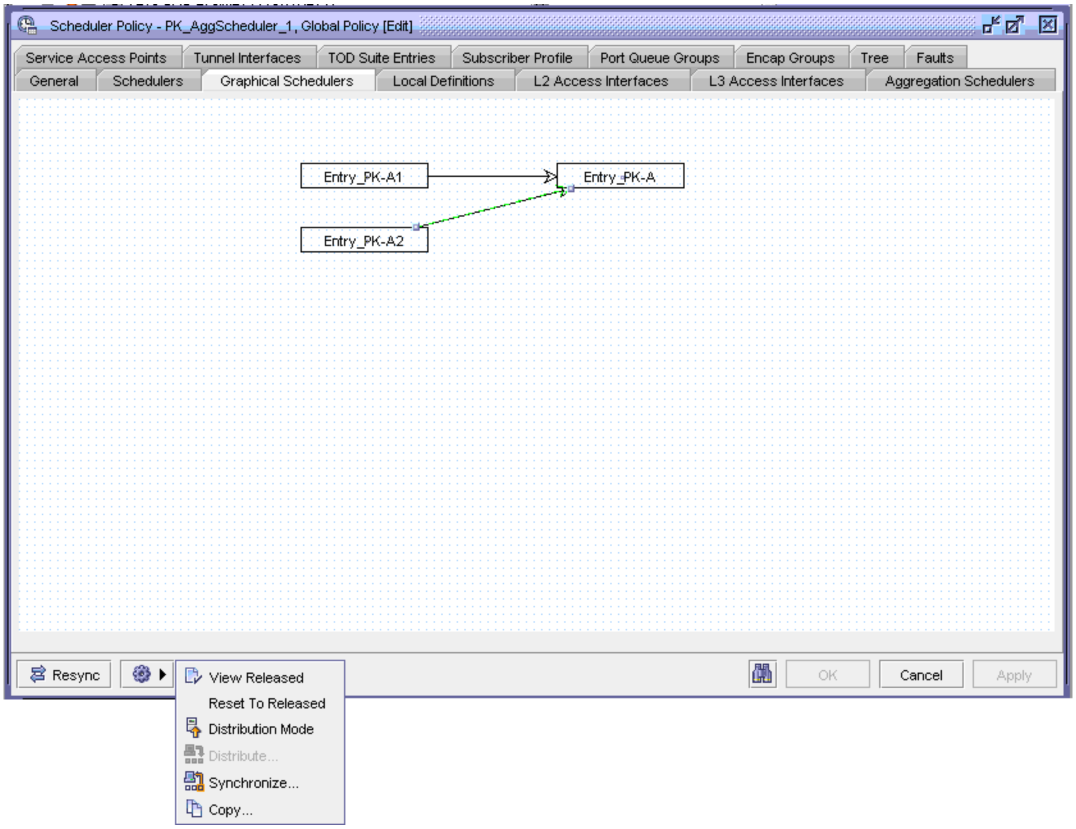
8 Click on the OK button. The Entry, Scheduler Policy (Create) form closes and a dialog box appears.

9 Click on the OK button. The newly configured scheduler is added to the list of schedulers.

10 To add additional schedulers to the policy, repeat steps 6 to 9.

11 Click on the Graphical Schedulers tab button to view a graphical display of the scheduler hierarchy within the scheduler policy. An example of the graphical display is shown in Figure 47-6.

Figure 47-6 Scheduler Policy form - Graphical Schedulers



12 Click on the Apply button.

13 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

14 Close the Scheduler Policy form. The Manage Scheduler Policies form reappears.

15 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-16 To configure an HSMDA scheduler policy

1 Choose Policies→QoS→SROS QoS→Scheduler→HSMDA Scheduler from the 5620 SAM main menu. The Manage HSMDA Scheduler Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The HSMDA Scheduler Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Maximum Rate (Mbps)

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the HSMDA Group Rates tab button.

5 Configure the Rate (Mbps) parameter for group 1 and group 2.

6 Click on the HSMDA Scheduler Classes tab button.

7 Configure the parameters for classes 1 to 8:

- Group
- Weight
- Rate (Mbps)

The Group parameter must be configured with the same group (Group 1 or Group 2) for up to three sequential classes for each group. For example, when you configure Class 1 as Group 2, you can configure Class 2 and Class 3 as Group 2, but not as Group 1.

The Rate (Mbps) parameter is configurable when the Group parameter is set to None. The Weight parameter is configurable when the Group parameter is set to a value other than None.

8 Click on the Apply button.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the Scheduler Policy form. The Manage Scheduler Policies form reappears.

11 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 47-17 To configure an HSMDA WRR Policy

The HSMDA WRR Policy is only applicable to the 7750 SR-7 and -12, NE release 9.0 R3 and later.

1 Choose Policies→QoS→SROS QoS→Scheduler→HSMDA WRR Policy from the 5620 SAM main menu. The Manage HSMDA WRR Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The HSMDA WRR Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Include Queues
- Schedule Using Class
- Weight

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button. The Global Policy Configuration block appears on the form.

5 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. The Distribute HSMDA WRR Policy form opens.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

6 Select the devices you want to distribute the policy to from the list of Available Nodes and click the right-pointing arrow to move the devices into the Selected Nodes list.

7 Click the Distribute button.

When the Policy has been successfully distributed, the selected devices will appear on the list under the Local Definitions tab button.

8 Policy parameters for a specific local device can be modified by selecting the device from the Local Definitions list and clicking on Properties. The HSMDA WRR Policy (Edit) form for the device opens. Any changes you make here will only affect the selected device.

9 Close the HSMDA WRR Policy form. The Manage HSMDA WRR Policies form reappears.

The newly created policy or policies appear in the bottom panel of the form.

10 For an existing HSMDA WRR policy, you can also determine which objects currently refer to the policy by checking the following tabs, selecting an item, and clicking the Properties button:

- L2 Access Interfaces
- L3 Access Interfaces
- Network Queue Policies
- Access Egress Policies
- Subscriber Profiles

11 Close the Manage HSMDA WRR Policies form.

Procedure 47-18 To configure a port scheduler policy

1 Choose Policies→QoS→SROS QoS→Scheduler→Port Scheduler from the 5620 SAM main menu. The Manage Port Scheduler Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Port Scheduler (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Maximum Rate (kbps)

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

The Maximum Rate (kbps) parameter is configurable when the MAX check box is deselected.

4 Click on the Groups tab button.

5 Click on the Create button. The Port Scheduler Group (Create) form opens.

6 Configure the parameters:

- Displayed Name
- PIR (kbps)
- CIR (kbps)

The PIR (kbps) and CIR (kbps) parameters are configurable when the associated MAX check box is deselected.

7 Click on the Apply button. A dialog box appears.

8 Click on the OK button. The Port Scheduler Group (Create) form closes and the Port Scheduler (Create) form reappears.

9 Click on the Level tab button.

10 Click on the Select button in any of the Level panels to choose a port scheduler group from the list in the Select Group form. The port scheduler group must be preexisting on the port scheduler policy (see step 4).

11 Configure the parameters:

- PIR (kbps) (level 1)
- CIR (kbps) (level 1)
- Weight in group (level 1)
- PIR (kbps) (level 2)
- CIR (kbps) (level 2)
- Weight in group (level 2)
- PIR (kbps) (level 3)
- CIR (kbps) (level 3)
- Weight in group (level 3)
- PIR (kbps) (level 4)
- CIR (kbps) (level 4)
- Weight in group (level 4)
- PIR (kbps) (level 5)
- CIR (kbps) (level 5)
- Weight in group (level 5)
- PIR (kbps) (level 6)
- CIR (kbps) (level 6)
- Weight in group (level 6)
- PIR (kbps) (level 7)
- CIR (kbps) (level 7)
- Weight in group (level 7)
- PIR (kbps) (level 8)
- CIR (kbps) (level 8)
- Weight in group (level 8)
- Level
- Weight
- CIR Level
- CIR Weight

Note — Contiguous mapping of levels to a group is enforced. Priority levels cannot be added to a group unless the resulting set of priority levels is contiguous. When a level is not explicitly mapped to any group, it maps directly to the root of the port scheduler at its own priority.

The PIR (kbps) to PIR (kbps) and CIR (kbps) to CIR (kbps) parameters are each configurable when the associated MAX check box is deselected.

The Weight in group to Weight in group parameters are configurable when a port scheduler group is associated with the port scheduler policy.

12 Click on the Apply button.

13 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

14 Close the Port Scheduler Policy configuration form. The Manage Port Scheduler Policies form reappears.

15 Close the Manage Port Scheduler Policies form.

Procedure 47-19 To configure a 7210 SAS port scheduler policy

1 Choose Policies→QoS→SROS QoS→Scheduler→7210 Port Scheduler from the 5620 SAM main menu. The Manage 7210 Port Scheduler Policies form opens.

2 Perform one of the following:

   a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

   b Click on the Create button. The Port Scheduler (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Mode

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 If you selected a value of WeightedRoundRobin or WeightedDeficitRoundRobin for the Mode parameter, go to step 5. Otherwise go to step 7.

5 Click on the Queues tab button.

6 Configure the Weight parameter for queues 1 to 8.

7 Click on the Apply button.

8 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

9 Close the Port Scheduler form. The Manage 7210 Port Scheduler Policies form reappears.

Procedure 47-20 To configure a policer control policy

1 Choose Policies→QoS→SROS QoS→Scheduler→Policer Control from the 5620 SAM main menu. The Manage Policer Control Policies form opens.

2 Perform one of the following steps.

a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

b Click on the Create button. The Policer Control Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Maximum Frame Based Bandwidth
- Minimum Separation Buffer Space

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Arbiter tab button.

i Click on the Create button. The Arbiter (Create) form opens.

ii Configure the parameters:

- Arbiter Name
- Description
- Tier
- Priority Level
- Weight
- Frame Based Bandwidth Rate
- Parent Arbiter
  The Parent Arbiter parameter is configurable when the Tier parameter is set to 2.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The Arbiter (Create) form closes, and the Policer Control Policy form reappears.

5 (Optional step) Click on the Graphical Arbiters tab button to view a graphical display of the arbiter hierarchy within the policer control policy. You can perform any of the following steps.

a Right-click on the grid and select New Arbiter from the drop-down menu. The Arbiter (Create) form opens. You can create a new arbiter, as described in step 4.

b Right-click on an arbiter object and select Edit from the drop-down menu. The Arbiter (Edit) form opens. You can change the arbiter, as described in step 4.

c Right-click on an arbiter and select Remove from the drop-down menu. The arbiter object is removed from the hierarchy.

d Click on a Tier 2 arbiter object and draw a line to a Tier 1 arbiter object. The Tier 1 arbiter becomes the parent of the Tier 2 arbiter.

6 Click on the Tree tab button to view a hierarchical display of the policer control policy properties and sub components.

7 Click on the Priority Level tab button to configure the MBS contribution for eight priority levels. For each level, configure the following parameters:

- Cumulative MBS Contribution
- Fixed MBS contribution

8 Click on the Apply button.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the network elements. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the Policer Control form. The Manage Policer Control Policies form reappears.

Procedure 47-21 To configure a named buffer pool policy

To associate a Named Buffer Pool to a MDA, see Procedure 19-24.

1 Choose Policies→QoS→SROS QoS→Buffer Pool→Named Buffer Pool from the 5620 SAM main menu. The Manage Named Buffer Pool Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Named Pool Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Default Weight
- MDA Weight
- Port Weight

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 To configure Q1 pools perform steps 3 to 10 in Procedure 47-28.

5 Click on the Apply button.

6 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

7 Close the Named Pool Policy form. The Manage Named Buffer Pool Policies form reappears.

8 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

9 Close the Manage Named Buffer Pool Policies form.

Procedure 47-22 To configure an ingress queue group template policy

1 Choose Policies→QoS→SROS QoS→Queue Group→Ingress Template from the 5620 SAM main menu. The Manage Ingress Queue Group Template Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Ingress Queue Group Template Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Queues tab button.

5 Perform one of the following:

a Specify a filter to search for and edit an existing queue. Use the filters to search for and open an existing queue by choosing a queue in the filtered list and clicking on the Properties button.

b Click on the Create button. The Ingress Queue, Ingress Queue Group Template Policy, Global Policy (Create) form opens with the General tab displayed.

6 Configure the parameters:

- ID
- Displayed Name
- Description
- Multipoint
- Mode
- Policed
- Expedite

7 Configure the Named Buffer Pool parameter.

i Click on the Select button beside the Named Buffer Pool parameter. The Named Buffer Pool form opens.

Note — Before you can configure the Named Buffer Pool parameter, you must create a Named Buffer Pool policy using Procedure 47-21.

ii Specify a filter to search for existing policy.

iii Select the policy and click on the OK button. The Ingress Queue, Ingress Queue Group Template Policy, Global Policy (Create) form reappears.

8 Configure the Scheduler button parameter.

i Click on the Select button beside the Scheduler button parameter. The Schedulers form opens.

ii Specify a filter to search for existing scheduler.

iii Select the scheduler and click on the OK button. The Ingress Queue, Ingress Queue Group Template Policy, Global Policy (Create) form reappears.

iv Configure the parameters in the Scheduler Association panel.

- Level
- Weight
- CIR Level
- CIR Weight

9 Configure the CIR/PIR parameters.

i Click on the CIR/PIR tab button.

ii Configure the parameters:

- CIR (kbps)
- PIR (kbps)
- CIR Adaptation
- PIR Adaptation

Ensure that the CIR value is lower than the PIR value.

10 Configure the Burst Size parameters.

i Click on the Burst Size tab button.

ii Configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- Burst Limit (kb)

The parameters are configurable when the Default check box above each is deselected.

Ensure that the Committed Burst Size (kb) value is lower than the Maximum Burst Size (bytes) value.

iii Click on the OK button. A dialog box appears.

11 Close the Ingress Queue Group Template Policy form.

Procedure 47-23 To configure an egress queue group template policy

1 Choose Policies→QoS→SROS QoS→Queue Group→Egress Template from the 5620 SAM main menu. The Manage Egress Queue Group Template Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Egress Queue Group Template Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Queues tab button.

5 Perform one of the following:

a Specify a filter to search for and edit an existing queue. Use the filters to search for and open an existing queue by choosing a queue in the filtered list and clicking on the Properties button.

b Click on the Create button. The Egress Queue, Egress Queue Group Template Policy, Global Policy (Create) form opens with the General tab displayed.

6 Configure the parameters:

- ID
- Displayed Name
- Description
- Port Parent
- Rate Type
- Expedite
- Level
- Weight
- CIR Level
- CIR Weight

The Level, Weight, CIR Level, and CIR Weight parameters are configurable only if the Port Parent parameter is set to True.

7 Configure the Named Buffer Pool parameter.

i Click on the Select button beside the Named Buffer Pool parameter. The Named Buffer Pool form opens.

Note — Before you can configure the Named Buffer Pool parameter, you must create a Named Buffer Pool policy using Procedure 47-21.

ii Specify a filter to search for existing policy.

iii Select the policy and click on the OK button. The Egress Queue, Egress Queue Group Template Policy, Global Policy (Create) form reappears.

8 Configure the Scheduler button parameter.

i Click on the Select button beside the Scheduler button parameter. The Schedulers form opens.

Note — The Scheduler parameter is configurable only if you set the Port Parent parameter to False.

ii Specify a filter to search for existing scheduler.

iii Select the scheduler and click on the OK button. The Egress Queue, Egress Queue Group Template Policy, Global Policy (Create) form reappears.

iv Configure the parameters in the Scheduler Association panel.

- Level
- Weight
- CIR Level
- CIR Weight

9 Configure the WRED Queue parameters.

i Select the Use WRED Queue parameter.

ii Click on the Select button beside the Displayed Name parameter. The Select WRED Queue Slope Policy form opens.

Note — Before you can select a WRED Queue Slope policy, you must create the policy using Procedure 47-8.

iii Specify a filter to search for existing policy.

iv Select the WRED Slope policy and click on the OK button. The Egress Queue, Egress Queue Group Template Policy, Global Policy (Create) form reappears.

10 Configure the CIR/PIR parameters.

i Click on the CIR/PIR tab button.

ii Configure the parameters:

The choice of CIP and PIR parameter definitions depends on the Rate Type parameter setting on the General tab.

- CIR (kbps) - if Rate Type parameter is set to Specific
- PIR (kbps) - if Rate Type parameter is set to Specific
- CIR (Percentage) - if Rate Type parameter is set to Percentage
- PIR (Percentage) - if Rate Type parameter is set to Percentage
- CIR Adaptation
- PIR Adaptation

Ensure that the CIR value is lower than the PIR value.

11 Configure the Burst Size parameters.

i Click on the Burst Size tab button.

ii Configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- Burst Limit (kb)

The parameters are configurable when the Default check box above each is deselected.

Ensure that the Committed Burst Size (kb) value is lower than the Maximum Burst Size (bytes) value.

iii Click on the OK button. A dialog box appears.

iv Click on OK.

12 Click on the Forwarding Classes tab button.

13 Perform one of the following:

a Specify a filter to search for and edit an existing forwarding class. Use the filters to search for and open an existing forwarding class by choosing a forwarding class in the filtered list and clicking on the Properties button.

b Click on the Create button. The Forwarding Class (Create) form opens.

14 Configure the parameters:

- Forwarding Class
- Queue ID

15 Close the Egress Queue Group Template Policy form.

Procedure 47-24 To configure a 7705 SAR fabric profile

1 Choose Policies→QoS→SROS QoS→7705 SAR Fabric from the 5620 SAM main menu. The Manage Fabric Profiles form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The 7705 SAR Fabric Profile (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Mode

4 Click on the Rates tab button. In Aggregate mode, one rate is displayed. In Destination mode, six rates are displayed. Perform one of the following:

a For Aggregate mode, configure the Aggregate Rate parameter to set the fabric shaping rate to the daughter card slots.

b For Destination mode, configure the Rate To MDA (destRateTo1<card#> parameter for each daughter card slot to set the fabric shaping rate to each daughter card.

You can also configure the MultiPoint Rate parameter to be distributed to all of the daughter cards.

5 Click on the Apply button. The form changes to enable the other tabs.

6 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

7 Close the 7705 SAR Fabric form. The Manage 7705 SAR Fabric form is updated.

8 Click on the Search button to display the newly created profile or profiles in the bottom panel of the form.

9 Close the Manage 7705 SAR Fabric form.

Procedure 47-25 To configure a 7210 SAS remarking policy

The 7210 SAS remarking policy is used to configure the remarking behavior for the NE at the egress of the access SAPs, ports, and IP interfaces. A 7210 SAS remarking policy can be associated with the following 7210 SAS QoS policies:

- Port Access Egress Policy (the remarking policy must be DOT1P or DOT1P-LSP-EXP SHARED)
- Network Policy (the remarking policy must be LSP-EXP or DOT1P-LSP-EXP SHARED)
- Network Queue Policy (the remarking policy must be DOT1P-DSCP, DOT1P, or DSCP)

1 Choose Policies→QoS→SROS QoS→7210 Remarking from the 5620 SAM main menu. The Manage Remarking Policies form opens.

2 Perform one of the following:

  a Specify a filter to search for and choose a policy. Click on the Properties button to modify the policy.

  b Click on the Create button. The 7210 Remarking Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Policy Id
- Auto-Assign ID
- Displayed Name
- Description
- Type

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button. The 7210 Remarking Policy (Edit) form appears with the General tab displayed.

5 Click on the Forwarding Classes tab button. Eight default objects based on the eight forwarding classes, as described in Table 47-1, are displayed on the form. Configure the forwarding class parameters, as required.

6 Double-click on a forwarding class. The 7210 Remark Forwarding Class (Edit) form opens.

7 Configure the parameters:

- Dot1P-LSP-EXP-Shared In Profile
- Dot1P-LSP-EXP-Shared Out Profile

8 Click on the OK button. The 7210 Remark Forwarding Class (Edit) form closes and the 7210 Remarking Policy (Edit) form appears.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The 7210 Remarking Policy (Edit) form closes and the Manage Remarking Policies form appears.

11 Click on the Search button to display a list of 7210 remarking policies.

12 Choose a 7210 remarking policy and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

Procedure 47-26 To configure a 7210 MPLS LSP-Exp Map policy

Use this procedure primarily for RSVP LSP with FRR one-to-one. For LDP LSPs, or when using FRR facility, use of a single MPLS LSP-Exp Map policy for all IP interfaces is recommended. Local LDP FC Enable needs to be set to true from CLI.

1 Choose Policies→QoS→SROS QoS→7210 MPLS LSP-Exp Map from the 5620 SAM main menu. The 7210 MPLS LSP-Exp Map Policies form opens.

2 Click on the Create button. The 7210 MPLS LSP-Exp Map Policy (Create) form opens with the general tab displayed.

3 Configure the parameters:

- Policy Id
- Auto-Assign ID
- Displayed Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the MPLS LSP-Exp Bits tab button.

5 Select a bit from the list and click on the Properties button. The MPLS LSP-Exp Map Profile (Create) form opens.

6 Configure the Profile parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The MPLS LSP-Exp Map Profile (Create) form closes.

9 Repeat steps 5 to 8 as required.

10 Click on the OK button. The 7210 MPLS LSP-Exp Map Policy (Create) form closes.

Procedure 47-27 To configure an HSMDA pool policy

To associate an HSMDA buffer pool with an MDA, see Procedure 19-24.

1 Choose Policies→QoS→SROS QoS→Buffer Pool→HSMDA Pool from the 5620 SAM main menu. The Manage HSMDA Pool Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The HSMDA Pool Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- System Reserve (%)

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Root Pools tab button.

5 Configure the Allocation Weight parameter for root pools 1 to 8.

The Allocation Weight parameter is configurable when the Default check box is deselected.

6 Click on the Class Pools tab button.

7 Configure the parameters for root pools 1 to 8:

- Root Parent
- Allocation Percent

The Allocation Percent parameter is configurable when the Default check box is deselected.

8 Click on the Apply button.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the HSMDA Pool Policy form. The Manage HSMDA Pool Policies form reappears.

11 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

12 Close the Manage HSMDA Pool Policies form.

Procedure 47-28 To configure Q1 pools

You must configure a Q1 pool to before you can assign the pool to an access ingress, access egress, network queue or shared queue policy.

1 Choose Policies→QoS→SROS QoS→Buffer Pool→Named Buffer Pool from the 5620 SAM main menu. The Manage Named Buffer Pool Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Named Pool Policy (Create) form opens with the General tab displayed.

3 Click on Q1 Pool tab button. A list of configured Q1 Pools is displayed.

4 Perform one of the following steps:

a Select an existing Q1 pool. A QI Pool (Edit) form opens with the General tab displayed. Go to step 5.

b Click on the Create button. A Q1 Pool (Create) form opens with the General tab displayed. Go to step 5.

5 Configure the parameters:

- Pool Name
- Description
- Network Weight
- Access Weight

6 Click on the Select button beside the Displayed Name parameter. The Select Slope Policy - Q1 Pool list form opens.

7 Select a policy in the list and click on the OK button. The Select Slope Policy - Q1 Pool list form closes and the Q1 Pool (Create) form is refreshed with the slope policy information.

8 Configure the remaining parameters:

- Reserved CBS (%)
- Default Reserved CBS
- Amber Alarm Action Max (%)
- Amber Alarm Action Step (%)
- Amber Alarm Threshold (%)
- Red Alarm Threshold (%)

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Q1 Pool configuration form closes and the Named Pool Policy form reappears.

11 Click on the Ok button. A dialog box appears.

12 Click on the OK button. The Named Pool Policy configuration form closes and the Manage Named Buffer Pool Policies form reappears.

13 Close the Manage Named Buffer Pool Policies form.

Procedure 47-29 To create an aggregation scheduler

You can create an aggregation scheduler when you have created two or more scheduler policies. See "Hierarchical schedulers" in this chapter for more information.

1 Create two or more scheduler policies, as described in Procedure 47-15.

2 Choose Manage→Service→Customers from the 5620 SAM main menu. The Manage Customers form opens.

3 Specify a filter to search for an existing customer and click on the Search button.

4 Select a customer in the list and click on the Properties button. The Customer (Edit) form opens.

5 Click on the Sites tab button.

6 Select a site in the list and click on the Properties button. The Site (Edit) form opens.

7 Click on the Aggregation tab button.

8 Click on the Create button. The Create Aggregation Scheduler wizard opens.

9 Select a site in the list and click on the Next button.

10 Configure the parameters:

- Scheduler Name
- Description

11 Click on the Next button. The Select Assignment Scope step is displayed.

12 Configure the Equipment Type parameter.

13 Click on the Next button. The Select Card or the Select Port step is displayed, depending on the option chosen for the Equipment Type parameter.

14 Click on the Select button to specify a card or port. The Select Card - Aggregation Scheduler form or the Select Port - Aggregation Scheduler form opens.

15 Select a card or port in the list and click on the OK button. The Select - Aggregation Scheduler form closes and the card or port information is displayed on the Select Card or Select Port form.

16 Click on the Next button. The Select Ingress and Egress Scheduler Policies step is displayed.

17 Click on the Select buttons to choose ingress and egress scheduler policies. The Select Policy - Aggregation Scheduler form opens.

18 Set the filter criteria, if required, and click on the Search button. A list of policies is displayed.

19 Select a policy in the list and click on the OK button. The Select Policy - Aggregation Scheduler form closes and the policy information is displayed in the Select Ingress and Egress Scheduler Policies form.

20 If you are creating an aggregation scheduler for an IOM3 port, then go to step 21. Otherwise go to step 25.

21 Click on the Next button. The Select Ingress and Egress Policer Control Policies step is displayed.

22 Click on the Select buttons to choose ingress and egress policer control policies. The Select Policer Control Policy - Aggregation Scheduler form opens.

23 Set the filter criteria, if required, and click on the Search button. A list of policies is displayed.

24 Select a policy in the list and click on the OK button. The Select Policer Control Policy - Aggregation Scheduler form closes and the policy information is displayed in the Select Ingress and Egress Policer Control Policies form.

25 Click on the Next button. The Select Time Of Day Suite Policy step is displayed.

26 Click on the Select button to choose a time of day suite. The Select Time Of Day Suite - Aggregation Scheduler form opens.

27 Select a time of day suite entry and click on the OK button. The Select Time Of Day Suite - Aggregation Scheduler form closes and the policy information is displayed in the Select Time Of Day Suite Policy form.

28 Click on the Finish button. A dialog box appears.

29 Click on the OK button. The aggregation scheduler is listed in the Aggregation tab of the Site (Edit) form.

30 Close the Site (Edit) form. The Customer (Edit) form reappears.

31 Click on the OK button. A dialog box appears.

32 Click on the Yes button. The Customer (Edit) form closes and the Manage Customers form reappears.

33 Close the Manage Customers form.

Procedure 47-30 To configure an ANCP MSS static map

You can configure an ANCP MSS static map when you have created an ANCP policy and an aggregation scheduler.

1 Create an ANCP policy, as described in Procedure 68-2.

2 Create an aggregation scheduler, as described in Procedure 47-29.

3 Choose Manage→Service→Customers from the 5620 SAM main menu. The Manage Customers form opens.

4 Select a customer in the list and click on the Properties button. The Customer (Edit) form opens.

5 Click on the Aggregation tab button.

6 Select a site in the list and click on the Properties button. The Aggregation Scheduler (Edit) form opens.

7 Click on the ANCP Static Map button.

8 Select an ANCP policy in the list and click on the Create button. The ANCP MSS Static Map (Create) form opens.

9 Configure the parameters:

- ANCP String
- Displayed Name

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The ANCP Policy is listed in the ANCP Static Map tab of the Aggregation Scheduler (Edit) form.

12 Click on the OK button to close the Aggregation Scheduler (Edit) form. The Customer (Edit) form reappears.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button.

15 Close the Manage Customers form.

Procedure 47-31 To configure an ATM QoS policy

1 Choose Policies→QoS→SROS QoS→ATM QoS from the 5620 SAM main menu. The Manage ATM QoS Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The ATM QoS Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Displayed Name
- Description

4 Click on the QoS tab button.

5 Configure the parameters:

- Service Category
- MIR (kbps)
- PIR (kbps)
- CDVT
- Shaping
- Policing
- Descriptor Type
- CLP Tagging

6 Click on the OK button to save the policy. The ATM QoS Policy (Create) form closes and the Manage ATM QoS Policies form reappears.

7 Click on the Search button to display the newly created policy or policies.

8 Choose a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

9 Close the Manage ATM QoS Policies form.

Procedure 47-32 To configure a 9500 MPR ATM QoS policy

1 Choose Policies→QoS→9500 MPR QoS→ 9500 ATM QoS from the 5620 SAM main menu. The 9500 ATM QoS Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The 9500 ATM QoS Policy, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Displayed Name

4 Click on the QoS tab button.

5 Configure the parameters:

- Service Category
- Policing
- PCR (cells/second)
- CDVT (microseconds)
- MDCR

6 Click on the OK button to save the policy. The ATM QoS Policy (Create) form closes and the 9500 ATM QoS Policies form reappears.

7 Click on the Search button to display the newly created policy or policies.

8 Choose a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

9 Close the 9500 ATM QoS Policies form.

Procedure 47-33 To configure and distribute a 9500 Radio Interface Queue Map policy

When configuring a 9500 Radio Interface Queue Map policy, the following QoS variants are supported: ODU, MPT-HL, MPT-HC/MPT-MC.

1 Choose Policies→QoS→9500 MPR QoS→ 9500 Radio Interface Queue Map from the 5620 SAM main menu. The 9500 Radio Interface Map Policies form opens.

2 Perform one of the following:

   a Specify a filter to search for a policy. Choose a policy from the list, modify the policy and click on the Properties button.

   b Click on the Create button. The 9500 Radio Interface Queue Map Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Description

4 Click on the Radio Interface Queue Map tab button.

5 Perform one of the following:

   a Specify a filter to search for a policy. Choose a policy from the list, modify the policy and click on the Properties button.

   b Click on the Create button. The 9500 Radio Interface Queue Map Global Policy (Create) form opens.

6 Configure the parameters in the Radio Interface and Queue Size Settings panel:

- Card ID
- Port ID
- Snmp Port ID
- Status
- Reset all Queues
- Queue 1 Size
- Queue 2 Size
- Queue 3 Size
- Queue 4 Size
- Queue 5 Size

Note — You cannot configure the queue size parameters when the Reset all Queues parameter is selected.

7 Click on the OK or Apply button to apply the changes and return to the 9500 Radio Interface Queue Map Global Policy (Create) form. The newly created policy is displayed.

8 Select the newly created policy, and choose the Properties button. The 9500 Radio Interface Queue Map Global Policy (Edit) form opens with the General tab displayed.

9 Click on the Switch Mode button beside the Configuration Mode parameter to distribute the policy.

10 Choose a policy in the list from the 9500 Radio Interface Map Policies form and perform one of the following:

a Click on the Distribute button in the 9500 Radio Interface Map Policies form. See Procedure 46-1 for more information about how to release and distribute the newly created or modified policy.

b Click on the Properties button, the 9500 Radio Interface Queue Map Global Policy (Edit) form is displayed. Click on the More Actions button and choose Distribute from the drop-down to distribute the policy locally to devices. See Procedure 46-1 for more information about how to release and distribute the newly created or modified policy. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

11 Close the 9500 Radio Interface Map Policies form.

Procedure 47-34 To configure and distribute a 9500 NE QoS policy

1 Choose Policies→QoS→9500 MPR QoS→ 9500 NE QoS from the 5620 SAM main menu. The 9500 NE QoS Policies form opens.

2 Perform one of the following:

a Specify a filter to search for a policy. Choose a policy from the list, modify the policy and click on the Properties button.

b Click on the Create button. The 9500 NE QOS Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- QoS Classification
- Description

For the QoS Classification parameter, choose one of the following:

a 802.1p and click on the Dot1p tab button

b DiffServ and click on the DSCP tab button

4 Click on the QueueMap policy tab button and choose Select. The Select 9500 Radio Interface Queue Map Policy form is displayed.

Note — You can link the Interface Queue Map policy as described in Procedure 47-33 to the NE Qos Policy.

5 Choose a policy and click on the OK button. The 9500 NE QOS Global Policy (Create) form opens.

6 Click on the Global Queue Setting tab button. To change the algorithm, choose an algorithm and choose Properties. The RadioQ (Multiple Instances) (Edit) form is displayed.

7 Configure the parameters:

- Queue Number
- Algorithm
- Weight

8 Click on the OK button to open the 9500 NE QoS Policies form. The newly created policy is displayed.

9 Select the newly created policy, and choose the Properties button. The 9500NE QOS Global Policy (Edit) form opens with the General tab displayed.

10 Click on the Switch Mode button beside the Configuration Mode parameter to distribute the policy. See Procedure 46-1 for more information on how to release and distribute the newly created policy.

11 Choose a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

12 Close the 9500 NE QoS Policies form.

Procedure 47-35 To configure a 7250 SAS or Telco QoS level policy

1 Choose Policies→QoS→7250 SAS and Telco QoS from the 5620 SAM main menu. The Manage 7250 SAS and Telco QoS Node Level Policies form opens.

2 Perform one of the following:

a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button. The 7250 SAS and Telco Qos Node Level Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Displayed Name
- Description
- Queue Algorithm

4 If the Queue Algorithm parameter is set to Strict Priority, go to step 6.

5 Click on the Scheduling Tx Queue tab button.

i Configure the Txq 0 to Txq 7 parameters, depending on the number of queues. There is one Txq parameter for each queue. The number of queues and Txq parameters depends on the Queue Algorithm parameter value chosen in step 3.

ii Repeat step i for each Txq parameter on the Scheduling Tx Queue tab.

6 Click on the Traffic Class Entries tab button.

7 Click on the Create button. The QoSTrafficClassEntry (Create) form opens.

8 Configure the parameters:

- Traffic Class
- DSCP
- Priority
- Color
- DSCP Value

The DSCP Value parameter is configurable when the DSCP parameter is enabled.

9 To add more policy entries, repeat steps 7 to 8.

10 Click on the OK button. The QoSTrafficClassEntry (Create) form closes and the Manage 7250 SAS and Telco QoS Node Level Policies form reappears.

11 Click on the Search button to display the newly created policy or policies.

12 Select a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

13 Close the Manage 7250 SAS and Telco QoS Node Level Policies form.

Procedure 47-36 To configure an OmniSwitch QoS policy condition

Note — OmniSwitch QoS policies consist of a condition and an action. You must configure at least one condition and one action before you can create a policy.

1 Choose Policies→QoS→AOS QoS Policies from the 5620 SAM main menu. The AOS QoS Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing condition. Select a condition in the filtered list and click on the Properties button.

b Click on the Create button and choose Create QoS Condition. The AOS QoS Condition, Global Policy (Create) form opens with the General tab displayed.

3 Configure the Displayed Name parameter.

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Filter Properties tab button. The Filter Properties form opens with the Port tab displayed.

5 Configure the parameters in the Port Match Criteria panel, if required:

- Match Source Port
- Source Slot
- Source Port
- Match Destination Port
- Destination Slot
- Destination Port

6 Click on the Layer 2 tab button.

7 Configure the parameters in the MAC Match Criteria panel, if required:

- Source MAC
- Source Mask
- Destination MAC
- Destination Mask

8 Configure the Source VLAN parameter in the Source VLAN Match Criteria panel, if required.

9 Configure the Priority parameter in the 802.1p Match Criteria panel, if required.

10 Click on the Layer 3 tab button.

11 Configure the parameters in the IP Match Criteria panel:

- Source IP
- Source Mask
- Source Net Mask
- Destination IP
- Destination Mask
- Destination Net Mask
- VRF Status
- VRF Name

12 Configure the parameters in the DSCP Match Criteria panel, if required:

- Differentiated Services Code Point
- Mask

13 Configure the parameters in the ToS Match Criteria panel, if required:

- ToS Precedence
- Mask

14 Configure the parameters in the ICMP Match Criteria panel, if required:

- ICMP Code
- ICMP Type

15 Click on the Layer 4 tab button.

16 Configure the IP Protocol parameter.

The following parameters are not displayed when the IP Protocol parameter is set to HOPOPT.

17 Configure the parameters in the IP Port Match Criteria panel, if required:

- Match Source IP Port Range
- Source IP Port (Start)
- Source IP Port (End)
- Match Destination IP Port Range
- Destination IP Port (Start)
- Destination IP Port (End)

18 Click on the OK button. The AOS QoS Condition, Global Policy (Create) form closes.

19 To create more QoS policy conditions, repeat steps 2b to 18.

20 Close the AOS QoS Policies form.

Procedure 47-37 To configure an OmniSwitch QoS policy action

Note — OmniSwitch QoS policies consist of a condition and an action. You must configure at least one condition and one action before you can create a policy.

1 Choose Policies→QoS→AOS QoS Policies from the 5620 SAM main menu. The AOS QoS Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing action. Select an action in the filtered list and click on the Properties button.

b Click on the Create button and choose Create QoS Action. The AOS QoS Action, Global Policy (Create) form opens with the General tab displayed.

Note — You cannot use DSCP and ToS parameters in the same action.

3 Configure the Displayed Name parameter.

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Configure the Action parameter in the Disposition panel.

5 Configure the parameters in the Priority and Bandwidth panel:

- Priority
- Maximum Bandwidth (Kbps)
- Share Resources

6 Configure the Priority parameter in the 802.1p panel.

7 Configure the Differentiated Services Code Point parameter in the DSCP panel.

8 Configure the Type of Service parameter in the ToS panel.

9 Configure the parameters in the Redirect panel, if required.

- Slot
- Port
- LAG Number

10 Click on the OK button. The AOS QoS Action, Global Policy (Create) form closes.

11 To create more actions, repeat steps 2b to 10.

12 Close the AOS QoS Policies form.

Procedure 47-38 To create an OmniSwitch QoS policy

Note — OmniSwitch QoS policies consist of a condition and an action. You must configure at least one condition and one action before you can create a policy.

1 Choose Policies→QoS→AOS QoS Policies from the 5620 SAM main menu. The AOS QoS Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button and choose Create QoS Policy. The AOS QoS Policy, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Policy Status
- Precedence

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Select button in the Action panel to choose an action for the policy. The Select Action - QoS Policy form opens with a list of available actions displayed.

5 Select an action and click the OK button. The Select Action - QoS Policy form closes and the AOS QoS Policy, Global Policy (Create) form refreshes.

6 Click on the Select button in the Condition panel to choose a condition for the policy. The Select Action - QoS Policy form opens with a list of available conditions displayed.

7 Select a condition and click the OK button. The Select Condition - QoS Policy form closes and the AOS QoS Policy, Global Policy (Create) form refreshes.

8 To create more policies, repeat steps 2b to 9.

9 Click on the OK button. The AOS QoS Policy, Global Policy (Create) form closes and the AoS QoS Policies form reappears.

10 Click on the Search button to display the newly created policy or policies.

11 Select a policy and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is dimmed and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

12 Close the AOS QoS Policies form.

Procedure 47-39 To create an OmniSwitch QoS list

This procedure is used to configure a QoS list, which is a collection of QoS polices. This QOS list includes support of egress policy configurations to perform last minute operations on the data traffic before it egresses through the port.

See Procedures 47-36, 47-37, and 47-38 to create AOS QoS policy actions, policy conditions, and policies.

1 Choose Policies→QoS→AOS QoS Policies from the 5620 SAM main menu. The AOS QoS Policies form opens.

2 Click on the Create button and choose Create QoS List. The AOS QoS Policy, Global Policy (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- Displayed Name
- List Type
- Policy Status

Note — Do not use a colon to create the displayed name because the 5620 SAM uses colons as separators for the object full name.

4 To add an AOS QoS policy to the QoS list, click on the List Policies tab button.

5 Click on the Create button. The AOS QoS Policy List, AOS QoS List, Global Policy (Create) form opens.

6 Click on the Select button. The Select Policy Name - QoS Policy List- AOS QoS List, Global Policy form opens.

7 Select a policy entry. Click on the OK button. The Select Policy Name - QoS Policy List- AOS QoS List, Global Policy form closes.

8 The Select Policy Name - QoS Policy List- AOS QoS List, Global Policy form reappears, with the policy name selected in Step 7 displayed in the Displayed Name field.

9 Click on the Properties button. The AOS QoS Policy -<policy name>, Global Policy (Edit) form opens.

10 If required, configure the Precedence parameter.

11 Close the AOS QoS Policy -<policy name>, Global Policy (Edit) form

12 The AOS QoS Policy List, AOS QoS List, Global Policy (Create) form reappears. Click on the OK button. A dialog box appears.

13 Click on the OK button.

14 Close the AOS QoS Policy, Global Policy (Create) form.

Procedure 47-40 To create or configure a MC MLPPP ingress QoS profile

1 Choose Policies→QoS→SROS QoS→MLPPP→Ingress QoS Profile from the 5620 SAM main menu. The Manage MLPPP Ingress QoS Profile form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing profile. Use the filters to search for and open an existing profile by choosing a profile in the filtered list and clicking on the Properties button.

Note — You can edit the properties of the default ingress MC profile, but you cannot delete the profile.

b Click on the Create button. The MLPPP Ingress QoS Profile (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- Auto-Assign ID
- Profile ID
- Description

4 Click on the Apply button. The MLPPP Ingress QoS Profile (Edit) form opens with the General tab displayed.

5 Click on the Classes tab button.

6 Select a class in the list and click on the Properties button. The MlpppIngressQosProfileClass (Edit) form opens.

7 Configure the Reassembly Timeout (msec) parameter.

8 Click on the OK button to save the values and close the form.

9 Repeat steps 6 to 8 for each class that you need to configure.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The MLPPP Ingress QoS Profile (Edit) form closes.

12 Click on the Search button to display any newly created policy or policies in the bottom panel of the form.

13 Close the Manage MLPPP Ingress QoS Profile form.

Procedure 47-41 To create or configure a MC MLPPP egress QoS profile

1 Choose Policies→QoS→SROS QoS→MLPPP→Egress QoS Profile from the 5620 SAM main menu. The Manage MLPPP Egress QoS Profile form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing profile. Use the filters to search for and open an existing profile by choosing a profile in the filtered list and clicking on the Properties button.

Note — You can edit the properties of the default egress MC profiles, but you cannot delete them.

b Click on the Create button. The MLPPP Egress QoS Profile (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- Auto-Assign ID
- Profile ID
- Description

4 Click on the Apply button. The MLPPP Egress QoS Profile (Edit) form opens with the General tab displayed.

5 Click on the Classes tab button.

6 Select a class in the list and click on the Properties button. The MlpppEgressQosProfileClass (Edit) form opens.

7 Configure the following parameters:

- MIR (%)
- Weight (%)
- Maximum Queue Size (msec)

8 Click on the OK button to save the changes and close the form.

9 Repeat steps 6 to 8 for each class that you need to configure.

10 Click on the Forwarding Classes tab button.

11 Select a forwarding class in the list and click on the Properties button. The MlpppEgressQosProfileForwardingClass (Edit) form opens.

12 Configure the MLPPP Class parameter.

13 Click on the OK button to save the values and close the form.

14 Repeat steps 11 to 13 for each forwarding class that you need to configure.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The MLPPP Ingress QoS Profile (Edit) form closes.

17 Click on the Search button to display any newly created policies in the bottom panel of the form.

18 Close the Manage MLPPP Egress QoS Profile form.

Procedure 47-42 To create or configure an MCFR ingress QoS profile

1 Choose Policies→QoS→SROS QoS→MCFR→Ingress QoS Profile from the 5620 SAM main menu. The Manage MCFR Ingress QoS Profile form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing profile. Use the filters to search for and open an existing profile by choosing a profile in the filtered list and clicking on the Properties button.

Note — You can edit the properties of the default ingress MC profile, but you cannot delete the profile.

b Click on the Create button. The MCFR Ingress QoS Profile (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- Auto-Assign ID
- Profile ID
- Description

4 Click on the Apply button. The MCFR Ingress QoS Profile (Edit) form opens with the General tab displayed.

5 Click on the Classes tab button.

6 Select a class in the list and click on the Properties button. The MCFR Ingress QoS Profile Class (Edit) form opens.

7 Configure the Reassembly Timeout (msec) parameter.

8 Click on the OK button to save the values and close the form.

9 Repeat steps 6 to 8 for each class that you need to configure.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The MCFR Ingress QoS Profile (Edit) form closes.

12 Click on the Search button to display any newly created policies in the bottom panel of the form.

13 Close the Manage MCFR Ingress QoS Profile form.

Procedure 47-43 To create or configure an MCFR egress QoS profile

1 Choose Policies→QoS→SROS QoS→MCFR→Egress QoS Profile from the 5620 SAM main menu. The Manage MCFR Egress QoS Profile form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing profile. Use the filters to search for and open an existing profile by choosing a profile in the filtered list and clicking on the Properties button.

Note — You can edit the properties of the default egress MC profile, but you cannot delete the profile.

b Click on the Create button. The MCFR Egress QoS Profile (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- Auto-Assign ID
- Profile ID
- Description

4 Click on the Apply button. The MCFR Egress QoS Profile (Edit) form opens with the General tab displayed.

5 Click on the Classes tab button.

6 Select a class in the list and click on the Properties button. The MCFR Egress QoS Profile Class (Edit) form opens.

7 Configure the following parameters:

- MIR (%)
- Weight (%)
- Maximum Queue Size (msec)

8 Click on the OK button to save the changes and close the form.

9 Repeat steps 6 to 8 for each class that you need to configure.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The MCFR Egress QoS Profile (Edit) form closes.

12 Click on the Search button to display any newly created policies in the bottom panel of the form.

13 Close the Manage MCFR Egress QoS Profile form.

Procedure 47-44 To configure QoS policy overrides on an L2 or L3 access interface

Use this procedure to override some or all settings associated with an access ingress, access egress, or scheduler policy on an L2 or L3 access interface configured for a service.

See the following procedures for information about overriding access ingress, access egress, or scheduler policies that are associated with residential subscribers:

- Procedure 68-13 for the overrides associated with SLA profiles
- Procedure 68-14 for the overrides associated with subscriber profiles

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens with Service (Service Management) selected in the filter list.

2 Choose Access Interface (Service Management) from the object drop-down list.

3 Click on one of the following icons listed below the Access Interface (Service Management) icon.

- L2 Access Interface (Service Management)
- L3 Access Interface (Service Management)

4 Set the filter criteria, if required, and click on the Search button. A list of L2 or L3 access interfaces is displayed.

5 Select an interface in the list and click on the Properties button. Based on the interface that you chose in step 3, the L2 Access Interface form or L3 Access Interface form opens.

6 Perform one of the following:

a Create an override for an access ingress or access egress policy queue. Go to step 7.

b Create an override for an access egress policy HSMDA queue. Go to step 15.

c Create an override for an ingress or egress policy policer. Go to step 25.

d Create an override for an ingress or egress policer control policy. Go to step 34.

e Create an override for an ingress or egress scheduler policy. Go to step 46.

7 Click on the Override Policy Items tab button. Perform one of the following actions.

a Click on the Access Ingress Queues tab button.

b Click on the Access Egress Queues tab button.

8 Click on the Create button.

Based on the tab that you selected in step 7, the Access Ingress Queue Override form or the Access Egress Queue Override form opens with the General tab displayed.

9 Choose the policy queue that you want to override.

i Click on the Select button. The policy queue form opens.

ii Choose the policy queue.

iii Click on the OK button. The queue override form reappears with the configured values for the policy queue.

10 Click on the Override tab button.

11 Configure the parameters, as required:

- Override PIR
- Override CIR
- Override Maximum Burst Size
- Override Committed Burst Size
- Override High Priority Reserved
- Override PIR Adaptation
- Override CIR Adaptation
- Override Queue Weight
- Override Queue CIR Weight
- Override Port Average Overhead

Overrides for the PIR and CIR are configured in kbps if the Rate Type for the queue was originally set to kbps. The PIR and CIR overrides are configured as a percentage (%) if the Rate Type for the queue was originally set to either Percent Port Limit or Percent Local Limit.

The Override Port Average Overhead parameter is only configurable for access egress queues.

To override any of these parameters, you must select the appropriate check box. Deselect the associated Default or MAX check box to enter a specific value, or to select a drop-down parameter option.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The queue override form closes and the L2 Access Interface form or L3 Access Interface form reappears.

14 Go to step 55.

15 Click on the Override Policy Items tab button.

16 Click on the Access Egress HSMDA Queues tab button.

17 Click on the Create button.

The Access Egress HSMDA Queue Override form opens with the General tab displayed.

18 Choose the queue that you want to override.

i Click on the Select button. The Select Access Egress Policy Queue form opens.

ii Choose the queue.

iii Click on the OK button. The Access Egress HSMDA Queue Override form reappears with the configured values for the queue.

19 Click on the Override tab button.

20 Configure the parameters:

- PIR (kbps)
- Maximum Burst Size (bytes)
- WRR Weight

If you select the Override check box for a parameter, the original parameter value is displayed.

To specific another override value for the PIR (kbps) parameter, you must first deselect the associated MAX check box. To specific another override value for the Maximum Burst Size (bytes) parameter you must first deselect the associated Default check box.

You can only specify an override value for WRR Weight for queues 1, 2, or 3.

21 Choose the HSMDA Slope policy that you want to override.

i Click on the Select button. The Select HSMDA Slope Policy form opens.

ii Select the policy.

iii Click on the OK button. The queue override form reappears with the selected HSMDA Slope policy name displayed.

22 Click on the OK button. A dialog box appears.

23 Click on the OK button. The queue override form closes and the L2 Access Interface form or L3 Access Interface form reappears.

24 Go to step 55.

25 Click on the Override Policy Items tab button. Perform one of the following actions.

a Click on the Ingress Policer tab button.

b Click on the Egress Policer tab button.

26 Click on the Create button. The policer override form opens.

27 Click on the Select button. The select policy policer form opens.

28 Select a policy policer and click on the OK button. The select policy policer form closes and the policer override form refreshes with the configured values for the policy policer.

Note — Policy policers must be applied to the L2 Access Interface or the L3 Access Interface in order to be selected.

29 Click on the Override tab button.

30 Select the Override check box for any of the following parameters, and then configure the parameters:

- Override PIR
- Override CIR
- Override Maximum Burst Size
- Override Committed Burst Size
- Override Packet Offset
- Stats Mode

Overrides for the PIR and CIR are configured in kbps if the Rate Type for the policer was originally set to kbps. The PIR and CIR overrides are configured as a percentage if the Rate Type for the policer was originally set to Percent Local Limit.

To override any of these parameters, you must select the required check box. Deselect the associated Default or MAX check box to enter a specific value, or to select a drop-down parameter option.

31 Click on the OK button. A dialog box appears.

32 Click on the OK button. The policer override form closes and the L2 Access Interface form or L3 Access Interface form reappears.

33 Go to step 55.

34 Click on the Override tab button. Perform one of the following actions.

a Click on the Ingress Policer Control tab button.

b Click on the Egress Policer Control tab button.

Note — Policer control policies must be applied to the L2 Access Interface or the L3 Access Interface in order to enable the policer control tab buttons.

35 Click on the Create button. The policer override form opens.

36 Select the Override check box for any of the following parameters, and then configure the parameters:

- Maximum Frame Based Bandwidth
- Minimum Separation Buffer Space

37 Click on the Level Override Policy Items tab button.

38 Select a Level Override from the list and click on the Properties button. The policy policer level override form opens with the General tab displayed.

39 Click on the Override tab button.

40 Select the Override check box, and then configure the Maximum Cumulative Buffer Space parameter.

41 Click on the OK button. A dialog box appears.

42 Click on the OK button. The policy policer level override form closes and the policer override form reappears.

43 Click on the OK button. A dialog box appears.

44 Click on the OK button. The policer override form closes and the L2 Access Interface form or L3 Access Interface form reappears.

45 Go to step 55.

46 Click on the Schedulers tab button.

47 Choose the scheduler policy that you want to override.

i Click on the Select button to define the Ingress Scheduler and Egress Scheduler policy that you want to modify.

ii Choose the scheduler policy.

iii Click on the Apply button. A dialog box appears.

iv Click on the Yes button. The L2 Access Interface form or L3 Access Interface form reappears.

48 Click on the Override Policy Items tab button.

49 Perform one of the following actions.

a Modify the Ingress Scheduler parameters.

i Click on the Ingress Schedulers tab button.

ii Click on the Create button.

The Ingress policy scheduler override form opens with the General tab displayed.

b Modify the Egress Scheduler parameters.

i Click on the Egress Schedulers tab button.

ii Click on the Create button.

The Egress policy scheduler override form opens with the General tab displayed.

50 Choose the scheduler policy that you want to override.

i Click on the Select button. The Select Scheduler Policy Entry form opens.

ii Choose the policy entry.

iii Click on the OK button. The policy scheduler override form reappears with the configured values for the scheduler policy.

51 Click on the Override tab button.

52 Configure the parameters:

- Override Summed CIR
- Summed CIR
- Override PIR
- PIR (kbps)

53 Click on the OK button. A dialog box appears.

54 Click on the OK button. The scheduler entry override form closes and the L2 Access Interface form or L3 Access Interface form reappears.

55 Click on the OK button to close the L2 Access Interface form or L3 Access Interface form.

48 — Filter policies

48.1 Filter policies overview

Filter policies specify a forward, drop, or HTTP redirect action for packets based on information specified as the match criteria. You can create up to 2000 IP and 2000 MAC filter policies per managed NE. You can create up to 131 071 entries in a filter policy.

Filter entry matching criteria are either general or specific, but all conditions must be met for the packet to be considered a match and the specified entry action performed. The process stops when the first complete match is found and the action defined in the entry is executed.

When an interface or circuit is not configured with a filter policy, all traffic is allowed. By default, there are no filters associated with services or interfaces.

The 5620 SAM supports the creation and management of the following filter policies:

- ACL IP filter policies—applied to network and access IP interfaces, and service tunnels
- ACL IPv6 filter policies—applied to access interfaces and service tunnels
- ACL MAC filter policies—applied to access interfaces and service tunnels
- ACL IGMP filter policies—applied to 7250 SAS and Telco interfaces

Note — The 7705 SAR does not support IPv6 and MAC ACL filters.

The 7705 SAR has the following configuration limits for ACL IP filter entries:

- For non-extended range filter entries, the match criteria cannot be defined to match more than 256 packets.
- For extended range filter entries, there is no limit on the number of packet matches for the defined criteria; however, the total number of unique match criteria in use across all extended range filter entries within the same ACL IP filter cannot exceed eight.

SAP and service tunnel forwarding

ACL IP and ACL MAC filters contain options for delivering packets to specific destination SAPs and service tunnels based on the match criteria. Because the forwarding action is specified separately from device configuration, the packet destination name must be entered directly in text form (for example, 1/1/2:500) and validated by the 5620 SAM. Consider the following before you create a SAP or service tunnel forwarding filter:

- Although you can configure them on other service types, you should only create these filters on a VPLS. On other service types, packets are dropped.
- You can apply these filters on an ingress, but not an egress, SAP or service tunnel.

- The destination SAP or service tunnel must be on the same service as the device on which the filter is applied.
- The encapsulation type of the destination SAP and the associated port must be the same. Supported encapsulations are Ethernet Null, dot1q, Q in Q, BCP, bridged Ethernet, FR, and ATM.

Web portal redirect

ACL IP and ACL MAC filters contain options for redirecting hosts to a URL address. The 7710 SR, 7750 SR-7, and 7750 SR-12 open a new connection to the specified web portal. The host can use the web portal to create or modify a service profile. The web portal updates the ACL policy directly, or through another system such as the 5750 SSC, to remove the redirection policy.

Note — The 7750 SR-1 does not support web portal redirect.

48.2 Filter policies procedures

The following procedures describe how to configure filter policies.

Procedure 48-1 To configure an ACL IP filter policy

1 Choose Policies→Filter→ACL IP Filter from the 5620 SAM main menu. The Manage ACL IP Filter Policies form opens.

2 Perform one of the following:

  a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

  The ACL IP Filter (Edit) form opens with the General tab displayed.

  b Click on the Create button.

  The ACL IP Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Filter ID
- Auto-Assign ID
- Displayed Name
- Description
- Default Action

4 Click on the Insertion Blocks tab button.

5 Configure the parameters:

- Credit Control Start Entry
- Credit Control Count
- RADIUS Start Entry
- RADIUS Count
- High WaterMark (%)
- Low WaterMark (%)

6 Perform the following steps to configure a filter entry.

i Click on the Filter Entries tab button.

ii Click on the Create button. The Entry, ACL IP Filter (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description
- Log ID
- Administrative State

iv To assign a time range to the filter entry, click on the Select button in the Time Range panel. The Select Time Range - Ipv6FilterEntry list form opens. Otherwise, go to step 6 vi.

v Select a time range entry and click on the OK button. The Select Time Range - Ipv6FilterEntry list form closes and the Entry, ACL IPv6 Filter (Create) form refreshes with the time range information.

Note — ACL filters that include ACL filter entries to which you have assigned a time range cannot be assigned to a time of day suite policy.

Time ranges with which you have associated a ACL filter within a time of day suite policy cannot be assigned to ACL filter entries of that ACL filter.

vi Click on the Filter Properties tab button.

vii Configure the Action parameter:

If you specify Forward, the Next Hop Routing tab appears. Perform the following:

- Click on the Next Hop Routing tab button.
- Configure the parameters:
    - Forward NH
    - Is Indirect
    - Forward NH Interface
    - Remark DSCP
    - Remark DSCP Mask
    - Remark Dot1p

If you specify forward (SAP), the Forwarding Destination tab appears. Perform the following:

- Click on the Forwarding Destination tab button.
- Configure the parameters:
    - Port Name
    - Outer Encap Value
    - Inner Encap Value

If you specify forward (SDP), the Forwarding Destination tab is configurable. Perform the following:

- Click on the Forwarding Destination tab button.
- Configure the parameters:
    - Path ID
    - VC ID

If you specify HTTP redirect, the Web Redirect tab appears. Perform the following:

- Click on the Web Redirect tab button.
- Configure the Redirect URL parameter.

viii Configure the parameters:

- Protocol
- DSCP
- Source IP
- Destination IP
- Src Mask
- Dst Mask
- Fragment
- IP Option
- IP Opt Mask
- Option Present
- Multiple Option
- Source Port
- Dest Port
- ICMP Code
- ICMP Type
- TCP Syn
- TCP Ack
- Source Route Option

The Source Port and Dest Port parameters are configurable only when the Protocol parameter value is TCP, UDP, or UDPTCP (*).

The TCP Syn and TCP Ack parameters are configurable when the Protocol parameter value is TCP.

The ICMP Code and ICMP Type parameters are configurable when the Protocol parameter value is ICMP.

ix Click on the Cflowd tab button.

x Configure the parameters:

- Cflowd Sample
- Cflowd If Sample

xi Click on the OK button. The Entry, ACL IP Filter (Create) form closes and a dialog box appears.

xii Click on the OK button. The ACL IP Filter (Create) form reappears with the newly created filter entry displayed.

7 To create an additional filter entry, repeat step 6.

8 To define the order in which the policy tries to match filter entries with packets, perform the following steps for each filter entry.

i Select a filter entry in the list.

ii Click on the Renumber ID button. The Renumber Entry ID form opens.

iii Configure the New Entry ID parameter.

iv Click on the OK button. A dialog box appears.

v Click Yes to apply the change. The Renumber Entry ID form closes, and the Entry ID column displays the new identifier assigned to the entry.

9 Click on the OK button to save the policy. The ACL IP Filter form closes and the Manage ACL IP Filter Policies form reappears.

10 Click on the Search button to display the newly created policy or policies.

11 Select the newly created policy in the list and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

12 Select the distributed policy in the list and click on the Properties button. The ACL IP Filter Global Policy (Edit) form opens.

13 Click on the Local Definitions tab button.

14 Select a local definition from the list and click on the Properties button. The ACL IP Filter Local Policy (Edit) form opens.

15 Click on the Insertion Blocks tab button.

16 Configure the parameters:

- Credit Control Start Entry
- Credit Control Count
- RADIUS Start Entry
- RADIUS Count
- High WaterMark (%)
- Low WaterMark (%)

Note — The Group Entries Inserted panel displays the number of entries insterted on this filter range.

17 Configure the Application and Location parameters in the Group Insertion Sorting panel.

18 Click on the Sort Group Instertions button. A dialog box appears.

19 Click on the OK button.

20 Perform the following steps to view filter entry data.

i Click on the Filter Entries tab button.

ii Click on the Credit Control Entries tab button or the RADIUS Entries tab button.

iii Click on the Search button.

iv Select an entry from the list and click on the Properties button. A form opens.

v Close the form after viewing the filter entry data.

21 Close the ACL IP Filter Entry Local Policy (Edit) form.

22 Close the ACL IP Filter Entry Global Policy (Edit) form.

23 Close the Manage ACL IP Filter Policies form.

Procedure 48-2 To configure an ACL IPv6 filter policy

Note — The 7705 SAR does not support ACL IPv6 filters.

1 Choose Policies→Filter→ACL IPv6 Filter from the 5620 SAM main menu. The Manage ACL IPv6 Filter Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button.

The ACL IPv6 Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Filter ID
- Auto-Assign ID
- Displayed Name
- Description
- Default Action

4 Click on the Insertion Blocks tab button.

5 Configure the parameters:

- Credit Control Start Entry
- Credit Control Count
- RADIUS Start Entry
- RADIUS Count
- High WaterMark (%)
- Low WaterMark (%)

6 Perform the following steps to configure a filter entry.

i Click on the Filter Entries tab button.

ii Click on the Create button. The Entry, ACL IPv6 Filter (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description
- Log ID
- Administrative State

iv To assign a time range to the ACL IPv6 filter entry, click on the Select button in the Time Range panel. The Select Time Range - Ipv6FilterEntry list form opens. Otherwise, go to step 6 vi.

v Select a time range entry and click on the OK button. The Select Time Range - Ipv6FilterEntry list form closes and the Entry, ACL IPv6 Filter (Create) form refreshes with the time range information.

Note — ACL filters that include ACL filter entries to which you have assigned a time range cannot be assigned to a time of day suite policy.

Time ranges with which you have associated a ACL filter within a time of day suite policy cannot be assigned to ACL filter entries of that ACL filter.

vi Click on the Filter Properties tab button.

vii Configure the parameters:

- Action
- Protocol
- DSCP
- Source IP
- Src Mask
- Destination IP
- Dst Mask
- Source Port
- Dest Port
- ICMP Code
- ICMP Type
- TCP Syn
- TCP Ack

The Source Port and Dest Port parameters are configurable when the Protocol parameter value is TCP or UDP.

The TCP Syn and TCP Ack parameters are configurable when the Protocol parameter value is TCP.

The ICMP Code and ICMP Type parameters are configurable when the Protocol parameter value is IPv6_ICMP.

viii Click on the OK button. The Entry, ACL IPv6 Filter (Create) form closes and a dialog box appears.

ix Click on the OK button. The ACL IPv6 Filter (Create) form displays the new filter entry.

7 To create an additional filter entry, repeat steps 6.

8 To define the order in which the policy tries to match filter entries with packets, perform the following steps for each filter entry.

i Select a filter entry in the list.

ii Click on the Renumber ID button. The Renumber Entry ID form opens.

iii Configure the New Entry ID parameter.

iv Click on the OK button. The Renumber Entry ID form closes, and the Entry ID column displays the new identifier assigned to the entry.

9 Click on the OK button. The ACL IPv6 Filter (Create) form closes, and the Manage ACL IPv6 Filter Policies form reappears.

10 Click on the Search button to display the newly created policy.

11 Select the policy in the list and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

12 Select the distributed policy in the list and click on the Properties button. The ACL IPv6 Filter Global Policy (Edit) form opens.

13 Click on the Local Definitions tab button.

14 Select a local definition from the list and click on the Properties button. The ACL IPv6 Filter Local Policy (Edit) form opens.

15 Click on the Insertion Blocks tab button.

16 Configure the parameters:

- Credit Control Start Entry
- Credit Control Count
- RADIUS Start Entry
- RADIUS Count
- High WaterMark (%)
- Low WaterMark (%)

Note — The Group Entries Inserted panel displays the number of entries insterted on this filter range.

17 Configure the Application and Location parameters in the Group Insertion Sorting panel.

18 Click on the Sort Group Instertions button. A dialog box appears.

19 Click on the OK button.

20 Perform the following steps to view filter entry data.

i Click on the Filter Entries tab button.

ii Click on the Credit Control Entries tab button or the RADIUS Entries tab button.

iii Click on the Search button.

iv Select an entry from the list and click on the Properties button. A form opens.

v Close the form after viewing the filter entry data.

21 Close the ACL IPv6 Filter Entry Local Policy (Edit) form.

22 Close the ACL IPv6 Filter Entry Global Policy (Edit) form.

23 Close the Manage ACL IPv6 Filter Policies form.

Procedure 48-3 To configure an ACL MAC filter policy

Note — ACL MAC filters are not supported for the 7705 SAR.

1 Choose Policies→Filter→ACL MAC Filter from the 5620 SAM main menu. The Manage ACL MAC Filter Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The ACL MAC Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Filter ID
- Auto-Assign ID
- Displayed Name
- Description
- Default Action
- MAC Filter Type

The Default Action parameter specifies the action to be applied to packets when no action is specified in the MAC filter entries or when the packets do not match the specified criteria.

4 Configure the filter entries. Perform the following:

i Click on the Filter Entries tab button.

ii Click on the Create button. The Entry, ACL MAC Filter (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Auto-Assign ID
- Entry ID
- Displayed Name
- Description
- Log ID
- Administrative State

iv Assign a time range to the ACL MAC filter entry by clicking on the Select button beside the Name parameter. The Select Time Range - MacFilterEntry list form opens.

v Select a time range entry and click on the OK button. The Select Time Range - MacFilterEntry list form closes and the Entry, ACL MAC Filter (Create) form refreshes with the time range information.

Note — ACL filters that include ACL filter entries to which you have assigned a time range cannot be assigned to a time of day suite policy.

Time ranges with which you have associated a ACL filter within a time of day suite policy cannot be assigned to ACL filter entries of that ACL filter.

vi Click on the Filter Properties tab button.

vii Configure the Action parameter:

If you specify forward (SAP), the Forwarding Destination tab is displayed. Perform the following:

- Click on the Forwarding Destination tab button.
- Configure the parameters:
  - Port Name
  - Outer Encap Value
  - Inner Encap Value

If you specify forward (SDP), the Forwarding Destination tab is displayed. Perform the following:

- Click on the Forwarding Destination tab button.
- Configure the parameters:
  - Path ID
  - VC ID

If you specify HTTP redirect, the Web Redirect tab is displayed. Perform the following:

- Click on the Web Redirect tab button.
- Configure the Redirect URL parameter.

viii Click on the Filter Properties tab button.

ix Configure the parameters:

- Frame Type
- Source MAC
- Src Mask
- Destination MAC
- Dst Mask
- Dot1p
- Dot1p Mask
- Low ISID
- High ISID
- Inner Tag Value
- Inner Tag VID Mask
- Outer Tag Value
- Outer Tag VID Mask
- DSAP
- DSAP Mask
- SSAP
- SSAP Mask
- SNAP OUI
- SNAP PID
- Ether Type

The Source MAC, Src Mask, Destination MAC, Dst Mask, Dot1p, Dot1p Mask, Low ISID and High ISID parameter pairs are configurable when the check box for each pair is selected.

The Low ISID and High ISID parameters are only configurable when the MAC Filter Type parameter is set to ISID.

The Inner Tag Value, Inner Tag VID Mask, Outer Tag Value, and Outer Tag VID Mask parameters are only configurable when the MAC Filter Type parameter is set to VID.

The DSAP, DSAP Mask, SSAP, and SSAP Mask parameters are configurable when the Frame Type parameter value is set to e802dot2LLC and the MAC Filter Type parameter is set to Normal.

The SNAP OUI and SNAP PID parameters are configurable when the Frame Type parameter value is e802dot2SNAP and the MAC Filter Type parameter is set to Normal.

The Ether Type parameter is configurable only when the Frame Type parameter value is set to Ethernet II and the MAC Filter Type parameter is set to Normal.

x Click on the OK button. The Entry, ACL MAC Filter (Create) form closes and a dialog box appears.

xi Click on the OK button. The ACL MAC Filter (Create) form reappears with the newly created filter entry displayed.

5 By default, all IDs for filter entries are set to 0. Perform one of the following steps:

a Continue configuring the filter. Go to step 7.

b Reorder new or existing filter entries, using the New Entry ID parameter.

i Click on the Refresh button to find an existing filter entry. The list of filter entries is displayed.

ii Select a filter entry in the list.

iii Click on the Renumber ID button. The renumber entry ID form opens and displays the current filter ID.

iv Specify the New Entry ID parameter. The range is 1 to 65535.

v Click on the OK button. The renumber entry ID form closes and the list of filter entries is refreshed, based on the new ID number assigned to the filter.

6 To add an additional filter entry, repeat steps 4 and 5.

7 Click on the OK button to save the policy. The ACL MAC Filter (Create) form closes and the Manage ACL MAC Filter Policies form reappears.

8 Click on the Search button to display the newly created policy or policies.

9 Select a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the Manage ACL MAC Filter Policies form.

Procedure 48-4 To configure a 7250 SAS and Telco ACL standard IP filter policy

1 Choose Policies→Filter→7250 SAS and Telco ACL Standard IP Filter from the 5620 SAM main menu. The Manage 7250 SAS and Telco ACL Standard IP Filter Policies form opens.

2 Perform one of the following:

a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button. The 7250 SAS and Telco ACL Standard IP Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Filter ID
- Displayed Name
- Description

4 Click on the Filter Entries tab button.

5 Click on the Create button. The 7250 SAS and Telco ACL Standard IP Filter entry form opens with the General tab displayed.

6 Configure the parameters:

- Displayed Name
- Description

7 Click on the Filter Properties tab button.

8 Configure the parameters:

- Action
- Source IP
- Src Mask
- VLAN Priority Tag

The VLAN Priority Tag parameter is configurable when its check box is selected. The parameter is configurable by default.

9 To add more filter entries, repeat steps 5 to 8.

10 Click on the OK button. The 7250 SAS and Telco ACL Standard IP Filter entry form closes and the Manage 7250 SAS and Telco ACL Standard IP Filter Policies form reappears.

11 Click on the Search button to display the newly created policy or policies.

12 Select a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

13 Close the Manage 7250 SAS and Telco ACL Standard IP Filter Policies form.

Procedure 48-5 To configure a 7250 SAS and Telco ACL extended IP filter policy

1 Choose Policies→Filter→7250 SAS and Telco ACL Extended IP Filter from the 5620 SAM main menu. The Manage 7250 SAS and Telco ACL Extended IP Filter Policies form opens.

2 Perform one of the following:

a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button. The 7250 SAS and Telco ACL Extended IP Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Filter ID
- Displayed Name
- Description

4 Click on the Filter Entries tab button.

5 Click on the Create button. The 7250 SAS and Telco ACL Extended IP Filter entry form opens.

6 Configure the parameters:

- Displayed Name
- Description

7 Click on the Filter Properties tab button.

8 Configure the parameters:

- Action
- Source IP
- Destination IP
- Source Port
- Dest Port
- TCP Ack
- Protocol
- Src Mask
- Dest Mask
- TOS
- Precedence
- VLAN Priority Tag
- ICMP Code
- ICMP Type

The Source Port and Dest Port parameters are configurable when the Protocol parameter value is TCP or UDP.

The TCP Ack parameter is configurable when the Protocol parameter value is TCP.

The ICMP Code and ICMP Type parameters are configurable when the Protocol parameter value is ICMP.

9 To add more filter entries, repeat steps 5 to 8.

10 Click on the OK button. The 7250 SAS and Telco ACL Extended IP Filter entry form closes and the Manage 7250 SAS and Telco ACL Extended IP Filter form reappears.

11 Click on the Search button to display the newly created policy or policies.

12 Select a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

13 Close the Manage 7250 SAS and Telco ACL Extended IP Filter Policies form.

Procedure 48-6 To configure a 7250 SAS and Telco ACL IGMP filter policy

1 Choose Policies→Filter→7250 SAS and Telco ACL IGMP Filter from the 5620 SAM main menu. The Manage 7250 SAS and Telco ACL IGMP Filter Policies form opens.

2 Perform one of the following:

a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button. The 7250 SAS and Telco ACL IGMP Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Filter ID
- Displayed Name
- Description
- Name

4 Click on the Filter Entries tab button.

5 Click on the Create button. The Entry, 7250 SAS and Telco ACL IGMP Filter (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Displayed Name
- Description

7 Click on the Filter Properties tab button.

8 Configure the parameters:

- Action
- Source IP
- Src Mask
- Destination IP
- Dest Mask
- Loggable
- IGMP Option

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The 7250 SAS and Telco ACL IGMP Filter (Create) form reappears.

11 To add more filter entries, repeat steps 5 to 10.

12 Click on the OK button to close the 7250 SAS and Telco ACL IGMP Filter (Create) form and save the policy.

13 Click on the Distribute button to manually distribute the policy locally to 7250 SAS or Telco devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

14 Click on the Selected radio button to choose from the listed devices.

15 Choose one or more rows from the Available Nodes list.

16 Click on the right arrow button. The selected devices move to the list on the right side of the form.

17 Click on the Distribute button. The policy is distributed to the device or devices.

18 Close the Distribute form. The 7250 SAS and Telco ACL IGMP Filter Policy form reappears.

19 Close the 7250 SAS and Telco ACL IGMP Filter Policy form. The Manage 7250 SAS and Telco ACL IGMP Filter Policies form reappears.

20 Close the Manage 7250 SAS and Telco ACL IGMP Filter Policies form.

Procedure 48-7 To configure a 7250 SAS and Telco ACL MAC filter policy

1 Choose Policies→Filter→7250 SAS and Telco ACL MAC Filter from the 5620 SAM main menu. The Manage 7250 SAS and Telco ACL MAC Filter Policies form opens.

2 Perform one of the following:

  a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

  b Click on the Create button. The 7250 SAS and Telco ACL MAC Filter (Create) form opens.

3 Configure the parameters:

- Filter ID
- Displayed Name
- Description

4 Click on the Filter Entries tab button.

5 Click on the Create button. The 7250 SAS and Telco ACL MAC Filter entry form opens with the General tab displayed.

6 Configure the parameters:

- Displayed Name
- Description

7 Click on the Filter Properties tab button.

8 Configure the parameters:

- Action
- Source MAC
- Destination MAC
- Pattern
- Src Mask
- Dst Mask
- Pattern Mask

The Pattern and Pattern Mask parameters are configurable when the check box is selected.

9 Click on the OK button.

10 To add more filter entries, repeat steps 5 to 11.

11 Click on the OK button. The 7250 SAS and Telco ACL MAC Filter (Create) form closes and the Manage 7250 SAS and Telco ACL MAC Filter Policies form reappears.

12 Click on the Search button to display the newly created policy or policies.

13 Select a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

14 Close the Manage 7250 SAS and Telco ACL MAC Filter Policies form.

49 — Multicast policies

49.1 Multicast policies overview

You can use the 5620 SAM to create policies that regulate the flow of multicast traffic for more efficient multicast stream management, bandwidth management, traffic forwarding, and where multicast reports are sent.

Egress multicast groups

In VPLS standard multicasting, copies of the original packets are looped back to the SAP for transmission to each destination: an activity that consumes resources and makes the handling of congestion issues more difficult.

A more efficient method of forwarding multicast packets is to group destination SAPs in a set or "chain" that receives a single multicast packet from the egress forwarding plane with only a single pass. Adding SAPs to an EMG eliminates loopbacks by forwarding a multicast packet once to a group of shared definitions. As a result, an EMG makes multicasting more efficient and more scalable.

Creating an EMG in the 5620 SAM is similar to creating a policy, because it is first created globally and then distributed to NEs. The EMG is applied to an L2 access interface that has been created on an Ethernet port with null or dot1q encapsulation. SAP membership in an EMG has the following requirements:

- The SAP must belong to an SHG.
- The L2 access interface egress ACL filter must match that of the EMG.
- The access port and the EMG must have the same encapsulation type.

When a SAP becomes a member of an EMG, the common parameters that it shares with other EMG members cannot be changed. On the other hand, a modification to an EMG common requirement changes that parameter in all SAPs in the chain. The same common required traits apply to egress filters: individual SAP filters cannot be changed, and any change to the EMG egress filter parameters affects the egress filters in all member SAPs. In addition, if an egress filter is not defined in the EMG common parameter requirements, a new member SAP cannot have an egress filter.

The following restrictions also apply to an EMG:

- only IPv4 egress filters can be applied to an EMG
- up to 30 EMGs can be created on a router
- an EMG can be deleted only if it has no SAP members
- the number of members in an EMG (the chain limit) is restricted to 30, with an optimal length of 10 to 16

Multicast package policies

Multicast package policies for Telco devices group together BTV multicast streams which can be applied to Telco ring groups for distribution to end users.

Multicast package policies are also used to assign a common set of multicast groups to all 7450 ESSs and 7750 SRs in an MVR VPLS. Multicast package policies ensure that the multicast groups on the devices of one or more MVR VPLS instances are consistent. See chapter 30 for information about configuring multicast groups on individual devices using a multicast routing policy.

When a multicast package policy is distributed to a 7450 ESS or 7750 SR, a multicast routing policy is configured with the appropriate multicast prefix list, which is based on the multicast groups in the multicast package policy. Multicast package policies are only used to distribute the policies to one of the two NEs. Policy discovery and synchronization are not supported.

A multicast package policy has zero or more multicast groups associated with it. The multicast groups are distributed to the 7450 ESS or 7750 SR as part of the policy. Only root catalog multicast packages can be distributed to the 7450 ESSs or 7750 SRs.

Distributing multicast package policies

When you distribute a multicast package policy to a 7450 ESS or 7750 SR, the 5620 SAM maps one multicast package policy to one routing policy statement. Each multicast policy group entry is mapped to one routing policy prefix list member.

For example, the ID of a multicast package policy is 2. When the policy is distributed to a 7450 ESS or 7750 SR, the 5620 SAM automatically creates a routing policy statement for the device. The name created for the routing policy statement is SAM_MPP_2, where 2 is the multicast package policy ID.

When the policy is distributed to the 7450 ESS or 7750 SR, the ID of the routing policy statement entry is always 1. A name is generated by the 5620 SAM to identify the prefix list in the routing policy statement entry. The name is SAM_MPG_2_1, where 2 is the multicast package policy ID and 1 is the routing policy statement entry ID. The prefix list name is referenced in the routing policy statement entry as the multicast group prefix list name.

In the same example, the multicast address for the multicast group of a multicast package policy is 224.0.0.0. When the multicast package policy is distributed to a 7450 ESS or 7750 SR, the 5620 SAM automatically creates a routing policy prefix list member for the device. The prefix list member address is 224.0.0.0.

Since the multicast package policy is not resynchronized, you must avoid duplicate names for routing policies.

For the 7450 ESS and 7750 SR, if a multicast group does not have a policy group entry, the multicast group is not distributed to the device as a prefix member.

If a multicast package policy is used by any MVR VPLS, it cannot be removed from the 5620 SAM.

Multicast CAC policies

Multicast CAC policies control the bandwidth consumed by BTV distribution services. Bandwidth control helps manage network congestion and maintain QoS standards. The multicast CAC function is supported on any IGMP and PIM interface, and in the case of BTV distribution, on VPLS SAPs and SDPs where IGMP snooping is enabled.

A multicast CAC policy manages the bandwidth consumed by BTV services on both the access node link and specific links in the aggregation network. Routers in the path are configured to maintain certain limits on broadcast bandwidth and can limit the number of channels simultaneously sent on both the second mile link and the network link.

Multicast CAC policies are supported for VPLS on the 7710 SR, 7750 SR, and 7450 ESS.

Ingress Multicast Bandwidth policy

Ingress Multicast Bandwidth policies are used to manage the ingress multicast path bandwidth of the multicast forwarding paths into the switching fabric. When Multicast Path Management is disabled (the default), two paths are available:

- a high-priority path, on which packets from queues classified as “expedited” are forwarded
- a low-priority path on which packets from queues classified as “non-expedited” are forwarded

When Multicast Path Management is enabled, an Ingress Multicast Bandwidth policy can be used to manage the flow of multicast traffic through an MDA (IOM or IOM 2) or the forwarding plane of an 2 x XP MDA IOM 3 or IMM.

The maximum number of bandwidth policies per NE is 32, including the default policy.

MDAs can be configured to use previously defined Ingress Multicast Bandwidth policies. However, any path limits specified in the selected policy can be overridden for each MDA, if required.

Ingress Multicast Info policy

Ingress Multicast Info policies are used to define how each multicast channel is handled by NEs. The policy is assigned to a VPLS/VPRN service site or default routing instance, but the policy is actually used by the Ingress Multicast Bandwidth Manager, the ECMP Path Manager, and the Egress Multicast CAC Manager to determine the path through the switch fabric and to make decisions on joins to multicast streams.

The maximum number of Info policies per NE is limited to 32, including the default policy.

MDAs can be configured to use previously-defined Ingress Multicast Bandwidth policies. However, any path limits specified in the selected policy can be overridden for each MDA, if required.

Ingress multicast forwarding on L2-snooped and L3-routed IP multicast traffic can be explicitly configured by applying an Ingress Multicast Path Management Info policy to a VPLS site (all types of VPLS are supported), a VPRN site, or the default routing instance.

An Info policy consists of one or multiple named Bundles, which in turn, contain Channel ranges with possible overrides for individual channels.

Bundles

A Bundle groups a set of explicit multicast channels (or channel ranges) into a common bandwidth context for CAC functions (such as join decisions) using common preferences. The channels in the bundle are managed as a defined percentage of the available bandwidth.

Bundles also simplify provisioning, since the default characteristics of the bundle channels are specified on the bundle level. These characteristics can be overridden at the Channel range level, or explicitly per channel.

Each Info policy has a default bundle named “default”. It cannot be edited or removed. Any multicast channel that fails to match a channel range within an explicit operator-defined bundle is associated with this default bundle.

Note — The maximum number of Bundles per Info policies is limited to 32. This limit includes the default bundle, leaving 31 operator-defined bundles per Info policy.

Channels and channel ranges

Channel ranges are used to define a set of multicast channels contained in a bundle and to override the default channel settings in the containing bundle.

A channel range is defined by a start destination multicast IP address and an end destination multicast IP address (both IP v4 and IPv6 are supported, but the start and end addresses must be of the same type). A channel in this context is a channel range where the start address and end address are identical.

Note — After you create a channel range, it is not possible to modify the start address or end address.

A channel range can contain multiple channel overrides. A channel override is used to specify an explicit setting for a channel within the range. The channel override is identified by a destination multicast IP address which falls between the start and end IP addresses of the channel range.

Note — The 7450 ESS does not support channel ranges and channel overrides having IPv6 addresses. Therefore, the 5620 SAM does not allow the creation of such channel ranges and channel overrides on local Ingress Multicast Info policies. In addition, the 5620 SAM removes any such channel ranges and channel overrides when synchronizing local Info policies with their respective global policies.

Dual stream selection

Dual stream selection support allows a single multicast stream to be duplicated into two different transmission paths. The two paths may have different transmission characteristics, such as latency and jitter. Rather than select one stream for retransmission to the client, the duplicate stream protection feature evaluates each stream packet-by-packet, selecting the packet that first arrives (and is valid) for retransmission.

Dual stream selection is supported on the 7710 SR and the 7750 SR.

Video quality monitoring

VQM to provides the functionality to analyze the quality of a video stream just prior to reaching the STB of client in a IPTV network. Statistics reports and alarms can be generated for VQM, providing operators with a view of multicast video quality at the last mile of distribution.

VQM is supported on the 7710 SR and the 7750 SR.

Ingress Multicast Reporting Destination policy

Ingress Multicast Reporting Destination policies are used to specify the destination server for the collection of multicast reports. The policies are applied to residential subscriber IGMP policies.

49.2 Multicast policies procedures

This section contains procedures relating to the configuration and maintenance of multicast policies.

Procedure 49-1 To create an egress multicast group policy

1 Choose Policies→Multicast→Egress Multicast Group. The Manage Egress Multicast Group Policies form opens.

2 Perform one of the following:

   a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

   b Click on the Create button. The Egress Multicast Group (Create) form opens with the General tab displayed.

3 Configure the parameters:

   - Displayed Name
   - Description
   - Destination Chain Limit

4 Click on the SAP Common Requirements tab button.

5 Configure the parameters:

   - Encapsulation Type
   - Dot1 Q Ethertype
   - QinQ Ethertype
   - QinQ Fixed Tag Value

6 Click on the Select button in the Egress Filter panel to choose an egress policy. The Select Egress Filter search form opens.

7 Select an egress policy in the list and click on the OK button. The Select Egress Filter form closes and the egress policy information appears on the Egress Multicast Group (Create) form.

Note — The egress policy that you choose for this EMG must be the same as the egress policy specified for a member SAP.

8 Click on the Apply button to save the policy. The Egress Multicast Group (Create) form reappears with the General tab displayed.

9 Click on the More Actions button and choose Distribute to manually distribute the policy to local devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note 1 — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

Note 2 — To associate a SAP on the device with an EMG, the access port encapsulation type on the device must be the same as the encapsulation type that you specified in step 5.

10 Close the Egress Multicast Group form. The Manage Egress Multicast Group Policies form reappears.

11 Close the Manage Egress Multicast Group Policies form.

Procedure 49-2 To configure a multicast CAC policy

1 Choose Policies→Multicast→Multicast CAC. The Manage Multicast CAC Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Multicast CAC (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Default Action

4 Click on the Apply button. The Multicast CAC (Edit) form opens with the General tab displayed.

5 Click on the Bundles tab to associate a multicast bundle with the multicast CAC policy.

6 Click on the Create button. The Multicast CAC Bundle (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Name
- Description
- Max Bandwidth (kbps)
- Administrative State

8 Click on the Channels tab.

9 Click on the Create button. The Multicast CAC Channel (Create) form opens.

10 Configure the parameters:

- Start Address
- End Address
- Bandwidth (kbps)
- Class
- Type

11 Click on the OK button. The Multicast CAC Channel (Create) form closes and a dialog box appears.

12 Click on the OK button. The Multicast CAC Bundle (Create) form lists the newly configured channel.

13 To add additional channels to the bundle, repeat steps 9 to 12.

14 Click on the OK button. A dialog box appears.

15 Click on the OK button. The Multicast CAC Bundle (Create) form closes and the Multicast CAC (Edit) form reappears with the Bundles tab displayed.

16 Click on the OK button. A dialog box appears.

17 Click on the OK button. The Multicast CAC (Edit) form closes and the Manage Multicast CAC Policies form reappears.

18 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

19 Select a policy and click on the Distribute button to manually distribute the policy to local devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

20 Close the Manage Multicast CAC Policies form.

Procedure 49-3 To configure an Ingress Multicast Bandwidth policy

1 Choose Policies→Multicast→Ingress Multicast Path Management. The Manage Ingress Path Management Policies form opens.

2 Select the Multicast Bandwidth Policy (multicast) from the object drop-down list.

3 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button and select Create Multicast Bandwidth Policy from the contextual menu. The Multicast Bandwidth Policy (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Description
- Falling Percent Reset (%)
- Admin BW Use Threshold (kbps)
- Percentage of Total pool (%)
- Reserved CBS (%)
- Displayed Name

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the T1 Paths tab button. A table displays the policy definitions for the primary, secondary, and ancillary paths. Each path definition contains configurable parameters.

6 Choose one of the paths and click on the Properties button. The Bandwidth Policy Path (Create) form opens.

7 Configure the parameters:

- Path Limit (mbps)
- Committed Buffer Space (%)
- Maximum Buffer Space (%)
- High Priority Traffic (%)

8 Click on the Apply button. A dialog box appears.

9 Click on the OK button.

10 Repeat steps 6 to 9 for the remaining paths, if required.

11 Click on the T2 Paths tab button. A table displays the policy definitions for the primary and secondary paths. Each path definition contains configurable parameters.

12 Choose one of the paths and click on the Properties button. The Bandwidth Policy Path (Create) form opens.

13 Configure the parameters:

- Number of Secondary T2 Paths
- Committed Buffer Space (%)
- Maximum Buffer Space (%)
- High Priority Traffic (%)

14 Click on the Apply button. A dialog box appears.

15 Click on the OK button.

16 Repeat steps 12 to 15 for the remaining path, if required.

17 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

18 Close the Multicast Bandwidth Policy form. The Manage Ingress Path Management Policies form reappears.

19 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 49-4 To configure an Ingress Multicast Information policy

1 Choose Policies→Multicast→Ingress Multicast Path Management. The Manage Ingress Path Management Policies form opens.

2 Choose Multicast Info Policy (Multicast) from the object drop-down list.

3 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button and select Create Multicast Info Policy from the contextual menu. The Multicast Info Policy (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the Bundles tab button. All defined bundles are displayed, including the default.

6 Click the Create button. The Info Policy Bundle, Multicast Info Policy (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Name
- Description
- Congestion Priority Threshold
- ECMP Optimization Threshold
- Administrative BW (kbps)
- Preference Level
- BW Decision
- Falling Delay (seconds)
- Black Hole Rate (kbps)
- Explicit Path

8 Click on the Video Defaults tab button.

9 Configure the parameters:

- Video Group ID
- Channel Type
- Re-order Audio Interval (msec)
- FCC Server
- Min Duration (msec)
- Buffer Size
- (RT) Server
- Local Server

10 Configure the stream selection parameters, if the Stream Selection parameter is enabled for the video group.

Note — Stream selection parameters are only available if you are performing the configuration in the local policy definition. After the changes are applied to the local policy, the policy can be switched back to Sync With Global mode and the local changes made to the policy are retained. See chapter 46 for information on policy distribution modes.

i Enter a unicast IPv4 address for the Source Address parameter.

ii Click on the Select button next to the Primary Interface parameter. The Select - Multicast Path Management Bundle form opens.

iii Select an access interface and click on the OK button.

iv Click on the Select button next to the Secondary Interface parameter. The Select - Multicast Path Management Bundle form opens.

Note — The Primary Interface and Secondary Interface must be different.

v Select an access interface and click on the OK button.

11 Configure VQM if the Analyzer parameter is enabled for the video group.

Note — If VQM is not enabled for the video group, then parameters configured in the VQM Config tab will have no effect.

i Enable the Analyzer parameter in the VQM panel. The form refreshes with the additional VQM Config tab button.

ii Configure the Description parameter.

iii Click on the VQM Config tab button.

iv Configure the parameters:

- Continuity Counter Error
- Unreferenced PID Error
- SCTE35 Error
- TEI Error
- TS Sync Loss Error

v In the PAT (Program Association Table) Repetition panel, configure the PAT Syntax parameter.

vi Enable the PCR Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

vii In the PCR (Program Clock Reference) Repetition panel, enable the PCR Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

viii In the PMT (Program Map Table) Repetition panel, configure the PMT Syntax Error parameter.

ix Enable the PMT Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

x In the PID panel, configure the parameters:

- Video PID Absent Interval (msec)
- Non Video PID Absent Intv (msec)

12 Click on the Tunnel Interfaces tab button.

13 Click on the Select button next to the P2MP LSP Name parameter. The Select - Multicast Path Management Bundle form opens.

14 Select a Multicast Path Management Bundle and click on the OK button.

15 The Select - Multicast Path Management Bundle form closes and the information is displayed.

16 Click on the Select button next to the P2MP ID for LDP parameter. The Select LDP Tunnel Interface - Multicast Path Management Bundle form opens.

17 Select an LDP Tunnel Interface and click on the OK button.

18 The Select LDP Tunnel Interface - Multicast Path Management Bundle form closes and the information is displayed.

19 Configure the Ingress LER parameter.

Note 1 — You can configure either the P2MP LSP Name parameter or the P2MP ID for LDP parameter.

Note 2 — The Ingress LER parameter is automatically configured when the P2MP ID for LDP parameter is configured.

20 Click on the Channels tab button.

21 Click the Create button. The Info Policy Channel Range, Info Policy Bundle (Create) form opens with the General tab displayed.

22 Configure the channel range parameters:

- Start Address
- End Address

Note — The 7450 ESS does not support channel ranges and channel overrides having IPv6 addresses. Therefore, the 5620 SAM does not allow the creation of such channel ranges and channel overrides on local Ingress Multicast Info policies. In addition, the 5620 SAM removes any such channel ranges and channel overrides when synchronizing local Info policies with their respective global policies.

23 Configure any required overrides of the following parameters in the Channel Defaults block:

- Administrative BW (kbps)
- Preference Level
- BW Decision
- Falling Delay (seconds)
- Black Hole Rate (kbps)
- Explicit Path

24 Click on the Video tab button.

25 Configure the parameters:

- Video Group ID
- Channel Type
- Re-order Audio Interval (msec)
- FCC Server
- Min Duration (msec)
- Buffer Size
- (RT) Server
- Local Server

26 Configure the stream selection parameters, if the Stream Selection parameter is enabled for the video group.

Note — Stream selection parameters are only available if you are performing the configuration in the local policy definition. After the changes are applied to the local policy, the policy can be switched back to Sync With Global mode and the local changes made to the policy are retained. See chapter 46 for information on policy distribution modes.

i Enter a unicast IPv4 address for the Source Address parameter.

ii Click on the Select button next to the Primary Interface parameter. The Select - Multicast Path Management Bundle form opens.

iii Select an access interface and click on the OK button.

iv Click on the Select button next to the Secondary Interface parameter. The Select - Multicast Path Management Bundle form opens.

Note — The Primary Interface and Secondary Interface must be different.

v Select an access interface and click on the OK button.

27 Configure VQM if the Analyzer parameter is enabled for the video group.

Note — If VQM is not enabled for the video group, then parameters configured in the VQM Config tab will have no effect.

i Enable the Analyzer parameter in the VQM panel. The form refreshes with the additional VQM Config tab button.

ii Configure the Description parameter.

iii Click on the VQM Config tab button.

iv Configure the parameters:

- Continuity Counter Error
- Unreferenced PID Error
- SCTE35 Error
- TEI Error
- TS Sync Loss Error

v In the PAT (Program Association Table) Repetition panel, configure the PAT Syntax parameter.

vi Enable the PCR Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

vii In the PCR (Program Clock Reference) Repetition panel, enable the PCR Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

viii In the PMT (Program Map Table) Repetition panel, configure the PMT Syntax Error parameter.

ix Enable the PMT Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

x In the PID panel, configure the parameters:

- Video PID Absent Interval (msec)
- Non Video PID Absent Intv (msec)

28 Click on the Tunnel Interfaces tab button.

29 Click on the Select button next to the P2MP LSP Name parameter. The Select - Multicast Path Management Channel Range form opens.

30 Select a Multicast Path Management Channel Range and click on the OK button.

31 The Select - Multicast Path Management Channel Range form closes and the information is displayed.

32 Click on the Select button next to the P2MP ID for LDP parameter. The Select LDP Tunnel Interface - Multicast Path Management Channel Range form opens.

33 Select an LDP Tunnel Interface and click on the OK button.

34 The Select LDP Tunnel Interface - Multicast Path Management Channel Range form closes and the information is displayed.

35 Configure the Ingress LER parameter.

Note 1 — You can configure either the P2MP LSP Name parameter or the P2MP ID for LDP parameter, but not both.

Note 2 — The Ingress LER parameter is automatically configured when the P2MP ID for LDP parameter is configured.

36 Click on the Channel Override tab button if you need to specify overrides for explicit channels within the Channel Range.

37 Click on the Create button. The Info Policy Channel Override (Create) form opens, with the General tab displayed.

38 Enter the Source Address of the channel for which you want to specify overrides.

39 Configure any required overrides of the following parameters for the channel in the Overrides block:

- Administrative BW (kbps)
- Preference Level
- BW Decision
- Falling Delay (seconds)
- Black Hole Rate (kbps)
- Explicit Path

40 Click on the OK button. A dialog box appears. Click OK. The channel to which you applied overrides is displayed.

41 Click on the Video tab button.

42 Configure the parameters:

- Video Group ID
- Channel Type
- Re-order Audio Interval (msec)
- FCC Server
- Min Duration (msec)
- Buffer Size
- (RT) Server
- Local Server

43 Configure the stream selection parameters, if the Stream Selection parameter is enabled for the video group.

Note — Stream selection parameters are only available if you are performing the configuration in the local policy definition. After the changes are applied to the local policy, the policy can be switched back to Sync With Global mode and the local changes made to the policy are retained. See chapter 46 for information on policy distribution modes.

i Enter a unicast IPv4 address for the Source Address parameter.

ii Click on the Select button next to the Primary Interface parameter. The Select - Multicast Path Management Bundle form opens.

iii Select an access interface and click on the OK button.

iv Click on the Select button next to the Secondary Interface parameter. The Select - Multicast Path Management Bundle form opens.

Note — The Primary Interface and Secondary Interface must be different.

v Select an access interface and click on the OK button.

44 Configure VQM if the Analyzer parameter is enabled for the video group.

Note — If VQM is not enabled for the video group, then parameters configured in the VQM Config tab will have no effect.

i Enable the Analyzer parameter in the VQM panel. The form refreshes with the additional VQM Config tab button.

ii Configure the Description parameter.

iii Click on the VQM Config tab button.

iv Configure the parameters:

- Continuity Counter Error
- Unreferenced PID Error
- SCTE35 Error
- TEI Error
- TS Sync Loss Error

v In the PAT (Program Association Table) Repetition panel, configure the PAT Syntax parameter.

vi Enable the PCR Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

vii In the PCR (Program Clock Reference) Repetition panel, enable the PCR Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

viii In the PMT (Program Map Table) Repetition panel, configure the PMT Syntax Error parameter.

ix Enable the PMT Repetition Error parameter, if required, and configure the newly displayed parameters:

- TNC (msec)
- QoS (msec)
- TOA (msec)

x In the PID panel, configure the parameters:

- Video PID Absent Interval (msec)
- Non Video PID Absent Intv (msec)

45 Click on the Tunnel Interfaces tab button.

46 Click on the Select button next to the P2MP LSP Name parameter. The Select - Multicast Path Management Channel Range form opens.

47 Select a Multicast Path Management Channel Range and click on the OK button.

48 The Select - Multicast Path Management Channel Range form closes and the information is displayed.

49 Click on the Select button next to the P2MP ID for LDP parameter. The Select LDP Tunnel Interface - Multicast Path Management Channel Range form opens.

50 Select an LDP Tunnel Interface and click on the OK button.

51 The Select LDP Tunnel Interface - Multicast Path Management Channel Range form closes and the information is displayed.

52 Configure the Ingress LER parameter.

Note 1 — You can configure either the P2MP LSP Name parameter or the P2MP ID for LDP parameter, but not both.

Note 2 — The Ingress LER parameter is automatically configured when the P2MP ID for LDP parameter is configured.

53 Click on the Video Interfaces tab button if you need to configure a video interface.

Note — If you are configuring a video interface you must perform the configuration in the local policy definition. After the changes are applied to the local policy, the policy can be switched back to Sync With Global mode and the local changes made to the video interface are retained. See chapter 46 for information on policy distribution modes. See chapter 36 for more information about IPTV video features and configuration.

54 Click on the Create button. The Multicast Video Interface (Create) form opens with the General tab displayed.

55 Configure the Address parameter.

56 Click on the Channel Config tab button.

57 Select a channel in the list and click on the Properties button. The Multicast Video Interface Channel Config (Create) form opens.

58 Configure the parameters:

- RT Rate
- Local Retransmission Server
- RT Payload Type
- FCC Server Mode
- FCC Burst
- FCC MC Handover Rate
- Max IGMP Latency
- Max Number of Sessions

59 Click on the OK button. The Multicast Video Interface Channel Config (Create) form closes and a dialog box appears.

60 Click on the OK button. The configured channels are displayed in the list.

61 Repeat steps 56 to 60 to configure additional channels, if required.

62 Click on the OK button. The Multicast Video Interface (Create) form closes and a dialog box appears.

63 Click on the OK button.

64 Click on the Apply button.

65 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

66 You can view information on VPLS sites (regular sites and I-Sites), VPRN sites, and Default Routing Instances affected by the Multicast Info Policy by clicking the appropriate tab. Run a search and view the properties for the desired item.

67 Close the Multicast Info Policy form. The Manage Ingress Path Management Policies form reappears.

68 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 49-5 To create or edit an ingress multicast reporting destination policy

1 Choose Policies→Multicast→Ingress Multicast Path Management. The Manage Ingress Path Management Policies form opens.

2 Select Multicast Reporting Destination (Multicast) from the object drop-down list.

3 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button and select Multicast Reporting Destination from the list. The Multicast Reporting Destination, Global Policy (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Description
- Destination Address
- Destination UDP Port
- Max Delay (Deciseconds)
- Administrative State

5 Click on the Apply button to save the policy. The Multicast Reporting Destination, Global Policy (edit) form appears with the General tab displayed.

6 Click on the More Actions button and choose Distribute to manually distribute the policy to local devices. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

7 Close the Multicast Reporting Destination, Global Policy (edit) form.

8 Close the Ingress Path Management Policies form.

Procedure 49-6 To configure a Multicast SSM Translate policy

Source-Specific Multicast allows the receiver of multicast packets to specify desired source addresses to the router, so that only packets originating from the specified sources are delivered. IGMP is used by the client to inform the router of the specified addresses.

The SSM Translate Policy allows you to create global sets of SSM Translate Items that can be mass-delivered to many routers at once. Every policy has one or more SSM Translate Items. When the policy is distributed, all of these items are deployed to the target base routers.

Note — IGMP must be enabled on the routers to which you intend to distribute the SSM Translate policy.

1 Choose Policies→Multicast→SSM Translate. The SSM Translate Policies form opens.

2 Perform one of the following:

- **a** Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.
- **b** Click on the Create button. The SSM Translate Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the SSM Translate Items tab. All defined SSM Translate Items are displayed.

5 Click the Create button. The SSM Translate Policy Item (Create) form opens.

6 Configure the parameters:

- Start Mcast Address
- End Mcast Address
- Configured Source

Note — The SSM Translate Items added to a policy should not have overlapping IPv4 address ranges, otherwise a configuration error message will be issued.

7 Click OK. An information dialog box is displayed. Click OK.

8 Click the Apply button.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note 1 — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See Procedure 46-1 for more information.

Note 2 — When you distribute an SSM Translate policy to a router, it replaces any SSM Translate policy that may exist on that router. All existing SSM Translate Items on the router will be overwritten.

10 Close the SSM Translate Policy (Create) form. The SSM Translate Policies form reappears.

11 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

Procedure 49-7 To view NE multicast reporting destination statistics

Perform this procedure to view multicast reporting destination statistics for a particular NE. This procedure allows you to display useful information including frames and records lost and sent. See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Policies→Multicast→Ingress Multicast Path Management. The Ingress Path Management Policies form opens.

2 Choose Local from the Policy scope drop-down menu.

3 Click on the Select button to select an NE. The Select a Network Element form opens.

4 Choose an NE in the list and click on the OK button. The NE IP address is displayed in the Local Node IP Address field.

5 Choose Multicast Reporting Destination (Multicast) from the object drop-down list.

6 Specify a filter to search for an existing policy.

7 Choose a policy from the list and click on the Properties button. The Multicast Reporting Destination, Local Policy (Edit) form opens.

8 Click on the Statistics tab button.

9 Click on the Collect button to collect on-demand statistics.

10 Choose a statistics record and click on the Properties button to view the record. The Statistics Record - Multicast Reporting Destination Stats form opens.

11 View the statistics information.

12 Close the statistics record form.

13 Close other open forms, as required.

Procedure 49-8 To view multicast CAC channel statistics

Perform this procedure to view multicast CAC channel statistics and identify the status of BTV channels on a managed NE. This procedure allows you to display useful information including which channels are blocked and their location, bandwidth availability, the number of times channel requests are dropped on an interface, and the cause of the action based on the multicast CAC policy. See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Tools→BTV Channel Monitor. The Select Site form opens.

2 Select a site in the list and click on the OK button. The BTV Channel Monitor form opens.

3 Perform one of the following:

a Choose Multicast CAC Channel Statistics (multicast) from the object drop-down list to list network protocol statistics.

b Choose Multicast CAC Channel Statistics on Services (multicast) from the object drop-down list to list service statistics.

4 Configure the filter criteria and click on the Search button. A list of multicast CAC channel statistics is displayed at the bottom of the form.

Note — To get the most recent channel information on a managed NE, perform a resynchronization by clicking on the Resync button before clicking on the Search button.

5 Close the BTV Channel Monitor form.

Procedure 49-9 To configure a multicast package policy

Use multicast package policies to:

- define a set of broadcast channels that are multicast across a ring group in a BTV VLAN
- assign a common set of multicast groups to all 7450 ESSs or 7750 SRs in an MVR VPLS to ensure accuracy and consistency

Consider the following when creating multicast package policies:

- one root multicast package policy should be created for a ring or multiple rings, which contains the multicast addresses of all BTV channels distributed in the ring
- specify this root multicast package policy for the BTV (MVR) VLAN
- create other multicast package policies from the root package by clicking on the More Actions button and choosing Copy on the configuration form
- use the child policies to differentiate the types of broadcast TV services offered, for example, basic service and premium service
- when you create 7250 SAS and Telco IGMP ACL filter policies, use these child policies to limit access for end users to specific types of services, for example, access to basic service, premium service, or both services

1 Choose Policies→Multicast→Multicast Package from the 5620 SAM main menu. The Multicast Package Policy Manager form opens.

2 Perform one of the following:

a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button. The Multicast Package Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Name
- Description
- Is Root Catalogue
- IGMP Option
- Loggable

4 Click on the Multicast Groups tab button.

5 Click on the Create button. The Multicast Group (Create) form opens.

Note — Each multicast group that is specified must be preconfigured in the PIM configuration. See the PIM configuration procedures in chapter 31.

6 Configure the parameters:

- Multicast Address
- Name
- Description
- Channel
- Cost

7 Click on the Apply button to save the policy. The Multicast Package Policy (Create) form is refreshed with additional buttons.

8 Click on the Definitions tab, if applicable.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices in the ring. You can use the Distribute button when the Is Root Catalogue parameter is set to root. The Distribute form opens. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

When any new devices are added to the ring, the policy is automatically distributed to any new MVR VLAN service or to any new MVR VLAN service sites in the ring.

10 Click on the Selected radio button to choose from the listed devices.

11 Choose one or more rows from the Available Nodes list.

12 Click on the right arrow button. The selected devices move to the list on the right side of the form.

13 Click on the Distribute button. The policy is distributed to the device or devices.

14 Close the Distribute form. The Multicast Package Policy form reappears.

15 Close the Multicast Package Policy form.

Create other multicast package policies from the root policy by clicking on the More Actions button and choosing Copy, as required. These child policies of the root policy can be used to help differentiate the types of BTV services being created, for example, basic services and premium services.

50 — Time of day policies

50.1 Time of day policies overview

The 5620 SAM supports the creation of time of day policies that allow you to configure time-based QoS policies, ACL filters, and schedulers that are applied to aggregation schedulers and L2 and L3 access interfaces. For example, a time of day policy allows you to manage peer-to-peer traffic by limiting access during peak hours, such as evenings and weekends.

A time range policy consists of one or more schedules, which include a start and end day and time and a priority.

A time of day suite policy is a collection of ingress and egress policies, filter policies, and schedulers, to which time range policies have been assigned. You can apply time of day suite policies to aggregation schedulers and L2 and L3 access interfaces.

You can create a time of day suite policy by assigning time range policies to the following objects to apply time and day restrictions to their deployment and access:

- ACL MAC filters and filter entries
- ACL IP filters and filter entries
- ACL IPv6 filters and filter entries
- access ingress and egress QoS policies
- scheduler policies

The default time range policy is the NO-TIME-RANGE policy, which means that no time and day restrictions apply. There can be only one NO-TIME-RANGE entry in each type of time of day suite policy entry.

Time range policies are first created globally and then distributed to NEs. You can distribute time range policies to the 7210 SAS-D 6F 4T, 7210 SAS-D 6F 4T ETR, 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, 7710 SR, and 7750 SR.

Time range assignment analysis tool

The time range assignment analysis tool allows you to view the time range policies that have been assigned over a specific time period to the following objects:

- L2 access interfaces
- L3 access interfaces
- aggregation schedulers
- time of day suite policies

You can use the time range assignment analysis tool to verify the configuration of multiple schedules and the adequacy of a time of day suite policy on a specific NE. For example, you can use this tool to verify that multiple time ranges that are assigned to IP filters in a time of day suite policy cover an entire month.

50.2 Time of day policies procedures

The following procedures describe how to configure and manage time of day policies.

Procedure 50-1 To configure a time range policy

1 Choose Policies→Time of Day→Time Range from the 5620 SAM main menu. The Manage Time Range form opens.

2 Perform one of the following:

 a Specify a filter to search for an existing time range policy. Select a policy in the filtered list and click on the Properties button.

 b Click on the Create button. The Time Range (Create) form opens.

3 Configure the parameters:

- Name
- Description

4 Click on the Time Range Entries tab button.

5 Click on the Create button. The Time Range Entries (Create) form opens.

6 Configure the parameters:

- Start Time
- End Time
- Ongoing
- Frequency
- Start Run Day
- End Run Day

The Frequency parameter is configurable when the Ongoing parameter is enabled.

The Start Run Day and End Run Day parameters are configurable when the Frequency parameter is set to Weekly.

7 Click on the OK button. The Time Range Entries (Create) closes. The Manage Time Range form opens.

8 Click on the Search button to display the newly created policy or policies.

9 Select a policy and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

10 Close the Manage Time Range form.

Procedure 50-2 To configure a time of day suite

Consider the following when you create a time of day suite policy:

- when there are overlapping time range policy entries within a time of day suite policy, the time range policy entry with the highest priority is applied first
- only one time of day suite policy entry without a time range (default NO-TIME-RANGE) is allowed for each type of policy
- you cannot modify a time of day suite policy entry after you create the entry
- you cannot assign the same priority of a global policy within the same policy type
- you cannot assign the same priority of a local policy within the same policy type
- you cannot assign the same time range of a global policy within the same policy type
- you cannot assign the same time range a local policy within the same policy type
- you cannot distribute a time of day suite policy entry to a local policy if the local policy already has been assigned the same time range as the global policy
- you cannot distribute a time of day suite policy entry to a local policy if the local policy already has been assigned the same priority as the global policy
- all time of day suite policy entries of a local policy are replaced by the time of day suite policy entries of a global policy if none of the entries from the local policy have the same priority or time ranges as the global policy

1 Choose Policies→Time of Day→Time Of Day Suite from the 5620 SAM main menu. The Manage Time-of-day suite form opens.

2 Perform one of the following:

a Specify a filter to search for an existing suite. Select a suite in the filtered list and click on the Properties button.

b Click on the Create button. The Time of Day Suite (Create) form opens.

3 Configure the parameters:

- Name
- Description

4 Click on the TOD Suite Entries tab button.

5 Click on the Ingress tab button.

6 Assign a time range to ingress filter policies, if required. Perform the following steps:

i Click on the Create button. The Ingress *type_of_filter* (Create) form opens.

ii Configure the Priority parameter.

iii Click on the Select button beside the Name parameter. The Select Time Range - Ingress *filter* list form opens.

iv Select a time range in the list and click on the OK button. The Select Time Range - Ingress *filter* list form closes.

v Click on the Select button beside the Filter ID parameter. The ingress filter list form opens.

vi Select a filter in the list and click on the OK button. The ingress filter list form closes.

vii Click on the OK button to save the configuration and close the form. The Time of Day Suite (Create) form reappears with the time of day suite entry displayed in the list.

7 Assign a time range to ingress QoS policies, if required. Perform the following:

i Click on the QoS tab button.

ii Click on the Create button. The Ingress QoS (Create) form opens.

iii Configure the Priority parameter.

iv Click on the Select button in the Time Range panel. The Select Time Range - Ingress QoS list form opens.

v Select a time range in the list and click on the OK button. The Select Time Range - Ingress QoS list form closes.

vi Click on the Select button in the Policy panel. The Select Policy - Ingress QoS list form opens.

vii Select an entry in the list and click on the OK button. The Select Policy - Ingress QoS list form closes.

viii Click on the Select button in the 7210 Policy panel. The Select 7210 Policy - Ingress QoS list form opens.

ix Select an entry in the list and click on the OK button. The Select 7210 Policy - Ingress QoS list form closes.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The Time of Day Suite (Create) form reappears.

8 Assign a time range to ingress scheduler policies, if required. Perform the following:

i Click on the Scheduler tab button.

ii Click on the Create button. The Ingress Scheduler (Create) form opens.

iii Configure the Priority parameter.

iv Click on the Select button beside the Name parameter. The Select Time Range - Ingress Scheduler list form opens.

v Select a time range in the list and click on the OK button. The Select Time Range - Ingress Scheduler list form closes.

vi Click on the Select button beside the Displayed Name parameter. The Select Policy Name - Ingress Scheduler list form opens.

vii Select a filter in the list and click on the OK button. The Select Policy Name - Ingress Scheduler list form closes.

viii Click on the OK button to save the configuration and close the form. The Time of Day Suite (Create) form reappears with the time of day suite entry displayed in the list.

9 Click on the Egress tab button.

10 Assign a time range to egress filter policies, if required. Perform the following steps:

i Click on the Create button. The Egress *type_of_filter* (Create) form opens.

ii Configure the Priority parameter.

iii Click on the Select button beside the Name parameter. The Select Time Range - Egress *filter* list form opens.

iv Select a time range in the list and click on the OK button. The Select Time Range - Egress *type_of_filter* list form closes.

v Click on the Select button beside the Filter ID parameter. The egress filter list form opens.

vi Select a filter in the list and click on the OK button. The egress filter list form closes.

11 Assign a time range to egress QoS policies, if required. Perform the following:

i Click on the QoS tab button.

ii Click on the Create button. The Egress QoS (Create) form opens.

iii Configure the Priority parameter.

iv Click on the Select button in the Time Range panel. The Select Time Range - Egress QoS list form opens.

v Select a time range in the list and click on the OK button. The Select Time Range - Egress QoS list form closes.

vi Click on the Select button in the Policy panel. The Select Policy - Egress QoS list form opens.

vii Select an entry in the list and click on the OK button. The Select Policy - Egress QoS list form closes.

12 Assign a time range to egress scheduler policies, if required. Perform the following:

i Click on the Scheduler tab button.

ii Click on the Create button. The Egress Scheduler (Create) form opens.

iii Configure the Priority parameter.

iv Click on the Select button beside the Name parameter. The Select Time Range - Egress Scheduler list form opens.

v Select a time range in the list and click on the OK button. The Select Time Range - Egress Scheduler list form closes.

vi Click on the Select button beside the Displayed Name parameter. The Select Policy Name - Egress Scheduler list form opens.

vii Select a filter in the list and click on the OK button. The Select Policy Name - Egress Scheduler list form closes.

13 Click on the OK button. The Time of Day Suite (Create) form closes and the Manage Time-of-day suite form reappears.

14 Close the Manage Time-of-day suite form.

Procedure 50-3 To perform a time range entry assignment analysis

1 Choose Tools→Time Range Entry Assignment from the 5620 SAM main menu. The List Time Range Entry Assignment form opens.

2 Click on the Select button to choose a site for the analysis. The Select Site to Analyze form opens.

3 Select a site in the list and click on the OK button.

4 Configure the Time Range Entry Container Type parameter.

5 Click on the Select button beside the Time Range Entry Container Type to choose a specific object of the container type you chose in step 4. The appropriate list form opens.

6 Configure the filter criteria.

7 Click on the Search button.

8 Double-click on an entry in the list, or select an entry and click on the OK button. The list form closes and the List Time Range Entry Assignment form refreshes.

9 Configure the Search by TIme Of Day Entry Type and Time Of Day Entry Policy Type parameters.

10 Configure the Start Date and End Date parameters.

11 Click on the Search button. A list of time range entries that meet the defined criteria is displayed.

12 Double-click on an entry to view information about the time range policy and time of day suite policy. The Time Range Entry Assignment: *Start Date End Date* form opens.

13 Click on the Cancel button to close the Time Range Entry Assignment: *Start Date End Date* form.

14 Close the List Time Range Entry Assignment form.

51 — VRRP policies

51.1 VRRP policies overview

VRRP priority control-policies manage VR backup router priorities. The policies override the base priority value, depending on NE events or conditions. You can configure a VRRP policy only for the non-owner VRRP instance; the same policy can be applied to IPv4 and IPv6 VRRP instances.

The main function of a VRRP priority-control policy is to define the conditions or events that affect the VR ability to communicate with outside hosts or portions of the network. When at least one of these events is true, the base priority for the VR instance is affected in one of two ways:

- an explicit value is overridden
- a value is subtracted from the sum of delta priorities

The result is the actual in-use priority for the VR instance. Any priority event may be configured as an explicit event or a delta event.

Table 51-1 describes the policy events that you can configure using the 5620 SAM.

Table 51-1 VRRP policy events

Policy Event	Description
Host unreachable	Configures a host unreachable priority-control event that monitors the ability of a host to receive an ICMP echo reply packet from a specific IP host address. A host unreachable priority-control event creates a continuous ICMP echo request (ping) probe to the specified IP address. During ping failure, the event is considered to be set. During ping success, the event is considered to be cleared.
IPv6 Host unreachable	Configures an IPv6 host unreachable priority-control event that monitors the ability of a host to receive an ICMP echo reply packet from a specific IPv6 host address. An IPv6 host unreachable priority-control event creates a continuous ICMP echo request (ping) probe to the specified IPv6 address. During ping failure, the event is considered to be set. During ping success, the event is considered to be cleared.
LAG port down	Configures a LAG priority-control event that monitors the operational state of the links and each port in the LAG. When one or more of the ports enters the operational down state, the event is considered to be set. When all ports enter an operational up state, the event is considered to be clear.
Route unknown	Configures a route unknown priority-control event that monitors the existence of a specific active IP route prefix in the routing table. Route unknown defines a link between the VRRP priority-control policy and the RTM. The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes action according to the priority event definition.
Port Down Events	Configures an override or adjustment to the base priority value of a VRRP VR instance depending on the operational state of the event. Port Down events can only be configured on the local definitions of VRRP policies.

As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

51.2 VRRP policies procedures

The following procedures describe how to configure and manage VRRP policies.

Procedure 51-1 To configure a VRRP priority-control policy

1 Choose Policies→VRRP from the 5620 SAM main menu. The Manage VRRP Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The VRRP Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Displayed Name
- Description
- Delta in Use Limit

4 Click on the Apply button.

5 Perform one of the following steps:

a For IPv4 hosts, click on the Host Unreachable tab button.

i Click on the Create button. The Host Unreachable Event (Create) form opens.

ii Configure the parameters:

- IP Address
- Hold Clear (seconds)
- Hold Set (seconds)
- Priority Type
- Priority
- Limit of Echo Request Failures
- Interval for Echo Request (seconds)
- Timeout for Echo Request (seconds)

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The Host Unreachable Event form reappears with the newly created filter entries displayed.

v Go to step 6.

b For IPv6 hosts, click on the IPv6 Host Unreachable tab button.

i Click on the Create button. The IPv6 Host Unreachable Event (Create) form opens.

ii Configure the parameters:

- IP Address
- Interface Name
- Hold Clear (seconds)
- Hold Set (seconds)
- Priority Type
- Priority
- Limit of Echo Request Failures
- Interval for Echo Request (seconds)
- Timeout for Echo Request (seconds)

The Interface Name parameter is only configurable when the host IP Address parameter is a Link Local Address.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The IPv6 Host Unreachable Event form reappears with the newly-created filter entries displayed.

v Go to step 6.

6 Click on the Lag Port Down tab button.

7 Click on the Create button. The Lag Port Down Event (Create) form opens with the General tab displayed.

8 Configure the parameters:

- LAG ID
- Hold Clear (seconds)
- Hold Set (seconds)

9 Click on the Number Down tab button.

10 Click on the Create button. The Number Down (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Number of Ports Down
- Priority
- Priority Type

12 Close the Number Down (Create) form. A dialog box appears.

13 Click on the OK button.

14 Click on the OK button. A dialog box appears.

15 Click on the OK button. The Lag Port Down Event form reappears with the newly created filter entries displayed.

16 Click on the Route Unknown tab button.

17 Click on the Create button. The Route Unknown (Create) form opens with the General tab displayed.

18 Configure the parameters:

- IP Address
- Mask
- Hold Clear (seconds)
- Hold Set (seconds)
- Priority
- Priority Type
- Protocol
- Less Specific

19 Click on the Next Hop tab button.

20 Click on the Create button.

If the IP Address you specify on the General tab is an IPv4 address, the NextHop (Create) form opens; if it is an IPv6 address, the NextHopV6 (Create) form opens.

21 Configure the Hop Address parameter.

22 Configure the Interface Name parameter if the IPv6 Next Hop Address is a Link Local Address.

23 Click on the OK button. A dialog box appears.

24 Click on the OK button.

25 Click on the OK button.The Manage VRRP Policies form reappears.

26 Click on the Search button to display the newly created policy or policies.

27 Select a policy in the list and click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

28 Close the Manage VRRP Policies form.

52 — Auto tunnels policies

52.1 Auto tunnels policies overview

The 5620 SAM supports the creation of service tunnels for groups of NEs based on mesh, hub-and-spoke, or ring network topology. The 5620 SAM uses tunnel management policies to define the conditions for service tunnel creation. A tunnel management policy has four components:

- the group of NEs to which the policy applies and their collective role
- the tunnel specifications, for example, the tunnel type and underlying transport
- the topology specification, for example, mesh
- a tunnel template must be applied

You can specify a system-generated naming format, or you can also specify a naming prefix. The resulting name is a combination of the user-specified prefix and the ID of the tunnel.

Tunnel templates

You must create a tunnel policy using a tunnel template. You can view, but not save or reapply, a tunnel policy created using 5620 SAM releases earlier than 7.0. For example, if a new tunnel is required as a result of group member changes, the tunnel cannot be created if the policy was created using a 5620 SAM release earlier than 7.0. If such a tunnel must be deleted as a result of group member changes, the tunnel can be deleted regardless of the state of the policy.

Depending on the tunnel type selected for an auto tunnel, an SDP or LSP tunnel template can be selected. For an RSVP LSP tunnel type, one LSP template must be selected. For an RSVP SDP tunnel type, 16 LSP templates can be selected. When an LSP parent template with more than one LSP path child templates is specified, more than one LSP path is created.

A template should be configured to be deployed to a majority of the NE types. The user must validate the template and enter appropriate changes to the script before the template can be deployed in an auto tunnel policy. The parameters that can be modified, depend on the template type.

The following parameters can be modified for an SDP template:

- name
- source NE ID
- destination NE ID
- displayed name
- LDP enabled
- underlying transport
- path ID

The following parameters can be modified for an LSP template:

- name
- source NE ID
- path ID
- displayed name

- destination IP address
- destination NE ID

Note — If the policy ID value is specified by a format policy in the template, the path ID value must be set to 0.

When you execute an LSP path template in an auto tunnel policy, the following parameters are substituted with the values from the original tunnel policy:

- name
- resource ID

You can create templates from examples. Use an example as a starting point to create service or tunnel templates with or without format and range policies. When a template with format and range policies is associated with an auto tunnel rule, the format and range policies defined in the template override the name defined in the auto tunnel rule.

Class of Service

When you implement CoS, consider the following:

- To create a CoS-based SDP using RSVP, a user must apply a combination of SDP and LSP templates. An SDP tunnel template can use up to 16 LSPs. For CoS routing, 10 LSP s are required for the following: 1 for default, 1 for multicast, and 8 LSPs for different CoS routes.
- For CoS-based forwarding, at least one LSP template must be associated with the SDP. The LSP template must be specified as the default LSP template for CoS forwarding.
- When LSP templates are not specified, during non-CoS-based forwarding, the SDPs are created without LSPs attached.

Tunnel groups

A tunnel group is defined as collection of network resources, such as NEs, that perform the same role in the network; for example, the way that the designation of a port as an access or network port defines the role of the port in the network.

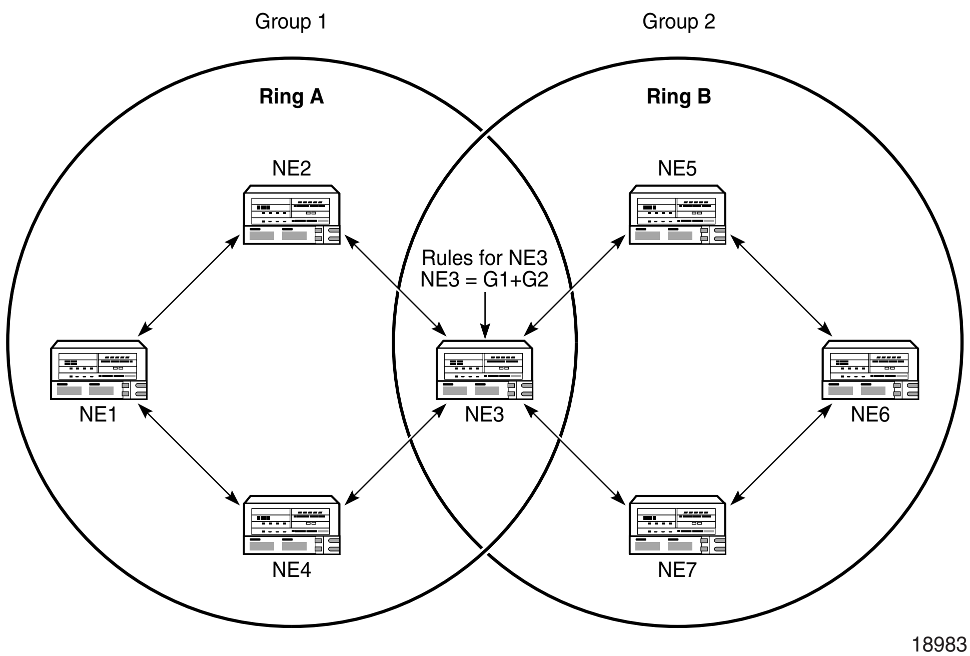
By grouping resources by role, a common policy-based management framework can be used to ensure the appropriate configuration of resources, for example, create service tunnels for different topologies.

The following conditions apply to tunnel groups.

- An NE can belong to multiple groups.
- A group is ordered or unordered depending on the requirements. The members in a group must be ordered when you create some topologies; for example, a ring topology. Topologies such as mesh or hub-and-spoke, in which NEs are not linearly arranged, do not need an ordered group.

- A non-5620 SAM-managed NE can belong to the tunnel group to which it was added, however, it is not active as a destination NE during rule execution.
- When two or more tunnel groups share an NE, the shared NE performs the roles defined for each group. In Figure 52-1, Group 1 contains routers NE1, NE2, NE3, and NE4, and Group 2 contains routers NE3, NE5, NE6, and NE7. NE3 is the intersection set of Groups 1 and 2, therefore NE3 assumes the roles defined for Groups 1 and 2.

Figure 52-1 NE shared by two tunnel groups



Tunnel policy creation requires the configuration of the following:

- one or more group conditions to specify the NEs that are included in the topology
- a least one tunnel template configuration
- one or more tunnel definitions that specify the service-tunnel characteristics, such as the type of tunnel and the underlying transport

Tunnel policy rules

The following conditions apply to tunnel policies.

- A 5620 SAM operator requires topology-management privileges to create or modify a tunnel policy.
- A tunnel can originate and terminate on 5620 SAM-managed NEs. Tunnels cannot originate on non-SAM-managed NEs, however, tunnels can terminate on non-SAM-managed NEs.
- When an NE, that is in a rule-based group, is unmanaged or delete, it is identified as unmanaged in the rule-based group. Tunnels to the NE are not removed, however tunnels from the NE are removed from 5620 SAM.

- When an auto-tunnel rule is created for a group that contains non-SAM-managed NEs, tunnels cannot be created to and from the NE using that rule.
- When you add NEs to a tunnel group that is in use, new tunnels are created according to the policy definition.
- A group condition must contain at least one group of NEs.
- Tunnel elements are not updated dynamically.
- An unmanaged NE is removed from the tunnel groups to which the NE belongs. The associated service tunnels are also removed if they originate from a managed NE. A service tunnel that originates on an unmanaged NE is retained, but is not included in the tunnel group after reconfiguration.
- When a service tunnel created by a tunnel policy is removed, the policy does not attempt to recreate the tunnel.
- You can modify the tunnel definition in a tunnel policy when the tunnel policy has not yet created a service tunnel.

Not all NEs that are assigned to a topology rule share the same functionality. The topology rule runs capability checks on the source NEs to determine whether specific tunnels or tunnel configurations can be applied. Table 52-1 lists the auto tunnel rules that are supported by each NE.

Table 52-1 Auto tunnel rules and NE support

Auto tunnel rule	7710 SR 7450 ESS 7750 SR	7705 SAR			7250 SAS-ES
		1.0	1.1	2.0	
SDP LDP	X	X	X	X	—
SDP GRE	X	—	X	X	—
SDP LSP	X	X	X	X	X
Dynamic LSP	X	—	—	X	X
CoS-based SDP	X	—	—	—	—
LDP-over-RSVP	X	—	—	—	—

52.2 Workflow to configure auto tunnel creation

Perform the following steps to configure an auto tunnel.

1. Configure a tunnel template from one of the following:
   - template creation form
   - network or service object properties form
   - pre-configured tunnel template

   See the *5620 SAM Scripts and Templates Developer Guide* for more information.

2. Configure rule-based groups. See Procedure 52-1 for more information.

3 As required, convert an auto tunnel rule created using a release of the 5620 SAM earlier than release 7.0 to a template-based auto tunnel rule. See Procedure 52-2 for more information.

4 As required, configure mesh or ring topology rules. See Procedure 52-3 for more information.

5 As required, configure hub and spoke topology rules. See Procedure 52-4 for more information.

6 As required, import tunnels not managed by topology rules. See Procedure 52-6 for more information.

7 Execute a topology rule. See Procedure 52-8 for more information.

8 As required, display missing tunnel elements. See Procedure 52-9 for more information.

9 Create a service and specify Automatic Mesh SDP Binding Creation. See the appropriate service chapter for more information.

52.3 Auto tunnels policies procedures

The following procedures describe how to configure and manage auto tunnel elements.

Procedure 52-1 To create a rule-based group

1 Choose Policies→Auto Tunnels→Rule-Based Groups from the 5620 SAM main menu. The Manage Rule-Based Groups form opens.

2 Click on the Create button and choose Create Rule-Based NE Group from the menu. The Rule-Based NE Group (Create) form opens.

3 Configure the parameters.

- Group Name
- Description
- Order

4 Click on the Apply button to save the changes. The Group Members tab becomes configurable.

5 Click on the Group Members tab button.

6 Depending on the value specified for the Order parameter, perform one of the following:

a Add members to an unordered group.

i Click on the Create button. The Select Network Elements form opens.

ii Select an NE and click on the OK button. A dialog box appears.

iii Click on the OK button. The Rule-Based NE Group (Edit) form reappears with the member NE displayed.

iv Repeat steps 6i to iii to add another member to the unordered group, if required or go to step 7.

b Add members to an ordered group.

i Click on the Create button. The Select Network Elements form opens.

ii Select an NE and click on the OK button. A dialog box appears.

iii Click on the OK button. The Rule-Based NE Group (Edit) form reappears with the member NE displayed.

iv Repeat steps 6i to iii to add a member to the end of the ordered group list, if required.

v To insert an NE between two NEs in the ordered group list, click on the Insert button and perform steps 6ii to iii.

7 Click the OK button. A dialog box appears.

8 Click the Yes button. The Rule-based NE Group (Edit) form closes and the Manage Rule-Based Groups form reappears.

9 Close the Manage Rule-Based Groups form.

Procedure 52-2 To convert old auto tunnel rules to template-based auto tunnel rules

Perform this procedure to convert tunnel policies created using a 5620 SAM Release earlier than 7.0 to template-based auto tunnel rules.

The number and type of templates that are displayed depend on the policy type. For example, a mesh SDP policy with GRE as the underlying transport requires 1 SDP template. A hub-and-spoke SDP policy with LSP as the underlying transport requires two SDP and two LSP templates.

When you apply a new template to an old auto tunnel rule, you must ensure that the parameter values defined in the template are consistent with the values that you defined in the original auto tunnel rule. For example, if you convert an auto tunnel rule that requires you to apply an LSP template, you must choose a template in which the LSP Bandwidth and Fast Re-Route parameter values in the template match the values defined in the old auto tunnel rule.

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Click on the Search button. A list of old and new auto tunnel rules is displayed.

3 Select an old auto tunnel rule in the list.

4 Click on the Properties button. An *Auto Rule_type* (Edit) form opens.

5 Click on the More Actions button and choose Convert. The Convert Old Rule form opens.

Note — The Convert option is displayed only if the selected policy has been created using a 5620 SAM Release earlier than 7.0.

6 Perform one or both of the following, depending on the type of tunnel and the underlying transport value.

When the tunnel type value is SDP and the underlying transport value is RSVP-LSP, you must choose a SDP and an LSP template. When the tunnel type value is LSP, you must choose an LSP template only.

a Click on the Select button beside the Name parameter in the SDP Template panel. The Select Template form opens.

b Click on the Select button beside the Name parameter in the LSP Template panel. The Select Template form opens.

7 Select a template in the list and click on the Execute button. The Convert Old Rule form is refreshed with the template information and the Execute button is replaced with a Done button.

Note — After an auto tunnel rule is converted, the Convert option is not displayed when the *Auto Rule_type* (Edit) form is opened.

8 Click on the Tunnel Definition tab in the *Auto Rule_type* (Edit) form. The Template panel is refreshed with the template information.

9 Close the Convert Old Rule form and close the *Auto Rule_type* (Edit) form.

Procedure 52-3 To create a mesh or ring topology rule

Perform this procedure to create a mesh topology rule for service-tunnel creation. A template must be applied to an auto-tunnel policy. You must configure an LSP or SDP tunnel template before you can deploy a template to an LSP or SDP tunnel. See the *5620 SAM Scripts and Templates Developer Guide* for information about creating tunnel templates.

Note — You must convert auto tunnel rules created using a 5620 SAM release earlier than 7.0 if the auto tunnels are not associated with a tunnel template. See Procedure 52-2 for more information.

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Click on the Create button and choose one of the following:

- **a** Create Mesh Topology Rule. The Mesh Topology Rule (Create) form opens with the General tab displayed.
- **b** Create Ring Topology Rule. The Ring Topology Rule (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Naming Format
- User Specified Naming Prefix
- Template Versions
- Tunnel Creation Pacing Interval (seconds)
- Auto-Rule Execution

4 Click on the LERs Definition tab button.

5 Click on the Add button. The Select Rule-Based Group form opens.

6 Click on the Search button.

7 Select a rule-based group in the list and click on the OK button. The Select Rule-Based Group form closes and the group is displayed on the Topology Rule (Create) form.

8 Click on the Tunnel Definition tab button.

9 Perform one of the following to configure the Tunnel Type parameter:

- **a** Choose SDP.
- **b** Choose RSVP-LSP; go to step 19.

10 Click on the SDP tab button.

11 Click on the Select button beside the Script ID parameter. The Select SDP Template form opens with a list of configured templates.

12 Select a template in the list. See Procedure 6-3 for information about creating a tunnel template.

13 Click on the OK button. The Select SDP Template form closes and the SDP template information is displayed on the Topology Rule (Create) form.

14 Configure the parameters:

- Underlying Transport
- Class Forwarding Capability
- Administrative State
- Import Administrative Groups

The Class Forwarding Capability and Administrative State parameters are configurable when the Underlying Transport parameter is set to RSVP-LSP.

The Administrative State parameter is not configurable when the Class Forwarding Capability parameter is disabled.

15 If you set the Underlying Transport parameter to RSVP-LSP, the LSPs tab is displayed. Click on the LSPs tab button; otherwise, go to step 22.

16 Click on the Add button. The Select LSP Template form opens.

17 Select a template in the list and click on the OK button. The Select LSP Template form closes and the Topology Rule (Create) form displays the LSP template information.

18 Go to step 22.

19 Click on the Select button beside the Script ID parameter. The Select LSP Template form opens.

20 Select a template in the list and click on the OK button. The Select LSP Template form closes and the LSP template information is displayed on the Topology Rule (Create) form.

21 Configure the Enable LDP-over-RSVP parameter.

22 Click the OK button. The Topology Rule (Create) form closes and the Manage Auto Tunnel Rules form reappears.

23 Close the Manage Auto Tunnel Rules form.

Procedure 52-4 To create a hub-and-spoke topology rule

Note — You must convert auto tunnel rules created using a 5620 SAM release earlier than 7.0 if the auto tunnels are not associated with a tunnel template. See Procedure 52-2 for more information.

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Click on the Create button and choose Create Hub and Spoke Topology Rule from the contextual menu. The Hub and Spoke Topology Rule (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Naming Format
- User Specified Naming Prefix
- Template Versions
- Tunnel Creation Pacing Interval (seconds)
- Auto-Rule Execution

4 Click on the Hub LERs Definition tab button.

5 Click on the Add button. The Select form opens.

6 Click on the Search button. A list of rule-based groups is displayed.

7 Select a group in the list and click on the OK button. The Select form closes and the group is displayed on the Hub and Spoke Topology Rule (Create) form.

8 Click on the Spoke LERs Definition tab button.

9 Click on the Add button. The Select form opens.

10 Click on the Search button. A list of rule-based groups is displayed.

11 Select a group and click on the OK button. The Select form closes and the group is displayed on the Hub and Spoke Topology Rule (Create) form.

12 Click on the Hub Tunnel Definition tab button.

13 Perform one of the following to configure the Tunnel Type parameter:

a Choose SDP.

b Choose RSVP-LSP; go to step 16.

14 Click on the SDP tab button.

15 Click on the Select button beside the Script ID parameter. The Select SDP Template form opens with a list of configured templates.

i Select a template in the list.

ii Click on the OK button. The Select SDP Template form closes and the SDP template information is displayed on the Hub and Spoke Topology Rule (Create) form.

iii Configure the parameters:

- Underlying Transport
- Class Forwarding Capability
- Administrative State
- Import Administrative Groups

The Class Forwarding Capability and Administrative State parameters are displayed when the Underlying Transport parameter is set to RSVP-LSP.

The Administrative State parameter is configurable when the Class Forwarding Capability parameter is enabled.

iv If you set the Underlying Transport parameter to RSVP-LSP, the LSPs tab is displayed. Click on the LSPs tab button; otherwise go to step 18.

v Click on the Add button. The Select LSP Templates form opens.

vi Select a template in the list and click on the OK button. The Select LSP Templates form closes and the Associated LSP Templates panel displays the LSP template information.

vii Select the LSP template in the Associated LSP Templates panel. If the Class Forwarding Capability parameter in step 15 is enabled, the buttons in the Class Forwarding panel become enabled; otherwise, go to step 18.

viii Click on the Set as Default LSP button to specify the LSP as the default, if required.

ix Click on the Set as Multicast LSP button to specify that the LSP is a multicast LSP, if required.

x Click on the Choose a Forwarding Class button and choose a forwarding class from the contextual menu, if required.

16 Click on the LSP tab button.

17 Click on the Select button beside the Script ID parameter. The Select LSP Template form opens.

i Select a template in the list and click on the OK button. The Select LSP Template form closes and the LSP template information is displayed on the Hub and Spoke Topology Rule (Create) form.

ii Configure the Enable LDP-over-RSVP parameter.

18 Click on the Spoke Tunnel Definition tab button.

19 Perform one of the following to configure the Tunnel Type parameter:

a Choose SDP.

b Choose RSVP-LSP; go to step 21.

20 Perform the following steps.

i Click on the SDP tab button.

ii Click on the Select button beside the Script ID parameter. The Select LSP Template form opens.

iii Select a template in the list and click on the OK button. The Select LSP Template form closes and the LSP template information is displayed on the Hub and Spoke Topology Rule (Create) form.

iv Configure the Underlying Transport parameter.

21 Perform the following steps.

  i Click on the LSP tab button.

  ii Click on the Select button beside the Script ID parameter. The Select LSP Template form opens.

  iii Select a template in the list and click on the OK button. The Select SDP Template form closes and the SDP template information is displayed on the Hub and Spoke Topology Rule (Create) form.

  iv Configure the Enable LDP-over-RSVP parameter.

22 Click the OK button. The Hub and Spoke Topology Rule (Create) form closes and the Manage Auto Tunnel Rules form reappears.

23 Close the Manage Auto Tunnel Rules form.

Procedure 52-5 To modify a topology rule

Use this procedure to change the parameter settings for a topology rule.

Note — You can modify group conditions and tunnel definitions only when a topology rule is not active.

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Configure the filter criteria and click on the Search button.

3 Select a rule and click on Properties. The system displays the rule properties form.

4 Make the required changes to the rule.

5 Click on OK button. A dialog box appears.

6 Click the Yes button. The rule properties form closes and the Manage Auto Tunnel Rules form reappears.

7 Close the Manage Auto Tunnel Rules form.

Procedure 52-6 To import tunnels not managed by topology rules

Use this procedure to import a tunnel that is not managed by a topology rule. After you import the tunnel, the tunnel is manage by the rule. However, the rule does not enforce the source and destination IDs to match the rule group. If the imported tunnel is not part of the group, the execute button or change notifications by the group members do not apply, even though the imported tunnel is part of the rule.

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Configure the filter criteria and click on the Search button. A list of auto tunnel rules is displayed.

3 Select a rule in the list and click on the Properties button. The system displays the *Topology_Rules* (Edit) form.

4 Click on the Created/Imported Tunnel Elements tab button.

5 Click on the More Actions button and choose Import Tunnels. An Import Tunnels form opens.

6 Perform one of the following:

- **a** Click on the Add SDPs button. The Select SDPs form opens. Go to step 8.
- **b** Click on the Add LSPs button. The Select LSPs form opens.

7 Click on the Search button. A list of LSPs is displayed.

- **i** Choose one or more LSPs in the list.
- **ii** Click on the OK button. The Select LSPs form closes and the Import Tunnels form is refreshed with the chosen LSPs. Go to step 9.

8 Click on the Search button. A list of SDPs is displayed.

- **i** Choose one or more SDPs in the list.
- **ii** Click on the OK button. The Select SDPs form closes and the Import Tunnels form is refreshed with the chosen SDPs.

9 Click on the Import button. The Import Tunnels form closes.

10 Click on the Created/Managed Tunnel Elements tab button to view the imported networks.

11 Close the *Topology_Rules* (Edit) form.

12 Close the Manage Auto Tunnel Rules form.

Procedure 52-7 To display and delete tunnel elements

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Configure the filter criteria and click on the Search button. A list of service-tunnel topology rules is displayed.

3 Select a rule and click on the Properties button. The rule properties form is displayed.

4 Click on the Created/Imported Tunnel Elements tab button.

5 Click on the Search button.

6 Perform one of the following actions to delete tunnel elements, as required:

- **a** Click on the Delete Unused button to delete tunnels that are no longer applied to a group. A dialog box appears.
- **b** Click on the Delete All button to delete all tunnels that are not associated with a service. A dialog box appears.

7 Click on the Yes button. The 5620 SAM deletes the elements and removes them from the list.

8 Close the rule properties form. The Manage Auto Tunnel Rules form reappears.

9 Close the Manage Auto Tunnel Rules form.

Procedure 52-8 To execute or reapply a topology rule

Use this procedure at any time after a rule is created. The execute button forces the topology rule to be evaluated; any missing or configuration changes are reapplied.

Note — The 5620 SAM supports the reapply function, except in reference to hop-less path changes. If a hop-less path changes, it may not be corrected by a reapply operation.

1 Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.

2 Select an auto tunnel rule type from the object drop-down menu.

3 Configure the filter criteria and click on the Search button. A list of service-tunnel topology rules is displayed.

4 Select a rule and click on the Properties button. The rule properties form opens.

5 Click on the More Actions button and choose Execute.

6 Close the Manage Auto Tunnel Rules form.

Procedure 52-9 To display missing tunnel elements

Perform this procedure to display the missing tunnel elements. A missing tunnel element is one that the 5620 SAM is unable to create based on the specified tunnel rules, or a tunnel element that is deleted.

1. Choose Policies→Auto Tunnels→Auto Tunnel Rules from the 5620 SAM main menu. The Manage Auto Tunnel Rules form opens.
2. Configure the filter criteria and click on the Search button. A list of service-tunnel topology rules is displayed.
3. Select a rule and click on the Properties button. The rule properties form is displayed.
4. Click on the Missing Tunnel Elements tab button.
5. Click on the Search button.
6. Select a missing tunnel element and click on the Properties button. The element properties form opens.
7. View the element properties.
8. Close the element properties form. The rule properties form reappears.
9. Close the rule properties form. The Manage Auto Tunnel Rules form reappears.
10. Close the Manage Auto Tunnel Rules form.

53 — RADIUS-based accounting policies

53.1 RADIUS-based accounting policies overview

A RADIUS-based accounting policy is used to send accounting information to a RADIUS server. The 7710 SR, 7450 ESS, and 7750 SR support the use of RADIUS-based accounting policies.

When a NE uses a RADIUS-based accounting policy and the creation of a subscriber host invokes the policy, the NE generates an accounting-start packet that includes the policy parameters, and forwards the packet to a RADIUS server. Depending on the policy specifications, the NE also sends interim update messages that contain usage statistics. When a policy is no longer used by any subscriber host, the NE sends an accounting-stop packet that contains the final usage statistics.

A RADIUS-based accounting policy specifies the type of accounting information that is forwarded to a RADIUS server. The information is one of the following:

- per-SLA profile—forwards start, stop, and interim update messages regarding SLA profile usage
- per-host and per-SLA profile—forwards the following:
    - start, stop, and interim update messages regarding SLA profile usage
    - start and stop messages for individual host sessions
- per-host only, on Release 9.0 and later NEs—forwards start, stop, and interim update messages for each subscriber host session

See chapter 68 for information about configuring RADIUS-based accounting policies for subscriber profiles.

53.2 RADIUS-based accounting policies procedures

The following procedures describe how to configure and manage RADIUS-based accounting policies.

Procedure 53-1 To configure RADIUS-based accounting policies

Perform the following procedure to create a RADIUS-based accounting policy to send subscriber session accounting information to the RADIUS server.

1 Choose Policies→RADIUS Based Accounting from the 5620 SAM main menu. The RADIUS Based Accounting Policies form opens.

2 Click on the Create button. The Radius Accounting Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Session ID Format
- Source Address
- Retry Attempts
- Timeout (seconds)
- Access Algorithm
- RADIUS Attributes
- Use Standard Accounting Attribute
- Host Accounting Message
- Enable
- Value (minutes)
- Port Prefix Type
- Port Prefix String
- Port Suffix Type
- Port Type
- Port Type Value
- Calling Station ID Type
- Port Binary Specification

Note — The Port Prefix Type Port Prefix String, and Port Suffix Type parameters are configurable when the NAS Port ID option is enabled for the RADIUS Attributes parameter.

The Port Type parameter is configurable when the NAS Port Type option is enabled for the RADIUS Attributes parameter.

The Port Type Value parameter is configurable when the NAS Port Type option is enabled for the RADIUS Attributes parameter, and the value of Port Type is set to Config.

The Calling Station ID Type parameter is configurable when the Calling Station ID option is enabled for the RADIUS Attributes parameter.

The Port Binary Specification parameter is configurable when the NAS Port option is enabled for the RADIUS Attributes parameter.

4 Configure the Router Instance parameter. If you set the Router Instance parameter to VPRN, perform step 5. Otherwise, go to step 6

Note — The Router Instance parameter is configurable on the 7450 ESS, 7710 SR, and 7750 SR.

5 Configure a VPRN service as a virtual router instance for the RADIUS-based accounting policy. Perform the following:

i Click on the Select button in the VPRN ID panel. The Select VPRN ID - Radius Accounting Policy list form opens.

ii Select a VPRN site in the list and click on the OK button. The Select VPRN ID - Radius Accounting Policy list form closes and the Radius Accounting Policy (Create) form refreshes with the VPRN service information.

6 Configure the RADIUS servers for the policy. Perform the following:

i Click on the RADIUS Servers tab button.

ii Click on the Create button. The RADIUS Server (Create) form opens.

iii Configure the parameters:

- Auto-Assign ID
- ID
- Description
- Server IP Address
- Port
- Secret Name

iv Click on the OK button. A dialog box appears.

v Click on the OK button.

vi Repeat steps ii and v to add additional RADIUS servers, as required.

7 Click on the OK button.

8 Perform the following steps.

i Click on the Custom Record tab button. The Significant Change Criteria tab is displayed.

ii Configure the Significant Change Delta parameters.

iii Configure the parameters in the Reference Queue panel:

Note 1 — You can select all options for a parameter by clicking on the Select All button beside the counters.

Note 2 — You can deselect all options for a parameter by clicking on the Deselect All button beside the counters.

- All Queues
- Ingress Counters
- Egress Counters

iv If the All Overrides parameter is enabled, go to step vii.

v Click on the Select button below the All Overrides parameter to choose a queue to monitor for the significant change. The Select Queue form opens.

vi Select a queue in the list and click on the OK button. The Select Queues form closes and the queue ID is displayed on the form.

vii Configure the parameters in the Reference Override panel:

Note 1 — You can select all options for a parameter by clicking on the Select All button beside the counters.

Note 2 — You can deselect all options for a parameter by clicking on the Deselect All button beside the counters.

- All Overrides
- Ingress Counters
- Ingress Counters

viii If you do not enable the All Overrides parameter, go to step 9.

ix Click on the Select button below the All Overrides parameter to choose an override counter to monitor for the significant change. The Select Override form opens.

x Select an override in the list and click on the OK button. The Select Override form closes and the override ID is displayed on the form.

9 Perform the following steps.

i Click on the Queue Counter Config tab button.

ii Click on the Create button. The CustomQueueConfig (Create) form opens.

iii Configure the ID parameter.

iv Configure the Counters parameter in the Ingress panel.

v Configure the Counters parameter in the Egress panel.

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The Accounting Policy (Edit) form reappears.

10 Perform the following steps.

i Click on the Override Counter Config tab button.

ii Click on the Create button. The CustomOverrideConfig (Create) form opens.

iii Configure the ID parameter.

iv Configure the Counters parameter in the Ingress panel.

v Configure the Counters parameter in the Egress panel.

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The Accounting Policy (Edit) form reappears.

11 Close the Radius Accounting Policy (Create) form. The Manage Radius Based Accounting Policies form reappears.

12 Click on the Search button to display the newly created policy or policies. Select a policy.

13 Click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

14 Close the Manage Radius Based Accounting Policies form.

54 — 802.1x policies

54.1 802.1x policies overview

The 5620 SAM implementation of the 802.1X protocol provides 802.1X authentication on an individual port basis.

In an 802.1X environment, a user called the supplicant requests access to an access point, called the authenticator. The authenticator forces the supplicant into an unauthorized state, forcing them to send an EAP start message.

The authenticator returns an EAP message to request the user identity. The user returns the identity, which is forwarded by the authenticator to the authentication server. The server authenticates the user and returns an accept or reject message to the authenticator.

If an accept message is received, the authenticator changes the user state to authorized and user traffic is processed.

54.2 802.1x policies procedures

The following procedures describe how to configure and manage 802.1x policies.

Procedure 54-1 To configure an 802.1X policy

Note — Before you can create an 802.1X policy, 802.1X must be enabled on the device. See Procedure 17-6 for information about enabling 802.1X.

1 Choose Policies→Ethernet→802_1x from the 5620 SAM main menu. The Manage 802_1x Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The 802_1x Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Source Address
- Administrative Status
- Description
- Retry Attempts
- Request Timeout

Note — Do not use a colon in the policy name. The 5620 SAM uses colons as separators for the object full name.

4 Click on the RADIUS Servers tab button, if required. Otherwise, go to step 8.

5 Click on the Create button. The RADIUS Server (Create) form opens.

6 Configure the parameters:

- Server Index
- IP Address
- Password
- Authorization Port
- Accounting Port
- Server Type

7 Click on the OK button. The Radius Server (Create) from closes and the 802_1x Policy (Edit) form refreshes with the server information displayed in the Radius Servers tab.

8 Click on the Apply button to save the policy. The 802_1x Policy form is refreshed with additional buttons and tab buttons.

9 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

Policies are also automatically distributed to devices when they are used by resources on the device.

10 Close the 802_1x Policies form.

11 Close the Manage 802_1x Policies form.

55 — PBB MRP policies

55.1 PBB MRP policies overview

This chapter describes how to configure and manage PBB MRP policies.

55.2 PBB MRP policies procedures

The following procedures describe how to configure and manage PBB MRP policies.

Procedure 55-1 To configure a PBB MRP policy

The PBB MRP policy limits the scope of MMRP advertisements to a specific network domain using ISID-based filters for both the MMRP control plane and the B-VPLS data plane. The policy contains a configurable option to instantiate an MMRP tree and related entry only when both an MMRP declaration and registration are received on a port.

1 Choose Policies→Ethernet→PBB MRP from the 5620 SAM main menu. The PBB MRP Policy Manager form opens.

2 Perform one of the following:

a Specify a filter to search for and edit an existing policy. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The PBB MRP Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Scope
- Default Action

4 Click on the Entries tab.

5 Click on the Create button to create entries for the policy. The PBB MRP Policy Entry (Create) form opens.

6 Configure the parameters:

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description
- Action

7 Click on the ISID Match Criteria tab.

8 Click on the Create button to specify ISID matching criteria for an entry in the policy. Multiple ISID matching criteria can be specified for each entry. The ISID Match Criteria (Create) form opens.

9 Configure the parameters:

- Low ISID
- High ISID

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The ISID Match Criteria you specified appears in the list.

12 Perform one of the following:

a Add another set of criteria. Go to step 8.

b Click on the OK button. A dialog box appears.

13 Click on the OK button. The Entries tab reappears.

14 Click on the OK button. The Entries tab closes.

15 Close the PBB MRP Policy Manager form.

56 — AOS Ethernet Service policies

56.1 AOS Ethernet Service policies overview

This chapter describes how to configure the UNI and SAP profiles associated with OmniSwitch Ethernet services.

56.2 AOS Ethernet Service policies procedures

The following procedures describe how to configure AOS Ethernet Service policies.

Procedure 56-1 To configure an OmniSwitch Ethernet service UNI profile

1 Choose Policies→Ethernet→AOS Ethernet Service from the 5620 SAM main menu. The Manage Ethernet Service Policies form opens.

2 Perform one of the following:

  a Specify a filter to search for and modify an existing UNI profile. Select a profile in the filtered list and click on the Properties button.

  b Click on the Create button and choose Create UNI Profile. The Ethernet Service UNI Profile, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- STP
- GVRP
- 802.1x
- 802.3ad
- MVRP
- OAM
- UDLD
- VTP
- PVST
- UPLINK
- 802.1AB
- AMAP
- LACPMARKER
- PAGP
- CDP
- DTP
- VLAN
- Tunnel MAC

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button. The Ethernet Service UNI Profile, Global Policy (Create) form closes.

5 To create more UNI profiles repeat steps 2b to 4.

6 Close the Manage Ethernet Service Policies form.

Procedure 56-2 To configure an OmniSwitch Ethernet SAP profile

1 Choose Policies→Ethernet→AOS Ethernet Service from the 5620 SAM main menu. The Manage Ethernet Service Policies form opens.

2 Perform one of the following:

a Specify a filter to search for and modify an existing SAP profile. Select a profile in the filtered list and click on the Properties button.

b Click on the Create button and choose Create SAP Profile. The Ethernet Service SAP Profile (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- Ingress Bandwidth (Mb)
- Bandwidth Sharing
- CVLAN Treatment
- Priority Mapping
- Priority

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button. The Ethernet Service SAP Profile, Global Policy (Create) form closes.

5 To create more SAP profiles repeat steps 2b to 4.

6 Close the Manage Ethernet Service Policies form.

57 — Connection profile policies

57.1 Connection profile policies overview

The 5620 SAM implementation of the connection profile policy provides a list of VPI/VCI pairs.

57.2 Connection profile policies procedures

The following procedures describe how to configure and manage connection profile policies.

Procedure 57-1 To configure a connection profile policy

1 Choose Policies→ATM→Connection Profile from the 5620 SAM main menu. The Manage Connection Profile form opens.

2 Perform one of the following:

a Specify a filter to search for and modify a policy, and click on the Properties button.

b Click on the Create button. The Connection Profile (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Connection Profile ID
- Description

Note — Do not use a colon in the policy name. The 5620 SAM uses colons as separators for the object full name.

4 Click on the ATM Member tab button and click on the Create button. The ATM Member (Create) form opens.

5 Configure the parameters:

- VPI
- VCI

6 Click on the OK button. The ATM Member (Create) from closes and the Connection Profile (Edit) form refreshes with the VPI and VCI information displayed in the ATM Member tab.

7 Click on the Apply button to save the policy. The Connection Profile form is refreshed with additional buttons and tab buttons.

8 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to local definitions. See chapter 46 for more information.

Policies are also automatically distributed to devices when they are used by resources on the device.

9 Close the Connection Profile form.

10 Close the Manage Connection Profile form.

58 — Service PW template policies

58.1 Service PW template policies overview

Service PW templates are policies that enable PE routers to discover the other participating PE routers in an LDP or BGP VPLS.

58.2 Service PW template policies procedures

The following procedure describes how to configure service PW templates.

Procedure 58-1 To create or configure a PW Template policy

1 Choose Manage→Service→Service PW Template Policies from the 5620 SAM main menu. The Manage Service PW Template Policies form opens.

2 Perform one of the following:

a Click on the Create button. The Service PW Template (Create) form opens with the General tab displayed.

b Search for an existing policy you want to modify.

i Click on the Search button.

ii Select a policy from the displayed list.

iii Click on the Properties button. The Service PW Template (Edit) form opens with the General tab displayed.

3 Perform one of the following:

a Click on the More Actions button and choose Populate from Pseudowire.

This allows you to populate the Service PW Template form using an existing pseudowire (SDP Binding) as a base.

i After choosing Populate from Pseudowire, the Select a Pseudowire form opens.

ii Click on the Search button.

iii Choose the required pseudowire from the displayed list.

iv Click on OK. All of the relevant values are copied into the Service PW Template form.

v Go to step 19.

b Populate the form manually.

i Configure the following parameters:

- Policy ID
- Auto-Assign ID
- Description
- Enable Hash Label
- Enable Signal Capability
- Use Provisioned SDP
- Force VLAN VC Forwarding
- Enable Control Word
- VC Type
- Collect Stats

ii Select an Accounting Policy, if required, by clicking on the Select button. The Select Accounting Policy form opens.

iii Select an accounting policy and click OK, or create a new one by clicking on the Create button.

4 Click on the MAC tab button.

5 Configure the following parameters, as required:

- MAC Learning
- MAC Aging
- Discard Unknown Source
- Limit MAC Move
- MAC Pinning
- VLAN VC Tag
- MAC Address Limit

6 Click on the Split Horizon Group tab button.

7 Configure the following parameters, as required:

- Split Horizon Group Name
- Description
- Restrict Protected Source
- Restrict Unprotected Destination

8 Click on the Ingress Filters tab button.

9 Configure the Ingress Filter Type parameter, if required.

10 Click on the Egress Filters tab button.

11 Configure the Egress Filter Type parameter, if required.

12 Click on the IGMP tab button.

13 Configure the following parameters, as required:

- IGMP Version
- IGMP Fast Leave
- IGMP Import Policy
- IGMP Last Member Interval (deciseconds)
- IGMP Max Number Groups
- IGMP Max Number Sources Per Group
- IGMP General Query Interval (seconds)
- IGMP Query Response Interval (seconds)
- IGMP Robust Count
- IGMP Send Queries

14 If you need to re-configure an existing, distributed local PW Template, go to step 15. Otherwise go to step 19.

15 Click on the Local Definitions tab button.

16 Select the required entry from the list and click the Properties button. The Service PW Template - Local Policy - (Edit) form opens with the General tab displayed.

17 Make any required changes here - the tabbed pages are essentially the same as for the global definition of the PW Template covered in steps 3 through 13.

18 Click the More Actions button and choose Re-evaluate PW Template to run an evaluation of the modified template. A pop-up window appears indicating if the re-evaluation was successful. If it was not, the reason for the failure is displayed. If you make any subsequent modifications, you can re-evaluate the template again.

19 Click on the OK button to confirm your changes. The Service PW Template - Local Policy - (Edit) form closes.

20 Click on the OK button to close the Service PW Template - Global Policy form.

59 — Residential subscriber policies

59.1 Residential subscriber policies overview

Residential subscriber management requires the use of policies and profiles that include the following:

- subscriber identification policies
- subscriber profiles
- SLA profiles

A subscriber identification policy is a component of residential subscriber management. It associates dynamic residential subscriber hosts with NE subscriber instances for the purpose of applying SLA profiles and subscriber profiles that act as templates for defining QoS, security and accounting attributes. There is no default subscriber identification policy in the 5620 SAM, but an operator can create a subscriber identification policy and designate it as the default.

A subscriber identification policy uses a parsing script to extract a subscriber identifier from a host DHCP packet. A common subscriber identifier indicates that hosts belong to the same subscriber and receive common HQoS and accounting treatment. A subscriber identification policy also assigns SLA profiles to hosts of a specific subscriber based on the type and class of service offering.

See chapter 68 for information about configuring and using subscriber identification policies, subscriber profiles, SLA profiles, and other residential subscriber management components.

60 — Remote network monitoring policies

60.1 Remote network monitoring policies overview

You can create remote network monitoring (RMON) policies that allow you to perform the following tasks.

- Use the policy framework to configure RMON that allows 5620 SAM users to deploy configurations to multiple devices.
- Map RMON events to information alarms in the 5620 SAM GUI.

Remote network monitoring allows you to monitor the behavior of functions that are not typically supported by the 5620 SAM. For example, events may be configured on generic NEs to monitor system temperature or CPU usage. The 5620 SAM can raise informational alarms for the exceeded thresholds. You can also configure custom values to supersede the hard-coded threshold values associated with a specific function on an NE.

The 5620 SAM maps RMON SNMP traps to alarms in the GUI.

Policy distribution and event mapping are supported for the following NE types:

- 7210 SAS-M24F
- 7210 SAS-M24F2XFP
- 7210 SAS-M24F2XFP [ETR]
- 7210 SAS-X24F2XFP
- 7250 SAS, Release 2.0 or later
- 7250 SAS-ES, Release 2.0 or later
- 7450 ESS
- 7710 SR
- 7750 SR

60.2 Remote network monitoring policies procedures

The following procedures describe how to configure and manage RMON policies.

Procedure 60-1 To configure a remote network monitoring policy

1. Choose Tools→Remote Network Monitoring (RMON) from the 5620 SAM main menu. The Remote Network Monitoring (RMON) form opens.

2. Perform one of the following:

   a. Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

   b. Click on the Create button. The RMON (Create) form opens.

3. Configure the parameters:

   - Displayed Name
   - Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Create events to associate with the rising and falling thresholds on the remote NE.

i Click on the Events tab button.

ii Click on the Create button. The Event RMON (Create) form opens.

iii Configure the parameters:

- Auto-Assign ID
- ID
- Displayed Name
- Description
- Type
- Owner
- Community

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Event RMON (Create) form closes and the RMON (Create) form reappears.

vi Repeat steps 4ii to v to create another event, if required.

5 Configure the alarm information that is associated with the remote event.

i Click on the Alarms tab button.

ii Click on the Create button. The Alarm RMON form opens.

iii Configure the parameters:

- Auto-Assign ID
- ID
- Displayed Name
- Description
- Monitored Object OID
- Interval (seconds)
- Sample Type
- Start Up Alarm
- Owner

6 Configure the properties for the rising threshold crossing alarm.

i Click on the Select button in the Rising TCA Properties panel. The Select Rising Event - Alarm form opens.

ii Select the event and click on the OK button. The Select Rising Event - Alarm form closes and the Alarm RMON form reappears.

iii Configure the Rising Threshold parameter.

7 Configure the properties for the falling threshold crossing alarm.

i Click on the Select button in the Falling TCA Properties panel. The Select Falling Event - Alarm form opens.

ii Select the event and click on the OK button. The Select Falling Event - Alarm form closes and the Alarm RMON form reappears.

iii Configure the Falling Threshold parameter.

8 Click on the OK button. A dialog box appears.

9 Click on the OK button. The Alarm RMON form closes and the RMON (Create) form reappears.

10 Click on the Apply button.

11 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

> **Note —** When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

12 Close the RMON (Create) form. The Remote Network Monitoring (RMON) form reappears.

13 Click on the Search button to display the newly created policy or policies in the bottom panel of the form.

14 Close the Remote Network Monitoring (RMON) form.

61 — Size constraint policies

61.1 Size constraint policies overview

Size constraint policies regulate the number of historical records that the 5620 SAM database retains. The scheduling of tasks through the 5620 SAM can generate a great deal of archived result information if left unchecked. Size constraint policies control this volume by defining thresholds for various record classes. When the number of records for a specific class or group of classes reaches a threshold specified in the policy, the 5620 SAM deletes a specified number of the oldest objects that are associated with the class or group of classes.

61.2 Size constraint policies procedures

The following procedures describe how to configure and manage size constraint policies.

Procedure 61-1 To configure a size constraint policy

1 Choose Administration→Size Constraint from the 5620 SAM main menu. The Size Constraint Policy Manager form opens.

2 Perform one of the following:

a Specify a filter to search for an existing policy. Select a policy in the filtered list and click on the Properties button.

b Click on the Create button. The Size Constraint Policy (Create) form opens.

3 Configure the parameters:

- Auto-Assign ID
- Policy Id
- Description
- Threshold (# of objects)
- Objects To Be Deleted When Threshold Exceeded (# of objects)
- Apply Threshold To

4 Click on the Constrained Packages tab button.

5 Right-click on the Size Constraint Policy icon and choose Select Packages from the contextual menu. The Select Size Constrained Packages form opens with a list of packages displayed.

6 Choose the packages to include in the size constraint policy and click on the OK button. The packages appear in the navigation tree under Constrained Packages.

7 From a package icon below the Size Constraint Policy icon, choose Select Classes from the right-click contextual menu to include in the size constraint policy.

i Right-click on a package and choose Select Classes from the contextual menu. The Select Size Constrained Classes form opens.

ii Choose the required classes in the list and click on the OK button. The classes appear in the navigation tree under the associated package.

8 Repeat step 7 for each package icon in the list.

9 Click on the OK button. The Size Constraint Policy Manager form reappears with the new size constraint policy displayed in the list.

10 Close the Size Constraint Policy Manager form.

62 — NAT policies

62.1 NAT policies overview

A Network Address Translation, or NAT, policy, defines general NAT properties and associates a NAT address pool with an ISA-NAT group on the same NE. A NAT policy is associated with a subscriber profile for L2-aware NAT in an IES or VPRN service, or for large-scale NAT in a VPRN service.

See chapter 18 for information about ISA-NAT groups. See chapter 30 for information about configuring and deploying NAT in a network. See Procedure 62-1 for NAT policy configuration information. See chapter 73 for information about configuring and using NAT in an IES. See chapter 74 for information about configuring and using NAT in a VPRN service.

62.2 NAT policies procedures

The following procedures describe how to configure and manage NAT policies.

Procedure 62-1 To create a NAT policy

Perform this procedure to create a NAT policy for a large-scale or L2-aware NAT implementation.

1. Choose Policies→ISA Policies→NAT Policy from the 5620 SAM main menu. The NAT Policy Manager form opens.

2. Click on the Create button. The NAT Policy (Create) form opens.

3. Configure the following parameters:
   - Displayed Name
   - Description

4. Click on the Select button in the NAT Pool panel to choose a NAT pool. The Select NAT Pool form opens.

5. Choose a NAT pool in the list and click on the OK button. The Select NAT Pool form closes and the NAT pool name is displayed on the NAT Policy (Create) form.

6. Configure the remaining parameters:
   - Filtering
   - Port Reservation Count
   - High Watermark
   - Low Watermark
   - Session Limit
   - Reservation Count
   - Session High Watermark
   - Session Low Watermark
   - ALG Protocols
   - UDP Inbound Refresh
   - Priority Session Forwarding Class Set
   - TCP Established (sec)
   - TCP Transitory (sec)
   - TCP Syn (sec)
   - TCP Time Wait (sec)
   - ICMP Query (sec)
   - UDP (sec)
   - UDP Initial (sec)
   - UDP DNS (sec)
   - SIP (sec)

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The NAT Policy (Create) form closes.

9 Close the NAT Policy Manager form.

63 — Format and range policies

63.1 Format and range policies overview

The 5620 SAM supports format and range policies. Format policies manage how services, policies, LSPs, L2 and L3 access interfaces are named and described. Range policies manage the ID numbers that are assigned to services, policies, LSPs, L2 and L3 access interfaces. For example, you can configure a range policy to specify a range of 200 and 499 for all IDs for a service. You can configure a format policy to specify that service names do not exceed 10 characters. The object creation form indicates when a range or format policy is in effect for an object.

Format and range policies are not distributed to NEs. The format and range policies are configured when services, policies, LSPs, L2 and L3 access interfaces are created from the 5620 SAM GUI. You cannot configure format and range policies when the services, LSPs, L2 and L3 access interfaces are created using templates. However, the 5620 SAM allows an operator to use pre-configured examples of LSPs and services that have format and range policies applied to them. The examples can be used to create a template. For more information about creating templates from a pre-configured example, see the *5620 SAM Scripts and Templates Developer Guide*.

Table 63-1 lists the objects and associated parameters that can be managed using format and range policies.

Table 63-1 Format and Range policy objects and associated parameters

Object name	Format policy parameter	Range policy parameter
B-VPLS Service Site	Description, Name	—
Bypass-only LSP	Description, Name	ID
Customer	—	ID
Dynamic LSP	Description, Name	ID
I-VPLS Service Site	Description, Name	—

63.2 Format and range policies procedures

The following procedures describe how to configure and manage format and range policies.

Procedure 63-1 To create or configure a format policy

Use this policy to specify the number and format of characters that can be used for text fields such as service names and descriptions.

1 Choose Administration→Format and Range from the 5620 SAM main menu. The Format and Range Polices form opens.

2 Click on Format/Range (Property Rules). A navigation tree is displayed.

3 Click on Format Policy (Property Rules).

4 Perform one of the following:

a Click on the Search button to specify a filter to search for and modify a policy. A list of format policies is displayed. Go to step 5.

b Click on the Create button. The Format Policy (Create) form opens with the General tab displayed. Go to step 6.

5 Select a format policy in the list. A Format Policy (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Auto-Assign ID
- Policy ID
- Name
- Priority
- Administrative State

7 Click on the Select button beside the Object Type parameter. The Select Property - Format/Range Policy form opens.

8 Select an object for which you need to apply the name format policy.

9 Click on the OK button. The Select Property - Format/Range Policy form closes and the Format Policy (Create) or (Edit) form is updated with the object type.

10 Click on the Select button beside the Property Name parameter. The Select Property - Format/Range Policy form opens with a list of configurable properties for the object. The content of the list depends on the object that you specified in step 8.

11 Choose the property for which you need to apply the format policy.

12 Click on the OK button. The Select Property - Format/Range Policy form closes and Format Policy form is updated with property name.

13 Click on the Users tab button.

Note — Only users and user groups that are assigned to this policy are affected by the policy. You can apply one or more format policies to a user or user group. See procedures 9-17 and 9-18 for more information about creating users and user groups.

14 Click on the Add button. The Select User form opens with a list of users.

15 Select one or more users in the list and click on the OK button. The Format Policy form is refreshed with the selected users.

16 Click on the User Groups tab button.

17 Click on the Add button. The Select Group form opens with a list of user groups.

18 Choose one or more user groups in the list and click on the OK button. The Format Policy (Create) or (Edit) form is refreshed with the selected user groups.

19 Click on the Text Block Formats tab button to further define the format of the text. For example, an operator can classify a group of services with a similar name. The operator can also create a tool tip text to describe the purpose of the parameter.

20 Click on the Move Up or Move Down buttons to change the sequence of the text blocks in the text string.

21 Click on the Create button and perform one of the following:

a Choose Auto-Filled Parameter. The Auto-Filled Parameter (Create) form opens.

b Choose Masked Text Parameter. The Formatted Text (Create) form opens. Go to step 24.

c Choose Text Parameter. The Text (Create) form opens. Go to step 26.

22 Configure the parameters:

- Source Object Name
- Source Property Name
- Copy Text From Position
- Through To Position
- Displayed Text
- Tooltip Text

23 Go to step 27.

24 Configure the parameters:

- Mask
- Tooltip Text

25 Go to step 27.

26 Configure the parameters:

- Default Value
- Read Only
- Min. Length
- Max. Length
- Tooltip Text

Note — The Min. Length and Max. Length parameters are not configurable when the Read Only parameter is enabled.

27 Click on the OK button. A dialog box appears.

28 Click on the OK button. The Format Policy form reappears.

29 Click on the OK button. The Format Policy form closes.

30 Close the Format and Range Policies form.

Note — After a format policy is applied to a service, a combo box is displayed beside the object field during object creation, to indicate that a format policy is in effect. When there is only one matching policy, the combo box is dimmed. When there are multiple matching policies, the combo box is used to choose a policy. The sequence of the policies in the combo box is based on the value of the Priority parameter.

Procedure 63-2 To create or configure a range policy

Use this policy to specify the ID range for services, LSPs, L2 and L3 access interfaces.

1 Choose Administration→Format and Range from the 5620 SAM main menu. The Format and Range Polices form opens.

2 Click on Format/Range (Property Values). A navigation tree is displayed.

3 Choose Range Policy (Property Rules).

4 Perform one of the following:

- **a** Click on the Search button to specify a filter to search for and modify a policy. A list of range policies is displayed. Go to step 5.
- **b** Click on the Create button. The Range Policy (Create) form opens with the General tab displayed. Go to step 6.

5 Select a range policy in the list. A Range Policy (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Auto-Assign ID
- Policy ID
- Name
- Priority
- Administrative State
- Minimum
- Maximum
- Auto Assignment Enabled
- Auto Assign By Default

7 Click on the Select button beside the Object Type parameter. The Select Property - Format/Range Policy form opens.

8 Select an object for which you need to apply the range policy.

9 Click on the OK button. The Select Property - Format/Range Policy form closes and the Range Policy (Create) form is updated with the object type.

10 Click on the Select button beside the Property Name parameter. The Select Property - Format/Range Policy form opens.

11 Choose the property for which you need to apply the range policy.

12 Click on the OK button. The Select Property - Format/Range Policy form closes and Range Policy (Create) form is updated with the property name.

13 Click on the Users tab button.

Note — Only users and user groups that are assigned to this policy are affected by the policy. You can apply one or more range policies to a user or user group. See procedures 9-17 and 9-18 for more information about creating users and user groups.

14 Click on the Add button. The Select User form opens with a list of users.

15 Choose one or more users in the list and click on the OK button. The Range Policy form is refreshed with the users.

16 Click on the User Groups tab button.

17 Click on the Add button. The Select Group form opens with a list of user groups.

18 Choose one or more user groups in the list and click on the OK button. The Range Policy form is refreshed with the user groups.

19 Click on the OK button. The Range Policy form closes and the Format and Range Policies form reappears.

20 Close the Format and Range form.

Note — After a range policy is applied to a service, a combo box is displayed beside the object field during object creation, to indicate that a range policy is in effect. When there is only one matching policy, the combo box is dimmed. When there are multiple matching policies, the combo box is used to choose a policy. The sequence of the policies in the combo box is based on the value of the Priority parameter.

Service management

64 — Service management and QoS

64.1 Service management and QoS overview

The 5620 SAM supports the configuration of the following network services:

- VLL service
- VPLS / MVPLS / HVPLS
- IES
- VPRN service
- VLAN service
- composite service
- mirror service

A 5620 SAM operator can create, configure and delete services on sites and routers that are within their span of control.

The benefits of the 5620 SAM service model include:

- service creation using configuration forms or preconfigured XML API template; see the *5620 SAM Scripts and Templates Developer Guide* for information about creating and using XML API templates
- service management using configuration forms and a navigation tree
- linking of services to create composite services that support complex customer applications
- policies that specify the NE traffic classification, policing, shaping, time of day restrictions, and marking
- traffic management capabilities to customize the delivery of different services according to SLAs
- integrated fault management functions

Customer traffic enters a service through one or more access interfaces. In a local service, all access interfaces are on one NE. In a distributed service, multiple NEs are deployed at the PE. Customer traffic is transported across an IP/MPLS core network in unidirectional service tunnels that use GRE or MPLS LSPs. Many services can use the same tunnel. Figure 64-1 shows an example of a distributed VLL service.

Figure 64-1 Distributed VLL service

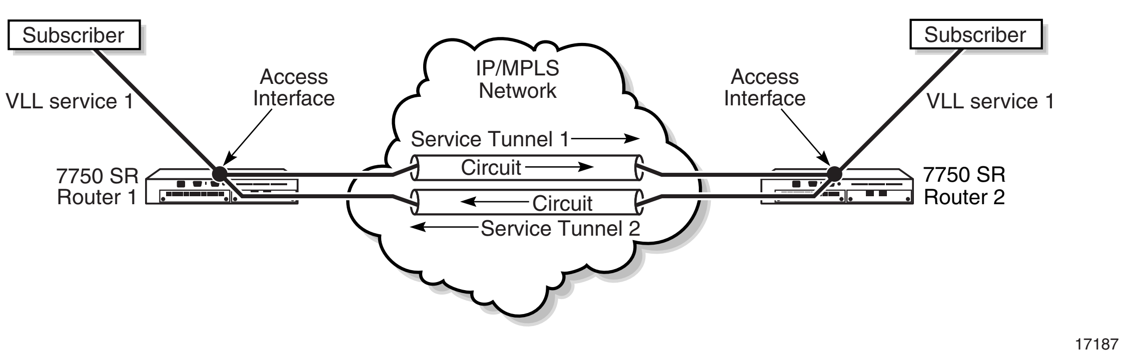

Figure 64-2 shows an example of a distributed VPLS.

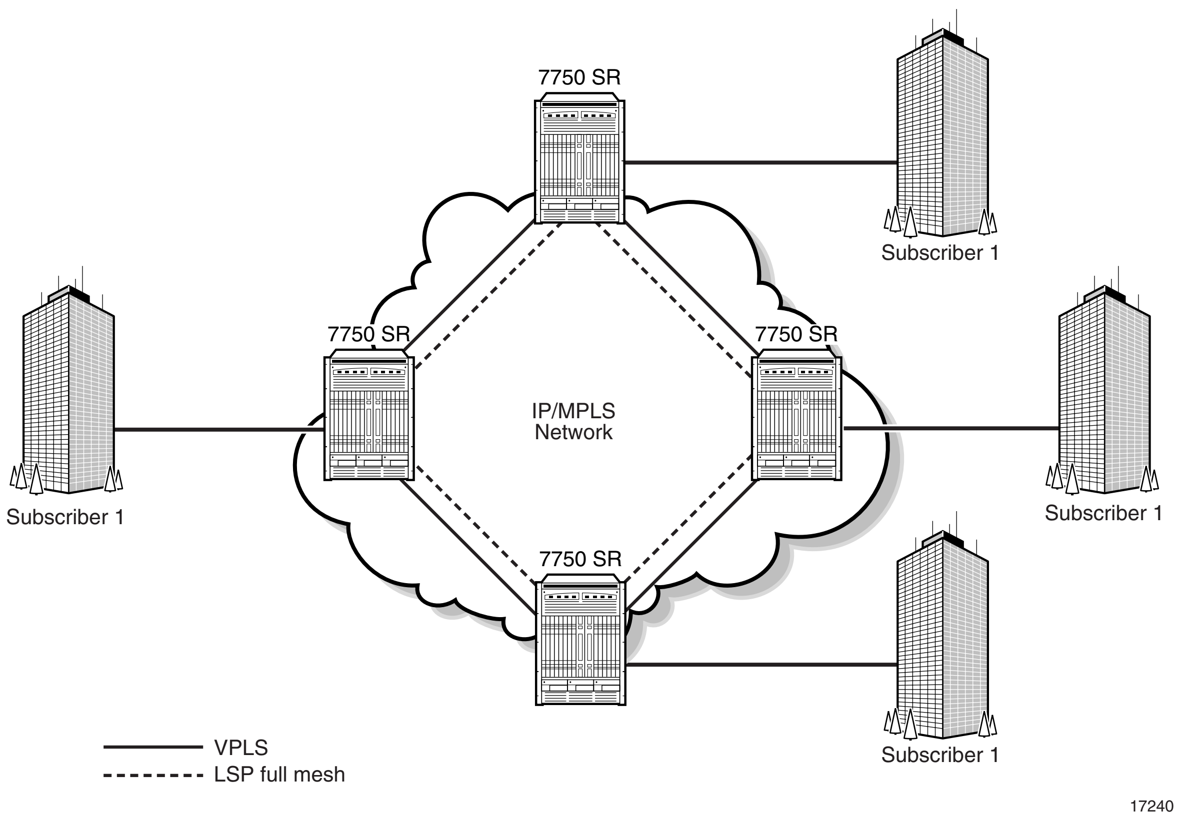
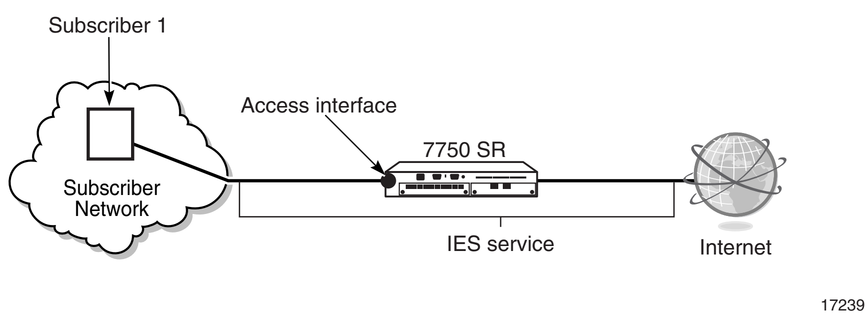
Figure 64-2 Distributed VPLS



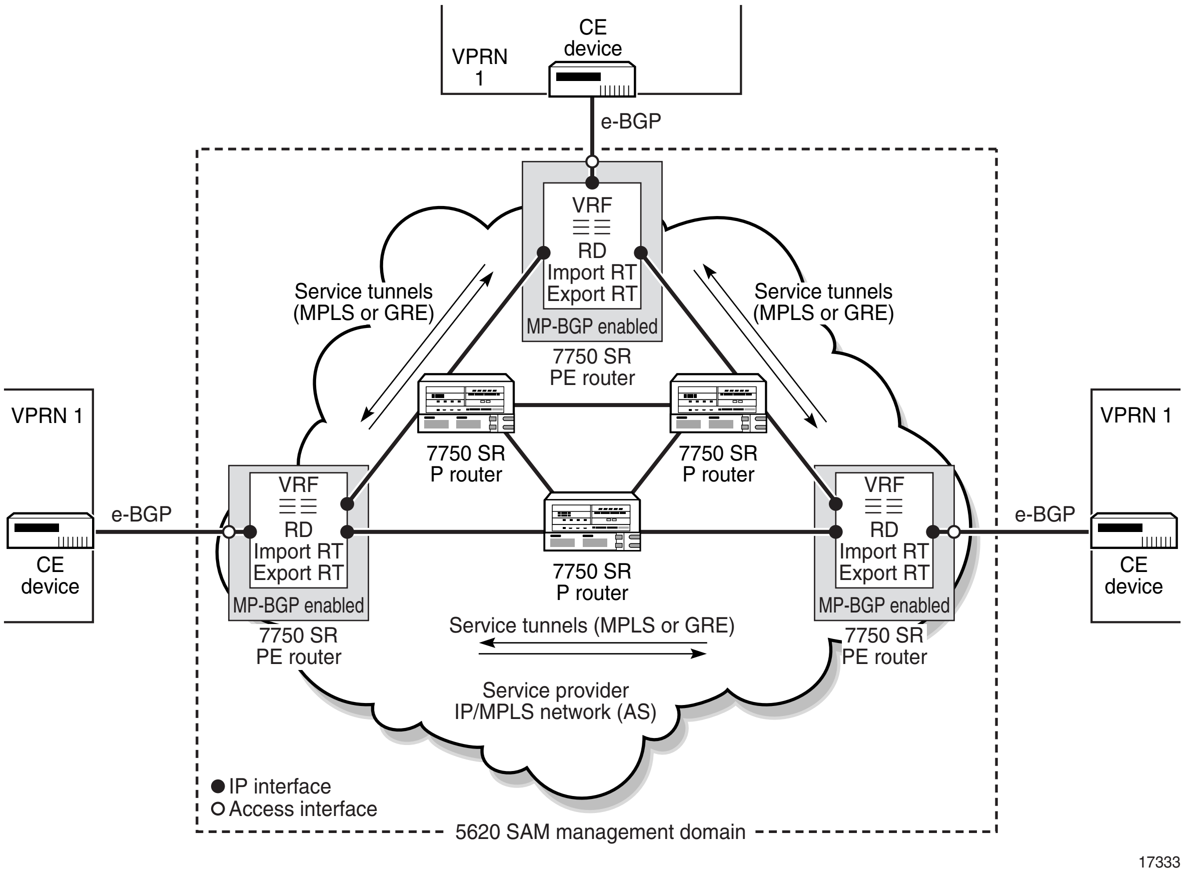
For IES, the managed devices are deployed at the provider edge and customer traffic enters the service using access interfaces. IES is a routed connectivity service where the customer communicates with an IP router interface to send and receive Internet traffic. Figure 64-3 shows a sample IES.

Figure 64-3 Sample IES



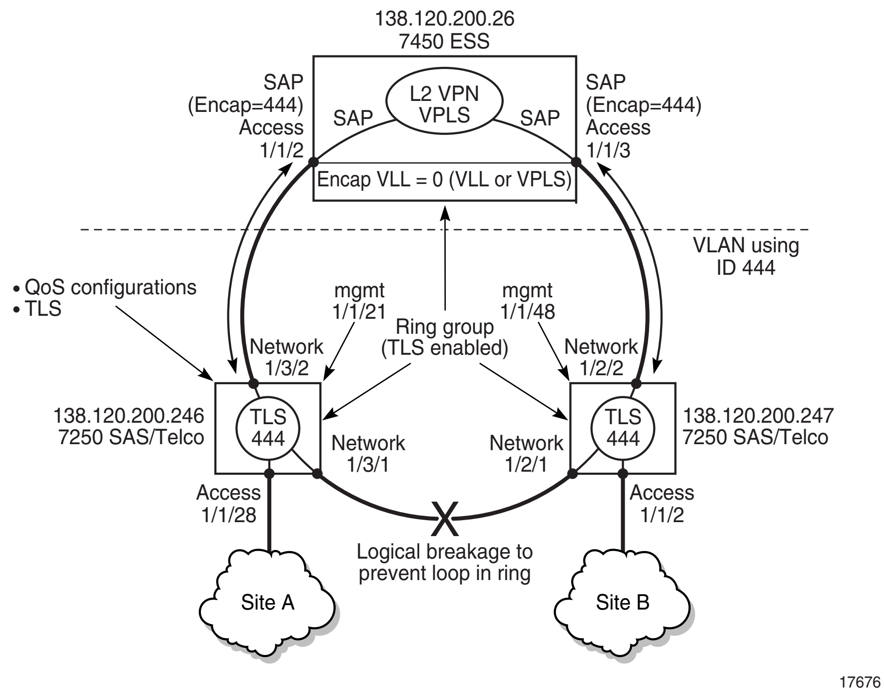
For VPRN services, the managed devices can be deployed as PE or provider core routers. Data and distribution of routing information are forwarded across an IP/MPLS service provider core network. Figure 64-4 shows a sample VPRN service.

Figure 64-4 Sample VPRN service



VLAN ring groups are used to send traffic across an Ethernet ring using copper or fiber optic connections from the source traffic device, for example, a 7450 ESS, to all devices in the ring. STP configuration on 7250 SAS and Telco devices ensures that there is a constant stream of traffic in either direction. Any breaks in the physical links between devices are rerouted. Figure 64-5 shows a sample VLAN for L2 VPNs.

Figure 64-5 Sample VLAN configuration for L2 VPNs



A composite service allows the interconnection of different service types to form a service delivery network that is tailored to a specific application. For example, VPRN, VPLS, and VLAN services can be joined to create a routed multicast TV distribution mechanism that spans a wide geographical area.

A mirror service is a unidirectional service function that duplicates a specified traffic stream and sends the duplicate stream to a monitoring device for troubleshooting or surveillance purposes. With pseudo-wire redundancy support, an ICB can be enabled in a mirror service spoke and a remote source, which can provide bidirectional service that enables support for active and standby PE redundancy.

QoS provides the ability to rate limit across multiple queues from one or more access interfaces for a customer, and to differentiate service levels for different types of traffic. For higher priority traffic such as VoIP or video, you can specify reserved bandwidth. Lower priority applications, such as data traffic, may not have reserved bandwidth but can burst to use all the available bandwidth.

The main elements of QoS are:

- QoS markings

  Customer traffic may be marked with QoS markings, such as DSCP, EXP, and dot1p, that are mapped to forwarding classes.

  All forwarding classes support profile marking of packets as in-profile or out-of-profile. In-profile packets have a high enqueuing priority. Out-of-profile packets have a low enqueuing priority. Profile marking of packets can occur at two points: when packets are classified into forwarding classes at access ingress and when packets are classified at service egress. Profile marking is only done on the internal header and not in an actual encapsulation.

- forwarding classes

  Provide network elements with a method to weigh the relative importance of packets, only in relation to other forwarding classes. A forwarding class is also referred to as a Class of Service.
- queues

  Location for buffering packets that are to be forwarded before they are scheduled.
- schedulers

  Hardware scheduling (or single-tier scheduling) exists by default on a device and consists of a high-priority and a low-priority scheduler.

  Scheduler policies (or multi-tier scheduling) provide a more complex, hierarchical structure of virtual schedulers that override the default hardware behavior for more flexible scheduling capabilities.
- slope policies

  Define the WRED slope characteristics of hardware buffer space that is used by the ingress and egress queues

See chapter 46 for more information about policies on the 5620 SAM. See the *7750 SR OS Services Guide* for more detailed information about QoS.

Access interfaces

Each customer service is configured with at least one access interface point called a SAP. The access interface identifies the point of customer interface for a service on the managed device.

A Layer 2 or Layer 3 access interface is uniquely identified using these parameters:

- physical Ethernet port or POS port and channel
- encapsulation type (if applicable)
- encapsulation id (if applicable)

Depending on the encapsulation type, a physical port or channel can have more than one access interface associated with it. Using encapsulation or a SONET/SDH channel, devices can support multiple services for a customer or for multiple customers.

Access interfaces can only be created on ports or channels that are designated as access in the physical port configuration. Access interfaces cannot be created on ports designated as core-facing network ports because these ports have a different set of features enabled in software.

Access interfaces can participate in policies. Time of day suites can also be associated with access interfaces to apply a set of time-based policies, filters, and schedulers. Configuration of access interfaces can be performed during service configuration or modification. When you configure an access interface, consider the following:

- An access interface is owned by and associated with the service in which it is created.
- An access interface is a local entity and is locally unique to a specific device. The same access interface ID value can be used on another device.
- There are no default access interfaces. All access interfaces must be created.

- The default administrative state for an access interface at creation time is administratively enabled.
- If a port or channel is shut down (administratively or operationally), access interfaces on that port/channel are operationally out of service.

Automatic SDP (service tunnel) binding for services

You configure automatic service tunnel (SDP) binding for services when you configure a service using configuration forms or templates.

The 5620 SAM defines its own internal rules on how automatic mesh SDP bindings are performed.

1. The 5620 SAM tries to find the least-used SDP (service tunnel) with the lowest load factor (the lower the number of bindings, the lower the load factor) from the source to destination node when the service tunnel meets the following conditions:
   - the service tunnel operational state is up
   - the operational MTU is greater than or equal to the MTU value of the service site
   - T-LDP is set for SDP bindings of VPLS, IES, or VLL services
   - the selected transport method, either GRE, LDP, or RSVP
2. When no service tunnel operational state is up, 5620 SAM tries to find the least-used service tunnel with the lowest load factor in an operationally down state.
3. For mirror services, binding are created from the source sites to the destination sites.
4. When a service tunnel cannot be found for a service site, a change in the site leads to another search. For example, if the service MTU is 1500 and the highest path MTU in all SDPs from that site is 1472, no SDP binding can be successful. If the service MTU is lowered to 1472 or less, a successful SDP binding results.
5. When a service tunnel is not found, and the transport method selected is GRE, 5620 SAM attempts to create a GRE service tunnel with a path MTU equal to the service site service MTU with T-LDP signaling turned on.

See “MTU size and port configuration” in section 20.2 for more information on MTU size considerations.

Multi-segment tunnel selection

Multi-segment tunnel selection functionality enhances tunnel selection functionality to allow the system to select intermediate NEs in a path, as well as the service tunnels from a selected intermediate NE to its next hop. Multi-segment tunnel selection functionality is used to select existing SDPs. It cannot create new SDPs.

Tunnels are selected based on the following criteria:

- If a metric value is specified for any of the SDPs along the path, the path with the lowest sum of the metric property for all SDPs along the path is selected.
- If no metric is specified for any of the SDPs along the path, the path with the fewest number of SDPs (hops) is selected.
- If two paths or SDPs are equal based on the selection criteria mentioned above, the SDP/path with the lowest load factor (number of services using that SDP) is selected.

Multi-segment tunnel selection functionality must be enabled at the system level, as well as at the tunnel selection profile level. Table 64-1 describes the objects to which a tunnel selection profile with multi-segment tunnel selection can be assigned, and the service tunnel configurations that result.

Table 64-1 Multi-segment tunnel selection scenarios

Tunnel selection profile applied to...	Resulting tunnel configuration
Spoke SDP binding on a VLL service	This scenario applies to a VLL service with two terminating sites. One of the sites has a spoke SDP binding configured with Auto-Select Transport Tunnel enabled, and a tunnel selection profile with Multi-segment Tunnel Selection enabled. If a valid path is found between the two terminating sites, the spoke SDP bindings and switching sites are created.
VLL service	This scenario applies to a VLL service with two terminating sites. The service is configured with Automatic SDP Binding/PBB Tunnel Creation enabled, and a tunnel selection profile with Multi-segment Tunnel Selection enabled. If a valid path is found between the two terminating sites, the spoke SDP bindings and switching sites are created.
Spoke termination point	This scenario applies to a spoke SDP binding between any two supporting objects. These include (M-)VPLS sites, (M-)VPLS I-sites, (M-)VPLS B-sites, VLL sites, IES L3 access interfaces, VPRN L3 access interfaces, VLL endpoints, and VPLS endpoints. The spoke SDP binding is configured with Auto-Select Transport Tunnel enabled, and a tunnel selection profile with Multi-segment Tunnel Selection enabled. If a termination point is specified, the spoke SDP bindings and return spoke SDP bindings are created. Switching sites are created as follows: • If the spoke SDP binding is created on a VLL service, the switching sites are created on the VLL service. • If the specified termination point is on a VLL service, the switching sites are created on the VLL service. • If neither end of the tunnel is on a VLL service, a new EPIPE service is created. The service component ID is auto-selected by the system. The subscriber ID is the same as the service on which the spoke is created. All other parameters are default values.

Redundant path selection

If Redundant Path Selection is enabled on a tunnel selection profile, a redundant path is created. Redundant Path Selection can only be enabled if Multi-Segment Tunnel Selection is also enabled. The selected redundant path does not use any of the same switching sites as the primary path. Redundant path selection is not supported when a termination point is selected on a spoke SDP binding. Table 64-2 describes the objects to which a tunnel selection profile with redundant path selection can be assigned, and the service tunnel configurations that result.

Table 64-2 Redundant path selection scenarios

Tunnel selection profile applied to...	Resulting redundant path configuration
Spoke SDP binding on a VLL service	This scenario applies to a VLL service with two terminating sites. One of the sites has a spoke SDP binding configured with Auto-Select Transport Tunnel enabled, and a tunnel selection profile with Multi-segment Tunnel Selection and Redundant Path Selection enabled. If a valid path is found between the two terminating sites, the spoke SDP bindings and switching sites for the redundant path are created. In this case, an endpoint and a return endpoint must be specified.
VLL service	This scenario applies to a VLL service with two terminating sites. The service is configured with Automatic SDP Binding/PBB Tunnel Creation enabled, and a tunnel selection profile with Multi-segment Tunnel Selection and Redundant Path Selection enabled. If a valid path is found between the two terminating sites, the spoke SDP bindings and switching sites for the redundant path are created. From a VLL Service, endpoints on the terminating sites that do not have SAPs or spokes are used for the auto-created spokes. If multiple endpoints exist on a terminating site, the endpoint without any SAPs is used. If multiple viable endpoints are available, an error is raised by the 5620 SAM and the operation fails. If there are no endpoints available, an endpoint is automatically created with default parameter values, with the following exceptions: • The Name parameter value is the endpoint Service ID. • The Description parameter value is auto-generated by the system.

SDP binding template handling

Multi-segment tunnel selection functionality will use SDP binding templates to create spoke SDP bindings in cases where a template is specified. SDP binding templates are handled using the following logic:

1. If an SDP binding template is specified on a tunnel selection profile, the template is used when creating the spoke SDP bindings.
2. If the site on which an SDP binding is being created has an associated site template, then the system attempts to find an SDP binding template within the site template. If an SDP binding template is found, it is used to auto-create the

spoke SDP bindings. If two or more templates are found, the system creates a spoke SDP binding with default parameters. If no templates are found, the logic described in item 3 applies.

3 If a service is associated with a template, then an attempt is made to find an SDP binding template within that template. If an SDP binding template is found, it is used to auto-create the spoke SDP bindings. If no templates are found, or two or more templates are found, then the system creates a spoke SDP binding with default parameters.

Automatic PBB tunnel binding

This feature is applicable only to VLL Epipes and I-VPLS services using a PBB tunnel.

Note — This feature has limited availability. Contact your Alcatel-Lucent technical support representative for more information about the availability of this feature.

The configuration of the service CAC functionality allows you to manage bandwidth at the service level and at the link level, which in turn enables the 5620 SAM to automatically select the best tunnel based on the number of active links and on the amount of available bandwidth on the service. The 5620 SAM also considers the shortest available path when it allocates bandwidth.

Although the 5620 SAM can select tunnels automatically—see Automatic SDP (service tunnel) binding for services—if service CAC is not configured, bandwidth will not be considered by the 5620 SAM when selecting the tunnel.

Bandwidth availability for the tunnel is calculated at the service admission request time and is based on the links currently used by the tunnel forwarding path. The booking of reserved bandwidth by the service is done directly on the link and directly on the tunnel, for a bandwidth-reserved tunnel.

The link monitors the bandwidth used by all of the services using that link. Since the bandwidth reserved on each tunnel that is used by a service can be different, the link monitors bandwidth usage through the tunnels rather than through a service.

You can perform a system-wide audit to ensure that the bandwidth on each link is properly calculated. The audit visits all tunnels in the network and adjusts the available bandwidth in all links currently being used by the forwarding tunnel path. The adjustments are made based on total bandwidth requests per CoS for all EVPLs currently using the tunnels.

You can perform this audit by clicking on the More Actions button on the Manage Services form and choosing CAC Audit. The audit also occurs automatically on system startup and when service CAC is switched from disabled to enabled. See chapter 6 for information about enabling and disabling service CAC.

Lightweight SAPs

SAPs that are associated with residential split horizon groups on VPLS sites are called lightweight SAPs. An RSHG uses dual-pass queue optimization and does not support downstream broadcast or multicast traffic. Lightweight SAPs have fewer internal configuration settings than regular SAPs. Therefore, you can create more lightweight SAPs on a node. The SAP Lightweight property is automatically set at creation time, when the SAP is associated with an RSHG, and cannot be modified later.

Users can:

- assign SAPs to residential split horizon groups
- list lightweight SAPs using the Lightweight filter property

Note — To get the most recent state of a lightweight SAP, it is recommended that users perform a resynchronization by clicking on the More Actions button and choosing Resync in the SAP configuration window.

64.2 5620 SAM and the triple play service delivery architecture

The TPSDA is based on three major components, as shown in Figure 64-6:

- broadband service aggregator
- broadband service router
- service and policy activation

Figure 64-6 TPSDA components

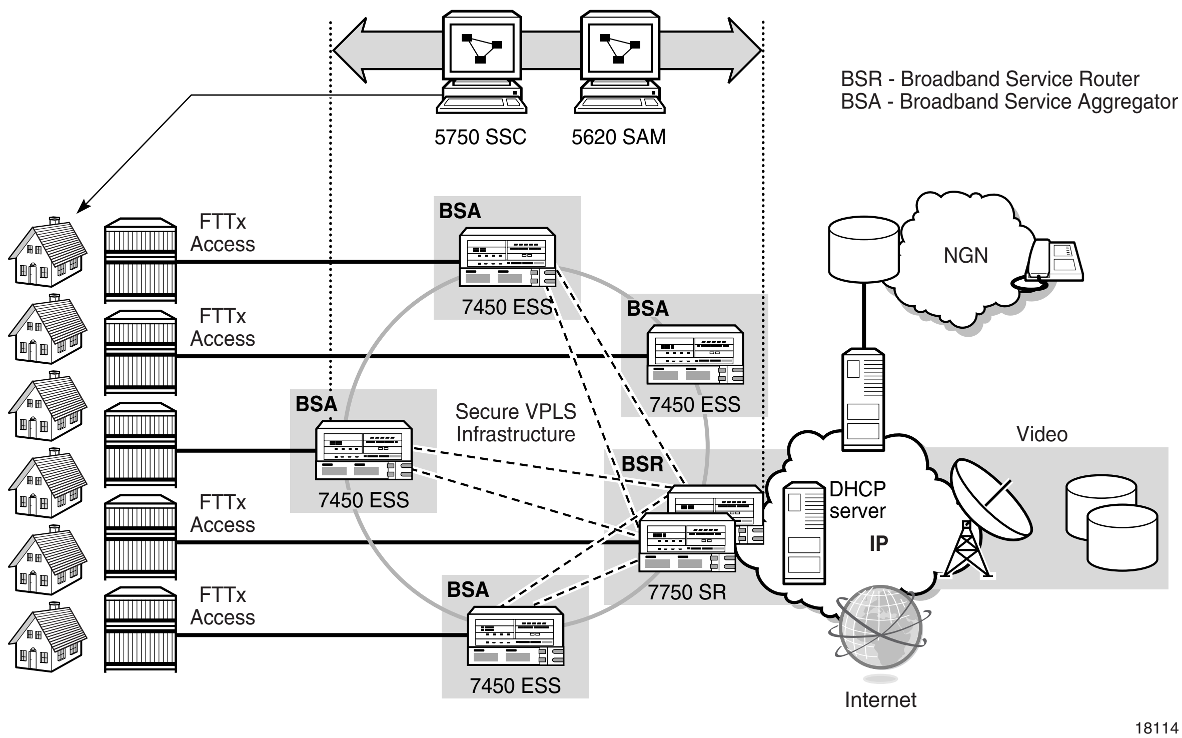


Table 64-3 lists the Alcatel-Lucent TPSDA product components.

Table 64-3 Product components of the TPSDA

Product	Role	Notes
5620 SAM	Provides network, service, and policy management across the TPSDA architecture, including a unified interface for element management and simple service activation and monitoring.	Create and configure QoS, filtering, and accounting templates that can then be reapplied to multiple L2 and L3 interfaces, and configure managed BSA and BSR devices to allow DHCP relay.
5750 SSC	Provides centralized control of host access services for triple play service delivery, for example, as a DHCP server to identify hosts and trigger service configuration or on-demand service profile changes made by the customer. Interworks with the 5620 SAM to enable per-customer QoS and bandwidth changes in the network.	Provide a customer self-service web portal and manage information that determines the levels of service allowed for an end user.
7750 SR	BSR	Support per-service and per-content type differentiation of QoS levels and supports distribution of multicast traffic.
7450 ESS	BSA	Aggregate traffic from DSLAMs and other FTTx access devices that are connected to end-user residential gateways.

DSLAMs or other access nodes are connected to Ethernet access ports on the broadband service aggregator. Typically, a single VLAN for each customer is set up between the access node and the BSA. This a configuration enables the application of consistent per-customer policies, such as QoS, filtering, and accounting, to be applied on the BSA.

Scaling of traffic and services is done by dividing L2 and L3 functions between the BSA and the BSR. The BSA aggregates traffic over Gigabit Ethernet ports and performs per-customer service queueing, scheduling, accounting and filtering, as described later in this chapter. The BSR terminates L2 access and routes over IP/MPLS with support for all protocols, including multicasting. Time of day QoS policies can be applied using 5620 SAM policy management.

Interconnectivity between BSAs and BSRs is provided by VPLS. VPLS instances can be automatically established using hub-and-spoke or ring topologies. Both can be configured and sites added to the VPLS using the 5620 SAM. Regardless of the fiber plant layout, VPLS enables a full mesh between all sites that are receiving and distributing customer traffic in the TPSDA, ensuring efficient transport and protection from node or fiber failures.

VPLS also provides mechanisms for traffic security, including residential split horizon groups in which direct user bridging is prohibited; ARP and broadcast suppression; DHCP-populated MAC and IP address filtering to prevent denial or service and theft of service using DHCP snooping, and RADIUS or TACACS+ authentication.

Service differentiation and QoS

This TPSDA approach provides a model based on call admission for video and VoIP, with the need to guarantee delay, jitter, and loss characteristics after the service connection is accepted. The architecture also meets the different QoS needs of HSI, namely per-user bandwidth controls, including shaping and policing functions that have little or no value for video and VoIP service delivery.

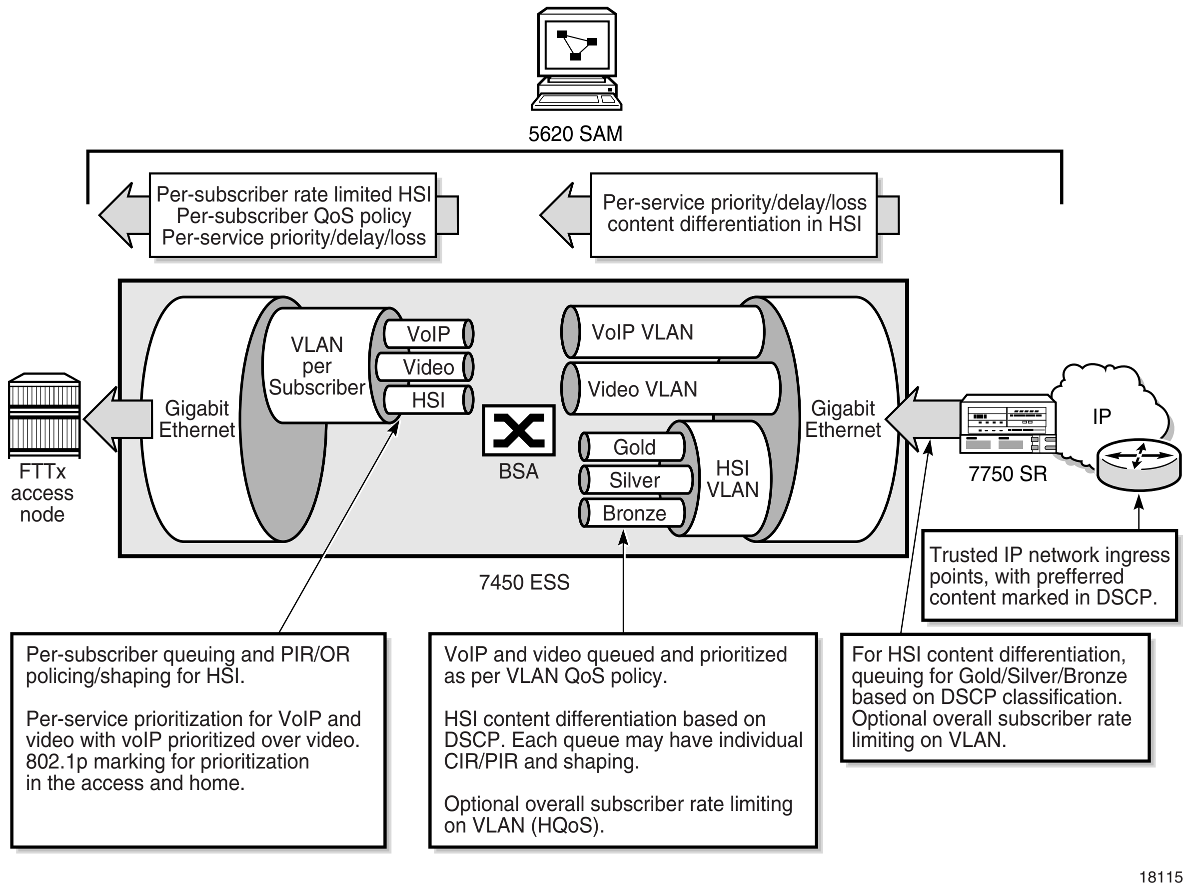
In conjunction with the architecture's support for content differentiation, this approach enables differentiated service pricing within high-priority data packages, also known as HSI. The distribution of QoS policy and enforcement across BSA and BSR allows the service provider to implement meaningful per-user service level controls. Sophisticated and granular QoS in the BSA allows the service provider to deliver truly differentiated IP services differentiation based on the user as well as on the content.

In the BSR to BSA downstream direction, IP services rely on IP layer classification of traffic from the network to queue traffic appropriately towards the BSA. Under extreme loading (only expected to occur under network fault conditions), lower priority data services and/or HSI traffic are compromised to protect video and voice traffic. Classification of HSI traffic based on source network address or IEEE 802.1p marking allows the QoS information to be propagated to upstream or downstream devices.

The BSR performs service distribution routing based on guarantees required to deliver the service and associated content, rather than on individual end users. The BSR only needs to classify content based on its forwarding class for a specific BSA to ensure that traffic for each service receives the appropriate treatment towards the BSA.

Figure 64-7 shows the downstream QoS configurations.

Figure 64-7 TPSDA downstream QoS configurations

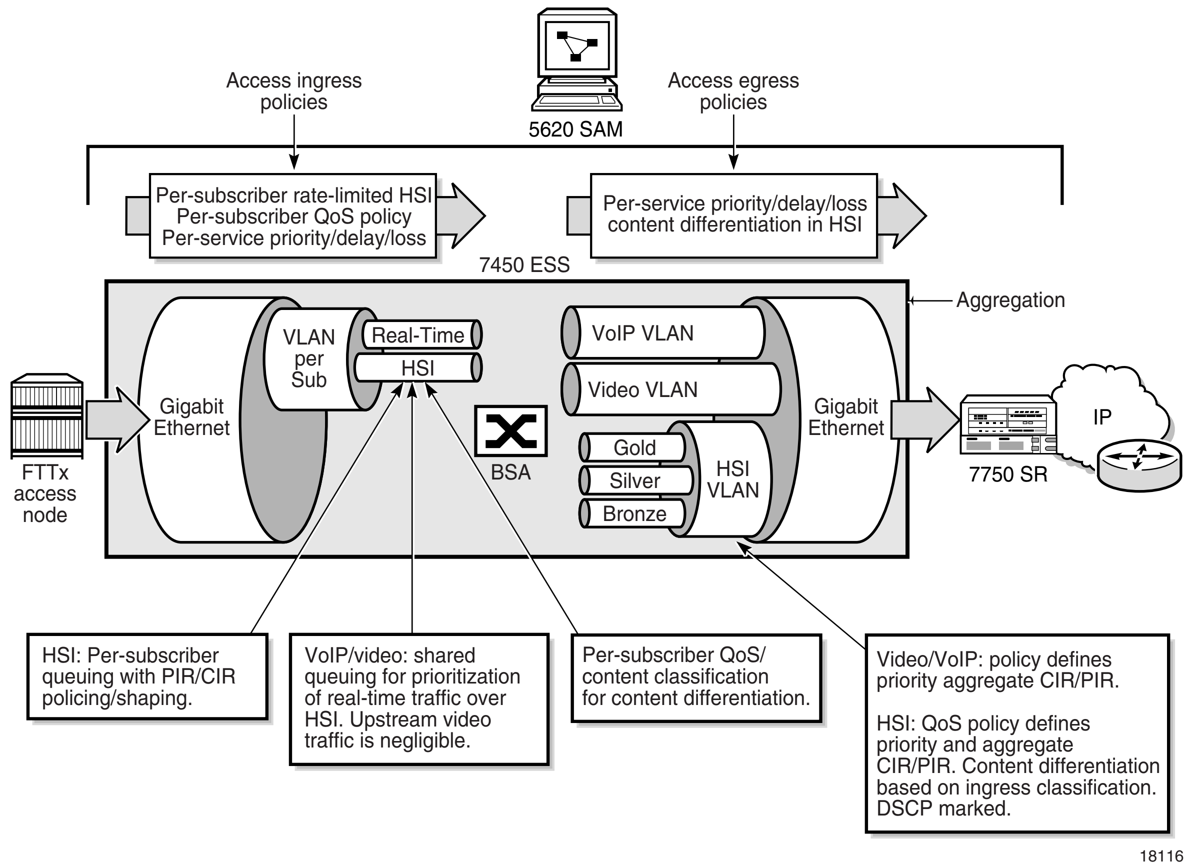


In the BSA-to-BSR upstream direction, traffic levels are substantially lower. Class-based queuing is used on the BSA network interface to ensure that video traffic is forwarded with minimal delay and that preferred data or HSI high-priority data traffic services receive better treatment than for best-effort Internet traffic. The IP edge device (BSR) therefore does not need to enforce per-user policies for hundreds of thousands of users. This function is distributed to the BSAs, and the per-user policies can be implemented on the interfaces directly facing the access nodes.

The BSA is capable of scheduling and queuing functions on a per-service, per-user basis, in addition to performing wire-speed packet classification and filtering based on both L2 and L3 interfaces. In addition to per-service rate limiting for Internet services, service traffic for each user can be rate-limited as an aggregate using a bundled service policy created using the 5620 SAM. These functions allow different users to receive different service levels independently and simultaneously.

Figure 64-8 shows the upstream QoS configurations.

Figure 64-8 TPSDA upstream QoS configurations



When a residential host device, such as a residential gateway or a set-top box in the customer's home, starts up, it requests network information, including the required IP address from a DHCP server. Figure 64-9 shows IP address assignment. See chapter 11 for information about using the 5750 SSC as a DHCP server. See Table 64-4 for more information about DHCP configuration options in the TPSDA.

Figure 64-9 DHCP IP address assignment in the TPSDA

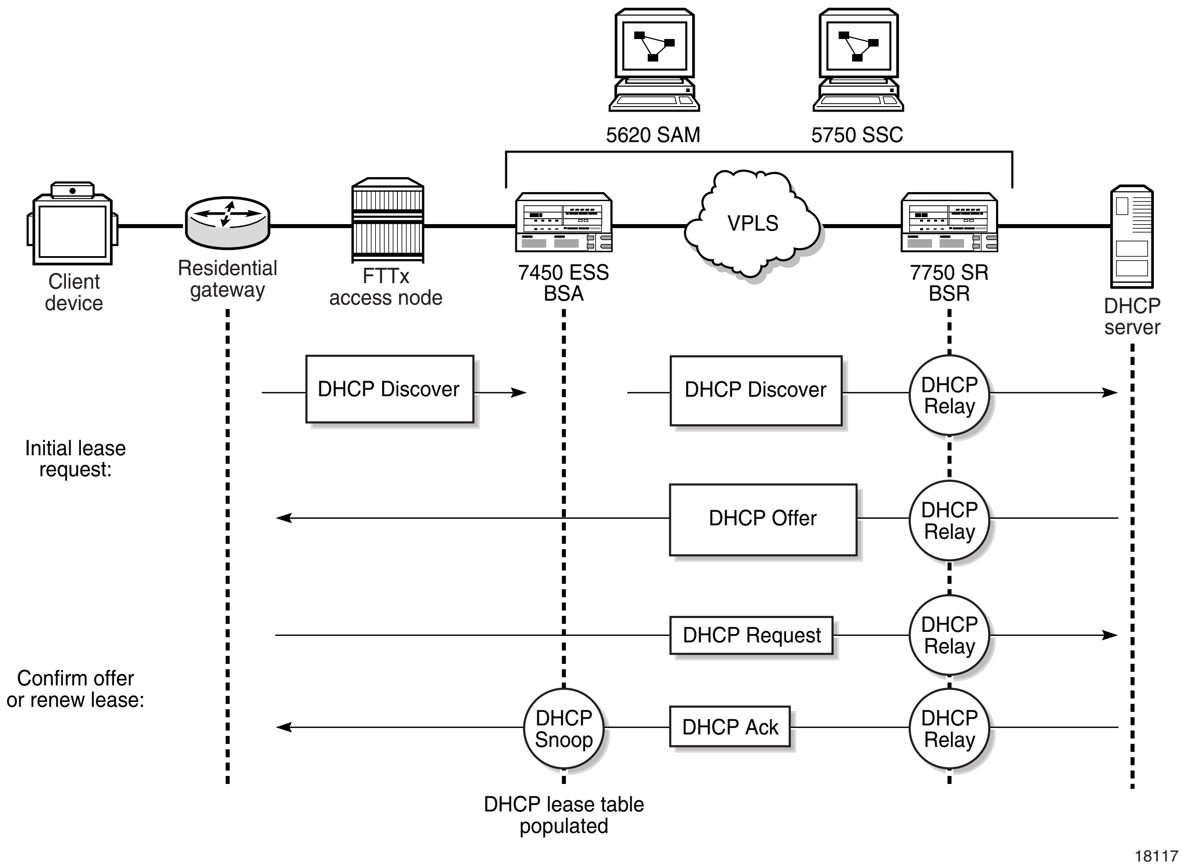


Table 64-4 lists the TPSDA features that you can configure using the 5620 SAM.

Table 64-4 TPSDA features

Feature and use	Notes	Reference
Split horizon groups		
For the TPSDA, there can be no user-to-user communication in the BSA; instead, all communication is done through the BSR. This residential bridging is done using split horizon groups, which ensures that traffic from different SAPs in the same service are not forwarded to other SAPs or spokes.	Traffic arriving on a spoke service tunnel or SAP within the split horizon group is not copied to other SAPs or spoke service tunnels. Traffic is copied to SAPs and spokes in other split horizon groups existing within the same service, such as a VPLS.	See chapter 71 for configuration of split horizon groups.
DHCP		

(1 of 3)

Feature and use	Notes	Reference
For the TPSDA, host devices, such as a residential gateway, SIP phone, or set-top box, use DHCP to obtain IP address and other network configuration information. The client device sends a DHCP discover message to request an IP address. The sequence of events is shown in Figure 64-9.	Information added to the DHCP discover requests may include information added by the FTTx access node or the BSA, for example, the shelf, slot, port, VPI, VCI, or other identifier of the host. You can use the 5620 SAM to configure DHCP relay on the first IP interface in the upstream direction. The BSA or BSR relays the message to a DHCP server. The gateway (residential gateway) IP address indicates to the DHCP server the subnet an IP address should be allocated to for the host.	See the appropriate service configuration chapter, as DHCP, option 82, and DHCP relay are configured at the service level.
DHCP relay DHCP discover messages are broadcast packets that typically do not leave the IP subnet. DHCP relay agents intercept the requests and forward them as unicast messages to a DHCP server. DHCP request messages from subscriber hosts are usually sent from the FTTx access node, with information appended to uniquely identify the residential gateway, either by MAC address of the residential gateway or by an option 82 string identifier that indicates the device, port type, rack, shelf, slot, port, and VLAN ID or VPI/VCI of the circuit connected to the residential gateway.	The DHCP relay agent sets the GIADDR in the packet to the IP address of the ingress interface (SAP). You must configure the BSA and BSR devices as DHCP relay agents when the DHCP requests are going to be forwarded to a DHCP server, or a 5750 SSC configured as a DHCP server. The maximum DHCP relay packet size is 1500 bytes.	See the appropriate L3 service (IES and VPRN) or L2 service (VPLS) configuration chapter. See the *5750 SSC Service Manager User Guide* and chapter 11 for more information about configuring the 5750 SSC as a DHCP relay agent.
DHCP lease state table The BSA maintains the identities of hosts that are allowed network access for each SAP on each service.	The lease state information is collected by snooping DHCP acknowledge messages on the SAP, using DHCP snooping. Entries in the DHCP lease state table remain valid for the duration of the IP address lease.	See chapter 20.
DHCP snooping The BSA can copy DHCP packets and inspect them to help secure the system. For example, if malicious user A sends an IP packet requesting a video stream intended for user B, return packets sent to user B could jam B’s connection.	Use the 5620 SAM to configure DHCP snooping for the following purposes: • To insert Option 82 information when the system is not configured for DHCP relay by enabling DHCP snooping on the SAP closest to the host. • To build a DHCP lease state table by enabling DHCP snooping on the service tunnel nearest the network egress and on the SAP closest to the host. • To efficiently associate dynamic hosts with subscriber instances and associated network resources in a triple play service configuration	See the appropriate service chapters for configuration of the lease populate and snooping parameters. See chapter 68 for information about using DHCP snooping for subscriber identification purposes.

(2 of 3)

Feature and use	Notes	Reference
Option 82 The DHCP relay option allows managed devices to append information to the DHCP request that identifies where the DHCP request originated. You can also independently insert Option 82 information when DHCP snooping is enabled on a VPLS SAP. The Option 82 information can be: • The DHCP Option 82 string circuit ID value associated with the 7330 ISAM FTTN, or other ISAM family of nodes in the form ssc(*SSL-7330-1 atm 1/1/04/06:8.35*). The *device port_type rack/shelf/slot/port: VPI:VCI* identifier on the 7330 ISAM FTTN indicates that this is the connection configured for residential use, which is connected to the user's residential gateway. • The DHCP Option 82 string remote ID value associated with the 7330 ISAM FTTN, or other ISAM family of nodes in the form ssc(*remote ID*).	Using Option 82, you can identify: • the circuit ID (service tunnel binding) that is unique to the device relaying the circuit • the remote ID (MAC address) of the host at the far end of the circuit • the subscriber to which a host belongs for the purpose of assigning network resources The maximum DHCP relay packet size is 1500 bytes. If adding Option 82 information to the packet causes the packet to exceed 1500 bytes, the DHCP relay request is forwarded without including the Option 82 information.	See the appropriate service configuration chapter. For DHCP option 82 information inserted because of 5750 SSC DHCP server authentication, see chapter 11. For DHCP option 82 information inserted to identify subscribers, see chapter 68.

(3 of 3)

BTV multicast

This section describes how the 5620 SAM can be used to configure and manage the delivery of BTV multicast traffic streams. See section 64.3 for examples.

Optimizing for broadcast TV means implementing multicast packet replication throughout the network. Multicasting improves the efficiency of the network by reducing the bandwidth and fiber needed to deliver broadcast channels to the end user. A multicasting device can receive a single copy of a broadcast channel and replicate it to any downstream devices that require it, thus substantially reducing the required network resources. This efficiency becomes increasingly important closer to the end user.

Multicast routing overview

Multicast routers direct traffic to several receivers without incurring any additional overhead for the source router or the receivers. In contrast, unicast networks can suffer from increased bandwidth requirements as the number of receivers increases.

In multicast routing, receivers query the source router to request a specific data stream. The multicast group is not restricted by physical location, so long as the hosts can be reached through the Internet. Routers in the network must use IGMP to send and receive multicast data streams.

A multicast-enabled device, such as a switch or router, distributes a data stream to multiple receivers. Multicast packets are replicated in the network by routers that are enabled with PIM, which results in the efficient delivery of data to multiple receivers using less bandwidth.

1 A switch or router distributes a data stream to multiple receivers, such as multicast-enabled PE switches or routers.

2 The multicast-enabled switch or router replicates the data stream, when required, and transmits a copy to each downstream switch or router in the multicast tree.

3 Each client receives the data stream it has subscribed to from the downstream switch or router.

The NEs involved in delivering BTV multicast streams are first preconfigured through CLI for discovery and management by 5620 SAM. After discovery, routing protocols are applied to the NEs using 5620 SAM. Routing, QoS, and network queue policies are then created. On some devices, multicast package and ACL filter policies are created. These policies are applied to NEs during service creation through 5620 SAM.

Content delivery

BTV source traffic consists of one IP multicast stream per broadcast channel. As a multicast stream enters the core network, it is directed by PIM to the RP, which replicates the multicast traffic to all DRs that have requested the specific multicast stream. DRs distribute the multicast stream directly to set-top receivers or through an M-VPLS to BTV VLAN rings to which customer set-top receivers are connected. Multicast streams are forwarded only to those set-top receivers that have requested them through IGMP and are entitled to them as subscriber hosts.

Content management

Multicast package policies on some devices define the available multicast addresses (BTV channels) for end users in a BTV network. Typically, a root package policy which includes all BTV channels associated with a 5620 SAM customer service is created. Subsets of the root policy are then created as BTV content packages to which end customers can subscribe. ACL filter policies on CE devices ensure that only the channels to which an end customer has subscribed are delivered to the customer set-top receiver.

PIM

PIM uses RPF to correctly forward multicast packets down a distribution tree, using the independent multicast and unicast routing tables created by the 7450 ESS in mixed mode or the 7750 SR. The unicast routing table is populated by the unicast routing protocols, such as OSPF, BGP, IS-IS, or static routes, which can also be configured to submit routes to the multicast routing table.

Depending on the configuration of the PIM routing instance, RPF can use the unicast routing table, the multicast table populated by the unicast routing protocols, or both to determine the upstream sources of multicast streams. PIM forwards a multicast packet only if it is received on an upstream interface that is associated with a source address of an upstream router. This RPF check assures that there are no loops in the distribution tree.

PIM uses a multicast domain to group receiver hosts on a router called the rendezvous point (RP). A bootstrap router (BSR) elects an RP from available candidates. The BSR manages RP information, disseminates it to all PIM routers in the multicast domain, and elects a new RP in the case of RP unavailability.

A receiver host becomes a member of a multicast domain by sending an IGMP join request for a multicast stream to a PIM designated router (DR). If the router does not currently receive the multicast stream, PIM updates the DR routing table with the receiver host IP address and requests the multicast stream from the RP. The RP adds the router to the distribution tree. Packets sent to the multicast IP address are propagated down the distribution tree to the receiver host. DRs use the RP as the source for a multicast stream unless a source with a lower path cost is available.

PIM stops sending a multicast stream to a router when it determines that there are no active receiver hosts for the multicast stream in that branch of the distribution tree.

MVR on VPLS

PIM is not supported on 7450 ESSs. When receiver hosts are connected to a PIM DR by way of a 7450 ESS, MVR must be configured on the switch. MVR allows multicast traffic to be forwarded downstream from the DR to the receiver host over an MVR VPLS.

IGMP

IGMP is a multicast protocol which service providers can use to establish multicast group memberships on a LAN. Within the LAN, end users use IGMP to communicate with a local multicast router, which then uses PIM to distribute the IGMP messages to other local and remote multicast routers. Multicast routers send regular membership queries to IGMP hosts which respond with membership reports. Multicast routers can use these reports to determine which hosts are interested in receiving particular multicast messages.

IGMP operates above the network layer on IPv4 networks.

MLD and MLD-snooping

The Multicast Listener Discovery protocol is essentially the IPv6 version of IGMP. It is used by IPv6 routers to discover the presence of multicast listeners (that is, nodes that wish to receive multicast packets) on their directly attached links, and to discover specifically which multicast addresses are of interest to those neighboring nodes.

MLD version 2 (MLDv2) is designed to be interoperable with MLD version 1 (MLDv1). MLDv2 adds the ability for a node to report interest in listening to packets with a specific multicast address only from specific source addresses or from all sources except for specific source addresses.

While 5620 SAM currently does not support MLD, it does support MLD-snooping. The 7x50 and 7710 SR routers allow the enabling of MLD snooping for VPLS services.

64.3 BTV multicast configuration examples

Figure 64-10 shows a simple BTV network and three methods of content delivery, examples A, B, and C. The sequence of specific configuration steps for each example follows general device, network and multicast configuration information common to all examples.

Note — In the examples on the following pages, references to "IGMP-snooping" may generally be read as "IGMP- or MLD-snooping", provided the routers employed in the configurations support the MLD protocol.

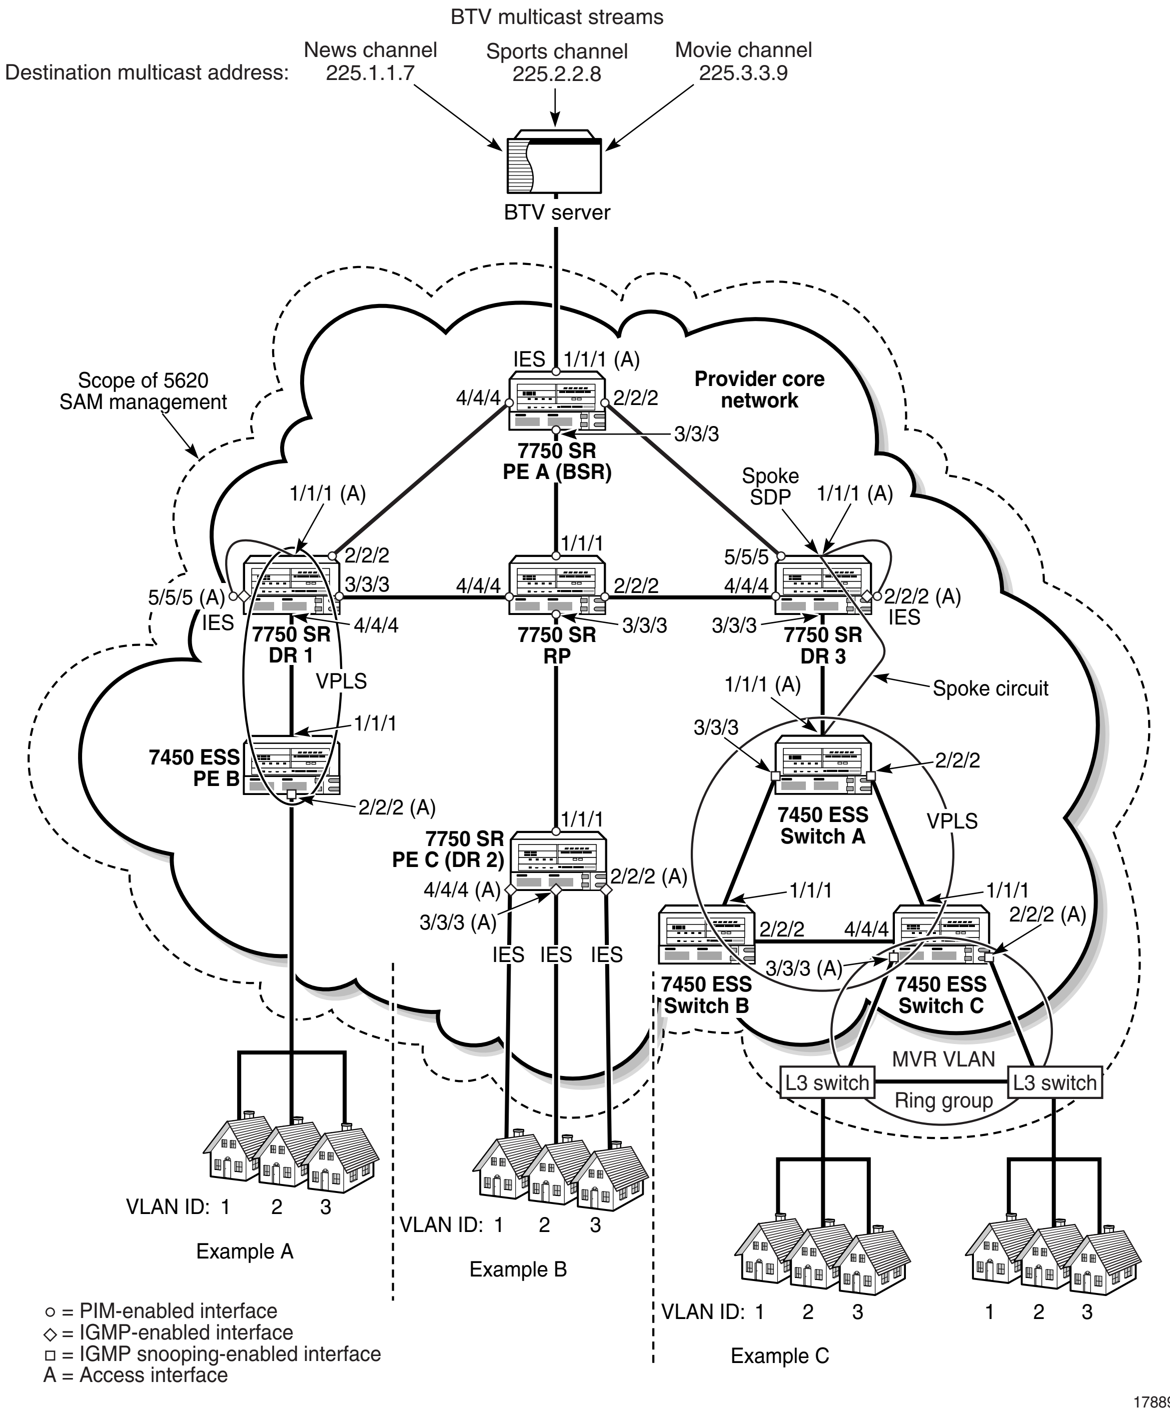
Device preconfiguration

A network device requires CLI preconfiguration before it can be managed by the 5620 SAM. The primary CLI preconfiguration actions for a device are:

- Assigning a system ID to the device
- Enabling and configuring SNMP on the device
- Enabling Telnet access on the device

See chapter 2 and the specific device documentation for more information about enabling device functionality before using the 5620 SAM.

Figure 64-10 BTV multicast delivery examples



After CLI preconfiguration, further actions are required:

- Discover devices, including mediation configuration with CLI user names and passwords.
- Use 5620 SAM to set the discovered device in a managed state.

See chapter 14 for more information about device discovery and management using 5620 SAM.

Network preconfiguration

The core network shown in Figure 64-10 represents a fully meshed group of devices. For simplicity, only the devices relevant to the BTV multicast examples are shown. Network preconfiguration consists of the following sequence of actions:

1. Configure network devices for in-band or out-of-band management. See chapter 13 for more information.
2. Configure a system interface on each device to serve as the identifier for the device. See chapter 30 for more information.
3. Configure network interfaces on each router to establish a full mesh of interconnectivity between devices. In Figure 64-10 the interfaces to be configured are PE A, ports 1/1/1, 2/2/2, 3/3/3, and 4/4/4; DR 1, port 2/2/2; RP, ports 1/1/1, 2/2/2, and 4/4/4; and DR 3, ports 1/1/1 and 4/4/4. See chapter 30 for more information.
4. Cable the network-interface ports between routers in the core network to establish the physical connectivity shown in Figure 64-10.
5. Use CLI ping commands to check IP connectivity between devices. See the device documentation for more information.
6. Enable IGPs such as RIP, OSPF, or IS-IS on devices according to network size and complexity. See chapter 31 for information about enabling routing protocols.
7. Enable an inter-AS routing protocol such as BGP or OSPF to PE routers, if required. See chapter 31 for more information.
8. Create routing policies as required. Create one multicast group for each BTV multicast destination address during policy creation. See chapter 30 for more information.
9. Configure routing protocols and apply routing policies as required. See chapter 31 for more information.
10. Configure LDP and MPLS, if required. See chapter 31 for information about configuring LDP. See chapter 32 for information about configuring MPLS.
    - Enable MPLS and LDP on the routing instance of each device that is participating in the MPLS network.
    - Assign a Layer 3 interface to the MPLS instance on each MPLS-enabled device.
    - Create a mesh of MPLS paths.
    - Create a mesh of LSPs.
    - Use the 5620 SAM to create MPLS administrative groups, and assign the groups to MPLS interfaces and LSP paths as required.

Multicast configuration common to all examples

The network connections shown between PE A and DR 1 and between PE A and DR 3 represent redundant multicast routes used by PIM in the event of an RP failure. PIM dynamically adjusts to BSR or RP failure by electing a replacement BSR or RP or by using a previously defined backup BSR or RP. PIM chooses the most appropriate source for a multicast stream based on path cost and source availability and bypasses the RP if a better source for a multicast stream is found.

For simplicity, Figure 64-10 does not show routes to PE C (DR 2) from DR 1 or DR 3. As shown, PE C (DR 2) is isolated from multicast traffic in the event of RP failure.

Network multicast configuration common to all three examples involves the following sequence of actions:

1. Enable IGMP on routers DR 1, PE C (DR 2), and DR 3. See Procedure 31-36 for more information.
2. Configure IGMP on routers DR 1, PE C (DR 2), and DR 3. See Procedure 31-37 for more information.
3. Enable PIM on routers PE A, RP, DR 1, PE C (DR 2), and DR 3. See Procedure 31-32 for more information.
4. Configure PIM on routers PE A, RP, DR 1, PE C (DR 2), and DR 3. See Procedure 31-33 for more information.
    - Specify PE A as the candidate bootstrap router.
    - Specify RP as the candidate rendezvous point. You can also specify it as a static RP for a multicast domain, if there are multiple BTV domains, and configure a second router as a redundant RP.
    - Specify IES as the Apply to parameter value on routers PE A, DR 1, PE C (DR 2), and DR 3.
5. Create PIM interfaces at PE A, ports 1/1/1, 2/2/2, 3/3/3, and 4/4/4; RP, ports 1/1/1, 2/2/2, 3/3/3 and 4/4/4; DR 1, ports 2/2/2 and 3/3/3; DR 2, port 1/1/1 and DR 3, ports 4/4/4 and 5/5/5. See Procedure 31-35 for more information.
6. Create QoS, scheduling, and accounting policies for the ingress BTV traffic. See chapter 46 for more information.
7. Create an IES from PE A, port 1/1/1, to the BTV multicast provider's network. See Procedure 73-1 for more information.
    - Enable PIM on the IES SAP during IES creation.

Example A configuration

In Example A, IGMP join requests from residential hosts ingress a VPLS SDP. IGMP snooping on the VPLS registers the join requests on the local switch. The switch sends the requests over the VPLS, which is physically cross-connected to an IGMP- and PIM-enabled IES SAP on the DR. PIM on the DR requests the desired multicast stream, if not present, from the RP. The requested stream then traverses the VPLS and is sent to end users.

1. Configure PE B, port 1/1/1 and DR 1, port 4/4/4 as network ports. See Procedure 20-1 for more information.
2. Configure PE B, port 2/2/2 and DR 1, port 1/1/1 as access ports. See Procedure 20-1 for more information.

3 Cable DR 1, port 3/3/3, and PE B, port 1/1/1 to establish physical connectivity.

4 Configure DR 1, port 5/5/5 as an access port. See Procedure 20-1 for more information.

5 Create an IES on DR 1, port 5/5/5. See Procedure 73-1 for more information.

- Enable IGMP on the IES SAP during IES creation.
- Enable PIM on the IES SAP during IES creation.

6 Connect a cable between ports 1/1/1 and 5/5/5 on DR 1 as a service cross connect.

7 Create QoS, scheduling, filter, and accounting policies to apply to egress BTV traffic during service creation. See chapter 46 for information about policy creation.

8 Create a distributed VPLS with endpoints at PE B, port 2/2/2 and DR 1, port 1/1/1. See Procedure 71-1 for more information.

- Enable IGMP snooping on the VPLS SDP at PE B, port 2/2/2.
- Apply previously defined QoS, scheduling, filter, and accounting policies to the VPLS SDP at PE B, port 2/2/2.

Example B configuration

In Example B, an IGMP join request ingresses an IES SAP on the DR. PIM on the DR requests the desired multicast stream, if not present, from the RP. The requested stream is then delivered over an IES to an end user.

1 Configure PE C (DR 2), ports 2/2/2, 3/3/3, and 4/4/4 as access ports. See Procedure 20-1 for more information.

2 Create QoS, scheduling, filter, and accounting policies to apply to egress BTV traffic during IES creation. See chapter 46 for information about policy creation.

3 Create IES services on PE C (DR 2), ports 2/2/2, 3/3/3, and 4/4/4 that terminate on the CE set-top devices. See Procedure 73-1 for more information.

- Enable IGMP on each IES SAP during IES creation.
- Apply previously defined QoS, scheduling, filter, and accounting policies to each IES, as required.

Example C configuration

In Example C, IGMP join requests from residential hosts pass over an MVR VLAN to an VPLS. IGMP snooping on the VPLS registers the join requests on the local switch, which passes them over the VPLS to a spoke SDP on the DR. The spoke SDP's port is physically cross-connected to an IGMP- and PIM-enabled IES SAP on the DR. PIM on the DR requests the desired multicast stream, if not present, from the RP, then sends the stream over the VPLS and MVR VLAN to the end users.

1 Create a BTV MVR VLAN of L3 switches, such as 7250 SAS or Telco devices, in a ring group with endpoints on Switch A, ports 2/2/2 and 3/3/3. See section 69.4 and Procedure 69-5 for more information. For redundancy, the MVR VLAN can be configured with endpoints on different switches. A VLL between the two switches acts as an unbreakable connection.

2 Enable and configure IGMP snooping on the bridge instances for the L3 switches included in the MVR VLAN. See section 31.1 for information specific to 7250 SAS Telco devices or see the specific device documentation if the L3 switch a type not managed by the 5620 SAM.

3 Create QoS, scheduling, filter, and accounting policies to apply to egress BTV traffic during service creation. See chapter 46 for information about policy creation.

4 Configure the following as network ports:

- Switch A, ports 1/1/1, 2/2/2, and 3/3/3
- Switch B, ports 1/1/1 and 2/2/2
- Switch C, ports 1/1/1, 2/2/2, 3/3/3 and 4/4/4

See Procedure 20-1 for more information.

5 Create a distributed VPLS consisting of Switch A, Switch B, and Switch C. See Procedure 71-1 for more information.

- Apply previously defined QoS, scheduling, filter, and accounting policies to the VPLS SDPs.
- Enable and configure IGMP snooping on the VPLS SDPs that are part of the MVR VLAN.
- Ensure that the encapsulation value of the VPLS SDPs that are part of the MVR VLAN matches the MVR VLAN ID.
- Create a split horizon group during VPLS creation to allow later addition of a spoke circuit to the VPLS.
- Configure STP on the VPLS, as required.

6 Configure DR 3, port 2/2/2 as an access port. See Procedure 20-1 for more information.

7 Create an IES on DR 3, port 2/2/2. See Procedure 73-1 for more information.

- Enable IGMP on the IES SAP during IES creation.
- Enable PIM on the IES SAP during IES creation.

8 Connect a cable between ports 1/1/1 and 2/2/2 on DR 3 as a service cross connect.

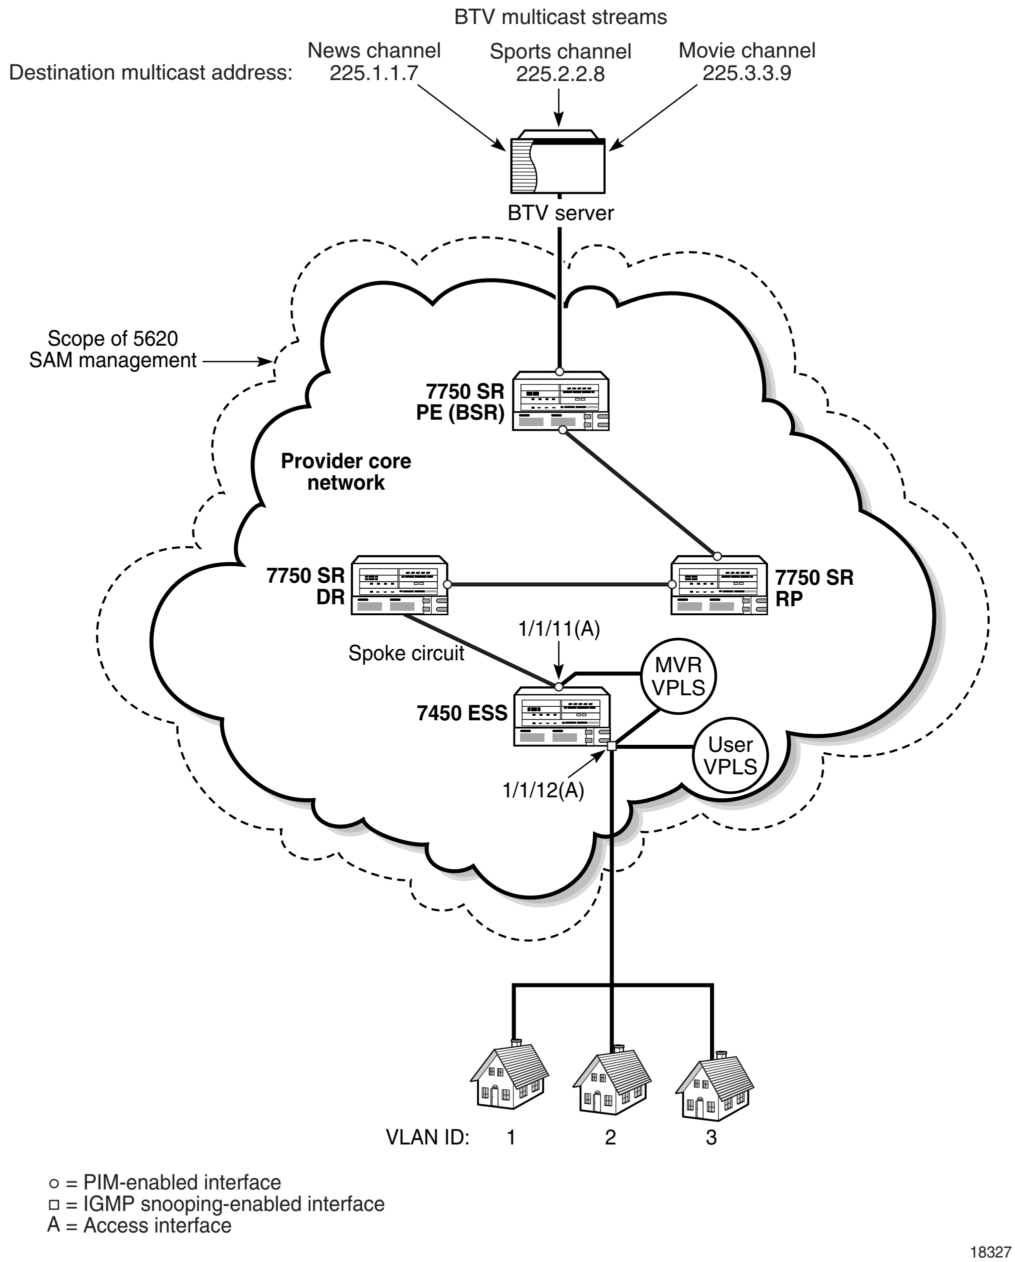
9 Create a VPLS spoke SDP at DR 3, port 1/1/1. See Procedure 71-9 for more information.

Example D configuration

Figure 64-11 shows an example of BTV multicast delivery using MVR on VPLS.

See Figure 64-10, and sections “Network preconfiguration” and “Multicast configuration common to all examples” for common network configuration information.

Figure 64-11 BTV multicast delivery using MVR on VPLS example



In Example D, IGMP join requests from residential hosts are sent to a user VPLS on the 7450 ESS. IGMP snooping on the user VPLS registers the join requests on the switch, which sends them to the 7750 SR DR. PIM on the DR requests the desired multicast stream, if not present, from the RP, then sends the stream over the MVR VPLS to the user VPLS, from which the multicast stream is sent to the end users.

1 Create a multicast package policy to apply to the 7450 ESS that belongs to the MVR VPLS. See chapter 49 for more information.

2 Configure the following ports as access ports. See Procedure 20-1 for more information.

- 7450 ESS, port 1/1/11
- 7450 ESS, port 1/1/12

3 Create an MVR VPLS on the 7450 ESS with SAPs 1/1/11 and 1/1/12. Apply the previously defined multicast package policy to the MVR VPLS.

4 Create a user VPLS on SAP 1/1/12 of the 7450 ESS.

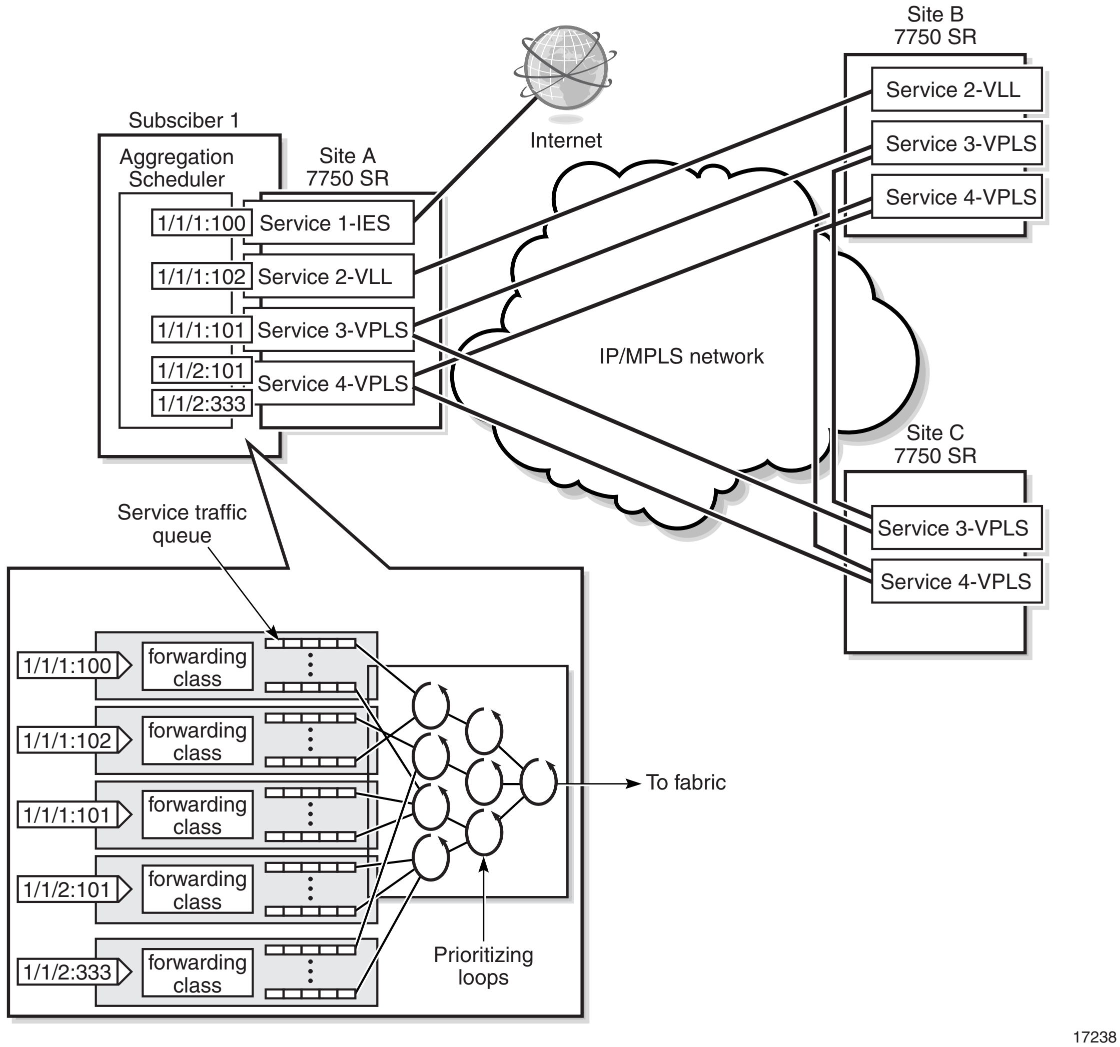
- Associate the user VPLS with the previously created MVR VPLS to identify the MVR VPLS as the source of the multicast traffic.
- Enable and configure IGMP snooping on the site.

5 Create a spoke circuit between the 7450 ESS (endpoint 1/1/11) and the 7750 SR DR.

64.4 Sample network configuration using QoS

Figure 64-12 shows an example of a service configuration using QoS.

Figure 64-12 Example of a service configuration using QoS



In this configuration, the following services are provisioned:

- Service 1: IES for Internet access, which requires a CIR of 10 Mb/s and a PIR of 100 Mb/s
- Service 2: VLL service for FTP connectivity between Site A and Site B, which requires a CIR of 10 Mb/s and a PIR of 20 Mb/s
- Service 3: VPLS for video-conference service over sites A, B, and C, which requires a CIR of 20 Mb/s and a PIR of 50 Mb/s
- Service 4: VPLS for voice traffic, which requires a CIR of 10 Mb/s and a PIR of 20 Mb/s

The cumulative rate at site A needs to be limited to 70 Mb/s.

The following high-level steps are required to create the Figure 64-12 configuration with rate limiting using QoS at Site A. Similar steps are required to configure QoS for Subscriber 1 on Sites B and C:

1 Configure a scheduler policy.
2 Create Subscriber 1.
3 Create the aggregation scheduler for Subscriber 1 on site A and assign ingress and egress scheduler policies to the aggregation scheduler.
4 Create IES, VLL, and VPLS for Subscriber 1.
    - Specify sites for the services.
    - Specify access interfaces for the sites.
    - Specify the aggregation scheduler policy for the access interfaces.
    - Bind the services to tunnels for transport through the IP/MPLS network.

Access interfaces 1/1/1:100, 1/1/1:101, 1/1/1:102, and 1/1/2:101 participate in the aggregation scheduler and are usually rate limited by the rate specified in the scheduler policy.

Access interface 1/1/2:333 does not participate in scheduler policy; rate limiting is specified by the queue values.

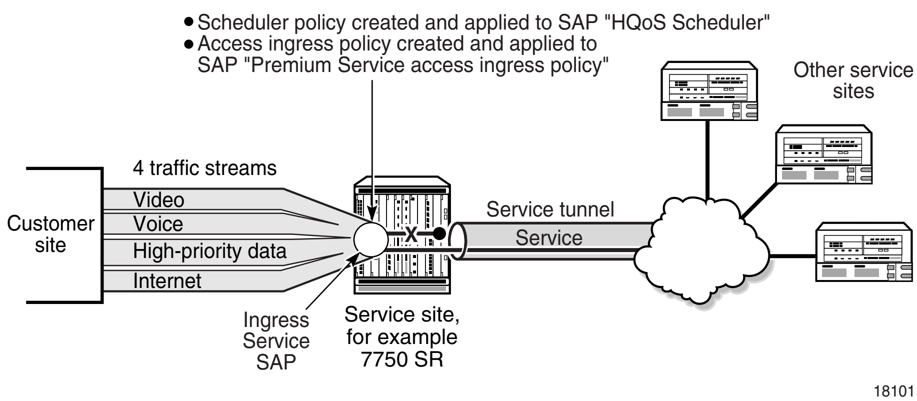
If one of the access interfaces does not participate in the scheduler aggregator, it may be managed by a separate scheduler policy.

64.5 Sample SAP QoS configuration

You can use 5620 SAM to configure and enforce traffic rate limiting, based on the priority of the traffic entering the ingress SAP of a service. This configuration limits bandwidth, to ensure that SLAs are met and higher priority traffic is processed first.

Figure 64-13 shows traffic of different priorities from a customer site to an ingress SAP.

Figure 64-13 Example showing ingress traffic to a service SAP



Based on the example, use the 5620 SAM client GUI to perform the following actions:

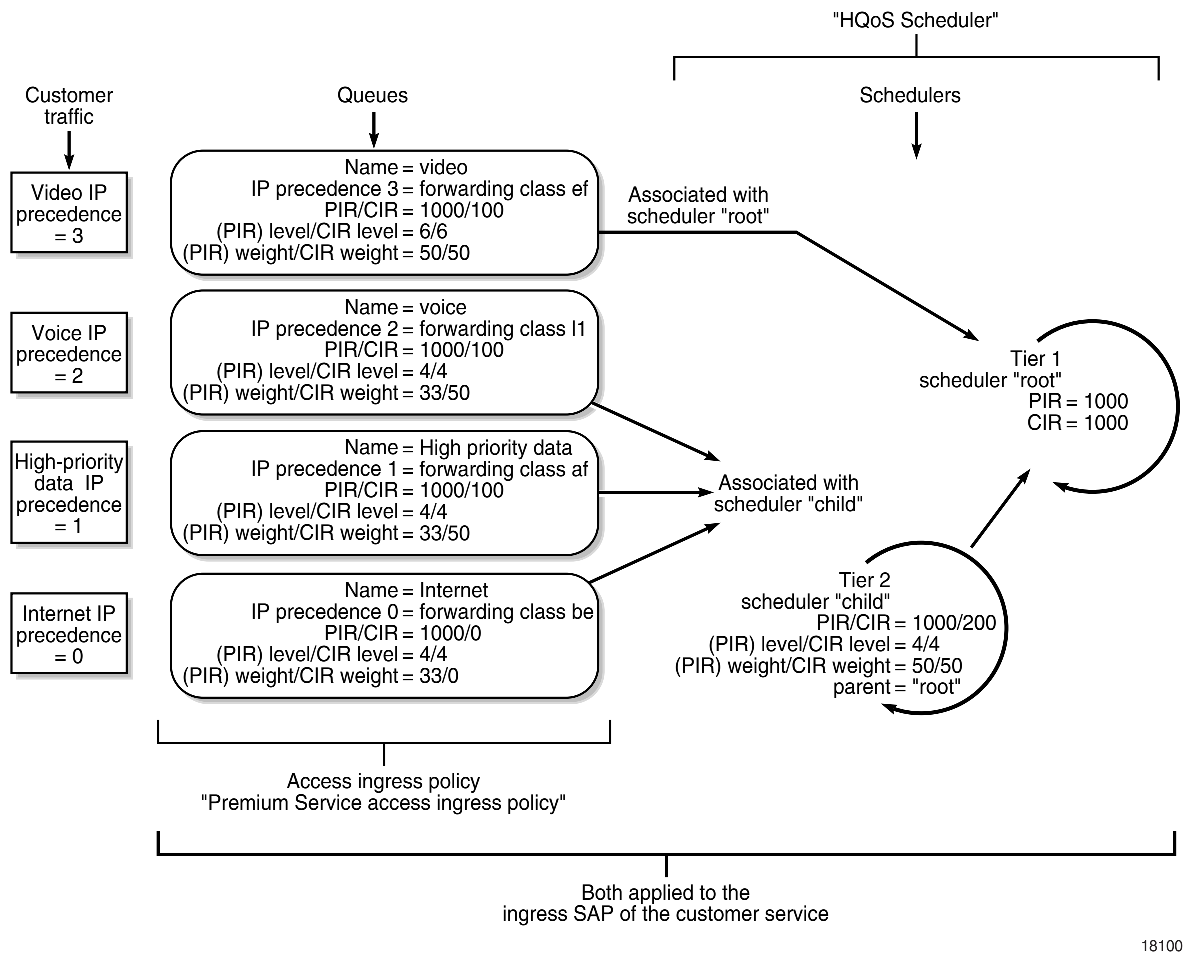
- Configure a parent scheduler that handles scheduling for a child scheduler.

  Note — You do not have to configure a parent tier 1 scheduler for a child tier 2 scheduler. You can create a tier 2 scheduler on its own, with no parent. This example is meant to show hierarchical QoS.

  - Add a root tier 1 scheduler
  - Add one child tier 2 scheduler with the root scheduler as a parent
- Create an access ingress policy named Premium service access ingress policy.
  - Create 4 queues within the access ingress policy, one for each type of traffic from the customer site.
  - Associate each queue with a forwarding class
  - Classify the incoming customer site traffic to a forwarding class. For this sample, IP precedence is used to classify traffic. You could classify traffic other ways, for example, based on filters for IP address or DSCP marking.
  - Associate each queue with the appropriate scheduler.
- Apply the schedulers and access ingress policy to the appropriate L2 or L3 interface for the customer service, for example, a VPLS L2 interface.

Figure 64-14 shows how traffic is handled based on the ingress access policy and scheduler queue handling applied to the ingress service SAP.

Figure 64-14 Traffic handling based on ingress access policy and scheduler queue



In this sample:

- higher-priority video traffic, with IP precedence bit 3 set, goes into queue 4 with a PIR of 1000 Kb/s and a CIR of 100 Kb/s. This traffic is handled by the tier 1 scheduler. The levels and weights associated with the video queue (forwarding class of ef, level of 6, PIR/CIR weights of 50/50) ensure this traffic gets all required bandwidth.
- all other traffic goes into its appropriate queues, based on the mapping of the IP precedence bit with the forwarding class.
- The voice, high-priority data, and Internet queues are serviced by the tier 2 scheduler.
- Because the voice and high-priority data queues have higher PIR/CIR weight than the Internet queue, when there is contention for bandwidth, the voice and high-priority data queues are processed first.

Preconfiguration

1 Before you begin, you must have:

- the service ingress SAP configured as access
- all necessary cabling and network routing protocol configurations complete to handle routing packets to and from the CPE equipment

Configuration

2 Choose Policies→QoS→SROS QoS→Scheduler→Scheduler from the 5620 SAM main menu. The manage scheduler policies form opens.

3 Click on the Create button. The scheduler policy create form opens.

4 Configure the parameters. Set the displayed name to High QoS.

5 Click on the Schedulers tab button.

6 Click on the Create button. The scheduler entry form opens.

7 Create a root, tier 1 scheduler entry,

i Configure the parameters.

- Displayed name to root
- tier to 1
- Summed CIR to false
- PIR (kbps) to 1000
- CIR (kbps) to 1000

ii Click on the OK button. The root scheduler appears in the list of scheduler entries.

8 Create a child, tier 2 scheduler entry.

i Click on the Create button.

ii Configure the parameters.

- Displayed name to child
- tier to 2
- Summed CIR to false
- PIR (kbps) to 1000
- CIR (kbps) to 200
- Parent scheduler to root, using the Select button to choose root from the list.
- Level (PIR level) to 4
- Weight (PIR weight) to 50
- CIR Level to 4
- CIR Weight to 50

iii Click on the OK button. The child scheduler appears in the list of scheduler entries.

9 Click on the Apply button.

10 Close the Scheduler form.

11 Choose Policies→QoS→SROS QoS→Access Ingress from the 5620 SAM main menu. The manage access ingress policies form opens.

12 Click on the Create button. The access ingress policy create form opens.

13 Configure the parameters. Set the displayed name to Premium service access ingress policy.

14 Click on the Queues tab button. Create four queues. For this sample, default queue 1 is modified, and three new queues are added. The default multicast queue 11 is unchanged.

15 Select queue 1 from the list.

i Click on the Properties button. The queue 1 edit form opens.

ii Configure the parameters.

- Displayed Name to Internet
- Scheduler to child by using the Select button and choosing child from the list
- Level (PIR level) to 4
- CIR Level to 4
- Weight (PIR weight) to 33
- CIR Weight to 0

iii Click on the CIR/PIR tab button.

iv Configure the parameters.

- Rate Type to kbps
- Policed to false
- deselect both MAX buttons
- Cir (kbps) to 0
- Pir (kbps) to 1000

v Click on the OK button.

16 Add queue 2.

i Click on the Create button. The queue create form opens.

ii Configure the parameters.

- ID to 2
- Displayed Name to High-priority traffic
- Scheduler to child by using the Select button and choosing child from the list
- Level (PIR level) to 4
- CIR Level to 4
- Weight (PIR weight) to 33
- CIR Weight to 50

iii Click on the CIR/PIR tab button.

iv Configure the parameters.

- Rate Type to kbps
- Policed to false
- deselect both MAX buttons
- Cir (kbps) to 100
- Pir (kbps) to 1000

v Click on the OK button. The queue is added to the list.

17 Add queue 3.

i Click on the Create button. The queue create form opens.

ii Configure the parameters.

- ID to 3
- Displayed Name to Voice
- Scheduler to child by using the Select button and choosing child from the list
- Level (PIR level) to 4
- CIR Level to 4
- Weight (PIR weight) to 33
- CIR Weight to 50

iii Click on the CIR/PIR tab button.

iv Configure the parameters.

- Rate Type to kbps
- Policed to false
- deselect both MAX buttons
- Cir (kbps) to 100
- Pir (kbps) to 1000

v Click on the OK button. The queue is added to the list.

18 Add queue 4.

i Click on the Create button. The queue create form opens.

ii Configure the parameters.

- ID to 4
- Displayed Name to Video
- Scheduler to root by using the Select button and choosing root from the list
- Level (PIR level) to 6
- CIR Level to 6
- Weight (PIR weight) to 50
- CIR Weight to 50

iii Click on the CIR/PIR tab button.

iv Configure the parameters.

- Rate Type to kbps
- Policed to false
- deselect both MAX buttons
- Cir (kbps) to 100
- Pir (kbps) to 1000

v Click on the OK button. The queue is added to the list.

19 Click on the Apply button to save the changes. Confirm the action.

20 Associate each queue with a forwarding class.

i Click on the Forwarding Classes tab button.

ii Click on the Create button. The forwarding class create form opens.

iii Configure the parameters.

- Forwarding class to be
- Queue ID to 1. This is the best-effort Internet traffic queue.

iv Click on the OK button. Confirm the action.

v Click on the Create button. The forwarding class create form opens.

vi Configure the parameters.

- Forwarding class to af
- Queue ID to 2. This is the high-priority data traffic queue.

vii Click on the OK button. Confirm the action.

viii Click on the Create button. The forwarding class create form opens.

ix Configure the parameters.

- Forwarding class to l1
- Queue ID to 3. This is the voice traffic queue.

x Click on the OK button. Confirm the action.

xi Click on the Create button. The forwarding class create form opens.

xii Configure the parameters.

- Forwarding class to ef
- Queue ID to 4. This is the highest priority, video traffic queue.

xiii Click on the OK button. Confirm the action.

21 Click on the Apply button. Confirm the action.

22 Associate the IP precedence bits of the incoming customer traffic with the forwarding class. The forwarding class is already associated with a queue. For this sample, IP precedence bits are used to associate different types of traffic with the forwarding class. You could classify traffic other ways, for example, based on filters for IP address or DSCP marking.

i Click on the Precedence tab button.

ii Click on the Create button. The precedence create form opens.

iii Configure the parameters to associate IP precedence 0 (Internet traffic from the customer site) with forwarding class be (the be forwarding class is associated with queue 1)

- Precedence is 0
- Forwarding Class is be

iv Click on the OK button. Confirm the action. The association between precedence 0 and the be forwarding class is added to the list.

v Click on the Create button. The precedence create form opens.

vi Configure the parameters to associate IP precedence 1 (high-priority data traffic from the customer site) with forwarding class af (the af forwarding class is associated with queue 2)

- Precedence is 1
- Forwarding Class is af

vii Click on the OK button. Confirm the action. The association between precedence 1 and the af forwarding class is added to the list.

viii Click on the Create button. The precedence create form opens.

ix Configure the parameters to associate IP precedence 2 (voice traffic from the customer site) with forwarding class l1 (the l1 forwarding class is associated with queue 2):

- Precedence is 2
- Forwarding Class is l1

x Click on the OK button. Confirm the action. The association between precedence 2 and the l1 forwarding class is added to the list.

xi Click on the Create button. The precedence create form opens.

xii Configure the parameters to associate IP precedence 3 (video traffic from the customer site) with forwarding class ef (the ef forwarding class is associated with queue 3)

- Precedence is 3
- Forwarding Class is ef

xiii Click on the OK button. Confirm the action. The association between precedence 3 and the ef forwarding class is added to the list.

23 Click on the Apply button. Confirm the action.

24 Click on the Relations tab button to view the associations between the IP precedence bit number, the forwarding class, and the queues.

25 Associate a service SAP with the created High QoS scheduler and the created Premium service access ingress policy. There are many ways to associate policies with L2 or L3 interfaces used as service SAPs, for example, from the service creation form or the port properties form. This sample modifies an existing L2 interface for an existing VPLS.

- **i** Choose Manage→Service→Services from the 5620 SAM main menu. The manage services form opens.
- **ii** Set the filters and click on the Search button. A list of filtered services appears.
- **iii** Select the service and click on the Properties button. The service form opens.
- **iv** Click on the L2 Access Interfaces tab button.
- **v** Choose an interface and click on the Properties button. The L2 interface edit form opens.
- **vi** Click on the QoS tab button.
- **vii** Configure the parameter. Use the Select button to set the Ingress Policy to Premium service access ingress policy. The policy ID and displayed name appear.
- **viii** Click on the Schedulers tab button.
- **ix** Configure the parameter. Use the Select button to set the Ingress Scheduler to High QoS. The displayed name appears.
- **x** Click on the Apply button to save the changes. Confirm the action.

64.6 Workflow to implement QoS on an OmniSwitch

1 Enable QoS on the OmniSwitch and configure global settings such as global port parameters, default disposition for flows, and timeouts. The parameters that you need to configure globally depend on the types of policies that you need to configure.

Typically, you do not need to change any of the global defaults. See step 36 of Procedure 31-54 for information.

2 Configure QoS port parameters, which includes setting QoS parameters on a per port basis. Typically you do not need to change the port defaults. See step 19 of Procedure 20-34 for information.

3 Configure QoS policies. See chapter 47 for more information.

64.7 Workflow to implement QoS on the 7750 SR, 7450 ESS, 7710 SR, and 7705 SAR

Planning and configuration

1 Perform network planning activities:

   i Determine the required types of services or applications; for example, voice, video, and data.

   ii Review SLAs.

   iii Perform traffic engineering activities at the IP/MPLS core level to ensure that resources are available.

2 Configure the IP and MAC ACL filters, as required. Refer to Procedures 48-1 and 48-3 for more information.

3 Configure the slope policies. Refer to Procedures 47-8 and 47-10 for more information.

4 Configure the scheduler policies. Scheduler policies can be shared between ingress and egress policies, depending on your specific requirements. Refer to Procedure 47-15 for more information.

5 Configure the port scheduler policies. Refer to Procedure 47-18 for more information.

6 As required, create the aggregation schedulers. Refer to Procedure 47-29 for more information.

7 Configure the access ingress policies. Refer to Procedure 47-1 for more information.

   i Configure the forwarding classes.

   ii Configure the queues.

   iii Map QoS markings on ingress packets to the forwarding classes.

   iv Map forwarding classes to the queue definitions.

   v Map queue definitions to the scheduler policies.

8 Configure the access egress policies. Refer to Procedure 47-3 for more information.

   i Configure the queues.

   ii Map forwarding classes to the queue definitions.

   iii Map queue definitions to the schedulers policies.

9 Configure the network policies. Refer to Procedure 47-6 for more information.

i Configure for ingress:

- Map QoS markings on ingress packets to the forwarding classes.
- Map forwarding classes to the queue definitions.

ii Configure for egress:

- As required, configure remarking.
- As required, map QoS markings to the forwarding classes.

10 Configure the network queue policies. Refer to Procedure 47-12 for more information.

11 Configure the time of day policies.

i Configure the time ranges. Refer to Procedure 50-1 for more information.

ii Create time of day suites. Refer to Procedure 50-2 for more information.

Application of policies and schedulers to equipment and interfaces

12 Associate the slope policies with ports or daughter cards. Refer to Procedures 20-1 and 19-24 for more information.

13 Associate the network queue policies with MDAs. Refer to Procedures 20-1 and 20-46 for more information.

Configuration of customers and services

14 Configure the customers. Refer to the appropriate service chapter for more information.

15 Create the customer services, and assign policies during the configuration. Refer to the appropriate service chapter for more information.

16 Assign the aggregation schedulers at the interface level, if required. Refer to the appropriate service chapter for more information.

64.8 5620 SAM QoS policies

Policies group and manage the various QoS elements used to determine how traffic is routed.

- access ingress policies
  Specify how QoS marking is interpreted, how customer traffic is mapped into queues, and how queues are classified.
- access egress policies
  Specify how customer traffic is mapped into queues, specify queue classification, queue parameters, and QoS marking.
- network policies
  Specify QoS marking to forwarding class mapping on ingress and QoS marking to forwarding class mapping on egress.

- network queue policies
  Specify CIR, PIR, and burst sizes for each queue. Forwarding class to queue mapping is not configurable.
- scheduler policies
  Specify custom settings and a hierarchical structure of virtual schedulers to replace the default hardware schedulers on the device.
- port scheduler policies
  Specify bandwidth allocation at the egress port level.
- HSMDA scheduler policies
  Specify schedulers to define egress port and ingress scheduler behavior on an HSMDA.
- slope policies
  Specify WRED settings to customize how in-profile and out-of-profile traffic is processed in hardware buffers, applied to daughter cards or ports.
- HSMDA slope policies
  Specify settings for controlling how the depth of HSMDA queues is managed.
- ATM QoS policies
  Specify ATM QoS settings to customize ATM traffic parameters including service category and shaping.

Figure 64-15 shows where QoS policies are applied at the service level.

Figure 64-15 Service-level view of policies

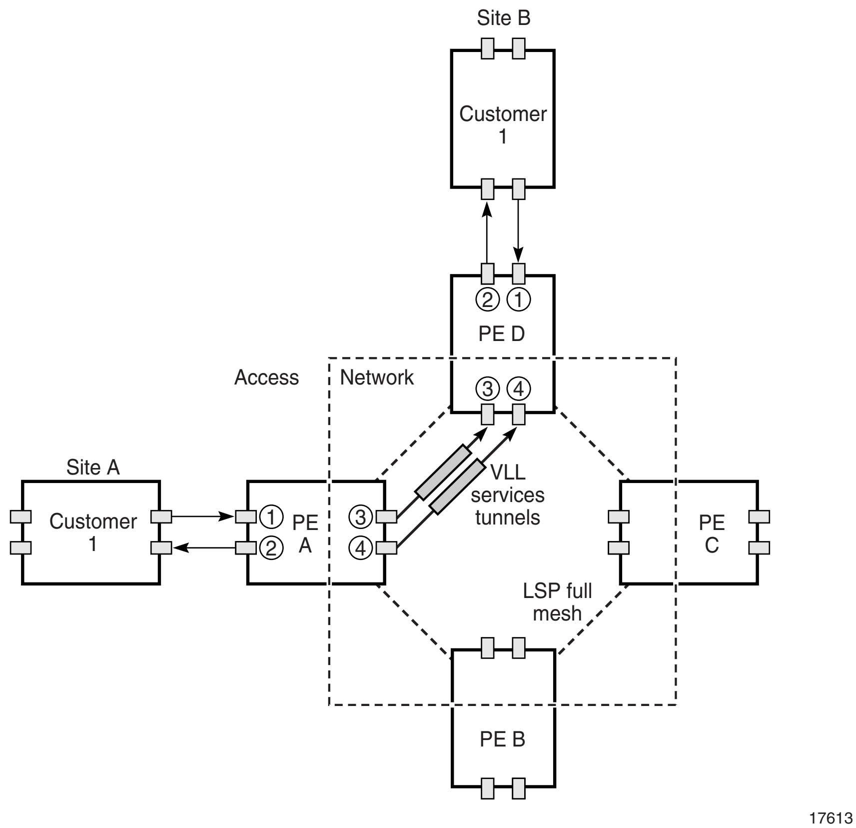


Figure 64-16 shows where policies are applied on a device with respect to access and network ingress and egress traffic.

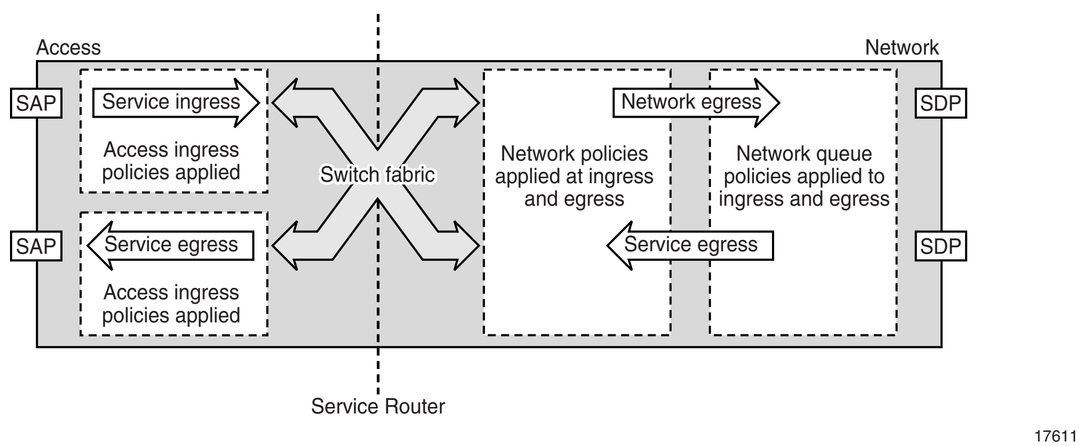
Figure 64-16 Types of traffic on a device and applied policies



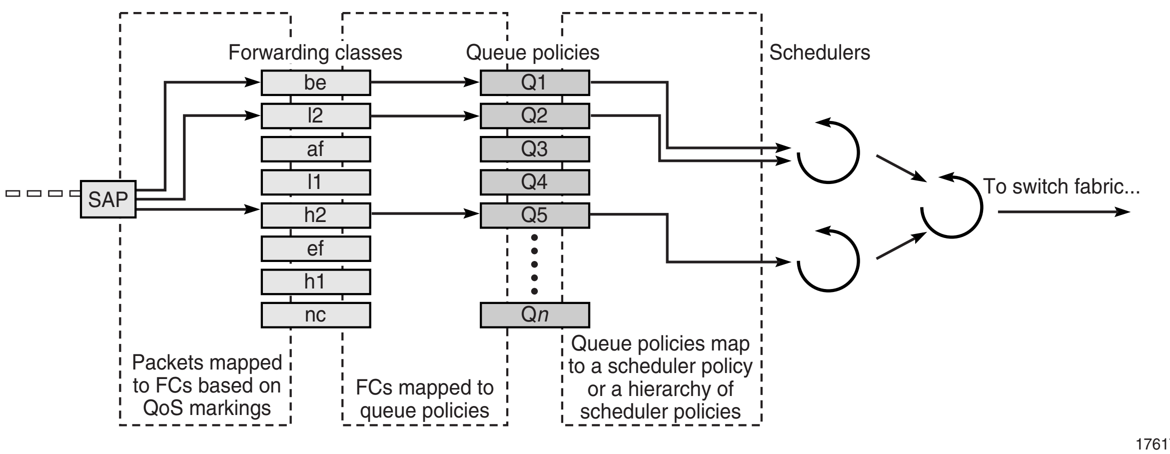
Access ingress policies

Access ingress policies are applied to access interfaces and specify QoS characteristics on ingress. Participation in access ingress policies is defined when access interfaces are configured or modified. Access ingress policies include:

- mapping of QoS marking, such as dot1p, DSCP, and precedence, and IP/MAC address information to forwarding classes
- forwarding class definitions and mapping to queues
- queue definitions and mapping to schedulers

Figure 64-17 shows the access ingress policy elements.

Figure 64-17 Access ingress policy elements



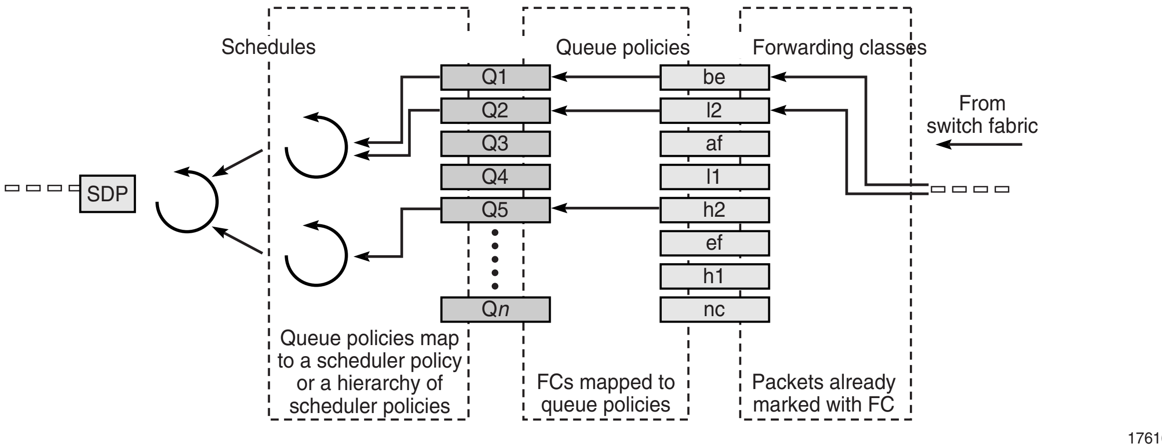
See "Access ingress policies" in section 47.1 for more information about access ingress policies.

Access egress policies

Access egress policies are applied to access egress interfaces and specify QoS characteristics on egress. Participation in Access egress policies is defined when access interfaces are configured or modified. Access egress policies include:

- forwarding class definitions and mapping to queues
- queue definitions and mapping to schedulers

Figure 64-18 Access egress policy elements



In Figure 64-18, packets are marked with an FC, either by:

- ingress policy if the packet was received on the same device
- in the tunnel transport encapsulation if received using a service tunnel

See "Access egress policies" in section 47.1 for more information.

Network policies

Network policies define egress QoS markings and ingress QoS interpretation for traffic on core network IP interfaces. A network policy defines:

- DSCP name mapping to forwarding classes
- LSP EXP value mappings to forwarding classes
- whether QoS remarking is enabled

Figure 64-19 shows the sequence of how the elements of network and network queue policies are applied at ingress.

Figure 64-19 Network and network queue policy elements on ingress

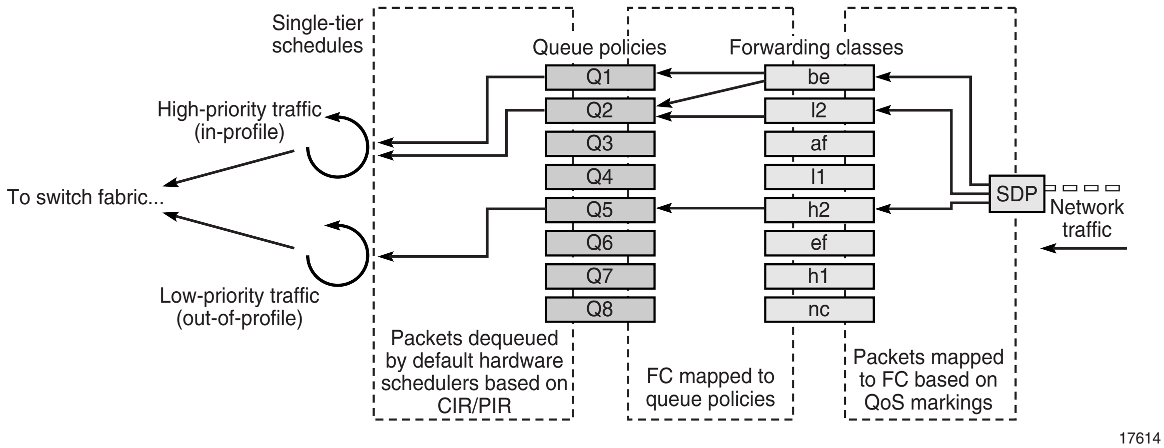


Figure 64-20 shows the sequence of how the elements of network and network queue policies are applied at egress.

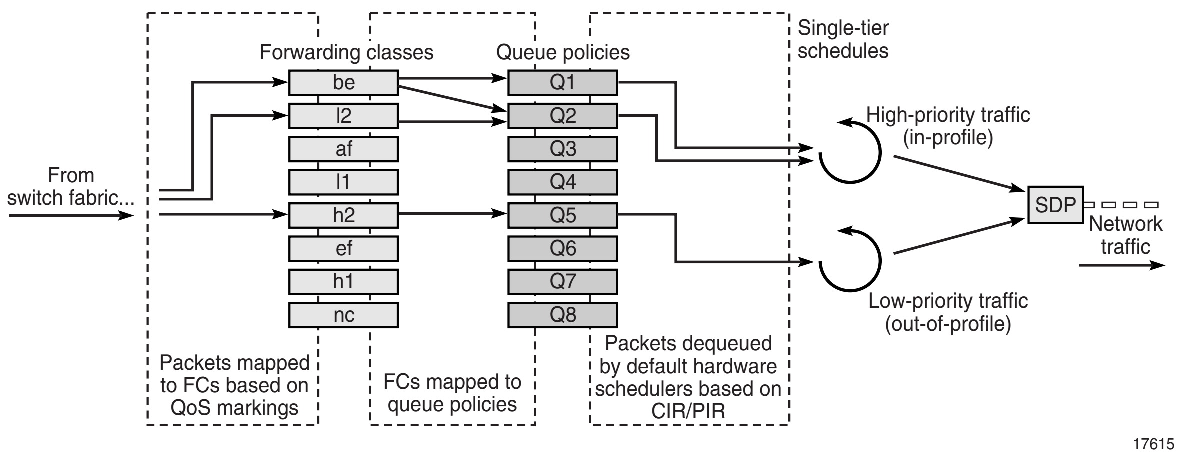
Figure 64-20 Network and network queue policy elements on egress



See “Network policies” in section 47.1 for more information.

Network queue policies

Network queue policies define the network forwarding class queue characteristics for core egress network ports and for ingress on MDAs.

See Figure 64-19 and Figure 64-20 for the sequence of how the different elements of network and network queue policies are applied on ingress in and on egress.

The queued packets are serviced by single-tier schedulers on the device and are forwarded to a single destination switch fabric port or a network interface.

See “Network queue policies” in section 47.1 for more information about network queue policies.

Scheduling

Scheduling defines the order and method for how packets which are enqueued in different queues, are dequeued. Ingress schedulers control the data transfer between the queues and the switch fabric. Egress schedulers control the data transfer between the egress queues and the switch fabric. Packets are not actually forwarded to schedulers, but are forwarded from the queues directly to ingress and egress interfaces. Participation in scheduler policies is defined when access interfaces are configured or modified. There are two types of scheduling:

- Single-tier scheduling is the hardware-based default method for scheduling queues on the device. There are no configurable parameters for single-tier schedulers. When a scheduler policy is not specified for an access interface, rate limiting is specified by the values specified in the queue and scheduling is performed by the default hardware scheduler on the device. Single-tier scheduling consists of a pair of scheduling priority loops in the 7750 SR and bases scheduling on the CIR and the PIR set in the queue policy. One loop is for scheduling high-priority (in-profile) traffic, and the other loop is for low-priority (out-of-profile) traffic.
- Virtual hierarchical (multi-tier) scheduling can provide more flexible scheduling for access ingress and egress interfaces, and determine how queues are scheduled. They are defined using a Scheduler policy, and can be configured to override default hardware scheduling. You can create up to three tiers of virtual schedulers.

  Aggregation schedulers are used to share a scheduler policy across a number of ports or daughter cards. This can be useful when a number of ports or cards are dedicated to the same customer. See “Scheduler policies” in section 47.1 for more information about configuring aggregation schedulers.

Port scheduler policies

Port scheduler policies define the bandwidth allocation based on the available bandwidth at the egress port level. A port scheduler policy manages a bandwidth allocation algorithm that represents a virtual multi-tier scheduling hierarchy.

The port scheduler allocates bandwidth to each service or subscriber that is associated with an egress port. Egress queues on the service may have a child association with a scheduler policy on the SAP or multi-service site. All queues must compete for bandwidth from an egress port. There are two methods of bandwidth allocation on the egress access port:

- **direct association of port scheduler on a SAP or multi-service site with service or subscriber queue**

  A service or subscriber queue is associated with a scheduler on the L2 access interface or multi-service site, and the service-level scheduler policy is associated with a port level scheduler.
- **direct association of port scheduler with service or subscriber queue**

  A service or subscriber queue is associated with a port scheduler. The port scheduler hierarchy allocates bandwidth at each priority level to each service or subscriber queue.

See “Port scheduler policies” in section 47.1 for more information about configuring port scheduler policies.

HSMDA scheduler policies

The port-based scheduler manages forwarding for each egress port on the HSDMA. Each port-based scheduler maintains up to eight forwarding levels. Eight scheduling classes contain each of the queues that are assigned to the port scheduler. Membership in a scheduler is defined by the queue identifier.

The port-based scheduler supports a port-based shaper that is used to create a sub-rate condition on the port. Each scheduling level can be configured with a shaping rate to limit the amount of bandwidth allowed for that level.

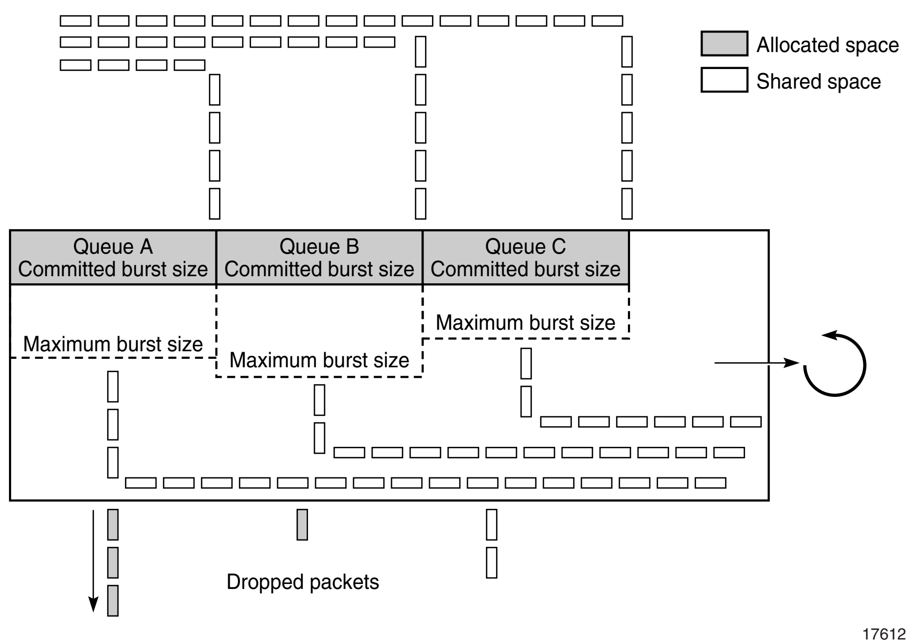
The port-based scheduler allows two weighted groups (group 1 and group 2) to be created. Each group can be populated with three consecutive scheduling classes.

See "HSMDA scheduler policies" in section 47.1 for more information about configuring slope policies.

Slope policies

Slope policies manage how shared buffers are utilized on the SR. When traffic is queued, the WRED slope parameters in the slope policy determine how the traffic is buffered for dequeuing, as shown in Figure 64-21.

Figure 64-21 Slope policy characteristics



All queues are in contention for shared buffer space when they exceed their CBS, and can use their MBS, when space is available in the shared buffer space. The WRED parameters determine whether a packet is discarded or not, and, as a result, determine whether the packet is dequeued. When the shared buffer space exceeds or approaches the maximum percentage defined by the WRED configuration, packets are discarded.

By using two independent slope policy configurations, one for in-profile traffic and one for out-of-profile traffic, you can configure in-profile traffic to receive preferential treatment over out-of-profile traffic.

See “Slope policies” in section 47.1 for more information about configuring slope policies.

HSMDA slope policies

HSMDA slope policies control the HSMDA queues. Each queue supports an index for an HSMDA slope policy table. Each policy in the table consists of two RED slopes (one high priority and another for low priority) to manage queue congestion. HSMDA RED slopes operate on the instantaneous depth of the queue.

A packet that attempts to enter a queue triggers a check to see whether the packet is allowed based on queue congestion conditions. The packet contains a congestion-priority flag that indicates whether the HSMDA is to use the high or low slope. The slope policy containing the slope is derived from the policy index in the queue configuration parameters on the HSMDA.

The RED slope discards are based on the current queue depth before a packet is allowed into the queue. Therefore, a queue may consume buffers that are greater than the configured MBS value based on the size of the packet. After the packet maximum is reached, packets that are associated with the queue are discarded. When the schedule removes packets from the queue, the queue depth decreases, which eventually lowers the depth of the threshold.

See “HSMDA slope policies” in section 47.1 for more information about configuring HSMDA slope policies.

65 — Queue groups

65.1 Queue group overview

Queue groups are objects created on access or network Ethernet port that allow SAP or IP interface forwarding classes to be redirected from standard queue mapping to a shared queue. Access ingress ports support a single queue group for each ingress port. Access egress and network egress ports support the creation of multiple queue groups.

Queue Group Template policies

Queue Group Template policies allow you to define the queuing and parenting structure for queue groups on Ethernet ports. The policy defines the number and types of queues within the port queue group, and provides the default queue parameters.

See "Queue Group Template policies" in section 47.1 for more information.

Port queue groups

The port queue group contains the queue groups that are created based on the queue IDs defined within the associated Ingress/Egress Queue Group Template policies. Port queue groups are supported on Ethernet ports and can be created on ports within a LAG. Port queue groups are not supported on HSMDA Ethernet ports and VSM MDAs. Network egress queue groups are not supported on the following IOM-1 cards:

- IOM-10 G
- IOM-20 G
- IOM-20 G-B

You can create a port queue group after creating an Ingress/Egress Queue Group Template policy.

Note — You must use the same name for the port queue group and Ingress/Egress Queue Group Template policy.

LAGs

When a port queue group is created on a LAG, the group is individually instantiated on each link in the LAG. The queue parameters for a queue within the queue group are used for each port queue.

You can create, modify, or delete a port access ingress, access egress, or network egress queue group on the primary port of the LAG. (The primary port is the port with the lowest port ID.) The NE automatically replicates the create, modify, or delete action for the queue group on all other ports within the LAG.

Note — The 5620 SAM does not allow you to create, modify, or delete an Access Ingress, Access Egress, or Network Egress queue groups on non-primary ports.

When you add a port to a LAG, the port must use the same access ingress, access egress, or network egress queue groups as the existing ports on the LAG. To ensure this requirement for the port, the 5620 SAM implements the following sequential comparison:

- number of queue groups
- queue group names
- number of queue overrides
- individual parameters

Note — Alcatel-Lucent recommends that you add all required ports to the LAGs before the configuration of the port queue group.

Access SAP forwarding class-based redirection

Typically, each SAP has dedicated ingress and egress queues that are only used by that specific SAP. Individual SAP queuing requires a more complex provisioning model to configure the ingress and egress SLAs of the SAP. The configuration requires service awareness at the aggregation locations in the network. There are cases where individual SAP queuing is not preferred. In these cases, you can use a shared queue or an individual port queue model. You can configure a shared queue by creating access ingress and access egress queue groups, and mapping the forwarding classes of the SAP to the queues within the queue group.

You can configure forwarding class redirection on a SAP to a queue group queue ID using the access ingress/egress QoS policy. In each policy, the forwarding class to queue ID mapping can specify a queue group name.

See section 65.2 for more information.

Network IP interface forwarding class-based redirection

You can create queue groups on egress network ports to provide network IP interface queue redirection. A single set of egress port-based forwarding class queues are available by default, and all IP interfaces on the port share the queues. The creation of a network queue group allows one or more IP interfaces to selectively redirect forwarding classes to the group to override the default behavior.

The redirection of the egress forwarding class on an IP interface to an egress queue group queue ID is provisioned using the Network policy. The actual queue group name can be specified when the Network Policy is applied to the IP interfaces.

You can configure dedicated queues for each IP interface using network egress queue groups.

See section 65.3 for more information.

Queue group statistics

The packets sent to the queue of a SAP are statistically tracked by a set of counters associated with the queue group queue, not the SAP counters. The tracking occurs when a forwarding class is redirected to an ingress or egress port queue group queue.

On a network interface, the counter sets are created for each egress IP interface, not for each egress queue. The same counter set is used when a forwarding class for an egress IP interface is redirected from the default egress port queue to a queue group queue.

See the *5620 SAM Statistics Management Guide* for information about managing statistics collection and to view a list of the MIB counters that are available for collection using the 5620 SAM.

Configuration validation rules

Table 65-1 describes the validation rules that are enforced for NE queue group configurations.

Table 65-1 Validation requirements for queue group configurations

Component		Validation action
Ingress Queue Group Template policy	Queue deletion	The deletion is blocked if there is an Access Ingress QoS policy with a forwarding class that is associated with the queue ID. The deletion can be blocked by the 5620 SAM or the NE. You can use the name binding list to verify dependencies.
	Policy deletion	The deletion is blocked if there is an Access Ingress QoS policy with a forwarding class that is associated with the policy.
Egress Queue Group Template policy	Queue deletion	The deletion is blocked if there is an Access Egress QoS policy with a forwarding class that is associated with the queue ID. The deletion can be blocked by the 5620 SAM or the NE. You can use the name binding list to verify dependencies.
		The deletion is blocked if there is a Network policy with a forwarding class that is associated with the queue ID.
	Policy deletion	The deletion is blocked if there is an Access Egress QoS policy with a forwarding class that is associated with the policy.
		The deletion is blocked if there is a network IP interface associated with the policy.
Port queue groups	Port Access Ingress Queue Group deletion	The deletion is blocked if there is an Access Ingress QoS policy, applied to the SAP, with a forwarding class that is associated with the port queue group. The SAP is directly or indirectly bound to the port by a LAG associated with the port queue group.
	Port Access Egress Queue Group	The deletion is blocked if there is an Access Egress QoS policy, applied to the SAP, with a forwarding class that is associated with the port queue group. The SAP is directly or indirectly bound to the port by a LAG associated with the port queue group.
	Network Egress Queue Group	The deletion is blocked if there is a network IP interface that is directly or indirectly bound to the port by a LAG associated with the port queue group.

(1 of 2)

Component		Validation action
Access SAP forwarding class-based redirection	Access Ingress QoS policy	The Queue Group name must exist as an Ingress Queue Group Templates policy.
		The Queue ID must exist within the associated Ingress Queue Group Templates policy with appropriate queue type.
		Only one unique Queue Group may be referenced within one Access Ingress QoS policy.
		The current Access Ingress QoS policy should not be applied to the SAPs on a non-Ethernet port or an Ethernet port where the specified Access Ingress Queue Group does not exist.
		The current Access Ingress QoS policy should not be applied to a SLA Profile policy.
	Access Egress QoS policy	The Queue Group name must exist as an Egress Queue Group Templates policy.
		The Queue ID must exist within the associated Egress Queue Group Templates policy.
		The current Access Egress QoS policy should not be applied to the SAPs on a non-Ethernet port or an Ethernet port where the specified Access Egress Queue Group does not exist.
		The current Access Egress QoS policy should not be applied to a SLA Profile policy.
	Access Ingress/Egress QoS policy assignment	When an Access Ingress/Egress QoS policy with a forwarding class redirection to a Queue Group Queue ID is applied to a SAP, the following configurations are verified: • The Queue Group specified in any forwarding class redirection must exist as an Access Ingress/Egress Queue Group on the port associated with the SAP • The Access Ingress/Egress QoS policy with Queue Group specified cannot be applied to SLA Profile policy
Network IP Interface forwarding class-based redirection	Network policy	The specified queue ID must exist within the Egress Queue Group Templates policy for all IP interfaces where the Network policy is applied. If the Network policy is currently applied to any IP interfaces without an explicit Network Egress Queue Group specified, the configuration fails.
		The following configurations are verified when the Network policy is applied to a network IP interface: • The network policy with a redirected queue group cannot be applied to the network IP interface without a port binding. • The redirected queue group name must exist as a Network Egress Queue Group on the port or LAG associated with the IP interface. • The queue ID for the redirected queue group in the associated Network policy must exist within the associated Egress Queue Group Templates policy.

(2 of 2)

65.2 Workflow to configure access SAP forwarding class-based redirection

The following workflow describes the steps required to configure access SAP forwarding class-based redirection.

1 Create a global ingress/egress queue group template policy.

   a Create an ingress queue group template policy. See Procedure 47-22 for more information.

   b Create an egress queue group template policy. See Procedure 47-23 for more information.

2 Distribute the global ingress/egress queue group template policy to the NEs. See Procedure 46-1 for more information.

3 Create an ingress/egress queue group on the Ethernet access port. See Procedure 20-1 for more information.

4 Create or configure a global access ingress/egress QoS policy with the forwarding class mapped to the queue group queue ID. The queue group queue ID must be included in the queue group template policy. Perform the following, as required:

   a Create an access ingress QoS policy. See Procedure 47-1 for more information.

   b Create an access egress QoS policy. See Procedure 47-3 for more information.

5 Distribute the global access ingress/egress QoS policy to the NEs. See Procedure 46-1 for more information.

6 On the SAP configuration form, assign the access ingress/egress QoS policy to the SAP bound to the port on which the access ingress/egress queue group was created in step 3. Perform one of the following, as required:

   a Assign an access ingress/egress QoS policy to an L2 access interface on a VLL. See Procedure 70-13 for more information.

   b Assign an access ingress/egress QoS policy to an L2 access interface on a VPLS. See Procedures 71-3, 71-13, and 71-14 for more information.

   c Assign an access ingress/egress QoS policy to an L2 access interface on an IES. See Procedure 73-8 for more information.

   d Assign an access ingress/egress QoS policy to an L2 access interface on a VPRN. See Procedure 74-13 for more information.

   e Assign an access ingress/egress QoS policy to an L3 access interface on an IES. See Procedure 73-1 for more information.

   f Assign an access ingress/egress QoS policy to an L3 access interface on a VPRN. See Procedure 74-2 for more information.

65.3 Workflow to configure network IP interface forwarding class-based redirection

The following workflow describes the steps required to configure a network IP interface forwarding class-based redirection.

1. Create a new global egress queue group template policy. See Procedure 47-23 for more information.

2. Distribute the global egress queue group template policy to the NEs. See Procedure 46-1 for more information.

3. Create an egress queue group on the Ethernet network port. See Procedure 20-1 for more information.

4. Create or configure a global network policy with the forwarding class mapped to the queue group queue ID. The queue group queue ID must be included in the egress queue group template policy, which is specified when the network policy is applied to the IP interface. See Procedure 47-6 for more information.

5. Distribute the global network policy to the NEs. See Procedure 46-1 for more information.

6. On the network interface configuration form, assign the network policy and the queue group template policy to the network interface. The network egress queue group must be created on the port to which the network interface is bound. The network egress queue group must use the same name as the selected queue group template policy. See Procedure 30-7 for more information.

65.4 Workflow to configure statistics collection for queue groups

The following workflow describes the steps required to enable the collection of queue groups statistics.

1. Create or modify an accounting policy. See Procedure 4-2 for more information on creating an accounting policy.

2. Configure the Type parameter on the Accounting Policy form to collect one of the following statistics options:

   - Combined Queue Group
   - Queue Group Octets
   - Queue Group Packets

   See Procedure 4-2 for more information on specifying the type and frequency of accounting statistics collection.

3. Enable the Collect Accounting Statistics parameter on the port's queue group Physical Port (Edit) form. See Procedure 20-1 for more information on adding an access ingress/egress queue group on an Ethernet access port.

66 — Virtual ports

66.1 Virtual port overview

A 7750 can act as a Broadband Network Gateway (BNG), fairly distributing bandwidth among the subscriber host sessions by accounting for the packet encapsulation overhead and ATM bandwidth expansion for each type of broadband session. In this way, subscriber packets are less likely to be dropped downstream in the DSLAM DSL port. Furthermore, the BNG shapes the aggregate rate of each subscriber and the aggregate rate of all subscribers destined to a given DSLAM to prevent congestion of the DSLAM.

In the BNG application, when a set of per FC queues are applied to each subscriber host context, the host per FC queue packet rate is overridden by the rate provided in the Radius access-accept message. This rate represents the ATM rate that will be seen on the last mile and includes the encapsulation offset and the per packet expansion due to ATM segmentation into cells at the BSAN.

In order to enforce the aggregate rate of each destination BSAN, a virtual port must be configured. Virtual ports are scheduling nodes that operate like port schedulers, with the exception that multiple virtual ports can be created on the egress context of an acess/hybrid Ethernet port. A virtual port and a port scheduler cannot exist simulatenously on a single port.

Virtual ports can be created on a port that is a member of a LAG. When a virtual port is created, modified, or deleted on the primary port of a LAG, this action is replicated on all other ports within the LAG. These actions can only be perfoemd on the primary port. When a port is added to a LAG, it must have the same virtual ports defined as the existing ports on the LAG. The name of a virtual port is local to the port on which it is applied, but must be the same for all member ports of a LAG.

Virtual ports are supported on Ethernet ports on IOM3/IMM in 7750, 7750 sparrow, and 7450.

Virtual ports are not supported on SR1 or ESS1 platforms, HSMDA Ethernet ports, or VSM MDA.

Virtual port statistics can be collected and displayed for all queues forwarding to a virtual port configured on an egress of an Ethernet port. This is only supported on an 7750 SR or 7740 SR equipped with a 2 x XP MDA IOM-3. The collected data is available on the Statistics tab of the Egress Scheduling Virtual Port properties form.

SLA Profiles

A subscriber host queue with the port-parent option enabled can be scheduled within the context of a port scheduler policy associated with a port or a virtual port. To specify that a subscriber host queue with the port-parent option enabled be scheduled within the context of a virtual port, the Scheduler Type parameter must be set to Virtual port when configuring an SLA Profile.

See Procedure 68-13 for more information.

Subcriber Profiles

The subscriber aggregate rate is adjusted to account for the fixed offset and per packet variable expansion of the last mile for the specific session used by the subscriber host. The adjustment is based on the average frame size.

See Procedure 68-14 for more information.

66.2 Virtual ports procedures

The following procedures describe how to configure and manage virtual ports.

Procedure 66-1 To configure virtual ports

1 Configure an SLA Profile, as described in Procedure 68-13.

2 Configure a Subscriber Profile, as described in Procedure 68-14.

3 Perform one of the following:

   a Create a virtual port using the navigation tree, as described in Procedure 66-2.

   b Create a virtual port using the Port QoS form, as decribed in Procedure 66-3.

Procedure 66-2 To create virtual ports using the navigation tree

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create virtual ports and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on an access/hybrid Ethernet port. The Port form opens with the General tab displayed.

5 Click on the Egress Scheduling Virtual Port tab button.

6 Click on the Create button. The Egress Scheduling Virtual Port (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Name
- Description
- Aggregate Rate Limit (kbps)

8 Click on the Select button in the Port Scheduler Policy panel to choose a Port Scheduler Policy. The Select Port Scheduler Policy form opens.

Note — You cannot select a port scheduler policy for the virtual port if you've already selected a port scheduler policy for the associated channel. Likewise, selecting a port scheduler policy for the virtual port will prevent you from selecting a port scheduler policy for the associated channel.

9 Select a Port Scheduler Policy and click on the OK button. The Select Port Scheduler Policy form closes and the Egress Scheduling Virtual Port (Create) form reappears with the Port Scheduler Policy information displayed.

10 Click on the Host Matching tab button.

11 Click on the Create button. The Host Matching form opens.

12 Configure the Destination String parameter.

13 Click on the OK button. A confirmation dialog box appears.

14 Click on the OK button. The Egress Scheduling Virtual Port (Create) form reappears with the Destination String information displayed.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Port form reappears with the Egress Scheduling Virtual Port information displayed.

17 Click on the OK button. A confirmation dialog box appears.

18 Click on the Yes button. The Port form closes.

Procedure 66-3 To create virtual ports using the Port QoS form

1 Choose Manage→Equipment→Port QoS from the 5620 SAM main menu. The Manage Port QoS list form opens.

2 Select Egress Scheduling Virtual Port from the object type drop-down list.

3 Click on the Create button and choose Virtual Port(s). The Egress Scheduling Virtual Port (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Description

5 Click on the Select button in the Port Scheduler Policy panel to choose a Port Scheduler Policy. The Select Port Scheduler Policy form opens.

6 Select a Port Scheduler Policy and click on the OK button. The Select Port Scheduler Policy form closes and the Egress Scheduling Virtual Port (Create) form reappears with the Port Scheduler Policy information displayed.

7 Click on the Host Matching tab button.

8 Click on the Create button. The Host Matching form opens.

9 Configure the Destination String parameter.

10 Click on the OK button. A confirmation dialog box appears. Click on OK.

11 Click on the Targeted Physical Ports tab button.

12 Click on the Add button. The Select Site form opens.

13 Click on the Search button. The form displays a list of sites.

Note — The count displayed on the form reflects the total number of found ports and may not align with the number of applicable ports displayed in the list.

14 Select a site in the list and click on the OK button. The Select Site form closes and the Egress Sheduling Virtual Port (Create) form reappears with the site information displayed.

15 Click on the OK button. The Egress Scheduling Virtual Port (Create) form closes and the Port QoS list form reappears.

16 Close the form.

Procedure 66-4 To copy virtual ports

1 Choose Manage→Equipment→Port QoS from the 5620 SAM main menu. The Port QoS list form opens.

2 Select Egress Scheduling Virtual Port from the object type drop-down list.

3 Click on the Search button. The form displays a list of virtual ports.

4 Select a virtual port in the list and click on the Copy... button. The Egress Scheduling Virtual Port (create) form opens with the virtual port's values populated.

5 Click on the Targeted Physical Ports tab button.

6 Click on the Add... button. The Select Site form opens.

7 Click on the Search button. The form displays a list of sites.

8 Select one or more sites in the list and click on the OK button. The Select Site form closes and the Egress Sheduling Virtual Port (create) form reappears with the site information displayed.

9 Click on the OK button. The Egress Scheduling Virtual Port (create) form closes and the Port QoS list form reappears.

10 Close the form.

67 — Customer configuration and service management

67.1 Customer configuration and service management overview

The 5620 SAM allows you to create and manage customers and the services they subscribe to.

An end user is the recipient of application content that is delivered through a service. The service is a means of transport for the application content and is owned by a service customer. For example, an end user subscribes to a high-speed Internet access service, and the Internet access service is owned by a service provider who is a service customer of the network provider. The 5620 SAM provides only customer management, not end-user management. Customers were called subscribers in earlier versions of 5620 SAM.

On the General tab of a customer management form, you can configure basic customer information. From the other tabs on the form, you can configure and monitor 5670 RAM thresholds, services, service sites, templates, and aggregation schedulers for a customer.

Each customer is associated with an ID that is assigned when the customer account is created. When configuring a service, you can use the ID or the listed name of the customer to associate a customer with a service.

A customer can own more than one service, but an individual service is owned by only one customer. Two or more services can be joined to form a composite service. The individual services that comprise the composite service can be owned by different customers. Customers that own services participating in a composite service are associated with the composite service.

Managing the size of a service associated with a customer

A customer service can become very large over time if new sites are continually added. As a result, a service containing thousands of sites or instances may become cumbersome to manage. The 5620 SAM allows you to easily move sites from one service to another in order to reduce the overall size of a particular service.

Sites can be moved for the following service types supported in 5620 SAM: VPRN, VPLS, MVPLS, IES, and all VLL types. However, the following restrictions apply:

- You can only move a site between like services, that is, from one VPLS to another VPLS, but not between a VPLS and a VPRN, for instance.
- The services that you are moving sites to and from must have the same Service ID.
- The services that you are moving sites to and from must have the same Customer ID.

If you need to reduce the size of an existing service, you can use another existing service that meets these restrictions. Alternatively, you can create a new service of the same type for this purpose. The Service ID and Customer ID of the new service must match those of the existing service.

In addition, if the existing service which you are moving sites from is a member of a composite service, then the newly-created service you are moving the sites to will also belong to the same composite service. This action will only take place after moving the sites that form the composite service connectors.

67.2 Workflow to create and manage customers and the services they subscribe to

1 Create customers that will purchase and use services. See Procedure 67-1.

- Configure or modify key customer contact and billing information.
- Assign or associate equipment or resources to customers, as appropriate.

2 As required, configure the system preferences of the services that are associated with customers. See Procedure 67-2.

3 Create, modify, or delete existing services (such as IES, VPLS, VPRN, or VLL) that are associated with customers. See the relevant service chapter in this guide.

4 Monitor or troubleshoot customers, based on SLAs between the customer and the service provider.

- Retrieve customer information and contact the customer when service problems or maintenance windows occur. See Procedure 67-3.
- View a service map for a customer. See Procedure 67-4.
- Perform diagnostics as appropriate to troubleshoot service problems associated with customers. See the relevant service chapter in this guide.
- As required, view and modify the inventory of all the services, interfaces, circuits, and other information that are associated with a customer. See Procedure 67-5.
- If required, reduce the service size associated with a customer by moving sites from one service to another. See Procedure 67-6.

5 As required, delete a customer from the 5620 SAM database. See Procedure 67-7.

67.3 Customer configuration and service management procedures

The following procedures describe how to configure and manage customers and the various aspects of their services. Detailed procedures on specific service type creation and modification are provided in the relevant service chapters.

Procedure 67-1 To create a customer

1 Choose Manage→Service→Customers from the 5620 SAM main menu.

2 Click on the Create button. The Customer (Create) form opens with the General tab displayed. The General tab shows contact and billing information.

3 Configure the parameters.

- Auto-Assign ID
- ID
- Name
- Description
- Address
- Phone Number
- Contact
- Email

The information in the General tab is used to create a database of customer information, including contact information, so that the customer can be contacted if there is a service or equipment problem.

4 As appropriate, configure any other tabs on the Customer (Create) form. See step 5 in Procedure 67-5.

5 Click on the Apply button to save the customer information.

Procedure 67-2 To configure the system preferences of services associated with a customer

Perform this procedure to configure the system preferences for customer services.

Caution — Changing a System Preference parameter value may affect one or more existing 5620 SAM services. Do not change a parameter value from the default without contacting Alcatel-Lucent technical support.

Note — The System Preferences parameters are configurable only by a user with administration privileges.

1 Choose Administration→System Preferences from the 5620 SAM main menu. The System Preferences form opens with the Services tab displayed.

2 Configure the parameters:

- Auto Discover Composite Services
- Maximum number of sites that can be moved
- Default Service Priority
- Suppress VPRN SNMP Community String Warning
- Remove Empty Service
- Multi-Segment Tunnel Selection
- CAC (Native Ethernet PBB)
- Alarm Aggregation to Composite Service
- Whenever a site is added to a service in SAM, propagate the Service Name to Site Name

3 Click on the OK button. The System Preferences form closes.

Procedure 67-3 To list the services associated with a customer

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens with Service (Service Management) selected in the filter list.
2. Use the filter for the Customer Name column to filter the list results.
3. Click on the Search button. A list of services matching the filter criterion appears.

Procedure 67-4 To view a service map for a customer

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Choose Service (Service Management) from the object drop-down list.
3. Use the filter for the Customer Name column to filter the list results.
4. Click on the Search button. A list of services matching the filter criterion appears.
5. Choose a service from the list and click on the Topology View button. A dialog box appears.
6. Click on the Yes button. The Service Topology - *Service Name* form opens.
7. Scroll the map to view the topology of the service and the devices used for the service.
8. Click on the Close button to close the map.

Procedure 67-5 To modify and manage customer information

Use this procedure to view and modify the inventory of all the services, interfaces, circuits, and other information that are associated with a customer.

1. Choose Manage→Service→Customers from the 5620 SAM main menu. The Manage Customers form opens.
2. Click on the Search button to search for the customer whose information you want to change. The search results are displayed in the bottom panel of the form.
3. Choose the customer and click on the Properties button. The Customer (Edit) form opens.
4. View or modify the information for the customer.

Each tab lists parameters you can view or modify, or functions that you can perform, related to customer management.

- The General tab lists the ID, the customer name, and contact information.
- The 5670 RAM Parameters lists the Apdex and MOS thresholds that can be set by the customer. See step 5b for more information.
- The Services tab lists which services such as VPLS, VPRN, or VLL are associated with the customer.
- The Sites tab lists the PE devices used by the customer.
- The Aggregation tab lists aggregation schedulers defined for the customer. See chapter 47 for information about creating aggregation schedulers.
- The Associated Templates tab lists service templates used to create services for the customer.
- The Spans tab lists the span of control over customers.

5 Modify customer information as appropriate:

a To modify text in the General tab:

i Make the changes in the appropriate fields and click on the OK button. A dialog box appears.

ii Click on the Yes button. The Customer (Edit) form closes.

b Configure the 5670 RAM parameters as listed below:

- Reporting Name
- Apdex scores below this threshold are unacceptable quality
- Apdex scores below this threshold are poor quality
- Apdex scores below this threshold are fair quality
- Apdex scores below this threshold are good quality
- MOS scores below this threshold are bad quality
- MOS scores below this threshold are poor quality
- MOS scores below this threshold are fair quality
- MOS scores below this threshold are good quality

c To modify site or template information for the customer:

i Click on the appropriate tab button on the Customer (Edit) form.

ii Select the object in the list for which you want to modify information.

iii Click on the Properties button. The configuration form for the object opens.

Caution — Ensure configuration changes do not affect customer services. Use the Turn Down button to turn down a service before making any changes that may affect customer traffic.

iv Modify the information on the configuration form as required and click on the OK button. The changes are saved and the object configuration form closes.

Procedure 67-6 To perform a service size reduction associated with a customer

Perform the following procedure to move sites between services:

1 If you plan to move more than 25 sites at a time then go to step 2. Otherwise, go to step 5.

2 Choose Administration→System Preferences from the 5620 SAM main menu. The System Preferences form opens.

3 Configure the Auto Discover Composite Services parameter. The maximum number of sites you can move at a time is 50.

Note — The Auto Discover Composite Services parameter can only be modified by a user with administration privileges.

4 Click OK. The System Preferences form closes.

5 If you are planning to move sites between two existing services then go to step 8. If you need to create a new service to move sites to then go to step 6.

6 Refer to the relevant service creation chapters in this guide to create the new type of service that you need. This new service must exist before you can move sites from an existing service.

When creating the new service, observe the following requirements:

- The new service must be of the same type as the existing service
- The Auto-Assign ID functionality for the Service ID must not be enabled. The Service ID must be manually entered, and it must match the Service ID for the existing service
- The Customer ID of the new service must match that of the existing service
- You do not need to create any sites for the new service

7 Return to step 8 in this procedure once you have created the new service.

8 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

9 Choose Service (Service Management) from the object drop-down list.

10 Click the Search button. A list of available services is displayed.

11 Select the service that you want to move sites from and click the Properties button. The service configuration form appears.

12 Perform one of the following:

- a On the service navigation tree:
  - i Click on the plus sign (+) next to the Sites icon to show the sites in the service.
  - ii Right-click on the site(s) you want to move to another service and choose Move to Another Service from the contextual menu. A message appears.
  - iii Click Yes to continue. The Select Services form appears and displays a list of applicable services to which you can move the selected site(s).
- b On the service configuration form:
  - i Click on the Sites tab button to show the sites in the service.
  - ii Select the site(s) you want to move to another service and click on the Move to Another Service button. A message appears.
  - iii Click Yes to continue. The Select Services form appears and displays a list of applicable services to which you can move the selected site(s).

13 Select the required service and click the OK button. A progress message is displayed, followed by a confirmation message, once the move is complete.

14 Click the OK button.

15 Close the service configuration form.

Procedure 67-7 To delete customers

Note — You cannot delete customers that have associated services.

1 Choose Manage→Service→Customers from the 5620 SAM main menu. The Manage Customers form opens.

2 Search for the customer that you want to delete. The search results are displayed in the bottom panel of the form.

3 Choose the customer from the list and click on the Delete button. A Confirm dialog box appears.

Caution — Removing a customer deletes all information associated with the customer. Ensure that the correct customer has been selected.

4 Perform one of the following:

a Click on the No button to avoid deleting the customer. The Confirm dialog box closes.

b Click on the Yes button. The customer is deleted from the 5620 SAM database.

68 — Residential subscriber management

68.1 Residential subscriber management overview

The emergence of residential broadband networks and the availability of multiple service offerings, such as triple play applications create a requirement for greater service differentiation and control at the level of the individual service recipient. The 5620 SAM provides functionality for the efficient provisioning of access, QoS, and security features on IES, VPLS, and VPRN for residential subscribers, while service-level customization for end users is available using systems such as the Alcatel-Lucent 5750 SSC.

In the context of the 5620 SAM, a residential subscriber, sometimes called a subscriber, is a unique identifier that associates a group of end-user devices with policies. A subscriber can be associated with multiple SAPs on multiple NEs, and a customer can be associated with multiple subscribers.

A subscriber host, sometimes called a host, is an end-user device, such as a computer, VoIP telephone, or set-top box, that connects to the provider network and receives the service traffic. Hosts with the same subscriber identifier share overall HQoS and accounting characteristics as defined in a customer SLA, but may use QoS policies and queues that differ by the type and class of service offering.

Residential subscriber management supports service delivery models in a routed or bridged configuration, such as one VLAN per host, one VLAN per application, one VLAN for all applications, and one VLAN per service provider per application.

Residential subscriber configuration

The 5620 SAM supports the creation and configuration of residential subscriber management components using configuration forms. Configuring residential subscriber management on the 5620 SAM involves the creation and configuration of the following components, depending on the service delivery model:

- subscriber identification policies
- subscriber profiles
- SLA profiles
- subscriber explicit map entries
- ANCP policies
- PPPoE policies
- MSAP policies
- host tracking policies
- category map policies
- credit control policies
- IGMP policies
- BGP peering policies
- diameter policies
- subscriber multicast CAC policies

For detailed NE-specific residential subscriber management information, see the *7450 ESS OS Triple Play Guide* and the *7750 SR OS Triple Play Guide*.

A host requires subscriber-profile and SLA-profile associations to gain access to the network. Profiles define service attributes for hosts such as scheduling, accounting, security, and traffic prioritization by application type. A profile uses existing 5620 SAM policy definitions and allows the customization of policy parameters using override values.

A 5620 SAM user that is assigned the administrator, subscriber management, service management, or policy management scope of command role can perform all residential subscriber management functions, such as managing profile or DHCP-lease information.

The 5620 SAM allows the configuration of multiple components in one operation, but limits configuration to those parameters that are not specific to a component. For example, when a policy is applied to multiple profiles, the 5620 SAM removes pre-existing policy override values in the profiles.

Migrating to the TPSDA model

The following residential subscriber management functionality facilitates the migration of hosts from SAP-based aggregation to the TPSDA model. You can:

- Associate a subscriber with a SAP by using the SAP identifier as the subscriber identification string. The existing hosts on a SAP can then be automatically associated with a subscriber.
- Rename a subscriber. This changes the subscriber identification string for all hosts and facilitates a move from a default subscriber identification string to a string that complies with a particular naming scheme.
- Configure an intermediate destination identifier, such as a DSLAM name, for a static host and obtain the identifier from the Option 82 information in a DHCP packet. This functionality enables the listing of the hosts for a specific DSLAM and facilitates interworking with other TISPAN components such as the 5750 SSC.
- Configure a default subscriber identification string for the hosts on a SAP. This enables residential subscriber management functionality without the use of a subscriber identification policy or RADIUS authentication. This default string is associated with hosts when a string is not available from another source.
- Interpret an SLA profile string or subscriber profile string from a host as the profile name when a profile with a matching profile string is not found. This eliminates the need to map a profile string to a profile.

Configuration requirements

The following must be true before you can enable residential subscriber management on a SAP or deploy a profile to an NE.

- The NE must be a 7450 ESS, 7750 SR, or 7710 SR.
- For dynamic hosts on the SAP:
    - DHCP snooping is enabled on the upstream SAP or SDP.
    - For IES, DHCP relay is enabled on the downstream SAP.
- The NE has sufficient resources for creating the SLA profile instances, queues, and schedulers.
- For new or existing static hosts on the SAP:
    - Anti-spoofing on the SAP is configured with at least IP matching criteria.
    - A subscriber identification string is assigned.
    - A subscriber profile is assigned.
    - An SLA profile is assigned.
    - An IP address is assigned.

Functional description

When residential subscriber management on a SAP is enabled, a dynamic or static subscriber host that connects to the SAP requires a subscriber identification string to associate the host with a subscriber instance on the NE, or network access is denied. A subscriber identification string uniquely identifies a subscriber in the 5620 SAM.

You cannot delete an active component of a residential subscriber management configuration.

Enabling residential subscriber management on a SAP does not affect an existing dynamic host on a SAP until the host DHCP lease expires, at which point a subscriber identification policy manages lease renewal. Static hosts require the provisioning of a subscriber identification string for continued network access.

The 5620 SAM identifies the subscriber for a dynamic host by obtaining a subscriber identification string from a source such as the following:

- information that the host passes in the Option 82 field of a DHCP packet
- a RADIUS server
- the local user database

A static host requires explicit provisioning on the 5620 SAM that includes the association of a subscriber identification string.

You can optionally specify a default subscriber identification string for a SAP. You can enter the string or configure the 5620 SAM to use the SAP ID as the string.

The 5620 SAM deploys the components associated with a subscriber, such as policies and profiles, to an NE when one of the following occurs:

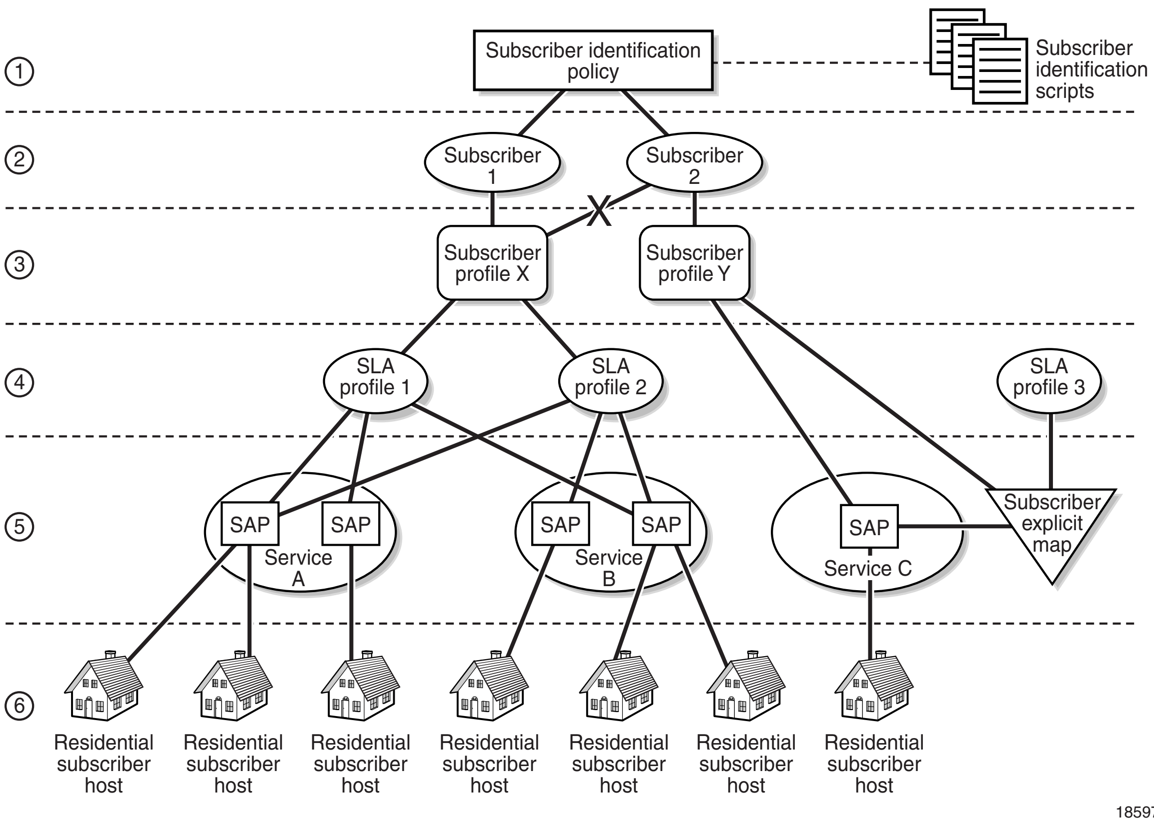
- The deployment of a subscriber identification policy with profile specifications
- The provisioning of the first static host for the subscriber on a SAP
- The provisioning of a Capture SAP with an MSAP Policy to automatically create an MSAP; see Managed SAP (MSAP) for more information

After the 5620 SAM deploys the subscriber and SLA profiles, the NE creates the queues, ACL filters and HQoS schedulers specified in the profiles. The NE ignores pre-existing queue or ACL filter policies on a SAP when subscriber management is enabled on the SAP.

The 5620 SAM maintains a record of subscribers that are deleted at the NE. Disconnected subscribers are marked as inactive. Subscriber information is retained in an inactive state in the Residential Subscriber and Residential Subscriber Instance views. In this way, the 5620 SAM treats the setup and teardown of a residential subscriber simply as a change of state, thereby avoiding the load imposed by object creation and deletion.

Figure 68-1 shows a conceptual model of the main component relationships in residential subscriber management. The model does not represent a specific type of service or service delivery mechanism and does not show all possible component configurations.

Figure 68-1 Residential subscriber management component relationships



As shown in Figure 68-1, there is a one-to-one relationship between a subscriber and a subscriber profile and a many-to-many relationship between subscriber profiles and SLA profiles. A subscriber profile or an SLA profile can apply to multiple SAPs or NEs, and can be specified as the default profile for the SAP or the NE.

Table 68-1 lists where to find configuration information for the components shown in Figure 68-1. The numbered levels segregate components for clarity only.

Table 68-1 Residential subscriber management components

Level	Component	Description	For more information, see	Procedure
1	Subscriber identification policy	Associates a dynamic host with a subscriber	"Subscriber identification policies" in this section	68-1
	Subscriber identification script	Parses DHCP Option 82 field to extract subscriber identification for a host, and optional profile, ANCP, and intermediate destination identification strings.	"Subscriber identification policies" in this section	68-47
2	Subscriber	Unique identifier that associates a group of subscriber hosts with policies	"Residential subscriber management overview" in this chapter	68-41

(1 of 2)

Level	Component	Description	For more information, see	Procedure
2	Subscriber instance	An instantiation of a subscriber on an NE	"Residential subscriber management overview" in this chapter	68-42
3	Subscriber profile	Names existing ingress and egress scheduler policies and an accounting policy for use by all hosts of a subscriber	"Subscriber profiles" in this section	68-14
4	SLA profile	Names existing QoS policies to define the traffic shaping for different classes of service within an application such as HSI, VoIP, VoD, or BTV Names existing ACL policies to filter the ingress and egress traffic	"SLA profiles" in this section	68-13
5	Subscriber explicit map	Lists subscriber identifiers and the associated SLA and subscriber profiles	"Subscriber explicit maps" in this section	68-34
6	Residential subscriber host (static)	A device such as a computer or set-top box that receives service traffic using a fixed IP address	"Static hosts and residential subscriber management" in this section	68-17 71-1, 73-1, and 74-1 access interface anti-spoofing configuration steps
	Residential subscriber host (dynamic)	A device such as a computer or set-top box that receives the service traffic using a temporarily assigned IP address	"Subscriber identification policies", "Subscriber profiles", "SLA profiles", "Subscriber explicit maps", Managed SAP (MSAP), and "PPPoE policies" in this section	68-43
5	Local DHCP server and PPPoE group interface	A local user database is created and associated to a local DHCP server and PPPoE group interface configuration	"Local DHCP servers" in this section	68-3 68-32 74-1 73-8

(2 of 2)

The 5620 SAM treats residential subscriber management components like policies. Depending on the distribution mode configuration of a local instance, when you modify a global component using the 5620 SAM, all local instances of the residential subscriber management component on the associated NEs can be updated. The Local Definitions tab of a component management form lists the local instances of the component.

Global residential subscriber management components are created in draft mode. This allows operators to verify the configuration before they distribute it to the network elements. See chapter 46 for information about global and local policy instances and policy distribution modes.

The maximum number of subscribers that use a SAP is configurable. When a SAP is limited to one subscriber, you can specify the treatment of traffic that does not match the subscriber profile, such as BTV traffic, which uses an IP address in the multicast range as the destination address. During single-subscriber SAP configuration, the 5620 SAM operator specifies whether to allow non-profile traffic and specifies the SLA and subscriber profiles to use for non-profile traffic, if it is allowed.

The 5620 SAM supports the collection of accounting statistics for subscriber instances. The 5620 SAM uniquely identifies a subscriber instance by using a combination of the subscriber identifier and the NE identifier.

Subscriber identification policies

Subscriber identification policies apply to SAPs and associate dynamic residential subscriber hosts with NE subscriber instances. Hosts that use the same subscriber identifier, called a subscriber identification string, belong to the same subscriber and receive common general HQoS and accounting treatment as defined by the customer SLA specifications in a subscriber profile. Hosts from multiple SAPs can belong to the same subscriber, but for HQoS scheduling purposes, all hosts of a subscriber must be active on the same IOM.

When a dynamic residential subscriber host requests an IP address using DHCP, the host can include a subscriber ID string and optional profile ID strings in the Option 82 field of the DHCP packet. If the request is approved by a DHCP server, the NE obtains the subscriber ID string for the host from the Option 82 information in the returning ACK message. The subscriber ID string is a match criterion for the assignment of SLA and subscriber profiles to the host unless profile ID strings are explicitly encoded in the DHCP option information by the host or configured as SAP default profiles. You can also configure a default subscriber ID string on a SAP.

Note — If adding Option 82 information to a DHCP relay packet causes the packet to exceed the DHCP relay maximum of 1500 bytes, the NE forwards the DHCP request without the Option 82 information. For this reason, short strings can be used as aliases for profile names.

A subscriber identification policy includes:

- URLs for subscriber identification scripts
- subscriber profile map
- SLA profile map

Entries in the subscriber and SLA profile maps are optional and are used for the direct assignment of profiles to hosts when hosts include profile ID strings in the DHCP Option 82 field.

Although the 5620 SAM is installed with no default subscriber identification policy, an operator can create a subscriber identification policy and designate it as the default policy by giving it the case-sensitive name “default”.

Subscriber identification scripts

A URL in a subscriber identification policy points to the location of a subscriber identification script that an NE uses to parse DHCP option information. During initialization, an NE downloads scripts from the URLs that are specified in the applied subscriber identification policies. An NE can store a maximum of four subscriber identification policies; each policy can contain up to three scripts.

A subscriber identification script derives the mandatory subscriber ID string, as well as a DSLAM identifier and optional profile ID strings, from the DHCP option information.

The 5620 SAM operator assigns a priority to each script in a subscriber identification policy. Only the operationally enabled script with the highest priority is active. If an NE encounters an error in a script or cannot find a script at the specified location, the NE marks the URL as operationally down, raises an alarm, and attempts to use the script that is next in priority. The script-related alarms that the 5620 SAM raises against the local instance of a subscriber identification policy are:

- warning alarm when the primary URL is operationally up but a lower-priority URL is operationally down
- major alarm when the primary script is operationally down but one of the other scripts is operationally up
- critical alarm when all scripts are operationally down

A modification to a subscriber identification script or URL takes effect only after the URL is administratively disabled and then re-enabled, which causes an NE to reload the script. Replacing or modifying a subscriber identification script or a URL can be service-affecting if not done properly. To avoid a service disruption when you modify a subscriber identification script or URL, perform Procedure 68-47.

Local DHCP servers

5620 SAM supports configuring local DHCP servers on a 7750 SR, 7710 SR, and the 7450 ESS. The local DHCP server leases IP addresses to clients in the network. Options are configured to define the IP address properties, such as, the length of time an IP address is active and which DNS server must be used. A local user database is used to authenticate and authorize clients requesting IP addresses from the local DHCP server. If the local DHCP server does not use the local user database, the server can use the GI address to assign free IP addresses, however it is not possible to configure match or authentication parameters.

Three applications are targeted for the local DHCP server.

- Subscriber aggregation using a single NE or TPSDA.
- Business services running VPRN and locally attached to the host can request and obtain IP addresses directly from the server.
- The DHCP server identifies an IP request from a PPPoE client and provides an IP address and options.

DHCP servers can be integrated with Enhanced Subscriber Management for DHCP and PPPoE clients. A local DHCP server can be created in the routing instance window or VPRN service site window. A local DHCP server created in the VPRN service site can be associated with the L3 access interface on a VPRN service only. A local DHCP server created in the routing instance window can be associated with a network interface or L3 access interface on IES.

ARP host

You can use the 5620 SAM to configure and retrieve ARP hosts on a 7750 SR. ARP hosts are a subtype of enhanced subscriber host objects. The creation of the object is triggered by the reception of ARP messages from end-user devices. ARP hosts can be configured as an alternative to DHCP subscriber hosts or PPPoE sessions.

ARP host configuration can be performed on VPLS and MVPLS L2 access interfaces, IES and VPRN group interfaces, and VPRN retailer subscriber interfaces. The configuration includes enabling the functionality, setting the maximum limit of hosts per SAP or interface, and setting the default authentication interval.The configuration must be performed in conjunction with other enhanced subscriber management configuration on these interfaces. ARP hosts can be retrieved from the VPLS, MVPLS, and IES or VPRN SAPs. ARP hosts can also reside on MSAPs.

You can retrieve ARP hosts from the Manage→Residential Subscribers menu option. The Manage Residential Subscribers form opens. See Procedure 68-40 for more information about the persistence and retrieval of subscriber hosts.

Local user database

The 5620 SAM supports configuring a local database on a 7750 SR, 7710 SR, and the 7450 ESS. The local user database is configured and associated with the local DHCP server to provide local authentication. The local DHCP server must have a pool of IP addresses configured, otherwise it is not able to lease IP addresses.

A create local user database configuration form is available from the Manage Residential Subscribers form. Once a local user database is configured, it can be associated with a local DHCP server and PPPoE configuration on a group interface.

When a local user database is not configured, you can use GI addresses to access free IP addresses, however the clients requesting the IP address will not be authenticated.

Subscriber profiles

A subscriber profile defines the aggregate HQoS and accounting characteristics for the hosts of a specific subscriber. During the creation of a subscriber profile, the 5620 SAM operator chooses ingress and egress scheduler policies that apply to all host queues of the subscriber. A subscriber profile permits the optional selection of SLA profiles to override the SLA profiles that are named in the subscriber identification policy.

A subscriber profile can be specified in the following components, which an NE searches in the order shown when it attempts to assign a subscriber profile to a host:

- subscriber explicit map
- subscriber identification policy

A subscriber requires an association with one and only one subscriber profile. If no subscriber profile is associated with a subscriber ID string or explicitly specified by a host, and there is no available default subscriber profile on an NE or on a SAP, the NE rejects the host.

A subscriber profile can include associations to the following policy types:

- ingress scheduler
- egress scheduler
- accounting
- ANCP
- NAT
- host tracking

- RADIUS accounting
- SLA profile map
- ingress QoS
- egress QoS
- HSMDA packet byte offset override
- HSMDA queue override
- ingress and egress scheduler policy parameter overrides
- ingress and egress policer control
- ingress and egress policer control overrides

The 5620 SAM operator can define a default subscriber profile for an NE or a SAP by giving it the case-sensitive name “default” during profile creation. NE and SAP default subscriber profiles apply to hosts for which a subscriber profile is unspecified in the subscriber explicit map and subscriber identification policy.

SLA profiles

An SLA profile defines the resources that an NE assigns to a particular subset of subscriber hosts, such as VoIP telephones or BTV set-top boxes. These resources include network-access and ACL policies. An SLA profile also optionally defines the maximum number of hosts that use the profile and the action taken when the number of hosts reaches the maximum.

An SLA profile can be specified in the following components, which an NE searches in the order shown when it attempts to assign an SLA profile to a host:

- subscriber explicit map
- subscriber profile
- subscriber identification policy

An SLA profile includes:

- access ingress policy association
- access egress policy association
- ingress IP ACL filter policy association
- egress IP ACL filter policy association
- host limit that specifies the maximum number of hosts that use the SLA profile
- access ingress and access egress policy parameter override values
- access ingress and access egress policer override values

The queues in the access ingress and egress policies of an SLA profile must use a scheduler from the scheduler policy in the subscriber profile as their parent scheduler. All hosts that use the SLA profile must be active on the same IOM. When an SLA profile does not name an access ingress or access egress policy, an NE uses the SAP default policy.

A 5620 SAM operator can define a default SLA profile for a SAP. A default SAP SLA profile applies only to hosts for which an SLA profile is unspecified in the subscriber explicit map, subscriber profile, and subscriber identification policy.

Managed SAP (MSAP)

The 5620 SAM enables the automatic creation of subscriber hosts on a shared SAP, for which the most secure model is one subscriber per SAP. In this model, each subscriber has a separate VLAN, and this requires complex configuration. Automatic SAP creation builds on the authentication mechanisms that an NE supports to provide an automatically created SAP for the one-subscriber-per-SAP model. The automatically created SAP is called a managed SAP, or MSAP.

You can use the 5620 SAM to configure a policy and a SAP template for automatic MSAP creation. Automatic MSAP creation is enabled after a Capture SAP is created. See "Automatic MSAP creation process" in this section for information about creating a Capture SAP.

When a Capture SAP is configured, triggering packets initiate RADIUS authentication, which provides a service context. The authentication and the service context for this request creates an MSAP. An MSAP behaves the same as a regular SAP, but the MSAP configuration is not editable. The MSAP configuration is not kept in the NE configuration file, but it can be maintained in a separate persistency file.

An MSAP remains active as long as there is at least one subscriber host on the MSAP. See "MSAP management" in this section for more information about managing an MSAP.

Note — MSAPs cannot be configured, but are reconciled by the 5620 SAM on the NE.

Although MSAPs are not configurable, a user with a Policy Management or Subscriber Management role can create, list, delete, or modify an MSAP policy to control how the parameters apply during MSAP creation. An MSAP policy must be created before you create a Capture SAP so that the policy can be added to the Capture SAP configuration. See Procedure 68-5 for information about creating an MSAP policy.

You can create a Capture SAP only in a VPLS. A Capture SAP can create MSAPs in the routed CO configuration of an IES or VPRN, and in a VPLS TPSDA configuration. IES and VPRN MSAPs are restricted to group interfaces.

An MSAP is typically used by only one subscriber. In an architecture that provides service access using a shared SAP, you can use automatic SAP creation to a limited extent to reduce the configuration required, and to allow multiple subscribers to share a SAP. However, if more than one subscriber is allowed and an MSAP has been defined by a host, the installation fails and raises an event if a new host installation attempts to change the MSAP policy.

MSAPs are supported in HA and dual-homing environments. In dual homing, the MSAP is synchronized with the other NE during MSAP creation. For both HA and dual-homing environments, each participating NE must use the same MSAP policy.

Automatic MSAP creation process

A Capture SAP must be defined to trigger the process that automatically creates an MSAP. A Capture SAP does not forward traffic.

The encapsulation type of a Capture SAP can be one of the following:

- dot1q—supports the parameter value 4095, which appears as an asterisk (*)
- QinQ—supports the parameter values 1 to 4095 for the outer encapsulation value and 4095 only for the inner encapsulation value
- LAG—supports the parameter values 1 to 4095

The Capture SAP is used if a more specific match for the dot1q or QinQ tags is not found.

Note 1 — Some providers use QinQ encapsulation to represent a service.sub or sub.service SAP. When configured, the full QinQ represents a subscriber.

Note 2 — Multiple leases for the same subscriber are allowed; however, only one MSAP policy is allowed. If an MSAP is defined by a host and a new host installation is attempting to change the policy, the installation fails and raises an event.

The Capture SAP is created in the same way as a regular SAP; however, you must change the SAP Sub Type parameter that appears on the General tab of the L2 Access Interface (Create) form from the default value of Regular to Capture. Capture SAP-specific configuration is performed on the Capture Access Interface tab of the L2 Access Interface (Create) form. In the Capture Access Interface tab you can configure the parameters and apply the PPPoE and MSAP policies that control MSAP creation.

You can create a Capture SAP on any VPLS service on an NE. MSAP creation can be configured to start on receipt of DHCP packets, PPPoE packets, ARP packets, or any combination of DHCP, PPPoE, and ARP packets. After you configure the Capture SAP, every DHCP packet, PPPoE packet, or ARP packet received on the SAP is sent to the CPM, which triggers RADIUS authentication to provide a service context. The MSAP is created in the specified service. Non-triggering packets captured by the Capture SAP are dropped. See Procedure 68-20 for information about how to create a Capture SAP.

The following triggers are supported to initiate MSAP creation:

- DHCP Trigger Packets—DHCP Discover (or Requests if configured) for DHCP clients; the MSAP lifetime is defined by the lease time.
- PPPoE Trigger Packets—PPPoE PADI for PPPoE client; the managed SAP lifetime is defined by the session time. The MSAP is installed after an IP address is provided.
- ARP Trigger Packets—ARP for static-ip hosts; the MSAP lifetime is defined by ARP entry time. Current ARP entry refresh behavior is maintained.

If RADIUS does not provide all of the required information to install the host (for example, RADIUS lacks the IP address), the MSAP is created with a short timer while waiting for the host to be installed. Default SAP polices are available on the NE and will be used if the MSAP policy is not configured.

An MSAP is created with dual-pass (shared) queuing. The SLA profile of the host may change the queuing later in the process. The MSAP is always created with the default QoS and scheduling.

For MSAPs, the authentication policy is defined in the MSAP policy. Based on the configuration, the system reauthenticates the sessions when they are renewed. If the authentication policy is not used or when only PPPoE is used, the MSAPs, stay active when the session is renewed.

The authentication policy used in the Capture SAP must be the same policy as the policy used for the MSAP. For L3, the authentication policy is defined under the group-interface.

Note 1 — When PPPoE is used with MSAPs, the authentication policy must not use the username for MSAP creation.

Note 2 — The MSAP is not created (and an event is generated) if the group-interface name returned from RADIUS points to a different authentication policy than the policy defined by the Capture SAP.

MSAP management

MSAP management is applied using the MSAP policy. The MSAP policy is used to configure the parameters in the tabs that are available on the Properties forms of the MSAP. The original MSAP policy applied to the Capture SAP is the default Creation MSAP Policy, which is used to configure all of the parameters for the MSAP. You cannot modify an MSAP. However, you can modify the Creation MSAP Policy to make changes to an MSAP.

After MSAP creation, all of the MSAP parameters are read-only, except for the Creation MSAP Policy Re-evaluation parameter on the MSAP Properties tab. The Creation MSAP Policy Re-evaluation parameter allows you to reapply the MSAP policy associated with the local MSAP.

If you need to change an MSAP policy and you are in the Manage Subscriber Policy form, you can choose an MSAP policy, click on the Properties button, make your changes, and click on the Reevaluate MSAPs button to perform an MSAP policy re-evaluation. You can use the MSAP Policy Reevaluate button to update the MSAP policies on a global or local basis.

After an MSAP Policy Re-evaluate operation is performed on an MSAP, the MSAP form is not automatically updated with the new values. You must perform a resynchronization to update the parameter values. See Procedure 68-23 for more information about modifying and re-evaluating a Creation MSAP policy on an MSAP. See Procedure 68-24 for more information about modifying and re-evaluating an MSAP policy on one or more MSAPs.

Each MSAP can have one MSAP policy; however, the same MSAP policy can be applied to multiple MSAPs. The Capture L2 Access tab of the MSAP Policy form displays all of the Capture L2 access interfaces that are associated with this specific MSAP policy. You can change an MSAP policy locally or for all of the MSAPs that are associated with the MSAP policy. A change to a specific MSAP policy will cause the same change in all the MSAPs that use that policy if all of the MSAPs are re-evaluated or if the MSAP policy is re-evaluated.

Warning — If there is a disruption on the NE and the NE recovers by restarting, the MSAP policy that was changed and re-evaluated will be applied to all of the MSAPs associated to the policy.

The 5620 SAM treats the setup and teardown of MSAPs as state transitions to offset the load imposed by constant SAP creation and deletion. There are two states that an MSAP can have, active or inactive. These states cannot be configured. The state is automatically set to active when the MSAP is created on the NE. When the NE deletes the MSAP, the state changes to inactive. That is, when the MSAP is torn down, the state changes to inactive, the MSAP continues to be available in the 5620 SAM but is not used until it is reactivated by the NE. When the MSAP is reactivated, it will have the same identification so that the 5620 SAM can identify it with the same FDN.

The state information is not automatically updated in the 5620 SAM GUI. You must perform a resynchronization to retrieve the current state information. When the state is inactive, performance statistics for the MSAP are not retrievable; however, historical statistical records are available. You can schedule MSAP statistics or collect the statistics on demand. See the *5620 SAM Statistics Management Guide* for more information about scheduling and collecting statistics.

MSAPs are listed on the L2 Access Interface tab for VPLSs and on the Service Access Points tab of the IES and VPRN forms.

MSAPs are bound by the maximum number of SAPs allowed on the NE. Typically, and as long as services are not deleted, the number of MSAPs within the 5620 SAM are bound by the formula:

$$A \times B \times C$$

where:

A is the number of services

B is the maximum number of SAPs allowed on the NE

C is the number of NEs

Inactive services that previously contained MSAPs consume database space. MSAPs that have been in an inactive state for a long period of time or that are no longer used must be manually deleted. See Procedure 68-25 for more information about deleting an MSAP.

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactivate until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 68-25 for more information about deleting MSAPs.

MSAP alarm suppression

An IES or VPRN MSAP that is created on a LAG in an SRRP deployment uses a 5620 SAM mechanism to suppress unnecessary AccessInterfaceDown alarms. The mechanism uses the SRRP states of the redundant BNGs, and determines whether to raise the alarm based on the following rules:

- When the active BNG is in the master SRRP state and the standby BNG is in the initialize or backupShunt SRRP state, no AccessInterfaceDown alarm is raised against the standby BNG.
- If the standby BNG reboots, or if there is a link failure between the standby BNG and the access network, the MSAP AccessInterfaceDown alarms are suppressed for the standby BNG. The active BNG continues to remain in the master SRRP state. In this scenario, there may be other alarms on the standby BNG for card or link failures.
- After a fault that results in an SRRP failover, for example, active BNG reboot or loss of access network connectivity on the active BNG, an AccessInterfaceDown alarm is raised against each BNG. The alarms clear after SRRP state convergence.
- After a fault that affects both BNGs concurrently and disables SRRP redundancy, an AccessInterfaceDown alarm is raised against each BNG. The alarms clear when a BNG regains connectivity and assumes the role of SRRP master.

Note — The alarm-suppression mechanism can function correctly only when SRRP is correctly configured. If an SRRP peer is missing or disabled, the alarms may not be suppressed for the BNG that the 5620 SAM perceives to be the standby BNG.

MSAP event logs

An MSAP event log records the date, time, and active state for each state change that occurs after the MSAP is created. An event log is not recorded when the MSAP is created, although the information is recorded in a time stamp. You can view the event log for each MSAP, purge the event log records, and modify the global MSAP log policy retention time and administrative state.

MSAP time stamps

You can view the following MSAP state time stamps:

- date and time that the MSAP was created
- date and time of the last active state change

See Procedure 68-21 for information about viewing MSAP properties.

MSAP creation and management tasks

Table 68-2 summarizes the tasks required for MSAP creation and management.

Table 68-2 MSAP creation and management tasks

Task:	See:
Create an MSAP policy that will be added to a Capture SAP	Procedure 68-5
Create a Capture SAP that will enable creation of an MSAP	Procedure 68-20
List MSAPs	Procedure 68-21
View the event log for an MSAP, modify the global MSAP log policy, and purge the log records for an MSAP	Procedure 68-22
Modify and reapply an MSAP policy	Procedure 68-23
Modify and re-evaluate an MSAP policy on one or more MSAP	Procedure 68-24
Delete an MSAP to create more space	Procedure 68-25
Delete an MSAP policy	Procedure 68-26

Subscriber explicit maps

A subscriber explicit map is a table that directly associates dynamic subscriber hosts with subscriber profiles and SLA profiles. The entries in a subscriber explicit map override the default profile definitions. A subscriber ID string is the unique key for a subscriber explicit map entry.

A subscriber explicit map includes:

- subscriber ID string
- subscriber profile name
- SLA profile name
- AA group policy name
- subscriber ID alias

A subscriber explicit map does not allow the association of a subscriber ID string with the subscriber profile called “default”. However, if the explicit mapping omits a subscriber profile, the subscriber ID string is associated with the SAP or NE default subscriber profile. An attempt to delete a subscriber profile that is named in a subscriber explicit map fails. A 5620 SAM operator can remove explicit map entries at any time.

If an operator creates a subscriber explicit map entry without using the 5620 SAM, for example, using CLI, the 5620 SAM creates a subscriber instance in the global subscriber explicit map. If the 5620 SAM subsequently discovers another NE with the same subscriber entry that has a mapping to different profile, the 5620 SAM treats the second mapping as a local mismatch to the global entry for the subscriber.

Static hosts and residential subscriber management

Static subscriber hosts require explicit provisioning rather than an association with a subscriber identification policy. Static hosts for VPLS are configurable on the anti-spoofing tab of the L2 access interface management form. For IES and VPRN services, static hosts are configurable using the management form for a SAP on a group interface. Static host configuration involves the following elements:

- IP address
- MAC address (optional)
- subscriber ID string, or the use of the SAP ID as the subscriber ID
- valid subscriber profile
- valid SLA profile
- ANCP string
- intermediate destination, such as a DSLAM
- application profile

Note — When residential subscriber management is enabled on a VPLS SAP that is part of an operational MC ring group, the following must be configured on each static host:

- an intermediate destination that is a ring node in the MC ring group
- subscriber identification, such as a subscriber ID string or the use of the SAP ID as the subscriber ID
- a subscriber profile
- an SLA profile

ANCP policies

An ANCP policy defines the behavior of the residential subscriber host with which the policy is associated. An ANCP policy includes one of the following:

- static ANCP association
- static ANCP MSS association
- dynamic subscriber-profile association on VPLS, IES, VPRN and VLL services

An ANCP policy conveys status and control information based on port-up/port-down messages and changes to the current access line rate between the edge device and the access node. This allows the 7450 ESS, the 7750 SR, or the 7710 SR to adjust the HQoS subscriber scheduler with the correct rate or raises an alarm when the rate goes below a set threshold. The policy can be changed if the rate drops below a minimal threshold value. The ANCP actual upstream synchronization rate is configured in the ingress panel while the ANCP actual downstream synchronization rate is configured in the egress panel.

Host tracking policy

A host tracking policy is used to allow a subscriber's video traffic (multicast) to be included in the egress rate control for the subscriber. When a host tracking policy is specified in a subscriber profile, the egress traffic rate for the subscriber takes into account the unicast and multicast traffic in the aggregate egress rate or in the egress scheduler rate specified in the ANCP policy. There is no default host tracking policy.

When a host tracking policy is applied to a subscriber profile, all subscribers associated with the subscriber profile are tracked using that host tracking policy. You can view the tracked subscribers on the associated local host tracking policy property form.

You can also configure IGMP host tracking parameters on VPLS, IES, and VPRN service sites and SAPs.

The following on-demand host tracking information is available:

- on the Residential Subscriber Instance form, Host Tracking Info tab button, which hosts are being tracked for this particular subscriber
- on the Residential Subscriber Instance form, Host Tracking Status tab button, the egress traffic rate reduction for this particular subscriber
- on the VPLS L2 access interface property form, Host Tracking Info tab button, which hosts are being tracked
- on the IES and VPRN service access point property form, Host Tracking Info tab button, which hosts are being tracked

On-demand historical and real-time host tracking statistics are supported for SAPs and residential subscribers. Only historical statistical plotting is supported. The statistics and read-only host tracking information can be cleared by the 5620 SAM.

Diameter policies

The 5620 SAM supports diameter policies and associated diameter peers. Diameter policies are used in a subscriber management context to provide a credit control mechanism. The diameter policy establishes a server/peer configuration, as well as Diameter Credit-Control Application (DCCA) support. The NE functions as the credit control client, while the peer acts as the credit control server.

DCCA represents an alternative to RADIUS for providing a mechanism to support pre-paid service model in access networks. Under a DCCA configuration, the credit control server is used to grant service to a subscriber for pre-defined duration. Before a subscriber host is created, the BNG queries the credit control server about the credit for the given subscriber. If credit is granted, the subscriber host is installed with the appropriate SLA level. If the subscriber has no credit, the credit control server denies access and no subscriber host is created.

The diameter policy is used to specify common diameter protocol parameters, while the diameter peer defines the relationship with an external diameter server. The diameter protocol parameters defined on the diameter policy describe connection and session characteristics, and indicate which attribute-value pairs (AVPs) to use in messages.

Peers

The diameter policy defines a set of peers with which to establish diameter sessions. Peers share the configuration of the policy with which they are associated, but can override individual timer parameters inherited from the policy. In addition, each peer defines transport and connection-specific parameters, values for destination-specific AVPs, and a preference value.

The 7750 SR and 7450 ESS provide read-only operational values and statistics for the peer definition of local diameter policies. The 5620 SAM can provide a snapshot view of operational values and statistics. Operational values include the peer's timer values, the current state of the peer's state machine, and the peer's order among the other peers within the policy.

DCCA

The 7710 SR and 7750 SR support a DCCA, which can be customized through a set of parameters on the diameter policy in the 5620 SAM. The parameters allow customization of DCCA error handling, DCCA timer(s), and AVP value definitions.

PPPoE policies

PPPoE is used in subscriber networks to encapsulate PPP frames inside Ethernet frames. PPPoE combines the point-to-point protocol used with DSL sessions with the Ethernet protocol used to support multiple subscribers in a local area network. PPPoE takes advantage of the speed of a packet-based Ethernet network with the security and accounting functions of a PPP network. PPPoE allows service providers to use existing RADIUS authentication.

Since more than one subscriber is sharing the same connection to a service provider, PPPoE organizes subscribers during two stages:

- PPPoE discovery stage
- PPPoE session stage

During the discovery stage, the subscriber and service provider identify each other’s MAC address and establish a PPPoE session ID.

The PPPoE discovery stage consists of the following steps:

1. PPPoE Active Discovery Initiation (PADI). The client initiates a session by broadcasting a PADI packet to the LAN to request a service.
2. PPPoE Active Discovery Offer (PADO). Any access device that can deliver the service requested by PADI packet, replies with a PADO packet that contains its name, unicast address and service requested.
3. PPPoE Active Discovery Request (PADR).The client selects one of the PADOs that it receives and sends a PADR packet to indicate the services required.
4. PPPoE Active Discovery Session Confirmation (PADS). When the selected device receives the PADR packet, it can accept or reject the PPPoE session. To accept the session the device sends the client a PADS packet with a unique ID and a service name. If the device rejects the session, it sends a PADS packet with a service name error and resets the session ID to zero.

During the session stage, PPPoE behaves as a peer-to-peer protocol. Each PPPoE session is identified by the MAC address of the peer and the session ID. Once a session is established, both end points build a point to point connection over the Ethernet and exchange packets. Once the connect is established, the RADIUS accounting policy can begin. LCP negotiates authentication parameters. After a session is authenticated IPCP sends an IP address to the PPPoE client. IP Addresses can be stored in the DHCP local user database, if configured.

After a session is established both end points monitor the session and can terminate a session after a configured number of keep alive intervals are exceeded. An alarm is raised by the 5620 SAM when a PPPoE session fails. Either peer can send a PPPoE Active Discovery Termination (PADT) packet. See "Local DHCP servers" in this chapter for more information on associating PPPoE with a local DHCP server.

PPPoA sessions

PPPoA is used in subscriber networks to encapsulate PPP frames inside ATM Adaption Layer 5 packets. Each PPP session is carried over a single ATM VC to the BNG. Two types of encapsulation are supported:

- AAL5_nlpid_PPP
- AAL5_Mux_PPP

PPPoEoA sessions

PPPoEoA is used in subscriber networks to encapsulate PPPoE messaging within ATM Adaption Layer 5 packets. Each PPP session can be directly terminated on any host within the customer Ethernet network and then transported over an ATM network to the BNG. Two types of encapsulation are supported:

- AAL5_muxed_bridged_EHT_no_FCS
- AAL5_snap_bridged

Subscriber host connectivity verification

Aside from relatively infrequent IP-address lease renewal, DHCP has no session-monitoring or connection-monitoring capability. Residential subscriber management provides this functionality for DHCP hosts and static hosts using subscriber host connectivity verification, or SHCV.

When SHCV is enabled on a SAP, an NE issues a periodic ARP request to each host on the SAP. If the NE receives no reply to an ARP request within the specified interval, the NE raises an event. When SHCV is configured to drop a lost host, the NE immediately removes the host from its active subscriber host table.

SHCV records the state information that it collects for hosts on a SAP and maintains a history of connectivity-related events for troubleshooting purposes. The size of the history log is restricted by a size-constraint policy.

SHCV operates in conjunction with DHCP snooping and is configurable on VPLS, VPRN, and IES SAPs and on IES group interfaces. Because it uses ARP, SHCV automatically populates the FIBs of bridging devices in the access and provider networks. The configurable items for SHCV on a SAP include:

- frequency of connectivity checks
- source of the ARP request
- action to take when a host loses connectivity

Note — On an L2 access interface, SHCV uses the NE system IP address as the source of the ARP request. On an L3 access interface, SHCV uses the IP- and MAC-address combination of the interface or the VRRP state for the interface as the ARP source. On IES group interfaces, SHCV uses the address of the subscriber interface as the source.

The behavior that an NE exhibits toward SHCV events is configurable using the residential subscriber management form. The configurable NE SHCV items include:

- maximum host connectivity loss rate
- action to take when the connectivity loss rate exceeds the maximum
- action to take when the NE drops an event trap, as such an event may indicate a high connectivity loss rate

SHCV event handling on an NE is disabled by default. When SHCV is enabled on a SAP but is disabled on the NE, the 5620 SAM records the blocking of SHCV events in the SHCV log. This ensures that an operator is aware of SHCV activity when viewing the SHCV log, even if the NE is configured to suppress SHCV events.

The following conditions represent an SHCV host connectivity loss:

- absence of a host response
- inconsistency between the reply data and the DHCP lease state

An NE makes more than one SHCV attempt before it raises an event against a host to ensure that the absence of a host response indicates a host connectivity problem and is not simply the result of occasional packet loss.

When a SAP becomes operationally down, the NE generates one trap for the SAP rather than one trap for each host on the SAP. When the SAP returns to service, the NE forwards a trap for each host as it verifies the restoration of connectivity. SHCV generates the following event traps:

- SAP up
- SAP down
- host up
- host down
- trap dropped

Routed CO

A broadband access network typically requires the aggregation of the traffic from access equipment before routing of the traffic is possible. Routed CO functionality allows a network operator to directly connect a DSLAM or similar multiplexer to a router such as the 7750 SR. Residential subscriber management, combined with the use of DSCP or dot1p values, supports access-integration models such as the following:

- one SAP for all subscribers and service offerings
- one SAP per service offering
- one SAP per subscriber

Routed CO allows the configuration of subscriber interfaces and group interfaces on IES and VPRN. A subscriber interface defines the subnets that are available to a subscriber. A group interface is a child object of a subscriber interface that allows the configuration of multiple SAPs as part of a single interface. Routed CO functionality depends on residential subscriber management to maintain the subscriber host information.

The 5620 SAM supports routed CO in IES and VPRN services:

There is no direct association between the subnets and the group interfaces. Subnets can be shared between group interfaces. If the host IP address is not in one of the subnets, packets from the network to that host IP are not received by the subscriber or group interfaces.

A subscriber interface defines a maximum of 16 subscriber subnets and acts as the DHCP relay agent for a subscriber. For the forwarding of DHCP packets to a subscriber server, a subscriber interface requires the specification of a gateway address that is in one of the subscriber subnets. Group interfaces below the subscriber interface inherit this gateway address but can specify an override value if required.

All SAPs in a group interface use the same port. The first SAP on a group interface determines which port the group interface uses. Additional SAPs for the group interface must be associated with the group-interface port during SAP creation.

A group interface is similar to a regular IES interface except for the following.

- Multiple SAPs are configurable.
- No IP addresses are specified.
- No broadcast traffic is permitted.
- No loopback mode exists.
- No static ARP can be specified.
- VRRP is not supported.

When a subscriber interface or a group interface is operationally disabled, no packets are sent to or from the subscriber hosts on the SAPs of the interface, but the state information for a static or dynamic host persists until the static host is removed from the NE by an operator or the DHCP lease of the dynamic host expires.

Because the configuration of multiple SAPs on a group interface makes normal forwarding of DHCP responses to hosts impossible, DHCP relay for routed CO maintains a cache of DHCP requests. If a DHCP server response does not arrive within the specified interval time, the NE discards the cache entry. The 5620 SAM operator can choose to have the NE use the Option 82 circuit ID field in a DHCP request as the match criterion for the returning DHCP ACK message.

You can configure Network Address Translation, or NAT, for dynamic subscriber hosts in a routed CO deployment. NAT for routed CO requires a NAT policy that is associated with a subscriber profile. In an IES routed CO deployment, NAT is configured on the base routing instance of an NE. NAT in a VPRN routed CO deployment is configured on the VPRN routing instance. See chapter 30 for general information about configuring and deploying NAT. See chapter 46 for information about configuring a NAT policy. See Procedure 68-14 for information about associating a NAT policy with a subscriber profile.

Lease populate is enabled on a group interface by default, and the number of allowable lease entries is set to one. All SAPs on the group interface inherit this configuration during creation.

See chapters 73 and 74 for more information on configuring subscriber and group interfaces for IES and VPRN services.

Wholesale and retail configurations for VPRN services

A VPRN routed CO allows a service provider to resell wholesale carrier services while providing direct DSLAM connectivity. You can create a VPRN service for the retailer and also define subscriber access and configuration information for the retailer network. The implementation of configuration changes occurs as if the VPRN is a standalone router using the routed CO model. The benefit of this model is flexibility for the retailer and decreased involvement for the wholesaler.

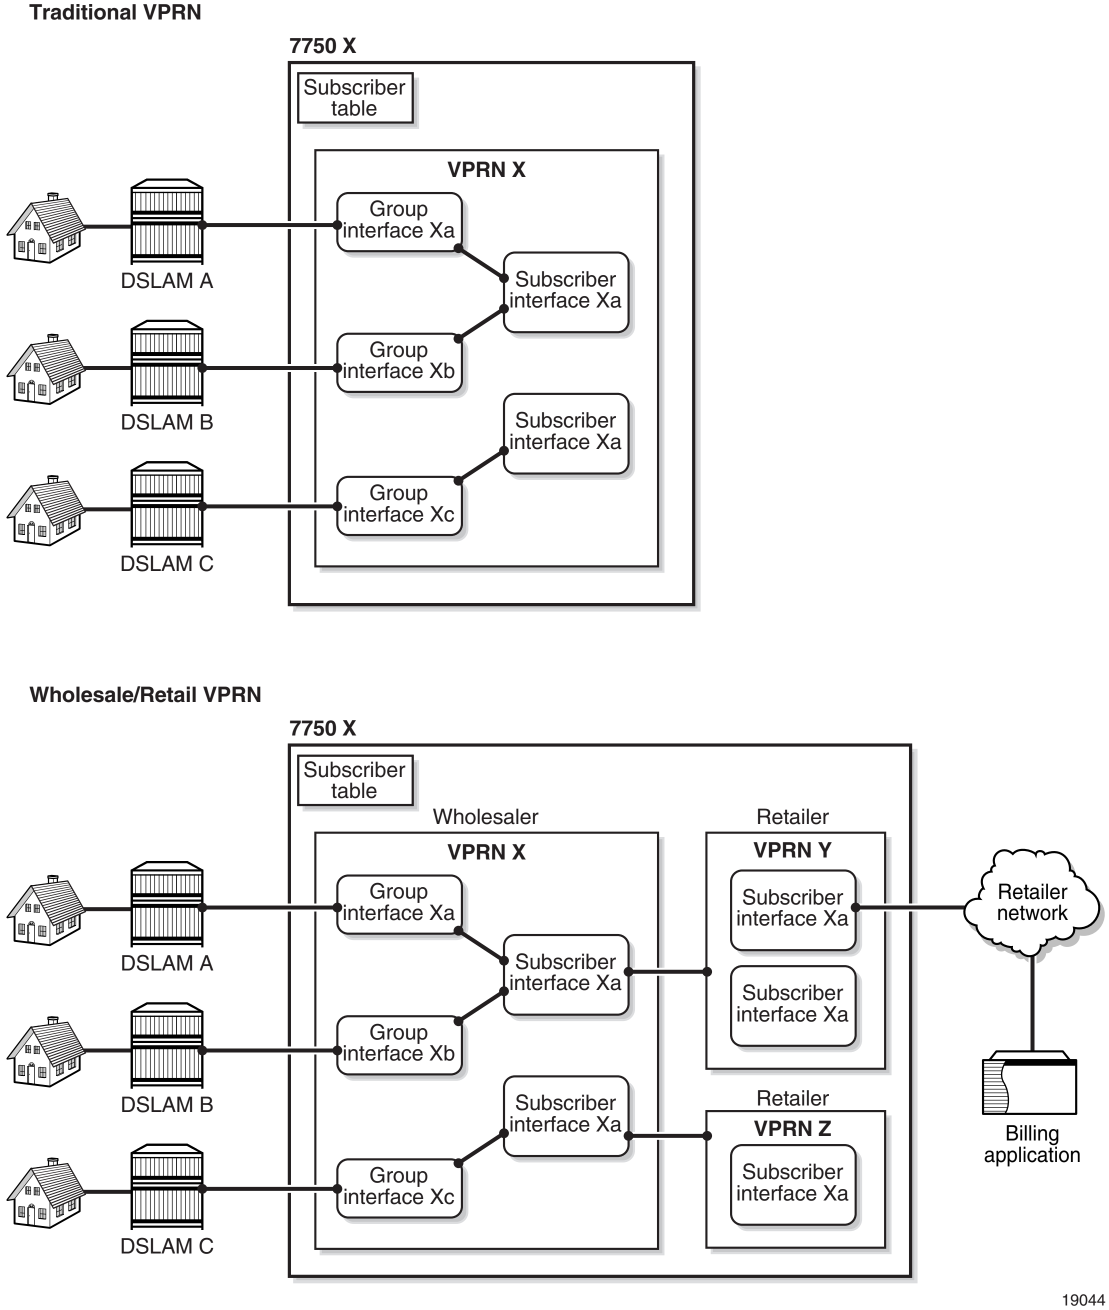
You must use a subscriber SAP to support shared access for multiple retailers. Another dependency of shared access is the requirement for the wholesaler to maintain separate access nodes for each retailer with network scaling issues.

In the wholesale and retail model, the wholesaler instance connections that are common to the access nodes are distributed to many retail instances. Upstream subscriber traffic ingresses into the wholesaler instance and, after identification, is then forwarded into the retail instance. The reverse principle occurs for traffic in the opposite direction. The wholesale and retail traffic flow is controlled with minimal communication to the RADIUS server. A RADIUS policy is defined in the wholesaler instance. The RADIUS response used during the subscriber instantiation provides the service context of the retailer VPRN. If the wholesaler has a retail business, the operator can configure a separate VPRN for their retail services.

The retailer subscriber interface primarily controls the DHCP configuration. The single exception to this model is the lease-populate value. The lease-populate value in the wholesale context controls the individual SAP limits. The lease-populate value in the retail subscriber interface controls the limits for that retailer interface. The wholesale and retail limits must be met before the instantiation of a new subscriber.

Figure 68-2 shows the configuration for a traditional and wholesale retail VPRN.

Figure 68-2 Routed CO for traditional and wholesale/retail VPRNs



See chapter 74 for more information on configuring the forwarding service component for wholesale and retail VPRN services.

Subscriber host polling and monitoring

Subscriber hosts can be periodically polled and monitored for certain DHCP event changes. A subscriber host monitoring configuration form is available from the Manage Residential Subscribers form.

The maximum number of hosts that can be selected for monitoring is configurable through XML; the default is five. Host monitoring has a performance impact, so only a small number are typically monitored at one time.

The Monitored Subscriber Host form displays a variety of polled information about the host that is obtained from the NE. You can also open a DHCP event log for the host from the Host Properties form. The logged events include information on DHCP lease renewals, lease expiration, and profile changes. An entry is added to the table whenever a new event occurs. You can purge event entries using the Host Properties form.

Host monitoring can be started, stopped, or removed from the monitoring configuration form, and the monitoring period and polling interval can be configured.

The Host monitored objects and associated events are stored in the 5620 SAM database. The monitoring continues until the monitoring period elapses or the monitoring is stopped by a 5620 SAM operator.

SAP monitoring

You can monitor the DHCP events on one or more SAPs. A SAP monitoring form is available from the Manage Residential Subscribers form.

The maximum number of SAPs that can be selected for monitoring is configurable through XML; the default is five. SAP monitoring has a performance impact, so only a small number are typically monitored at one time.

The Monitored Access Interface form displays a variety of DHCP-related events or notifications about subscriber hosts on a SAP that are compiled using traps received from NEs. You can also open an event log for the SAP from the SAP Properties form. The logged events include information on DHCP lease entries, lease states, and host connectivity. An entry is added to the table whenever a new event occurs. You can purge event entries using the Monitoring Configuration form.

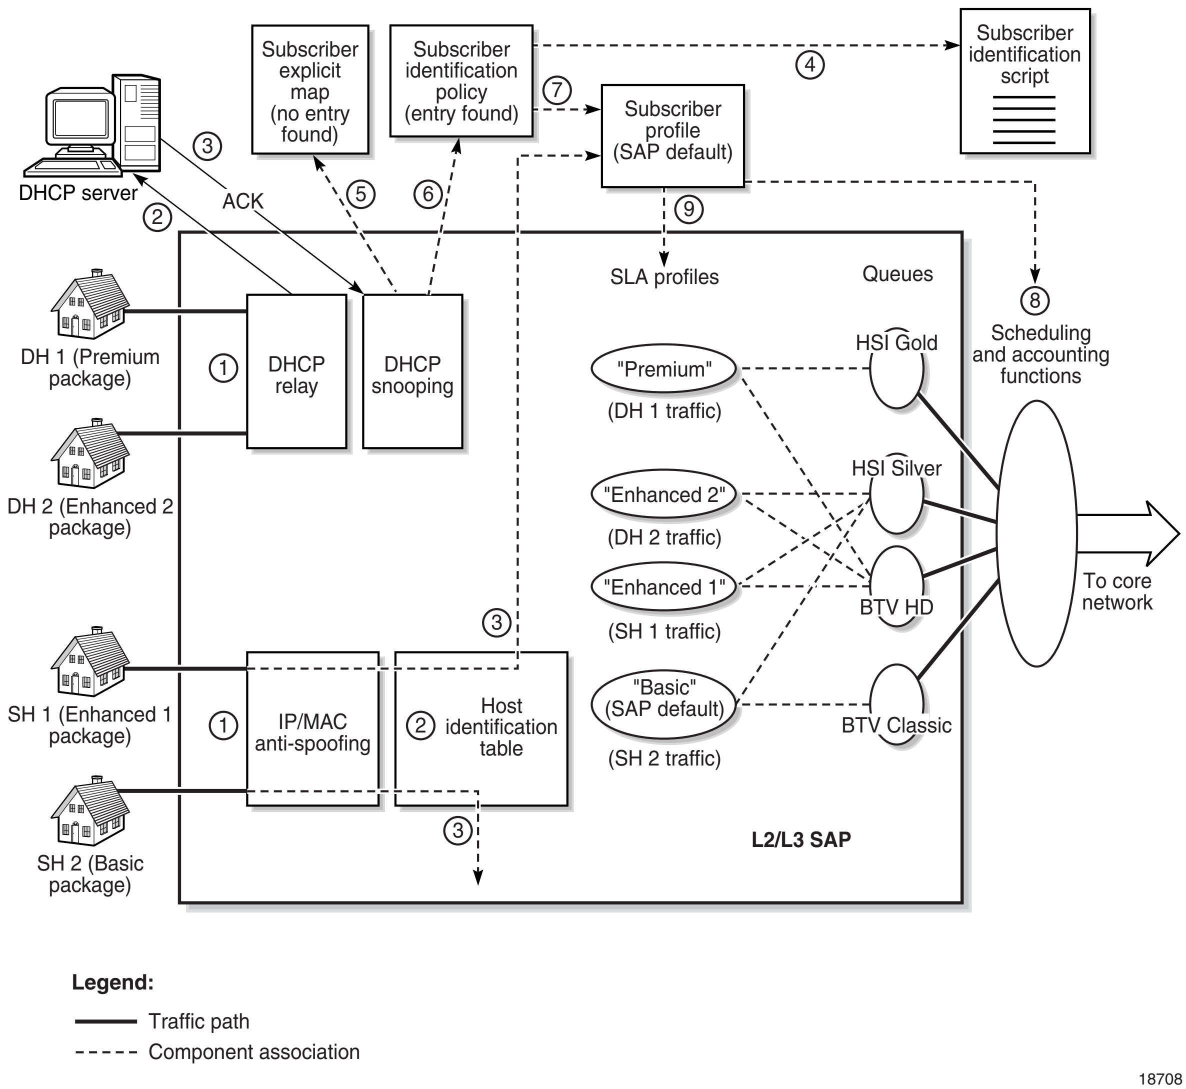
SAP monitoring can be started, stopped, or removed from the monitoring configuration form, and the monitoring period can be configured.

The SAP monitored objects and the associated events are stored in the database. The monitoring continues until the monitoring period elapses or the monitoring is stopped by a 5620 SAM operator.

68.2 Sample configuration

Figure 68-3 shows how residential subscriber management assigns resources to dynamic and static hosts. Many different configurations are possible; the sample portrays the residential subscriber management mechanism rather than a particular service delivery model. For simplicity, the sample consists of one subscriber instance on one SAP, and two types of service offering. Each service offering is available in two classes.

Figure 68-3 Sample configuration



The customer provides a subscriber identification string, the names of the four end-user service packages, and the bandwidth and class requirements for each package. Each package is a combination of HSI and BTV. A 5620 SAM operator creates four queues and four SLA profiles with which the queues are associated, as shown in Table 68-3. Alcatel-Lucent recommends that the 5620 SAM operator give the SLA profiles the same names as the packages to prevent confusion.

Table 68-3 Sample configuration service packages

Subscriber host	Package name	SLA profile name	Associated queues
DH 1	Premium	Premium	HSI Gold, BTV HD
DH 2	Enhanced 2	Enhanced 2	HSI Silver, BTV HD

(1 of 2)

Subscriber host	Package name	SLA profile name	Associated queues
SH 1	Enhanced 1	Enhanced 1	HSI Gold, BTV Classic
SH 2	Basic	Basic	HSI Silver, BTV Classic

(2 of 2)

The customer offers two classes of BTV and HSI services:

- BTV HD: high-definition broadcast television
- BTV Classic: regular-definition broadcast television
- HSI Gold: high-bandwidth broadband Internet access
- HSI Silver: regular broadband Internet access

The following steps, which correspond to the numeric labels in the upper part of Figure 68-3, define the sequence of events for dynamic subscriber hosts that attempt to join the network.

1 Dynamic Host 1 (DH 2) and Dynamic Host 2 (DH 2) each send a DHCP request to the SAP.

2 DHCP relay on the SAP forwards the DHCP requests to the DHCP server.

3 The DHCP server authorizes the requests and responds with a DHCP ACK message for each subscriber host.

4 The subscriber identification policy uses a script to obtain the subscriber identification string, an optional subscriber profile string, and an optional SLA profile string from the Option 82 information in each ACK message. DH 1 and DH 2 provide the same subscriber profile identification string but different SLA profile strings.

5 The NE checks the subscriber identification string values against the entries in the subscriber explicit map and finds no matching entries for the hosts.

6 The NE checks the subscriber profile string and the SLA profile string values for each host against the subscriber identification policy.

7 The NE assigns the same subscriber profile to DH 1 and DH 2 based on the subscriber profile string provided by each host.

8 DH 1 is the first host to join the network, so the scheduling and accounting functions associated with the assigned subscriber profile are instantiated on the SAP.

9 The NE matches the SLA profile string provided by each host to an SLA profile. The NE assigns the Premium SLA profile to DH 1 and the Enhanced 2 SLA profile to DH 2 based on the provided SLA profile strings. These are the first hosts of the subscriber to join the network, so the appropriate queues are instantiated on the SAP based on the SLA profile specifications, and host traffic subsequently flows.

The following steps, which correspond to the numeric labels in the lower part of Figure 68-3, define the sequence of operations for static subscriber hosts that join the network.

1 Static Host 1 (SH 1) turns on the computer, and Static Host 2 (SH 2) turns on the television.

2 The host devices request network access; IP- matching (and optional MAC-matching) anti-spoofing on the SAP checks the static host table on the NE and validates both requests.

3 The NE assigns resources to each static host based on subscriber profile and SLA profile designations, and host traffic subsequently flows.

- The static host table entry for SH1 names a subscriber profile and an SLA profile. Although SH 1 is the first host to use this SLA profile, the queues defined in the profile are already instantiated because of the application of the SLA profiles for DH 1 and DH 2.
- For SH 2, there is no explicit association between the host and a subscriber profile or an SLA profile, so the NE assigns the SAP default subscriber and SLA profiles, which define the most basic service package the customer offers to end users.

68.3 Workflow to manage residential subscribers

1 Create a service that effectively delivers the proposed residential service offering. See Chapter 64 for more information.

2 Depending on your service delivery model, configure the following policies as required:

- subscriber identification policy. See Procedure 68-1.
- ANCP policy. See Procedure 68-2.
- PPPoE policy. See Procedure 68-3.
- PPP policy. See Procedure 68-4.
- MSAP policy. See Procedure 68-5
- host tracking policy. See Procedure 68-6.
- category map policy. See Procedure 68-7.
- credit control policy. See Procedure 68-8
- IGMP policy. See Procedure 68-9.
- BGP Peering policy. See Procedure 68-10
- diameter policy. See Procedure 68-11.
- subscriber multicast CAC policy. See Procedure 68-12.

3 Create ingress and egress scheduler policies for the subscriber hosts in accordance with the customer SLA. See Procedure 47-15.

4 Create an accounting policy for the customer. See the *5620 SAM Statistics Management Guide* for more information.

5 Create access ingress and access egress QoS policies for the different applications, for example, HSI and VoIP, and levels of service, for example, gold, silver, and bronze, that subscriber hosts are to receive. See Procedure 47-1 and 47-3. Associate the queues in the QoS policies with the previously created ingress and egress scheduler policies.

6 Specify a unique subscriber identification string for the subscriber, according to your customer specifications. See “Functional description” in this chapter for the different options for specifying a subscriber identification string.

7 Create a RADIUS-based accounting policy for the subscriber, as required. See Procedure 53-1.

8 Create a policer control policy for the subscriber, as required. See Procedure 47-20.

9 Create SLA profiles that name the previously created QoS policies. See procedure 68-13 for more information.

- **i** Create a different SLA profile for each class of service offering.
- **ii** Use override values to customize the policy values, as required.
- **iii** Use override values to customize the policer values, as required.

10 Create a subscriber profile. See procedure 68-14 for more information.

- **i** Choose the previously created ingress and egress scheduler policies.
- **ii** Choose the previously created accounting policy.
- **iii** Enable accounting.
- **iv** Assign the previously created RADIUS-based accounting policy, as required.
- **v** Assign the previously created ingress and egress policer control policies, as required.
- **vi** Associate one or more of the previously created SLA profiles with the subscriber profile.

11 Create, configure, and manage SAPs, as required.

- **a** Assign the subscriber profile and SLA profiles to the service SAPs. See Procedure 68-15.
- **b** Enable or disable residential subscriber management on a SAP. See Procedure 68-16.
- **c** Specify a subscriber identifier, subscriber profile, and SLA profile for each static host, as required, if default values are not configured on the SAP. See procedure 68-17 for more information.
- **d** Configure a MEP on a SAP. See Procedure 68-18.
- **e** List and manage subscriber management SAPs. See Procedure 68-19.

12 Create, configure, and manage MSAPs, as required.

- **a** Create a Capture SAP that will enable the creation of an MSAP. See Procedure 68-20.
- **b** List MSAPs and view MSAP properties. See Procedure 68-21.
- **c** View an MSAP event log, modify the global MSAP log policy, and purge MSAP log records. See Procedure 68-22.
- **d** Modify and re-evaluate an MSAP policy on an MSAP. See Procedure 68-23.
- **e** Modify an MSAP policy and re-evaluate the MSAPs. See Procedure 68-24.

f Delete an MSAP. See Procedure 68-25.

g Delete an MSAP policy. See Procedure 68-26.

13 Configure or monitor DHCP or NE SHCV events or databases, as required.

a Configure DHCP event monitoring for a SAP. See Procedure 68-27.

b Monitor DHCP events for a SAP. See Procedure 68-28.

c Configure DHCP lease management for a subscriber host. See Procedure 68-29.

d Configure DHCP event monitoring for a subscriber host. See Procedure 68-30.

e Monitor DHCP events for a subscriber host. See Procedure 68-31.

f Configure a local user database to authenticate DHCP clients. See Procedure 68-32.

g Configure NE SHCV event handling. See Procedure 68-33.

14 Turn up the service.

15 Provide the customer with the necessary IP information for provisioning dynamic and static hosts in the customer network.

16 Perform one or more of the following, as required.

a Create a subscriber explicit map, if required. See procedure 68-34 for more information.

b Retrieve PPPoA sessions. See Procedure 68-35.

c Configure a MEP on an SDP Binding. See Procedure 68-36.

d Configure L2Aware static port forwarding on a residential subscriber instance. See Procedure 68-37.

e Resynchronize static port forwarding entries. See Procedure 68-38.

f Collect, view, and clear host tracking statistics and information. See Procedure 68-39.

17 View information associated with the residential subscriber, as required.

a View subscriber host information. See Procedure 68-40.

b View a subscriber and the associated subscriber hosts. See Procedure 68-41.

c View a subscriber instance and the associated subscriber hosts. See Procedure 68-42.

- **d** View or configure active residential subscriber hosts on a SAP. See Procedure 68-43.
- **e** View SHCV log events. See Procedure 68-44.

18 Modify a subscriber's subscription details, as required.

- **a** Rename a subscriber. See Procedure 68-45.
- **b** Reset a subscriber's subscription credit limit. See Procedure 68-46.
- **c** Modify the primary subscriber identification script or URL. See Procedure 68-47.
- **d** Delete an inactive residential subscriber instance. See Procedure 68-48.

68.4 Residential subscriber management procedures

Use the following procedures to perform residential subscriber management tasks.

Procedure 68-1 To create or modify a subscriber identification policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Perform one of the following.

- **a** Create a subscriber identification policy.
  - **i** Click on the Create button and choose Create Subscriber Identification Policy from the drop-down menu. The Subscriber Identification Policy (Create) form opens.
  - **ii** Go to step 3.
- **b** Modify a subscriber identification policy.

  Caution — Modifying an active subscriber identification policy is potentially service-affecting. Ensure that you consider the implications of reconfiguring the subscriber identification policy before you proceed.

  - **i** Choose Subscriber Identification Policy from the object drop-down list.
  - **ii** Configure the filter criteria and click on the Search button. A list of subscriber identification policies appears.
  - **iii** Select a subscriber identification policy and click on the Properties button. The Subscriber Identification Policy (Edit) form opens.

3 Configure the parameters:

- Displayed Name
- Description
- Strings From Option
- Primary Script URL
- Primary Script Administrative State
- Secondary Script URL
- Remove oldest Subscriber Host
- Tertiary Script URL
- Tertiary Script Administrative State

Note 1 — You can designate a subscriber identification policy as the default policy by specifying the case-sensitive name “default” for the Displayed Name parameter. The Displayed Name parameter is configurable only during subscriber identification policy creation.

Note 2 — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Supported Service Models tab button to indicate the intended service model for the subscriber identification policy.

Note — The 5750 SSC requires the specification of a service model for proper interoperation with the 5620 SAM.

5 Configure the parameters:

- VLAN per Subscriber (Routed)
- VLAN per Service (Routed)
- VLAN for all Services (Routed)
- VLAN per ISP per Service (Routed)
- VLAN per Subscriber (Bridged)
- VLAN per Service (Bridged)
- VLAN for all Services (Routed)
- VLAN per ISP per Service (Bridged)

6 Click on the SLA Profiles tab button. The General tab is displayed.

7 Configure the Use Direct Map as Default parameter.

8 Perform one of the following steps to configure SLA profiles for the subscriber identification policy, if required.

a Assign an SLA profile.

i Click on the Create button. The SLAProfileEntry (Create) form opens.

ii Click on the Select button to choose an SLA profile. The Select SLA Profile form opens.

iii Select an SLA profile and click on the OK button. The Select SLA Profile form closes, and the SLAProfileEntry (Create) form refreshes with the SLA profile information.

iv Configure the SLA Profile String parameter.

- v Click on the OK button to close the SLAProfileEntry (Create) form. A dialog box appears.
- vi Click on the OK button. The Subscriber Identification Policy (Create) form refreshes with the SLA profile entry.

b Remove an SLA profile.

- i Select an SLA profile and click on the Delete button. A dialog box appears.
- ii Click on the OK button. The SLA profile is removed from the list.
- iii If you want to assign an SLA profile to replace the removed SLA profile, go to step 8 a.

9 Click on the Subscriber Profiles tab button. The General tab is displayed.

10 Configure the Use Direct Map as Default parameter.

11 Perform one of the following steps to configure subscriber profiles for the subscriber identification policy, if required.

a Add a subscriber profile.

- i Click on the Create button. The SubscrProfileEntry (Create) form opens.
- ii Click on the Select button to choose a subscriber profile. The Select Subscriber Profile form opens.
- iii Select a subscriber profile and click on the OK button. The Select Subscriber Profile form closes, and the SubscrProfileEntry (Create) form refreshes with the subscriber profile information.
- iv Configure the Subscriber ID Alias parameter.
- v Click on the OK button to close the SubscrProfileEntry (Create) form. A dialog box appears.
- vi Click on the OK button. The Subscriber Identification Policy (Create) form refreshes with the subscriber profile entry.

b Remove a subscriber profile.

- i Select a subscriber profile and click on the Delete button. A dialog box appears.
- ii Click on the OK button. The subscriber profile is removed from the list.

12 Click on the Application Profiles tab button. The General tab is displayed.

13 Configure the Use Direct Map as Default parameter.

14 Perform one of the following steps to configure application profiles for the subscriber identification policy, if required.

a Add an application profile.

i Click on the Create button. The AppProfileEntry (Create) form opens.

ii Click on the Select button to choose an application profile. The Select Application Profile form opens.

Note 1 — If the subscriber identification policy opened in step 2 is a global policy, global AA group policies are listed. If the subscriber identification policy is a local policy, local AA group policies are listed.

Note 2 — The global AA group policies must be manually distributed to the NE before a global subscriber identification policy using the application profiles can be distributed.

Note 3 — When a new subscriber identification or subscriber explicit map is discovered from the NE, the AA group policy is not automatically resynchronized to the global subscriber identification policy.

iii Select an application profile and click on the OK button. The Select Application Profile form closes, and the AppProfileEntry (Create) form refreshes with the application profile information.

iv Configure the Application Profile parameter.

v Click on the OK button to close the AppProfileEntry (Create) form. A dialog box appears.

vi Click on the OK button. The Subscriber Identification Policy (Create) form refreshes with the application profile entry.

b Remove an application profile.

i Select an application profile and click on the Delete button. A dialog box appears.

ii Click on the OK button. The application profile is removed from the list.

15 Click on the OK button to close the Subscriber Identification Policy (Create) form. A dialog box appears.

16 Click on the Yes button. The Subscriber Identification Policy (Create) form closes.

17 Close the Manage Subscriber Policies form.

Procedure 68-2 To create or modify an ANCP policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Perform one of the following:

a Create an ANCP policy.

i Click on the Create button and choose Create ANCP Policy from the drop-down menu. The ANCP (Create) form opens.

ii Go to step 3.

b Modify an ANCP policy.

i Choose an ANCP policy from the object drop-down list of the Manage Subscriber Policies form.

ii Configure the filter criteria and click on the Search button. A list of ANCP policies appears.

iii Select an ANCP policy and click on the Properties button. The ANCP Policy (Edit) form opens.

3 Configure the Displayed Name parameter.

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Configure the following parameters in the Ingress panel:

- Rate Adjustment
- Rate Reduction (kbps)
- Rate Monitor (kbps)
- Rate Modification
- Rate Monitor Notification
- Rate Modification Scheduler

  The Rate Modification Scheduler parameter is configurable when the Rate Modification parameter is set to Scheduler.

5 Configure the following parameters in the Egress panel:

- Rate Adjustment
- Rate Reduction (kbps)
- Rate Monitor Notification
- Rate Modification
- Rate Monitor Notification
- Rate Modification Scheduler

  The Rate Modification Scheduler parameter is configurable when the Rate Modification Modification parameter is set to Scheduler.

6 Configure the following parameters in the Port Down panel:

- Disable SHCV
- Disable SHCV Notification
- Disable SHCV Hold Time (seconds)

7 Click on the OK button to close the ANCP Policy (Create) form.

Procedure 68-3 To create or modify a PPPoE policy

The 5620 SAM supports PPPoE configuration on the 7750 SR and the 7710 SR.

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Choose PPPoE Policy (pppoe) from the object drop-down list in the Manage Subscriber Policies form.

3 Perform one of the following:

a Create a PPPoE policy.

i Click on the Create button. A drop down menu appears.

ii Choose Create PPPoE Policy. The PPPoE Policy, Global Policy (Create) form opens.

b Modify a PPPoE policy.

i Configure the filter criteria and click on the Search button. A list of PPPoE policies appears.

ii Select a PPPoE policy and click on the Properties button. The PPPoE Policy (Edit) form opens.

4 Configure the parameters:

- Displayed Name
- Description
- PPP MTU
- LCP Keep-Alive Interval (seconds)
- LCP Keep-Alive Hold Up Multiplier
- Disable AC Cookies
- PADO Delay (100’s of milliseconds)
- Maximum Sessions Per MAC
- Enable Reply On PADT
- Authentication Type
- Minimum CHAP Challenge Length
- Maximum CHAP Challenge Length
- Initial Delay
- IPCP Subnet Negotiation

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the Apply button. The PPPoE Policy (Edit) form refreshes with the policy configuration mode information.

6 To distribute the policy to an NE, if a local definition does not exist, click on the Local Definitions tab button. A list of NEs appears. See Procedure 46-1 for more information about distributing a policy.

7 Click on the Options tab. A list of options appears.

8 Perform one of the following:

a To add an option, go to step 12.

b To edit an existing option, go to step 9.

9 Choose an option from the list.

10 Click on the Properties button. The PPPoE Option (Edit) form opens.

11 Go to step 13.

12 Click on the Create button. The PPPoE Option (Create) form opens.

13 Configure the parameters:

- Option Protocol
- Custom Option Number
- Option Type
- Option Value
- IP Address

14 Click on the OK button to close the PPPoE Option (Create) form. A dialog box appears.

15 Click on the OK button. The PPPoE Option (Create) form closes.

Procedure 68-4 To create or modify a PPP policy

The 5620 SAM supports PPP configuration on the 7450 ESS, 7750 SR, and the 7710 SR, release 4 and later.

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Choose PPP Policy (PPP Policy and Session) from the object drop-down list in the Manage Subscriber Policies form.

3 Perform one of the following:

a Create a PPP policy.

i Click on the Create button. A drop down menu appears.

ii Choose Create PPP Policy. The PPP Policy - Global Policy (Create) form opens.

b Modify a PPP policy.

i Configure the filter criteria and click on the Search button. A list of PPP policies appears.

ii Select a PPP policy and click on the Properties button. The PPP Policy (Edit) form opens.

4 Configure the parameters:

- Displayed Name
- Description
- PPP MTU
- LCP Keep-Alive Interval (seconds)
- LCP Keep-Alive Hold Up Multiplier
- Disable AC Cookies
- PADO Delay (100’s of milliseconds)
- Maximum Sessions Per MAC
- Enable Reply On PADT
- Authentication Type
- Minimum CHAP Challenge Length
- Maximum CHAP Challenge Length
- Initial Delay
- IPCP Subnet Negotiation
- PPP MTU Force Greater Than 1492
- Unique Session ID per SAP
- Reject Disabled NCP
- PADO AC Name

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the Apply button. The PPP Policy (Edit) form refreshes with the policy configuration mode information.

6 To distribute the policy to an NE, if a local definition does not exist, click on the Local Definitions tab button. A list of NEs appears. See Procedure 46-1 for more information about distributing a policy.

7 Click on the Options tab. A list of options appears.

8 Perform one of the following:

a To add an option, go to step 12.

b To edit an existing option, go to step 9.

9 Choose an option from the list.

10 Click on the Properties button. The PPP Option (Edit) form opens.

11 Go to step 13.

12 Click on the Create button. The PPP Option (Create) form opens.

13 Configure the parameters:

- Option Protocol
- Custom Option Number
- Option Type
- Option Value
- IP Address

14 Click on the OK button to close the PPP Option (Create) form. A dialog box appears.

15 Click on the OK button. The PPP Option (Create) form closes.

Procedure 68-5 To create or modify an MSAP policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber form appears.

2 In the Manage Residential Subscriber form, choose Global as the Policy scope and right-click on the Create button to open the contextual menu.

3 Perform one of the following:

a Create a MSAP policy.

i Click on the Create button. A drop down menu appears.

ii Choose Create MSAP Policy. The MSAP Policy - Global (Create) form opens.

b Modify a MSAP Policy.

i Configure the filter criteria and click on the Search button. A list of MSAP policies appears.

ii Select a PPP policy and click on the Properties button. The MSAP Policy (Edit) form opens.

4 Configure the parameters on the General tab:

- Displayed Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the Security tab button and configure the parameters.

   i In the DoS Protection Policy area, click on the Select button to open the Select NE DoS Protection form and choose a NE DoS Protection.

   ii If MAC Monitoring is required, select the MAC Monitoring check box.

6 Click on the Subscriber Management tab button and configure the parameters.

- Subscriber Limit
- Default Subscriber Identification Type
- Default Subscriber ID
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id
- Default Subscriber Profile
- Default SLA Profile
- Default Subscriber Identification Policy
- Default Application Profile
- Profiled Traffic Only
- Non-Subscriber Traffic Identification
- Non-Subscriber Traffic Subscriber Profile
- Non-Subscriber Traffic SLA Profile
- Non-Subscriber Traffic Application Profile

7 Click on the ATM tab button.

8 Configure the ATM OAM Alarm Cell Handling and Periodic ATM OAM Loopback parameters.

9 Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

10 Select an ingress ATM policy from the list and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes and the MSAP Policy - Global (Create) form refreshes with the ingress ATM policy information displayed.

11 Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

12 Select an egress ATM policy from the list and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes and the MSAP Policy - Global (Create) form refreshes with the egress ATM policy information displayed.

13 Perform the following as required:

   a Click on the VPLS Configuration Only tab button and configure the following tabs within the VPLS Configuration Only tab.

      i Click on the General tab button and configure the parameters:

      - Split Horizon Group Name
      - Displayed Name
      - ARP Reply Agent
      - LAG link selection

ii Click on the DHCP tab button and configure the parameters:

- Lease Populate
- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- Administrative State
- Emulated Server IP Address
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

iii Click on the IGMP Snooping tab button and configure the parameters:

- IGMP Import Policy
- Fast Leave
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- IGMP Version
- Last Member Query Interval (tenths of seconds)
- Name
- Description
- Default Action
- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- MVR Source Interface

b If this policy is for an MSAP on an IES or VPRN, click on the IES VPRN Only Configuration tab button and configure the Anti-Spoofing parameter to be Source IP and MAC Addr.

14 Click on the VPLS Multicast CAC Constraints tab button and configure the parameters as follows:

Note 1 — Up to eight Multicast CAC Level entries can be created for an MSAP policy.

Note 2 — Up to eight Multicast CAC LAG entries can be created for an MSAP policy

Note 3 — The Bandwidth (kbps) range is 1 to 4 294 967 952 for an MSAP policy.

i Click on the Create button in the LAG Port Down tab and configure the following parameters:

- Number of Ports Down
- Level ID

ii Click on the Create button in the Level tab and configure the following parameters:

- Level ID
- Bandwidth (kbps)

15 Click on the Apply button.

16 Click on the OK button.

Procedure 68-6 To create or modify a host tracking policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber Policies form opens.

2 Choose Host Tracking Policy (Residential Subscriber) from the object drop-down list in the Manage Residential Subscriber Policies form.

3 Perform one of the following:

a Create a host tracking policy.

i Click on the Create button. A drop down menu appears.

ii Choose Host Tracking Policy. The Host Tracking Policy, Global Policy (Create) form opens.

b Modify a host tracking policy.

i Configure the filter criteria and click on the Search button. A list of host tracking policies appears.

ii Select a host tracking policy and click on the Properties button. The Host Tracking Policy (Edit) form opens.

4 Configure the parameters:

- Displayed Name
- Description
- Rate Modification
- Rate Modification Scheduler

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the Apply button. The Host Tracking Policy (Edit) form refreshes with the policy configuration mode information.

6 To distribute the policy to an NE, if a local definition does not exist, click on the Local Definitions tab button. A list of NEs appears. See Procedure 46-1 for more information about distributing a policy.

7 Close the Host Tracking Policy (Edit) form.

Procedure 68-7 To create or modify a category map policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber form appears.

2 Click on the Create button to open the contextual menu.

3 Choose Category Map Policy from the contextual menu. The Category Map Policy (Create) form appears with the General tab displayed.

4 Perform one of the following:

a Create a category map policy.

i Click on the Create button. A drop down menu appears.

ii Choose Category Map Policy. The Category Map Policy, Global Policy (Create) form opens.

b Modify a category map policy.

i Configure the filter criteria and click on the Search button. A list of category map policies appears.

ii Select a category map policy and click on the Properties button. The Category Map Policy (Edit) form opens.

5 Configure the parameters:

- Displayed Name
- Description
- Credit Type
- Credit Exhuast Threshold (%)
- Activity Threshold (kbps)

6 Click on the Category tab button.

7 Click on the Create button. The Category (Create) form opens with the general tab displayed.

8 Configure the parameters:

- Displayed Name
- Description
- Credit Type Override
- Rating Group
- Out Of Credit Action
- Default Credit Type
- Default Credit Time (seconds)
- Default Credit Volume
- Default Credit Volume Unit
- PIR (kbps)

The Rating Group parameter is only configurable when the Use Rating Group check box is enabled.

The PIR (kbps) parameter is configured to its maximum value when the MAX check box is enabled.

Note — A maximum of three categories can be created for each category map policy.

9 Click on the Queues tab button.

10 Select any or all of the Ingress and Egress Queues to be defined in the category.

11 Click on the Policers tab button.

12 Select any or all of the Ingress and Egress Policers to be defined in the category.

13 Click on the Credit Exhausting Service Levels tab button.

14 Perform one of the following:

a To define credit exhausting service levels for IP filter entries, go to step 15.

b To define credit exhausting service levels for IPv6 filter entries, go to step 21.

15 Click on the IP Filter Entries tab button.

16 Click on the Create button. The Exhausted IP Filter Entry (Create) form opens with the General tab displayed.

17 Configure the parameters:

- Filter Direction
- Entry ID
- Displayed Name
- Description

18 Click on the Filter Properties tab button.

19 Configure the parameters:

- Action
- Protocol
- DSCP
- Source IP Address
- Src Mask
- Destination IP Address
- Dst Mask
- Fragment
- IP Option
- IP Opt Mask
- Option Present
- Multiple Option

20 Go to step 26.

21 Click on the IPv6 Filter Entries tab button.

22 Click on the Create button. The Exhausted IPv6 Filter Entry (Create) form opens.

23 Configure the parameters:

- Filter Direction
- Entry ID
- Displayed Name
- Description

24 Click on the Filter Properties tab button.

25 Configure the parameters:

- Action
- Protocol
- DSCP
- Source IP Address
- Src Mask
- Destination IP Address
- Dst Mask

26 Click on the OK button. A dialog box appears.

27 Click on the OK button. The Category (Create) for reappears with the filter entries information displayed.

28 Click on the OK button. A dialog box appears.

29 Click on the OK button. The Category Map Policy (Create) form reappears with the category information displayed.

30 Click on the OK button. The Category Map Policy (Create) form closes.

Procedure 68-8 To create or modify a credit control policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber form appears.

2 Click on the Create button to open the contextual menu.

3 Choose Credit Control Policy from the contextual menu. The Credit Control Policy (Create) form opens with the General tab displayed.

4 Perform one of the following:

a Create a credit control policy.

i Click on the Create button. A drop down menu appears.

ii Choose Category Map Policy. The Credit Control Policy (Create) form opens.

b Modify a credit control policy.

i Configure the filter criteria and click on the Search button. A list of credit control policies appears.

ii Select a category map policy and click on the Properties button. The Credit Control Policy (Edit) form opens.

5 Configure the parameters:

- Displayed Name
- Description
- Credit Control Server
- Out Of Credit Action
- Error Handling Action

6 Click on the Select button in the Category Map panel. The Select Category Map form opens.

7 Select a category map policy from the list to be used with the credit control policy and click on the OK button. The Select Category Map form closes.

8 If you selected a value of Diameter for the Credit Control Server parameter, click on the Select button in the Diameter Policy panel. The Select Diameter Policy form opens.

9 Select a diameter policy from the list to be used to access the credit control server and click on the OK button. The Select Diameter Policy panel closes.

10 Click on the OK button. The Credit Control Policy (Create) form closes.

Procedure 68-9 To create or modify an IGMP policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber Policies form opens.

2 Choose IGMP Policy (Residential Subscriber) from the object drop-down list in the Manage Residential Subscriber Policies form.

3 Perform one of the following:

a Create an IGMP policy.

i Click on the Create button. A drop down menu appears.

ii Choose Create IGMP Policy. The IGMP Policy, Global Policy (Create) form opens.

iii Go to step 4.

b Modify an IGMP policy.

i Configure the filter criteria and click on the Search button. A list of IGMP policies appears.

ii Select an IGMP policy and click on the Properties button. The IGMP Policy (Edit) form opens.

4 Configure the parameters:

- Displayed Name
- Description
- Import Policy
- Maximum Number of Groups
- Administrative Version
- Fast Leave
- Redirection Policy

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Configure the parameters in the multicast reporting panel:

- Administrative State
- Destination Name
- SAP ID
- Service ID
- PPPoE Session ID
- Host MAC

6 Click on the Apply button. The IGMP Policy (Edit) form refreshes with the policy configuration mode information.

7 Click on the Static Group/Source tab button. A list of multicast static group/static source address pairs appears.

8 Perform one of the following:

a Select an address pair from the list and click on the Properties button. The IGMP Policy Static (Edit) form appears. Go to step 9.

b Click on the Create button. The IGMP Policy Static (Create) form appears. Go to step 9.

9 Configure the parameters:

- Static Multicast Group
- Static Source

10 To distribute the policy to an NE, if a local definition does not exist, click on the Local Definitions tab button. A list of NEs appears. See Procedure 46-1 for more information about distributing a policy.

11 Close the IGMP Policy (Edit) form.

Procedure 68-10 To create or modify a BGP Peering policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber Policies form opens.

2 Choose BGP Peering Policy (Residential Subscriber) from the object drop-down list in the Manage Residential Subscriber Policies form.

3 Perform one of the following:

a Create a BGP Peering policy.

i Click on the Create button. A drop down menu appears.

ii Choose Create BGP Peering Policy. The BGP Peering Policy, Global Policy (Create) form opens.

iii Go to step 4.

b Modify a BGP Peering policy.

i Configure the filter criteria and click on the Search button. A list of BGP Peering policies appears.

ii Select a BGP Peering policy and click on the Properties button. The BGP Peering Policy (Edit) form opens.

4 Configure the parameters:

If the Inherit Value box is enabled for a parameter, the parameter value is inherited from the parent BGP object.

- Displayed Name
- Description
- Cluster ID
- Local Address
- BGP Keychain
- MED Source
- MED Value

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

5 Click on the Apply button. The BGP Peering Policy (Edit) form refreshes with the policy configuration mode information.

6 Click on the Behavior tab button and configure the parameters:

If the Inherit Value box is enabled for a parameter, the parameter value is inherited from the parent BGP object.

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- Disable Fast External Failover
- Advertise Inactive Routes
- Peer Type
- Passive
- Next Hop Self
- Minimum TTL Value
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Hold Time (seconds)
- Prefix Limit

7 Click on the AS Properties tab button and configure the parameters:

If the Inherit Value box is enabled for a parameter, the parameter value is inherited from the parent BGP object.

- Peer AS
- Min AS Origination (seconds)
- Disable 4Byte ASN
- AS Override
- Local AS
- Remove Private AS

8 Click on the Import Policies tab button and configure the parameters:

If the Inherit Value box is enabled for a parameter, the parameter value is inherited from the parent BGP object.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

9 Click on the Export Policies tab button and configure the parameters:

If the Inherit Value box is enabled for a parameter, the parameter value is inherited from the parent BGP object.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

10 Click on the Authentication tab button and configure the parameters:

If the Inherit Value box is enabled for a parameter, the parameter value is inherited from the parent BGP object.

- MD5 Authentication
- Authentication Key

11 To distribute the policy to an NE, if a local definition does not exist, click on the Local Definitions tab button. A list of NEs appears. See Procedure 46-1 for more information about distributing a policy.

12 Close the BGP Peering Policy (Edit) form.

Procedure 68-11 To create or modify a diameter policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber Policies form opens.

2 Perform one of the following.

a Create a diameter policy.

i Click on the Create button and choose Diameter Policy from the drop-down menu. The Diameter Policy (Create) form appears with the General tab displayed.

ii Go to step 3.

b Modify a diameter policy.

Caution — Modifying an active diameter policy is potentially service-affecting. Ensure that you consider the implications of reconfiguring the diameter policy before you proceed.

i Choose Diameter Policy from the object drop-down list.

ii Configure the filter criteria and click on the Search button. A list of diameter policies appears.

iii Select a diameter policy and click on the Properties button. The Diameter Policy (Edit) form opens.

3 Configure the parameters:

- Displayed Name
- Description

4 On the Connection Origin panel, configure the Virtual Router Type parameter.

If you specified VPRN Service as the Virtual Router Type, you must also configure the Service Name parameter on the VPRN Service panel. Click on the Select button and choose a VPRN service from the Select VPRN Service - Diameter Policy form.

5 Configure the timer parameters:

- Watchdog Timer (seconds)
- Connection Timer (seconds)
- Transaction Timer (seconds)

6 Click on the DCAA Parameters tab button.

7 Configure the parameters:

- Failover Support
- Failure Handling
- Tx Timer (seconds)
- Service Context ID
- RADIUS Called-Station-ID
- Include RADIUS User
- Origin Subscription ID
- Subscription ID Type

8 Click on the Peers tab button.

9 Click on the Create button. The Diameter Peer - Diameter Policy (Create) form appears with the General tab displayed.

10 Configure the parameters:

- Displayed Name
- Description
- Administrative State
- Preference
- IP Address
- Port Number
- Protocol
- Destination Host
- Destination Realm

11 If you want to specify local override settings for any of the timer settings for the peer, deselect the Inherit Value check box and then specify a value for any of the following timer parameters:

- Watchdog Timer (seconds)
- Connection Timer (seconds)
- Transaction Timer (seconds)

Note — When the Inherit Value check box is selected for a timer parameter on a peer object, the timer value is inherited from the parent diameter policy.

12 Click on the OK button on Diameter Peer - Diameter Policy (Create) form. The Diameter Policy (Create) form reappears with the new peer displayed on the Peers tab.

13 Click on the OK button in the Diameter Policy (Create) form. The Manage Residential Subscriber Policies form reappears with the new diameter policy displayed in the list.

14 Close the Manage Residential Subscriber Policies form.

Procedure 68-12 To create or modify a subscriber multicast CAC policy

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Perform one of the following.

a Create a subscriber multicast CAC policy.

i Click on the Create button and choose Create Subscriber Multicast CAC Policy from the drop-down menu. The Subscriber Multicast CAC Policy (Create) form opens.

ii Go to step 3.

b Modify a subscriber multicast CAC policy.

i Choose Subscriber Multicast CAC Policy from the object drop-down list.

ii Configure the filter criteria and click on the Search button. A list of subscriber multicast CAC policies appears.

iii Select a subscriber multicast CAC policy and click on the Properties button. The Subscriber Multicast CAC Policy (Edit) form opens.

3 Configure any applicable parameters:

- Displayed Name
- Description
- Administrative State
- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button. The Subscriber Multicast CAC Policy (Create) form closes.

5 Close the Manage Subscriber Policies form.

Procedure 68-13 To create or modify an SLA profile

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Perform one of the following.

a Create an SLA profile.

i Click on the Create button and choose Create SLA Profile from the drop-down menu. The SLA Profile (Create) form opens.

ii Go to step 3.

b Modify an SLA profile.

Caution — Modifying an active SLA profile is potentially service-affecting. Ensure that you consider the implications of reconfiguring the SLA profile before you proceed.

i Choose SLA Profile from the object drop-down list.

ii Configure the filter criteria and click on the Search button. A list of SLA profiles appears.

iii Select an SLA profile and click on the Properties button. The SLA Profile (Edit) form opens.

3 Configure the parameters:

- Displayed Name
- Application
- Description
- Host Limit
- Remove oldest Subscriber Host

The Displayed Name parameter is configurable only during SLA profile creation.

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Select button in the Credit Control Policy panel. The Select Credit Control Policy form opens.

5 Select a credit control policy from the list and click on the OK button. The Select Credit Control Policy form closes.

Note — If you select a credit control policy, you will not be able to select a category map in step 13.

6 Click on the QoS tab button to choose QoS policies for the SLA profile.

7 Perform one of the following steps using the buttons in the Ingress Policy and Egress Policy panels.

a Assign a policy.

i Click on the appropriate Select button to choose an ingress or egress QoS policy. The ingress or egress Select Policy - SLA Profile form opens.

ii Select a policy and click on the OK button. The Select Policy - SLA Profile form closes, and the SLA Profile (Create) form refreshes with the chosen policy.

iii Configure the ingress queue parameters:

- Use Shared Queue
- Use Multipoint Shared Queue
- Report Rate Type
- Report Rate Scheduler

iv Configure the egress QoS marking parameters:

- Use Egress QoS Marking From SAP
- Scheduler Type
- Report Rate Type
- Report Rate Scheduler

b Remove a policy.

i Click on the Clear button in the Ingress Policy or Egress Policy panel to remove an ingress or egress QoS policy. The policy is removed from the list.

ii If you want to assign a policy to replace the removed policy, go to step 7a.

8 Click on the ACL tab button to assign ingress or egress IP filters to the SLA profile, if required.

i Click on the Select button in the Ingress IP Filter panel to choose an ingress IP filter from the Select Ingress IP Filter - SLA Profile form.

ii Click on the Select button in the Egress IP Filter panel to choose an egress IP filter from the Select Egress IP Filter - SLA Profile form.

iii Click on the Select button in the Ingress IPv6 Filter panel to choose an ingress IPv6 filter from the Select Ingress IPv6 Filter - SLA Profile form.

iv Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress filter from the Select Egress IPv6 Filter - SLA Profile form.

9 Click on the Supported Service Models tab button to indicate the intended service model for the SLA profile.

Note — The 5750 SSC requires the specification of a service model for interoperation with the 5620 SAM.

10 Configure the parameters:

- VLAN per Subscriber (Routed)
- VLAN per Service (Routed)
- VLAN for all Services (Routed)
- VLAN per ISP per Service (Routed)
- VLAN per Subscriber (Bridged)
- VLAN per Service (Bridged)
- VLAN for all Services (Routed)
- VLAN per ISP per Service (Bridged)

11 Click on the Category Map tab button.

12 Click on the Select button in the Category Map panel. The Select Category Map form opens.

13 Select a category map from the list and click on the OK button. The Select Category Map form closes.

Note — If you selected a credit control policy in step 5, you will not be able to select a category map.

14 Click on the Create... button in the Categories panel. The Category (Create) form opens.

15 Click on the Select button in the Category Name panel. The Select Category Name form opens.

16 Select a category name from the list and click on the OK button. The Select Category Name form closes and the Category (Create) form reappears with the category name displayed.

17 Configure the Idle Timeout (seconds) parameter.

Note — The session will be disconnected if the value of the Activity Threshold (kbps) parameter is not met during the period specified by the Idle Timeout (seconds) parameter. See procedure 68-7 for more information about configuring the Activity Threshold (kbps) parameter.

18 Click on the OK button. A dialog box appears.

19 Click on the OK button.

20 Click on the Override Policy Items tab button to specify local overrides for queue parameters of the QoS policies assigned to the SLA profile, if required. The Access Ingress Policy tab is displayed.

21 Perform either of the following:

a Modify the access ingress queue parameters.

i Click on the Create button. The Access Ingress Queue Override (Create) form opens with the General tab displayed.

ii Go to step 22.

b Modify the access egress queue parameters.

i Click on the Access Egress Queues tab button.

ii Click on the Create button. The Access Egress Queue Override (Create) form opens with the General tab displayed.

22 Choose the policy queue that you want to override.

i Click on the Select button. The policy queue Select form opens.

ii Select a policy queue and click on the OK button. The policy queue Select form closes, and the Queue Override (Create) form refreshes with the configured values for the policy queue.

23 Click on the Override tab button and configure the parameters:

- Override PIR
- Override CIR
- Override Maximum Burst Size
- Override Committed Burst Size
- Override High Priority Reserved
- Override Port Average Overhead
- Default
- CIR (kbps)
- CIR (kbps)
- Maximum Burst Size (bytes)
- Committed Burst Size (kb)
- High Priority Reserved
- Port Average Overhead (%)

The Override Port Average Overhead and Port Average Overhead (%) parameters are configured only for access egress queues.

24 Click on the OK button to close the Queue Override (Create) form. A dialog box appears.

25 Click on the OK button. The SLA Profile (Create) form refreshes with the queue override entry.

26 Specify local overrides for statistics and traffic flow rate parameters of the ingress or egress policers assigned to the SLA profile, if required.

27 Perform either of the following:

a Modify the access ingress policer parameters.

i Click on the Access Ingress Policers tab button.

ii Click on the Create button. The Ingress Policer Override (Create) form opens with the General tab displayed.

iii Go to step 28.

b Modify the access egress policer parameters.

i Click on the Access Egress Policer tab button.

ii Click on the Create button. The Egress Policer Override (Create) form opens with the General tab displayed.

28 Choose the policy policer that you want to override.

i Click on the Select button. The policy policer Select form opens.

ii Select a policy policer and click on the OK button. The policy policer Select form closes, and the Policer Override (Create) form refreshes with the configured values for the policy policer.

29 Click on the Override tab button and configure the parameters:

- Override PIR
- Override CIR
- Override Maximum Burst Size
- Override Committed Burst Size
- Default
- CIR (kbps)
- CIR (kbps)
- Maximum Burst Size (bytes)
- Committed Burst Size (kb)
- Stats Mode
- Packet Byte Offset

30 Click on the OK button to close the Policer Override (Create) form. A dialog box appears.

31 Click on the OK button. The SLA Profile (Create) form refreshes with the policy policer override entry.

32 Click on the OK button. A dialog box appears.

33 Click on the Yes button. The SLA Profile (Create) form closes.

34 Close the Manage Subscriber Policies form.

Procedure 68-14 To create or modify a subscriber profile

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Perform one of the following.

a Create a subscriber profile.

i Click on the Create button and choose Create Subscriber Profile from the drop-down menu. The Subscriber Profile (Create) form opens.

ii Go to step 3.

b Modify a subscriber profile.

Caution — Modifying an active subscriber profile is potentially service-affecting. Ensure that you consider the implications of reconfiguring the subscriber profile before you proceed.

i Choose Subscriber Profile from the object drop-down list.

ii Configure the filter criteria and click on the Search button. A list of subscriber profiles appears.

iii Select a subscriber profile and click on the Properties button. The Subscriber Profile (Edit) form opens.

3 Configure the parameters:

- Displayed Name
- Description

Note 1 — You can designate a subscriber profile as the default profile by specifying the case-sensitive name “default” for the Displayed Name parameter. The Displayed Name parameter is configurable only during subscriber profile creation.

Note 2 — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

Note 3 — The Egress Aggregate Rate Limit (kbps) and Frame Base Accounting parameters are configurable only when a scheduler is not specified in the Egress Scheduler panel.

4 Click on the Select button in the Accounting Policy panel. The Select Accounting Policy ID - Subscriber Profile form opens.

5 Select an accounting policy and click on the OK button. The Select Accounting Policy ID - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the accounting policy information.

6 Click on the Select button in the ANCP Policy panel. The Select ANCP Policy - Subscriber Profile form opens.

7 Select an ANCP policy and click on the OK button. The Select ANCP Policy - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the ANCP policy information.

8 Click on the Select button in the Host Tracking Policy panel. The Select Host Tracking Policy - Subscriber Profile form opens.

9 Select a host tracking policy and click on the OK button. The Select Host Tracking Policy - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the host tracking policy information.

10 Click on the Select button in the NAT Policy panel. The Select NAT Policy - Subscriber Profile form opens.

11 Select a NAT policy and click on the OK button. The Select NAT Policy - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the NAT policy information.

12 Click on the Select button in the IGMP Policy panel. The Select IGMP Policy - Subscriber Profile form opens.

13 Select an IGMP policy and click on the OK button. The Select IGMP Policy - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the IGMP policy information.

14 Click on the Select button in the Subscriber Multicast CAC Policy panel. The Select Subscriber Multicast CAC Policy - Subscriber Profile form opens.

15 Select a subscriber multicast CAC policy and click on the OK button. The Select Subscriber Multicast CAC Policy - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the subscriber multicast CAC policy information.

16 Click on the Scheduling tab button.

17 Configure the parameters:

- Assign Aggregate Rate Limit
- Egress Aggregate Rate Limit (kbps)
- Average Frame Size
- Encapsulation Offset
- Frame Base Accounting

Note — An additional parameter, Encapsulation Offset Mode, can be configured using OSSI.

18 Perform one of the following steps using the buttons in the Ingress Scheduler and Egress Scheduler panels.

> **Note —** You cannot specify an egress scheduler in a subscriber profile when the Egress Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

a Assign a scheduler.

i Click on the appropriate Select button to choose an ingress or egress scheduler. The ingress or egress Select Scheduler - Subscriber Profile form opens.

ii Select a scheduler and click on the OK button. The Select Policy - Subscriber Profile form closes, and the Subscriber Profile (Create) form refreshes with the chosen scheduler.

b Remove a scheduler.

i Click on the appropriate Clear button to remove an ingress or egress scheduler. The scheduler is removed from the Subscriber Profile (Create) form.

ii If you want to assign a scheduler to replace the removed scheduler, go to step 18a.

19 Click on the RADIUS Accounting tab button to associate a RADIUS-based accounting policy with the subscriber profile or to remove a RADIUS-based accounting policy from the subscriber profile.

20 Perform one of the following steps.

a Assign a RADIUS accounting policy by performing the following steps.

i Click on the Select button in the RADIUS Accounting Information panel. The Select RADIUS Accounting Information - Subscriber Profile form opens.

ii Configure the filter criteria.

iii Click on the Search button. A list of RADIUS accounting policies appears.

iv Select a policy from the list and click on the OK button. The Select RADIUS Accounting Information - Subscriber Profile form closes and the Subscriber Profile (Create) form refreshes with the RADIUS accounting policy information.

b Remove a RADIUS accounting policy.

i Click on the Clear button to remove a RADIUS accounting policy. The policy is removed from the Subscriber Profile (Create) form.

ii If you want to assign a policy to replace the removed policy, go to step 20a.

21 Perform one of the following steps to assign or remove a duplicate RADIUS accounting policy to generate duplicate accounting information for the subscriber profile.

a Assign a duplicate RADIUS accounting policy by performing the following steps.

i Click on the Select button in the Duplicate RADIUS Accounting Information panel. The Select Duplicate RADIUS Accounting Information - Subscriber Profile form opens.

ii Configure the filter criteria.

iii Click on the Search button. A list of RADIUS accounting policies appears.

iv Select a policy from the list and click on the OK button. The Select Duplicate RADIUS Accounting Information - Subscriber Profile form closes and the Subscriber Profile (Create) form refreshes with the duplicate RADIUS accounting policy information.

b Remove a duplicate RADIUS accounting policy.

i Click on the Clear button to remove a duplicate RADIUS accounting policy. The duplicate policy is removed from the Subscriber Profile (Create) form.

ii If you want to assign a duplicate policy to replace the removed duplicate policy, go to step 21a.

22 Click on the SLA Profiles tab button to associate an SLA profile with the subscriber profile or to remove an SLA profile from the subscriber profile. The General tab is displayed.

23 Configure the Use Direct Map as Default parameter.

24 Click on the Profiles tab button.

25 Perform one of the following.

a Assign an SLA profile.

i Click on the Create button. The SLAProfileEntry (Create) form opens.

ii Click on the Select button to choose an SLA profile. The Select SLA Profile form opens.

iii Select an SLA profile and click on the OK button. The Select SLA Profile form closes, and the SLAProfileEntry (Create) form refreshes with the SLA profile information.

iv Configure the SLA Profile String parameter.

v Click on the OK button to close the SLAProfileEntry (Create) form. A dialog box appears.

vi Click on the OK button. The Subscriber Profile (Create) form refreshes with the SLA profile entry.

b Remove an SLA profile.

i Select an SLA profile and click on the Delete button. A dialog box appears.

ii Click on the OK button. The SLA profile is removed from the list.

iii If you want to assign an SLA profile to replace the removed SLA profile, go to step 25 a.

26 Repeat step 25 for each additional SLA profile that you want to associate with the subscriber profile or remove from the subscriber profile.

27 Click on the HSMDA QoS tab button.

28 Perform one of the following.

a Assign an ingress policy.

i Click on the Select button in the Ingress Policy panel to choose an ingress policy. The Select Ingress Policy form opens.

ii Select a policy and click on the OK button. The Select Ingress Policy form closes, and the Subscriber Profile (Create) form refreshes with the chosen policy.

b Assign an egress policy.

i Configure the parameters:

- Assign Aggregate Rate Limit
- Egress Aggregate Rate Limit (kbps)

ii Click on the Select button in the Egress Policy panel to choose an egress policy. The Select Egress Policy form opens.

iii Select a policy and click on the OK button. The Select Egress Policy form closes, and the Subscriber Profile (Create) form refreshes with the chosen policy.

29 Configure the Packet Byte Offset (bytes) parameter in the Egress Policy Override panel, if required. You must enable the associated Override check box to be able to configure this parameter.

30 Click on the Select button in the Egress Policy Override panel to choose a WRR policy. The Select WRR Policy form opens.

31 Select a policy and click on the OK button. The Select WRR Policy form closes, and the Subscriber Profile (Create) form refreshes with the chosen policy.

32 Click on the Policer Control tab button to configure ingress and egress policer control policies, if required.

i On the Ingress Policer Control Policy panel, configure the Displayed Name parameter.

Click on the Select button next to the Displayed Name field and select a policy from the Select Policer Control Policy form.

ii You can configure local overrides on the selected ingress policer control policy on the Ingress Policer Control Policy Override panel, if required. Enable the Override check box for either of the following parameters, and then configure the parameters:

- Maximum Frame Based Bandwidth
- Minimum Separation Buffer Space

iii On the Egress Policer Control Policy panel, configure the Displayed Name parameter.

Click on the Select button next to the Displayed Name field and select a policy from the Select Policer Control Policy form.

iv You can configure local overrides on the selected egress policer control policy on the Egress Policer Control Policy Override panel, if required. Enable the Override check box for either of the following parameters, and then configure the parameters:

- Maximum Frame Based Bandwidth
- Minimum Separation Buffer Space

33 Click on the Override Policy Items tab button to modify the scheduler parameters for the subscriber profile, if required.

34 Perform one of the following.

a Modify the ingress scheduler parameters.

i Click on the Ingress Schedulers tab button.

ii Click on the Create button. The Ingress Scheduler Entry Override (Create) form opens with the General tab displayed.

iii Click on the Select button. The Select Ingress Scheduler Policy Entry form opens.

iv Select a scheduler policy and click on the OK button. The Select Ingress Scheduler Policy Entry form closes, and the Ingress Scheduler Entry Override (Create) form refreshes with the configured values for the scheduler policy entry.

v Click on the Override tab button.

vi Configure the parameters:

- Summed CIR
- PIR (kbps)
- CIR (kbps)

The CIR (kbps) parameter can only be configured when Summed CIR is set to false.

vii Click on the OK button to close the Ingress Scheduler Entry Override (Create) form.

b Modify the egress scheduler parameters.

i Click on the Egress Schedulers tab button.

ii Click on the Create button. The Egress Scheduler Entry Override (Create) form opens with the General tab displayed.

iii Click on the Select button. The Select Egress Scheduler Policy Entry form opens.

iv Select a policy and click on the OK button. The Select Egress Scheduler Policy Entry form closes, and the Egress Scheduler Entry Override (Create) form refreshes with the configured values for the policy entry.

v Click on the Override tab button.

vi Configure the parameters:

- Summed CIR
- PIR (kbps)
- CIR (kbps)

The CIR (kbps) parameter can only be configured when Summed CIR is set to false.

vii Click on the OK button to close the Egress Scheduler Entry Override (Create) form.

c Modify the access egress HSMDA queue parameters.

i Click on the Access Egress HSMDA Queues tab button.

ii Click on the Create button. The Access Egress HSMDA Queue Override (Create) form opens with the General tab displayed.

iii Click on the Select button. The Select Access Egress Policy Queue form opens.

iv Select a queue and click on the OK button. The Select Access Egress Policy Queue form closes, and the Access Egress HSMDA Queue Override (Create) form refreshes with the configured values for the policy entry.

v Click on the Override tab button.

vi Configure the parameters:

- PIR (kbps)
- Maximum Burst Size (bytes)
- WRR Weight

If you enable the Override check box for any of these parameters, then the original value of the parameter that was configured for the Access Egress HSMDA Queue will appear in that parameter's value field. You can then configure the override value for that parameter.

You can only specify an override value for WRR Weight for queues 1, 2, or 3.

vii Click on the Select button. The Select HSMDA Slope Policy form opens.

viii Select a policy and click on the OK button. The Select HSMDA Slope Policy form closes, and the Access Egress HSMDA Queue Override (Create) form refreshes with the selected HSMDA Slope policy name displayed.

ix Click on the OK button to close the Access Egress HSMDA Queue Override (Create) form.

d Click on the Ingress Policer Level tab button to configure ingress policer priority level overrides, if required. An ingress policer control policy must be configured on the subscriber profile before these steps can be completed.

i Click on the Create button. The Ingress Policer Level Override Create form appears. The configured policer control policy appears in the Displayed Name field.

ii On the Policer Level panel, click on the Select button. The Select Policer Level form appears.

iii Select a policer level from the list and click OK. The Select Policer Level form closes and the selected level appears in the Level field on the Policer Level panel. The current maximum cumulative buffer space value for the policer level is displayed in the Maximum Cumulative Buffer Space field.

iv To override the maximum cumulative buffer space value for the policer level, click on the Override tab button.

v On the Overridden Policer Level panel, enable the Override check box.

- **vi** Either enable the Max check box or configure the Cumulative MBS Contribution parameter.
- **vii** Click OK. The policer level override is applied to the subscriber profile. To configure additional policer level overrides, repeat steps i through vii.

e Click on the Egress Policer Level tab button to configure egress policer priority level overrides, if required. An egress policer control policy must be configured on the subscriber profile before these steps can be completed.

- **i** Click on the Create button. The Egress Policer Level Override Create form appears. The configured policer control policy appears in the Displayed Name field.
- **ii** On the Policer Level panel, click on the Select button. The Select Policer Level form appears.
- **iii** Select a policer level from the list and click OK. The Select Policer Level form closes and the selected level appears in the Level field on the Policer Level panel. The current maximum cumulative buffer space value for the policer level is displayed in the Maximum Cumulative Buffer Space field.
- **iv** To override the maximum cumulative buffer space value for the policer level, click on the Override tab button.
- **v** On the Overridden Policer Level panel, enable the Override check box.
- **vi** Either enable the Max check box or configure the Cumulative MBS Contribution parameter.
- **vii** Click OK. The policer level override is applied to the subscriber profile. To configure additional policer level overrides, repeat steps i through vii.

35 Click on the OK button. The Subscriber Profile (Create) form refreshes with the scheduler override entry.

36 Click on the OK button to close the Subscriber Profile (Create) form. A dialog box appears.

37 Click on the Yes button. The Subscriber Profile (Create) form closes.

38 Close the Manage Subscriber Policies form.

Procedure 68-15 To manage residential subscriber management components on a SAP

Perform this procedure to manage the subscriber configuration on one or more SAPs. You can configure the subscriber-related SAP parameters and assign one or more of the following residential subscriber management components:

- subscriber identification policy
- default subscriber identification string
- default subscriber profile
- default SLA profile
- non-subscriber traffic subscriber profile
- non-subscriber traffic SLA profile

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to manage the SAPs; expand the entries for that site.

5 Click on the Access Interfaces icon to display the site SAPs.

6 Select one or more SAPs, right-click, and choose Properties. The SAP configuration form opens with the General tab displayed.

Note 1 — You can configure subscriber management on multiple SAPs at once from any list of SAP search results that the 5620 SAM generates. For simplicity, the procedure uses the term SAP to mean one or more SAPs, and focuses only on SAPs that belong to the same service site.

Note 2 — The 5620 SAM commits changes to a SAP configuration only when subscriber management is enabled on all SAPs that you are configuring.

7 Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

8 Click on the Profiles tab button.

9 Perform one of the following steps for a component.

a Associate a component with the SAP.

i Click on the Select button beside the component in the Policies panel. The component Select Default form opens.

ii Select a component and click on the OK button. The component Select Default form closes, and the Policies panel refreshes with the component name.

b Remove a component, or replace an existing component with a new component.

Caution — Removing or replacing a residential subscriber management component on a SAP that is in use by subscriber hosts can be service-affecting to hosts that attempt to join the network. Ensure that removing the component does not affect the subscriber hosts before you proceed.

i Click on the Clear button beside the component in the Policies panel. The 5620 SAM removes the component from the Policies panel.

ii If you want to choose a component to replace the removed component, go to step 9 a.

10 Click on the OK button. The SAP configuration form closes.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The service configuration form closes.

13 Close the Manage Services form.

Procedure 68-16 To enable or disable residential subscriber management on a SAP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to enable or disable residential subscriber management on a SAP; expand the entries for that site.

5 Click on the Access Interfaces icon to display the site SAPs.

6 Select one or more SAPs, right-click, and choose Properties. The SAP configuration form opens with the General tab displayed.

7 Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

8 Click on the Profiles tab button.

9 Configure the Admin Status parameter by performing one of the following.

   a Set the parameter to Enabled to enable residential subscriber management on the SAP.

   b Set the parameter to Disabled to disable residential subscriber management on the SAP.

10 Click on the OK button. The SAP configuration form closes.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The service configuration form closes.

13 Close the Manage Services form.

Procedure 68-17 To create a static host for residential subscriber management on a SAP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to create a static host for residential subscriber management on a SAP; expand the entries for that site.

5 Navigate to the SAPs that support subscriber management. Perform one of the following, depending on the type of service that you are configuring:

   a For an IES, the path is IES→Site→Subscriber Interfaces→*subscriber interface*→*group interface*→Service Access Points→*SAP*.

   b For a VPLS, the path is VPLS→Site→Access Interfaces→*SAP*.

   c For a VPRN service, the path is VPRN→Site→Subscriber Interfaces→*subscriber interface*→*group interface*→Service Access Points→*SAP*.

6 Select one or more SAPs, right-click, and choose Properties. The SAP configuration form opens with the General tab displayed.

7 Click on the Anti-Spoofing tab button. The General tab is displayed.

8 Configure the Anti-Spoofing parameter.

Note — You must set the Anti-Spoofing parameter to IP-address matching or to IP- and MAC-address matching before you can enable subscriber management for the static hosts on a SAP.

9 Click on the Static Hosts tab button.

10 Click on the Create button. The Access Interface Anti-Spoofing Static Host (Create) form opens with the General tab displayed.

11 Configure the parameters:

- IP Address
- MAC Address
- Subscriber Identification
- Use SAP ID as Subscriber ID
- ANCP String
- Intermediate Destination ID

Note — To enable residential subscriber management for a static host, you must specify values for the IP Address and Subscriber Identification parameters.

12 Configure the Administrative State parameter.

13 Click on the Select button in the Subscriber Profile panel to choose a subscriber profile for the static host, if required. The Select Subscriber Profile - AntiSpoofingStaticHosts form opens with a list of available subscriber profiles.

Note — To enable residential subscriber management for a static host, you must specify a subscriber profile.

14 Select a subscriber profile and click on the OK button. The Select Subscriber Profile - AntiSpoofingStaticHosts form closes, and the subscriber profile name appears in the Subscriber Profile panel.

15 Click on the Select button in the SLA Profile panel to choose an SLA profile for the static host, if required. The Select SLA Profile - AntiSpoofingStaticHosts form opens with a list of available SLA profiles.

Note — To enable residential subscriber management for a static host, you must specify an SLA profile.

16 Select an SLA profile and click on the OK button. The Select SLA Profile - AntiSpoofingStaticHosts form closes, and the SLA profile name appears in the SLA Profile panel.

17 Click on the Select button in the Application Profile panel to choose an application profile for the static host, if required. The Select Application Profile - AntiSpoofingStaticHosts form opens with a list of local application profiles.

18 Select an application profile and click on the OK button. The Select Application Profile - AntiSpoofingStaticHosts form closes, and the application profile name appears in the Application Profile panel.

19 Click on the OK button.

Note — The Administrative State parameter must be set to Up, to enable validation of Subscriber Identification, Subscriber Profile, and Application Profile.

Partially configured Static Hosts can be configured if the Administrative State parameter is set to Down.

20 Click on the Managed Routes tab button.

21 Click on the Create button.

22 The Access Interface Anti-Spoofing Static Host Managed Route Display (Create)form opens.

23 Configure the parameters:

- IP Address
- Prefix Length

24 Click on the OK button. A dialog box appears.

25 Click on the OK button.The Access Interface Anti-Spoofing Static Host Managed Route Display (Create) form closes.

Note — The creation of 16 managed routes is supported for each static host on IES and VPRN SAPs on the 7750 SR, 7450 ESS, and 7710 SR, Release 6.1 or later.

26 Click on the Apply button if you want to create an additional static host entry. A dialog box appears. Otherwise go to step 28.

27 Repeat steps 11 to 25 for each additional static host entry that you want to create.

28 Click on the OK button. A dialog box appears.

29 Click on the OK button. The Access Interface Anti-Spoofing Static Host (Create) form closes, and the SAP configuration form refreshes with the new static host entries.

30 Click on the OK button. The SAP configuration form closes.

31 Click on the OK button. A dialog box appears.

32 Click on the Yes button. The service configuration form closes.

33 Close the Manage Services form.

Procedure 68-18 To configure a MEP on a SAP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to configure a MEP on a SAP; expand the entries for that site.

5 Perform one of the following steps.

- **a** To create a MEP on an Access Interface SAP, on the navigation tree, click on the site where you want to create the MEP; expand the entries for that site. Go to step 6

- **b** To create a Down MEP on a Subscriber Group Interface SAP, on the navigation tree, click on the site where you want to create the Down MEP; expand the entries for that site. Go to step 7.

Note 1 — MEPs can be configured on an Access Interface SAP for VPLS, VPRN, IES, and VLL Epipe services.

Note 2 — Down MEPs can be configured on a Subscriber Group Interface SAP for VPRN and IES.

6 Click on the Access Interfaces icon to display the site SAPs. Go to step 8.

7 Click on the Group Interfaces icon to display the site SAPs.

8 Select one or more SAPs, right-click, and choose Properties. The SAP configuration form opens with the General tab displayed.

9 Click on the MEP tab button.

10 Click on the Create button. The MEP (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Auto-Assign ID
- ID
- Site ID
- Direction
- Administrative State
- CCM Messages Enabled
- Control MEP
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Type
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

The Control MEP parameter is only displayed if the Interface Type parameter is set to Ethernet Tunnel Path Endpoint.

Note — When configuring a Down MEP on a Subscriber Group Interface SAP, the Direction parameter cannot be configured.

12 If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step 16.

13 Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

14 Click on the AIS tab button.

15 Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

16 Click on the OK button. A dialog box appears.

17 Click on the OK button. The MEP (Create) form closes.

18 Close the Manage Services form.

Procedure 68-19 To list and manage subscriber management SAPs

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Select one of the available SAP types from the object drop-down list:

- IES Service Access Point (ies)
- L2 Access Interface (mvpls)
- L2 Access Interface (vpls)
- VPRN Service Access Point (vprn)

3 Click on the Select button to choose a site.

4 Click on the Search button. A list of SAPs for the selected service type appears.

5 To view or manage the information for a particular SAP, select the entry from the list and click on the Properties button. The SAP Properties form opens on the General tab. You can view SAP information or make changes to a variety of parameters on the various tabs of the form.

6 Click on the OK button to implement any changes you have made.

7 Close the Properties form.

8 Close the Manage Residential Subscribers form.

Procedure 68-20 To create a Capture SAP

Use this procedure to create a Capture SAP, which enables the creation of an MSAP. A Capture SAP must be the default on a port.

Note 1 — A Capture SAP is not intended to carry traffic. The only purpose of the Capture SAP is to trigger the creation of an MSAP.

Note 2 — The MSAPs that are subsequently created will be on the same port as the Capture SAP.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the Capture SAP; expand the entries for that site.

5 Right-click on Access Interfaces and choose Create VPLS L2 Access Interface. The VPLS L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters as required for the service.

- SAP Sub Type, choose Capture from the SAP Sub Type drop-down menu.

Note — When you choose Capture as the SAP Sub Type, the displayed form changes to allow configuration of the Capture SAP.

- Description
- Administrative State

7 Click on the Port tab button.

8 Click on the Select button beside the Terminating Port Displayed parameter. The Select Terminating Port form appears.

9 Choose a terminating port from the list in the Select Terminating Port form.

10 Click on the DHCP tab button and add a Subscriber Authentication policy.

i Click on the Select button in the Subscriber Authentication Policy area. The Select Subscriber Authentication Policy - L2 access I/F window appears.

ii Filter the list to the Subscriber Authentication policy that you need.

iii Choose the required Subscriber Authentication policy.

11 Click on the Capture Access Interface tab button.

12 Perform one of the following to configure the Trigger Packet type:

a Select the check box beside one or two of the parameters that you want used to trigger RADIUS authentication. The parameters are:

- DHCP Trigger Packet
- PPPoE Trigger Packet
- ARP Trigger Packet
- PPP Trigger Packet

b Select the check box beside each of the parameters displayed to trigger RADIUS authentication when any or all of the trigger packets are received.

13 Click on the Select button in the MSAP Defaults panel to choose an MSAP Policy Name. The Select MSAP Policy - Capture L2 Access Interface form opens.

14 Configure the filter criteria. A list of available MSAP policies appears.

15 Choose an MSAP policy and click on the OK button. The Select MSAP Policy - Capture L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form appears with the MSAP policy name displayed.

16 Configure the parameters:

- MSAP Service ID
- MSAP Group Interface Name

17 Click on the Select button in the PPPoE Policy panel. The Select PPPoE Policy form opens.

18 Select a PPPoE policy from the list and click on the OK button. The Select PPPoE Policy form closes.

19 Click on the Select button in the PPP Policy panel. The Select PPP Policy form opens.

20 Select a PPP policy from the list and click on the OK button. The Select PPP Policy form closes.

21 Click on the Select button in the PPPoE Local User DB panel. The Select PPPoE Local User DB form opens.

22 Select a PPPoE Local User DB from the list and click on the OK button. The Select PPPoE Local User DB form closes.

23 Click on the Select button in the PPP Local User DB panel. The Select PPP Local User DB form opens.

24 Select a PPP Local User DB from the list and click on the OK button. The Select PPP Local User DB form closes.

25 Click on the Select button in the Redundancy panel. The Select SRRP Instance form opens.

26 Select an SRRP Instance from the list and click on the OK button. The Select SRRP Instance form closes.

27 Click on the ATM tab button.

28 Configure the AAL5 Encapsulation parameter.

29 Click on the VC Ranges tab button.

30 Click on the Create button. The ATM Configuration (Create) form opens.

31 Configure the parameters:

- VC Range Index
- VPI Range Start
- VPI Range End
- VCI Range Start
- VCI Range End

32 Click on the OK button. A dialog box appears.

33 Click on the OK button. The ATM Configuration (Create) form closes.

34 Click on the Apply button.

35 Click on the OK button.

Procedure 68-21 To list MSAPs and view MSAP properties

Use this procedure to list MSAPs and view MSAP properties.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Choose Access Interface (Service Management) from the list.

3 Perform one of the following to display the MSAPs associated with each service:

a For VPLS MSAPs:

i Click on the L2 Access Interface (Service Management).

ii Click on the Abstract L2 Access Interface (VPLS) icon.

iii Click on the L2 Access Interface (VPLS) icon.

iv Click on the VPLS L2 Access Interface icon.

v Choose VPLS MSAP and click on the Search button.

b For IES MSAPs:

i Click on the Service Access Point icon (Service Management).

ii Click on the IES Service Access Point (IES) icon.

iii Choose IES MSAP and click on the Search button.

c For VPRN MSAPs:

i Click on the Service Access Point icon (Service Management).

ii Click on the VPRN Service Access Point (VPRN) icon.

iii Choose VPRN MSAP and click on the Search button.

4 Choose an MSAP from the list and click on the MSAP Properties tab button to view the MSAP properties.

Procedure 68-22 To view an MSAP event log, modify the global MSAP log policy, and purge MSAP log records

Use this procedure to view the event log for an MSAP, modify the global MSAP log policy, or purge the log records in an MSAP event log.

1 Perform Procedure 68-21 to list the MSAPs and choose the appropriate MSAP.

2 Click on the Events tab button to display the MSAP event log.

3 If you need to view an event log record, choose a record from the event log and click on the Properties button. The Statistics Record - MSAP Event Log form opens and displays the MSAP record properties.

4 Close the Statistics Record - MSAP Event Log form.

5 If you need to modify the global MSAP event log policy click on the Log Policy button. The Log Policy - Ressubscr. MSap Event Log form opens.

Note — The global MSAP log policy affects all MSAP event logs.

6 Configure the parameters:

- Retention Time (hours)
- Administrative State

7 Click on the Apply button to save the changes.

8 Close the Log Policy - Ressubscr. MSap Event Log form.

9 If you need to purge the MSAP event log records, click on the Purge Log Records button.

10 Click on the OK or Cancel button to close the Log Policy - Ressubscr. MSap Event Log form.

11 Click on the Close button to close the Statistics Record - MSAP Event Log form.

Procedure 68-23 To modify and re-evaluate an MSAP policy on an MSAP

Use this procedure to re-apply an MSAP policy on an existing MSAP. MSAPs cannot be edited; however, MSAP policies on existing MSAPs can be changed and re-applied.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form appears.

2 Configure the filter criteria. See Procedure 68-21 for more information about configuring the filter to list MSAPs. A list of MSAPs for the service appears.

3 Choose an MSAP and click on the Properties button. The service configuration form opens with the General tab displayed.

4 Click on the MSAP Properties tab button.

5 Click on the Properties button in the Creation MSAP Policy area and enter your required changes.

   i Click on the Apply button.

   ii Click on the OK button.

6 Click on the MSAP Properties tab button.

7 Choose the Do Action option from the Creation MSAP Policy Re-evaluation parameter to apply the policies new parameter values. When you choose Not Applicable, the new parameter values in the policy are not applied but remain in the policy until you choose the Do Action option.

8 Click on the Apply button.

9 Click on the OK button.

Procedure 68-24 To modify an MSAP policy and re-evaluate the MSAPs

Use this procedure to re-apply an MSAP policy on existing MSAPs. MSAPs cannot be edited; however, MSAP policies on existing MSAPs can be changed and re-applied.

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form appears.

2 Choose the policy scope as required. The policy scope can be Global or Local.

3 Configure the filter criteria to list MSAPs for the service. Choose MSAP Policy (MSAP Policy) and click on the Search button. A list of MSAP policies appears in the form.

4 Choose an MSAP policy and click on the Properties button. The MSAP Policy (Edit) form appears with the General tab displayed.

5 Enter your required changes.

   i Click on the Apply button.

   ii Click on the OK button.

6 Click on the Reevaluate MSAPs button. The MSAPs are re-evaluated with the changed MSAP policy.

7 Click on the Apply button.

8 Click on the OK button.

Procedure 68-25 To delete an MSAP

Use this procedure to delete any MSAP that is an inactive state. Verify that the MSAP is in an inactive state. The 5620 SAM prevents attempts to delete an MSAP that is in an active state.

1. Perform Procedure 68-21 to list the MSAPs and choose the appropriate MSAP to delete.
2. Click on the Delete button. A dialog box appears.
3. Click on the Yes button in the dialog box. The MSAP is deleted.

Procedure 68-26 To delete an MSAP policy

Use this procedure to delete any MSAP policy on an MSAP that is an inactive state. Ensure that the MSAP is inactive and that the policy is not associated with other MSAPs that may be used at a later date. Do not attempt to delete MSAP policies on MSAPs that are in an active state.

1. Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Residential Subscriber form appears.
2. In the Manage Residential Subscriber form, choose the Policy scope.
3. Choose MSAP Policy (MSAP Policy) from the list.
4. Click on the Search button in the Manage Residential Subscriber form. The MSAP policies are listed in the MSAP Policy list window.
5. Choose one or more MSAP policies that you need to delete.
6. Click on the Delete button. A dialog box appears.
7. Click on the Yes button in the dialog box. The MSAP policy is deleted.

Procedure 68-27 To configure DHCP event monitoring for a SAP

1. Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.
2. Select one of the available SAP types from the object drop-down list:
   - IES Service Access Point (ies)
   - L2 Access Interface (mvpls)
   - L2 Access Interface (vpls)
   - VPRN Service Access Point (vprn)
3. Click on the Select button to choose a site.

4 Click on the Search button. A list of SAPs appears.

5 To configure DHCP monitoring for a particular SAP, select the entry from the list and click on the Create Monitored SAP button. The Monitored Access Interface (Create) form opens with the General tab displayed.

Note — A maximum of five hosts or five SAPs can be monitored simultaneously. If more than the maximum number of hosts is selected and configured for monitoring an error message will be displayed.

6 Configure the parameters:

- Monitoring Period
- Units

7 Click on the OK button to close the Monitored Access Interface (Create) form.

Note — You must complete Procedure 68-28 to enable and schedule SAP monitoring.

8 Close the Manage Residential Subscribers form.

Procedure 68-28 To monitor DHCP events for a SAP

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Monitored Access Interface from the object drop-down list.

3 Configure the filter criteria at the top-right panel of the form, if required.

4 Click on the Search button. A list of Monitored SAPs appears.

5 To initiate or view DHCP monitoring for a particular SAP, select the entry from the list and click on the Properties button. The Monitored Access Interface (Edit) form opens on the General tab.

6 You can perform one or more of the following on this form:

a To start monitoring the chosen SAP, click on the Start Monitor button.

b To stop monitoring the chosen SAP, click on the Stop Monitor button.

c To remove monitoring of the chosen SAP, click on the Delete button.

d To change the Monitoring Period, click on the Stop Monitor button, enter the desired value into the field, and select an appropriate Unit from the adjacent drop-down menu.

7 To view DHCP events for the chosen SAP, click on the Events tab. The DHCP Events list is displayed.

8 Select an event from the list and click on the Properties button to view detailed information about the event.

9 Click on the OK button to close the Monitored Access Interface form.

10 Close the Manage Residential Subscribers form.

Procedure 68-29 To configure DHCP lease management for a subscriber host

DHCP is used to assign IP addresses to hosts or workstations on the network. This function is usually performed by a DHCP server. Essentially, it "leases" out addresses for specific times to the various hosts. If a host does not use a specific address for a set period of time, that IP address can then be assigned to another machine by the DHCP server.

In order to allow the DHCP client to lease out address for specific times, the 5620 SAM allows an operator to force the DHCP client to change its state by sending a renewal command. Upon receipt of the renewal command from the 5620 SAM, the DHCP client changes to the renewal state and then negotiates with the DHCP server for lease times.

Conversely, an operator can also terminate (clear) a lease for a particular host from within the Residential Subscriber Host form of 5620 SAM.

Note — The DHCP lease renewal and termination are supported only on dynamic hosts, not on static hosts or subscriber hosts.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Select Residential Subscriber Host from the object drop-down list.

3 Click on the Search Subscriber Host Information from Last Resynch radio button.

4 Click on the Select button beside Site ID to specify an NE. The Select an ESM Capable Network Element form opens.

5 Select an NE in the list and click on the OK button. The Select an ESM Capable Network Element form closes and the NE system IP address is displayed on the Manage Residential Subscribers form.

6 Configure the Service ID parameter.

7 Click on the Select button beside Port to specify a port. The Select Port form opens.

8 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed on the Manage Residential Subscribers form.

9 Configure the Inner Encapsulation Value and Outer Encapsulation Value parameters.

Note — The Outer Encapsulation Value parameter is configurable only when the port encapsulation type is Dot1 Q or Q in Q. The Inner Encapsulation Value parameter is configurable only when the port encapsulation type is Q in Q.

10 Click on the Search button. A list of subscriber hosts is displayed.

11 Select one or more entries in the list.

Note — You can renew a lease for multiple entries. However, you can perform a lease termination for only one host at a time.

12 Perform one of the following steps.

a To renew the lease, click on the Force Renew button.

b To terminate the lease, click on the Clear Lease State button.

13 A dialog box appears. Click on the Yes button. The action is completed.

14 Close the Manage Residential Subscribers form.

Procedure 68-30 To configure DHCP event monitoring for a subscriber host

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber Hosts from the object drop-down list.

3 Click on the Select button beside Site ID to specify an NE. The Select an ESM Capable Network Element form opens.

4 Select an NE in the list and click on the OK button. The Select an ESM Capable Network Element form closes and the NE system IP address is displayed on the Manage Residential Subscribers form.

5 Configure the Service ID parameter.

6 Click on the Select button beside Port to specify a port. The Select Port form opens.

7 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed on the Manage Residential Subscribers form.

8 Configure the Inner Encapsulation Value and Outer Encapsulation Value parameters.

Note — The Outer Encapsulation Value parameter is configurable only when the port encapsulation type is Dot1 Q or Q in Q. The Inner Encapsulation Value parameter is configurable only when the port encapsulation type is Q in Q.

9 Click on the Search button. A list of subscriber hosts appears.

10 To configure DHCP monitoring for a particular subscriber host, select the entry from the list and click on the Create Monitored Host button. The Monitored Subscriber Host form opens.

Note — A maximum of five hosts or five SAPs can be monitored simultaneously. If more than the maximum number of hosts is selected and configured for monitoring an error message will be displayed.

11 Configure the parameters:

- Monitoring Period
- Units
- Polling Interval

12 Click on the OK button to close the Monitored Subscriber Host form.

Note — You must complete Procedure 68-31 to enable and schedule subscriber host monitoring.

13 Close the Manage Residential Subscribers form.

Procedure 68-31 To monitor DHCP events for a subscriber host

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Monitored Subscriber Host from the object drop-down list.

3 Configure the filter criteria at the top right panel of the form, if required.

4 Click on the Search button. A list of monitored subscriber hosts appears.

5 To initiate or view DHCP monitoring for a particular subscriber host, select the entry from the list and click on the Properties button. The Monitored Subscriber Host (Edit) form opens with the General tab displayed.

6 You can perform one or more of the following on this form:

a To start monitoring the chosen subscriber host, click on the Start Monitor button.

b To stop monitoring the chosen subscriber host, click on the Stop Monitor button.

c To remove monitoring of the chosen subscriber host, click on the Delete button.

d To change the Monitoring Period, click on the Stop Monitor button, enter the desired value into the field, and select an appropriate Unit from the adjacent drop-down menu.

e To change the Polling Interval, click on the Stop Monitor button and then select the desired value from the drop-down menu.

7 To view DHCP events for the chosen subscriber host, click on the Events tab. The DHCP Events list is displayed.

8 Select an event from the list and click on the Properties button to view detailed information about the event.

9 Click on the OK button to close the Monitored Subscriber Interface form.

10 Close the Manage Residential Subscribers form.

Procedure 68-32 To configure a local user database to authenticate DHCP clients

A local user database is used by a local DHCP server to authenticate DHCP clients that request IP addresses. A group interface uses the local user database to authenticate a PPPoE clients that request IP addresses.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Local User Database (localuserdb) from the object drop-down list.

3 Perform one of the following steps:

a To create a local user database, click on the Create Local User Database button. A Local User Database (Create) window opens with the General tab displayed. Go to step 6.

b To modify an existing database, click on the Search button. A list of existing databases is displayed. Go to step 4.

4 Choose a database from the list.

5 Click on the Properties button. The Local User Database (Edit) form opens with the General tab displayed.

6 Click on the Select button in the Site panel to specify an NE. The Select a Local User Database Capable Network Element form opens.

7 Select an NE in the list and click on the OK button. The Select a Local User Database Capable Network Element form closes and the NE system address is displayed on the Local User Database (Create) form.

8 Configure the parameters.

- Displayed Name
- Description
- Administrative State

9 Click on the DHCP tab button. The DHCP Match List form is displayed.

10 Configure the parameters.

- Match Type DHCP 1
- Match Type DHCP 2
- Match Type DHCP 3
- Match Type DHCP 4

11 Click on the Masks tab button.

12 Click on the Create button. The Local User Database Dhcp Mask form is displayed.

13 Configure the parameters:

- Match Type
- Prefix String
- Prefix Length
- Suffix String
- Suffix Length

14 Click on the Hosts tab button.

15 Click on the Create button. The Local User DB DHCP Host (Create) form opens with the General tab displayed.

16 Configure the parameters:

- Host Name
- Administrative State
- Domain Name
- Server Address

17 Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - Local User DB DHCP Host form opens.

18 Configure the filter criteria. A list of available policies appears.

19 Select a policy and click on the OK button. The Select Subscriber Authentication Policy - Local User DB DHCP Host form closes, and the Local User DB DHCP Host (Create) form reappears with the policy name information displayed.

20 Click on the Select button in the MSAP Defaults panel to choose an MSAP Policy Name. The MSAP Policy - Local User DB DHCP Host form opens.

Note — You can also enter text in the fields next to the MSAP Policy Name, MSAP Service ID, and MSAP Group Interface Name parameters.

21 Configure the filter criteria. A list of available MSAP policies appears.

22 Select an MSAP policy and click on the OK button. The MSAP Policy - Local User DB DHCP Host form closes, and the Local User DB DHCP Host (Create) form appears with the MSAP policy name displayed.

23 Click on the Select button in the MSAP Defaults panel to choose an MSAP Service ID. The Service - Local User DB DHCP Host form opens with a list of services displayed.

24 Select a service and click on the OK button. The Service - Local User DB DHCP Host form closes, and the Local User DB DHCP Host (Create) form appears with the service information displayed.

25 Click on the Select button in the MSAP Defaults panel to choose an MSAP Group Interface Name. The Group Interface - Local User DB DHCP Host form opens with a list of group interfaces displayed.

26 Select a group interface and click on the OK button. The Group Interface - Local User DB DHCP Host form closes, and the Local User DB DHCP Host (Create) form appears with the group interface information displayed.

27 Click on the Address tab button. Configure only one of the following parameters.

- IP Address
- Use GI Address
- IP Address Pool Name
- Use Client Pool

28 Configure the IPv6 addressing parameters, if required:

- IPv6 Address
- IPv6 Prefix
- IPv6 Prefix Length

29 Click on the Host Identification tab button. Configure 4 of the following parameters.

- Circuit ID Format
- Circuit ID
- MAC Address
- Option 60
- Remote ID Format
- Remote ID
- SAP ID
- Service ID
- DHCP String
- System ID

30 Click on the Identification Strings tab button. Configure the Option Number parameter. The window is refreshed with additional parameters.

31 Configure the parameters.

- ANCP String
- Application Profile
- Intermediate Destination ID
- SLA Profile String
- Subscriber Profile String
- Subscriber ID

32 Click on the Options tab button. The Options form is displayed.

33 Click on the Create button. A Local User Database DHCP Option form opens.

34 Configure the Option Depending on the Option Value different parameters must be configured for each option.

35 Perform one of the following steps:

a Configure Custom Option, Subnet Mask, Default Routers, DNS Name Servers, and Netbios Name Server options. Go to step 36.

- Number
- Type
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

b Configure Lease Time, Lease Renew Time and Lease Rebind Time options. Go to step 36.

- Days
- Hours
- Minutes
- Seconds

c To configure the Domain Name option, configure the Option Value Go to step 36.

d To configure Netbios Node Type option, configure the Netbios Node Type parameter. Go to step 36.

36 Click on the OK button. A confirmation dialog box appears.

37 Click on the OK button. The Local User Database DHCP Option window closes and the Local User DB DHCP Host (Create) window is refreshed with the new options.

38 Click on the OK button.

39 Click on the PPPoE tab button. The PPPoE Match List form opens.

40 Configure the parameters.

- Match Type PPPoE 1
- Match Type PPPoE 2
- Match Type PPPoE 3

41 Click on the Masks tab button.

42 Click on the Create button. The Local User Database PPPoE Mask form opens.

43 Configure the parameters.

- Match Type
- Prefix String
- Prefix Length
- Suffix String
- Suffix Length

Note — You must configure the Mask Type parameter before you configure the remaining parameters on the Local User Database PPPoE Mask form.

44 Click on the Hosts tab button.

45 Click on the Create button. The Local User DB PPPoE Host (Create) form opens with the General tab displayed.

46 Configure the parameters.

- Host Name
- Administrative State
- Retail Service ID
- PADO Delay (100’s of milliseconds)

47 Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - Local User DB PPPoE Host form opens.

48 Configure the filter criteria. A list of available policies appears.

49 Choose a policy and click on the OK button. The Select Subscriber Authentication Policy - Local User DB PPPoE Host form closes, and the Local User DB PPPoE Host (Create) form reappears with the policy name displayed.

50 Click on the Select button in the MSAP Defaults panel to choose an MSAP Policy Name The MSAP Policy - Local User DB PPPoE Host form opens.

Note — You can also enter text in the fields next to the MSAP Policy Name, MSAP Service ID, and MSAP Group Interface Name parameters.

51 Configure the filter criteria. A list of available MSAP policies appears.

52 Select an MSAP policy and click on the OK button. The MSAP Policy - Local User DB PPPoE Host form closes, and the Local User DB PPPoE Host (Create) form appears with the MSAP policy name displayed.

53 Click on the Select button in the MSAP Defaults panel to choose an MSAP Service ID. The Service - Local User DB PPPoE Host form opens with a list of services displayed.

54 Select a service and click on the OK button. The Service - Local User DB PPPoE Host form closes, and the Local User DB PPPoE Host (Create) form appears with the service information displayed.

55 Click on the Select button in the MSAP Defaults panel to choose an MSAP Group Interface Name. The Group Interface - Local User DB PPPoE Host form opens with a list of group interfaces displayed.

56 Select a group interface and click on the OK button. The Group Interface - Local User DB PPPoE Host form closes, and the Local User DB PPPoE Host (Create) form appears with the group interface information displayed.

57 Click on the Address tab button. Configure one of the following parameters:

Note — If more than one IP address parameter is configured, the 5620 SAM displays an error message.

- IP Address
- IP Address Prefix Length
- Use GI Address
- IP Address Pool Name
- Use Client Pool

58 Click on the Host Identification tab button. Configure only 3 of the following parameters:

Note 1 — Circuit ID Format and Circuit ID are considered one parameter.

Note 2 — User Name Format and User Name are considered one parameter.

- Prefix String
- Circuit ID
- MAC Address
- Remote ID Format
- Remote ID
- Service Name
- User Name Format
- User Name

59 Configure the following parameters:

- Password Type
- Password

60 Click on the Identification Strings tab button. Configure the Option Number parameter. The window is refreshed with additional parameters.

61 Configure the parameters.

- ANCP String
- Application Profile
- Intermediate Destination ID
- SLA Profile String
- Subscriber Profile String
- Subscriber ID

62 Click on the L2TP tab button. A list of available tunnel groups appears.

Note — L2TP configuration is required on an NE that has the LAC role if RADIUS authentication is not used for PPPoE clients.

63 Click on the Select button next to the Group Name parameter to choose a tunnel group name. The Select Tunnel Group Name - Local User DB PPPoE Host form opens.

64 Configure the filter criteria and click on the Search button. A list of available tunnels is displayed.

65 Choose a tunnel group and click on the OK button. The Select Tunnel Group Name - Local User DB PPPoE Host form closes, and the Local User DB PPPoE Host (Create) form reappears with the Group Name displayed.

66 Click on the Options tab button.

67 Click on the Create button. A Local User DB PPPoE Option form opens.

68 Configure the parameters:

- Option
- Number
- Type
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Option Value parameter is configurable when the Type parameter is set to ASCII string or Hex String.

69 Click on the OK button. A confirmation dialog box opens.

70 Click on the OK button. The Local User DB PPPoE Host (Create) form is refreshed with the new options.

71 Close the Local User DB PPPoE Host (Create) form.

72 Click on the following tab buttons to view information:

- Local DHCP Servers
- Group Interfaces
- Subscriber Authentication Policies
- Faults

73 Close the Local User Database (Edit) form.

Procedure 68-33 To configure NE SHCV event handling

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Click on the View SHCV button. The Subscriber Host Connectivity Verification form opens.

3 Choose Network Element SHCV from the object drop-down list.

4 Configure the filter criteria and click on the Search button. A list of NEs appears.

5 Select an NE and click on the Properties button. The Network Element SHCV (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Trap Dropped Raises Alarm
- Rate Exceeded Raises Alarm
- Maximum Sessions Per MAC

7 Click on the OK button. The Network Element SHCV (Edit) form closes, and a dialog box appears.

8 Click on the Yes button.

9 Close the Subscriber Host Connectivity Verification form.

10 Close the Manage Residential Subscribers form.

Procedure 68-34 To create or modify a subscriber explicit map

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Perform one of the following.

- **a** Create a subscriber explicit map entry.
  - **i** Click on the Create button and choose Create Subscriber Explicit Map Entry from the drop-down menu. The Subscriber Explicit Map Entry (Create) form opens.
  - **ii** Go to step 3.
- **b** Modify a subscriber explicit map entry.

  Caution — Modifying an active subscriber explicit map entry is potentially service-affecting. Ensure that you consider the implications of reconfiguring the subscriber explicit map entry before you proceed.

  - **i** Choose Subscriber Explicit Map Entry from the object drop-down list.
  - **ii** Configure the filter criteria and click on the Search button. A list of subscriber explicit map entries appears.
  - **iii** Select a subscriber explicit map entry and click on the Properties button. The Subscriber Explicit Map Entry (Edit) form opens.

3 Configure the parameters:

- Subscriber Identification
- Description
- Subscriber ID Alias

The Subscriber Identification parameter is configurable only during subscriber explicit map creation.

4 Click on the Select button in the Subscriber Profile panel to associate a subscriber profile with the subscriber explicit map. The Select Subscriber Profile form opens.

5 Select a subscriber profile and click on the OK button. The Select Subscriber Profile form closes, and the Subscriber Explicit Map Entry (Create) form refreshes with the subscriber profile.

6 Click on the Select button in the SLA Profile panel to associate an SLA profile with the subscriber explicit map. The Select SLA Profile form opens.

7 Select an SLA profile and click on the OK button. The Select SLA Profile form closes and the Subscriber Explicit Map Entry (Create) form refreshes with the SLA profile.

8 Click on the Select button in the Application Profile panel to associate an application profile with the subscriber explicit map. The Select Application Profile form opens.

9 Select an application profile and click on the OK button. The Select Application Profile form closes and the Subscriber Explicit Map Entry (Create) form refreshes with the application profile.

Note 1 — The global AA group policy must be manually distributed to the NE before a global subscriber identification policy using the application profiles can be distributed.

Note 2 — When a new subscriber identification or subscriber explicit map is discovered from the NE, the AA group policy is not automatically resynchronized to the global subscriber identification policy.

10 Click on the OK button to close the Subscriber Explicit Map Entry (Create) form.

Procedure 68-35 To retrieve PPPoA sessions

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Subscribers form opens.

2 Choose PPPoA Session (PPP Policy and Session) from the object drop-down list in the Manage Subscribers form.

3 Click on the Select button next to the Site ID parameter. The Select an ESM Capable Network Element form opens.

4 Select a network element from the list and click on the OK button. The Select an ESM Capable Network Element form closes.

5 Click on the Select button next to the Service ID parameter. The Select a Service Site form opens.

6 Select a service site from the list and click on the OK button. The Select a Service Site form closes.

7 Click on the Select button next to the Service Access Point parameter. The Select a Service Access Point form opens.

8 Select a service access point from the list and click on the OK button. The Select a Service Access Point form closes.

9 Click on the Search button. A list of applicable PPPoA sessions appears.

10 Select a PPPoA session from the list and click on the Properties button. The PPPoA Session form opens.

11 Review the PPPoA session information.

12 Close the PPPoA Session form.

13 Close the Manage Subscribers form.

Procedure 68-36 To configure a MEP on an SDP Binding

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to configure a MEP on an SDP Binding; expand the entries for that site.

Note — MEPs can be configured on a SDP Binding for VPLS, VPRN, and VLL Epipe services.

5 Click on the Spoke SDP Bindings icon to display the site Spoke SDP Bindings.

6 Select one or more Spoke SDP Bindings, right-click, and choose Properties. The Spoke SDP Bindings configuration form opens with the General tab displayed.

7 Click on the Meps tab button.

8 Click on the Create button. The MEP (Create) form opens.

9 Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

10 Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

11 Configure the parameters:

- Auto-Assign ID
- ID
- Site ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- Mac Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

12 If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step 16.

13 Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

14 Click on the AIS tab button.

15 Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

16 Click on the OK button. A dialog box appears.

17 Click on the OK button. The MEP (Create) form closes.

18 Close the Manage Services form.

Procedure 68-37 To configure L2Aware static port forwarding on a residential subscriber instance

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber Instance from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of residential subscriber instances appears.

4 Select a residential subscriber instance and click on the Properties button. The Residential Subscriber Instance (Edit) form opens with the General tab displayed.

5 Click on the NAT Static Port Forwarding tab button.

6 Click on the Create button. The NAT Static Port Forwarding Display (Create) form opens.

7 Configure the parameters:

- Inside IP Address
- Outside IP Address
- Inside Port
- Protocol
- Outside Port
- Lifetime (seconds)

Note — You cannot specify the same set of Inside Port and Protocol values in more than one static port mapping to an Inside IP Address.

You can specify the same Outside Port value in multiple mappings to an Inside IP Address.

8 Click on the OK button. The NAT Static Port Forwarding Port Display (Create) form closes, and the new entry is listed on the Residential Subscriber (Edit) form.

9 Perform the following steps to synchronize NAT static port forwards, if required.

i Choose a static port forward from the list and click on the Sync button. The NAT Static Port Forwarding Sync form opens.

ii Click on the Select button in the Targeted Router Instance panel. The Select Targeted Router Instance form opens.

iii Select a router instance from the list and click on the OK button. The Select Targeted Router Instance form closes and the NAT Static Port Forwarding Sync form reappears with the router instance information displayed.

iv Configure the Lifetime (seconds) parameter and click on the OK button. A dialog box appears.

v Click on the OK button.

10 Close the Residential Subscriber (Edit) form.

11 Close the Manage Residential Subscribers form.

Procedure 68-38 To resynchronize static port forwarding entries

Because of the potentially large number of static port forwarding entries, the entries are not resynchronized during a full NE resynchronization. Perform this procedure to manually resynchronize the entries, if required.

Note — The 5620 SAM static port forwarding entries are current and do not require resynchronization if the following conditions are true.

- The 5620 SAM is used to create, maintain, and delete each entry.
- Each entry has an infinite lifetime, so is truly static.

1 Right-click on an NE in the navigation tree and choose Resync→Customized Resync from the contextual menu. The Resync Sites step form opens with the Resync Options step displayed.

2 Select Choose MIB entries.

3 Click on the Next button. The Choose MIB Entries step is displayed.

4 Select tmnxNatFwdEntry in the list.

5 Click on the Next button. The Force Resync step is displayed.

6 Select the Ignore Timestamps parameter.

7 Click on the Finish button. The entries are refreshed.

Note — You can view the static port forwarding entries on the NAT Static Port Forwarding tab of the NAT Configuration form for the following:

- base or service routing instances
- residential subscriber instances

Procedure 68-39 To collect, view, and clear host tracking statistics and information

Use this procedure to perform one or more of the following:

- collect, view, and clear on-demand host tracking statistics and information for a residential subscriber instance
- collect, view, and clear on-demand host tracking statistics and information for a VPLS L2 access interface
- collect, view, and clear on-demand host tracking statistics and information for an IES service access point
- collect, view, and clear on-demand host tracking statistics and information for a VPRN service access point
- clear statistics and host tracking information for a VPLS, VPRN, or IES service site
- clear statistics and host tracking information for a residential subscriber host

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 To collect, view, and clear on-demand host tracking statistics and information for a residential subscriber instance.

i Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

ii Choose Residential Subscriber Instance (Residential Subscriber) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of residential subscriber instances appears.

iv Choose a residential subscriber instance and click on the Properties button. The Residential Subscriber Instance (Edit) form opens with the General tab displayed.

v Click on the Statistics tab button.

vi Choose Host Tracking Stats (Residential Subscriber) from the object drop-down list.

vii Click on the Collect button to collect the statistics.

viii Select a statistics record and click on the Properties button to view the record. The statistics record form opens.

ix View the statistics information.

x Click on the Close button to close the statistics record form.

xi Repeat steps viii to x for each statistics record that you want to view.

xii Click on the Host Tracking Info tab button.

xiii Configure the filter criteria and click on the Search button. Host tracking data for the residential subscriber instance appears.

xiv Click on the Clear button. A dialog box appears.

xv If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

xvi Click the Yes button. An information box appears.

xvii Click the OK button. The data is deleted from the NE.

xviii Click the Clear Status tab button to view a list of host tracking information clear results.

xix Choose a request and click on the Properties button to view information about the request, if required.

xx Close the Residential Subscriber Instance (Edit) form.

xxi Close the Manage Residential Subscribers form.

2 To collect, view, and clear on-demand host tracking statistics and information for a VPLS L2 access interface.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Choose VPLS Service (VPLS) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of VPLS services appears.

iv Select a service and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

v On the navigation tree, click on an access interface. The VPLS L2 Access Interface (Edit) form opens.

vi Click on the Statistics tab button.

vii Choose Host Tracking Stats on SAP (Residential Subscriber) from the object drop-down list.

viii Click on the Collect button to collect the statistics.

ix Select a statistics record and click on the Properties button to view the record. The statistics record form opens.

x View the statistics information.

xi Click on the Close button to close the statistics record form.

xii Repeat steps ix to xi for each statistics record that you want to view.

xiii Click on the Subscriber Management tab button.

xiv Click on the Host Tracking Info tab button.

xv Configure the filter criteria and click on the Search button. Host tracking data for the L2 access interface appears.

xvi Click on the Clear button. A dialog box appears.

xvii If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

xviii Click the Yes button. An information box appears.

xix Click the OK button. The data is deleted from the NE.

xx Repeat steps xvi to xix for each host that you need to clear.

xxi Click the Clear Status tab button to view a list of host tracking information clear results.

xxii Choose a request and click on the Properties button to view information about the request, if required.

xxiii Close the VPLS L2 Access Interface (Edit) form.

xxiv Close the VPLS Service (Edit) form.

xxv Close the Manage Services form.

3 To collect, view, and clear on-demand host tracking statistics and information for an IES service access point.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Choose IES Service (IES) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of IES services appears.

iv Select a service and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

v On the navigation tree, click on a service access point. The IES Service Access Point (Edit) form opens.

vi Click on the Statistics tab button.

vii Choose Host Tracking Stats on SAP (Residential Subscriber) from the object drop-down list.

viii Click on the Collect button to collect the host tracking statistics.

ix Select a statistics record and click on the Properties button to view the record. The statistics record form opens.

x View the statistics information.

xi Click on the Close button to close the statistics record form.

xii Repeat steps ix to xi for each statistics record that you want to view.

xiii Click on the Subscriber Management tab button.

xiv Click on the Host Tracking Info tab button.

xv Configure the filter criteria and click on the Search button. Host tracking data for the IES service access point appears.

xvi Click on the Clear button. A dialog box appears.

xvii If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

xviii Click the Yes button. An information box appears.

xix Click the OK button. The data is deleted from the NE.

xx Repeat steps xvi to xix for each host that you need to clear.

xxi Click the Clear Status tab button to view a list of host tracking information clear results.

xxii Choose a request and click on the Properties button to view information about the request, if required.

xxiii Close the IES Service Access Point (Edit) form.

xxiv Close the IES Service (Edit) form.

xxv Close the Manage Services form.

4 To collect, view, and clear on-demand host tracking statistics and information for a VPRN service access point.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Choose VPRN Service (VPRN) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of VPRN services appears.

iv Select a service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

v On the navigation tree, click on a service access point. The VPRN Service Access Point (Edit) form opens.

vi Click on the Statistics tab button.

vii Choose Host Tracking Stats on SAP (Residential Subscriber) from the object drop-down list.

viii Click on the Collect button to collect the host tracking statistics.

ix Select a statistics record and click on the Properties button to view the record. The statistics record form opens.

x View the statistics information.

xi Click on the Close button to close the statistics record form.

xii Repeat steps vi to xi for each statistics record that you want to view.

xiii Click on the Subscriber Management tab button.

xiv Click on the Host Tracking Info tab button.

xv Configure the filter criteria and click on the Search button. Host tracking data for the VPRN service access point appears.

xvi Click on the Clear button. A dialog box appears.

xvii If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

xviii Click the Yes button. An information box appears.

xix Click the OK button. The data is deleted from the NE.

xx Repeat steps xvi to xix for each host that you need to clear.

xxi Click the Clear Status tab button to view a list of host tracking information clear results.

xxii Choose a request and click on the Properties button to view information about the request, if required.

xxiii Close the VPRN Service Access Point (Edit) form.

xxiv Close the VPRN Service (Edit) form.

xxv Close the Manage Services form.

5 To clear on-demand host tracking statistics and information for a VPLS service site.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Choose VPLS Service (VPLS) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of VPLS services appears.

iv Select a service and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

v On the navigation tree, click on a site. The VPLS Site (Edit) form opens with the General tab displayed.

vi Click on the IGMP Host Tracking tab button.

vii Click on the Clear button. A dialog box appears.

viii If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

ix Click the Yes button. An information box appears.

x Click the OK button. The service site data is deleted from the NE.

xi Click the Clear Status tab button to view a list of site host tracking information clear results.

xii Choose a request and click on the Properties button to view information about the request, if required.

xiii Close the VPLS Site (Edit) form.

xiv Close the VPLS Service (Edit) form.

xv Close the Manage Services form.

6 To clear on-demand host tracking statistics and information for an IES service site.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Choose IES Service (IES) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of IES services appears.

iv Select a service and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

v On the navigation tree, click on a site. The IES Site (Edit) form opens with the General tab displayed.

vi Click on the IGMP Host Tracking tab button.

vii Click on the Clear button. A dialog box appears.

viii If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

ix Click the Yes button. An information box appears.

x Click the OK button. The service site data is deleted from the NE.

xi Click the Clear Status tab button to view a list of site host tracking information clear results.

xii Choose a request and click on the Properties button to view information about the request, if required.

xiii Close the IES Site (Edit) form.

xiv Close the IES Service (Edit) form.

xv Close the Manage Services form.

7 To clear on-demand host tracking statistics and information for a VPRN service site.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Choose VPRN Service (VPRN) from the object drop-down list.

iii Configure the filter criteria and click on the Search button. A list of VPRN services appears.

iv Select a service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

v On the navigation tree, click on a site. The VPRN Site (Edit) form opens with the General tab displayed.

vi Click on the IGMP Host Tracking tab button.

vii Click on the Clear button. A dialog box appears.

viii If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

ix Click the Yes button. An information box appears.

x Click the OK button. The service site data is deleted from the NE.

xi Click the Clear Status tab button to view a list of site host tracking information clear results.

xii Choose a request and click on the Properties button to view information about the request, if required.

xiii Close the VPRN Site (Edit) form.

xiv Close the VPRN Service (Edit) form.

xv Close the Manage Services form.

8 To clear on-demand host tracking statistics and information for a residential subscriber host.

i Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

ii Choose Residential Subscriber Host (Residential Subscriber) from the object drop-down list.

iii Select the Search Current Subscriber Host Information option.

iv Click on the Select button beside Site ID to specify an NE. The Select an ESM Capable Network Element form opens.

v Select an NE in the list and click on the OK button. The Select an ESM Capable Network Element form closes and the NE system IP address is displayed on the Manage Residential Subscribers form.

vi Configure the Service ID parameter.

vii Click on the Select button beside Port to specify a port. The Select Port form opens.

viii Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed on the Manage Residential Subscribers form.

ix Click the Search button. A list of hosts appears.

x Choose a host from the list and click the Clear Host Tracking button. A dialog box appears.

xi If you only need to clear the host tracking statistics, enable the Clear only Host Tracking Statistics? check box.

xii Click the Yes button. An information box appears.

xiii Click the OK button. The residential subscriber host data is deleted from the NE.

xiv You can view a list of the residential host clear results by clicking on the Clear Status button on the residential subscriber instance form.

xv Repeat steps x to xiv for each host that you need to clear.

xvi Close the Manage Residential Subscribers form.

Procedure 68-40 To view subscriber host information

ESM Dynamic Host Persistence provides persistence of subscriber host information of properties that bind a host to a SAP, an IP address or a MAC address. This provides troubleshooting functionality while avoiding unnecessary and unscalable network queries. Only the properties of the subscriber host which are required to tie the host to other objects for troubleshooting, since there are no statistics and no OAM tests for subscriber hosts, are persisted.

Note — Only IPoE (DHCP and ARP) and IPOE-DHCP6 hosts can be persisted in the 5620 SAM.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber Host from the object list.

3 Click on the Search Subscriber Host Information from Last Resynch radio button.

4 View the available read-only attributes.

5 If required, click on the Resync Subscriber Host Table button. The ESM Capable Network Element form opens.

6 Select one or more NEs. Click on the OK button. A dialog box opens.

7 Click on the check box. Click on the Yes button.

8 The Select an ESM Capable Network Element form closes.

9 To retrieve the SAPs on which a subscriber host with an IP address resides, perform the following steps:

Note — You can also retrieve DHCP, PPPoE sessions, and ARP host information on demand from the Manage→Residential Subscribers menu option. The Manage Residential Subscribers form opens.

i Click on the Search Current Subscriber Host Information radio button.

ii Click on the Select button beside Site ID to specify an NE. The Select an ESM Capable Network Element form opens.

iii Select an NE in the list and click on the OK button. The Select an ESM Capable Network Element form closes and the NE system IP address is displayed on the Manage Residential Subscribers form.

iv Configure the Service ID parameter.

v Click on the Select button beside Port to specify a port. The Select Port form opens.

vi Select a port in the list and click on the OK button. Configure the Inner Encapsulation Value and Outer Encapsulation Value parameters. The Select Port form closes and the port identifier is displayed on the Manage Residential Subscribers form.

vii Click on the Search button.

viii View the available read-only attributes.

ix Close the Manage Residential Subscribers form.

Procedure 68-41 To view a subscriber and the associated subscriber hosts

Note — You can use the 5620 SAM GUI to display the object model associated with 5750 SSC residential subscriber services. See chapter 100 for more information.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of residential subscribers appears.

4 Select a residential subscriber and click on the Properties button. The Residential Subscriber (View) form opens with the General tab displayed.

5 View a list of the residential subscriber instances for the subscriber, if required.

i Click on the Residential Subscriber Instances tab button.

ii Select a residential subscriber instance and click on the Properties button. The Residential Subscriber Instance (Edit) form opens with the General tab displayed.

iii View the instance information.

The Residential Subscriber State panel displays the following subscriber status information:

- Active
- Residential Subscriber Creation
- Last Active State Change

iv Close the Residential Subscriber Instance (Edit) form.

6 Specify the subscribed application profile for AA reporting, if required.

i Click on the Residential Subscriber Instances tab button.

ii Select a residential subscriber instance and click on the Properties button. The Residential Subscriber Instance (Edit) form opens with the General tab displayed.

iii Configure the Subscribed Application Profile parameter.

iv Click on the OK button. A dialog box appears.

v Click on the Yes button.

7 List and view the active hosts for the subscriber, if required.

i Click on the Subscriber Hosts tab button.

ii Click on the Find button. A confirmation prompt appears.

iii Click on the Yes button. The list of subscriber hosts refreshes with the active subscriber host entries.

iv To view the information for a subscriber host, select the host and click on the Properties button. The Subscriber Host form opens with the subscriber host information displayed. Otherwise, go to step 8.

v View the subscriber host information.

vi Close the Subscriber Host form.

8 Close the Residential Subscriber (View) form.

9 Close the Manage Residential Subscribers form.

Procedure 68-42 To view a subscriber instance and the associated subscriber hosts

Note — You can use the 5620 SAM GUI to display the object model associated with 5750 SSC residential subscriber services. See chapter 100 for more information.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber Instance from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of residential subscriber instances appears.

4 Select a residential subscriber instance and click on the Properties button. The Residential Subscriber Instance (Edit) form opens with the General tab displayed.

The Residential Subscriber State panel displays the following subscriber status information:

- Active
- Residential Subscriber Creation
- Last Active State Change

5 List and view the active hosts for the subscriber instance, if required.

i Click on the Subscriber Hosts tab button.

ii Click on the Find button. A confirmation prompt appears.

iii Click on the Yes button. The list of subscriber hosts refreshes with the active subscriber host entries.

iv To view the information for a subscriber host, select the host and click on the Properties button. The Subscriber Host form opens with the subscriber host information displayed. Otherwise, go to step 7.

v View the subscriber host information.

vi Click on the Cancel button to close the Subscriber Host form.

6 List and view the subscriber hosts for which a DHCP lease has been manually terminated, if required.

i Click on the Clear Status tab button.

ii To view the information for a subscriber host, select the host and click on the Properties button. The Subscriber Host form opens with the subscriber host information displayed. Otherwise, go to step 7.

iii View the subscriber host DHCP lease information.

iv Click on the Cancel button to close the Subscriber Host form.

7 View the collected statistics for the subscriber instance, if required.

i Click on the Statistics tab button.

ii Choose a statistics class from the object drop-down list.

iii Click on the Collect button to collect the statistics for the chosen class, or click on the Collect All button to collect the statistics for all classes.

iv Select a statistics record and click on the Properties button to view the record. The statistics record form opens.

v View the statistics information.

vi Click on the Close button to close the statistics record form.

vii Repeat steps ii to vi for each statistics class that you want to view.

8 Click on the Cancel button to close the Residential Subscriber Instance (Edit) form.

9 Close the Manage Residential Subscribers form.

Procedure 68-43 To view or configure active residential subscriber hosts on a SAP

Note — The 5620 SAM does not automatically display a list of all active hosts on a SAP because the number of hosts on a SAP is potentially large and may take a long time to retrieve. You must request the list of hosts on a SAP. The 5620 SAM prompts you for confirmation before retrieving the list of hosts.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to view or configure active residential subscriber hosts on a SAP; expand the entries for that site.

5 Click on the Access Interfaces icon to display the site SAPs.

6 Select a SAP, right-click, and choose Properties. The SAP configuration (Edit) form opens with the General tab displayed.

7 Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

8 Click on the Subscriber Hosts tab button.

9 Click on the Find button. A confirmation prompt appears.

10 Click on the Yes button. The list of subscriber hosts refreshes with the active subscriber host entries.

11 To view the information for a subscriber host, select the host entry and click on the Properties button. The Subscriber Host form opens with the subscriber host information displayed.

12 If the subscriber host is a static host, go to step 19.

13 Configure the Subscriber Profile String parameter for the dynamic host or PPPoE host, if required. Click on the Select button to choose a subscriber profile string from the Subscriber Profile String - Subscriber Host form.

> **Caution —** Changing the subscriber profile string directly on a subscriber host is potentially service-affecting to all hosts on all SAPs that belong to the subscriber. Because a subscriber is associated with only one subscriber profile, when you change the subscriber profile string for one host, all dynamic or PPPoE hosts associated with the subscriber on all SAPs are automatically configured with the new subscriber profile.

14 Configure the SLA Profile String parameter for the dynamic host or PPPoE host, if required. Click on the Select button to choose an SLA profile from the SLA Profile - Subscriber Host form.

15 Configure the Application Profile parameter for the dynamic host PPPoE host, if required. Click on the Select button to choose an application profile string from the Application Profile String - Subscriber Host form.

> **Caution —** Changing the application profile string directly on a subscriber host is potentially service-affecting to all hosts on all SAPs that belong to the subscriber. Because a subscriber is associated with only one application profile, when you change the application profile string for one host, all dynamic or PPPoE hosts associated with the subscriber on all SAPs are automatically configured with the new application profile.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Subscriber Host form closes.

18 Go to step 20.

19 Click on the Cancel button to close the Subscriber Host form.

20 Click on the OK button. The SAP configuration form closes.

21 Close the Manage Services form.

Procedure 68-44 To view SHCV log events

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Click on the View SHCV button. The Subscriber Host Connectivity Verification form opens.

3 Choose SHCV Event Log from the object drop-down list.

4 Configure the filter criteria and click on the Search button. A list of NE SHCV event logs appears.

5 Select a log entry and click on the Properties button. The SHCV Log Entry form opens.

6 View the log entry.

7 Close the SHCV Log Entry form.

8 Close the Subscriber Host Connectivity Verification form.

9 Close the Manage Residential Subscribers form.

Procedure 68-45 To change the identification of a subscriber

Perform this procedure to change the identification of a subscriber, for example, when you no longer want hosts on the SAP to use the SAP ID as the subscriber ID.

Caution 1 — Renaming a subscriber can be service-affecting because it changes the subscriber identification string of all associated subscriber hosts. Before you proceed, ensure that no subscriber hosts require the subscriber identification string associated with this subscriber.

Caution 2 — Renaming a subscriber changes the SAP default subscriber identification strings that are associated with it.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of residential subscribers appears.

4 Select a residential subscriber and click on the Modify button. The Residential Subscriber (Edit) form opens with the General tab displayed.

5 Configure the New Subscriber Identification parameter.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The 5620 SAM renames the subscriber.

8 Close the Manage Residential Subscribers form.

Procedure 68-46 To reset a subscriber's subscription credit limit

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form appears.

2 Choose Residential Subscriber Host from the Object Type drop-down list.

3 Click on the Search button. A list of residential subscriber hosts is displayed.

4 Perform one of the following:

  a Select a host from the list and click on the Reset Credit button. Go to step 9.

  b Select a host from the list and click on the Properties button. The Subscriber Host form opens.

5 Click on the Credit Control Operational values tab button.

6 Select an entry from the list and perform one of the following:

  a Click on the Reset Credit button. Go to step 8.

  b Click on the Properties button. A form opens.

7 Close the form after viewing credit control data.

8 Close the Subscriber Host form.

9 Close the Manage Residential Subscribers form.

Procedure 68-47 To modify the primary subscriber identification script or URL

This procedure allows a 5620 SAM operator to modify the primary subscriber identification script without service disruption. Perform this procedure only when the primary script and URL are operational.

Caution — Modifying the primary subscriber identification script is potentially service-affecting if no functional backup script is administratively enabled. Modifying a backup (secondary or tertiary) subscriber identification script is unlikely to be service-affecting if the other backup script (secondary or tertiary) functions properly and is administratively enabled. Ensure that at least one administratively enabled backup script is accessible to the 5620 SAM and the NEs to which it applies before you proceed.

1 Choose Policies→Residential Subscriber from the 5620 SAM main menu. The Manage Subscriber Policies form opens.

2 Choose Subscriber Identification Policy from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of subscriber identification policies appears.

4 Select a subscriber identification policy and click on the Properties button. The Subscriber Identification Policy (Edit) form opens with the General tab displayed.

5 Copy the operational primary script URL to the secondary position. This action ensures that an operational backup script is in place in the event that there is a problem with the new primary script or URL.

- **i** Set the Secondary Script Administrative State parameter to disabled.
- **ii** Click on the Apply button. A dialog box appears.
- **iii** Click on the Yes button. The 5620 SAM administratively disables the secondary script.
- **iv** Configure the Secondary Script URL parameter with the value of the Primary Script URL parameter.
- **v** Set the Secondary Script Administrative State parameter to enabled.
- **vi** Click on the Apply button. A dialog box appears.
- **vii** Click on the Yes button. The 5620 SAM administratively enables the secondary script.

Note — You must administratively disable and enable a script URL to cause the NEs to which the subscriber identification policy applies to load the script using the URL.

6 Modify a renamed copy of the former primary script or create a replacement script, as required; record the new or modified script URL.

7 Configure the new URL as the primary script URL.

i Set the Primary Script Administrative State parameter to Disabled.

ii Click on the Apply button. A dialog box appears.

iii Click on the Yes button. The 5620 SAM administratively disables the primary script. The secondary (former primary) script is the active script.

iv Configure the Primary Script URL parameter with the new URL value.

v Set the Primary Script Administrative State parameter to Enabled.

vi Click on the Apply button. A dialog box appears.

vii Click on the Yes button. The 5620 SAM administratively enables the primary script. The new primary script is the active script.

Note — You must administratively disable and enable a script URL to cause the NEs to which the subscriber identification policy applies to load the script using the URL.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The Subscriber Identification Policy (Edit) form closes.

10 Close the Manage Subscriber Policies form.

Procedure 68-48 To delete an inactive residential subscriber instance

Use this procedure to remove the record of an inactive residential subscriber instance from the 5620 SAM database. Residential subscriber instances become inactive in the 5620 SAM when the subscriber is deleted from the NE.

Note — AA statistics data can be lost when you delete a residential subscriber instance before the 5620 SAM is finished collecting and processing AA statistics. Alcatel-Lucent recommends waiting at least two statistics collection intervals before deleting an inactive residential subscriber instance.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber Instance from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of residential subscriber instances appears.

The Active property indicates the status of each residential subscriber instance in the list. An inactive residential subscriber instance has no check mark under the Active heading.

4 Select the inactive residential subscriber instance you want to delete and click on the Delete button. The inactive residential subscriber instance is removed from the list.

5 Close the Manage Residential Subscribers form.

69 — VLAN service management

69.1 VLAN service management overview

VLANs are created to provide the segmentation services traditionally provided by routers in LAN configurations. VLANs address issues such as scalability, security, and network management. Routers in VLAN topologies provide broadcast filtering, security, address summarization, and traffic flow management. Table 69-1 lists the types of VLAN services that are supported on the 5620 SAM by device type:

Table 69-1 Device VLAN support

Device	Supported VLAN types
7250 SAS 7250 SAS-ES 7250 SAS-ESA 7450 ESS Telco	• Standard VLAN • Management VLAN • L2 VPN (TLS/VLAN-Stacking) VLAN • Broadcast TV (MVR/IPMV) VLAN • Super (Internet Access) VLAN
All OmniSwitches except for the OS 6900 and OS 10K	• Standard VLAN • L2 VPN (TLS/VLAN-Stacking) VLAN • Broadcast TV (MVR/IPMV) VLAN
9500 MPR	• 9500 MPR (dot1q) VLAN

Several 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, 7450 ESS, Telco, 9500 MPR and OmniSwitch VLAN services can be interconnected through a backbone VPLS.

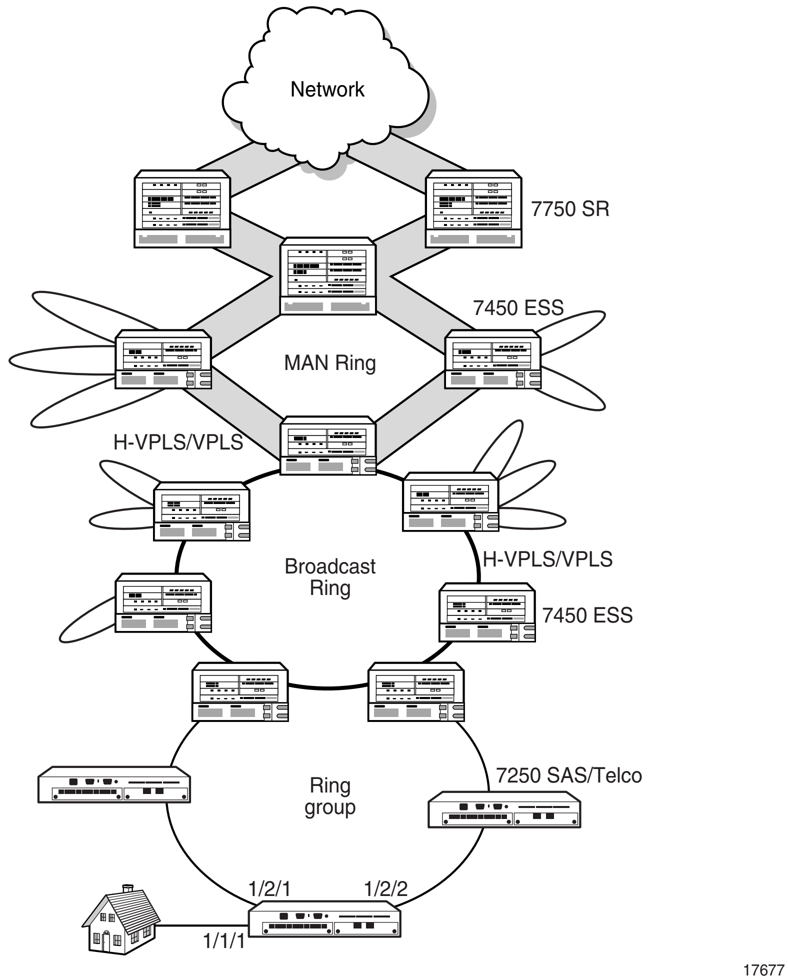
The 5620 SAM supports end-to-end VLAN configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Pre-configured template. A user that is assigned the template management role can create a service template. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

VLAN ring groups

VLAN ring groups are used to send traffic across an Ethernet ring using copper or fiber optic connections from the source traffic device, for example, from a 7450 ESS, to all devices in the ring. STP configuration on OmniSwitch, 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco devices ensures that there is a constant stream of traffic in either direction by rerouting traffic around breaks in the physical links between the devices. Figure 69-1 shows an example of a ring group that is part of a larger metropolitan area network. The scenario shown in Figure 69-1 also supports OmniSwitch NEs instead of the 7250 SAS/Telco NEs shown.

Figure 69-1 Ring in a metropolitan and broadcast network



The 5620 SAM provides OAM tools for service validation and for troubleshooting service and network transport issues.You can run the OAM Validation test suite for the VLAN service by clicking on the More Actions > Validate button. If a check mark appears beside the OAM Validation Failed state cause indicator, the test has failed. In addition, the Validation Result tab on the Tests tab displays more detailed information about the OAM test result. See chapter 78 for more information about how to configure OAM validation test suites.

The Aggregated Service Site Operational State parameter has four possible values. The value is derived from the operational states of the sites that are part of the service, as follows:

- Up—all sites are operationally up
- Partially Down—at least one site is operationally down
- Down—all sites are operationally down
- Unknown—the service has no provisioned sites

When the Aggregated Service Site Operational State parameter is Partially Down or Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator. You can view alarms on the Faults page.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology map views. See chapter 76 for more information about the hierarchical organization of composite services.

VLAN groups and paths

The 5620 SAM supports the configuration and provisioning of VLAN groups and paths which are used by the following NEs.

- OmniSwitch devices (VLAN groups only) to configure VLAN services
- 9500 MPR ANSI/ETSI (2.x and 3.x streams) to configure VLAN and VLL services

VLAN groups

You can use VLAN groups to:

- logically group OmniSwitch and 9500 MPR devices to represent a typical network topology. An OmniSwitch and a 9500 MPR cannot belong to the same VLAN group.
- manage the VLAN IDs that are assigned to 9500 MPR VLAN group members.

Note — When you create a 9500 MPR service, they can only be configured between 9500 MPRs that belong to the same VLAN group.

See Procedure 69-10 for more information about creating VLAN groups.

VLAN paths

A VLAN path is a bidirectional transport-tunnel service that is used to support alarm correlation and to turn up radio backhaul services on 9500 MPR devices. VLAN paths use a tree or mesh topology. The paths can span NEs that are connected by both radio links and physical links. You can configure a VLAN path as follows:

- Ring based—An ERP topology is a collection of Ethernet ring nodes that form a closed physical loop. Each Ethernet ring node is connected to two adjacent Ethernet ring nodes via a duplex communications facility. An Ethernet ring can contain a minimum of 2 Ethernet ring nodes and a maximum of 16.
- Hop based—Users specify the number of hops from a source 9500 MPR to a destination 9500 MPR. Each hop in the path is a 9500 MPR that belongs to the same VLAN group.The following hop-based VLAN paths variants are supported.
    - Auto—A user defines the head end of the VLAN group, the hops the VLAN path takes, and optionally, the minimum bandwidth requirements, and whether the shortest path should be used. The 5620 SAM determines the appropriate available route for the VLAN path.
    - Manual—A user defines the source 9500 MPR, the hops and links the VLAN path takes, and optionally, the minimum bandwidth requirements.
    - Point 2 Point—A user defines the source and destination 9500 MPR, the maximum number of allowed hops and, optionally, the minimum bandwidth requirements, and whether the shortest path should be used.

See Procedure 69-12 for more information about creating VLAN paths.

VLAN service policies (7250 SAS, 7450 ESS, and Telco)

Policies can be assigned to ports on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices. Policies are defined at a global level and then applied to components of the service, such as a port.

Note — The 5620 SAM supports the distribution of policies on the 7450 ESS, 7750 SR, 7710 SR, Release 6.3 or earlier Telco devices, and on the 7250 SAS and 7250 SAS-ES, prior to Release 2.0.

The policy on the component is then a local version of the global policy. The following policies are common to VLAN services:

- QoS policies define ingress classification, policing, shaping, and marking on the device. QoS policies are configured using the Telco Qos Node Level Policy Manager.
- Filter policies control network traffic into or out of an interface or device based on IP or MAC matching criteria. Filter policies are configured using the Telco ACL Standard IP Filter Manager, the Telco ACL Extended IP Filter Manager, and the Telco ACL MAC Filter Manager.
- Multicast policies define the available broadcast addresses (BTV channels) for a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco ring. ACL IGMP filters specify the filters that are applied for end users to the channels to ensure that only the subscribed channels are delivered. Multicast polices and filters are configured using the Multicast Package Policy Manager and the Telco ACL IGMP Filter Manager, and are applied during service creation.

See chapter 46 for more information about policies.

VLAN service policies (OmniSwitch)

Policies can be assigned to ports on an OmniSwitch. Policies are defined at a global level and then applied to components of the service, such as a port.

The policy on the component is then a local version of the global policy. The following policies are common to VLAN services:

- QoS policies define ingress classification, policing, shaping, and marking on the device.
- UNI policies define how control frames that are received on a port are processed. UNI policies are applied to a port that is used as a SAP in a L2 VPN TLS (stacked) VLAN.
- SAP policies define traffic engineering parameters for bandwidth sharing, rate limiting, CVLAN translation (or double-tagging), and priority bit mapping. SAP policies are applied to the service access multi-point.
- Filter policies control network traffic into or out of an interface or device based on IP or MAC matching criteria.

See chapter 46 for more information about policies.

Default VLANs

By default, 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch devices (except for the OS 6900 and OS 10K) are configured with a default VLAN that uses VLAN ID 1. In addition, access ports on the 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA are untagged and configured for access mode as members of VLAN ID 1.

Note — The 5620 SAM does not manage VLAN ID 1 on an OmniSwitch.

Before you create a VLAN on a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA, device using untagged ports, ensure the following.

- Renumber the default VLAN (ID 1) with the new VLAN ID that you want to use.
- Remove all untagged access ports that are not members of the new VLAN.
- Do not share untagged ports between VLANs, as there can only be one default VLAN for each untagged port.

See section 20.2 for more information about tagged and untagged ports.

7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch network management

The 5620 SAM manages the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch devices (except for the OS 6900 and OS 10K) using SNMP and CLI messages. The devices support termination of all VLAN types on Ethernet ports. The 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA supports the termination of standard VLANs and L2 VPN VLANs on CES ports with dot1q encapsulation.

When using 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices to ensure the latest management view of the network, a management VLAN must be created on devices that belong to a ring group. This is done by:

- ensuring ports are configured to allow management message traffic
- making the 7450 ESS part of a management VPLS, used to relay SNMP and CLI messages to the devices

Spanning tree protocols

The STP configuration on a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device in a ring group or an OmniSwitch device (except for the OS 6900 and OS 10K) in a VLAN group detects loops in the topology and ensures that there is a constant stream of traffic by rerouting traffic around breaks in the physical links between the devices. The 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch devices support STP, MSTP and RSTP.

Spanning tree on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices

Spanning tree protocols are a global configuration, and only one protocol can be enabled at a time. For example, if you enable RSTP while STP is already running, the 7250 SAS disables STP and runs RSTP. You can disable STP per port when MSTP or RSTP is enabled globally. Spanning tree protocols must be configured before the 5620 SAM manages the device.

Spanning tree on OmniSwitch devices

The OmniSwitch can operate in the following spanning tree modes:

- flat
- 1 x 1

The flat mode provides a CST instance that applies across all VLANs and supports STP (802.1D), RSTP (802.1w), and MSTP. MSTP allows the mapping of one or more VLANs to a single spanning tree instance.

The 1x1 mode is an Alcatel-Lucent proprietary implementation that automatically calculates a separate spanning tree instance for each VLAN configured on the switch. This mode only supports the use of the STP and RSTP.

By default, an OmniSwitch runs in the 1x1 mode and uses the 802.1D protocol.

The 5620 SAM supports the configuration of Spanning Tree protocols and modes.

See the OmniSwitch user documentation for more information about Spanning Tree modes.

STP

STP is a Layer 2 link management protocol that provides path redundancy while preventing undesirable loops in the network. Fault-tolerant internetworks must have a loop-free path between all the nodes in a network. The spanning tree algorithm calculates the best loop-free path through a switched Layer 2 network. Switches send and receive STP frames at regular intervals but do not forward these frames.

See the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch user documentation for more information about device-specific STP CLI commands and parameters.

RSTP

RSTP uses point-to-point wiring to provide rapid convergence of the spanning tree. With RSTP, the spanning tree may be reconfigured in less than 1 s, as compared to 50 s required with the default STP settings. This is critical in networks that carry voice, video, and other delay-sensitive traffic.

RSTP assigns port roles and determines the active topology to provide rapid convergence of the spanning tree. RSTP selects the switch with the highest switch priority.

See the 7250 SAS, Telco, and OmniSwitch user documentation for more information about device-specific RSTP CLI commands and parameters.

MSTP

MSTP allows you to group and associate VLANs to multiple spanning tree instances, or forwarding paths. MSTP allows up to 16 RSTP instances to be run and associates a VLAN with a specific MST instance. This reduces link convergence time and enables load balancing over a large number of VLANs.

Each MST instance can have its own independent topology. Multiple forwarding paths improve network fault tolerance because when one instance fails, data flow is unaffected over the remaining forwarding paths. You can manage large networks and use redundant paths more easily by allocating different VLAN and spanning tree instance assignments to different parts of the network.

See the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch user documentation for more information about device-specific RSTP CLI commands and parameters.

MSTP fast ring (7250 SAS and Telco only)

The MSTP fast ring mode shortens the MSTP convergence time in a ring topology when a disconnection occurs. To use MSTP fast ring, you must select one bridge to be the root bridge by setting its priority to the lowest value. All of the user ports must be configured as MSTP edge ports.

To optimize the performance of your network, increment the priority of the bridges as you draw away from the root bridge.

See the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco user documentation for information about configuring the MSTP fast ring.

7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, 7210 SAS-M and Telco VLAN restrictions

VLANs with the characteristics listed in either of the following scenarios cannot be modified using the 5620 SAM. A deployment error results when you attempt to modify the VLAN.

Scenario 1

- the VLAN was not created using the 5620 SAM
- the VLAN name contains more than 19 characters

Scenario 2

- the VLAN was created using the 5620 SAM
- the VLAN contains more than 19 characters
- the VLAN was removed from the 5620 SAM database because of the unmanaging and remanaging of a node or the deletion of a service
- the nodes that are part of the VLAN were rediscovered

9500 MPR services

A 9500 MPR service is created by configuring sites and access interfaces, and then associating the service with a VLAN path. The 5620 SAM creates cross-connects between the physical ports on all 9500 MPRs along the VLAN path. These paths with cross-connects are called VLAN path instances. VLAN path instances are specific to a service, and each VLAN service will have its own underlying VLAN path instance. A VLAN path can have multiple VLAN path instances. The VLAN path instance and all of the cross-connects on the service can be viewed along with other service properties.

All 9500 MPR services use the default customer and are identified by a VLAN ID assigned at each inflow interface and a service ID. The service ID and VLAN ID have different values.The VLAN ID can be automatically assigned by the 5620 SAM or assigned by the user. When the 5620 SAM assigns the VLAN ID, the ID is based on the VLAN group that the endpoint 9500 MPR belongs to.

You can configure the following service types on the 9500 MPR:

- 9500 MPR (dot1q) VLAN services; see Procedure 69-8.
- VLL services; see chapter 70.
    - Epipe (ANSI)
    - Apipe (ETSI)
    - Cpipe (ANSI and ETSI)
- Composite services; see chapter 76.

Service-in-service automatic discovery

The 5620 SAM supports automatic discovery for service-in-service associations created with the 9500 MPR. Service-in-service refers to a transport service which carries services for network routers. Automatic discovery allows the 5620 SAM to automatically associate a transport service with a service tunnel when a physical link is created between the 9500 MPR and a non-MPR NE. Service faults generated on either of the associated services will become cross-correlated in the 5620 SAM.

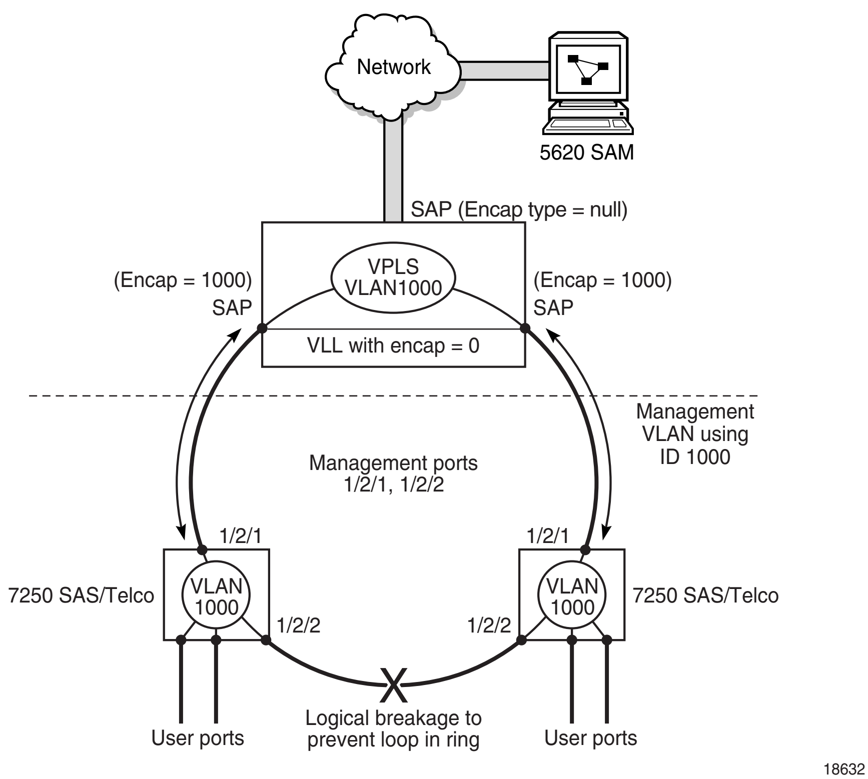
Note 1 — Service-in-service automatic discovery will not overwrite a service which is already associated with a service tunnel. Users can, however, manually overwrite an automatic association with another service. Only one service can be associated to a service tunnel. Refer to Chapter 33 for mote information on associating a service to a service tunnel.

Note 2 — If the physical link between the 9500 MPR and the network router is removed, the 5620 SAM will automatically disassociate the service from the service tunnel.

69.2 Sample management VLAN configuration

Figure 69-2 shows a sample management VLAN service configuration. The configuration depends on the specific network requirements.

Figure 69-2 Sample management VLAN



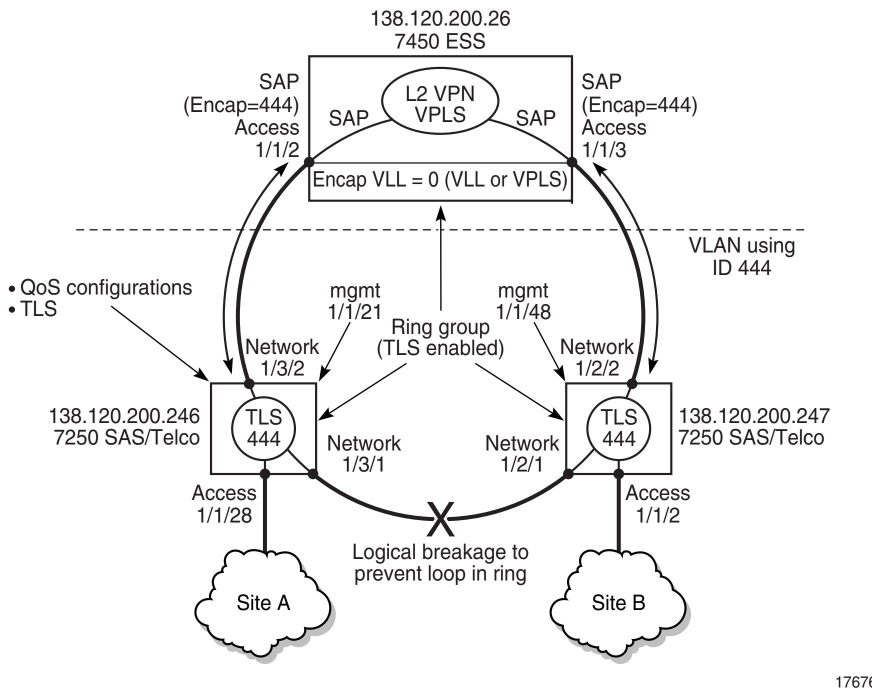
The following high-level steps describe the configuration of the sample management VLAN.

1 Choose a management VLAN ID to be used in the ring, for example, ID 1000.
2 Create a VPLS on the 7450 ESS that has the SAPs in the VPLS set with encapsulation 1000. See chapter 71 for more information about creating a VPLS.
3 The port to which the 5620 SAM is connected to the network is added to the VPLS without encapsulation.
4 Create a management VLAN on each 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device; for example, by using CLI:
    - config vlan
    - create mgt_1000
    - config mgt_1000
    - add ports 1/2/1, 1/2/2 tagged
5 Exclude all other VLANs from being management VLANs, for example, by using CLI:
    - config vlan
    - no management 1-999,1001-4094 (for a Telco) no management 1-999, 1001-4092 (for a 7250 SAS)
6 Ensure only the uplink ports from the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices have device management capabilities to ensure user ports cannot access CLI, SNMP, or FTP functionality, for example, by using CLI:
    - config
    - no port management 1/1/1-1/1/24

69.3 Sample L2 VPN VLAN configuration

Figure 69-3 shows a sample L2 VPN VLAN service configuration. Transparent LAN services such as a L2 VPN are used to transport large numbers of customer VLANs while keeping the traffic in each VLAN segregated. The configuration depends on the specific network requirements.

Figure 69-3 Sample L2 VPN VLAN configuration



Verify that the following preconfigurations are complete.

- Ensure that the appropriate preconfigurations have been performed on the 7250 SAS or Telco devices.
    - pre-discovery CLI modifications
    - discovery including mediation configuration with the CLI user names and passwords
    - configure protocol to manage topology loops, such as MSTP or RSTP
- Ensure that the TLS VPLS that feeds the ring VLAN service is configured on the 7450 ESSs. The encapsulation of the SAPs that belong to the VPLS on the 7450 ESSs must match the VLAN ID of the ring VLAN.
- Configure the 7250 SAS or Telco ports as access (ports that are part of the VLAN) and network (ports that are used for uplinks), as required, from the navigation tree.
- Configure the bridge instances for the 7250 SAS or Telco devices from the network view in the navigation tree.
- Devices that belong to the ring, and the 7450 ESS that the ring connects to, should be added to the ring group.
- Ensure that the appropriate preconfigurations have been performed on the 7450 ESS.
    - A VLL is created with 0 encapsulation between the SAPs (1/1/2 and 1/1/3) on the 7450 ESS
    - The SAPs on the 7450 ESS that are part of the VPLS use the same encapsulation as the VLAN ID for the ring group
    - A L2 VPN VPLS is created on the 7450 ESS.

Table 69-2 lists the high-level tasks that are required to configure this sample VLAN L2 VPN service.

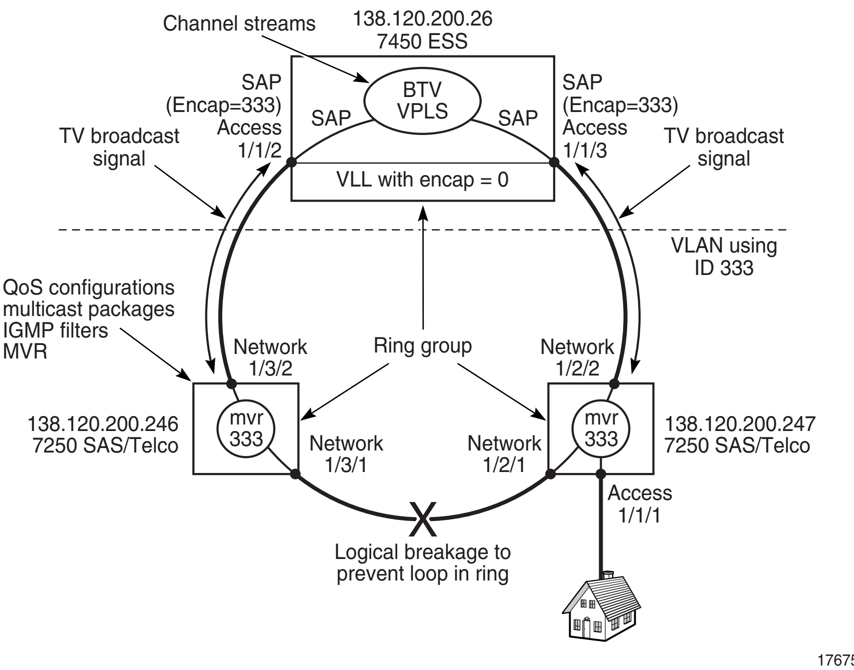
Table 69-2 Sample VLAN L2 VPN service configuration

Task	Description
1. Manage and configure devices	Ensure that the required configurations are completed to equipment, including configuring access and network ports, enabling CLI configuration on managed 7250 SAS and Telco devices, and the creating of ring groups that are enabled to receive TLS (L2 VPN) streams: • The ring group contains all three devices. • TLS is enabled for the ring group. • Ports 1/3/1 and 1/3/2 on the device connected to Site A and 1/2/1 and 1/2/2 connected to Site B are configured as network to act as uplinks. • Ports 1/1/2 and 1/1/3 are configured as access on the 7450 ESS, and the encapsulation matches the VLAN ID (444). • Ports 1/1/2 and 1/1/28 on the 7250 SAS and Telco devices are configured as access ports.
2. Configure policies as required	Policies should be configured before you create a service. The following key policies can be applied to resources that are part of a VLAN. • QoS policies for the 7250 SAS and Telco devices and ports • scheduling policies • filter policies, including IGMP filter policies to create and deploy access control lists on the 7250 SAS and Telco devices in the ring
3. Distribute policies to devices	Distribute configured policies to the devices. The policies are used during the creation of VLAN services.
4. Create VLAN services	Create VLAN services using a series of configuration forms. Ensure that the VLAN created for the ring group uses ID 444.
5. Add access interfaces	Associate access interfaces (similar to SAPs) with VLAN services, that are the physical ports to which end users connect. Use the L2 Interfaces tab button on the VLAN properties form to associate VLAN services with the ports used by end users.

69.4 Sample BTV VLAN configuration

Figure 69-4 shows a sample broadcast TV VLAN configuration. BTV VLANs are shared VLANs, where the multicast broadcast channels or pay per view channels are available across the ring, and based on subscriptions and privileges determined using IGMP snooping, the user gains or is denied access. The configuration depends on the specific network requirements.

Figure 69-4 Sample BTV VLAN configuration



Verify that the following preconfigurations are complete.

- Ensure that the appropriate preconfigurations have been performed on the 7250 SAS and Telco devices:
    - pre-discovery CLI modifications
    - SNMP trap forwarding to the 5620 SAM
    - discovery, including mediation configuration with the CLI user names and passwords
    - configure protocols to manage topology loops, such as MSTP or RSTP
- Ensure that the BTV VPLS that feeds the ring VLAN service is configured on the 7450 ESSs. The encapsulation of the SAPs that belong to the VPLS on the 7450 ESSs should match the VLAN ID of the ring VLAN.
- Configure 7250 SAS and Telco ports as access (ports that are part of the VLAN) and network (ports that are used for uplinks), as required, from the navigation tree.
- Configure the bridge instances for the 7250 SAS and Telco devices from the network view in the navigation tree.
- Enable IGMP snooping on the bridge instance for the 7250 SAS and Telco devices included in the broadcast TV VLAN.
- 7250 SAS and Telco devices that belong to the ring, and the 7450 ESS that the ring connects to, should be added to the ring group.

- Ensure that the appropriate preconfigurations have been performed on the 7450 ESS.
    - A VLL is created with 0 encapsulation between the SAPs (1/1/2 and 1/1/3) on the 7450 ESS
    - The SAPs on the 7450 ESS that are part of the VPLS use the same encapsulation as the VLAN ID for the ring group
    - A BTV VPLS is created on the 7450 ESS.
- Create and manage the necessary broadcast TV policies, including multicast package and IGMP filtering.

Table 69-3 lists the high-level tasks that are required to configure this sample broadcast TV VLAN service.

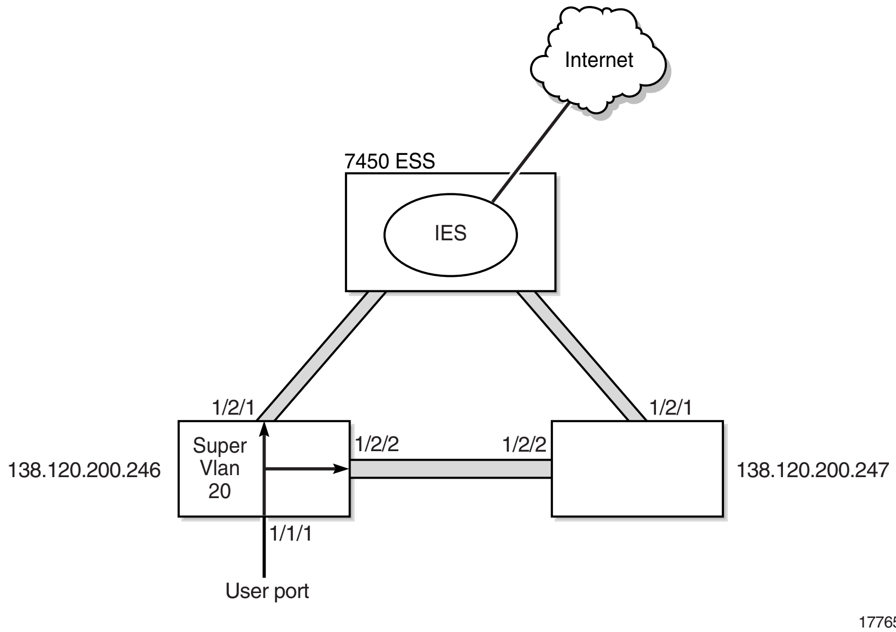
Table 69-3 Sample broadcast TV VLAN service configuration

Task	Description
1. Manage and configure devices	Ensure that the required configurations are completed to equipment, including configuring access and network ports, enabling CLI configuration on managed 7250 SAS and Telco devices, and the creation of ring groups: • The ring group contains all three devices. • Ports 1/3/1 and 1/3/2 on the device with the IP address 138.120.200.246 and ports 1/2/1 and 1/2/2 on the device with the IP address 138.120.200.247 are configured as network to act as uplinks. • Ports 1/1/2 and 1/1/3 are configured as access on the 7450 ESS with an encapsulation matching the VLAN ID (333). • Port 1/1/1 on device 138.120.200.247 is configured as access.
2. Configure policies as required	Policies should be configured before you create a service. The following key policies can be applied to resources that are part of a VLAN BTV service. • QoS policies for the 7250 SAS and Telco devices and ports • scheduling policies • filter policies, including IGMP filter policies to create and deploy access control lists on the 7250 SAS and Telco devices in the ring • multicast package policies to determine the content of the broadcast streams that are sent to the 7250 SAS and Telco devices in the ring
3. Distribute policies to devices	Distribute configured policies to the devices. Policies are used during the creation of VLAN services.
4. Create VLAN services	Create VLAN services using a series of configuration forms: Ensure that the VLAN created for the ring group uses ID 333.
5. Add access interfaces	Associate access interfaces (similar to SAPs) with VLAN services, that are the physical ports to which end users connect. You use the L2 Interfaces tab button on the VLAN properties form to associate VLAN services with the ports used by end users.

69.5 Sample super VLAN configuration

Figure 69-5 shows a sample super VLAN configuration. Super VLANs are used to restrict traffic that arrives on the user port to the uplink port. This disallows traffic between user ports. This application is often used for public Internet access services. The configuration depends on the specific network requirements.

Figure 69-5 Sample super VLAN configuration



Verify that the following preconfigurations are complete.

- Ensure that the appropriate preconfigurations have been performed on the 7250 SAS and Telco devices:
    - pre-discovery CLI modifications
    - SNMP trap forwarding to the 5620 SAM
    - discovery, including mediation configuration with the CLI user names and passwords
    - configure protocol to manage topology loops, such as MSTP or RSTP
- Ensure that the 7450 ESS is configured to support super VLAN Internet access.
- Create an IES on the 7450 ESS.
- Configure 7250 SAS and Telco ports as access (ports that are part of the VLAN) and network (ports that are used for uplinks), as required, from the navigation tree.
- 7250 SAS and Telco devices that belong to the ring, and the 7450 ESS that the ring connects to, should be added to the ring group.

Table 69-4 lists the high-level tasks that are required to configure this sample super VLAN service.

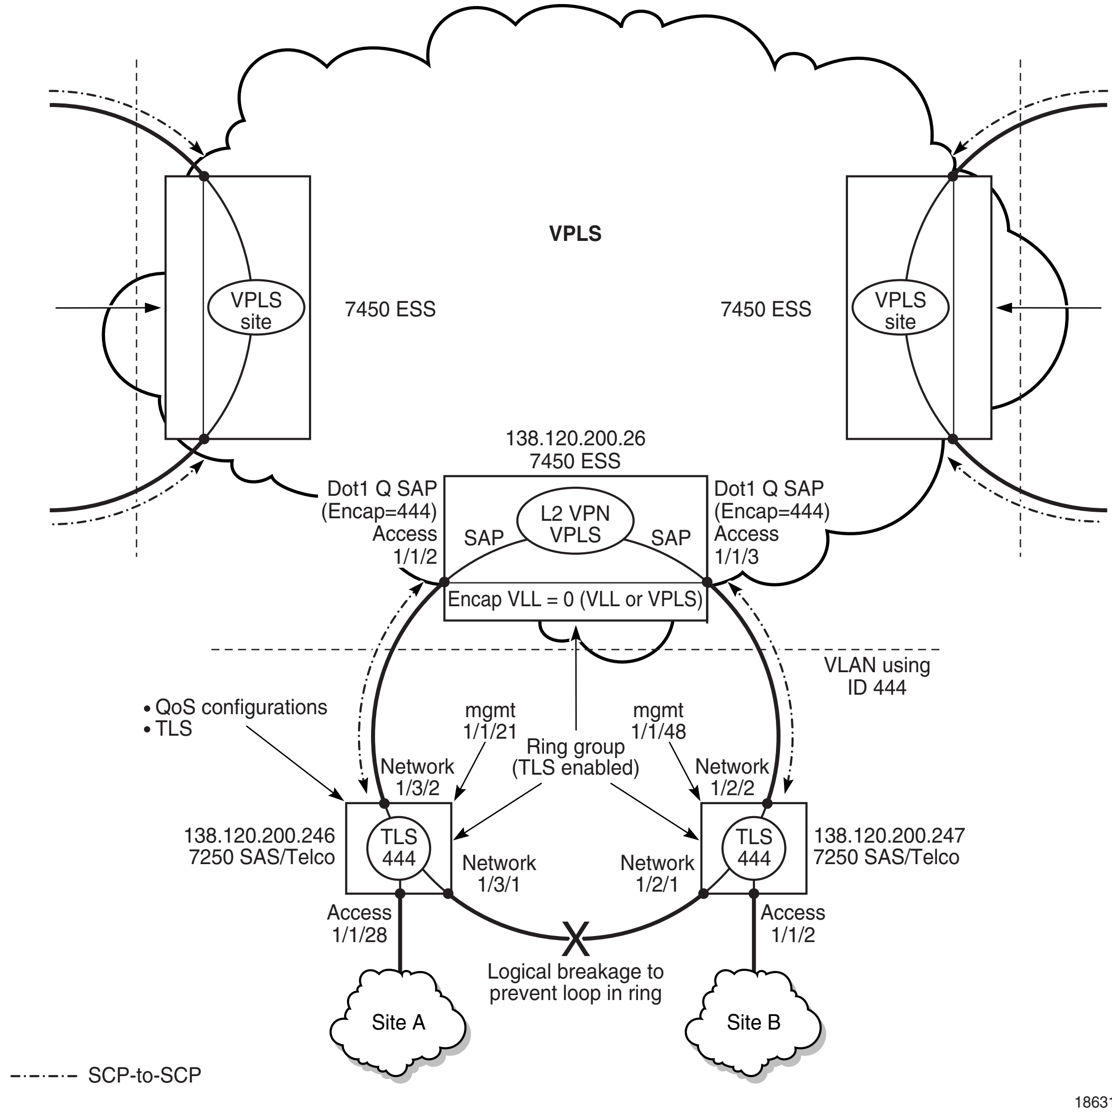
Table 69-4 Sample configuration for a super VLAN

Task	Description
1. Manage and configure devices	Ensure that the required configurations are completed to equipment, including configuring access and network ports, enabling CLI configuration on managed 7250 SAS and Telco devices, and the creation of ring groups: • The ring group contains all three devices. • Ports 1/2/1 and 1/2/2 on the device with the IP address 138.120.200.246 and ports 1/2/1 and 1/2/2 on the device with the IP address 138.120.200.247 are configured as network to act as uplinks. • Port 1/1/1 on device 138.120.200.246 is configured as access.
2. Configure policies as required	Policies should be configured before you create a service. The following key policies can be applied to resources that are part of a super VLAN service. • QoS policies for the 7250 SAS and Telco devices and ports • scheduling policies
3. Distribute policies to devices	Distribute configured policies to the devices. Policies are used during the creation of VLAN services.
4. Create VLAN services	Create VLAN services using a series of configuration forms: • The super VLAN created for the ring group uses ID 20.
5. Add access interfaces	Associate access interfaces (similar to SAPs) with VLAN services, that are the physical ports to which end users connect. Use the L2 Interfaces tab button on the VLAN properties form to associate VLAN services with the ports used by end users.

69.6 Sample interconnection VLAN configuration

Figure 69-6 shows a sample configuration of an interconnection of VLANs across a VPLS backbone.

Figure 69-6 Sample interconnection VLAN



Verify that the following preconfigurations are complete:

- Ensure that the appropriate preconfigurations have been performed on the 7250 SAS and Telco devices.
    - pre-discovery CLI modifications
    - SNMP trap forwarding to the 5620 SAM
    - discovery including mediation configuration with the CLI user names and passwords
    - ports are configured as access (ports that are part of the VLAN) and network (ports that are used for uplinks)
    - configure protocol to manage topology loops, such as MSTP or RSTP, using CLI

- Configure 7250 SAS and Telco ports as access and network, as required, from the navigation tree.
- 7250 SAS and Telco devices that belong to the ring, and the 7450 ESS that the ring connects to, should be added to the ring group.

Table 69-5 lists the high-level tasks that are required to configure this sample interconnection of VLAN services.

Table 69-5 Sample VLAN interconnection configuration

Task	Description
1. Manage and configure	Ensure that the required configurations are completed to equipment as described in Table 69-2, including the following. • configuring access and network ports • enabling CLI configuration on managed 7250 SAS and Telco devices • creating ring groups that are enabled to receive TLS (L2 VPN) streams • configuring and distributing policies
2. Create VLAN services	Create VLAN services using a series of configuration forms. Ensure that the VLAN created for the ring group uses ID 444.
3. Configure VPLS	Ensure that the encapsulation value of the ports that contain the SAPs on the 7450 ESS matches the VLAN ID of each VLAN service in the ring group. Ensure that the encapsulation value of the ports that contain the SAPs on the 7450 ESS at each VPLS site is Dot1 Q. See chapter 71 for more information about creating a VPLS.
4. Create composite service	Create a composite service to interconnect the VLAN services with the VPLS. • Create the composite service. • Define general properties for the composite service. • Specify the services that are participating in the composite service. You can specify multiple services in one operation. • Create SCP-to-SCP connectors to link the dot1q-encapsulated VPLS SAP and the adjacent L2 switch uplinks of the VLAN ring group. See chapter 76 for more information about creating composite services.

69.7 Workflow to create VLAN services (7250 SAS, 7450 ESS, Telco, and 9500 MPR)

The following workflow lists the high-level steps required to create a VLAN service on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and 9500 MPR devices. As a prerequisite for creating a VLAN service, this workflow assumes that the following appropriate preconfigurations have been performed:

- pre-discovery CLI modifications
- discovery including mediation configuration with CLI user name and password
- configuration of protocol to manage topology loops, such as MSTP or RSTP.
- ensure the TLS or BTV VPLS that feeds the ring VLAN service is configured on the 7450 ESSs. The encapsulation of the SAPs that belong to the VPLS on the 7450 ESSs should match the VLAN ID of the ring VLAN.

- Configure 7250 SAS and Telco ports as Access and Network, as required, from the navigation tree.
- Configure the bridge instances for the 7250 SAS and Telco devices from the network view in the navigation tree, as described in chapter 31.
- Create and add devices connected to the 7450 ESS as part of a ring group, as described in chapter 17.
- Set up customers or associate existing customers with the new service; see chapter 9 for more information.
- Policies should be configured before you create a service. The following key policies can be applied as required, to resources that are part of a VLAN service. See chapter 46 for more information.
    - QoS policies for the 7250 SAS and Telco devices and ports
    - scheduling policies
    - filter policies, including IGMP filter policies to create and deploy access control lists on the 7250 SAS and Telco devices in the ring
    - multicast package policies to determine the content of the broadcast streams that are sent to the 7250 SAS and Telco devices in the ring
- Ensure that the required configurations are completed on equipment, including configuring access and network ports, enabling CLI configuration on managed 7250 SAS and Telco devices, and the creation of ring groups that are enabled to receive TLS (L2 VPN) streams. See Table 69-2, 69-3, or 69-4 for the high-level equipment tasks that are required to configure a VLAN.

1 Distribute configured policies to the devices. The policies are used during the creation of VLAN services. See Procedure 46-1.

2 Provision the VLAN service.

a For Standard VLANs, see Procedure 69-1.

- Set the application parameter to Standard VLAN.

b For Management VLANs, see Procedure 69-2.

- Set the application parameter to Management VLAN.

c For L2 VPN TLS VLANs, see Procedure 69-3.

- Set the application parameter to L2-VPN (TLS/VLAN-Stacking).
- Ensure that the VLAN created for the ring group uses ID 444.

d For BTV VLAN s VLANs, see Procedure 69-5.

- Set the application parameter to Broadcast TV (MVR/IPMV).
- Ensure that the VLAN created for the ring group uses ID 333.

e For Super VLANs, see Procedure 69-7.

- Set the application parameter to Internet Access (Super-VLAN).
- Ensure that the VLAN created for the ring group uses ID 20.
- Ensure the IES that provides Internet access to the ring VLAN service is configured on the 7450 ESSs.

f For 9500 MPR (dot1q) VLANs, see Procedure 69-8.

- Set the application parameter to 9500 MPR.

3 Associate access interfaces (similar to SAPs) with the VLAN services. These are the physical ports to which end users connect. Use the L2 Interfaces tab button on the VLAN properties form to associate VLAN services with the ports used by end users. See Procedure 69-9.

4 For services created on a 9500 MPR, as required:

a Create VLAN groups and add members to each group. See Procedure 69-10.

b Delete a VLAN group or group member. See Procedure 69-11.

c Create the VLAN paths that are required between the 9500 MPR group members. The VLAN path can be hop based or ring based. See Procedure 69-12.

d Delete a 9500 MPR VLAN path. See Procedure 69-13.

5 Turn up the service.

Network interface VLAN bindings are created between the newly created VLAN and all of the network ports on the node.

6 As required, run an OAM validation test on a VLAN service. See Procedure 69-16.

7 As required, view VLAN information:

a View the VLAN service operational status. See Procedure 69-17.

b View the service topology map associated with a VLAN service. See Procedure 69-18.

8 As required, modify a VLAN service. See Procedure 69-19.

9 As required, delete a VLAN service. See Procedure 69-20.

69.8 Workflow to create VLAN services (OmniSwitch)

The following workflow lists the high-level steps required to create a VLAN service on OmniSwitch devices (with the exception of OS 6900 and OS 10K devices). As a prerequisite for creating a VLAN service, this workflow assumes that the following appropriate preconfigurations have been performed:

- pre-discovery CLI modifications
- discovery including mediation configuration with CLI usernames and passwords
- addition of the OmniSwitches that participate in the VLAN to a VLAN group

- configure OmniSwitch network ports, as required, from the navigation tree. The Automatic VLAN Binding parameter associated with a network port or LAG must be enabled before the 5620 SAM can identify the network port or LAG as a network interface.
- configure QoS policies, as required.
- configure the bridge instances for the OmniSwitches from the network view in the navigation tree.
- set up customers or associate existing customers with the new service; see chapter 9 for more information.

1 Provision a Standard VLAN service. See Procedure 69-1.

i Create the VLAN and associate a customer with the VLAN. Set the application parameter to Standard VLAN.

ii Add sites that are participating in this VLAN. Configure STP and VLAN properties, as required.

iii Create VLAN access interfaces to be used for this service. Specify the access port to be used by each interface and whether the access is tagged.

2 Provision a L2 VPN TLS VLAN service. See Procedure 69-4.

i Create the VLAN and associate a customer with the VLAN. Set the application parameter to L2-VPN (TLS/VLAN-Stacking).

ii Add devices connected as part of a VLAN group to the VLAN.

iii Add sites that are participating in this VLAN. Configure STP and VLAN properties, as required.

iv Create Ethernet services. Enter the names of the services that you need to associate with the SVLAN created in the previous steps.

v Create one or more service access multipoints. SAPs, CVLANs, and a SAP policy are associated with a service access multipoint. A service access multipoint is assigned a user-selected or auto-generated ID when the multipoint is created.

vi Create SAPs. Specify the port to be used as a customer-facing port (UNI).

vii Create CVLANs to associate customer traffic with a VLAN-stacking SAP. CVLANs identify the type of customer traffic that is received on the SAP UNI ports.

3 Provision a BTV VLAN service. See Procedure 69-6.

i Create the VLAN and associate a customer with the VLAN. Set the application parameter to Broadcast TV (MVR/IPMV).

ii Add devices connected as part of a VLAN group, to the VLAN.

iii Create an L2 access interface. The interface acts as the receiver port on the IPMV. The port that is selected must already be used as a SAP in a SVLAN.

iv Create Ethernet services. Enter the names of the services that you need to associate with the SVLAN created in the previous steps.

- **v** Create one or more service access multipoints. SAPs, CVLANs, and a SAP policy are associated with a service access multipoint. A service access multipoint is assigned a user-selected or auto-generated ID when the multipoint is created.
- **vi** Create SAPs. Specify the port to be used as a customer-facing port (UNI). The UNI port must already be configured as a receiver port on the IP multicast VLAN.
- **vii** Create CVLANs that will be used to associate customer traffic with a VLAN stacking SAP. CVLANs identify the type of customer traffic received on the SAP UNI ports. The service processes and tunnels the traffic through the SVLAN.
- **viii** Add multicast group addresses to the IP multicast VLAN site.
- **ix** Add CVLAN tags to the IP multicast VLAN site. CVLAN tags are used to bind IP multicast VLANs to a receiver port.

4 Associate access interfaces (similar to SAPs) with the VLAN services. These are the physical ports to which end users connect. Use the L2 Interfaces tab button on the VLAN properties form to associate VLAN services with the ports used by end users. See Procedure 69-9.

5 For services created on a OmniSwitch, as required:

- **a** Create VLAN groups and add members to each group as required. See Procedure 69-10.
- **b** Delete a VLAN group or group member. See Procedure 69-11.
- **c** Add a MEP to an OmniSwitch VLAN service access interface. See Procedure 69-14.
- **d** Configure IGMP on an OmniSwitch VLAN site. See Procedure 69-15.

6 Turn up the service.

Network interface VLAN bindings are created between the newly-created VLAN and all of the network ports on the node.

7 As required, run an OAM validation test on a VLAN service. See Procedure 69-16.

8 As required, view VLAN information:

- **a** View the VLAN service operational status. See Procedure 69-17.
- **b** View the service topology map associated with a VLAN service. See Procedure 69-18.

9 As required, modify a VLAN service. See Procedure 69-19.

10 As required, delete a VLAN service. See Procedure 69-20.

69.9 VLAN service management procedures

Use the following procedures to perform VLAN creation and management tasks.

Procedure 69-1 To create a standard VLAN service

Perform the following procedure to create a standard VLAN service on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch devices.

Note — Alcatel-Lucent recommends that you specify the OmniSwitch ports that will be network interfaces before you configure a standard VLAN service.

1 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN (Create) Service form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VLAN. The Select Customer - VLAN Service form opens.

3 Select a customer for the VLAN and click on the OK button. The Select Customer - VLAN Service form closes and the VLAN Service (Create) form reappears with the customer information displayed in the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State
  This parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

5 Click on the VLAN tab button.

6 Set the Application parameter to Standard VLAN.

7 Click on the Select button in the Group panel to choose a group to associate with the VLAN. The Select Group - VLAN Service form opens.

8 Select a group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

9 On the navigation tree, right-click on VLAN and choose Create VLAN Site. The Select Network Elements - VLAN form opens.

10 Select a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form appears with the site information displayed on the General tab.

11 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

12 Perform one of the following actions:

a If you are configuring a standard VLAN on an OmniSwitch, go to step 13.

b If you are configuring a standard VLAN on a 7250 SAS or Telco device, go to step 15.

13 Click on the VLAN tab button.

14 Configure the parameters:

- Enable Mobile-Tag
- Enable Authentication

15 On the navigation tree, right-click on Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed.

16 Configure the parameters.

- Description
- Administrative State

17 Click on the Port tab button.

18 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

19 Use the configurable filter and Search button to choose a port for user-side access to the VLAN, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

20 Click on the VLAN tab button.

21 Configure the VLAN Tagging parameter. The parameter must be set to Tagged on CES interfaces.

You can only configure this parameter when you create a SAP. After the SAP is created, the parameter cannot be modified. If you need to change the value of this parameter, you must first delete the SAP and create a SAP that matches the new requirements.

22 Click on the OK button. The VLAN Access Interface (Create) form closes, and a dialog box appears.

23 Click on the OK button. The Site (Create) form reappears.

24 Repeat steps 15 to 23 for each access interface that you need to create on the site.

25 Perform one of the following actions:

- If you are configuring a standard VLAN on an OmniSwitch, go to step 26.
- If you are configuring a standard VLAN on a 7250 SAS or Telco device, go to step 24.

26 Click on the STP tab button.

27 Configure the parameters:

- Enable STP
- Enable Flat STP
- Enable 1x1 STP

28 Click on the DHCP Snooping tab button if you need to enable DHCP snooping on the VLAN. The DHCP Snooping General tab is displayed.

29 Click on the Create button. The VLAN Level DHCP Snooping (Create) form opens.

30 Configure the parameters:

- VLAN Level Option-82 Data Insertion
- VLAN Level MAC Address Verification

These parameters are automatically enabled when DHCP snooping is enabled on a VLAN.

31 Click on the OK button. The VLAN Level DHCP Snooping (Create) form closes, and a dialog box appears.

32 Click on the OK button. The DHCP Snooping General tab reappears.

33 Click on the Binding Database tab button if you need to add a static entry to the DHCP binding table.

34 Click on the Create button. The DHCP Snooping Binding Database (Create) form opens.

35 Configure the MAC Address parameter.

36 Click on the Select button to choose a port. The Select Port - DHCP Snooping Binding Database form opens.

37 Choose a port from the list and click on the OK button.

38 The DHCP Snooping Binding Database (Create) form reappears.

39 Configure the parameters:

- IP Address
- Lease Time

40 Click Apply to add the static entry to the table. A dialog box appears.

41 Click on the OK button.

42 Repeat steps 33 to 41 for each static entry that you need to add to the binding table.

43 Click the Cancel button to close the DHCP Snooping Binding Database (Create) form.

44 Click on the OK button. The Site (Create) form reappears.

45 Click on the OK button. The VLAN (Create) form reappears with the new site information displayed.

46 Click on the OK button to close the VLAN (Create) form.

Procedure 69-2 To create a management VLAN service

Perform the following procedure to create a management VLAN service on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices.

1 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN (Create) Services form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the management VLAN. The Select Customer - VLAN Service form opens.

3 Select a customer for the management VLAN and click on the OK button. The Select Customer - VLAN Service form closes and the VLAN Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State

This parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

5 Click on the VLAN tab button.

6 Set the Application parameter to Management VLAN.

7 Click on the Select button in the Group panel to choose a group to associate with the management VLAN. The Select Group - VLAN Service form opens.

8 Select a group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

9 On the navigation tree, right-click on VLAN and choose Create VLAN Site. The Select Network Elements - VLAN form opens.

10 Select a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form reappears with the site information displayed on the General tab.

11 Configure the parameters.

- Description
- Administrative State
- Monitor Access Interface Operational State

12 On the navigation tree, right-click on Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed.

13 Configure the parameters.

- Name
- Description
- Administrative State

14 Click on the Port tab button.

15 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

16 Use the configurable filter and Search button to choose a port for user-side access to the management VLAN, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

17 Configure the remaining parameters, if required.

18 Click on the VLAN tab button.

19 Configure the VLAN Tagging parameter. This parameter must be set to Tagged on CES interfaces.

You can only configure this parameter when you create a SAP. After the SAP is created the parameter cannot be modified. If you need to change the value of this parameter you must first delete the SAP and create a new one that matches the new requirements.

20 Click on the OK button. The VLAN Access Interface (Create) form closes, and a dialog box appears.

21 Click on the OK button. The Site (Create) form reappears.

22 Repeat steps 12 to 21 for each access interface to be created on the site.

23 Click on the OK button. The Site (Create) form closes, and a dialog box appears.

24 Click on the OK button. The VLAN (Create) form reappears with the new site information displayed in the service navigation tree.

25 Click on the OK button to close the VLAN (Create) form.

Procedure 69-3 To create an L2 VPN TLS VLAN service

Perform the following procedure to create a L2-VPN (TLS/VLAN-Stacking) service on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices.

1 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the L2 VPN TLS VLAN. The Select Customer - VLAN Service form opens.

3 Select a customer for the L2 VPN and click on the OK button. The Select Customer - VLAN Service form closes and the VLAN Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State
  This parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

5 Click on the VLAN tab button.

6 Set the Application parameter to L2-VPN (TLS/VLAN-Stacking).

7 Click on the Select button in the Group panel to choose a group to associate with the L2 VPN. The Select Group - VLAN Service form opens.

8 Select a group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

9 On the navigation tree, right-click on VLAN and choose Create VLAN Site. The Select Network Elements - VLAN form opens.

10 Select a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form opens with the site information displayed in the General tab.

11 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

12 On the navigation tree, right-click on Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed.

13 Configure the parameters.

- Description
- Administrative State

14 Click on the Port tab button.

15 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

16 Use the configurable filter and Search button to choose a port for user-side access to the L2 VPN service, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

17 Configure the remaining parameters, if required.

18 Click on the VLAN tab button.

19 Configure the VLAN Tagging parameter. This parameter must be set to Tagged on CES interfaces.

You can only configure this parameter when you create a SAP. After the SAP is created, the parameter cannot be modified. If you need to change the value of this parameter, you must first delete the SAP and then create a SAP that matches the new requirements.

20 Click on the OK button. The VLAN Access Interface (Create) form closes, and a dialog box appears.

21 Click on the OK button. The Site (Create) form reappears.

22 Repeat steps 12 to 21 for each access interface to be created on the site.

23 Click on the OK button. The Site (Create) form closes, and a dialog box appears.

24 Click on the OK button. The VLAN (Create) form reappears with the new site information displayed in the service navigation tree.

25 Click on the OK button to close the VLAN (Create) form.

Procedure 69-4 To create an OmniSwitch L2 VPN TLS VLAN service

Note 1 — The TLS Mode must be set to Ethernet Service before a sL2 VPN TLS (stacked) VLAN service can be created on an OmniSwitch. See Procedure 31-54 to configure the TLS Mode.

Note 2 — Alcatel-Lucent recommends that you configure OmniSwitch network ports before you configure a L2 VPN TLS VLAN service.

1 Complete steps 1 to 11 in Procedure 69-3.

2 Click on the Select button to choose a customer to associate with the VLAN. The Select Customer - VLAN Service form opens.

3 On the navigation tree, right-click on Ethernet Services and choose Create Ethernet Service. The Ethernet Service (Create) form opens with the General tab displayed.

4 Configure the Ethernet Service Name parameter.

5 On the navigation tree, right-click on Ethernet Service and choose Create Service Access Multipoint. The Service Access MultiPoint (Create) form opens with the General tab displayed

6 Configure the parameters:

- Auto-Assign ID
- Service Access Multi-Point ID

7 If you need to apply a SAP policy other than the default one, click on the Clear button to clear the default SAP policy from the SAP Profile panel. Otherwise, go to step 10.

8 Click on the Select button to choose a SAP profile to associate with the service access multipoint. The Select SAP Profile - Service Access MultiPoint form opens.

9 Choose a SAP profile and click on the OK button. The Select SAP Profile - Service Access MultiPoint form closes and the Service Access Multipoint (Create) form reappears with the selected SAP profile information displayed.

10 On the navigation tree, right-click on Service Access Points and choose Create VLAN Service Access Point. The VLAN Service Access Point (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Name
- Description

12 Click on the Port tab button.

13 Click on the Select button to choose a port for the VLAN SAP. The Select Terminating Port - VLAN Service Access Point form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

14 Use the configurable filter and Search button to choose a port for the VLAN SAP, and click on the OK button. The Select Terminating Port - VLAN Service Access Point form closes, and the VLAN Service Access Point (Create) form displays the port information.

15 Click on the Apply button if you need to add another VLAN SAP. A dialog box appears. Otherwise go to step 19.

16 Click on the OK button. The VLAN SAP appears in the list of service access points in the service navigation tree.

17 Click on the General tab button.

18 Repeat steps 11 to 16 to add an additional VLAN service access point.

19 Click on the OK button. The VLAN Service Access Point (Create) form closes and a dialog box appears.

20 Click on the OK button. The Service Access MultiPoint (Create) form reappears.

21 Click on the Customer VLANs tab button.

22 Click on the Create button to add a customer VLAN to the service access multipoint. The Customer VLAN (Create) form opens.

23 Configure the parameters:

- Customer VLAN ID
- Map Type

24 Click on the Apply button if you need to add another customer VLAN. A dialog box appears. Otherwise, go to step 27.

25 Click on the OK button.

26 Repeat steps 23 to 25 to add another customer VLAN.

27 Click on the OK button. The Customer VLAN (Create) form closes, and a dialog box appears.

28 Click on the OK button. The Service Access Multipoint (Create) form reappears with the customer VLAN information displayed.

29 Click on the OK button. The Service Access Multipoint (Create) form closes and a dialog box appears.

30 Click on the OK button. The Ethernet Service (Create) form reappears.

31 Repeat steps 5 to 30 to add another service access multipoint to the Ethernet service.

32 Click on the OK button. The Ethernet Service (Create) form closes and a dialog box appears.

33 Click on the OK button. The Site (Create) form reappears.

34 Repeat steps 3 to 33 to add another Ethernet service to the site.

35 Click on the STP tab button.

36 Configure the parameters:

- Enable STP
- Enable Flat STP
- Enable 1x1 STP

37 Click on the DHCP Snooping tab button if you need to enable DHCP snooping on the VLAN. The DHCP Snooping General tab is displayed.

38 Click on the Create button. The VLAN Level DHCP Snooping (Create) form opens.

39 Configure the parameters:

- VLAN Level Option-82 Data Insertion
- VLAN Level MAC Address Verification

These parameters are automatically enabled when DHCP snooping is enabled on a VLAN.

40 Click on the OK button. The VLAN Level DHCP Snooping (Create) form closes, and a dialog box appears.

41 Click on the OK button. The DHCP Snooping General tab reappears.

42 Click on the Binding Database tab button if you need to add a static entry to the DHCP binding table.

43 Click on the Create button. The DHCP Snooping Binding Database (Create) form opens.

44 Configure the MAC Address parameter.

45 Click on the Select button to choose a port. The Select Port - DHCP Snooping Binding Database form opens.

46 Choose a port from the list and click on the OK button.

47 The DHCP Snooping Binding Database (Create) form reappears.

48 Configure the parameters:

- IP Address
- Lease Time

49 Click Apply to add the static entry to the table. A dialog box appears.

50 Click on the OK button.

51 Repeat steps 42 to 50 for each static entry that you need to add to the binding table.

52 Click the Cancel button to close the DHCP Snooping Binding Database (Create) form.

53 Click on the OK button. A dialog box appears.

54 Click on the OK button. The VLAN (Create) form reappears.

55 Click on the OK button to close the VLAN (Create) form.

Procedure 69-5 To create a BTV VLAN service

Perform the following procedure to create a BTV VLAN service on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices.

1 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the BTV VLAN. The Select Customer - VLAN Service form opens.

3 Select a customer for the BTV VLAN and click on the OK button. The Select Customer - VLAN Services form closes and the VLAN Services (Create) form reappears with the customer information displayed in the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State
  This parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

5 Click on the VLAN tab button.

6 Set the Application parameter to Broadcast TV (MVR/IPMV).

7 Click on the Select button in the Group panel to choose a group to associate with the BTV VLAN. The Select Group - VLAN Service form opens.

8 Select a group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

9 In the IPMVLAN panel, configure the Type parameter.

10 Click on the MVR tab button.

11 Configure the parameters.

- Mode
- Query Response Time (seconds)

12 Click on the Select button in the Multicast Package panel to choose a multicast package for the BTV VLAN. The Select Multicast Package - MvrConfiguration form opens.

13 Select a multicast package and click on the OK button. The Select Multicast Package - MvrConfiguration form closes and the VLAN (Create) form reappears with the multicast package information displayed.

14 On the navigation tree, right-click on VLAN and choose Create Site. The Select Network Elements - VLAN form opens.

15 Select a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form opens with the site information displayed on the General tab.

16 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

17 Click on the MVR tab button to configure the Mode parameter, if required.

18 On the navigation tree, right-click on Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed.

19 Configure the parameters.

- Description
- Administrative State

20 Click on the Port tab button.

21 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

22 Use the configurable filter and Search button to choose a port for user-side access to the BTV VLAN, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

23 Configure the remaining parameters, if required.

24 Click on the VLAN tab button.

25 Configure the VLAN Tagging parameter.

You can only configure this parameter after you create a SAP. After the SAP is created, the VLAN Tagging parameter cannot be modified. If you need to change the value of the parameter, you must first delete the SAP and then create a SAP that matches the new requirements.

26 Click on the OK button. The VLAN Access Interface (Create) form closes, and a dialog box appears.

27 Click on the OK button. The Site (Create) form reappears.

28 Repeat steps 18 to 27 for each access interface to be created on the site.

29 Click on the OK button. The Site (Create) form closes, and a dialog box appears.

30 Click on the OK button. The VLAN (Create) form reappears with the site information displayed in the service navigation tree.

31 Click on the OK button to close the VLAN (Create) form.

Procedure 69-6 To create an OmniSwitch BTV VLAN service

1 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN (Create) Service form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VLAN. The Select Customer - VLAN Service form opens.

3 Choose a customer for the VLAN and click on the OK button. The Select Customer - VLAN Service form closes and the VLAN Service (Create) form reappears with the customer information.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State
  This parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

5 Click on the VLAN tab button.

6 Set the Application parameter to Broadcast TV (MVR/IPMV).

7 Click on the Select button in the Group panel to choose a group to associate with the VLAN. The Select Group - VLAN Service form opens.

8 Choose a group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form opens with the group information displayed.

9 In the IPMVLAN panel, configure the Type parameter.

10 On the navigation tree, right-click on VLAN and choose Create VLAN Site. The Select Network Elements - VLAN form opens.

11 Choose a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form opens with the site information displayed in the General tab displayed.

12 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

13 On the navigation tree, right-click on Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed. The VLAN access interface serves as a receiver port on the IP multicast VLAN.

14 Configure the Description parameter.

15 Click on the Port tab button.

16 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

17 Use the configurable filter and Search button to choose a port for the VLAN access interface, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

Note — To configure an access interface, a L2 VPN TLS VLAN user port must be created. See Procedure 69-4.

18 Click on the VLAN tab button.

19 Configure the VLAN Tagging parameter.

20 Click on the Apply button if you need to add another VLAN access interface and the VLAN access interface appears in the list of access interfaces in the navigation tree. A dialog box appears. Otherwise, go to step 24.

21 Click on the OK button.

22 Click on the General tab button.

23 Repeat steps 14 to 21 for each additional VLAN access interface to be added to the site.

24 Click on the OK button. A dialog box appears.

25 Click on the OK button. The VLAN Access Interface (Create) form closes.

26 Right-click on Ethernet Services and choose Create Ethernet Service. The Ethernet Service (Create) form opens with the General tab displayed.

27 Configure the Ethernet Service Name parameter.

28 On the navigation tree, right-click on Ethernet Service and choose Create Service Access MultiPoint. The Service Access MultiPoint (Create) form opens with the General tab displayed.

29 Configure the parameters:

- Auto-Assign ID
- Service Access Multi-Point ID

30 If you need to apply a SAP policy other than the default one, click on the Clear button to clear the default SAP policy from the SAP Profile panel. Otherwise, go to step 33.

31 Click on the Select button to choose a SAP profile to associate with the service access multi-point. The Select SAP Profile - Service Access MultiPoint form opens.

32 Choose a SAP profile and click on the OK button. The Select SAP Profile - Service Access MultiPoint form closes and the Service Access Multipoint (Create) form reappears with the selected SAP profile information displayed.

33 On the navigation tree, right-click on Service Access Points and choose Create VLAN Service Access Point. The VLAN Service Access Point (Create) form opens with the General tab displayed.

34 Configure the parameters:

- Name
- Description

35 Click on the Port tab button.

36 Click on the Select button to choose a port for the VLAN SAP. The Select Terminating Port - VLAN Service Access Point form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrids. After you do this, the port is listed when you click on the Search button.

37 Use the configurable filter and Search button to choose a port for the VLAN SAP, and click on the OK button. The Select Terminating Port - VLAN Service Access Point form closes, and the VLAN Service Access Point (Create) form displays the port information.

38 Click on the Apply button if you need to add another VLAN SAP. A dialog box appears. Otherwise, go to step 42.

39 Click on the OK button. The VLAN service access point appears in the list of Service Access Points on the service navigation tree.

40 Click on the General tab button.

41 Repeat steps 33 to 39 to add an additional VLAN SAP.

42 Click on the OK button. The VLAN Service Access Point (Create) form closes and a dialog box appears.

43 Click on the OK button. The Service Access MultiPoint (Create) form reappears.

44 Click on the Customer VLANs tab button.

45 Click on the Create button to add a customer VLAN to the service access multipoint. The Customer VLAN (Create) form opens.

46 Configure the parameters:

- Customer VLAN ID
- Map Type

47 Click on the Apply button if you need to add another customer VLAN. A dialog box appears. Otherwise, go to step 50.

48 Click on the OK button.

49 Repeat steps 46 to 48 to add another customer VLAN.

50 Click on the OK button. The Customer VLAN (Create) form closes, and a dialog box appears.

51 Click on the OK button. The Service Access Multipoint (Create) form reappears with the customer VLAN information displayed.

52 Click on the OK button. The Service Access Multipoint (Create) form closes and a dialog box appears.

53 Click on the OK button. The Ethernet Service (Create) form reappears.

54 Repeat steps 28 to 53 if you need to add another service access multipoint to the Ethernet service.

55 Click on the OK button. The Ethernet Service (Create) form closes and a dialog box appears.

56 Click on the OK button. The Site (Create) form reappears.

57 Repeat steps 26 to 56 if you need to add another Ethernet service to the site.

58 Click on the STP tab button.

59 Configure the parameters:

- Enable STP
- Enable Flat STP
- Enable 1x1 STP

60 Click on the DHCP Snooping tab button if you need to enable DHCP snooping on the VLAN. The DHCP Snooping General tab is displayed.

61 Click on the Create button. The VLAN Level DHCP Snooping (Create) form opens.

62 Configure the parameters:

- VLAN Level Option-82 Data Insertion
- VLAN Level MAC Address Verification

These parameters are automatically enabled when DHCP snooping is enabled on a VLAN.

63 Click on the OK button. The VLAN Level DHCP Snooping (Create) form closes, and a dialog box appears.

64 Click on the OK button. The DHCP Snooping General tab reappears.

65 Click on the Binding Database tab button if you need to add a static entry to the DHCP binding table.

66 Click on the Create button. The DHCP Snooping Binding Database (Create) form opens.

67 Configure the MAC Address parameter.

68 Click on the Select button to choose a port. The Select Port - DHCP Snooping Binding Database form opens.

69 Choose a port from the list and click on the OK button.

70 The DHCP Snooping Binding Database (Create) form reappears.

71 Configure the parameters:

- IP Address
- Lease Time

72 Click Apply to add the static entry to the table. A dialog box appears.

73 Click on the OK button.

74 Repeat steps 65 to 73 for each static entry that you need to add to the binding table.

75 Click the Cancel button to close the DHCP Snooping Binding Database (Create) form.

76 Click on the Multicast Groups tab button.

77 Click on the Create button to add a multicast group address to the site. The Multicast Group (Create) form opens.

78 Configure the Multicast Address parameter.

79 Click on the Apply button if you need to add another multicast address. A dialog box appears. Otherwise, go to step 82.

80 Click on the OK button. The multicast address information appears on the Site (Create) form.

81 Repeat steps 78 to 80 to add another multicast address to the site.

82 Click on the OK button.

83 Click on the Customer VLAN Tags tab button.

84 Click on the Create button to add a customer VLAN tag to the site. The Customer VLAN Tag (Create) form opens.

85 Configure the Customer VLAN Tag parameter.

86 Click on the Apply button if you need to add another customer VLAN tag. The customer VLAN tag information appears on the Site (Create) form. A dialog box appears. Otherwise, go to step 89.

87 Click on the OK button.

88 Repeat steps 85 to 87 to add another customer VLAN tag to the site.

89 Click on the OK button.

90 Click on the OK button to the close the Site (Create) form. A dialog box appears.

91 Click on the OK button. The Site (Create) form closes.

92 Click on the OK button to close the VLAN (Create) form.

Procedure 69-7 To create a super VLAN service

Perform the following procedure to create a super VLAN (Internet Access) service on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices.

1 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the super VLAN. The Select Customer - VLAN Service form opens.

3 Select a customer for the super VLAN and click on the OK button. The Select Customer - VLAN form closes and the VLAN (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State

This parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

5 Click on the VLAN tab button.

6 Configure the Application parameter. Choose the Internet Access (Super-VLAN) option.

7 Click on the Select button in the Group panel to choose a group to associate with the super VLAN. The Select Group - VLAN Service form opens.

8 Select a group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

9 On the navigation tree, right-click on VLAN and choose Create VLAN Site. The Select Network Elements - VLAN form opens.

10 Select a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form reappears with the site information displayed on the General tab.

11 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

12 On the navigation tree, right-click on Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed.

13 Configure the parameters.

- Description
- Administrative State

14 Click on the Port tab button.

15 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

16 Use the configurable filter and Search button to choose a port for user-side access to the super VLAN, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

17 Configure the remaining parameters, if required.

18 Click on the VLAN tab button.

19 Configure the parameter.

- VLAN Tagging

You can only configure this parameter when you create a SAP. After the SAP is created the parameter cannot be modified. If you need to change the value of this parameter you must first delete the SAP and create a new one that matches the new requirements.

The VLAN Tagging parameter should always be set to Tagged on CES interfaces.

20 Click on the OK button. The VLAN Access Interface (Create) form closes, and a dialog box appears.

21 Click on the OK button. The Site (Create) form reappears.

22 Repeat steps 12 to 21 for each access interface to be created on the site.

23 Click on the OK button. The Site (Create) form closes, and a dialog box appears.

24 Click on the OK button. The VLAN (Create) form reappears with the new site information displayed in the service navigation tree.

25 Click on the OK button to close the VLAN (Create) form.

Procedure 69-8 To create a 9500 MPR (dot1q) VLAN service

Before you create a 9500 MPR (dot1q) VLAN service, perform the following procedures:

- Create a customer profile. See Procedure 67-1.
- Create a VLAN group. See Procedure 69-10.
- Create a VLAN path if you need to assign a specific VLAN path to the 9500 MPR (dot1q) VLAN service. See Procedure 69-12.

1 Right-click on a 9500 MPR in the navigation tree and choose Properties from the contextual menu. The 9500 MPR properties form opens with with the General tab displayed.

2 Click on the System Settings tab and set the Bridge Type parameter to 802.1Q.

3 Close the 9500 MPR properties form.

4 Choose Create→Service→VLAN from the 5620 SAM main menu. The VLAN (Create) Service form opens with the General tab displayed.

5 Click on the Select button to choose a customer to associate with the 9500 (dot1q) VLAN service. The Select Customer - VLAN Service form opens.

6 Choose a customer for the 9500 MPR (dot1q) VLAN service and click on the OK button. The Select Customer - VLAN Service form closes and the VLAN (Create) Service form reappears with the customer information displayed on the General tab.

7 Configure the parameters:

- Service ID
  The Service ID parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  The SVC Mgr Service ID parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- OLC State
  The OLC State parameter is configurable when you click on the Apply button on the VLAN Service (Create) form.

8 Click on the VLAN tab button and set the Application parameter to 9500 VLAN.

9 Click on the Select button in the Group panel to choose a VLAN group to associate with the 9500 MPR (dot1q) VLAN service. The Select Group - VLAN Service form opens.

10 Select a VLAN group and click on the OK button. The Select Group - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

11 Perform one of the following:

a Enable the Auto-Assign ID parameter. If the Auto-Assign ID parameter is enabled, the 5620 SAM chooses the VLAN ID.

b Disable the Auto-Assign ID parameter to configure the VLAN ID parameter.

12 Perform one of the following:

a Enable the Specify VLAN Path parameter.

b Disable the Specify VLAN Path parameter to specify a VLAN path by clicking on the Select button in the VLAN path panel. Go to step 16.

13 Configure the parameters:

- Path Type
- Point to Point VLAN
  The Point to Point VLAN parameter is configurable when the Path Type parameter is set to Hop Based.

Note — The service created using Point to Point VLAN service will be discovered as a normal VLAN service without the point-to-point option.

14 Click on the Select button in the VLAN Path panel to choose a VLAN Path to associate with the 9500 MPR (dot1q) VLAN service. The Select VLAN Path - VLAN Service form opens.

15 Choose a VLAN Path and click on the OK button. The Select VLAN Path - VLAN Service form closes and the VLAN (Create) form reappears with the group information displayed.

Note 1 — The VLAN path may consist of consecutive physical links, non-consecutive physical links, or radio links spanning NEs.

Note 2 — You cannot reconfigure the Point to Point VLAN parameter after you choose a VLAN path. To change the parameter, you are required to clear the selected VLAN path.

16 On the navigation tree, right-click on VLAN and choose Create VLAN Site. The Select Network Elements - VLAN form opens.

Note — The service navigation tree will be auto-populated with sites that correspond to the hops in the specified VLAN Path.

17 Choose a site and click on the OK button. The Select Network Elements - VLAN form closes and the Site (Create) form opens with the site information displayed in the General tab.

18 Configure the parameters:

- Description
- Administrative State
- Monitor Access Interface Operational State

19 Click on the OK button. The Site (Create) form closes and a dialog box appears.

20 Click on the OK button. The VLAN (Create) form reappears with the new site information displayed in the service navigation tree.

21 Click on the OK button to close the VLAN (Create) form.

Procedure 69-9 To associate an access interface with a VLAN service

Associate access interfaces (similar to SAPs) with VLAN services, that are the physical ports to which end users connect. Use the L2 Interfaces tab button on the VLAN properties form to associate VLAN services with the ports used by end users.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Use the configurable filter and Search button to choose the VLAN service to be associated with an interface, and click on the Properties button. The VLAN - *Service Name* (Edit) form opens.

3 On the navigation tree, click on the site to which you want to associate the new access interface; expand the entries for that site.

4 Right-click on the Access Interfaces and choose Create VLAN Access Interface. The VLAN Access Interface (Create) form opens with the General tab displayed.

5 Configure the parameters.

- Description
- Administrative State

6 Click on the Port tab button.

7 Click on the Select button to choose a port for the VLAN access interface. The Select Terminating Port - VLAN Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

8 Use the configurable filter and Search button to choose a port for the VLAN access interface, and click on the OK button. The Select Terminating Port - VLAN Access Interface form closes, and the VLAN Access Interface (Create) form displays the port information.

9 Configure the remaining parameters, if required.

10 Click on the OK button. The VLAN Access Interface (Create) form closes, and a dialog box appears.

11 Click on the OK button. The VLAN - *Service Name* (Edit) form reappears with the new interface displayed in the service navigation tree under Access Interfaces for the site specified in step 3.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button to confirm the action and close the dialog box. The Manage Services form reappears.

14 Click on the Close button to close the Manage Services form.

Procedure 69-10 To create a VLAN group

1 Choose Manage→VLAN→VLAN Groups from the 5620 SAM main menu. The Manage VLAN Groups form opens.

2 Click on the Create button. The VLAN Group (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Group Name
- Description
- Node Type
- Technology
- Topology
- VLAN Space Management by SAM
- Head Ends

You can configure the VLAN Space Management by SAM parameter when the Node Type parameter is set to 9500.

You can configure the Head Ends parameter when the Node Type parameter is set to OMNI.

4 Click on the Apply button.

5 Click on the Group Members tab button.

6 Click on the Create button. The Select Network Elements form opens and a list of available NEs is displayed. Only NE types specified by the Node Type parameter are displayed in the list.

7 Choose one or more NEs from the list and click on the OK button. A dialog box appears.

8 Click on the OK button. The selected NEs are listed on the VLAN Group (Edit) form.

9 If you enabled the Head Ends parameter, you can add head end NEs to the group. Otherwise, go to step 13.

10 Click on the Add Headend Node button. The Select Network Elements form opens and a list of available NEs is displayed. Only 7750 SR, 7710 SR, and 7450 ESS NE types are displayed in the list.

11 Choose one or more NEs from the list and click on the OK button. A dialog box appears.

12 Click on the OK button. The selected NEs are listed on the VLAN Group (Edit) form.

13 If you need to apply a span of control to a group, other than the default, click on the Spans tab button. Otherwise, go to step 14.

  i Click on the Create button. The Select Span(s) - VLAN Group form opens with a list of available spans.

  ii Choose one or more spans of control to apply to the VLAN group.

  iii Click on the OK button. The Select Span(s) - VLAN Group form closes and a dialog box appears.

  iv Click on the OK button.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The VLAN Group (Edit) form closes.

16 A list of VLAN groups is displayed in the Manage VLAN Groups form.

17 Close the Manage VLAN Groups form.

Procedure 69-11 To delete a VLAN group or group member

Note 1 — You must delete all of the members from a group before you can delete the group.

Note 2 — A 9500 MPR group member cannot be deleted if it is part of a VLAN path.

1 Choose Manage→ VLAN→VLAN Group from the 5620 SAM main menu. The Manage VLAN Groups form opens.

2 Apply a filter, or create and apply a filter, and click on the Search button. A list of VLAN groups is displayed.

3 Choose a VLAN group from the list.

4 Click on the Properties button. The VLAN Group (Edit) form opens with the General tab displayed.

5 Click on the Group Members tab button.

6 If the group does not contain any members, go to step 9. Otherwise go to step 7.

7 Choose one or more members of the VLAN group and click on the Delete button. A dialog box appears.

8 Click on the OK button to delete the group members.

9 Close the VLAN Group (Edit) form. The Manage VLAN Groups form is displayed.

10 Choose the VLAN group that you need to delete from the displayed list.

11 Click on the Delete button. A dialog box appears.

12 Click on the Yes button to delete the VLAN group.

13 Close the Manage VLAN Groups form.

Procedure 69-12 To create a 9500 MPR VLAN path

Note 1 — When you create an Auto or Point 2 Point variant of a hop-based VLAN path, all of the 9500 MPR NEs that traverse the VLAN path must be part of the same VLAN group. For Manual VLAN paths variants, a VLAN group is not required. See Procedure 69-10 for information about creating VLAN groups.

Note 2 — To create a ring-based VLAN path, you need a radio ring element. See Procedure 33-9 for information about creating a radio ring element.

1 Choose Manage→VLAN→Paths from the 5620 SAM main menu. The Manage VLAN Paths form opens.

2 Click on the Create button. The Create VLAN Path form opens with the Path Type step displayed.

3 Configure the Path Type parameter.

4 Click on the Next button. The Identification step is displayed.

5 Configure the parameters:

- Name
- Description
- Creation Type

  The Creation Type parameter appears when the Path Type parameter is set to Hop Based.

6 Click on the Next button. For ring based VLAN paths, the Select Ring step is displayed. For hop-based VLAN paths, the Specify Vlan Path Constraints step is displayed.

7 Perform one of the following:

a If you configured the Ring Based option for the Path Type parameter, go to step 8.

b If you configure the Hop Based option for the Path Type parameter, go to step 10.

8 Click on the Select button. The Select Ring - VLAN Path opens.

9 Choose a radio ring in the list and click on the OK button. The Select Ring - VLAN Path form closes and the address of the selected Radio Ring is displayed in the Mgr ID parameter. Go to Step 41.

10 Perform one of the following:

a If you configured the Manual option for the Creation Type parameter, go to step 11.

b If you configured the Auto or Point 2 Point options for the Creation Type parameter, go to step 22.

11 Configure the Minimum Bandwidth (kbps) parameter.

12 Click on the Next button. The Define Source Site step is displayed.

13 Perform one of the following:

a Enter the IP address of the starting VLAN path endpoint in the Starting Network Element parameter.

b Click on the Select button. The Select a Network Element - Define Source Site form opens. Choose a 9500 MPR in the list and click on the OK button. The Select a Network Element - Define Source Site form closes and the IP address of the selected 9500 MPR is displayed in the Starting Network Element parameter.

14 Click on the Next button. The Define the Provisioned Path step is displayed

15 Click on the Insert Hop button to insert a VLAN path hop. The Hop for New VLAN Path (Create) form opens.

16 Click on the Select Network Element button. The Select a Network Element - New VLAN Path form opens.

17 Choose a 9500 MPR in the list and click on the OK button. The New VLAN Path form closes and the IP address of the NE is displayed in the Network Element parameter.

18 Click on the Select Link button. The Select Links - New VLAN Path form opens.

19 Choose a link from the list and click on the OK button.

20 Click on the Apply button if you need to add another hop. Click on the OK button after you add all of the required hops.

21 Close the Hop for New VLAN Path (Create) form. Go to Step 41.

22 Configure the parameters:

- Max Hops
- Minimum Bandwidth (kbps)
- Select Shortest Path

23 Perform one of the following:

a If you selected the Auto option for the Creation Type parameter in Step 5, go to Step 24.

b If you selected the Point 2 Point option for the Creation Type parameter in Step 5, go to Step 31.

24 Click on the Next button. The Define Head step is displayed.

25 Perform one of the following:

a In the Head End parameter, enter the IP address of the 9500 MPR at the head end of a VLAN group.

b Click on the Select button. The Select a Network Element - Define Head End form opens. Choose a 9500 MPR in the list and click on the OK button. The Select a Network Element - Define Head End form closes and the IP address of the selected 9500 MPR is displayed in the Head End parameter.

26 Click on the Next button. The Possible Vlan Path step is displayed.

27 Click on the Insert Hop button to insert a VLAN path hop. The Hop (Create) form opens.

28 Choose a 9500 MPR in the list and click on the OK button. The New VLAN Path form closes and the IP address of the NE is displayed in the Network Element parameter.

29 Click on the Apply button if you need to add an additional hop. Click on the OK button after you add all of the hops.

30 Close the Hop (Create) form. Go to Step 41.

31 Click on the Next button. The Define Source Site step is displayed.

32 Perform one of the following:

- **a** Enter the IP address of the starting VLAN path endpoint in the Starting Network Element parameter.
- **b** Click on the Select button. The Select a Network Element - Define Source Site form opens. Choose a 9500 MPR in the list and click on the OK button. The Select a Network Element - Define Source Site form closes and the IP address of the selected 9500 MPR is displayed in the Starting Network Element parameter.

33 Click on the Next button. The Define Destination Site step is displayed.

34 Perform one of the following:

- **a** Enter the IP address of the destination VLAN path endpoint in the Destination Network Element parameter.
- **b** Click on the Select button. The Select a Network Element - Define Destination Site form opens. Choose a 9500 MPR in the list and click on the OK button. The Select a Network Element - Define Destination Site form closes and the IP address of the selected 9500 MPR is displayed in the Destination Network Element parameter.

35 Click on the Next button. The Possible VLAN Path step is displayed.

36 Click on the Insert Hop button to insert a VLAN path hop. The Hop for New VLAN Path (Create) form opens.

37 Click on the Select Network Element button. The Select a Network Element - New VLAN Path form opens.

38 Choose a 9500 MPR in the list and click on the OK button. The New VLAN Path form closes and the IP address of the NE is displayed in the Network Element parameter.

39 Click on the Apply button if you need to add an additional hop. Click on the OK button after you add all of the hops.

40 Close the Hop for New VLAN Path (Create) form.

41 Click on the Finish Button to save the VLAN path configuration.

42 Click on the Close button. The Create VLAN Path form closes.

43 Close the Manage VLAN Paths form.

Procedure 69-13 To delete a 9500 MPR VLAN path

Note — You cannot delete a VLAN path if the path is being used by a service.

1 Choose Manage→VLAN→Paths from the 5620 SAM main menu. The Manage VLAN Paths form opens.

2 Apply a filter, or create and apply a filter, and click on the Search button. A list of VLAN paths is displayed.

Note — If VLAN paths are already in your network, the 9500 MPR NE that the path traverses is auto-discovered by the 5620 SAM. The paths appear on the Manage VLAN Paths form with a name with the following syntax: *Discovered-VLANPath-<IP address of the source 9500 MPR>-<IP address of the destination 9500 MPR*

3 Choose a VLAN path from the list and click on the Delete button. The VLAN path and all of the associated hops are deleted.

4 Close the Manage VLAN Paths form.

Procedure 69-14 To add a MEP to an OmniSwitch VLAN service access interface

Perform the procedure to manually add a MEP to an OmniSwitch VLAN service access interface. See Chapter 80 for more information on MEPs.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Use the configurable filter and Search button to choose the VLAN service and click on the Properties button. The VLAN - *Service Name* (Edit) form opens.

3 On the navigation tree, click on the site to which you want to add the MEP; expand the entries for that site.

4 Right-click on the access interface and click on Properties. The VLAN Access Interface (Edit) form opens with the General tab displayed.

5 Click on the MEPs tab button.

6 Click on the Create button.

7 Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

8 Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

9 Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect

10 Click on the OK button. The VLAN Access Interface (Edit) form reappears.

11 Click on the Refresh button to update the MEP list.

12 Repeat steps 6 to 11 to add additional MEPs.

13 Close the VLAN Access Interface (Edit) form to return to the VLAN Service (Edit) form.

14 Close the VLAN Service (Edit) form.

15 Close the Manage Services form.

Procedure 69-15 To configure IGMP on an OmniSwitch VLAN site

OmniSwitch IGMP parameters can be configured globally and per VLAN site. You can configure VLAN site IGMP parameters only after you create the VLAN. VLAN IGMP configuration settings override global IGMP settings. See Procedure 31-38 for information about configuring global OmniSwitch IGMP parameters.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an OmniSwitch VLAN service.

4 Click on the Properties button. The VLAN *Service Name* (Edit) form opens with the general properties of the service displayed on the General tab.

5 Click on the Sites tab button.

6 Choose a site from the list and click on the Properties button. The Site (Edit) form opens with the General tab displayed.

7 Click on the IGMP tab button.

8 Choose an entry from the list and click on the Properties button. The IGMP (Edit) form opens with the General tab displayed.

9 Configure the following parameters, if required:

- Administrative State
- Querying
- Spoofing
- Proxying
- Query Interval (seconds)
- Last Member Query Interval (tenths of seconds)
- Query Response Interval (tenths of seconds)
- Robust Count
- Querier Forwarding
- Zapping
- Max Group Action
- Max Group
- Protocol Version
- Router Timeout (seconds)
- Source Timeout (seconds)
- Unsolicited Report Interval (seconds)

10 Click on the Multicast Group tab button to create a static IGMP group.

11 Click on the Create button. The Group (Create) form opens.

12 Click on the Select button to choose a terminating port. The Select Port - Group form opens with a list of available ports.

13 Choose a port from the list and click on the OK button. The Select Port - Group form closes and the selected port is displayed on the Group (Create) form.

14 Configure the Multicast Group IP Address parameter.

15 Click on the OK button. The Select Port - Group form closes, the multicast group appears in the listing, and a dialog box appears.

16 Click on the OK button.

17 Repeat steps 11 to 16 for each multicast group that you need to add.

18 Click on the Multicast Neighbor tab button to create a static IGMP neighbor.

19 Click on the Create button. The Neighbor (Create) form opens.

20 Click on the Select button to choose a terminating port. The Select Port - Neighbor form opens with a list of available ports.

21 Choose a port from the list and click on the OK button. The Select Port - Neighbor form closes and the selected port is displayed on the Neighbor (Create) form.

22 Click on the OK button. The Select Port - Neighbor form closes, the multicast neighbor appears in the listing, and a dialog box appears.

23 Click on the OK button.

24 Repeat steps 19 to 23 for each multicast neighbor that you need to add.

25 Click on the Multicast Querier tab button to create a static IGMP querier.

26 Click on the Create button. The Querier (Create) form opens.

27 Click on the Select button to choose a terminating port. The Select Port - Querier form opens with a list of available ports.

28 Choose a port from the list and click on the OK button. The Select Port - Querier form closes and the selected port is displayed on the Querier (Create) form.

29 Click on the OK button. The Select Port - Querier form closes, the multicast querier appears in the listing, and a dialog box appears.

30 Click on the OK button.

31 Repeat steps 26 to 30 for each multicast querier that you need to add.

32 Click on the OK button to close the IGMP (Edit) form.

33 Click on the OK button to close the Site (Edit) form

34 Click on the OK button to close the VLAN (Edit) form

35 Click on the Yes button to confirm the action. The VLAN *Service Name* (Edit) form closes and the Manage Services form reappears.

36 Click on the Close button to close the Manage Services form.

Procedure 69-16 To run an OAM validation test on a VLAN service

A validator test suite must be created for the tested entity. See chapter 78 for more information about how to create a validator test suite.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a service and click on the Properties button. The VLAN (Edit) form opens with the General tab displayed.

4 Click on the More Actions button and choose Validate. If a validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

  i Click on the OK button to associate the service with an existing validator test suite. The Choose Validator Test Suite form appears.

  ii Configure the filter criteria. A list of validator test suites appears.

  iii Select a validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark beside the OAM Validation Failure indicator.

6 Click on the Tests tab button.

7 Click on the Validation Result tab button.

8 Select an entry and click on the Properties button. The Tested Entity Result form opens and displays information about the validation test.

9 Close the Tested Entity Result form.

10 Close the VLAN (Edit) form.

11 Close the Manage Services form.

Procedure 69-17 To view the VLAN service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a service and click on the Properties button. The VLAN (Edit) form opens.

4 View the Aggregated Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab button to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab button to view the alarms for the object. The Object Alarms tab is displayed.

7 Click on the Aggregated Alarms tab button to view the aggregated alarms for the object. The Aggregated Alarms tab is displayed.

8 Close the VLAN (Edit) form.

9 Click on the Close button to close the Manage Services form.

Procedure 69-18 To view the service topology associated with a VLAN

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VLAN service and click on the Topology View button. A Topology View dialog box appears.

4 Click on the Yes button to proceed. The Service Topology - *Service Name* map opens.

See chapter 5 for more information about service topology views.

Procedure 69-19 To modify a VLAN service

Caution — Modifying parameters can be service-affecting.

Note — Restrictions apply to VLANs using 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices. See "7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, 7210 SAS-M and Telco VLAN restrictions" in this chapter, for more information.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VLAN service.

4 Click on the Properties button. The VLAN *Service Name* (Edit) form opens with the general properties of the service displayed on the General tab.

The following tabs contain non-configurable parameter information for the service:

- VLAN tab—displays information about the VLAN type
- MVR tab—displays multicast package policy information for the service

The MVR tab button is not selectable for some types of VLAN.

The following tabs list the service elements that can be individually or collectively selected and configured:

- Sites tab—lists the sites that are included in the service
- VLAN Access Interfaces tab—lists the L2 access interfaces that are included in the service
- Ethernet Services—lists the Ethernet services
- Service Termination Point tab — lists the ports on the far end points of the service
- Template tab — displays the template used to create the mirror service, if applicable.
- Faults tab—displays the faults associated with the service

The Ethernet Services tab button is not selectable for some types of VLAN.

Note — Users with the administrator scope of command role can click on the Select button on the Templates tab to associate a service template with the service object, if required.

5 Modify the parameters for the service as required.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button to confirm the action. The VLAN *Service Name* (Edit) form closes and the Manage Services form reappears.

8 Click on the Close button to close the Manage Services form.

Procedure 69-20 To delete a VLAN service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

Caution — Do not delete any VLANs that are used for network management, otherwise connectivity between the 5620 SAM and the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, OmniSwitch, or Telco devices is lost.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This message is dynamic based on the priority of the service. Perform one of the following:

- **a** For services with a low priority, go to Step 5.
- **b** For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.
- **c** For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

70 — VLL service management

70.1 VLL service management overview

The 5620 SAM supports the provisioning of VLL services on edge devices. A VLL service is an L2 point-to-point service that connects access interfaces. A VLL service is completely transparent to customer or subscriber data and to control protocols. Because of this, the device performs no MAC learning in a VLL service.

The 5620 SAM supports multiple variations of VLL services. See “VLL types” in this section for more information.

A VLL service that connects access interfaces on one device is called a local VLL service. As there is no need for signaling between devices, a local VLL service uses no SDPs.

A VLL service that connects access interfaces on two devices is called a distributed VLL service. Subscriber or customer data enters a distributed VLL service through access interfaces on different edge devices. The VLL service encapsulates the data and transports it across a service provider IP/MPLS network through GRE or MPLS service tunnels.

Packets that arrive at an edge device are associated with a VLL service based on the access interface on which they arrive. An access interface is uniquely identified using these parameters:

- physical port or POS port and channel
- encapsulation type
- encapsulation identifier (if required, depending on encapsulation type)

A VLL service uses T-LDP signaling, and uses MPLS or GRE as the service tunnel transport.

A new or existing VLL can be configured as the spoke of an HVPLS. See “HVPLS” in section 71.1 and chapter 76 for more information.

The 5620 SAM supports end-to-end VLL configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Preconfigured template. A user that is assigned the template management role can create a service template. The template management user can also configure and bind site, circuit, and L2 interface templates to the service template. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

Common to all device services, such as VLL, are policies that are assigned to the service. Policies are defined at a global level and can then be applied to components of the service, such as interfaces or circuits, when the service is configured or modified. The following policies are common to all device services:

- QoS policies define ingress classification, policing, shaping, and marking on the ingress side of the interface. QoS policies are configured using the Access Ingress Policy form, the Access Egress Policy form, and the ATM QoS Policy form. Because a VLL service is a point-to-point service, ingress QoS policies create only the unicast queues that are defined in the policy and not the multicast queues.
- (Epipe service only) Policer control policies to control access ingress policers and access egress policers under a common hierarchy. Policer control policies are configured using the Policer Control Policy Manager.
- Scheduling policies define hierarchical rate limiting and scheduling to govern the scheduling of queues. Scheduler policies are configured using the Scheduler Policy and HSMDA Scheduler Policy forms.
- Port scheduler policies define hierarchical bandwidth allocation and scheduling at the egress port level. Port scheduler policies are configured using the Port Scheduler Policy form.
- Filter policies control network traffic into or out of an interface or circuit based on IP or MAC matching criteria. Filter policies are configured using the ACL IP Filter form and the ACL MAC Filter form.
- Accounting policies measure the traffic on a service to ensure proper billing and enforcement of SLAs. Accounting policies are configured using the Accounting Policy form.
- ANCP policies provide status and control information based on port-up and port-down messages and changes to the current access line rate between the edge device and the access node. ANCP policies are configured using the Manage Subscriber Policies form.
- Time of day suites specify time and day restriction policies that are assigned to QoS policies and schedulers, ACL filters, and aggregation schedulers. Time of day suites and time range policies are configured using the Time of Day Suite form and Time Range form, respectively.

See chapter 46 for more information about policies.

OAM diagnostics can be performed on a per-service basis. See chapter 38 for more information.

The General tab of the VLL service management form displays information about the operational state of the service and its sites through the Operational State and State Cause indicators.

The Operational State indicator identifies the states of the sites that are part of the service, as follows:

- Up—one operational path in both directions (end-to-end)
- Down—path is not operationally complete

When the Operational State is Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator.

You can run the OAM Validation test suite for the service by clicking on the More Actions > Validate button. If a check mark appears beside the OAM Validation Failed state cause indicator, the test has failed. In addition, the Validation Result tab on the Tests tab displays detailed information about the OAM test result. See chapter 78 for more information about how to configure OAM validation test suites.

The 5620 SAM also monitors the status of a peer SAP after a VLL has been created and put into service. Status information includes faults detected on the service tunnel, and access and network SAP transmissions and receptions. The States tab of the Spoke SDP Binding form displays indicators of failure in the VLL in the State Cause panel.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default Service Tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology views. See chapter 76 for more information about the hierarchical organization of composite services.

VLL types

The 5620 SAM supports the creation of the following VLL service types:

- Epipe, or Ethernet VLL service
- Apipe, or ATM VLL service
- Fpipe, or frame relay VLL service
- Hpipe, or HDLC service
- Ipipe, or IP interworking VLL service
- Cpipe, or circuit emulation VLL service

Epipe (Ethernet VLL)

An Epipe, or Ethernet VLL service, provides a point-to-point Ethernet service. One endpoint of an Epipe uses Ethernet encapsulation, and the other endpoint uses Ethernet, ATM, frame relay encapsulation, or CEM encapsulation. An Epipe effectively provides ATM and frame relay bridged encapsulation termination for interworking. The 5620 SAM supports local cross-connecting when the Epipe endpoints are on the same device. The device supports these Epipe connectivity scenarios:

- a frame relay or ATM user in an ATM network communicating with an Ethernet user on an IP/MPLS network
- a frame relay or ATM user who connects to a PE device in an IP/MPLS network and communicates with an Ethernet user who connects to another PE device in the same network

ATM users connect through a UNI using AAL-5 or bridged Ethernet PDUs, and use the VCI/VPI as the ATM SAP identifier. Frame relay users connect through a UNI that uses Multiprotocol Interconnect over frame relay or bridged Ethernet PDUs, or over an Ethernet UNI interface. The DLCI is the frame relay SAP identifier. The VCI/VPI and DLCI identifier tags are transparent to the service and remain unaffected during transport.

The 5620 SAM supports the following Ethernet SAP encapsulations for an Epipe service:

- null
- dot1q
- SONET/SDH BCP-null
- SONET/SDH BCP-dot1q

Epipe services allow you to designate a dot1q encapsulated SAP as the default SAP for a specific port. For more information about how you can use default SAPs on an Ethernet port, see "Default SAPs" in section 71.1.

A default SAP can co-exist with other SAPs on a port, but it cannot be implemented on a null encapsulated port. Through the SAM 5620 interface, you can create a default SAP by specifying an outer encapsulation value of 4095 or * to a SAP. If OSSI is used, the outer encapsulation value is always 4095.

Apipe (ATM VLL)

An Apipe, or ATM VLL service, provides a point-to-point ATM service between users who connect to 7750 SR, 7710 SR, 7705 SAR, or 7450 ESS NEs in an IP/MPLS network directly or through an ATM access network. One endpoint of an Apipe uses ATM encapsulation and the other endpoint uses ATM or frame relay encapsulation. An ATM PVC—for example, a VC or a VP—is configured on the managed device. As a result, the ATM switches at the service endpoints appear to be directly connected over an ATM link. The 5620 SAM supports VPI/VCI translation in an Apipe and supports local cross-connecting when the Apipe endpoints are on the same managed device.

An Apipe encapsulates standard UNI/NNI cells that ingress the ATM SAP into a pseudowire packet using N:1 cell mode encapsulation or AAL-5 SDU mode encapsulation. When using N:1 cell mode encapsulation, an Apipe supports cell concatenation into a pseudowire packet and the setup of both VC- and VP-level connections.

For ATM and frame relay interworking, an Apipe provides a point-to-point service between a user who connects to an existing ATM network and another user who connects to a PE in an IP/MPLS network. An ATM AAL-5 SDU pseudowire or a frame relay 1-to-1 mode pseudowire connects the nodes. The PE performs an FRF.5 interworking function to join the ingress and egress data paths.

An ATM VT SAP on a PE is identified by the physical port and VPI range. Cells that arrive on a specified port and are within the specified VPI range go into a single pseudowire for transport through the IP/MPLS network. A user can configure the whole ATM port as a VT and does not need to specify a VPI range. There is no ingress or egress VPI/VCI translation or loss of cell order.

The 7705 SAR uses N>1 cell mode encapsulation to support multiple VCs on an Apipe. You can multiplex VCs on a 7705 SAR Apipe service using SAP aggregation groups. See Procedure 70-14 for more information on configuring SAP aggregation groups.

The 5620 SAM supports the ATM N:1-N>1 VC type to allow interoperability between 7705 SAR and 7750 SR Apipe services, despite each site using different cell mode encapsulation. An interoperating Apipe service uses the ATM N:1-N>1 VC type, while the 7705 SAR site uses ATM VCC and the 7750 SR uses ATM Cell. An interoperating Apipe service combines SAP aggregation groups from the 7705 SAR Apipe with connection profiles from the 7750 SR Apipe onto a single Apipe service.

Fpipe (frame relay VLL)

An Fpipe, or frame relay VLL service, provides a point-to-point frame relay service between users who connect to PE 7750 SR, 7710 SR, or 7450 ESS NEs in an IP/MPLS network. Both endpoints of an Fpipe use frame relay encapsulation. An Fpipe connects users through frame relay PVCs. An Fpipe receives standard Q.922 core frames on the frame relay SAP and encapsulates them in a pseudowire packet according to the 1-to-1 frame relay encapsulation mode. This is the VC type used on the SDP by default. The 5620 SAM does not support the many-to-one, or port encapsulation, mode. Fpipe creation supports local cross-connecting when the endpoints are on the same managed device.

Hpipe (HDLC VLL)

An Hpipe, or HDLC VLL service, is used to carry HDLC PDUs over an MPLS network. HDLC PWs enable service providers to offer emulated HDLC services over existing MPLS networks. HDLC mode provides port-to-port transport of HDLC-encapsulated traffic.The HDLC PDU is transported in its entirety, including the HDLC address and control fields, but the HDLC flags and the FCS are excluded. If the optional control word is used, the flag bits in the control word are not used and must be set to 0 for transmitting and must be ignored upon receipt.

Before HDLC SAPs can be configured, the mda-mode command must be set to cem-fr-hdlc-ppp at the card level. Only ports that are configured with HDLC encapsulation can be mapped to an Hpipe SAP.HDLC encapsulating ports do not terminate the HDLC. The ports pass the HDLC frames through the Hpipe. HDLC encapsulated ports can pass through any HDLC-framed traffic, such as Cisco-HDLC, FR, PPP, etc.

Ipipe (IP interworking VLL)

An Ipipe, or IP interworking VLL service, uses the IP/MPLS network to provide Layer 3 connectivity between different Layer 2 technologies. An Ipipe service provides point-to-point IP connectivity between a user on a frame relay, ATM, cHDLC, or PPP access circuit with routed PDU IPv4 encapsulation and a user on an Ethernet interface. The Ethernet SAP interface can terminate on a 7705 SAR, 7750 SR, 7450 ESS, or 7710 SR.

Table 70-1 summarizes the supported SAP types.

Table 70-1 Supported SAP types

SAP Types	Frame relay	ATM	PPP/IPCP	cHDLC	Ethernet
Frame relay	✓	✓			✓

(1 of 2)

SAP Types	Frame relay	ATM	PPP/IPCP	cHDLC	Ethernet
ATM	✓	✓			✓
PPP/IPCP			✓		✓
cHDLC				✓	✓
Ethernet	✓	✓	✓	✓	✓

(2 of 2)

In an Ipipe service, both CE devices appear to be on the same IP interface. The PE devices must therefore resolve Layer 2 addresses when different resolution protocols are used on either SAP. Each PE device is manually configured with the IP addresses of both CE devices, or alternatively, can be set to automatically discover the IP addresses of the CE routers. The PE device maintains an ARP cache context for each IP interworking VLL, and responds to ARP request messages received on the Ethernet SAP. The PE device responds with the Ethernet SAP configured MAC address as a proxy for an ARP request for the frame relay, ATM, or PPP user access circuit IP address, and silently discards any ARP request message received on the Ethernet SAP for any other address. The PE device maintains a record of the association of IP addresses with MAC addresses for ARP requests that it receives over the Ethernet SAP.

An Ipipe SAP can be bound to a physical or logical port with PPP, cHDLC, ATM, or FR encapsulation. On Release 8.0 R5 or earlier NEs, when IPv6 is enabled, cHDLC, ATM and FR encapsulation are not supported. ATM users connect through a UNI using AAL-5 MUX IP or AAL-5 SNAP routed PDU encapsulation. Frame relay users connect using routed PDU IPv4 encapsulation. PPP interfaces use PPP/IPCP encapsulation of an IPv4 packet. Users of cHDLC connect using routed IPv4 encapsulation.

The 5620 SAM supports the following Ethernet SAP encapsulations for an Ipipe service:

- Null
- dot1q
- Q in Q

Note — IPCP SAPs on the 7705 SAR can be configured to assign primary and secondary DNS addresses to the remote peer.

The following identifiers are used for packet forwarding:

- VCI/VPI as the ATM SAP identifier
- DLCI as the frame relay SAP identifier

Cpipe (circuit emulation VLL)

A Cpipe, or circuit emulation VLL service, provides a point-to-point CEM service between users who connect directly to 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7705 SAR, 7710 SR, or 7750 SR devices, or to 7450 ESS devices in an IP/MPLS network. The endpoints of a Cpipe use CEM encapsulation.

Note — The creation of point-to-point Cpipe CEM services on a 7450 ESS is supported only on a Release 8.0 R5 or later 7450 ESS.

The Cpipe L2 access interface can be bound to a unstructured DS1 or E1 channel, a channelized DS0 channel group, or a DS0 group with CAS signalling. Consider the following when creating a Cpipe:

- The Time Slots parameter of the DS0 channel must be configured with at least one time slot.
- Time slots are automatically configured for unstructured E1 and T1 endpoints.
- The Clock Source parameter of the DS1 channel must be set to Node-Timed.

VLL spoke switching

VLL spoke switching allows you to create a VLL service by cross-connecting two spoke SDPs. Spoke switching allows you to scale L2 services, such as VLLs and H-VPLS, over a multi-area network without the requirement for a full mesh T-LDP. The 5620 SAM supports spoke switching on all VLL types, however, all service instances must be the same type.

The 5620 SAM supports VLL services with spoke switching on the 7750 SR and 7450 ESS.

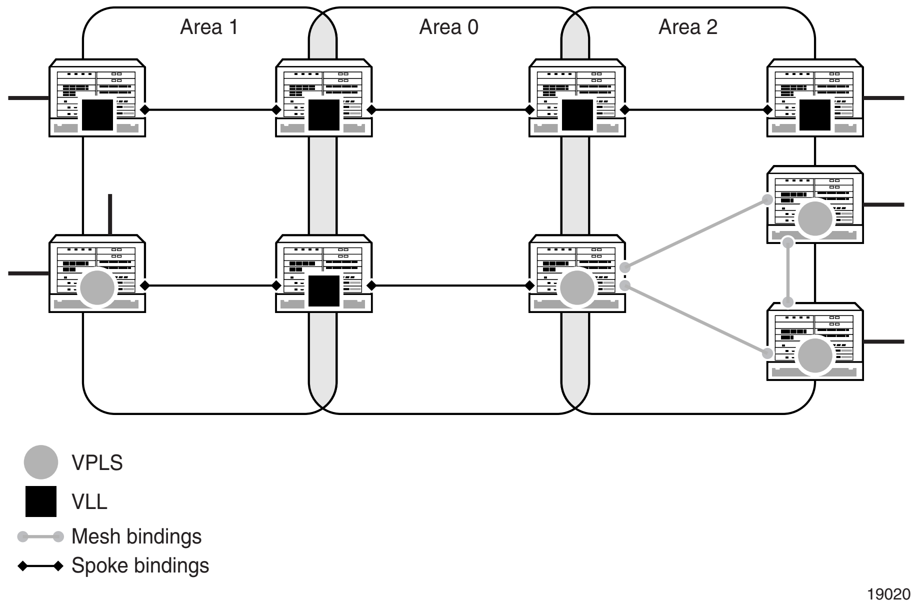
Table 70-2 describes the VLL site types that you can use in a spoke switching configuration.

Table 70-2 VLL site types

VLL site type	Description
Terminating	VLL instance has one or two VLL SAPs.
Switching	VLL instance cross-connects two spoke bindings.

Figure 70-1 shows a switching VLL that connects two VPLS. The configuration uses two T-PEs, three S-PEs, and two pairs of spoke bindings to connect the two VPLS.

Figure 70-1 VLL spoke switching



Configuration requirements

You must consider the following configuration rules when provisioning VLL services with spoke switching:

- Service type must be a VLL at the switching node.
- VC IDs can be different for the segments in the service.
- Segments in the service can run on different types of tunnels; for example, LDP, GRE, and RSVP SDPs.
- VLL instances in a service must use the same service ID to avoid the discovery of multiple and composite services.
- VLL with one or more switching sites must have two or more terminating sites.
- Autobinding creation service is not supported for switching VLLs.

VLL redundancy

VLL redundancy requires that you associate the SAP or SDP bindings to an endpoint. You can configure the endpoint association as active or standby so that you can create a redundant configuration. The associated nodes use signaling to determine the active SAP or SDP binding. The 5620 SAM supports VLL redundancy on the 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR.

A VLL service site can have up to two local endpoints. A local endpoint combines a SAP with a binding (access) or a group of bindings (network). A SAP or an SDP binding can also exist without an endpoint association.

The 7450 ESS, 7710 SR, and 7750 SR support HSDPA offload fallback for VLL Apipe and Epipe services by allowing fallback from an active PW on a primary spoke SDP to a secondary SAP.

Table 70-3 describes the components in redundant VLL configurations.

Table 70-3 VLL components for redundant configurations

VLL component	Description
Primary or Redundant binding	Primary or redundant binding is the same as a regular spoke binding. Up to four spoke bindings can form a VLL instance network endpoint. Only one binding can be configured as the primary; up to 3 others can only be configured as redundant spokes. Each redundant spoke has a precedence value to decide which spoke is the immediate backup. Only the terminating VLL instance can have multiple bindings on the network side endpoint. A switching VLL instance has up to 2 bindings, one on each side.
Inter-Chassis Backup	You can use an ICB in conjunction with a redundant SAP to provide protection for the SAP. The SAP must also be associated with a MC-LAG or MC-APS port. The ICB transports network traffic to the SAP on the second PE when the local SAP is unavailable. You must define a switching state for the redundant SAP. You must also configure the return ICB on the opposite endpoint of the protected site.

Configuration options

Table 70-4 describes the redundancy configuration options for each VLL site.

Table 70-4 VLL redundancy configuration options

Option	Configuration	Description
1	SAP SDP binding	You can create an endpoint without any SAP or SDP.
2	SAP SAP	You can create an endpoint without any SAP or SDP.
3	SDP binding SDP binding	You can configure this option for switching sites only.
4	SAP Endpoint with SDP bindings (maximum of 4 spokes and 1 ICB)	Figure 70-2 shows the configuration of this option on the PE nodes.
5	Endpoint with SAP/ICB SDP binding	Figure 70-3 shows the configuration of this option on Node B.
6	Endpoint with SAP/ICB endpoint with SAP/ICB	Figure 70-4 shows the configuration of this option.
7	Endpoint with SAP/ICB Endpoint with up to 4 SDP bindings	Figure 70-5 shows the configuration of this option.

Figure 70-2 VLL redundancy configuration - option 4

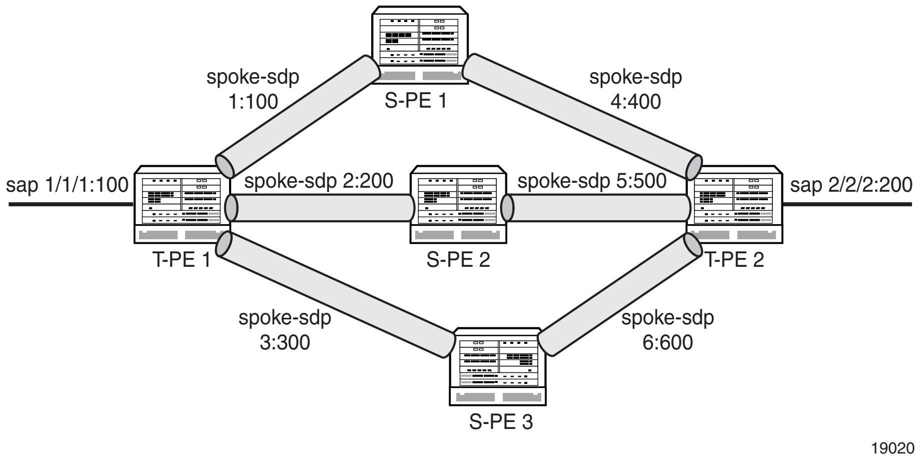


Figure 70-3 VLL redundancy configuration - option 5

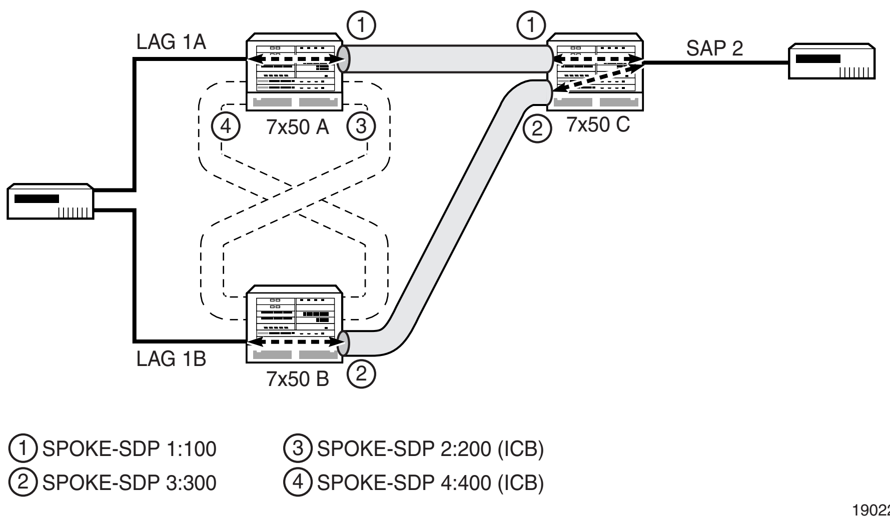

Figure 70-4 VLL redundancy configuration - option 6

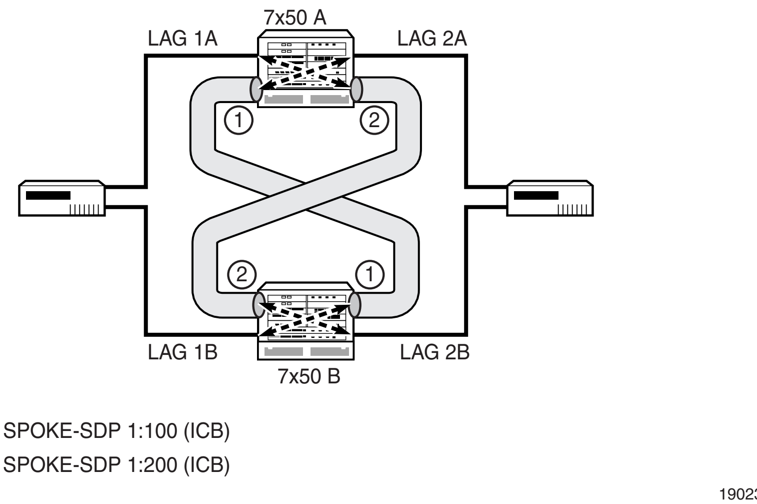

Figure 70-5 VLL redundancy configuration - option 7

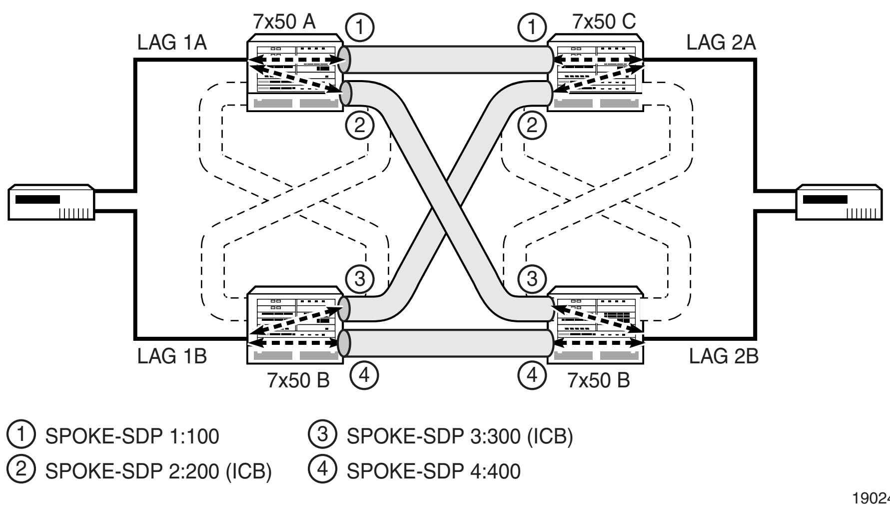


Configuration requirements

You must consider the following configuration rules when provisioning VLL services with spoke switching and redundancy:

- A VLL service can have one or more VLL instances. An instance can reside on a 7210 SAS-M, 7705 SAR, 7750 SR, 7450 ESS, or 7710 SR.
- Local endpoint rules:
  - A VLL instance has a maximum of two endpoints. A terminating VLL instance has at least one access endpoint and a switching VLL instance has two network endpoints.
  - A network endpoint has a maximum of four spoke-bindings, which can include any combination of the following: a single primary spoke, one or more secondary spokes with precedence, and one ICB spoke.
  - A SAP or a binding has a maximum of one endpoint association.
  - An endpoint has a maximum of one SAP.
  - A SAP or a binding with association to an endpoint can be moved to another endpoint or removed from that endpoint.
- SAP rules:
  - A MC-LAG SAP or MC-APS SAP cannot be deleted when there is an ICB on the same endpoint.
  - SAPs cannot exist on switching sites.
  - A maximum of two SAPs can exist for each site.
  - A SAP with a non-ICB spoke cannot exist on the same endpoint.
  - Apipe and Epipe services support MC-APS.
- Spoke binding rules:
  - The SDP types (GRE, MPLS) used by the redundant spoke bindings do not have to be the same when you manually create the spoke bindings.
  - Redundant configurations are not supported for S-PE because there are a maximum of two spoke bindings for a switching VLL instance.
  - An ICB SDP binding should not be created on an endpoint without a MC-LAG SAP or MC-APS SAP.
  - Only one ICB can exist for each endpoint.
  - ICB SDP binding can only have a precedence of 4, the lowest priority.
  - Only one primary spoke can exist for each endpoint.
  - Spoke SDP binding cannot associate with an endpoint on a switching site.
- HSDPA offload fallback rules:
  - Apipe and Epipe services support HSDPA offload fallback on ATM interfaces.
  - The spoke SDP must be configured with primary precedence.
  - The SAP must be configured with MC-APS or ATM channel.
  - When the SAP is configured with MC-APS, the spoke SDP can be configured with ICB.

HSDPA Offload Resiliency

Mobile service providers deliver both voice and data services to their customers using mobile handsets. The data services provided require significantly more bandwidth than voice services. In order to minimize the operational costs (specifically, bandwidth), service providers typically separate the voice and data traffic at the mobile base station. The voice traffic may be backhauled over an ATM infrastructure, while a Metro Ethernet infrastructure (their own or third-party) is used to backhaul the data traffic. The separation of data traffic onto a separate network for backhaul is referred to as High Speed Data-Link Packet Access offload.

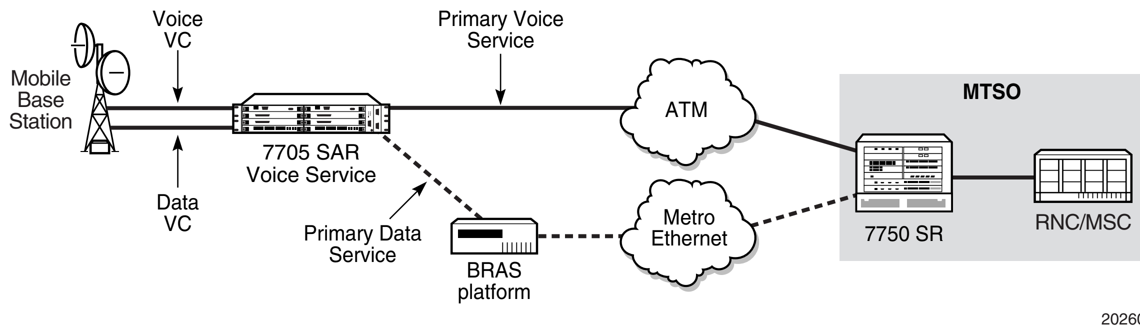
The HSDPA Apipe services traverse a path over the Metro Ethernet network which contains single potential points of failure that are unprotected. The ATM network can be used to provide a transient path for the data service in the event of a failure in the Metro Ethernet infrastructure, as long as the voice traffic is not impacted (data traffic is given lower QoS priority by the 7705 SAR and 7750 SR NEs). Clearly there is potential for the data service to suffer degradation (depending on the bandwidth required), until the fault in the Metro Ethernet network is resolved. However the SLA requirements for the data service are typically best effort.

The ability to switch to this alternate transient pathway for the data service is referred to as HSPDA resiliency.

HSPDA resiliency is implemented through the use of VLL Apipes on the 7705 SAR, Release 1.1 or later. The network architecture used in the ATM backhaul scenario is shown in Figure 70-6.

Note — For HSPDA offload resiliency, the primary and secondary services must be on the same NE.

Figure 70-6 ATM-based HSDPA offload architecture - nominal operation



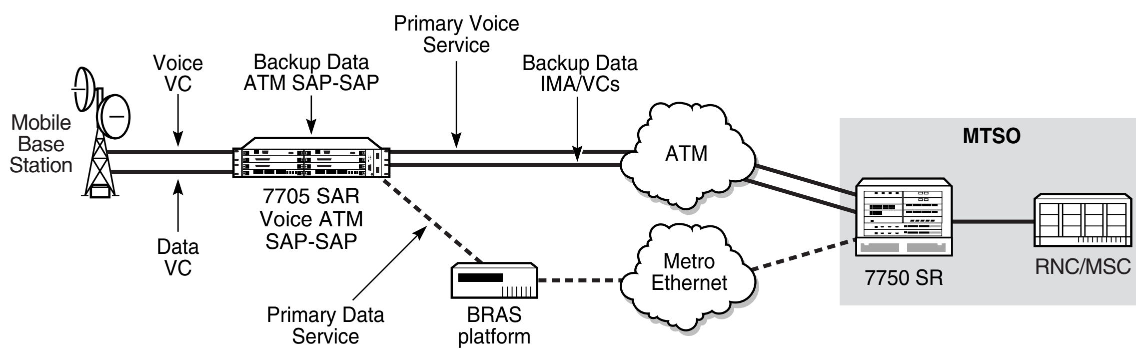
The mobile base station node separates the voice and data traffic and delivers the two different traffic types to the 7705 SAR on different VCs. Both the voice and data services use Apipe pseudo-wires to carry the traffic over the backhaul network to the 7705 SAR. The HSDPA Apipe service is paired with an OAM service (not shown in Figure 70-6) which is used by the wireless infrastructure to monitor the end-to-end path between the wireless endpoints.

For the ATM voice traffic, an internal Apipe is used on the 7705 SAR to switch ATM cells between the access VC/IMA group and the network side VC/IMA group. The service does not span the radio access network between the 7705 SAR and the 7750 SR located at the Mobile Telephone Switching Office (MTSO).

Data Apipe services (HSDPA/OAM) use service tunnels based on either MPLS or GRE. GRE is generally used in the context of a third-party Metro Ethernet network, since there is a Broadband Remote Access Server (BRAS) in the path between the DSLAM and the 7750 SR located at the MTSO (BRAS platforms do not support MPLS). MPLS is typically used when the mobile provider owns the Metro Ethernet network.

When the resiliency solution described below detects a failure in the Metro Ethernet network, its protection mechanism switches the traffic associated with the data service from the path over the Metro Ethernet network to a path which traverses the ATM (shown in Figure 70-7). The detection, switchover, and switchback mechanisms are implemented by the 5620 SAM.

Figure 70-7 HSDPA Offload Protection - ATM data backhaul



A backup (secondary) data service for an active (primary) data service is pre-configured on the 7705 SAR. For a typical 7705 SAR deployment at a cell site, two backup services are required, one for the HSDPA service and one for the OAM service. These backup services are created by the operator during the deployment of the 7705 SAR. A peer resiliency relationship between the active and backup services must also be configured.

The backup services used are internal Apipes. The switchover from primary to secondary is triggered by an event from the 7705 SAR sent to 5620 SAM, which indicates that the service tunnel (SDP) has failed. When the failure event is processed by 5620 SAM, the SAPs on the active data services are moved (along with the associated VCs) from the active service to its peer backup service and are enabled. After the re-configuration of the SAPs on the backup services completes, the traffic is moved to the backup services, which then carry the traffic over the ATM portion of the network. When the switchover is complete, an alarm is raised against the primary service indicating that it has been switched to the secondary service.

Other considerations include the following:

- If a service configured as primary is deleted from 5620 SAM or the CLI, then the corresponding resiliency is also deleted.
- If a service configured as secondary is deleted from 5620 SAM, this is blocked and a pop-up message indicates that the corresponding resiliency must first be deleted.
- If a service configured as secondary is deleted from the CLI, an alarm is raised indicating that the resiliency is misconfigured. If a secondary service is then subsequently added to the resiliency, this alarm is cleared.
- If the SAP initially configured on the primary service is deleted, the 5620 SAM raises an alarm. If the SAP is restored in the same service, the alarm clears.
- When the 5620 SAM detects that a failed SDP is up, which indicates that the primary service has recovered, the resiliency is set to the Secondary (Debounced) state and a damping timer is started. If the SDP goes down while the resiliency is in the Secondary (Debounced) state, the resiliency changes to the Secondary state and the damping timer stops. If the SDP changes state during the damping time, the value of the damping timer doubles until it rises to the maximum damping time. This prevents the service from flapping between primary and secondary. If the SDP does not change operational state during the damping time, the resiliency is set to Primary, the SAP is moved from the secondary to the primary service, and the alarm related to the service switch clears.
- After the primary service is restored, the damping timer value is set back to its initial value. The damping timer value is not displayed. The initial damping time is 30 000 ms; the time doubles, if required, to a maximum of 480 000 ms.
- The availability of this HSDPA resiliency feature is controlled by the 5620 SAM license key. If this feature is enabled using the 5620 SAM license key, then the Manage→Redundancy→HSDPA Resiliency feature is available on the main 5620 SAM menu, otherwise it does not appear. This feature also requires the SAM(P) module. A new package is added to the 5620 SAM License form called the Mobile Services Package. The HSDPA Resiliency feature is available when this package is enabled.

SDP bindings bandwidth allocation

You can administratively account for the bandwidth used by VLL services inside an RSVP SDP that consists of RSVP LSPs. The SR service manager keeps track of the available bandwidth for each SDP.

When you create a service tunnel, you configure an SDP Bandwidth Booking Factor percentage, which is applied to the SDP available bandwidth. You then assign an SDP Admin Bandwidth value (in kbps) to the spoke SDP. When you bind a VLL service to this SDP, this amount of bandwidth is subtracted from the adjusted available SDP bandwidth. If you subsequently delete the VLL service binding from this SDP, this bandwidth amount is added back into the adjusted SDP available bandwidth. If you overbook the total adjusted SDP available bandwidth when adding a VLL service, a warning is issued and the binding is rejected.

This feature does not guarantee bandwidth to a VLL service, as there is no change to the data path to enforce the bandwidth of an SDP by means such as shaping or policing of the constituent RSVP LSPs. Also, this feature does not provide a CAC capability for a local VLL service which consists of a cross-connect between two SAPs.

In addition, if multipoint services such as VPLS and VPRN are using the same SDP for forwarding packets, the amount of bandwidth consumed by these services is also not accounted for. Therefore, it is advisable to dedicate an SDP for VLL services for which bandwidth reservation is required. Furthermore, VPLS and VPRN services which use separate SDPs but which forward packets over the same network port as the VLL SDP also do not have their bandwidth accounted for. This may impact the bandwidth available to the VLL services.

Auto SDP binding (for all spoke bindings or just the return binding) cannot be used when there is a bandwidth request for the binding. The converse also applies. An error message appears when saving the configuration if this conflict occurs. 5620 SAM checking is done for OSSI.

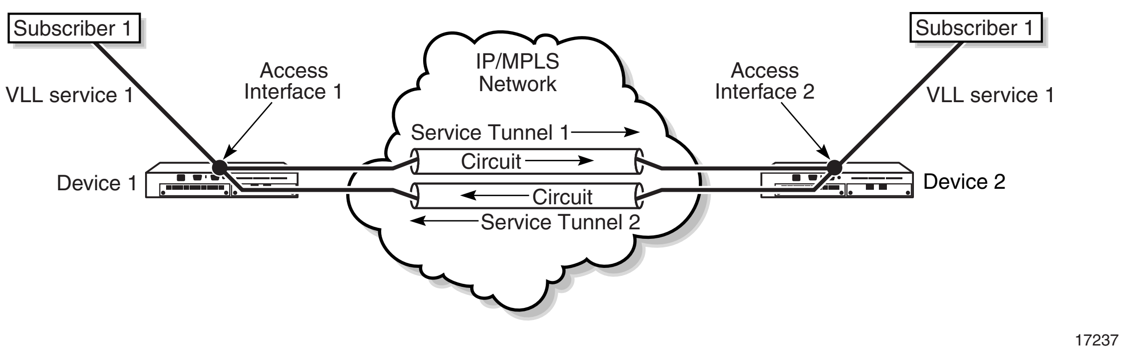
Copying and moving SAPs between ports

You can copy and move SAPs between ports. See section “Moving and copying SAPs between ports” in chapter 20 for more information.

70.2 Sample VLL service

Figure 70-8 shows a sample VLL service.

Figure 70-8 Sample VLL service



Assuming the core IP/MPLS network and service tunnels have already been configured, Table 70-5 shows the high-level tasks required to configure this sample VLL service.

Table 70-5 Sample VLL service configuration

Task	Description
1. Configure policies as required	Policies should be configured prior to creating a service. Participation in policies is defined when you configure or modify resources such as access interfaces during VLL service creation or modification. The following key policies can be applied to resources that are part of a VLL service. • Access ingress and egress interface policies, or ATM policies. Choose Policies→QoS→SROS QoS→Access Ingress, Access Egress, or ATM QoS to open these forms. • Scheduler policy. Choose Policies→QoS→SROS QoS→Scheduler to open the scheduler policy form. • ACL IP and ACL MAC filter policies. Choose Policies→Filter→ACL IP Filter or ACL MAC Filter to open the filter policy form. • Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form. • ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.
2. Configure ports as access ports for use in the service	If applicable, choose a port from the navigation tree, right-click on the port, and choose Properties from the contextual menu. Specify the port as an access port and specify an encapsulation type, if required.
3. Configure service tunnels as required	Service tunnels are automatically created if there are no tunnels between the source and destination devices. You must choose GRE as the transport type for the 5620 SAM to automatically create service tunnels. To manually create service tunnels, choose Manage→Service Tunnels. Unidirectional service tunnels carry service traffic between edge managed devices using aggregated SDP bindings. SDP bindings can be associated with service tunnels during service configuration. During service creation, you can also configure the 5620 SAM to automatically create and associate service tunnels with SDP bindings. In this case, you do not have to create service tunnels before you create the service. After you have created a VLL, status indicators display selected operational failures on the service tunnel and peer SAP.
4. Create and configure Subscriber 1	Choose Manage→Service→Customers to open the customer manager form and create a customer.

5. Create and configure Service 1	Choose Create→Service→VLL→*Type of VLL service*. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure Service 1.
	• Associate Subscriber 1 with the service.
	• Specify Device 1 and Device 2 as the sites for the VLL service.
	• Configure and specify Access Interface 1 and Access Interface 2 as the access interfaces for the VLL service. You do the following when you configure access interfaces.
	  • Specify the ports for the access interfaces. Ethernet ports must be configured as access ports.
	  • Specify participation of the access interfaces in access ingress, access egress, and ATM QoS policies as required.
	  • Specify participation of the access interfaces in aggregation rate limiting across a card or port. If aggregation is not required, specify participation of the access interfaces in ingress and egress scheduler policies. If aggregation is required, specify participation of the access interfaces in an aggregation scheduler policy.
	  • Specify participation of the access interfaces in scheduler policies as required.
	  • Set the ATM OAM Terminate parameter to Up when the VLL L2 access interface port belongs to a MC-APS channel and the VC Type parameter is set to ATM-SDU.
	Create and configure circuits in both directions. Associate the circuit from Device 1 to Device 2 with Service Tunnel 1. Associate the circuit from Device 2 to Device 1 with Service Tunnel 2. You can also configure the 5620 SAM to automatically create and associate service tunnels with circuits.

70.3 Workflow to create a VLL service

The following workflow lists the high-level steps required to create a VLL service. As a prerequisite for creating a VLL service, this workflow assumes the following:

- a group or customer with the required user access privileges has been set up; see chapter 9 for more information.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 33-1.
- the access ports for the service are created; see chapter 20 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 46 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 31 for more information about protocol configuration.

1 Create and configure the VLL service:

i Define the VLL service type as Epipe, Apipe, Fpipe, Hpipe, Ipipe, or Cpipe.

- For VLL Epipe services:
  - For all devices that support the creation of a VLL service except for 7210 SAS or 9500 MPR devices, see Procedure 70-1.
  - For 7210 SAS devices, see Procedure 70-2.
  - For 9500 MPR (ANSI only) devices, see Procedure 70-3.
- For VLL Apipe services:
  - For all devices that support the creation of a VLL service except for 9500 MPR devices, see Procedure 70-4.
  - For 9500 MPR (ETSI only) devices, see Procedure 70-5.
- For VLL Fpipe services, see Procedure 70-6.
- For VLL Hpipe services, see Procedure 70-7.
- For VLL Ipipe services, see Procedure 70-8.
- For VLL Cpipe services:
  - For all devices that support the creation of a VLL service except for 9500 MPR devices, see Procedure 70-9.
  - For 9500 MPR (ETSI and ANSI) devices, see Procedure 70-10.

ii Specify the devices (sites) used in the service based on the following topologies:

- Traditional VLL: terminating site only
- Switching VLL: switching site with two or more terminating sites
- Redundant VLL: ICB spoke to MC-LAG (Epipe) or MC-APS (for Apipe and Epipe)

iii Specify the following information for redundant VLL services:

- endpoints
- access interfaces for VLL terminating sites

iv Specify the following information to create a VLL Apipe or Epipe HSDPA offload fallback solution:

- endpoints
- SAP on endpoint one with MC-APS or ATM channel
- spoke SDP with ICB on endpoint one
- spoke SDP with primary precedence on endpoint two
- SAP on endpoint two with MC-APS
- spoke SDP with ICB on endpoint two

v Specify aggregation on a service basis, or across a card or port.

vi Specify QoS, scheduling, accounting, ANCP, MEP association and filter policies.

vii Specify the time of day suite.

2 For VLL services created on a 9500 MPR or OmniSwitch, if required:

a Create VLAN groups and add members to each group as required. See Procedure 69-10.

b Delete a VLAN group or group member. See Procedure 69-11.

3 For VLL services created on a 9500 MPR, if required:

a Create the VLAN paths that are required between the 9500 MPR group members. The VLAN path can be hop based or ring based. See Procedure 69-12.

b Delete a 9500 MPR VLAN path. See Procedure 69-13.

c Fix a failed cross-connection in a 9500 MPR Cpipe. See Procedure 70-11.

4 Turn up the service.

5 Perform one or more of the following as required.

a Configure a GNE site on a VLL service. See Procedure 70-12.

b Create a VLL L2 access interface on a terminating site. See Procedure 70-13.

c Create a SAP aggregation group for a 7705 SAR Apipe. See Procedure 70-14.

d Create an HSDPA resiliency configuration. See Procedure 70-15.

e Activate and manually operate an HSDPA resiliency configuration. See Procedure 70-16.

f Run an OAM validation test for a VLL service. See Procedure 70-17.

6 As required, view VLL information:

  a View the service topology map associated with a VLL service. See Procedure 70-18.

  b View the VLL service operational status. See Procedure 70-19.

  c View the peer status information associated with the VLL service. See Procedure 70-20.

7 As required, modify a VLL service:

  a Using the Manage Services form. See Procedure 70-21.

  b Using the topology view. See Procedure 70-22.

8 As required, delete a VLL service. See Procedure 70-23.

70.4 VLL service management procedures

Use the following procedures to perform VLL service creation and management task

Procedure 70-1 To create a VLL Epipe service

1 Choose Create→Service→VLL→Epipe (Ethernet to Ethernet/ATM/FR/CEM) from the 5620 SAM main menu. The Epipe Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL Epipe service. The Select Customer - Epipe Service form opens.

3 Choose a customer for the VLL service and click on the OK button. The Select Customer - Epipe Service form closes and the Epipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Default VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.
  The CAC Status, CAC Probable Cause, and Last CAC Time fields are visible if service CAC has been configured. See step 48 for more information. The Last CAC Time field displays the last time that a CAC verify or CAC audit was run.

5 To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

i Click on the 5670 RAM Parameters tab button.

ii Click on the General tab button.

iii Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name

6 Perform one of the following:

a Choose a site for the VLL service. Go to step 7.

b Complete the VLL service creation if the sites and interfaces are to be created later. Go to step 52.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

7 On the navigation tree, right-click on VLL Epipe and choose Create Epipe Site. The Select Network Elements - VLL Epipe form opens with a list of available sites.

8 Choose a site and click on the OK button. The Site (Create) form opens with the General tab displayed.

9 Configure the parameters:

- Name
- Description
- MTU
- MTU Check
- Administrative State
- Monitor Access Interface Operational State
- Per Service Hashing for LAG Enabled
- VLL Site Type
- Tunnel Fault Notification

The VLL Site Type parameter is configurable only on the 7450 ESS, 7710 SR, and 7750 SR.

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault propagation from the facility tunnel MEP.

10 Click on the Apply button.

11 Perform one of the following:

a Link the site to a Backbone VPLS. Go to step 12.

b Create endpoints for a redundant VLL. Go to step 14.

Note — Redundant VLL Epipe services are configurable on the 7705 SAR, 7450 ESS, 7750 SR, and 7710 SR.

c Create an L2 access interface for the VLL terminating site. Perform Procedure 70-13.

d Create a spoke SDP binding for the site. Go to step 20.

e Create a spoke SDP FEC for the site. Go to step 41.

f Complete site creation. Go to step 49.

12 Choose the Backbone VPLS site to link the Epipe service to. For additional information on Provider Backbone Bridging, see chapter 71.

i Click on the Backbone tab button.

ii Click on the Select button. The Select Backbone VPLS Site - Site form is displayed.

iii Click the Search button. A list of all the B-Sites that can be used by the Epipe is displayed. You can narrow the search by using the using the filtered properties shown in the form.

Note — The B-Sites listed are only those that are on the same node as the Epipe site.

iv Choose a B-VPLS and click on OK. The Select Backbone VPLS Site - Site form closes and the Service ID of the chosen B-VPLS appears on the Site (Create) form.

Note — The selection of a B-Site in this step must be repeated for both Epipe sites you create. You must select a B-Site that is on the same node as the Epipe site you are creating.

v In the PBB block, configure the following parameters:

- ISID
- Destination MAC Address or MAC Name

Note 1 — The ISID parameter should be set to the same value for both Epipe sites you create for this service.

Note 2 — To select a previously created Mac Name, click on the Select button and select a MAC Name from the list in the Select MAC Destination MAC Address Alias window. See Procedure 17-10 for more information on how to create a MAC Name.

Note 3 — The Destination MAC Address or MAC Name parameter you set for this Epipe site should be the same as the Source MAC Address of the B-Site on the other node of the Epipe service you are creating.

vi Configure the Force Q Tag Forwarding parameter.

vii Click on Apply. The Operational Destination MAC Address is updated with the configured Destination MAC Address or MAC Address associated with the selected MAC Name.

13 If you are creating an Epipe service linked to a Backbone VPLS go to step 18.

14 On the navigation tree, right-click on Endpoints and choose Create Endpoints. The Endpoint (Create) form opens.

15 Configure the parameters:

- Name
- Description
- Revert Time (second)
- Active Hold Delay (100s of milliseconds)
- Enable PW Standby Signaling Master
- Enable PW Standby Signaling Slave

16 Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears.

Repeat steps 14 through 16 for each endpoint in the VLL service.

17 Click on the Apply button.

18 Perform one of the following:

a Create an L2 access interface for the VLL terminating sites. Perform Procedure 70-13.

Note 1 — If you are configuring access dual-homing with local switching over PBB tunnels, you must configure two L2 access interfaces. The L2 access interfaces can be on LAGs that participate in the MC LAG, or they can be just regular or Ethernet tunnel access interfaces.

Note 2 — If the Use SAP Backbone MAC Address parameter is enabled on both B-Sites then:

- MC-LAG access interfaces for the PBB Epipe local switching must be on IOM3 MDAs for the feature to work properly. There is no 5620 SAM or CLI validation.
- Other access interfaces may be on IOM1 or IOM2 MDAs.

b Create a spoke SDP binding for the site. Go to step 20.

c Complete site creation. Go to step 49.

19 If you are creating an Epipe service linked to a Backbone VPLS go to step 49.

20 On the navigation tree, right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding (Create) form opens with the General tab displayed.

21 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

22 Configure the parameters:

- Description
- Auto-Assign ID
- VC ID
- VC Type
- VLAN VC Tag
- Ingress Label
- Egress Label

23 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto-Select Transport Tunnel parameter is enabled, 5620 SAM obeys the following conditions:

- Tunnels that do not meet the bandwidth requirements are never selected.
- When more than one tunnel meets the bandwidth requirements, the tunnel with the most available bandwidth is selected.
- When two tunnels meets the bandwidth requirements and have the same available bandwidth, the tunnel with the fewest SDP bindings on it is selected.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

Note — 5620 SAM will block the manual selection of a tunnel with insufficient bandwidth if the following condition is set in the nms-server.xml file:

<vll-CAC enforceTunnelBandwidth="true"/>

The condition is false by default. If it is left as false, 5620 SAM will not block the manual selection of a tunnel with insufficient bandwidth, but the State Cause flag "Insufficient Bandwidth To Allocate To SDP Binding" will be raised.

Refer to Chapter 6 for related notes on modifying the nms-server.xml file. It is recommended that you contact your Alcatel-Lucent technical support representative before modifying this file, since this action can have serious consequences.

24 If you are creating redundant SDP bindings, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to select an endpoint for the transport tunnel. The drop-down menu displays the available endpoints.

ii Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State

25 When you set the Precedence parameter to 0, you can configure a secondary SAP on an ATM interface, MC-APS, or APS for HSPDA offload fallback.

26 Configure the parameters:

- Enable Hash Label
- Enable Signal Capability
- Enable PW Status Signaling
- Enable PW Standby Signaling Slave
- Force VLAN VC Forwarding
- SDP Admin Bandwidth

27 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Click on the Return tab button.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto Select Return Transport Tunnel parameter is enabled, 5620 SAM will consider and use a portion of the bandwidth you specified when setting the SDP Admin Bandwidth parameter in step 26.

b Configure the transport tunnel manually.

i Click on the Return tab button.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

28 Click on Select in the Return SDP Binding Endpoint panel to choose a Return Endpoint on the terminating site. Select the required endpoint from the drop-down list that appears.

29 Choose an Application Profile for the spoke SDP binding.

i Click on the Select button next to the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of Application Profiles appears.

iii Choose an application profile from the list and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding - VLL service form displays only local profiles on the NE.

30 Associate an AA transit prefix policy with the service object, if required.

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit IP policy and click on the OK button.

31 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Name
- Subscriber Class
- Subscriber Type
- Total Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

32 Click on the States tab button.

33 Configure the Administrative State parameter.

34 Click on the Pseudowire OAM tab button.

35 Configure the Control Word parameter.

36 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.

iii Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.

v Choose an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the egress ACL filter information displayed.

vi Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - Spoke SDP Binding form opens.

vii Choose an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the IPv6 ingress ACL filter information displayed.

viii Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - Spoke SDP Binding form opens.

ix Choose an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the IPv6 egress ACL filter information displayed.

37 Assign an accounting policy to the SDP binding, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Spoke SDP Binding form opens.

iv Choose an accounting policy and click on the OK button. The Select Accounting Policy - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the accounting policy information displayed.

38 Associate a MEP to the spoke SDP binding, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens on the General tab.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- CCM Messages Enabled
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step x.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab button.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The MEP (Create) form closes.

39 Click on the OK button. The Spoke SDP Binding form closes and a dialog box appears.

40 Click on the OK button. The Site (Create) form reappears with the new spoke SDP binding information displayed in the service navigation tree.

A VLL with spoke switching requires that there is a switching site and two or more terminating sites. Repeat steps 20 through 40 to define the sites required for your VLL configuration.

41 On the navigation tree, right-click on Spoke SDP FECs and choose Create Spoke SDP FEC. The Spoke SDP FEC (Create) form opens. Complete steps 42 through 47 to configure a spoke SDP FEC.

42 Configure the PW ID parameter or enable the Auto-Assign ID parameter.

43 On the Source panel, do the following:

i Click on the Select button next to the SAII Address field and select an SAII address.

ii Configure the SAII AC ID parameter.

44 On the Target panel, do one of the following:

a Configure the Auto Config parameter.

b Do the following:

i Click on the Select button next to the TAII Address field and select a TAII address.

ii Configure the TAII AC ID parameter.

45 On the General Parameters panel, do the following:

i Configure the parameters.

- Administrative State
- Signalling Type
- Retry Timer
- Retry Counter

ii Click on the Select button next to the Path field and select a path.

iii Click on the Select button next to the PW Template field and select a PW template.

46 On the Redundancy panel, do the following:

i Click on the Select button next to the Endpoint field and select an endpoint.

ii Configure the parameters.

- Inter-Chassis Backup
- Precedence
- Active State

47 On the Pseudowire Signalling panel, configure the Enable PW Standby Signaling Slave parameter.

48 To configure bandwidth for the service if required, click on the Bandwidth tab and proceed as follows:

Note — The Bandwidth tab is only available if service CAC is configured; see chapter 6 for information about enabling and disabling service CAC.

i For each CoS, enter the value for the Reserved Bandwidth, as required.

ii Click on the General tab to determine the CAC status.

If the Verify CAC button is enabled, the CAC has not been verified. The Probable Cause and CAC Status fields provide details.

The CAC Status field describes the current CAC status of the service. CAC statuses are as follows.

- CAC Verified indicates that all tunnels have sufficient bandwidth to admit service and that requested bandwidth for the service is booked on the appropriate physical links.
- CAC Failed indicates that the attempt made to admit service into the network was unsuccessful. The most likely cause for this is insufficient bandwidth. See the Probable Cause field for more specific information.
- BW Defined, No CAC Request indicates that the required bandwidth is defined on the service; however, a CAC request has not occurred.
- CAC To be Verified indicates that a tunnel has been configured on the service either manually or through the CLI; however, the required bandwidth has not been verified in the network.

The Probable Cause field describes possible reasons for the current CAC state. Probable causes are as follows.

- No Candidate Tunnels Found indicates that the autobind tunnel function was found, but no suitable tunnels were found.
- Different PBB Tunnels Applied to Service indicates that two or more different PBB tunnels are configured on this service.
- Not Enough Bandwidth on any Candidate Tunnels indicates that one or more candidate tunnels were found, but the available bandwidth was insufficient to admit the service.
- Automatic PBB Tunnel Selection Failed indicates that a suitable PBB tunnel was found, but there were errors when attempting to assign the tunnel to the service. A dialog box will provide more details.
- Site Missing Tunnel indicates that at least one selected site is not configured with a PBB tunnel.
- All PBB Tunnels have not been Verified indicates that all sites within the service have a tunnel configured, but the available bandwidth has not been booked or verified in the network.

iii To manually verify the CAC, click on the Verify CAC button if it is enabled. The 5620 SAM will attempt to find the most appropriate PBB tunnel for the service-based on available bandwidth, and to automatically bind the tunnel to the service if one has not already been assigned.

49 Click on the OK button. The Site (Create) form closes and a dialog box appears.

50 Click on the OK button. The VLL Epipe (Create) form reappears with the new information displayed in the service navigation tree.

51 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 7 to 50.

b Complete service creation. Go to step 52.

52 Click on the OK button. The VLL Epipe (Create) form closes.

You can use the topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-2 To create a VLL Epipe service on a 7210 SAS device

1 Choose Create→Service→VLL→Epipe (Ethernet to Ethernet/ATM/FR/CEM) from the 5620 SAM main menu. The Epipe Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL service. The Select Customer - Epipe Service form opens.

3 Choose a customer for the VLL service and click on the OK button. The Select Customer - Epipe Service form closes and the Epipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Default VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.

5 To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

i Click on the 5670 RAM Parameters tab button.

ii Click on the General tab button.

iii Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name

6 On the navigation tree, right-click on VLL Epipe and choose Create Site. The Select Network Elements - VLL Epipe form opens with a list of available sites.

7 Perform one of the following:

a Choose a 7210 SAS and click on the OK button. The Site (Create) form opens with the General tab displayed. Continue to step 8.

b Choose a non-7210 SAS terminating site that is physically connected to the 7210 SAS by a port or a LAG and click on the OK button. The Site (Create) form opens with the General tab displayed. Go to step 13.

Note — The non-7210 SAS terminating sites typically are a 7450 ESS, 7750 SR, or 7710 SR.

8 Configure the parameters:

- Name
- Description
- MTU
- MTU Check
- Administrative State
- SAP Type
- Monitor Access Interface Operational State
- PBB Epipe

The PBB Epipe parameter is only configurable on the 7210 SAS-M and 7210 SAS-X.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button.

11 If you enabled the PBB Epipe parameter in step 8, choose the Backbone VPLS site to link the Epipe service to. For additional information on Provider Backbone Bridging, see chapter 71.

i Click on the Backbone tab button.

ii Click on the Select button. The Select Backbone VPLS Site - Site form is displayed.

iii Click the Search button. A list of all the B-Sites that can be used by the Epipe is displayed. You can narrow the search by using the using the filtered properties shown in the form.

Note — The B-Sites listed are only those that are on the same node as the Epipe site.

iv Choose a B-VPLS and click on OK. The Select Backbone VPLS Site - Site form closes and the Service ID of the chosen B-VPLS appears on the Site (Create) form.

Note — The selection of a B-Site in this step must be repeated for both Epipe sites you create. You must select a B-Site that is on the same node as the Epipe site you are creating.

v In the PBB block, configure the following parameters:

- ISID
- Destination MAC Address or MAC Name

Note 1 — The ISID parameter should be set to the same value for both Epipe sites you create for this service.

Note 2 — To select a previously created Mac Name, click on the Select button and select a MAC Name from the list in the Select MAC Destination MAC Address Alias window. See Procedure 17-10 for more information on how to create a MAC Name.

Note 3 — The Destination MAC Address or MAC Name parameter you set for this Epipe site should be the same as the Source MAC Address of the B-Site on the other node of the Epipe service you are creating.

vi Click on Apply. The Operational Destination MAC Address is updated with the configured Destination MAC Address or MAC Address associated with the selected MAC Name.

12 Go to step 14.

13 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- VLL Site Type

You can only configure the VLL Site Type parameter when the terminating site is a 7450 ESS, 7710 SR, or 7750 SR.

Note — The site must be exclusively terminating, when physically connected to the 7210 SAS.

14 On the navigation tree, right-click on Access Interfaces below the site and choose Create L2 Access Interface. The L2 Access Interface (Create) form opens with the General tab displayed.

Note — If 7210 SAS-D 6F 4T ETR or 7210 SAS-E sites are connected in a ring network, you must configure an Uplink SAP between the sites.

15 Configure the parameters:

- Description
- Administrative State

16 Click on the Port tab button.

17 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

18 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

19 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Transit SAP

20 Click on the OK button. A dialog box appears.

21 Click on the Yes button.

22 The L2 Access Interface (Create) form closes.

23 Close the Epipe Service (Create) form.

Procedure 70-3 To create a VLL Epipe service on the 9500 MPR (ANSI only)

1 Choose Create→Service→9500 VLL→Epipe (ETH to Eth) from the 5620 SAM main menu. The Epipe Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the Epipe service. The Select Customer - Epipe Service form opens.

3 Choose the Default Customer as the customer for the Epipe service and click on the OK button. The Select Customer - Epipe Service form closes and the Epipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Priority
- Specify VLAN Path
- OLC State
  This parameter is configurable when you click on the Apply button.

5 To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

i Click on the 5670 RAM Parameters tab button.

ii Click on the General tab button.

iii Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name

6 Click on the main General tab button.

7 Click on the Select button to choose a VLAN path to associate with the Epipe service. The Select VLAN Path - Epipe Service form opens.

Note — If no VLAN path exists, see Procedure 69-12 for more information about how to create VLAN paths.

8 Choose a VLAN path to use for the service and click on the OK button. The Select VLAN Path - Epipe Service form closes and the Epipe Service (Create) form reappears with the VLAN path information displayed on the General tab.

9 Configure the parameters:

- Auto-Assign ID
- VLAN ID

The VLAN ID parameter is enabled when the Auto-Assign ID parameter is disabled.

Note — The CEM to Eth Service Class is set automatically and is read-only.

10 Configure the parameter:

- Clock Source

11 On the navigation tree, right-click on an Epipe Site and choose Create Epipe Site. The Epipe Site (Create) form opens with the General tab displayed.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

12 Configure the parameters:

- Name
- Description

13 On the navigation tree, right-click on the Access Interfaces and choose Create L2 Access Interface. The L2 Access Interface (Create) form opens with the General tab displayed.

14 Configure the parameters:

- Name
- Auto-Assign ID
- Mac Address
- Monitor Access Interface Operational State

15 Click on the Port tab button.

16 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

Note — The form lists Ethernet ports in access mode.

17 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

18 Click on the OK button. A dialog box appears.

19 Click on the OK button. The L2 Access Interface (Create) form closes, and the Epipe Site (Create) form reappears with the new interface information displayed in the service navigation tree.

20 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 11 to 17.

b Complete service creation. Go to step 21.

Note 1 — The backhaul service is extended to include the far end points when the 9500 MPR is paired with the 7705 SAR or 7210 SAS nodes. These nodes are called Termination Points (TPs). The far end node could be any of the above nodes which are fully managed by the 5620 SAM. The TP is a permanent object of an 9500 MPR VLL; when the service is within the 9500 MPR network, the TP would point to SAPs on the 9500 MPR, when the services are extended or terminated on other nodes then it points to the far end points of the 7705 SAR or 7210 SAS devices. The TPs improve alarm aggregation or correlation and they would be displayed in the service topology.

Note 2 — Whenever a non-MPR node is connected to the 9500 MPR through a physical link, you can change the mode of the 9500 MPR Ethernet port from Access to Network. However, if the 9500 MPR port is part of the L2 Access interface, then the mode cannot be changed from Access to Network.

21 Click on the OK button. The VLL Epipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-4 To create a VLL Apipe service

VLL Apipe services are configurable only on the 7450 ESS in mixed mode, 7750 SR, 7710 SR, and 7705 SAR.

1 Choose Create→Service→VLL→Apipe (ATM to ATM/FR) from the 5620 SAM main menu. The Apipe Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL service. The Select Customer - Apipe Services form opens.

3 Choose a customer for the VLL service and click on the OK button. The Select Customer - Apipe Service form closes and the Apipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
- Auto-Assign ID
- SVC Mgr Service ID
- Default VC ID
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- VC Type
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
- Transport Type
- OLC State

The Service ID and SVC Mgr Service ID parameters are configurable when the Auto-Assign ID parameter is disabled. The Default VC ID parameter is configurable when the Inherit Service ID Value parameter is disabled. The Profile Name parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled. The Transport Type parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank. The OLC State parameter is configurable when you click on the Apply button.

5 Perform one of the following:

a Create a site for the VLL. Go to step 6.

b Complete VLL creation if sites and interfaces are to be created later. Go to step 32.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

6 On the navigation tree, right-click on VLL Apipe and choose Create Apipe Site. The Select Network Elements - VLL Apipe form opens with a list of available sites.

7 Choose a site and click on the OK button. The Site (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- VLL Site Type
- Interworking Type
- Signalling VC Type Override

The VLL Site Type parameter is configurable only on the 7450 ESS and 7750 SR.

9 Perform one of the following:

a Create endpoints for a redundant VLL. Go to step 10.

Note — Redundant VLL Apipe services are configurable on the 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR.

b Create an L2 access interface for the VLL terminating site. Perform Procedure 70-13.

c Create a spoke SDP binding for the site. Go to step 15.

d Complete site creation. Go to step 33.

10 On the navigation tree, right-click on Endpoints and choose Create Endpoint. The Endpoint (Create) form opens.

11 Configure the parameters:

- Name
- Description
- Revert Time (second)
- Active Hold Delay (100s of milliseconds)

12 Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears.

Repeat steps 10 through 12 for each endpoint in the VLL service.

13 Click on the Apply button.

14 Perform one of the following:

a Create an L2 access interface for the VLL terminating sites. Perform Procedure 70-13.

b Create a SAP aggregation group with L2 access interfaces for the VLL terminating sites. Perform Procedure 70-14.

c Create a spoke SDP binding for the site. Go to step 15.

d Complete site creation. Go to step 33.

15 On the navigation tree, right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding form opens with the General tab displayed.

16 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

17 Configure the parameters:

- Auto-Assign ID
- VC ID
- Ingress Label
- Egress Label
- SDP Admin Bandwidth

18 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto-Select Transport Tunnel parameter is enabled, 5620 SAM obeys the following conditions:

- Tunnels that do not meet the bandwidth requirements are never selected.
- When more than one tunnel meets the bandwidth requirements, the tunnel with the most available bandwidth is selected.
- When two tunnels meets the bandwidth requirements and have the same available bandwidth, the tunnel with the fewest SDP bindings on it is selected.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

Note — 5620 SAM blocks the manual selection of a tunnel with insufficient bandwidth if the following condition is set in the nms-server.xml file:

<vll-CAC enforceTunnelBandwidth="true"/>

The condition is false by default. If it is left as false, 5620 SAM will not block the manual selection of a tunnel with insufficient bandwidth, but the State Cause flag "Insufficient Bandwidth To Allocate To SDP Binding" will be raised.

Refer to Chapter 6 for related notes on modifying the nms-server.xml file. It is recommended that you contact your Alcatel-Lucent technical support representative before modifying this file, since this action can have serious consequences.

19 If you are creating redundant SDP bindings, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to select an endpoint for the transport tunnel. The drop-down menu displays the available endpoints.

ii Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State

20 When you set the Precedence parameter to 0, you can configure a secondary SAP on an ATM interface, MC-APS, or APS for HSPDA offload fallback.

21 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Click on the Return tab button.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto Select Return Transport Tunnel parameter is enabled, 5620 SAM will consider and use a portion of the bandwidth you specified when setting the SDP Admin Bandwidth parameter in step 17.

b Configure the transport tunnel manually.

i Click on the Return tab button.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

22 Click on Select in the Return SDP Binding Endpoint panel to choose a Return Endpoint on the terminating site. Select the required endpoint from the drop-down list that appears.

23 Click on the States tab button.

24 Configure the Administrative State parameter.

25 Click on the Pseudowire OAM tab button.

26 Configure the Control Word parameter.

If you set the VC Type parameter to ATM-SDU in step 4, you must set the Control Word parameter to Preferred.

27 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

28 Click on the OK button. The Site (Create) form reappears with the new spoke SDP binding information displayed in the service navigation tree.

29 Click on the OK button. The Site (Create) form closes and a dialog box appears.

30 Click on the OK button. The VLL Apipe (Create) form reappears with the new information displayed in the service navigation tree.

31 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 6 to 30.

b Complete service creation. Go to step 32.

32 Click on the OK button. The VLL Apipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

33 If required, modify the SDP binding parameters for ATM cell concatenation.

i Open and modify the Apipe configuration form, as described in Procedure 70-21.

ii Click on the Spoke SDP Binding tab.

iii Choose a SDP binding from the list and click on the Properties button.

iv Click on the ATM tab.

v Configure the parameters:

- AAL5 Frame Aware
- Admin Concat Limit
- Max Concat Delay
- CLP Change

vi Save the changes and close the Apipe configuration form.

Procedure 70-5 To create a 9500 MPR Apipe service (ETSI only)

1 Choose Create→Service→9500 VLL→Apipe (ATM to ATM/Eth) from the 5620 SAM main menu. The Apipe Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the Apipe service. The Select Customer - Apipe Service form opens.

3 Choose the Default Customer as the customer for the Apipe service and click on the OK button. The Select Customer - Apipe Service form closes and the Apipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Priority
- Specify VLAN Path
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Click on the Select button to choose a VLAN path to associate with the Apipe service. The Select VLAN Path - Apipe Service form opens.

6 Choose a VLAN path to use for the service and click on the OK button. The Select VLAN Path - Apipe Service form closes and the Apipe Service (Create) form reappears with the VLAN path information displayed on the General tab.

Note — If no VLAN path exists, see Procedure 69-12 for more information about how to create VLAN paths.

7 Configure the parameters:

- VLAN ID
- Auto-Assign ID
- Service Class
- PW Label
- Auto-Assign ID
- VC Type

The VLAN ID and PW Label parameters are enabled when the Auto-Assign ID parameters are disabled.

8 If you specified the ATM to Eth option in step 7, configure the MAC Address parameter.

9 On the navigation tree, right-click on an Apipe Site. The Apipe Site (Create) form opens with the General tab displayed.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

10 Configure the parameters:

- Name
- Description

11 On the navigation tree, right-click on the Access Interfaces and choose Create L2 Access Interface. The L2 Access Interface (Create) form opens with the General tab displayed.

12 Configure the parameters:

- Name
- Description

13 Click on the Port tab button.

14 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

15 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

Note 1 — If ports on a card slot of the 2+2 x Ethernet (EAS) card are used to create the Apipe service, first configure the Profile Name parameter on the card slot. See Procedure 20-29 for more information on configuring this parameter.

Note 2 — If MPT-MC or MPT-HC ports are being used as network ports on the 2+2 x Ethernet (EAS) card, then the peer MAC Address must be specified for the L2 Access Interface.

16 Do one of the following.

a If you selected a value of VCC for the VC Type parameter, go to step 17.

b If you selected a value of VPC for the VC Type parameter, go to step. 19.

17 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value (VCI)
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)

18 Go to step 20.

19 Configure the parameters:

- Outer Encapsulation Value
- Outer Encapsulation Value (VPI)

20 Click on the ATM tab button.

21 Click on the Select button to choose an Ingress ATM Policy. The Select Ingress ATM Policy - ATM Configuration form opens.

22 Use the configurable filter and Search button to choose a policy, and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the L2 Access Interface (Create) form displays the policy information.

23 Click on the Select button to choose an Egress ATM Policy. The Select Egress ATM Policy - ATM Configuration form opens.

24 Use the configurable filter and Search button to choose a policy, and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the L2 Access Interface (Create) form displays the policy information.

25 Click on the OK button. A dialog box appears.

26 Click on the OK button. The L2 Access Interface (Create) form closes, and the Apipe Site (Create) form reappears with the new interface information displayed in the service navigation tree.

27 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 11 to 20.

b Complete service creation. Go to step 28.

28 Click on the OK button. The VLL Apipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Note — In case of a service creation failure and/or generated NE inconsistencies, see Procedure 37-21.

Procedure 70-6 To create a VLL Fpipe service

1 Choose Create→Service→VLL→Fpipe (FR to FR) from the 5620 SAM main menu. The VLL Fpipe (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL service. The Select Customer - VLL Fpipe form opens.

3 Choose a customer for the VLL service and click on the OK button. The Select Customer - VLL Fpipe form closes and the VLL Fpipe (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Default VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- VC Type
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Perform one of the following:

a Create a site for the VLL. Go to step 6.

b Complete VLL creation if sites and interfaces are to be created later. Go to step 31.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

6 On the navigation tree, right-click on VLL Fpipe and choose Create Fpipe Site. The Select Network Elements - VLL Fpipe form opens with a list of available sites.

7 Choose a site and click on the OK button. The Site (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- VLL Site Type

The VLL Site Type parameter is configurable only on the 7450 ESS, 7750 SR, and 7705 SAR.

9 Perform one of the following:

- **a** Create endpoints for a redundant VLL. Go to step 10.
- **b** Create an L2 access interface for the VLL terminating site. Perform Procedure 70-13.
- **c** Create a spoke SDP binding for the site. Go to step 15.
- **d** Complete site creation. Go to step 33.

10 On the navigation tree, right-click on Endpoints and choose Create Endpoint. The Endpoint (Create) form opens.

11 Configure the parameters:

- Name
- Description
- Revert Time (second)
- Active Hold Delay (100s of milliseconds)

12 Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears.

Repeat steps 10 through 12 for each endpoint in the VLL service.

13 Click on the Apply button.

14 Perform one of the following:

- **a** Create an L2 access interface for the VLL terminating sites. Perform Procedure 70-13.
- **b** Create a spoke SDP binding for the site. Go to step 15.
- **c** Complete site creation. Go to step 33.

15 On the navigation tree, right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding form opens with the General tab displayed.

16 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

17 Configure the parameters:

- Description
- Auto-Assign ID
- VC ID
- Ingress Label
- Egress Label

18 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto-Select Transport Tunnel parameter is enabled, 5620 SAM obeys the following conditions:

- Tunnels that do not meet the bandwidth requirements are never selected.
- When more than one tunnel meets the bandwidth requirements, the tunnel with the most available bandwidth is selected.
- When two tunnels meets the bandwidth requirements and have the same available bandwidth, the tunnel with the fewest SDP bindings on it is selected.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

Note — 5620 SAM will block the manual selection of a tunnel with insufficient bandwidth if the following condition is set in the nms-server.xml file:

<vll-CAC enforceTunnelBandwidth="true"/>

The condition is false by default. If it is left as false, 5620 SAM will not block the manual selection of a tunnel with insufficient bandwidth, but the State Cause flag "Insufficient Bandwidth To Allocate To SDP Binding" will be raised.

Refer to Chapter 6 for related notes on modifying the nms-server.xml file. It is recommended that you contact your Alcatel-Lucent technical support representative before modifying this file, since this action can have serious consequences.

19 If you are creating redundant SDP bindings, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to select an endpoint for the transport tunnel. The drop-down menu displays the available endpoints.

ii Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State

20 Configure the parameters:

- Enable Hash Label
- Enable Signal Capability
- SDP Admin Bandwidth

21 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Click on the Return tab button.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto Select Return Transport Tunnel parameter is enabled, 5620 SAM will consider and use a portion of the bandwidth you specified when setting the SDP Admin Bandwidth parameter in step 20.

b Configure the transport tunnel manually.

i Click on the Return tab button.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

22 Click on Select in the Return SDP Binding Endpoint panel to choose a Return Endpoint on the terminating site. Select the required endpoint from the drop-down list that appears.

23 Click on the States tab button.

24 Configure the Administrative State parameter.

25 Click on the Pseudowire OAM tab button.

26 Configure the Control Word parameter.

If you set the VC Type parameter to FR-DLCI in step 4, you must set the Control Word parameter to Preferred.

27 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.

iii Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.

v Choose an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the egress ACL filter information displayed.

28 Click on the OK button. The Spoke SDP Binding form closes and a dialog box appears.

29 Click on the OK button. The Site (Create) form reappears with the new information displayed in the service navigation tree.

30 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 6 to 29.

b Complete service creation. Go to step 31.

31 Click on the OK button. A dialog box appears.

32 Click on the OK button. The VLL Fpipe (Create) form reappears.

33 Click on the OK button. The VLL Fpipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-7 To create a VLL Hpipe service

VLL Hpipe services are configurable only on the 7705 SAR and 7705 SAR-M (version 5.0 and later).

In order to configure a VLL Hpipe service on a supporting NE, the daughter card MDA Mode must be set to cem-fr-hdlc-ppp. For more information, see Procedure 19-24. Only ports that are configured with an Encap Type of HDLC can be mapped to an Hpipe SAP. For more information, see Procedure 20-1.

1 Choose Create→Service→VLL→Hpipe (HDLC to HDLC) from the 5620 SAM main menu. The Hpipe Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL Hpipe service. The Select Customer - Hpipe Service form opens.

3 Choose a customer for the VLL Hpipe service and click on the OK button. The Select Customer - Hpipe Service form closes and the Hpipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Default VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- VC Type
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Perform one of the following:

a Create a site for the Hpipe. Go to step 6.

b Complete Hpipe creation if sites and interfaces are to be created later. Go to step 28.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

6 On the navigation tree, right-click on Hpipe Service and choose Create Hpipe Site. The Select Network Elements - Hpipe form opens with a list of available sites.

7 Choose a site and click on the OK button. The Hpipe Site (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Name
- Description
- MTU
- MTU Check
- Administrative State
- Monitor Access Interface Operational State
- VLL Site Type

9 Perform one of the following:

a Create endpoints for a redundant VLL. Go to step 10.

b Create an L2 access interface for the VLL terminating site. Perform Procedure 70-13.

c Create a spoke SDP binding for the site. Go to step 14.

d Complete site creation. Go to step 30.

10 Click on the Endpoints tab and then click on the Create button. The Endpoint (Create) form opens.

11 Configure the parameters:

- Name
- Description
- Revert Time (second)
- Enable PW Standby Signaling Master
- Enable PW Standby Signaling Slave

12 Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears.

Repeat steps 10 through 12 for each endpoint in the VLL service.

13 Click on the Apply button.

14 Click on the Spoke SDP Bindings tab and then click on the Create button. The Spoke SDP Binding form opens with the General tab displayed.

15 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

16 Configure the parameters:

- VC ID
- Auto-Assign ID
- Ingress Label
- Egress Label

17 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto-Select Transport Tunnel parameter is enabled, 5620 SAM obeys the following conditions:

- Tunnels that do not meet the bandwidth requirements are never selected.
- When more than one tunnel meets the bandwidth requirements, the tunnel with the most available bandwidth is selected.
- When two tunnels meets the bandwidth requirements and have the same available bandwidth, the tunnel with the fewest SDP bindings on it is selected.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

Note — 5620 SAM will block the manual selection of a tunnel with insufficient bandwidth if the following condition is set in the nms-server.xml file:

<vll-CAC enforceTunnelBandwidth="true"/>

The condition is false by default. If it is left as false, 5620 SAM will not block the manual selection of a tunnel with insufficient bandwidth, but the State Cause flag "Insufficient Bandwidth To Allocate To SDP Binding" will be raised.

Refer to Chapter 6 for related notes on modifying the nms-server.xml file. It is recommended that you contact your Alcatel-Lucent technical support representative before modifying this file, since this action can have serious consequences.

18 If you are creating redundant SDP bindings, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to select an endpoint for the transport tunnel. The drop-down menu displays the available endpoints.

ii Configure the parameters:

- Precedence
- Active State

19 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab button does not appear.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Click on the Return tab button.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto Select Return Transport Tunnel parameter is enabled, 5620 SAM will consider and use a portion of the bandwidth you specified when setting the SDP Admin Bandwidth parameter in step 20.

b Configure the transport tunnel manually.

i Click on the Return tab button.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

20 Click on Select in the Return SDP Binding Endpoint panel to choose a Return Endpoint on the terminating site. Select the required endpoint from the drop-down list that appears.

21 Click on the States tab button.

22 Configure the Administrative State parameter.

23 Click on the Pseudowire OAM tab button.

24 Configure the Control Word parameter.

If you set the VC Type parameter to HDLC in step 4, you must set the Control Word parameter to Preferred.

25 Click on the OK button. The Spoke SDP Binding form closes and a dialog box appears.

26 Click on the OK button. The Hpipe Site (Create) form reappears with the new information displayed in the service navigation tree.

27 Perform one of the following:

- **a** Create an additional site for the VLL service, if required. Repeat steps 6 to 26.
- **b** Complete service creation. Go to step 28.

28 Click on the OK button. A dialog box appears.

29 Click on the OK button. The VLL Hpipe (Create) form reappears.

30 Click on the OK button. The VLL Hpipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-8 To create a VLL Ipipe service

1 Choose Create→Service→VLL→Ipipe from the 5620 SAM main menu. The Ipipe Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL service. The Select Customer - Ipipe Service form opens.

3 Choose a customer for the VLL service and click on the OK button. The Select Customer - Ipipe Service form closes and the Ipipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Default VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- VC Type
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank.
- Use Bandwidth-Reserved Paths
- OLC State
  This parameter is configurable when you click on the Apply button.

5 To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

i Click on the 5670 RAM Parameters tab button.

ii Click on the General tab button.

iii Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name

6 Perform one of the following:

a Create a site for the VLL. Go to step 7.

b Complete VLL creation if sites and interfaces are to be created later. Go to step 40.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

7 On the navigation tree, right-click on Ipipe Service and choose Create Ipipe Site. The Select Network Elements - Ipipe Service form opens with a list of available sites.

8 Choose a site and click on the OK button. The Ipipe Site (Create) form opens with the General tab displayed.

9 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- VLL Site Type
- Enable CE IP Address Discovery
- Enable IPv6
- Stack Capability Signaling
- Tunnel Fault Notification

The VLL Site Type parameter is configurable only on the 7450 ESS, 7750 SR, and 7705 SAR.

The Enable CE IP Address Discovery parameter is configurable only for VLL terminating sites.

The Enable IPv6 parameter is configurable only when the Enable CE IP Address Discovery parameter is enabled.

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault notification from the facility tunnel MEP.

Note — The IPv6 capability is only supported on the 7450 ESS in mixed mode (chassis mode D and above), 7710 SR (chassis mode C and above), and 7750 SR (chassis mode C, and chassis modes A and B with mixed mode enabled).

The Stack Capability Signaling parameter is configurable only when the Enable IPv6 parameter and the Enable CE IP Address Discovery parameters are enabled.

10 Perform one of the following:

a Create endpoints for a redundant VLL. Go to step 11.

Note — Redundant VLL Ipipe services are configurable only on the 7705 SAR, 7450 ESS, 7710 SR, and 7750 SR.

b Create an L2 access interface for the VLL terminating site. Perform Procedure 70-13.

c Create a spoke SDP binding for the site. Go to step 17.

d Complete site creation. Go to step 36.

11 On the navigation tree, right-click on Endpoints and choose Create Endpoint. The Endpoint (Create) form opens.

12 Configure the parameters:

- Name
- Description
- Revert Time (second)
- Active Hold Delay (100s of milliseconds)

13 Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears.

14 Repeat steps 11 to 13 for each endpoint in the VLL service.

15 Click on the Apply button.

16 Perform one of the following:

a Create an L2 access interface for the VLL terminating sites. Perform Procedure 70-13.

b Create a spoke SDP binding for the site. Go to step 17.

c Complete site creation. Go to step 36.

17 On the navigation tree, right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding (Create) form opens with the General tab displayed.

18 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

19 Configure the parameters:

- Description
- Auto-Assign ID
- VC ID
- VC Type
- Ingress Label
- Egress Label

20 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto-Select Transport Tunnel parameter is enabled, 5620 SAM obeys the following conditions:

- Tunnels that do not meet the bandwidth requirements are never selected.
- When more than one tunnel meets the bandwidth requirements, the tunnel with the most available bandwidth is selected.
- When two tunnels meets the bandwidth requirements and have the same available bandwidth, the tunnel with the fewest SDP bindings on it is selected.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Mesh SDP Binding form opens.

ii Choose a service tunnel for the mesh SDP binding and click on the OK button. The Select Tunnel - Mesh SDP Binding form closes, and the Mesh SDP Binding (Create) form refreshes with the service tunnel identifier.

Note — 5620 SAM will block the manual selection of a tunnel with insufficient bandwidth if the following condition is set in the nms-server.xml file:

<vll-CAC enforceTunnelBandwidth="true"/>

The condition is false by default. If it is left as false, 5620 SAM will not block the manual selection of a tunnel with insufficient bandwidth, but the State Cause flag "Insufficient Bandwidth To Allocate To SDP Binding" will be raised.

Refer to Chapter 6 for related notes on modifying the nms-server.xml file. It is recommended that you contact your Alcatel-Lucent technical support representative before modifying this file, since this action can have serious consequences.

21 If you are creating redundant SDP bindings, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to select an endpoint for the transport tunnel. The drop-down menu displays the available endpoints.

ii Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State

22 Configure the parameters:

- Enable Hash Label
- Enable Signal Capability
- SDP Admin Bandwidth

23 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required:

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Click on the Return tab button.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameters.

Note — When the Auto Select Return Transport Tunnel parameter is enabled, 5620 SAM will consider and use a portion of the bandwidth you specified when setting the SDP Admin Bandwidth parameter in step 22.

b Configure the transport tunnel manually.

i Click on the Return tab button.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Choose a service tunnel for the mesh SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

24 Click on Select in the Return SDP Binding Endpoint panel to choose a Return Endpoint on the terminating site. Select the required endpoint from the drop-down list that appears.

25 Choose an Application Profile for the spoke SDP binding.

- **i** Click on the Select button next to the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.
- **ii** Configure the filter criteria. A list of Application Profiles appears.
- **iii** Choose an application profile from the list and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding service form displays only local profiles on the NE.

26 Associate an AA transit prefix policy with the service object, if required.

- **i** Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.
- **ii** Select a transit IP policy and click on the OK button.

27 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

- **i** Click on the 5670 RAM Parameters tab button.
- **ii** Click on the Reporting tab button.
- **iii** Click on the Create button. The AA Reporting (Create) form opens.
- **iv** Configure the parameters:
  - Customer Name
  - Subscriber Class
  - Total Bandwidth Upstream (Kbps)
  - Class of Service 1 Bandwidth Upstream (Kbps)
  - Class of Service 2 Bandwidth Upstream (Kbps)
  - Class of Service 3 Bandwidth Upstream (Kbps)
  - Class of Service 4 Bandwidth Upstream (Kbps)
  - Subscriber Name
  - Subscriber Type
  - Downstream (Kbps)
  - Downstream (Kbps)
  - Downstream (Kbps)
  - Downstream (Kbps)
  - Downstream (Kbps)
- **v** Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.
- **vi** Click on the General tab button.

28 Click on the States tab button.

29 Configure the Administrative State parameter.

30 Click on the Pseudowire OAM tab button.

31 Configure the Control Word parameter.

32 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

- **i** Click on the ACL tab button.
- **ii** Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.
- **iii** Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the ingress ACL filter information displayed.
- **iv** Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.
- **v** Choose an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the egress ACL filter information displayed.
- **vi** Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - Spoke SDP Binding form opens.
- **vii** Choose an IPv6 ingress filter and click on the OK button. The Select IPv6 Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the IPv6 ingress ACL filter information displayed.
- **viii** Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - Spoke SDP Binding form opens.
- **ix** Choose an IPv6 egress filter and click on the OK button. The Select IPv6 Egress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding form reappears with the IPv6 egress ACL filter information displayed.

33 Click on the Ipipe tab button.

34 Configure the Peer CE IP Address parameter.

35 Click on the OK button. The Spoke SDP Binding form closes and a dialog box appears.

36 Click on the OK button. The Site (Create) form reappears with the new spoke SDP binding information displayed in the service navigation tree.

37 Click on the OK button. The Site (Create) form closes and a dialog box appears.

38 Click on the OK button. The VLL Ipipe (Create) form reappears with the new information displayed in the service navigation tree.

39 Perform one of the following:

- **a** Create an additional site for the VLL service, if required. Repeat steps 7 to 38.
- **b** Complete service creation. Go to step 40.

40 Click on the OK button. The VLL Ipipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-9 To create a VLL Cpipe service

VLL Cpipe services are configurable only on the 7710 SR, 7750 SR, 7705 SAR, 7210 SAS-M, and 7450 ESS devices. Consider the following when creating a VLL Cpipe:

- The Time Slots parameter of the DS0 channel must be configured with at least one time slot.
- Time slots are automatically configured for unstructured E1 and T1 endpoints
- The Clock Source parameter of the DS1 channel must be set to Node-Timed.

1 Choose Create→Service→VLL→Cpipe (CEM to CEM) from the 5620 SAM main menu. The VLL Cpipe Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VLL service. The Select Customer - VLL Cpipe Service form opens.

3 Choose a customer for the VLL service and click on the OK button. The Select Customer - VLL Service Cpipe form closes and the VLL Cpipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Default VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- VC Type
- Automatic SDP Binding/PBB Tunnel Creation
- Profile Name
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic SDP Binding/PBB Tunnel Creation parameter is enabled and the Profile Name parameter is left blank.
- Use Bandwidth-Reserved Paths
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Perform one of the following:

a Create a site for the VLL. Go to step 6.

b Complete VLL creation if sites and interfaces are to be created later. Go to step 31.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

6 On the navigation tree, right-click on VLL Cpipe and choose Create Cpipe Site. The Select Network Elements - VLL Cpipe form opens with a list of available sites.

7 Choose a site and click on the OK button. The Select Network Elements - VLL Cpipe form closes and the Site (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- VLL Site Type

9 Perform one of the following:

a Create endpoints for a redundant VLL. Go to step 10.

b Create an L2 access interface for the VLL terminating site. Perform Procedure 70-13.

c Create a spoke SDP binding for the site. Go to step 15.

d Complete site creation. Go to step 28.

10 On the navigation tree, right-click on Endpoints and choose Create Endpoints. The Endpoint (Create) form opens.

11 Configure the parameters:

- Name
- Description
- Revert Time (second)
- Active Hold Delay (100s of milliseconds)

12 Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears.

Repeat steps 10 to 12 for each endpoint in the VLL service.

13 Click on the Apply button.

14 Perform one of the following:

a Create an L2 access interface for the VLL terminating sites. Perform steps 4 to 33 of Procedure 70-13.

b Create a spoke SDP binding for the site. Go to step 15.

c Complete site creation. Go to step 29.

15 On the navigation tree, right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding form opens with the General tab displayed.

16 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

17 Configure the parameters:

- Auto-Assign ID
- VC ID
- Ingress Label
- Egress Label
- SDP Admin Bandwidth

18 Perform one of the following to specify a transport tunnel for the spoke SDP binding:

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto-Select Transport Tunnel parameter is enabled, 5620 SAM obeys the following conditions:

- Tunnels that do not meet the bandwidth requirements are never selected.
- When more than one tunnel meets the bandwidth requirements, the tunnel with the most available bandwidth is selected.
- When two tunnels meets the bandwidth requirements and have the same available bandwidth, the tunnel with the fewest SDP bindings on it is selected.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Mesh SDP Binding form opens.

ii Choose a service tunnel for the mesh SDP binding and click on the OK button. The Select Tunnel - Mesh SDP Binding form closes, and the Mesh SDP Binding (Create) form refreshes with the service tunnel identifier.

Note — 5620 SAM will block the manual selection of a tunnel with insufficient bandwidth if the following condition is set in the nms-server.xml file:

<vll-CAC enforceTunnelBandwidth=“true”/>

The condition is false by default. If it is left as false, 5620 SAM will not block the manual selection of a tunnel with insufficient bandwidth, but the State Cause flag “Insufficient Bandwidth To Allocate To SDP Binding” will be raised.

Refer to Chapter 6 for related notes on modifying the nms-server.xml file. It is recommended that you contact your Alcatel-Lucent technical support representative before modifying this file, since this action can have serious consequences.

19 If you are creating redundant SDP bindings, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to select an endpoint for the transport tunnel. The drop-down menu displays the available endpoints.

ii Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State

20 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

a Allow the 5620 SAM to configure the transport tunnel automatically.

i Click on the Return tab button.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

Note — When the Auto Select Return Transport Tunnel parameter is enabled, 5620 SAM will consider and use a portion of the bandwidth you specified when setting the SDP Admin Bandwidth parameter in step 17.

b Configure the transport tunnel manually.

i Click on the Return tab button.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Choose a service tunnel for the mesh SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

21 Click on Select in the Return SDP Binding Endpoint panel to choose a Return Endpoint on the terminating site. Select the required endpoint from the drop-down list that appears.

22 Click on the States tab button.

23 Configure the Administrative State parameter.

24 Click on the Pseudowire OAM tab button.

25 Configure the Control Word parameter.

26 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

27 Click on the OK button. The Site (Create) form reappears with the new spoke SDP binding information displayed in the service navigation tree.

28 Click on the OK button. The Site (Create) form closes and a dialog box appears.

29 Click on the OK button. The VLL Cpipe (Create) form reappears with the new information displayed in the service navigation tree.

30 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 6 to 29.

b Complete service creation. Go to step 31.

31 Click on the OK button. The VLL Cpipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-10 To create a 9500 MPR Cpipe service

1 Choose Create→Service→9500 VLL→Cpipe (CEM to CEM/Eth) from the 5620 SAM main menu. The Cpipe Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the Cpipe service. The Select Customer - Cpipe Service form opens.

3 Choose the Default Customer as the customer for the Cpipe service and click on the OK button. The Select Customer - Cpipe Service form closes and the Cpipe Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Specify VLAN Path
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Click on the Select button to choose a VLAN path to associate with the Cpipe service. The Select VLAN Path - Cpipe Service form opens.

Note — If no VLAN path exists, see Procedure 69-12 for more information about how to create VLAN paths.

6 Choose a VLAN path to use for the service and click on the OK button. The Select VLAN Path - Cpipe Service form closes and the Cpipe Service (Create) form reappears with the VLAN path information displayed on the General tab.

7 Configure the parameters:

- Auto-Assign ID
- VLAN ID

The VLAN ID parameter is enabled when the Auto-Assign ID parameter is disabled.

8 Configure the Service Class parameter.

9 If you specified the CEM to Eth option in step 8, configure the parameters:

- EC ID Tx
- Auto-Assign ID
- EC ID Rx
- Auto-Assign ID
- Clock Source
- Mac Address

The VLAN ID parameters are enabled when the associated Auto-Assign ID parameter is disabled.

10 If you specified the SDH to SDH option in step 8, configure the parameters:

- Clock Source
- Jitter Buffer Depth

11 On the navigation tree, right-click on Cpipe Service and choose Create Cpipe Site. The Select Network Elements - Cpipe Service form opens with a list of available 9500 MPR sites.

For information on adding a GNE site to a VLL service, see Procedure 70-12.

12 Choose a site and click on the OK button. The Select Network Elements - Cpipe Service form closes and the Cpipe Site (Create) form opens with the General tab displayed.

13 Configure the parameters:

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

14 On the navigation tree, right-click on the Access Interfaces and choose Create L2 Access Interface. The L2 Access Interface (Create) form opens with the General tab displayed.

15 Configure the Name parameter.

16 Click on the Port tab button.

17 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

18 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

19 Click on the OK button. A dialog box appears.

20 Click on the OK button. The L2 Access Interface (Create) form closes, and the Cpipe Site (Create) form reappears with the new interface information displayed in the service navigation tree.

21 Repeat steps 14 to 20 if you need to create another L2 access interface for the site in the Cpipe service.

22 Perform one of the following:

a Create an additional site for the VLL service, if required. Repeat steps 11 to 21.

b Complete service creation. Go to step 23.

23 Click on the OK button. The VLL Cpipe (Create) form closes.

You can use the service topology maps to view the service. See chapter 5 for more information about service topology maps.

Note — In case of a service creation failure and/or generated NE inconsistencies, see Procedure 37-21.

Procedure 70-11 To fix a failed cross-connection in a 9500 MPR Cpipe

The 5620 SAM may fail to establish one or more cross-connects when you deploy a 9500 MPR Cpipe service, or a cross-connect may fail after the service is created. If you determine that a service is down because of a failed cross-connect, you can try to re-establish the cross-connect.

Note — You must clear deployment errors that are associated with a failed cross-connect before you attempt to re-establish the cross-connect.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria for the service type that you need to find and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a 9500 MPR Cpipe service and click on the Properties button. The Cpipe Service (Edit) form opens with the General tab displayed.

4 Click on the Complete Service button. A dialog box appears.

5 Click on the Yes button.

6 Verify that the cross-connects are operational.

7 Close the Manage Services form.

Procedure 70-12 To configure a GNE site on a VLL service

Use this procedure to add a GNE site and GNE service interfaces to an existing VLL service. This procedure applies to VLL Epipe, Apipe, Fpipe, Ipipe, and Cpipe services. This procedure also applies to 9500 MPR VLL Epipe, Apipe, and Cpipe services.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VLL service and click on the Properties button. The *VLL_type* Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on *VLL_type* Service and choose Create GNE Site. The Select Network Elements - *VLL_type* Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

  i Click on the GNE Service Interfaces tab button and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

  ii Configure the parameters:

  - Name
  - Description
  - Type

  iii Click on the Ports tab button and then click on the Select button next to the Interface Index field. The Select Generic NE Interface form appears.

  iv Select an interface from the list and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

  v Configure the parameters:

  - Encap Type
  - Outer Encapsulation Value
  - Inner Encapsulation Value

  vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab button to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The *VLL_type* (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The *VLL_type* (Edit) form closes.

You can use the topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 70-13 To create a VLL L2 access interface on a terminating site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VLL and click on the Properties button. The VLL *VLL_type* (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site on which you want to create a VLL L2 access interface; expand the entries for that site.

For information on adding a GNE service interface to a VLL service, see Procedure 70-12.

5 Right-click on Access Interfaces below the site and choose Create L2 Access Interface. The L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Description
- Administrative State
- ATM Connection Type
- MC Ring Node
- Tunnel Fault Notification
- Enable AIS

The ATM Connection Type parameter is configurable only in a VLL Apipe service that has the VC Type parameter set to ATM-cell.

The MC Ring Node parameter is configurable only in a VLL Epipe service.

The Tunnel Fault Notification parameter is configurable on L2 access interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

The Enable AIS parameter is configurable only in a VLL Epipe service where the device has ports configured in access or hybrid mode with Q in Q encapsulation to forward AIS frames generated by a facility tunnel MEP.

7 If you are creating a redundant L2 access interface, configure the endpoint in the Redundancy panel:

i Click on the Select button in the Redundancy panel to choose an endpoint for the L2 access interface. The drop-down menu displays the available endpoints.

ii Choose an endpoint from the drop-down menu.

8 Click on the Select button beside the Application Profile parameter. The Application Profile String: - L2 Access Interface form opens.

Note — The Application Profile parameter is configurable only for an Epipe and Ipipe L2 access interface.

9 Choose a profile from the list and click on the OK button. The Application Profile String: - L2 Access Interface form closes and the L2 Access Interface (Create) form is refreshed with the application profile information.

Note — The Application Profile String: - L2 Access Interface form only displays local profiles that are on the node.

10 Associate an AA transit prefix policy with the service object, if required.

- **i** Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.
- **ii** Select a transit IP policy and click on the OK button.

11 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

- **i** Click on the 5670 RAM Parameters tab button.
- **ii** Click on the Reporting tab button.
- **iii** Click on the Create button. The AA Reporting (Create) form opens.
- **iv** Configure the parameters:
  - Customer Name
  - Subscriber Class
  - Total Bandwidth Upstream (Kbps)
  - Class of Service 1 Bandwidth Upstream (Kbps)
  - Class of Service 2 Bandwidth Upstream (Kbps)
  - Class of Service 3 Bandwidth Upstream (Kbps)
  - Class of Service 4 Bandwidth Upstream (Kbps)
  - Subscriber Name
  - Subscriber Type
  - Downstream (Kbps)
  - Downstream (Kbps)
  - Downstream (Kbps)
  - Downstream (Kbps)
  - Downstream (Kbps)
- **v** Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.
- **vi** Click on the General tab button.

12 Click on the Port tab button.

13 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

14 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

Note — If you choose an Ethernet tunnel endpoint, the Port form is refreshed and an Ethernet Tunnel tab is added.

15 Perform one of the following:

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactivate until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 68-25 for more information about deleting MSAPs.

a If you are creating an Epipe or Ipipe L2 access interface, configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- LLF Enabled

  The LLF Enabled parameter is configurable only for Epipe L2 access interfaces on ports with Null encapsulation.

When the selected port uses dot1q encapsulation, you can enable the Auto-Assign ID check box to have the Outer Encapsulation Value parameter automatically assigned. If you choose this, the system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form.

The Inner Encapsulation Value parameter is configurable only when the port encapsulation type is Q in Q.

The Outer Encapsulation Value (VPI) parameter is configurable only when the port encapsulation type is ATM.

If the port you have chosen is an Ethernet Tunnel Endpoint, you will be able to set the Outer Encapsulation Value to 8191. This automatically enables the Ethernet Tunnel Endpoint Control SAP parameter.

The Inner Encapsulation Value (VCI) parameter is configurable only when the port encapsulation type is ATM.

If you are creating an Epipe and use dot1q or Q in Q encapsulation, then you can enable ingress VLAN translation, if required. Configure the parameters:

- Translation
- Translation ID

b If you are creating an Apipe L2 access interface, configure the parameters:

- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- Encapsulation Value
- Encapsulation Value
- Encapsulation Value
- LLF Enabled
- Connection Profile ID

The Encapsulation Value parameter and the Encapsulation Value parameter are configurable only when the VC Type parameter is set to ATM-cell in step 4 of Procedure 70-4 and the ATM Connection Type parameter is set to PVT in step 6 of this procedure.

The Encapsulation Value parameter is configurable only when the VC Type parameter is set to ATM-VPC in step 4 of Procedure 70-4.

The LLF Enabled parameter is configurable only for SAPs with “Port” ATM Connection Type and on a clear channel under 4 port OC3-STM1 ASAP MDA.

The Connection Profile ID parameter is configurable only when the Signalling VC Type Override parameter is set to ATM-VCC or None. The Connection Profile ID parameter can only be associated with an Apipe when the VC Type parameter is set to ATM-cell.

c If you are creating an Fpipe L2 access interface, configure the Outer Encapsulation Value parameter.

d If you are creating a CPipe L2 access interface, go to step 18.

16 Configure the Ethernet Tunnel Endpoint Control SAP parameter, if required.

Note — Enabling the Ethernet Tunnel Endpoint Control SAP parameter creates the control L2 Access Interface (also known as a Control SAP). It also automatically sets the value of the Outer Encapsulation Value parameter to 8191.

If you are currently creating a same-fate SAP, the Ethernet Tunnel Endpoint Control SAP parameter must not be enabled.

17 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab button.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

Note — If a bundle was selected in step 14, only the Scheduling Class parameter is configurable.

The Fragment Interleave parameter is configurable only in a VLL Epipe or Ipipe service.

18 Assign ingress and egress QoS policies to the interface, if required.

a To configure a 7450 ESS, 7705 SAR, 7710 SR, or 7750 SR, perform the following steps.

Note — Items such as policies, schedulers and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab.

i Click on the QoS tab button.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only on Epipe L2 access interfaces.

The Ingress Match QinQ Dot1P parameter is not configurable if the port encapsulation type is ATM or FR.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - L2 Access Interface form opens.

iv Choose an ingress QoS policy and click on the OK button. The Select Ingress Policy - L2 Access Interface form closes and the L2 Access Interface (Create) form reappears with the ingress QoS policy information displayed.

Note — For Epipe and Ipipe VLL L2 access interfaces, if you select an access ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you are configuring for the Epipe or Ipipe L2 access interface has the access ingress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

v Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - L2 Access Interface form opens.

vi Choose an egress QoS policy and click on the OK button. The Select Egress Policy - L2 Access Interface form closes and the L2 Access Interface (Create) form reappears with the egress QoS policy information displayed.

Note — For Epipe and Ipipe VLL L2 access interfaces, if you select an access egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you are configuring for the Epipe or Ipipe L2 egress interface has the access egress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

vii If you are configuring an L2 access interface for a 7710 SR or 7705 SAR, or if the port you selected in step 14 is not an HSMDA port, then go to step 19.

viii Configure the Packet Byte Offset (bytes) parameter, if required. You must enable the associated Override check box if you need to configure this parameter.

ix Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

x Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the L2 Access Interface (Create) form reappears with the WRR policy information displayed.

xi Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xii Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

b To configure a 7210 SAS-D 6F 4T ETR, 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP, perform the following steps.

i Click on the Select button in the 7210 Specific panel to choose a SAS ingress policy. The Select SAS Ingress Policy - L2 Access Interface form opens.

ii Choose a SAS ingress policy and click on the OK button. The Select SAS Ingress Policy - L2 Access Interface form closes and the information is displayed.

Note — To support H-metering, you must choose a SAS ingress policy with all meter rate modes set to trtcm2.

iii Configure the following parameters in the Aggregate Rate Limit panel:

- Ingress Meter
- Ingress Meter Rate (kbps)
- Ingress Meter Burst

Note 1 — The Ingress Meter parameter is configurable only during SAP creation on a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP. The parameter must be set to true to support H-metering.

Note 2 — On a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP, the Ingress Meter Rate (kbps) and Ingress Meter Burst parameters are configurable only after SAP creation.

19 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 21.

Note 1 — The Schedulers tab is configurable only if a port is assigned to the interface earlier in the procedure.

Note 2 — For the 7210 SAS-X, the port is enabled only when you select the SAP based type in the Egress Scheduler Mode.

20 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 14 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 14 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - L2 Access Interface form opens.

iv Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - L2 Access Interface form closes, and the L2 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v If you are configuring this interface for an Ipipe service then go to step viii.

vi Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vii Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

viii If the port you selected in step 14 is an HSMDA port, go to step 21.

ix Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - L2 Access Interface form opens.

x Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - L2 Access Interface form closes, and the L2 Access Interface (Create) form refreshes with the egress scheduler information displayed.

xi If you are configuring this interface for an Ipipe service then go to step 21.

xii Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xiii Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xiv Go to step 21.

b Specify that an aggregation scheduler policy is applied to the interface.

i Set the Aggregation parameter to On.

Note — You cannot specify an access scheduler policy if the port you selected in step 14 is an HSMDA port. Go to step 21.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - L2 Access Interface form opens.

iii Choose an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - L2 Access Interface form closes, and the L2 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

21 Assign ingress and egress ACL filters to the interface, if required.

Note 1 — IPv6 ACL filters are not supported on the 7705 SAR.

Note 2 — ACL filters are not supported for CPipe L2 access interfaces.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - L2 Access Interface form opens.

iii Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - L2 Access Interface form closes and the L2 Access Interface (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - L2 Access Interface form opens.

v Choose an egress ACL filter and click on the OK button. The Select Egress Filter - L2 Access Interface form closes and the L2 Access Interface (Create) form reappears with the egress ACL filter information displayed.

vi Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - L2 Access Interface form opens.

vii Choose an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - L2 Access Interface form closes and the L2 Access Interface (Create) form reappears with the IPv6 ingress ACL filter information displayed.

viii Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - L2 Access Interface form opens.

ix Choose an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - L2 Access Interface form closes and the L2 Access Interface (Create) form reappears with the IPv6 egress ACL filter information displayed.

22 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab button.

ii Click on the Select button to choose an accounting policy. The Select Accounting Policy - L2 Access Interface form opens.

iii Choose an accounting policy and click on the OK button. The Select Accounting Policy - L2 Access Interface form closes, and the L2 Access Interface (Create) form refreshes with the accounting policy name.

iv Configure the Collect Accounting Statistics parameter.

v If you are configuring statistics collection for a 7210 SAS-E or 7210 SAS-M, go to step vi. Otherwise, go to step 23.

vi Configure the parameters:

- Enable Egress Packets Forwarding
- Ingress Counter Mode

vii If you are configuring statistics collection for a 7210 SAS-D 6F 4T ETR, go to step viii Otherwise, go to step 23.

viii Configure the parameters:

- Enable Egress Forwarding
- Enable Ingress Forwarding

23 Assign a time of day suite to the interface, if required.

i Click on the TOD Suite tab button.

ii Click on the Select button in the Time Of Day Suite panel. The Select Time Of Day Suite - L2 Access Interface list form opens.

iii Choose a time of day suite and click on the OK button. The Select Time Of Day Suite - L2 Access Interface list form closes, and the L2 Access Interface (Create) form reappears with the time of day suite name.

Note 1 — You cannot assign a ToD suite to a L2 access interface if accounting statistics collection is enabled on the L2 access interface. You must disable the Collect Accounting Statistics parameter in step 22.

Note 2 — SapEgrQosPlcyStats and SapIngQosPlcyStats statistics will only be collected if a Time Of Day Suite is applied on the SAP.

24 Configure an Ethernet tunnel.

Note — You can only configure an Ethernet tunnel if you are creating a same-fate SAP or a control/data SAP.

i Click on the Ethernet Tunnel tab.

ii If you are configuring a fate-sharing Ethernet Tunnel Endpoint SAP (also referred to as same-fate SAP) then go to step iii. Otherwise, go to step 25.

iii Click on the Create button. The Ethernet Tunnel (Create) form opens.

iv Configure the parameters:

- Path ID
- Tag (Outer Encapsulation Value)
- Tag (Inner Encapsulation Value)

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The L2 Access Interface (Create) form refreshes with the Ethernet Tunnel entry.

25 If you need to create an Epipe or Ipipe L2 access interface, specify the queue overrides by clicking on the Override Policy Items tab button.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

Set the queue overrides, as described in Procedure 47-44.

26 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button. The ANCP Static Map (Create) form opens.

ii Configure the ANCP String parameter.

iii Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

iv Choose an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

v Click on the OK button. The ANCP Static Map form closes.

27 Associate a MEP to an Epipe or Apipe L2 access interface, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step x.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab button.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The MEP (Create) form closes.

28 If you are creating an Epipe, Apipe, or Ipipe L2 access interface, specify OAM functionality and assign ingress and egress ATM policies to the interface. Otherwise, go to step 32.

i Click on the ATM tab button.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- ATM OAM Terminate

The ATM OAM Terminate parameter is configurable only on Apipe L2 access interfaces. When the VLL access interface port belongs to a MC-APS channel and the VC Type parameter is set to ATM-SDU, set the ATM OAM Terminate parameter to Up.

The AAL5 Encapsulation parameter is configurable only on Epipe and Ipipe L2 access interfaces.

The ATM OAM Alarm Cell Handling parameter is configurable on Apipe L2 access interfaces only when the VC Type parameter is set to ATM-VCC or ATM-VPC, or when the VC Type parameter is set to ATM-cell and the ATM Connection Type parameter is set to PVC. The parameter is configurable on Epipe and Ipipe L2 access interfaces.

The ATM OAM Terminate is configurable on Apipe L2 access interfaces only when the VC Type parameter is set to ATM-SDU or ATM-VCC in step 4 of Procedure 70-4.

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Choose an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes and the L2 Access Interface (Create) form reappears with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Choose an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes and the L2 Access Interface (Create) form reappears with the egress ATM policy information displayed.

29 If you are creating an Ipipe L2 access interface, specify Ipipe functionality for the interface. Otherwise, go to step 32.

i Click on the IPIPE tab button.

ii Configure the parameters:

- CE IP Address
- MAC Refresh Interval
- MAC Address
- Use Broadcast MAC Address

The MAC Address parameter, MAC Refresh Interval parameter, and Use Broadcast MAC Address parameters are configurable only when the port encapsulation type is dot1q, Q in Q, or Null.

30 If you are creating an Epipe L2 access interface with CEM encapsulation, specify the CEM functionality for the service. Otherwise, go to step 32.

Note — Consider the following when creating a VLL Epipe L2 access interface with CEM encapsulation:

- The Time Slots parameter of the DS0 channel must be configured with at least one time slot.
- Time slots are automatically configured for unstructured E1 and T1 endpoints
- The Clock Source parameter of the DS1 channel must be set to Node-Timed.

i Click on the OK button to close the L2 access interface configuration form. The Site (Create) form reappears.

ii Click on the OK button. The Site (Create) form closes and the VLL Cpipe (Create) form reappears.

iii Click on the Apply button.

iv On the navigation tree, expand the Site object. Click on the SAP object for the L2 access interface that you are creating. The L2 Access Interface (Edit) form opens with the General tab displayed.

v Click on the CEM EPipe tab button.

vi Configure the parameters:

- Jitter Buffer (ms)
- Payload Size (octets)
- RTP Header
- Report Alarm
- Local ECID
- Remote ECID
- Remote MAC Address

31 If you are creating a Cpipe L2 access interface, specify the CEM functionality for the service. Otherwise, go to step 32.

Note — Consider the following when creating a VLL Cpipe L2 access interface:

- The Time Slots parameter of the DS0 channel must be configured with at least one time slot.
- Time slots are automatically configured for unstructured E1 and T1 endpoints
- The Clock Source parameter of the DS1 channel must be set to Node-Timed.

i Click on the OK button to close the L2 access interface configuration form. The Site (Create) form reappears.

ii Click on the OK button. The Site (Create) form closes and the VLL Cpipe (Create) form reappears.

iii Click on the Apply button.

iv On the navigation tree, expand the Site object. Click on the SAP object for the L2 access interface that you are creating. The L2 Access Interface (Edit) form opens with the General tab displayed.

v Click on the CEM CPipe tab button.

vi Configure the parameters:

- Jitter Buffer (ms)
- Payload Size (octets)
- Packetization Buffer (ms)
- RTP Header
- Report Alarm

32 Click on the OK button. A dialog box appears.

33 Click on the OK button. The L2 Access Interface (Create) form closes, and the Site (Create) form reappears with the new interface information displayed in the service navigation tree.

Repeat steps 5 to 33 to create another L2 access interface for the site in the VLL service.

Note 1 — If you are configuring access dual-homing with local switching over PBB tunnels, you must configure two L2 access interfaces. The L2 access interfaces must be on LAGs that participate in the MC LAG. See chapter 43 for information about MC LAGs.

Note 2 — If you are creating the L2 access interface during service creation, return to the appropriate VLL service creation procedure:

- For Epipes, go to step 18 of Procedure 70-1.
- For Apipes, go to step 14 of Procedure 70-4.
- For Fpipes, go to step 14 of Procedure 70-6.
- For Ipipes, go to step 16 of Procedure 70-8.
- For Cpipes, go to step 14 of Procedure 70-9.

Procedure 70-14 To create a SAP aggregation group

Perform this procedure to create a SAP aggregation group on a 7705 SAR Apipe service.

Note — SAP aggregation groups can be created only on Apipe services that are configured with the ATM VCC or ATM N:1-N>1 VC Type option. See Procedure 70-4 for more information about configuring the VC type.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria, if required, and click on the Search button.

3 From the list, choose an Apipe service with at least one 7705 SAR site and click on the Properties button. The Apipe Service (Edit) form opens with the General tab displayed.

4 From the component tree, expand to the site level and click on a 7705 SAR site. The Apipe Site (Edit) form opens with the General tab displayed.

5 Click on the Aggregation Group tab button.

6 Click on the Create button. The SAP Aggregation Group (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Description
- Aggregation Group

8 Click on the QoS tab button.

9 Specify an ingress policy for the SAP aggregation group:

   i Click on the Select button in the Ingress Policy panel. The Select Ingress Policy - SAP Aggregation Group form opens.

   ii Configure the filter criteria, if required, and click on the Search button.

   iii Choose an ingress policy and click on the OK button. The Select Ingress Policy - SAP Aggregation Group form closes.

10 Specify an egress policy for the SAP aggregation group:

   i Click on the Select button in the Egress Policy panel. The Select Egress Policy - SAP Aggregation Group form opens.

   ii Configure the filter criteria, if required, and click on the Search button.

   iii Choose an egress policy and click on the OK button. The Select Egress Policy - SAP Aggregation Group form closes.

11 Click on the Accounting tab button.

12 Specify an accounting policy for the SAP aggregation group:

   i Click on the Select button in the Accounting Policy panel. The Select Accounting Policy - SAP Aggregation Group form opens.

   ii Configure the filter criteria, if required, and click on the Search button.

   iii Choose an accounting policy and click on the OK button. The Select Accounting Policy - SAP Aggregation Group form closes.

13 Click on the OK button. The SAP Aggregation Group (Create) form closes.

14 From the component tree, expand the entries of the 7705 SAR site.

15 Right-click on Access Interfaces under the entry and choose Create L2 Access Interface from the contextual menu. The L2 Access Interface (Create) form opens with the General tab displayed.

16 Configure the parameters:

   - Description
   - Administrative State

17 Click on the Select button in the Aggregation Group panel and choose the SAP aggregation group that you created.

Note — The QoS and Accounting tab buttons are dimmed when an L2 access interface is assigned to a SAP aggregation group. The QoS and accounting policies that are assigned to the SAP aggregation group are automatically assigned to all of the SAPs in the group.

18 Click on the Port tab button.

19 Specify a terminating port for the L2 access interface:

i Click on the Select button in the Termination Port panel. The Select Terminating Port - L2 Access Interface form opens.

ii Configure the filter criteria, if required, and click on the Search button.

iii Choose a port from the list and click on the OK button. The Select Terminating Port - L2 Access Interface form closes.

20 Configure the parameters:

- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)

21 Click on the ATM tab button.

22 Configure the parameters:

- ATM OAM Alarm Cell Handling
- Subscriber Vlan
- Translated VPI
- Translated VCI

23 Assign an Ingress ATM Policy to the L2 access interface:

i Click on the Select button in the Ingress ATM Policy panel. The Select Ingress ATM Policy - ATM Configuration form opens.

ii Configure the filter criteria, if required, and click on the Search button.

iii Choose a policy from the list and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes.

24 Assign an Egress ATM Policy to the L2 access interface:

i Click on the Select button in the Egress ATM Policy panel. The Select Egress ATM Policy - ATM Configuration form opens.

ii Configure the filter criteria, if required, and click on the Search button.

iii Choose a policy from the list and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes.

25 Click on the OK button. The L2 Access Interface (Create) form closes.

26 Repeat steps 15 to 25 to create more SAPs, as required.

Note 1 — A SAP aggregation group can contain up to 16 SAPs.

Note 2 — If you are creating the SAP aggregation group during service creation, return to step 15 of Procedure 70-4.

27 Close all forms.

Procedure 70-15 To create an HSDPA resiliency configuration

See “HSDPA Offload Resiliency” in section 70.1 for information about HSDPA resiliency.

1 Choose Manage→Redundancy→HSDPA Resiliency from the 5620 SAM main menu. The HSDPA Resiliency Manager form opens.

2 Click on the Create button. The HSDPA Resiliency (Create) form opens.

3 Configure the parameters:

- Description
- Administrative State

4 Click the Select button beside the Name parameter in the Site panel. The Select Site - HSDPA Resiliency form opens. Only sites utilizing a 7705 SAR chassis are displayed.

5 Choose a site and click on the OK button. The Select Site - HSDPA Resiliency form closes and the HSDPA Resiliency (Create) form is displayed with your site choice shown in the Name parameter field.

6 Click the Select button beside the Name parameter in the Primary Service panel. The Select Primary Service - HSDPA Resiliency form opens with a list of services.

Note — The Select Primary Service - HSDPA Resiliency form does not give you the option to create the required Apipe service. See Procedure 70-4 to create the required service before configuring HSDPA Resiliency.

7 Choose a service and click on the OK button. The HSPDA Resiliency (Create) form refreshes with the primary service information.

8 Click the Select button beside the Name parameter in the Secondary Service panel. The Select Secondary Service - HSDPA Resiliency form opens with a list of services.

Note — The Select Secondary Service - HSDPA Resiliency form does not give you the option to create the required Apipe service. See Procedure 70-4 to create the required service before configuring HSDPA Resiliency.

9 Choose a service and click on the OK button. The HSPDA Resiliency (Create) form refreshes with the secondary service information.

10 Click on the OK button. The HSDPA Resiliency (Create) form closes.

11 Perform one of the following:

a Perform Procedure 70-16 to turn up or manually operate an HSDPA resiliency configuration.

b Close the HSDPA Resiliency Manager form.

Procedure 70-16 To activate and manually operate an HSDPA resiliency configuration

See section "HSDPA Offload Resiliency" for a detailed description of this feature.

1 Choose Manage→Redundancy→HSDPA Resiliency from the 5620 SAM main menu. The HSDPA Resiliency Manager form opens.

2 Choose the required HSDPA resiliency configuration from the displayed list and click the Properties button. The HSDPA Resiliency (Edit) form opens with the properties of the configuration displayed on the General tab.

The Active Service field displays whether the Primary or Secondary Service is active. When you initially want to turn up a resiliency configuration, typically Primary is displayed.

3 Set the Administrative State parameter to Disabled. Activity for the resiliency configuration can only be manually switched from this form when this parameter is set to Disabled.

4 Perform one of the following:

a Set the Administrative State parameter to Enabled. Activity automatically switches between the primary and secondary services as required when this parameter is enabled.

b Click on the Turn Up button to manually activate the HSDPA resiliency configuration. Do this if the Administrative State parameter is not enabled.

c If the Primary Service is currently active, you can click on the Force Secondary Service Active button. This manually forces the configuration to the Secondary Service (if up), regardless of state of damping timer. The Active Service field displays Secondary if the switchover is successful.

d If the Secondary Service is currently active, you can click on the Force Primary Service Active button. This manually forces the configuration to the Primary Service (if up), regardless of state of damping timer. The Active Service field displays Primary if the switchover is successful.

e Click on the Shut Down button to de-activate the HSDPA resiliency configuration.

f Click on the Faults tab to view and address alarms related to the configuration.

5 Click on the OK button. The HSDPA Resiliency (Edit) form closes.

6 Close the HSDPA Resiliency Manager form.

Procedure 70-17 To run an OAM validation test for a VLL service

An OAM validator test suite must be created for the tested entity. See chapter 78 for more information about how to create a validator test suite.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose a service and click on the Properties button. The VLL *Type_of_VLL* (Edit) form opens with the General tab displayed.

4 Click on the More Actions button and choose Validate. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

- **i** Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form appears.
- **ii** Configure the filter criteria. A list of OAM validator test suites appears.
- **iii** Choose an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab button. The Test Suite tab is displayed.

7 Click on the Validation Result tab button.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab button to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise, go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result form.

14 Close the VLL *Type_of_VLL* (Edit) form.

15 Close the Manage Services form.

Procedure 70-18 To view the service topology associated with a VLL service

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter parameters and click on the Search button. A list of services appears at the bottom of the Manage Services form.
3. Choose a VLL service and click on the Topology View button. A Topology View dialog box appears.
4. Click on the Yes button to proceed. The Service Topology - *Service Name* map opens.

   See chapter 5 for more information about service topology views.

Procedure 70-19 To view the VLL service operational status

The Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.
3. Choose a service and click on the Properties button. The VLL *Type_of_VLL* (Edit) form opens.
4. View the Operational State and State Cause indicators. When the Operational State is Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.
5. Click on the appropriate tab button to view or edit an object that is identified as faulty by a State Cause indicator.
6. Click on the Faults tab button to view the alarms for the object. The Object Alarms tab is displayed.
7. Click on the Aggregated Alarms tab button to view the aggregated alarms for the object. The Aggregated Alarms tab is displayed.
8. Close the VLL *Type_of_VLL* (Edit) form.
9. Click on the Close button to close the Manage Services form.

Procedure 70-20 To view the peer status information associated with the VLL service

You can view peer status faults in the peer PE SAP and service tunnel in the Peer State Cause panel of the Spoke SDP Binding form.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose the service and click on the Properties button. The VLL *Type_of_VLL* (Edit) form opens.

4 Click on the Spoke SDP Binding tab button.

5 Choose an entry and click on the Properties button. The Spoke SDP Binding (Edit) form opens.

6 Click on the States tab button.

7 View the peer status information in the Peer State Cause panel. When the service tunnel or peer SAP is down or partially down, a check mark beside the appropriate Peer State Cause indicator identifies the type of associated service fault.

8 Click on the Cancel button to close the Spoke SDP Binding (Edit) form.

Procedure 70-21 To modify a VLL service

Caution — Modifying parameters can be service-affecting.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose a VLL service and click on the Properties button. The *VLL_type* Service (Edit) form opens with the general properties of the service displayed on the General tab.

The following tabs list the service elements that can be individually or collectively selected and configured:

Note 1 — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

Note 2 — Some service element do not apply to all VLL services.

- Sites tab — lists the sites that are included in the service
- Endpoints tab — lists the service endpoints
- L2 Access Interfaces tab — lists the L2 access interfaces that are included in the service
- Spoke SDP Bindings tab — displays the spoke SDP bindings that are associated with the service
- VLAN Path Instance - list VLAN path instances associated with a 9500 MPR service
- Template tab — displays the template used to create the service, if applicable.
- Tests tab
- Faults tab — displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Modify the parameters for the service as required.

To configure items on the tabs that contain lists of service elements, select the items and click on the Properties button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The *VLL_type* Service (Edit) form closes and the Manage Services form reappears.

7 Click on the Close button to close the Manage Services form.

Procedure 70-22 To modify a VLL service using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose a VLL and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains a number of sub-procedures describing the various components that can be created and modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating site components. Go to step 9.
- Creating spoke SDP bindings. Go to step 17.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the option allowing you to create a new site. This may be an Epipe, Cpipe, Ipipe, Apipe, or Fpipe site, depending on what type of VLL service you are modifying.

The Select Network Elements form appears.

5 Choose one or more sites to add to the service and click OK. The Site (Create) form for the new site is displayed. If you selected more than one site, the Site (Multiple Instances) (Create) form for the new sites is displayed.

6 Click on OK. The Site (Create) (or Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

7 If you want to perform detailed configuration of site properties for the new site, right-click the site icon and select Properties from the contextual menu. The Site (Edit) form opens. Refer to Procedures 70-1 through 70-10 for detailed site configuration information for the various types of VLL services.

8 Return to step 3 for a list of other functions you can perform from the topology view or go to step 25 to finish.

Creating site components

9 Right-click on any site icon in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- Endpoint. Go to step 10.
- L2 Access Interface. Go to step 13.

10 If you choose to create an Endpoint, then the Endpoint (Create) form is displayed.

11 Configure the Name parameter for the endpoint.

Refer to Procedures 70-1 through 70-9 and 70-13 for detailed information on further configuring the endpoint, if required.

12 Click OK. The Endpoint (Create) form closes and the new endpoint is displayed in the topology view.

13 If you choose to create an L2 Access Interface, then the L2 Access Interface (Create) form is displayed.

14 Click on the Port tab and assign a port to the interface.

Refer to Procedures 70-1 through 70-10 and 70-13 for detailed information on further configuring the interface, as required.

15 Click OK. L2 Access Interface (Create) form closes.

16 Return to step 3 for a list of other functions you can perform from the topology view or go to step 25 to finish.

Creating spoke SDP bindings

17 Choose the sites you want to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note — When you create a spoke binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

18 Choose Connect from the contextual menu and choose the Create Spoke SDP Binding option.

The Spoke SDP Binding (Create) form is displayed.

Note 1 — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

Note 2 — You can also create a spoke SDP binding between a site icon and an endpoint icon, or between two endpoint icons in the topology view. Appropriate endpoints must first exist or be created to enable this.

19 Enable the Auto-Select Transport Tunnel parameter.

20 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedures 70-1 through 70-9 for more detailed information on creating and configuring spoke SDP bindings for the various types of VLL services, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

21 Assuming that the spoke SDP binding was successfully created in step 20, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a spoke binding for the return tunnel.

22 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

23 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

24 Return to step 3 for a list of other functions you can perform from the topology view or go to step 25 to finish.

25 Close the Service Topology form.

26 Close the Manage Services form.

Procedure 70-23 To delete a VLL service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This message is dynamic based on the priority of the service. Perform one of the following:

  a For services with a low priority, go to Step 5.

  b For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.

  c For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

71 — VPLS management

71.1 VPLS management overview

VPLS is a class of virtual private network multipoint L2 service that allows multiple customer sites to be connected in a single bridged domain contained within the service provider-managed IP/MPLS network. Customer sites in the VPLS appear to be on the same LAN, even if the sites are geographically dispersed.

VPLS offers the following advantages:

- Ethernet interfaces on the host access side simplify provisioning.
- All routers in the VPLS are part of the same LAN, which simplifies IP addressing and allows customers to control and simplify their routing strategies.
- VPLS is protocol independent, which means there is no L2 protocol conversion between LAN and WAN technologies.

A VPLS can span a single site or multiple sites. A VPLS that spans a single site is called a local VPLS. In a local VPLS, customer data enters the service through multiple access interfaces on a single PE device. No circuit provisioning is required for the local VPLS.

A VPLS that spans multiple sites is called a distributed VPLS. In a distributed VPLS, customer data enters the service using two or more interfaces on different PE devices. The VPLS is transported by service circuits over an IP/MPLS provider core network carried by service tunnels. Service tunnels are created using GRE or MPLS LSPs.

You can use HVPLS to eliminate the need for a full mesh of virtual circuits between devices in the VPLS. See “HVPLS” in this section for more information.

The 5620 SAM supports end-to-end VPLS configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Pre-configured template. A user that is assigned the template management role can create a service template. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

The General tab of the 5620 SAM service management form displays useful information about the operational state of the service and its sites through the Aggregated Operational State and State Cause indicators.

You can run the OAM Validation test suite for the service by clicking on the More Actions > Validate button. If a check mark appears beside the OAM Validation Failed state cause indicator, the test has failed. In addition, the Validation Result tab on the Tests tab displays detailed information about the OAM test result. OAM validation tests are not supported for HVPLS. See chapter 78 for more information about how to configure OAM validation test suites.

The Aggregated Operational State indicator has four possible values: Up, Down, Partially Down, and Unknown. The value is derived from the operational states of the sites that are part of the service, as follows:

- Up—all sites are operationally up
- Partially Down—at least one site is operationally down
- Down—all sites are operationally down
- Unknown—the service has no provisioned sites

When the Aggregated Service Site Operational State is Partially Down or Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator. Alarms can be viewed on the Faults page.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology map views. See chapter 76 for more information about the hierarchical organization of composite services.

Common to all services, such as VPLS, are policies that are assigned to the service. Policies are defined at a global level and can then be applied to components of the service, such as interfaces and circuits, when the service is configured or modified. The following policies are common to all services:

- QoS policies to define ingress classification, policing, shaping, and marking on the ingress side of the interface. QoS policies are configured using the Access Ingress Policy Manager and the Access Egress Policy Manager.
- Policer control policies to control access ingress policers and access egress policers under a common hierarchy. Policer control policies are configured using the Policer Control Policy Manager.
- Scheduling policies to define hierarchical rate limiting and scheduling to govern the scheduling of queues. Scheduler policies are configured using the Scheduler Policy Manager.
- Port scheduler policies define hierarchical bandwidth allocation and scheduling at the egress port level. Port scheduler policies are configured using the Port Scheduler Policy and HSMDA Scheduler Policy forms.
- Filter policies to control network traffic into or out of an interface or circuit based on IP or MAC matching criteria. Filter policies are configured using the ACL IP Filter Manager and the ACL MAC Filter Manager.
- Accounting policies to count the traffic on a service to ensure proper billing and enforcement of SLAs. Accounting policies are configured using the Accounting Policy Manager.
- ANCP policies provide status and control information based on port-up and port-down messages and current line rate changes between the edge device and the access node. ANCP policies are configured using the Manage Subscriber Policies form.
- Time of day suites specify time and day restriction policies that are assigned to QoS policies and schedulers, ACL filters, and aggregation schedulers. Time of day suites and time range policies are configured using the Time of Day Suite form and Time Range form, respectively.

See chapter 46 for more information about policies.

Packets that arrive at an edge device are associated with a VPLS based on the access interface on which they arrive. An access interface is uniquely identified using the following parameters:

- physical Ethernet port or POS port and channel
- encapsulation type
- encapsulation identifier (if required)

If there are service issues, the service provider can use OAM tools to troubleshoot service and network transport issues, and ensure problems are handled properly through the physical and logical network. See chapter 38 for more information.

To provide a VPLS over an MPLS infrastructure, the device is configured to provide bridging and replication for each VPLS. The routers that are part of the VPLS are connected by MPLS LSPs. Multiple VPLS can use the same set of service tunnels. Multiple service tunnels can rely on multiple LSPs. The signaling is specified in sets of ingress and egress VC labels for each VPLS.

The following additional features are configured for the VPLS:

- MAC learning for the access ports and tunnels, including filtering based on MAC addresses on a per SAP basis
- MAC learning protection on SAPs to prevent DoS attacks from sourcing
- rate limiting of broadcast, destination unknown, and multicast traffic on a per access port basis
- FIB for each VPLS, including FIB size limits, static MAC addresses, alarms, and discarding unknown locations
- optional support for spanning tree for loop detection
- GSMP for each VPLS
- L2 management interfaces for each VPLS

HVPLS

A hierarchical VPLS is created by enhancing the VPLS core mesh with a spoke SDP binding that is connected to another site in the same VPLS, a site in another VPLS, or a VLL site.

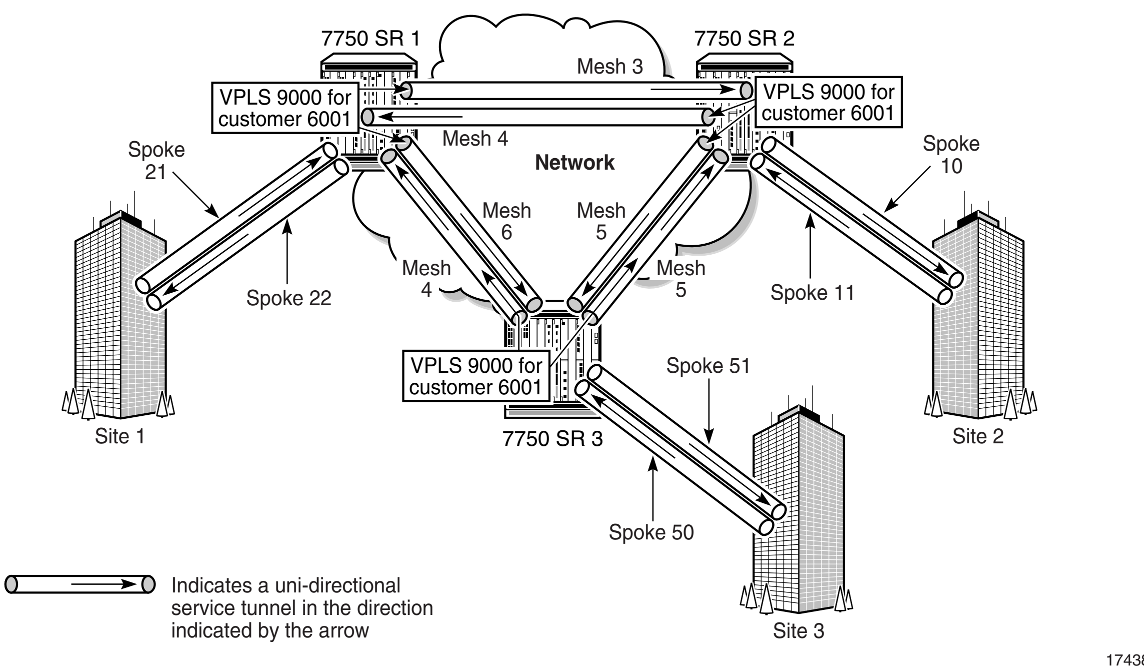
HVPLS offers the following advantages:

- reduces the complexity of mesh configuration
- decreases the amount of signaling of routes between devices

When traffic arrives at an access-spoke circuit, it acts like a bridge port where flooded traffic received on the access spoke is replicated to all other spokes, meshes, or SAPs but it is not transmitted on the port where it is received.

Figure 71-1 shows a sample HVPLS with a mesh and spoke configuration. Spokes 50 and 51 are unidirectional access-spoke circuits bound to service tunnels. The access-spoke circuits exist within the context of a VLL service or VPLS that is interconnected to the original, fully meshed VPLS. Alternatively, the access-spoke circuit can provide interconnectivity to a service site.

Figure 71-1 HVPLS configuration



The 5620 SAM supports the following HVPLS interconnectivity using spoke SDPs:

- VPLS to VPLS
- intra-VPLS
- VPLS to VLL

MVPLS

VPLS topology loops can occur if either of the following is true:

- Two VPLS are connected by redundant spoke SDPs.
- A CE NE is connected to a VPLS with redundant L2 access interfaces.

To remove topology loops, RSTP must be enabled on the redundant spoke SDPs or L2 access interfaces to block some of them from passing traffic. This requires the creation of an MVPLS.

MSTP is an extension of RSTP which allows VLANs to be grouped into spanning tree instances. Each instance has an independent spanning tree topology. MSTP can be run in an MVPLS to provide multiple forwarding paths for data traffic, which allows load balancing and reduces the number of spanning tree instances required to support a large number of VLANs. An MST region comprises a set of interconnected switches that have the same MST configuration. Each region can be configured with up to 16 MST instances. The instance with ID 0 is an internal spanning tree that runs an MST region and sends and receives BPDUs. All other spanning tree instance information is encapsulated within MSTP BPDUs.

An MVPLS is created to run RSTP or MSTP and manage traffic on the associated VPLS. An MVPLS contains sites, spoke SDP bindings, mesh SDP bindings, and L2 access interfaces. The MVPLS spoke SDP bindings and L2 access interfaces are configured to manage the associated VPLS spoke SDP bindings and L2 access interfaces.

In the case of spoke redundancy, the MVPLS runs RSTP on the redundant spoke SDPs and associates the resultant traffic-blocking actions with all VPLS that use the same spoke SDPs.

MVPLS traffic blocking can also be used on the access side to manage redundant L2 access interface connections. A VLAN ID range is specified for each MVPLS L2 access interface which identifies the VC IDs of the managed VPLS L2 access interfaces.

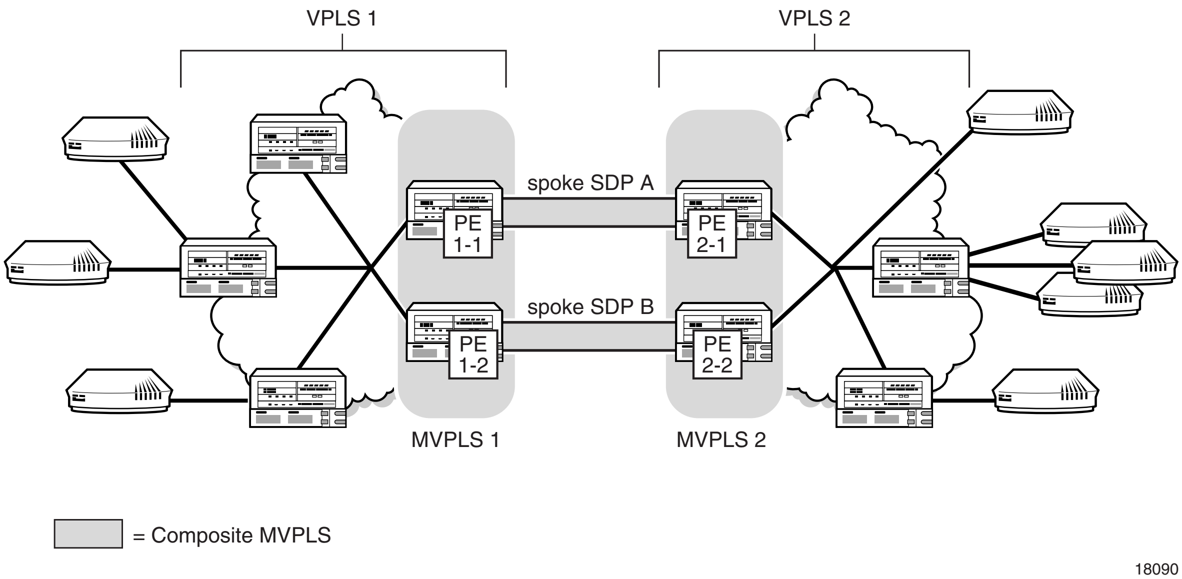
RSTP is enabled by default on an MVPLS. When the Admin state of an MVPLS is down, all managed L2 access interfaces and spoke SDPs in the associated VPLS are disabled. However, if the Admin state of individual L2 access interfaces or spoke SDPs of an MVPLS are down, then the managed VPLS L2 access interfaces or spoke SDPs are not affected by traffic blocking.

A common MVPLS situation occurs when two VPLS are connected by redundant spoke SDPs. If traffic is not blocked on one of the redundant spoke SDPs, then a loop results. To remove the loop, RSTP must be run on the spoke SDPs that form the loop to block one of the redundant spoke SDPs. Blocking is accomplished by creating an MVPLS on each side of the redundant spoke SDPs and creating a composite MVPLS to connect the MVPLS.

Another common MVPLS situation occurs when an access switch with many VLANs is redundantly connected to two other bridges, on which each uplink carries half the VLANs. MSTP allows you to build multiple spanning trees over VLAN trunks and to group and associate the VLANs to spanning tree instances, each with a different port instance cost and port instance priority.

Figure 71-2 shows an example of a composite MVPLS that is composed of MVPLS 1, MVPLS 2, and spoke SDPs.

Figure 71-2 Composite MVPLS



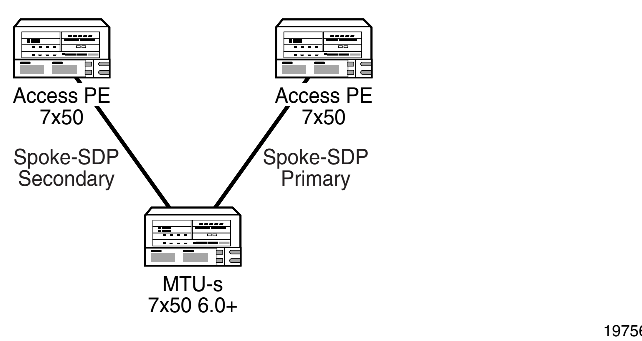
Another scenario occurs when multiple L2 access interfaces from a VPLS are connected to the same customer edge equipment. In this case, a single MVPLS must be created with L2 access interfaces defined to manage the traffic on the associated VPLS redundant L2 access interfaces.

Dual homing for VPLS

A VPLS can be configured for dual homing through the use of redundant spoke SDPs. 5620 SAM handles the redundant spoke SDPs by grouping them together to form an endpoint object. The redundant spoke SDPs provide active and standby pseudowires for the service. This spoke SDP access arrangement allows data flow control and management support without requiring STP, which cannot be enabled on a spoke SDP binding that is under an endpoint. For VPLS, you can associate only spoke SDP bindings with an endpoint, and each endpoint can be associated with a maximum of two spoke SDP bindings.

Figure 71-3 shows a simple dual homing configuration.

Figure 71-3 MTU redundant access to VPLS



VPLS dual homing provides the ability to have an NE deployed as an MTU-s with links to multiple PE NEs without requiring an MVPLS.

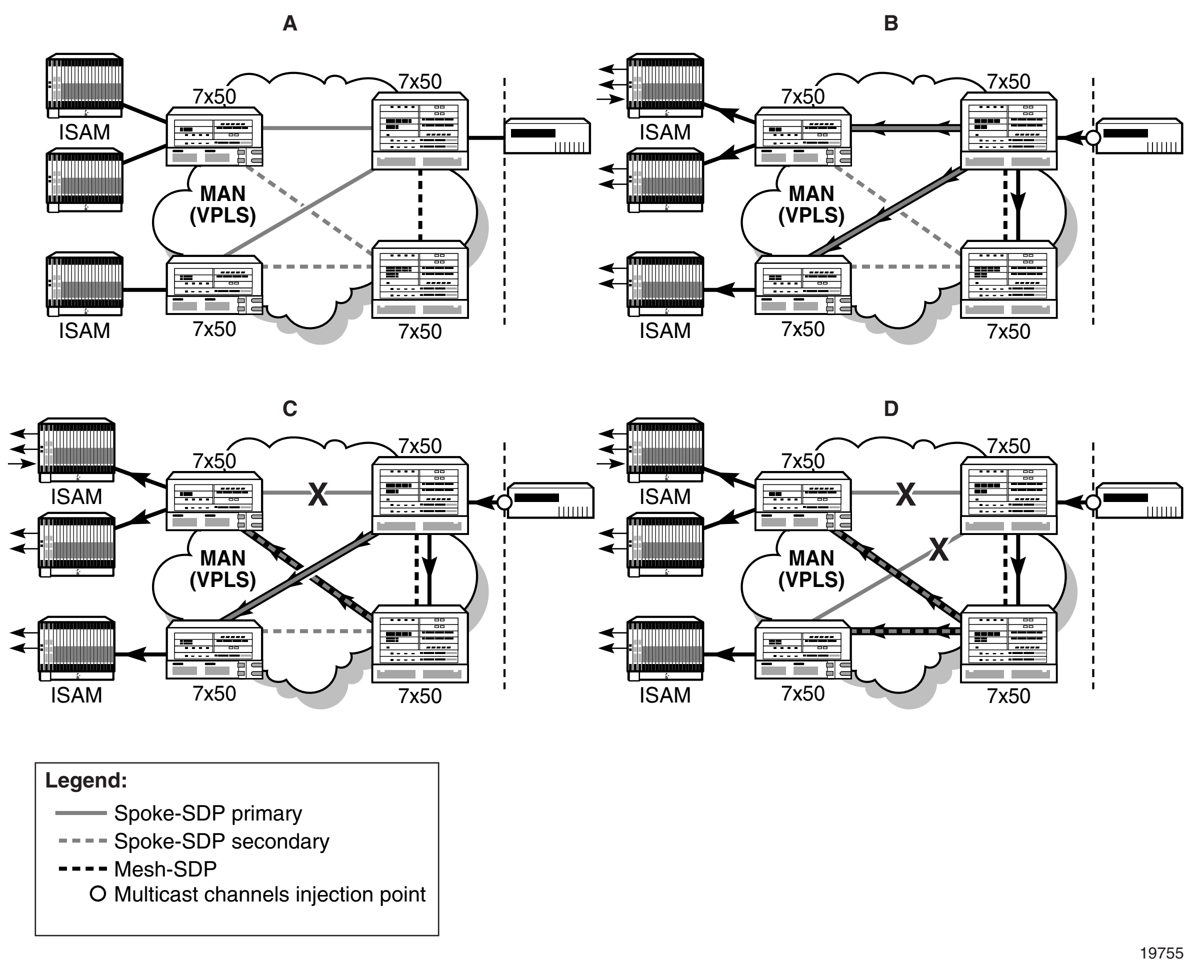
Note 1 — You cannot create a VPLS endpoint on a site that has an active or inactive MC ring SAP. See chapter 45 for more information.

Note 2 — You cannot create an endpoint in an MVPLS.

In this example, the MTU-s has spoke SDPs to two PE devices. One is designated as the primary spoke and the other as the secondary, or standby spoke, based on a precedence value specified for each spoke. The standby spoke is in a blocking state when the primary spoke is available. If the primary spoke becomes unavailable, the MTU-s immediately switches the traffic to the standby spoke. You can configure the service to revert back to the original configuration, after a specified delay, when the primary spoke is again available. Forced manual switchover is also supported.

You can configure a MAC flush to speed the convergence during a switchover. The PE devices that receive the MAC flush remove each MAC address that is associated with the affected VPLS instance and forward the MAC flush to the other PE devices in the VPLS. Figure 71-4 shows a dual-homed VPLS for BTV distribution.

Figure 71-4 BTV distribution in redundant VPLS architecture

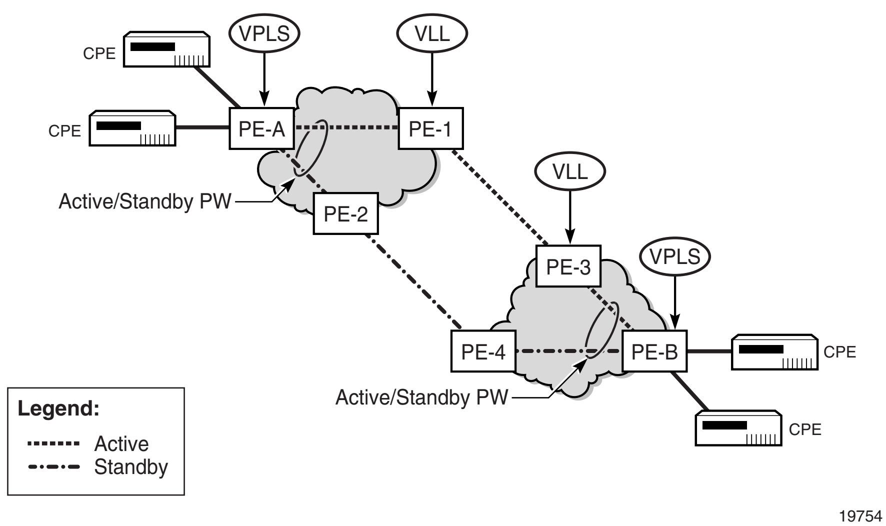


In the nominal operating mode shown in panel A, the edge router (grey icon) has been configured to statically join all multicast channels and inject them into the aggregation network. The access layer 7x50 unit (directly connected to ISAM) is dual-homed into two aggregation layer 7x50s edge routers (larger icons) using primary and secondary spoke SDPs. A mesh SDP interconnects both aggregation nodes. Injected BTV traffic from the edge router is broadcast on the primary spoke SDPs to the connected MTU devices (panel B).

A copy of the channels is also sent on the mesh SDP to the peer aggregation node, which also replicates the traffic to the connected spoke SDPs (aggregation layer nodes are not aware of primary/secondary spoke selection done by the MTU layer devices). The MTUs only receive traffic from the primary spoke SDP. Traffic received on the secondary spoke SDP is blocked. In the event of a link failure (panel C) or MDA failure (panel D), the MTU switches over to the secondary spoke SDP and immediately start receiving traffic from it instead of the primary spoke SDP.

Composite services also support VPLS with redundant spoke SDP bindings to VLL services. Figure 71-5 shows a VPLS and VLL combination example that provides an E2E redundant path.

Figure 71-5 VPLS and VLL combination to provide E2E redundant path



Provider Backbone Bridging in VPLS

Provider Backbone Bridging (PBB) is a technology configuration employed in next-generation networks that utilize carrier-grade Ethernet as the transport architecture. It addresses the potentially enormous increase in MAC addresses stored in the router lookup databases by encapsulating the customer frame in a Provider Ethernet header. The Customer MAC address (C-MAC) is then only dealt with by lower tier (or satellite) H-VPLS PEs. The core H-VPLS PEs only need to handle the backbone provider's MAC addresses (B-MAC), which are substantially less in number. For this reason, the technique is also referred to as MAC-in-MAC encapsulation.

IEEE 802.1ah defines an architecture and bridge protocols for interconnection of multiple Provider Bridge Networks (PBNs). PBB is defined in IEEE as a connectionless technology based on multipoint VLAN tunnels. MSTP is used as the core control plane for loop avoidance and load balancing. As a result, the coverage of the solution is limited by STP scale in the core of large service provider networks.

A Provider Backbone Bridged Network is a Virtual Bridged Local Area Network that comprises Backbone Edge Bridges (BEBs) and Backbone Core Bridges (BCBs) under the administrative control of a single backbone provider. Each BEB provides interfaces that encapsulate or verify the encapsulation of customer frames, and then relay those frames across the backbone. The term that the customer used may also mean a provider who is purchasing a service from another provider and using either a PBN or PBBN internally.

Backbone VLANs are used to create multipoint trunks in the backbone. The B-VLAN determines the route the frames take and limits broadcasting within the backbone. The B-TAG is added to the frame at the Customer Backbone Port (CBP). The selection of B-VLAN used to form the B-TAG is determined by the configuration of the CBP service instance table. This table maps ISIDs to B-VIDs and is created as part of service provisioning.

Backbone VLAN Connectivity

The backbone provider can use and configure MSTP to provide a number of independent spanning tree active topologies and can assign each B-VLAN to one of these active topologies to best use the resources in the network. MVRP, running in the context of each spanning tree active topology, configures the extent of each B-VLAN to the subset of that active topology necessary to support connectivity between the customer points of attachment to the instance of MAC service provided, and can reconfigure that connectivity as required if the spanning tree active topology changes. The operation of MSTP within a backbone provider's network is independent of the operation of any spanning tree protocol within attached provider or customer networks. This is achieved by removing all MSTP BPDUs received or to be transmitted at the service access interfaces. The operation of MVRP within a PBBN is independent of the operation of any configuration protocol within attached customer networks.

SR PBB implementation

The IEEE PBB model is organized around a B-component handling the provider backbone layer and an I-component concerned with the mapping of Customer/Provider Bridge (Q in Q) domain (that is, MACs, and VLANs) to the provider backbone (that is, B-MACs, and B-VLANs). The I-component contains the boundary between the customer and backbone MAC domains. PBB encapsulates the customer payload in a provider backbone Ethernet header, which allows the C-MACs to be hidden from the core PEs. A special Group MAC is used for the Backbone Destination MAC when the customer frame type is either unicast, multicast, broadcast, or unknown.

The SR PBB solution can be summarized as follows:

- Two VPLS variants are employed, namely B-VPLS and I-VPLS, functioning as the B-type BEB, and the I-type BEB respectively. A B-VPLS instance (a service instance within a service router) and its corresponding I-VPLS instances must be co-located in a service router. From a network-wide perspective, a B-VPLS comprises multiple Backbone Virtual Switch Instances (B-VSIs).

  Note — For the description in this section and in the procedures in this chapter, B-VSI is used for a single B-type BEB instance, and is referred to as a B-Site. Similarly, I-VSI is used for a single I-type BEB instance, and is referred to as an I-Site.

- mB-VPLS and mI-VPLS are also available to provide loop avoidance for B- and I-VPLS in the same way as m-VPLS and regular VPLSs operate.
- A 5620 SAM VPLS can include regular sites and either B-Sites or I-Sites. The service should not contain both B-Sites and I-Sites. When a VPLS has at least one B-Site it becomes a B-VPLS. When a VPLS has at least one I-Site, it becomes an I-VPLS.

  Note — Regular sites, B-Sites, and I-Sites cannot change their type after they are created.

- An I-Site can be bound to one B-Site, but a B-Site can be used by multiple I-VPLSs.
- PBB is configurable on a Release 6.4.2 or later OS 9700E or OS 9800E, and on the 7450 ESS, 7710 SR, and 7750 SR.

B-VPLS and I-VPLS instances

PBB processing may be seen as a chain of two linked VPLS contexts, namely B-VPLS and I-VPLS. Their characteristics are summarized in the sections that follow.

I-VPLS

I-VPLS is the abbreviated form for Service Instance ID (ISID) VPLS. An I-VPLS instance on a service site is referred to as an I-Site.

The following are I-VPLS and I-Site characteristics:

- An I-Site operates using customer addressing and maps the C-MACs to B-MACs.
- You can select one B-Site to associate with an I-Site; the B-Site must be on the same PE NE as the I-Site.
- I-Sites support only spoke SDP bindings and not mesh SDP bindings.
- An I-Site L2 access interface, or I-SAP, can co-exist on a port with regular L2 access interfaces or subscriber management M-L2 access interfaces. The existing port encapsulation is supported. An encapsulation tag that is used for service selection on an I-SAP is removed before the PBB encapsulation is added. The appropriate encapsulation tags are added at the remote PBB PE when sending the packet out on the egress access interface.

- An I-Site can be connected to one or more regular VPLS sites. A regular (network level) VPLS can have a mix of regular sites and I-Sites. The I-Sites of such services are responsible for the mapping of C-MACs to B-MACs. The regular sites of the service function as normal (bridge).
- ISID is a 24-bit field that carries the service instance identifier associated with this frame. It is used at the destination PE as a demultiplexer field, a function similar to a VC label. Default to service ID only works if the service ID is within the ISID range. For a service with service ID larger than 16 777 215, the ISID value must be specified.
- The ISID must be unique on one router.
- The Provider MSTP support in an M-VPLS is in the I-VPLS space.
- The I-Site MTU must be at least 18 bytes smaller than the B-Site MTU to which it is bound.
- If a VPLS has an attached I-Site, the Include I-Site(s) indicator on the General tab of the VPLS configuration form is selected.
- IGMP snooping can be configured for I-Sites and I-L2 Access Interfaces.

Backbone-VPLS (B-VPLS)

Multiple L2 services can use a single B-VPLS. Ordinarily, a pair of SDP bindings (in opposite directions) provide either point-to-point connection between two sites of a service (as SDP bindings) or between different services (as a service connector). However, a B-VPLS provides a multipoint connection between sites of a service or for multiple services.

The following are properties and characteristics of a B-VPLS and B-Sites:

- The B-VPLS operates using the provider or backbone addressing (B-MACs).
- The B-VPLS provides backbone tunneling for one or multiple I-VPLSs.
- The B-VPLS accepts mesh or spoke SDP bindings, thereby providing both routing and MAC hiding using PBB/PW encapsulation.
- The B-VPLS accepts access interfaces using PBB encapsulation for tunneling through an Ethernet-only network.
- A regular (network level) VPLS can have a mix of regular sites and B-Sites to function as a B-VPLS (that is, operating using B-MACs).
- The backbone’s Source MAC address can be configured on a B-Site. All the I-Sites provisioned under this B-Site shares the provisioned values. By default, this is a loopback chassis MAC address. It must be a unicast MAC address.
- A B-Site site can not be deleted until all its I-Site associations are removed.
- A B-Site can have both spoke and mesh SDP bindings and only an MPLS type of tunnel can be used (including LDP SDP). This also applies for a regular pseudowire, where the outgoing PBB frame on a B-SDP (that is, a B-PW) contains a B-VID qtag only if the PW type is Ethernet VLAN. Alternatively, if the pseudowire type is Ethernet, the B-VID qtag is stripped before the frame goes out.

- Only Null, dot1q, and Q in Q encapsulation types can be used by a B-Site L2 access interface. These access interfaces must use PBB encapsulation and have the following properties:
  - Ethernet dot1q is applicable to the bulk of PBB use cases, such as one B-VID.
  - Ethernet Null is supported for direct connection between neighboring I-VPLS, for example, when no B-VID is required and all traffic is sent to or from local I-VPLS.
  - There is no requirement for a PBB SAP type for PBB on the B-VPLS SAPs. Only the B-VID is used for tunnel delimitation on the port.
  - The default access interface type is blocked for the B-L2 access interface.
  - The following rules apply to the SAP processing of PBB frames:

    > For transit frames (frames not destined to a local MAC), there is no need to process the I-tag component of the PBB frames. Regular Ethernet SAP processing is applied to the backbone header (B-MACs and B-VID).

    > If a local I-VPLS instance is associated with the B-VPLS, then local frames (frames originated or terminated on local I-VPLSs) are PBB encapsulated and de-encapsulated using the pbb-etype provisioned under:

    related port->I-VPLS->root pbb component

    (listed in decreasing order of precedence, where the related port is highest in the order).
- If a VPLS has an attached B-Site, the Include B-Site(s) indicator on the General tab of the VPLS configuration form is selected

Service topology map views

Service and composite service topology maps support PBB.

The service map shows different types of sites with various icons for I-Sites, B-Sites, and Epipe PBB sites. With an I-VPLS bound to B-VPLS, the map shows the PBB backbone network as a cloud. The bindings between I-VPLS and B-VPLS are shown as a binding link.

MRP and MMRP support

The Multiple Registration Protocol allows participants in an MRP application to register Group MAC addresses with other participants in a Bridged LAN. An MRP participant may transmit and receive MRP PDUs. For the PBB implementation, the MRP parameters can be configured at the service site level, on the access interface, or the SDP binding.

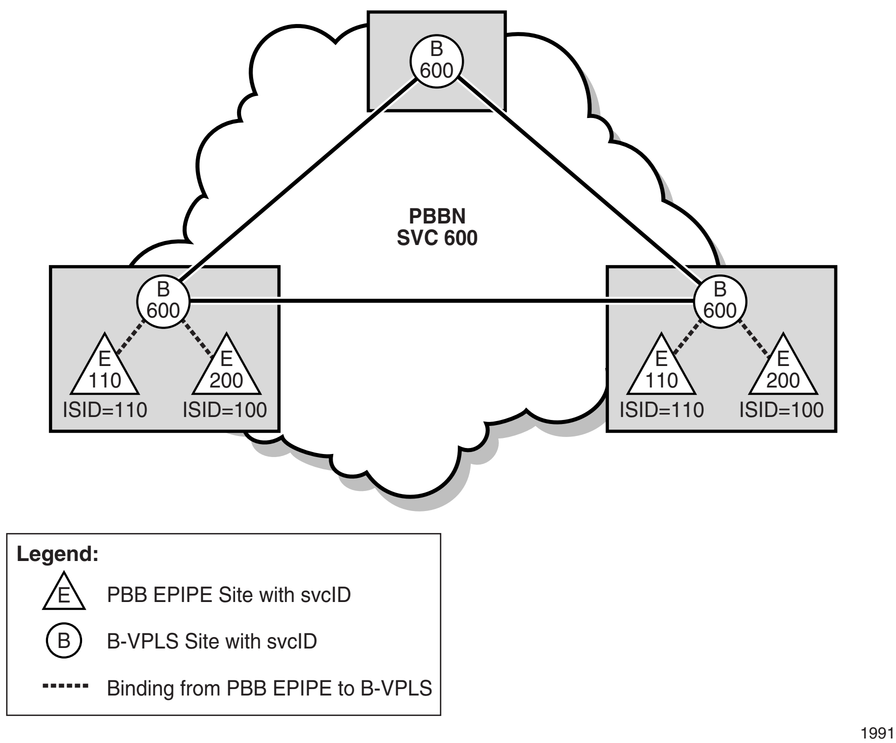
If MRP is enabled on the node, 5620 SAM's MMRP application automatically advertises the presence of the Group B-MAC address on the active B-VPLS virtual links (that is, on the B-Site spoke bindings or the B-L2 access interfaces). You can view the MMRP entries advertised and/or received on the Forwarding Control>MMRP Entries tabs of the B-Site spoke bindings or the B-L2 access interfaces. All the MMRP entries may also be viewed together at the I-Site level.

Epipe service with PBB

A PBB tunnel may be linked to an Epipe and to a B-VPLS. MAC switching and learning is not required for the point-to-point service, since all packets ingressing the Epipe access interface are PBB encapsulated and then forwarded to the PBB tunnel for the backbone destination MAC address. Similarly, all the packets ingressing the B-VPLS and destined for the ISID are PBB de-encapsulated and then forwarded to the Epipe access interface. A fully-specified backbone destination address must be provisioned for each PBB Epipe instance to be used for each incoming frame on the related Epipe L2 access interface. If the backbone destination address is not found in the B-VPLS forwarding database, then packets may be flooded through the B-VPLSs.

To enable an Epipe service with PBB, the Epipe site is configured as a PBB site and functions similarly to a VPLS I-Site. This can only be specified during the site's creation. On the Epipe PBB site, you select a B-Site that acts as the tunnel for the Epipe. You also specify the destination B-MAC address of the remote PE where the other site is located. Figure 71-6 shows a simplified view of this configuration.

Figure 71-6 Epipe service link to a B-VPLS



See the *7750 SR OS Services Guide* for more information about PBB.

BGP Auto Discovery

BGP Auto Discovery enables a VPLS PE router to discover other PE routers that are part of the same VPLS domain. This allows each PE's configuration to consist only of the identity of the VPLS instance established on a specific PE, and not the identity of every other PE in that VPLS instance. If you need to change the VPLS topology, only the affected PE's configuration needs to change. Other PEs automatically discover the change using MP-BGP and adapt themselves accordingly. In contrast, if the BGP AD functionality is not used, you must then explicitly configure each PE router with the identities of all the other PEs in a specific VPLS.

You must assign a single, globally unique VPLS-ID to each VPLS (that is, the same value for all sites to the same VPLS across the entire network). The VPLS-ID eliminates the possibility of a collision between VPLSs belonging to different service providers.

There is also a globally unique Route Distinguisher (RD) ID associated with a VPLS. Each site also needs a unique ID that is a BGP NLRI. The PE address does not have to be globally routable, but it must be unique within the VPLS. The PE ID can be the PE router ID, for operational convenience.

Each site must also be associated with one or more RT Extended Communities, and the RTs control the distribution of NLRIs.

Each PE distributes the NLRI for each of its sites, with itself as the BGP next hop, and with the appropriate RT for each NLRI. A PE with a specific RT imports all NLRIs that have that same RT (and learns the other PEs addresses through their next hops). H-VPLS can be configured by using multiple RTs.

In summary, the BGP advertisement for a specific site in a PE includes:

- An NLRI. This is the VSI-ID.
- A BGP next hop equal to the loopback address of the PE.
- An extended community attribute containing the VPLS-ID.
- An extended community attribute containing one or more RTs.

Targeted-LDP [(T-)LDP] signaling is set up for the point-to-point PWs between sites using the selected (T-)LDP sessions corresponding to the remote PE(s) that have been recently added to their list.

To auto-create a Spoke-SDP, a PW Template must be created and pushed down to the NE. The SAM policy distribution mechanism is used to send out the template and maintain consistency in the network. The template selection is at the PE level, not at the service level, because not all PEs are capable of supporting BGP AD and some VPLS sites may not support BGP discovery.

Consider the following with regard to tunnel creation:

- If you plan to use BGP AD for all or part of the VPLS, you must not enable automatic mesh SDP binding creation.
- A provisioned PW to a specific remote PE takes precedence over one that is auto-discovered using BGP AD. In other words, if there is an existing SDP binding available, the router selects this existing binding and does not automatically create a new one.
- When the 5620 SAM auto-tunnel creation function is being used for non-BGP AD VPLSs, the automatically-created components are excluded from discovery. Also, you cannot select an automatically-created SDP or SDP binding when you create a service tunnel that is to be used as part of a BGP AD VPLS.

A 5620 SAM-managed VPLS or H-VPLS may consist of various site types located on different PEs, and which in turn, may be of differing versions. Due to these possibilities, some restrictions apply in terms of using Auto Discovery. For example, an M-VPLS site cannot be in the same service with a regular site. However, BGP AD-enabled sites and regular sites can be components of the same VPLS.

BGP VPLS

BGP VPLS is an extension of the VPLS concept. When configured as a BGP VPLS, such a service can interconnect with another BGP VPLS across different VPLS domains.

The control plane of the BGP VPLS provides auto-discovery and signaling capability. In this context, auto-discovery is a means for a PE router to discover other remote PE routers that are members of a given VPLS. The signaling function enables a PE router to know which pseudowire label a given remote PE router will use when sending the data to the local PE router. The BGP VPLS control plane carries sufficient information to provide the auto-discovery and signaling functions concurrently.

Some of the major features of the Alcatel-Lucent BGP VPLS solution include:

- The data plane is identical with the BGP AD (LDP VPLS) solution. For example, VPLS instances are interconnected via a pseudowire mesh. Split horizon groups may be used for loop avoidance between the pseudowires.
- Addressing is based on a two-byte VE ID assigned to the VPLS instance.
- The target VPLS instance is identified by the Route Target (RT) contained in the MP-BGP advertisement (extended community attribute).
- Auto-discovery is MP-BGP based.
- Pseudowire label signaling is MP-BGP based. As a result, the BGP NLRI content also includes label related information such as block offset, block size, label base, and so forth,

The Alcatel-Lucent BGP VPLS solution is compliant with RFC 4761.

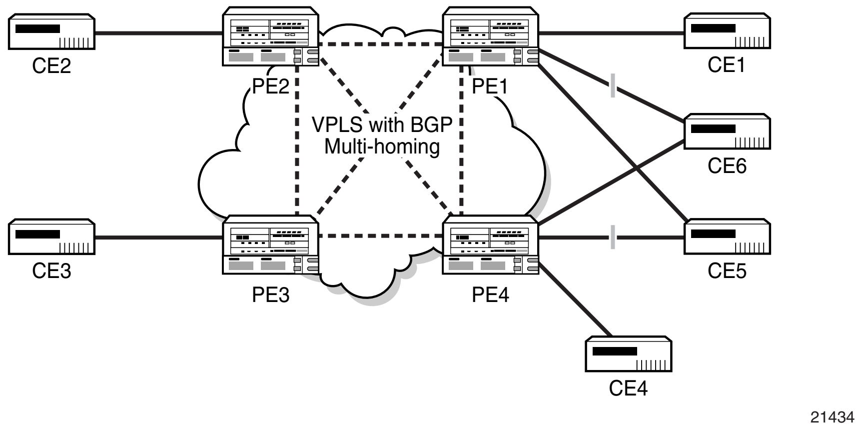
See the *7750 SR OS Services Guide* for more information regarding BGP VPLS.

BGP VPLS Multi-homing

The 5620 SAM allows BGP VPLS multi-homing to be established for CEs and access PEs by first configuring the multi-homing VPLS sites and then assigning the same multi-homing site ID to each.

Figure 71-7 shows an example of this approach, where a VPLS contains certain CEs that are multi-homed to pairs of VPLS PEs.

Figure 71-7 CE Multi-homing in VPLS



The BGP/LDP-signaled PW infrastructure (shown as the cloud at the center) is used to interconnect the VSIs between PEs. In this example, CE5 and CE6 are dual-homed to PE1 and PE4. To avoid loops, only one SAP must be active at any point in time between any multi-homed CE (such as CE5 or CE6) and its pair of connected PEs (such as PE1 and PE4). The others are blocked. Service providers use their MP-BGP on PE1 and PE4 to control the activation of the SAPs connected to the same customer site.

Other CE topologies (for instance, square connectivity) where, for example, CE1 and CE4 are part of the same customer site (and are themselves interconnected) are also supported.

When multi-homing a VPLS site using BGP (potentially into different autonomous systems), the PE routers (for example, PE1 and PE4) that are connected to the same customer site (for example, CE5) are configured with the same multi-homing ID. In this way, a loop-free topology is constructed using a routing mechanism such as BGP path selection. When a BGP speaker receives two equivalent NLRIs, it applies standard path selection criteria such as local preference and AS path length to determine which NLRI to choose.

Two VPLS NLRIs are considered equivalent from a path selection perspective if the following are identical:

- Route distinguisher
- Multi-homing ID

MVR on VPLS

MVR on VPLS is a bandwidth optimization method for applications on a broadband services network. At the port level, MVR allows a VPLS end user to subscribe or unsubscribe to a multicast stream on one or more network-wide multicast VPLS instances without requiring that the stream be part of the customer VPLS.

MVR on VPLS is a mechanism through which the supporting devices are able to participate in a multicast distribution system. Separate, dedicated VLANs must be constructed specifically for multicast traffic distribution.

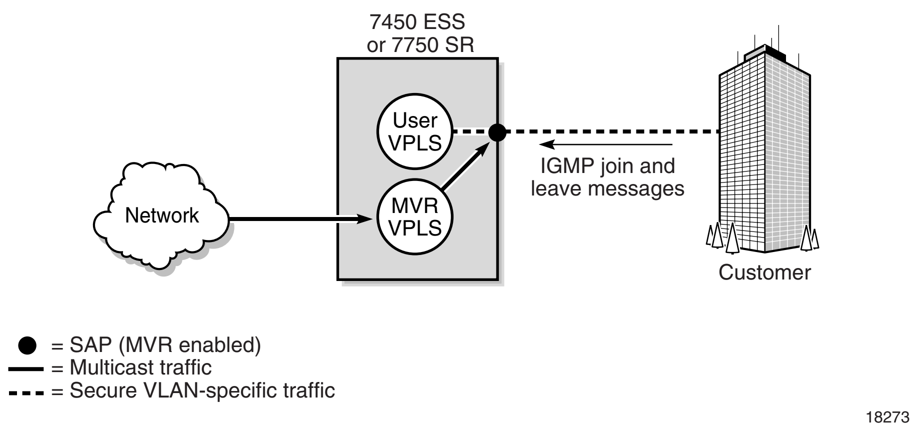
MVR assumes that hosts join and leave multicast streams by sending IGMP join and leave messages. The IGMP join and leave messages are sent inside the VPLS to which the host port is assigned. The multicast VPLS is shared in the network while the hosts remain in separate VLANs. For example, two user VPLS that are bound to the same MVR VPLS cannot exchange any information, but the same multicast service can still be provided to them.

An MVR VPLS is a VPLS that is responsible for sending multicast traffic through the network. An MVR VPLS is associated with a multicast package policy and has MVR-enabled sites. The MVR VPLS is configured to distribute certain multicast streams. An MVR VPLS can also be configured as a user VPLS to receive multicast traffic.

A user VPLS is a VPLS that contains SAPs that can receive multicast traffic from an MVR VPLS. Each SAP must be configured individually to use a specific MVR VPLS. Any VPLS, including an MVR VPLS, can be used as a multicast receiver for an MVR VPLS. IGMP and/or MLD snooping must be enabled on each site.

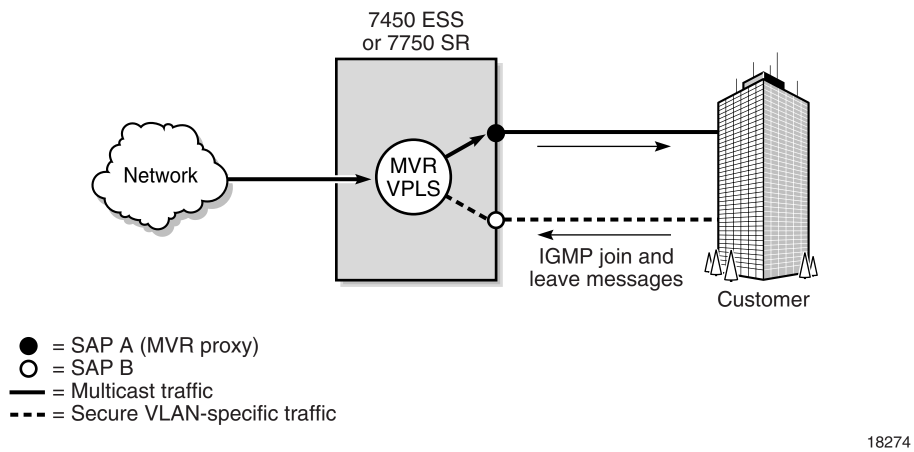
Figure 71-8 shows an example of MVR on VPLS. MVR reacts only to join and leave IGMP messages from the multicast groups configured for the MVR VPLS with which the user VPLS is associated. Join and leave messages from all other multicast groups are managed by IGMP and/or MLD snooping. Therefore, several MVR VPLS instances can be configured, each with its own set of multicast channels.

Figure 71-8 MVR on VPLS



In some situations, such as when a host is connected to a 7301 ASAM, the multicast traffic cannot be sent from the MVR VPLS to the VLAN on which the IGMP message was received (standard MVR behavior) but to another VLAN. This configuration is known as MVR by proxy. The 7450 ESS, 7750 SR, 7710 SR allow multicast traffic to be sent to a SAP other than the SAP from which the IGMP message originated. When configuring MVR by proxy, you must indicate the MVR VPLS on which the multicast channel is available and the SAP to which the multicast traffic must be copied. Figure 71-9 shows an example of MVR by proxy.

Figure 71-9 MVR by proxy



Configuring MVR on VPLS using the 5620 SAM involves the following steps.

1 Configure PIM before configuring MVR. See chapter 31 for more information.

2 Create a multicast package policy for all supporting NEs in an MVR VPLS. See chapter 49 for more information.

 Alternatively, you can configure NEs individually in an MVR VPLS using a routing policy. See Procedure 30-11 for more information.

3 Create the MVR VPLS. See Procedure 71-1 for more information.

- Associate the multicast package policy with the service, which indicates that a VPLS is an MVR VPLS.
- Specify the VPLS sites that are the sources of the multicast groups. MVR must be enabled on each site.
- Configure SAPs only if you are configuring the MVR VPLS to be a user VPLS as well. See Procedure 71-1 for more information about configuring a user VPLS.

4 Create the user VPLS. See Procedure 71-1 for more information.

- The SAPs are standard host access points.
- Configure IGMP and/or MLD snooping and MVR on each site.
- Associate the MVR VPLS with each SAP for which access to multicast traffic is needed. This association means that IGMP requests received at that SAP for a multicast group are fulfilled as long as the multicast group being requested is included in the multicast package policy of the MVR VPLS. After the SAPs in a user VPLS have been associated with a specific MVR VPLS, the SAP becomes known to the MVR VPLS.

5 If using MVR by proxy, configure a VPLS SAP that is to act as the MVR proxy. See Procedure 71-1 for more information.

In a situation in which an MVR VPLS has VPLS sites that do not support MVR, the following conditions apply.

- The ability to configure MVR is not available for the VPLS sites and SAPs of a device that does not support MVR.
- Multicast package policies are not distributed to the devices that do not support MVR.

GSMP group on VPLS

The edge devices determine the circuit that opens an ANCP session. ANCP provides status and control information such as current line rate and port-up and port-down messages to the edge devices. The edge devices perform the following functions:

- adjust the H-QoS subscriber scheduler with the correct rate
- raise an alarm when the rate goes below a set threshold
- send DSL line OAM commands to complete OAM tests

A GSMP group is created under the GSMP tab of the VPLS site form. Multiple groups can be defined and different ANCP capabilities can be associated with different groups. A neighbor can be defined in a GSMP group. Multiple neighbors can be configured for each group.

Note — A GSMP group must be configured on VPLS, MVPLS or VPRN for an ANCP session to open.

L2 management interfaces on VPLS

L2 management interfaces act as a host. L2 management interfaces are created the same way out-of-band interfaces are created on VPLS. L2 management interfaces are used for CPM protocols such as telnet, SSH, SNMP, ping, and ANCP.

CPM filtering is used to limit access to L2 management interfaces.

Routed VPLS

A routed VPLS connector joins an L3 access interface within an IES or VPRN service context to a VPLS service on the same site. When an IES or VPRN IP interface is bound to a VPLS site name, the site name cannot be bound to another IP interface. While an IES or VPRN IP interface can only be bound to a single VPLS site, the service context containing the IP interface can have other IP interfaces bound to other VPLS sites. Both the IES or VPRN IP interface and VPLS site must be located on the same NE.

If a VPLS site name does not exist within the system, the binding between the IP interface and the VPLS site remains operationally down until a VPLS site name is assigned to the VPLS site. When an IP interface is bound to a VPLS site, the operational state of the routed VPLS binding is dependent upon the operational state of the VPLS site, and whether the IP interface binding is enabled on the VPLS site.

This functionality is limited to supporting devices.

Note 1 — You can create and manage a routed VPLS connector from the navigation tree on the Composite Service (Edit) form or from an IES or VPRN access interface form, routed VPLS path.

Note 2 — The routed VPLS binding will not be operationally up until the Enable IP interface binding parameter is set to true and the VPLS site is operationally up. See Procedure 71-1 for more information.

FIBs

The FIB is the set of information that represents the best forwarding information for a destination. A FIB entry is analogous to a static MAC address, and every computer and network node has a MAC address that is hardware-encoded. In 5620 SAM, static MAC addresses can be also created on VPLS endpoint objects, access interfaces, and service circuits.

The edge devices perform the packet replication required for broadcast and multicast traffic across the bridged domain. Devices perform MAC-address learning to reduce the amount of unknown destination MAC address flooding. The edge devices learn the source MAC addresses of the traffic arriving on their access and network ports. You can also specify and manage static MAC addresses using the FIB entries table.

Each device maintains a FIB for each VPLS instance. Learned MAC addresses are populated in the FIB table of the service. All traffic is switched based on MAC addresses and forwarded between all participating sites using the service. Unknown destination packets (i.e., the destination MAC address has not been learned) are forwarded on all LSPs to the participating devices for that service until the router responds and the MAC address is learned by the device associated with that service.

Note — Each VPLS FIB entry consumes system resources. The devices allow you to set the maximum number of MAC entries allowed in a VPLS instance to prevent a VPLS instance from consuming a disproportionate amount of resources.

The size of the VPLS FIB can be configured with a low watermark and a high watermark expressed as a percentage of the total FIB size limit. If the actual FIB size grows above the configured high watermark percentage, an alarm is generated. If the FIB size falls below the configured low watermark percentage, the alarm is cleared.

MAC learning

Like an L2 device, learned MACs within a VPLS instance can be aged out if no packets are sourced from the MAC address for a specified period of time (the aging time). In each VPLS, there are independent aging timers for locally learned MAC and remotely learned MAC entries in the FIB. A local MAC address is a MAC address associated with an access interface, because it ingressed on a SAP. A remote MAC address is a MAC address received using a service tunnel from another device that is part of the VPLS.

Unknown MAC discard is a feature which discards all packets ingressing the service where the destination MAC address is not in the FIB. The normal behavior is to flood these packets to all end points in the service.

MAC learning can also occur for Split Horizon Groups (SHG) but with accompanying risks. For example, in an L2 environment of an SHG, hosts—among whom mutual communication is disallowed—can launch DoS attacks by sending a flood of packets that source an uplink MAC address to unprotected customer SAPs.

This situation can be managed by controlling MAC learning on the SAPs and SDPs in the following way: when a frame arrives at a protected SAP or SDP, the MAC is applied to its learning table; when a frame arrives at an unprotected customer SAP or SAP containing the address of a protected source MAC address, the frame is immediately dropped and not learned by the unprotected SAP. As a result, the unprotected SAP does not know the MAC address of the uplink and, therefore, cannot use it to flood packets to other SAPs in the SHG. You can create a list of protected MAC addresses and configure the behavior of a SAP that receives a frame that contains a protected source MAC address or an unprotected destination MAC address.

MAC move

A sustained high MAC re-learn rate can be a sign of a loop somewhere in the VPLS topology. Typically, STP detects loops in the topology, but for those networks that do not run STP, the MAC move feature is an alternative way to protect the network against loops.

When enabled on a VPLS, MAC move monitors the re-learn rate of each MAC. If the rate exceeds the configured allowed limit, it disables the SAP on which the source MAC last arrived. The SAP can be disabled permanently or for a length of time that grows linearly with the number of times the SAP is disabled.

There is also the option of marking a SAP as non-blockable, which means that when the re-learn rate exceeds the limit, another SAP—one that is blockable—is disabled instead. When the MAC move parameter is set to blockable, ports can be blocked in a specific order depending on the number of times the re-learn rate exceeds the configured threshold period.

MAC move is configurable on VPLS SAPs and VPLS spoke SDPs. Blocking information for an object is displayed on the MAC move configuration form for the object. This information includes:

- the number of MAC learning retries that remain before blocking occurs
- the time that remains before the blocked object is unblocked
- the order of blocking, starting with tertiary, secondary and primary

Flooding

Traffic that is normally flooded throughout the VPLS can be rate limited on SAP ingress through the use of Service Ingress QoS Policies. In a Service Ingress QoS Policy, individual queues can be defined per forwarding class to provide shaping of broadcast traffic, MAC multicast traffic and unknown destination MAC traffic. You can also specify how to classify frames.

Multiple services and service types can be configured on a port. VPLS spanning tree protocols are configured on a per-service site basis, not a per-port basis, thus, multiple instances of STP per site are supported. Unknown destinations, broadcasts, and multicasts are flooded to all other SAPs in the service.

The flooding mechanism and the way that the Interior Gateway Protocol (IGP) operates ensure that no packets are duplicated on any interface. If SAPs are connected together, either through misconfiguration or for redundancy purposes, loops can form and duplicate packets can traverse the network. The STP is designed to prevent multiple SAPs from forwarding a packet into the VPLS

Spanning tree protocols

The 5620 SAM supports RSTP for VPLS instances and maintains support for legacy STP implementations. STP on the 7750 SR and 7710 SR incorporates an optimized and compatible implementation of IEEE 802.1D which attempts to eliminate STP blocking of links in the core of the VPLS. STP on the 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, and 7450 ESS is used to guarantee that service tunnels are not blocked in any circumstance while not imposing artificial restrictions on the placement of the root bridge in the network. To provide this support, all mesh service tunnels are configured as root ports or designated ports.

RSTP, which is the default STP mode managed by the 5620 SAM, is compliant with IEEE standard 802.1D-2004. Other available STP types include an RSTP variant with 802.1w-2001 backward compatibility, an STP variant that is compliant with 802.1w-2001, and MSTP, an STP variant that is compliant with 802.1s-2002. The 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, 7750 SR, and 7710 SR support MSTP.

The 5620 SAM verifies STP parameters that are configured within each VPLS instance. However, it does not check the compatibility of STP configurations between interconnected VPLS instances.

IGMP snooping

IGMP snooping allows a device to snoop packets sent between IP multicast routers or switches and IP multicast hosts to learn the IP multicast group membership. The device checks the IGMP packets for the group registration information, and configures multicasting accordingly.

Without IGMP snooping, multicast traffic is forwarded to all ports, which is the same as broadcast traffic. IGMP snooping ensures that multicast traffic is only forwarded to ports that are members of the specific multicast group, which reduces the amount of multicast traffic passing through the device.

You can enable IGMP snooping for VPLS on Release 1.0 R4 or later of the 7210 SAS-E, Release 1.1 R6 or later of the 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, and 7210 SAS-X 24F 2XFP, the 7450 ESS, 7710 SR, and 7750 SR, and Release 6.4.2 R1 or later of the OS 9700E and OS 9800E. You can enable IGMP snooping for VPLS sites, access interfaces, and spoke SDPs on a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP. A database of group members per VPLS instance is built by listening to IGMP queries and reports from each SAP and SDP of a service site. The reports are forwarded to the multicast routers.

IGMP snooping is not supported when MAC subnetting is enabled.

MLD snooping

Multicast Listener Discovery snooping is essentially the IPv6 version of IGMP snooping. The guidelines and procedures are very similar to IGMP snooping.

When MLD snooping is not enabled, L2 switches treat multicast traffic like an unknown MAC address or broadcast frame, that is, the frame is flooded out on every port of a VLAN. When MLD snooping is enabled, switches snoop the frame's L3 header for more efficient switching. In the context of IP multicast, only hosts that have expressed interest in receiving packets for the multicast groups have the frames forwarded to them.

The 7x50 and 7710 SR routers allow the enabling of MLD snooping for VPLS. A database of group members (per VPLS instance) is built by listening to MLD queries and reports from each SAP and SDP of the instance. These reports are forwarded to the multicast routers, if any are present.

MLD snooping is not supported when MAC subnetting is enabled.

Consider the following:

- Multicast groups can be learned (using the destination IP addresses of multicast packets) through MLD snooping or by static configuration at the port.
- The Fast leave feature modifies the membership leave mechanism by terminating the session immediately, rather than issuing a group-specific query to check if other members are still present on the network. Therefore, if a port (SAP or SDP) is configured for Fast leave, the session is terminated immediately without checking if the port also has other hosts subscribed to that same multicast group.
- A multicast router retains a list of multicast group memberships for each attached network. Therefore, a multicast router can assume the role of querier or listener. However, there can be only one querier per physical network.
- MLD snooping statistics are collected for each NE port, SAP, or SDP binding, and are viewable from the Statistics tab of a VPLS site properties form.
- The 5620 SAM supports MLDv1 and MLDv2.
- The 5620 SAM supports MVR.
- MLD snooping can co-exist with IGMP snooping and PIM snooping.
- MAC-based forwarding entries can be built using MLD snooping results.

PIM snooping

Protocol Independent Multicast snooping for VPLS allows a VPLS PE router to build multicast states by snooping PIM protocol packets that are sent over the VPLS. The VPLS PE then forwards multicast traffic based on the multicast states.

When all receivers in a VPLS are IP multicast routers running PIM, multicast forwarding in the VPLS can be efficient when PIM snooping for VPLS is enabled. After PIM snooping is turned up at the service level, all sites have PIM snooping configured and are set to the down state, by default. If any site does not support this feature, the 5620 SAM treats it as having PIM snooping turned off.

Since PIM snooping operates on PIM Hello packets as well as Join/Prune packets, PIM neighbors of the current router are learned by snooping on Hello packets. Therefore, in a meshed VPLS, every node learns from every other node's Hello packet and considers that node as a neighbor.

VPLS PE routers only snoop on PIM Hello and Join/Prune packets; they do not generate PIM messages on their own. Therefore, when PIM snooping is configured at the service level, all CE routers must have Join/Prune suppression disabled. If a VPLS PE router detects a condition where Join/Prune suppression is not disabled on one or more CE routers, the PE router puts PIM snooping into a non-operational state for the entire service. A trap on the PE is generated to report this condition and an alarm is raised to the 5620 SAM operator. To bring PIM snooping back to the operational state, PIM snooping must be disabled and then re-enabled.

Since PIM uses state refreshes, VPLS PE routers may not learn multicast states from all the CE routers, if PIM snooping was just enabled or the all snooping state was just cleared, until the next refresh.

To avoid traffic interruption, PIM snooping should hold up its operations for a period of time (60 seconds, if default timer is used). During this period of time, multicast traffic is flooded in the VPLS just like snooping was not enabled. SAM should have this hold-up timer configurable on VPLS properties panel having range 0-120 with 60 secs as default.

A variety of statistics are gathered for PIM snooping operation and are available for viewing and analysis in the PIM Snooping tab of a VPLS configuration form.

PIM snooping is not supported when MAC subnetting is enabled.

PIM snooping only supports IPv4.

Split horizon groups

SHGs control traffic that flows through SAPs or spoke SDPs for a VPLS site. SHGs prevent a packet received on a SAP within the group from being propagated to other members of the group.

SHGs are defined when you create or modify a VPLS site. You can create multiple SHGs for a VPLS site. SHGs can support a mix of spoke SDPs and SAPs. When you create SAPs or spoke SDPs they can be associated with an SHG.

Users can:

- configure, modify, or delete SHGs on a VPLS site
- associate SAPs or spoke SDPs with SHGs

Residential split horizon groups

RSHGs are SHGs with the Residential parameter enabled. SAPs that are associated with RSHGs are called lightweight SAPs. RSHGs use dual-pass queue optimization and do not support downstream broadcast or multicast traffic.

Users can:

- configure, modify, or delete RSHGs on a VPLS site
- associate SAPs or spoke SDPs with RSHGs

Note — If a SAP or spoke SDP is associated with an RSHG, then the following apply:

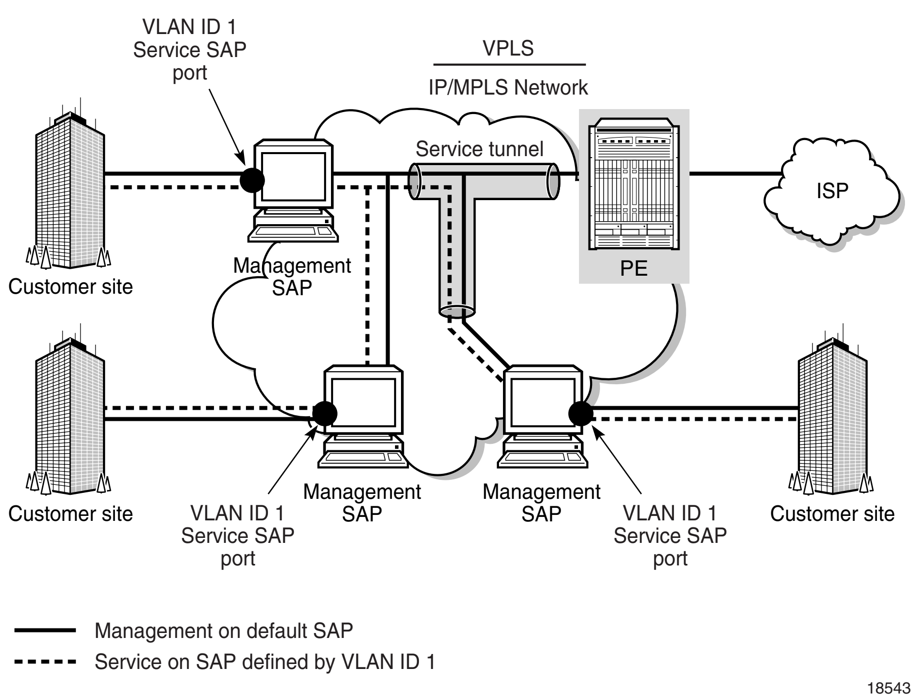
- MAC pinning is enabled by default and cannot be disabled for the interface
- IGMP snooping, MLD snooping, and MVR are not configurable for the interface

Default SAPs

The 5620 SAM allows you to create a default SAP that you can use in an L2-based service to perform management tasks or to deliver a specific class of end-user service. One default SAP can be defined on any dot1q encapsulated Ethernet port. You can create a default SAP by specifying an outer encapsulation value of 4095 or *. If OSSI is used, the outer encapsulation value is always 4095.

Figure 71-10 shows a default SAP used as a dedicated management port.

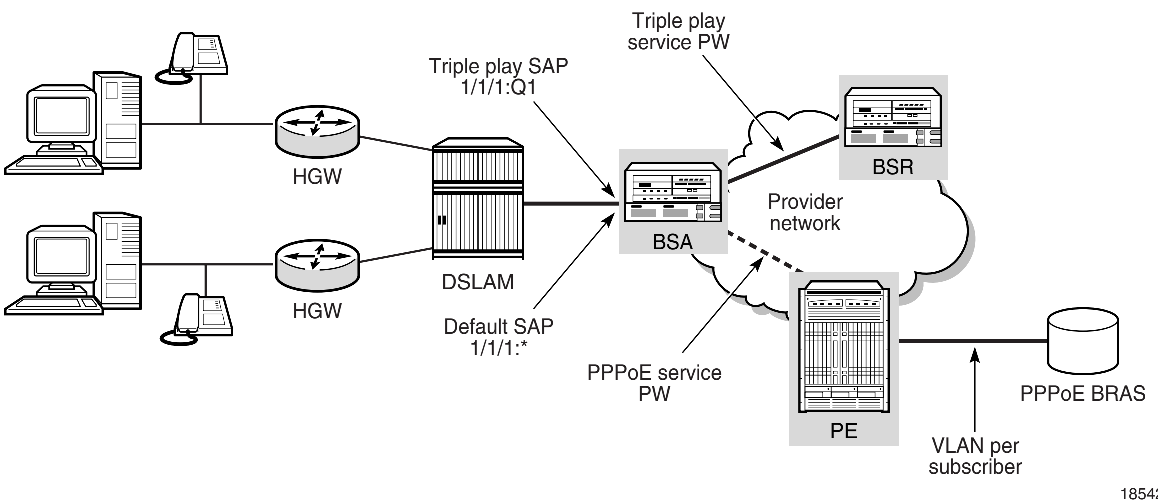
Figure 71-10 Default SAP as a dedicated management port



The dotted line shows that a business customer uses an entire port to access an L2 service using a VLAN tag ID 1, which is transparent to the network service provider. The service provider has assigned a default SAP for management of the customer network, as shown by the solid line. The customer uses one SAP for service delivery, and the service provider uses the default SAP to manage the customer network.

Default SAPs can also be used to differentiate one class of service from another on a single port. In Figure 71-11 the service provider can deliver aggregated high-speed Internet services on a single default SAP for multiple hosts while applying tags that assign one VLAN per host. At the same time, each of the remaining SAPs on the same port can be deployed for higher-level services, such as triple play delivery, in which multiple or individual hosts are assigned to a single SAP. Using such differentiated SAPs is efficient and significantly increases network scalability, because of the reduced number of SAPs allocated to various customers.

Figure 71-11 Default SAP to differentiate subscriber services



Layer 2 protocol tunneling termination

L2PT allows service providers to preserve the VLAN and Layer 2 protocol configurations of individual customers without impacting the traffic of other customers across the core network. L2PT termination allows Layer 2 PDUs to be transparently tunneled across the core network, avoiding interaction between the network provider and customer protocols.

Transparent L2PT is performed on the ingress side of every SAP or spoke SDP of the PE routers configured with L2PT termination. L2PT tunnels PDUs by overwriting the customer PDU of the destination MAC address in an Ethernet packet the multicast MAC address 01-00-0c-cd-cd-d0. The Ethernet packet is then transparently tunneled over the core network to a peer PE router. The peer PE router at the egress side of the tunnel restores the MAC address and the L2 protocol so that packets are forwarded to all ports in the same VLAN.

L2PT termination can only be enabled if STP is disabled on the VPLS.

BPDU translation

VPLS networks typically interconnect customer sites that use different access technologies, such as Ethernet and bridge-encapsulated ATM PVCs. Because of this, BPDU translation may be necessary to provide end-to-end interconnectivity.

If BPDU translation is enabled on a SAP or spoke SDP, the device intercepts all BPDUs and performs the required translation.

BPDU translation can be enabled only on a SAP or spoke SDP binding if STP is disabled on the VPLS.

DoS protection

To protect a VPLS from a high incoming packet rate that characterizes a DoS attack, you can use the 5620 SAM to create DoS protection policies for the VPLS L2 access interfaces. A DoS protection policy limits the number of control-plane packets that an interface receives each second, and optionally logs a violation notification if a policy limit is exceeded. You can use the NE System Security form to view the violations for a specific NE.

You can configure a DoS protection policy to control the following on a VPLS L2 access interface:

- the control-plane packet arrival rate per subscriber host on the interface
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

Each VPLS L2 access interface on an NE that supports DoS protection is automatically assigned a default DoS protection policy. The default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified. See Procedure 21-3 for information about creating a DoS protection policy.

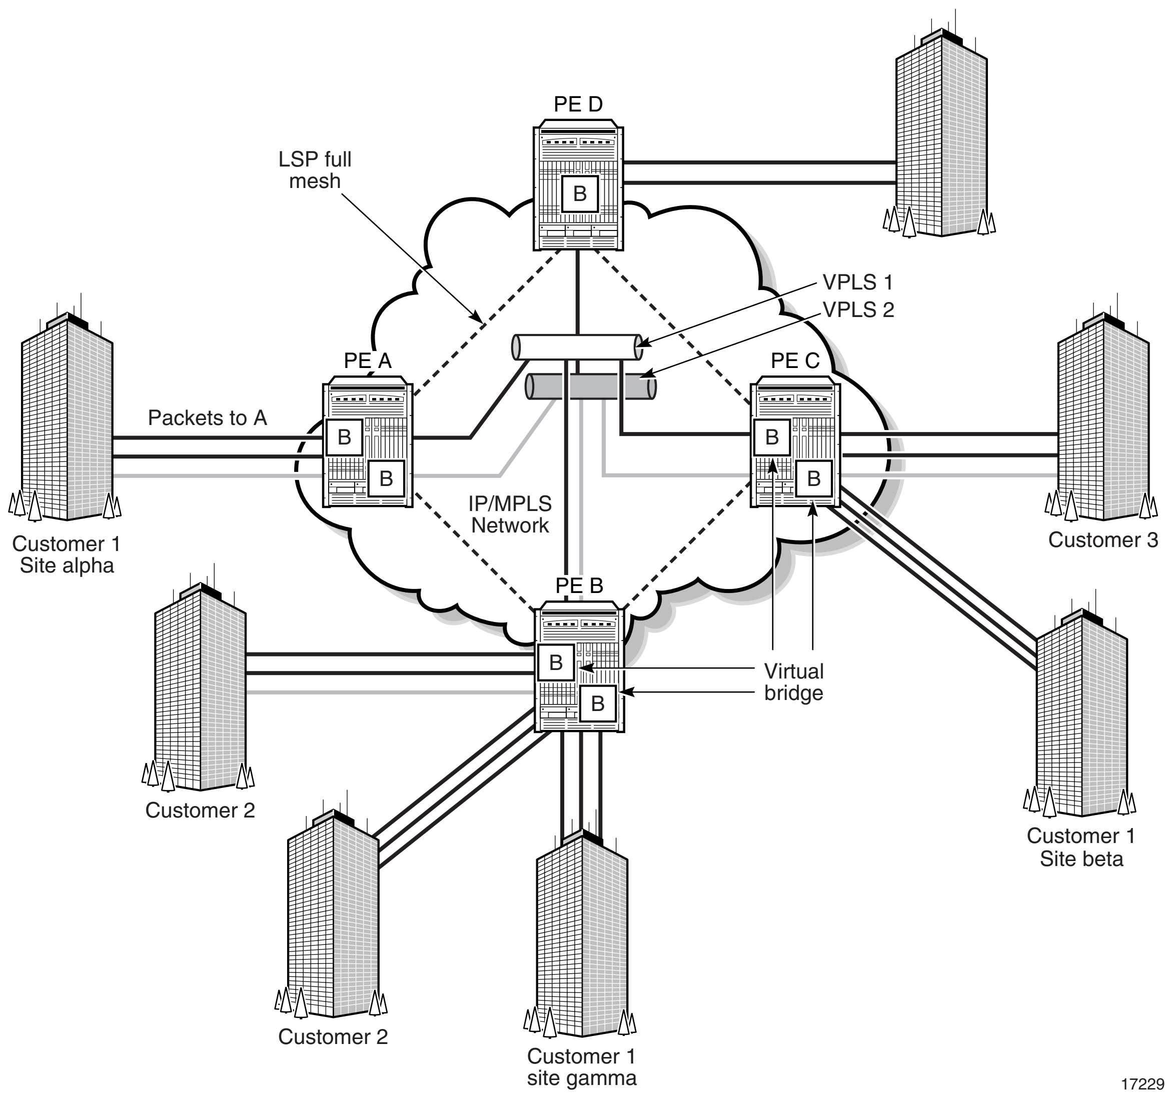
Copying and moving SAPs between ports

You can copy and move SAPs between ports. See “Moving and copying SAPs between ports” in chapter 20 for more information.

71.2 Sample VPLS configuration

Figure 71-12 shows a sample VPLS configuration.

Figure 71-12 Sample VPLS



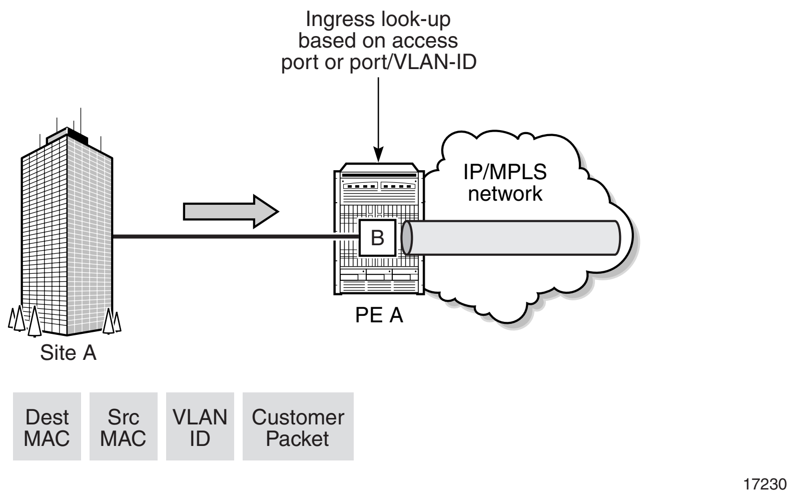
VPLS 1 is a distributed service, which consists of customer 1 connected to PE A, PE B, and PE C, at sites alpha, gamma, and beta, respectively. All three customer sites belong to VPLS 1.

In the following example, Customer 1 wants to send data from site alpha to site beta.

Customer 1 packets arriving at PE A are associated to the appropriate VPLS 1 for that customer, based on the combination of the access port and the dot1q (VLAN ID) in the packet. PE A learns the source MAC address in the packet and creates an entry in the FIB table that associates the MAC address to the access port on which it was received.

PE A is sending the packets to PE C. The destination MAC address in the packet is looked up in the FIB table of PE A for the VPLS instance, as shown in Figure 71-13.

Figure 71-13 Packet forwarding by ingress router PE A



The destination MAC address in the FIB table has one of two values:

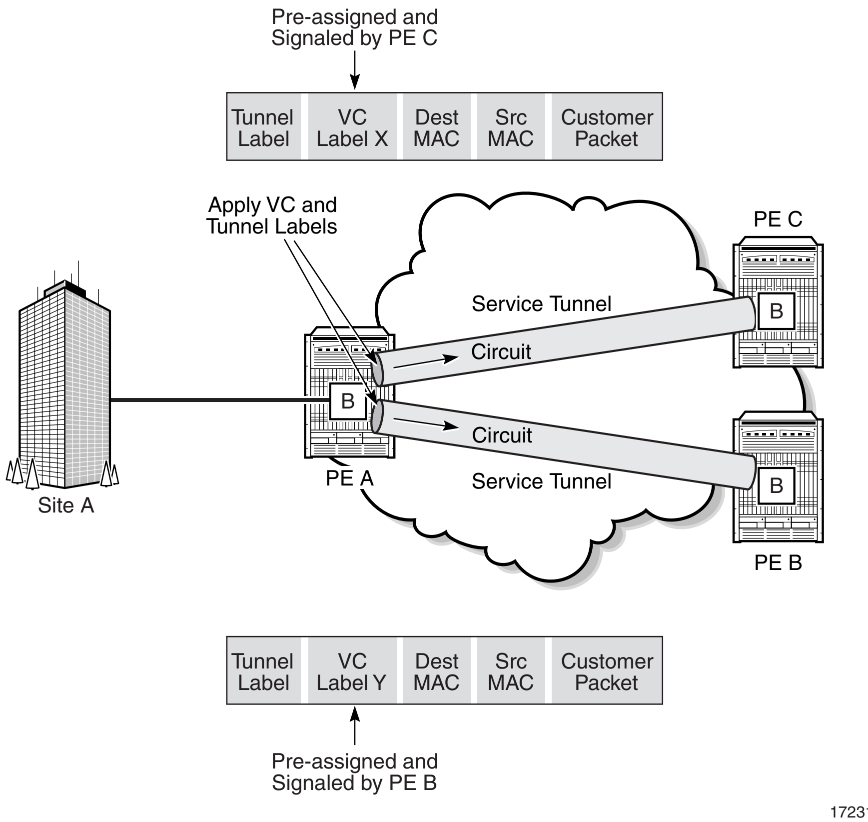
- known
- unknown

If the destination MAC address is known by PE A, an existing entry in the FIB table identifies the far-end PE C and the service VC label (VLAN ID) used to send the packets from PE A to PE C. PE A chooses a transport LSP to send the packets to PE C. The packets from the customer 1 site alpha to site beta are sent on the LSP after the VC label is removed and the transport label is added to the packet, as shown in Figure 71-13.

If the destination MAC address is not known by PE A, PE A floods packets to both PE B and PE C, which are both part of VPLS 1. PE A uses the VC labels (VLAN IDs) that PE B and PE C previously signaled for this VPLS 1.

As shown in Figure 71-14, the packets from PE A are transported across the core IP/MPLS network.

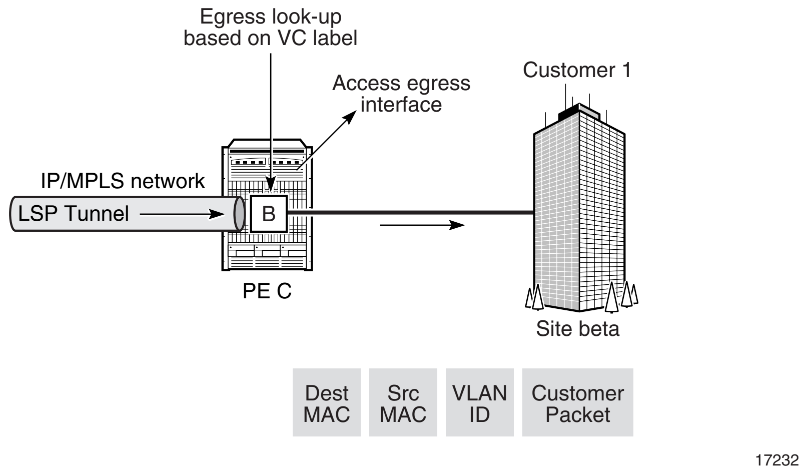
Figure 71-14 Packet forwarding from PE A across the core IP/MPLS network



The core routers are LSRs that switch the packets towards their destination based on the tunnel label, also called a transport label. The core routers are not aware that the packets belong to a VPLS.

When the packets from PE A arrive at PE C, PE C removes the tunnel label to reveal the VC label that associates the packets with VPLS 1, as shown in Figure 71-15.

Figure 71-15 Packet forwarding by egress router PE C



PE C learns the source MAC address of PE A and creates an entry in its FIB table that associates the MAC address and the VC label with PE A. The destination MAC address is looked up in the FIB table. It has one of two values:

- known
- unknown

If the destination MAC address is known by PE C, an existing entry in the FIB table identifies the local access (egress SAP) port used by VPLS 1 site beta and the service VC label (VLAN ID) that needs to be added to send the packets from PE C to customer 1.

If the destination MAC address is not known by PE C, PE C floods packets to all local access ports that belong to VPLS 1.

Assuming the core IP/MPLS network has already been configured, the following high-level tasks are required to configure this sample VPLS.

Table 71-1 Sample VPLS configuration

Task	Description
1. Configure policies as required	Policies must be configured before service creation. The following key policies can be applied to resources that are part of a VPLS: • Access ingress and access egress policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress to open the access ingress and egress interface policy forms. • Scheduler policy. Choose Policies→QoS→SROS QoS→Scheduler to open the scheduler policy form. • ACL MAC filter policies. These policies specify access control lists based on MAC addresses. You can specify MAC learning for access ports or tunnels. Choose Policies→Filter→ACL MAC Filter to open the ACL filter policy form. • Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form. • ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form. • DoS protection policy. Choose Administration→Security→NE DoS Protection to open the NE DoS protection form.
2. Configure ports as access ports for use in the service	Choose a port from the navigation tree, right click on the port, and choose Properties. Specify the port as an access port and specify an encapsulation type, if required.
3. Configure service tunnels, as required.	Service tunnels, or SDPs, are automatically created if there are no tunnels between the source and destination devices. You must choose GRE or LDP as the transport type for the 5620 SAM to automatically create service tunnels. To manually create service tunnels, choose Manage→Service Tunnels. Service tunnels carry service traffic between edge-managed routers. Services are associated with service tunnels by SDP bindings during service configuration. During service creation, you can also configure the 5620 SAM to automatically create SDP bindings to associate service tunnels with a service. In this case, you do not have to create service tunnels before you create the service.
4. Create and configure Customer 1.	Choose Manage→Service→Customers to open the customer manager form and create the customer.

(1 of 3)

<table>
<tr><th>Task</th><th>Description</th></tr>
<tr><td>5. Create and configure VPLS 1.</td><td>
Specify Customer 1 as the customer for the VPLS.
Configure MVR for the VPLS, if required.
Configure a GSMP Group and a GSMP group neighbor for the VPLS, if required.
Configure L2 management interfaces, if required.
Specify PE A, PE B, and PE C as the sites for the VPLS.
Specify VPLS STP parameters, if required.
Specify VPLS FIB parameters, if required.
Specify VPLS MAC move parameters, if required.
Specify VPLS MAC flush parameters, if required.
Enable VPLS PIM snooping, if required.
Specify VPLS IGMP snooping parameters, if required.
Specify VPLS MLD snooping parameters, if required.
Create an SHG for the VPLS, if required.
Configure and specify access interfaces on the PE A and PE C sites as the access interfaces for the VPLS to site alpha and site beta. You do the following when you configure interfaces:
Specify the ports for the access interfaces and configure the access interfaces. Ports must be configured as access ports.
Specify the EMG to which the L2 access interface belongs.
Assign ingress and egress QoS policies as required.
Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
Assign ACL filter policies as required.
Assign an accounting policy, if required.
Specify a ToD suite, if required.
Configure STP and FIB forwarding control.
Configure subscriber management parameters, if required.
Assign a DoS protection policy, if required.
Configure VPLS PIM snooping, if required.
Configure IGMP snooping for the interface, if required.
Configure MLD snooping for the interface, if required.
Configure DHCP for the interface, if required.
Configure ARP host configuration, if required.
Configure MVR for the interface, if required.
Configure anti-spoofing for the interface, if required.
Associate MEPs with SDP spoke bindings or SAPs, if required.
Associate virtual MEPs with services, if required.
Configure ANCP, if required.
Configure ATM functionality, if required.

Create and configure service tunnels in both directions.
If the VPLS is a distributed VPLS, configure mesh SDP bindings to connect the VPLS sites. You can also configure the 5620 SAM to automatically create SDP bindings.
</td></tr>
<tr><td>6. Create, update, or configure additional sites or L2 access interfaces for the VPLS.</td><td>
Repeat the above steps as required.
Create an MSAP policy, if required. See Procedure 68-5 for more information about creating an MSAP policy.
Configure the SAP Sub Type to be created. If your SAP is to support a shared SAP model, configure a Regular SAP; that is choose Regular as the SAP Sub Type. If you need to use an MSAP to support the one subscriber per SAP model, choose Capture as the SAP Sub Type and then configure the Capture L2 Interface parameters, which control the DHCP, PPPoE, or ARP triggered creation of MSAPs. See Managed SAP (MSAP) in section 68.1 for more information about creating a Capture SAP and MSAP.
</td></tr>
<tr><td>7. For an HVPLS, use spoke SDP bindings to connect VPLS sites to other sites in the same VPLS, to sites in a different VPLS, or to VLL service sites.</td><td>An HVPLS consists of VPLS sites connected to other VPLS sites in the same or different VPLS, or to VLLs, using spoke SDP bindings. You perform the following when you configure an HVPLS.
Create one or more VPLS and VLL services, as required. See chapter 70 for information about creating a VLL service. See Procedure 71-1 in this chapter for information about creating a VPLS.
Create spoke SDP bindings between the service sites, one in each direction. Specify existing service tunnels and a VC ID for the spoke SDP bindings, as required.
</td></tr>
</table>

(2 of 3)

Task	Description
8. Create a single MVPLS.	Create an MVPLS to run RSTP and to protect redundant spoke SDPs or SAPs in the associated VPLS.
9. Create a composite MVPLS to manage traffic blocking for multiple VPLS.	An MVPLS composite service manages traffic for multiple VPLS with redundant spoke SDPs or SAPs. You perform the following when you configure an MVPLS composite service: • Create a composite service and add the individual MVPLS. • Create spoke SDP connectors between the MVPLS.

(3 of 3)

71.3 Workflow to create a VPLS

The following workflow lists the high-level steps required to create a VPLS. As a prerequisite for creating a VPLS, this workflow assumes the following:

- a group or customer with the required user access privileges has been set up; see chapter 9 for more information.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 33-1.
- the access ports for the service are created; see chapter 20 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 46 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 31 for more information about protocol configuration.

1 Create and configure a VPLS. See Procedure 71-1 for all devices that suppport the creation of a VPLS except for 7210 SAS devices. See Procedure 71-2 for 7210 SAS devices.

i Define the service type as VPLS.

ii Ensure the LSP network is configured when the transport mechanism is MPLS.

iii Configure HVPLS spoke redundancy, if required.

iv Specify the sites for the service.

v Create endpoints for redundant configuration, if required.

vi Create a spoke SDP binding under any endpoints you created, if required.

vii Configure the split horizon group parameters, if required.

viii Configure DHCP, if required.

ix Configure MVR, if required.

x Configure GSMP group and GSMP group neighbor parameters, if required.

xi Specify the STP parameters, if required.

xii Create MSTP instances and associate VLANs, if required.

xiii Specify protected MAC addresses, if required.

2 Create L2 access interfaces for the VPLS sites, as required. See Procedure 71-3.

i Specify aggregation on a service basis, or across a card or port.

ii Configure MSAP policies, if required. Create an MSAP Policy to control how the parameters are applied to an MSAP when it is automatically created. See Procedure 68-5 for more information.

iii Configure the SAP Sub Type as Regular or Capture, as required. Regular is the default value used for the creation of a SAP and Capture is the value used to enable the automatic creation of an MSAP. That is, you create a Capture SAP to enable the creation of an MSAP. See Procedure 68-20 for more information about creating a Capture SAP.

iv Assign QoS, scheduling, accounting, ANCP and filter policies.

v Specify MAC ACL filters, if required.

vi Assign a time of day suite, if required.

vii Configure the FIB and STP parameters.

viii Configure subscriber management, if required.

ix Assign a DoS protection policy, if required.

x Configure PIM snooping parameters, if required.

xi Configure IGMP snooping parameters, if required.

xii Configure MLD snooping parameters, if required.

xiii Configure DHCP relay parameters, if required.

xiv Configure ARP hosts, if required.

xv Configure MVR, if required.

xvi Configure anti-spoofing parameters, if required.

xvii Configure queue override parameters, if required.

xviii Configure MEP parameters, if required.

xix Configure ANCP, if required.

xx Configure L2 management interfaces, if required.

3 Create a mesh SDP binding for the VPLS site, if required. See Procedure 71-4.

4 Create a spoke SDP binding for the VPLS site, if required. See Procedure 71-5.

5 Create and enable a video interface for the VPLS, if required. See Procedure 36-3.

6 Configure a site for BGP AD or BGP VPLS, as required. See Procedure 71-6.

7 Configure a site for BGP VPLS Multi-homing, as required. See Procedure 71-7.

8 Perform one or more of the following.

- **a** Re-evaluate the PW Templates associated with a BGP AD or BGP VPLS site, as required. See Procedure 71-8.
- **b** Create an HVPLS. See Procedure 71-9.
- **c** Create an MVPLS. See Procedure 71-10.
- **d** Create a B-site for VPLS or MVPLS. See Procedure 71-11.
- **e** Create an I-VPLS. See Procedure 71-12.
- **f** To create a VPLS or MVPLS B-L2 access interface. See Procedure 71-13.
- **g** Create a VPLS I-L2 access interface. See Procedure 71-14.
- **h** Configure a GNE site on a VPLS service. See Procedure 71-15.
- **i** Force a switchover to a redundant spoke SDP binding. See Procedure 71-16.
- **j** Run an OAM validation test for a VPLS. See Procedure 71-17.

9 As required, modify the FIB entries associated with a VPLS:

- **a** Add or modify FIB entries; see Procedure 71-18.
- **b** To list FIB entries; see Procedure 71-19.

10 As required, view VPLS information:

- **a** View the service topology map associated with a VPLS. See Procedure 71-20.
- **b** View the VPLS operational status. See Procedure 71-21.
- **c** View IGMP snooping queriers. See Procedure 71-22.
- **d** View MLD snooping queriers. See Procedure 71-23.

11 As required, modify a VPLS:

- **a** Using the Manage Services form. See Procedure 71-24.
- **b** Using the topology view. See Procedure 71-25.

12 As required, delete a VPLS. See Procedure 71-26.

71.4 VPLS management procedures

Use the following procedures to perform VPLS creation and management tasks.

Procedure 71-1 To create a VPLS

This procedure applies to all devices that suppport the creation of a VPLS except for 7210 SAS devices. See Procedure 71-2 for 7210 SAS devices.

Note 1 — For OS devices, only the OS 9700E and OS 9800E NEs support the creation of a VPLS.

Note 2 — The following tab buttons are supported on the OS 9700E and OS 9800E NEs for VPLS configuration at the site level:

- General
- Components
- Scripts
- L2 Access Interface
- Forwarding Control
- Mesh SDP Bindings
- Templates
- Faults

1 Choose Create→Service→VPLS from the 5620 SAM main menu. The VPLS Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VPLS. The Select Customer - VPLS Service form opens.

3 Choose a customer for the VPLS and click on the OK button. The Select Customer - VPLS Service form closes, and the VPLS Service (Create) form displays the customer information.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Default Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Automatic Mesh SDP Binding Creation
- Profile Name
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Depending on the type of device being configured, the MVR tab is configurable. Assign a multicast package policy to the VPLS, if required.

i Click on the MVR tab button.

ii Click on the Select button to choose a multicast package policy. The Select Multicast Package Policy - VPLS Service - Subscriber form opens.

iii Choose a multicast package policy and click on the OK button. The Select Multicast Package Policy - VPLS Service - Subscriber form closes, and the VPLS Service (Create) form refreshes with the multicast package policy name.

After the multicast package policy is applied to the VPLS, the policy is distributed as the routing policy to all MVR-capable VPLS sites. If you apply another package policy to the site, the new policy is distributed to the site. The previously distributed policy remains on the site.

6 To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

i Click on the 5670 RAM Parameters tab button.

ii Click on the General tab button.

iii Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name

7 If you are configuring the service for BGP Auto-Discovery, go to step 8. Otherwise, go to step 11.

8 Click on the BGP AD tab button.

9 Set the BGP AD Administrative Status parameter to Up. The BGP AD Service Identification group appears.

10 Configure the VPLS ID parameter. This parameter must be a unique network-wide ID.

11 Perform one of the following:

a Create a site for the VPLS. Go to step 12.

b Complete service creation if sites, L2 access interfaces, and SDP bindings for the VPLS are to be created later. Go to step 41.

For information on adding a GNE site to a VPLS service, see Procedure 71-15.

12 On the navigation tree, right-click on Sites and choose Create VPLS Site. The Select Network Elements - VPLS Service - Subscriber form opens with a list of available sites.

Note — The options to create either a B-Site or an I-Site are used when you are creating a VPLS that utilizes Provider Backbone Bridging. See "Provider Backbone Bridging in VPLS" in section 71.1 for more information.

13 Select a site and click on the OK button. The VPLS Site (Create) form opens with the General tab displayed.

14 Configure the parameters:

- Name
- Description
- MTU
- MTU Check
- Default Mesh VC ID
- Administrative State
- Monitor Access Interface Operational State
- GSMP Administrative State
- PIM Snooping Enabled
- Per Service Hashing for LAG Enabled
- Enable IP Interface Binding
- SAP Type
- Customer VID
- PPPoE Circuit ID
- Tunnel Fault Notification

Note 1 — The Enable IP Interface Binding parameter is configurable only on a 7450 ESS in mixed mode, or a Release 8.0 R5 or later 7750 SR.

Note 2 — The parameters that appear on the VPLS Site (Create) form depend on the device type and release that you are configuring.

Note 3 — Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

Note 4 — If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault propagation from the facility tunnel MEP.

If you are configuring a 7250 SAS-ES or 7250 SAS-ESA site, configure the following additional parameters:

- Default VC ID
- Inherit Service ID Value
- Enable Secure SAPs
- VPLS Tag
- VC Type

Caution — On the 7250 SAS, Release 2.0, the SAPs and SDPs on a VPLS site will go down when the 5620 SAM is used to configure the site attributes. You must manually reconfigure these SAPs and SDPs back up after configuring the VPLS site.

Note — 7250 SAS-ES NEs must be included in a VPLS ring group before VPLS services can be created or discovered.

15 If you are configuring a 7250 SAS-ES or 7250 SAS-ESA site, go to step 30.

16 Configure MFIB, STP, FIB, and MAC learning protection parameters for the VPLS site, if required.

i Click on the Forwarding Control tab button. The MFIB tab is displayed.

ii Configure the parameters:

- Table size (entries)
- High Watermark (%)
- Low Watermark (%)

iii Click on the STP tab button to configure STP parameters for the VPLS site, if required. Otherwise, go to step iv.

- Bridge Forward Delay (seconds)
- Bridge Hello Time (seconds)
- Bridge Max Age (seconds)
- Priority
- STP Mode
- Maximum BPDUs (PDUs/Hello Interval)
- Administrative State

Note 1 — Alcatel-Lucent STP in a VPLS interoperates with customer STP implementations as a mechanism for loop detection and prevention. The bridge-level parameters balance the STP resiliency and speed of convergence. Modifying the bridge-level parameters must be done within the constraints of the following formulas:

- 2 × (Bridge Forward Delay - 1.0 s) >= Bridge Max Age
- Bridge Max Age >= 2 × (Bridge Hello Time + 1.0 s)

Note 2 — If you are configuring an MVPLS site, set the STP Mode parameter to RSTP or MSTP, depending on the MVPLS type. The MSTP option is available only if you are creating an MVPLS. See Procedure 71-10 for more information about creating an MVPLS.

Note 3 — MSTP is configurable only on the 7450 ESS and 7750 SR.

iv Click on the FIB tab button to configure FIB parameters for the VPLS site, if required. Otherwise, go to step 17.

v Configure the parameters:

- High Watermark (%)
- Low Watermark (%)
- Local Age Time (seconds)
- Remote Age Time (seconds)
- Size (entries)
- Aging Enabled
- Learning Enabled
- Discard Unknown Destinations
- MAC Flush on fail
- Propagate MAC Flush
- MAC Subnet Length

vi Depending on the type of device being configured, the Mac Move panel appears. Configure the MAC move parameters, if required:

- Move Frequency
- Retry Timeout
- Number Of Retries
- Administrative State
- Primary Ports Cumulative Factor
- Secondary Ports Cumulative Factor

vii Click on the MAC Protection tab to configure the list of protected MAC addresses.

viii Click on the Create button. The MAC Protection (Create) form opens.

ix Configure the Protected Mac Address parameter.

x Click on the OK button to close the form and add the MAC address to the list of protected MAC addresses.

xi If you are configuring an MVPLS site that requires MSTP, click on the MSTP tab button. Otherwise, go to step 17.

Note — MSTP is configurable only on the 7450 ESS and 7750 SR.

xii Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

xiii Click on the MST Instances tab button.

xiv Click on the Create button. The MST Instance (Create) form opens with the General tab displayed.

xv Configure the parameters:

- Instance Index
- Priority

xvi Click on the VLAN Ranges tab button. Click on the Create button. The MST Instance Managed VLAN range (Create) form opens.

xvii Configure the parameters:

- Min. VLAN Tag
- Max. VLAN Tag

xviii Click on the OK button. The MST Instance Managed VLAN Range (Create) form closes, and a dialog box appears.

xix Click on the OK button. The MST Instance (Create) form refreshes with the new managed VLAN range.

xx Click on the OK button. The MST Instance (Create) form closes and a dialog box appears.

xxi Click on the OK button. The MVPLS Site (Create) form refreshes with the new MST instance.

17 Configure SHCV for the site, if required.

i Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

ii Select the SHCV Enabled parameter to enable SHCV.

iii Configure the parameters:

- SHCV Interval (minutes)
- SHCV Source
- SHCV Source MAC Address
- SHCV Action
- SHCV Retry Timeout (seconds)
- SHCV Retry Count

18 Configure a default gateway for the site, if required.

i Click on the Default Gateway tab button.

ii Configure the parameters:

- Default Gateway IP Address
- Default Gateway MAC Address

19 Configure ingress multicast forwarding, if required.

Note — An Operational Channels tab appears when you access the VPLS Site form in the Edit mode. It displays data for the operational channels when traffic from a specific multicast source for a specific multicast group passes through the service. You must click on the Search button to refresh the data. See chapter 46 for information about listing the operational channel parameters.

i Click on the Mcast Path Mgmt tab button.

ii Click on the Select button to choose a multicast info policy. The Select Ingress Info Policy form opens.

iii Choose a policy in the list and click on the OK button. The Select Ingress Info Policy form closes and the policy identifier is displayed on the Site (Create) form.

20 Configure IGMP snooping for the site, if required.

i Click on the IGMP Snooping tab button.

ii Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Robust Count
- Report source address
- Use query source address

21 Create an endpoint for redundancy (dual homing) on the site, if required.

Note — You cannot create a VPLS endpoint on a site that has an active or inactive MC ring SAP. See chapter 45 for more information.

i Click on the Endpoints tab button.

ii Click on the Create button. The VPLS Endpoint (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Name
- Description
- Revert Time (seconds)
- Revert Time (seconds)
- Suppress Standby Signalling
- Ignore Standby Signalling
- MAC Pinning
- Maximum FIB Entries
- Block On Mesh Failure
- Endpoint Type

If you set the Endpoint Type parameter to Multi Chassis, go to step iv. Otherwise, go to step ix.

iv Configure the EndPoint ID parameter.

v Click on the Select button beside the Peer Name parameter. The Select Multi Chassis Endpoint Peer - VPLS Endpoint form opens.

vi Configure the filter and click on the Search button. A list of multichassis endpoint peers appears.

vii Select a multichassis endpoint peer and click on the OK button to close the Select Multi Chassis Endpoint Peer - VPLS Endpoint form. A dialog box prompts you to click on the OK or Apply button to commit the changes.

viii Click on the OK button.

ix Click on the OK button. A dialog box appears indicating changes are not committed until you click on the OK or Apply button.

x Click on the OK button. The Endpoint (Create) form closes and the Site (Create) form reappears with the new endpoint displayed in the list.

22 If you are configuring an MVPLS site, go to step 24.

23 Configure an SHG on the site, if required.

Note — You must configure an SHG or RSHG if you plan to create a spoke circuit from this VPLS site to a VLL or to another VPLS.

i Click on the Split Horizon Groups tab button.

ii Click on the Create button. The Site, New Split Horizon Group (Create) form opens.

iii Configure the parameters:

- Name
- Description
- Residential
- Restrict Protected Source
- Restrict Unprotected Destination
- Restrict Protected Source Action

iv Click on the OK button. The Site, New Split Horizon Group (Create) form closes.

24 Depending on the type of device you are configuring, the MVR tab is configurable. Configure MVR for the site, if required.

i Click on the MVR tab button. The General tab is displayed.

ii Configure the parameters:

- Administrative State
  The Administrative State parameter specifies whether a site is an MVR VPLS site.
- Description
- Use Component Package Policy
- Routing Policy Name

After the multicast package policy is applied to the MVPLS, the policy is distributed as the routing policy to all MVR-capable MVPLS sites. If you apply another package policy to the site, the new policy is distributed to the site. The previously distributed policy remains on the site.

iii If you deselect the Use Component Package Policy parameter, you must specify a multicast package policy to associate with the MVR VPLS site. Perform one of the following.

- Click on the Select button to specify a multicast package policy. The Select - VPLS Site form opens. Configure the filter criteria to choose a policy. Choose a policy and click on the OK button. The Select - VPLS Site form closes, and the VPLS Site (Create) form refreshes with the policy name.
- Manually enter a multicast package policy name as the Routing Policy Name parameter value.

iv Click on the User MVR SAPs tab button to view the VPLS SAPs that use the MVR VPLS site, if required.

- Click on the Search button to list the VPLS SAPs.

25 Configure a GSMP group on the site, if required.

i Click on the GSMP tab button.

ii Click on the Create button. The GSMP Group (Create) form opens.

iii Configure the following parameters:

- Displayed Name
- Description
- Administrative State
- Keep-Alive (seconds)
- Hold Multiplier
- OAM Administrative State
- Dynamic Topology Discovery

iv Click on the GSMP Group Neighbor tab button.

v Click on the Create button. The GSMP (Create) form opens.

vi Configure the following parameters:

- IP Address
- Description
- Administrative State
- Local Address
- Priority Type
- Priority Precedence
- Priority Dscp

vii Click on OK button. The GSMP (Create) form closes.

26 Configure L2 management interfaces, if required.

i Click on the L2 Management Interfaces tab button.

ii Click on the Create button. The VPLS L2 Management Interface Subscriber (Create) form opens.

iii Click on the General tab to configure the following parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- ARP Timeout (seconds)
- I/F MAC Address

iv Click on the Addresses tab button.

v Click on the Create button. The IP Address (Create) Form opens.

vi Configure the following parameters:

- Address ID
- IP Address
- Prefix Length
- Broadcast Address Format

vii Click on the OK button. The IP Address (Create) form closes.

27 Configure MLD snooping for the site, if required.

i Click on the MLD Snooping tab button.

ii Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Robust Count
- Report source address
- Query source address

28 Depending on the type of device that you are configuring, the MVR (MLD) tab is configurable. Use the MVR (MLD) tab to use MLD snooping on the site. Configure MVR for MLD on the site, if required.

i Click on the MVR (MLD) tab button. The General tab is displayed.

ii Configure the parameters:

- Administrative State
  The Administrative State parameter specifies whether the site is an MVR VPLS site.
- Description
- Use Component Package Policy
- Routing Policy Name

The Routing Policy Name parameter is configurable when the Use Component Package Policy is disabled.

After a multicast package policy is applied to an MVPLS, the policy is distributed as the routing policy to all MVR-capable MVPLS sites. If you apply another package policy to the site, the new policy is distributed to the site and the previously distributed policy remains on the site.

iii If you deselect the Use Component Package Policy parameter, you must specify a multicast package policy to associate with the MVR VPLS site. Perform one of the following.

- Click on the Select button to specify a multicast package policy. The Select - VPLS Site form opens. Configure the filter criteria to choose a policy. Choose a policy and click on the OK button. The Select - VPLS Site form closes, and the VPLS Site (Create) form refreshes with the policy name.
- Manually enter a multicast package policy name as the Routing Policy Name parameter value.

iv Click on the User MVR SAPs tab button to view the VPLS SAPs that use the MVR VPLS site, if required.

- Click on the Search button to list the VPLS SAPs.

29 Configure IGMP host tracking, if required.

i Click on the IGMP Host Tracking tab button.

ii Configure the parameters:

- Expiry Time
- Administrative State

30 To create an access interface for the site, perform steps 5 to 54 of Procedure 71-3.

31 To create a mesh SDP binding for the site, perform steps 5 to 25 of Procedure 71-4.

Note 1 — The maximum number of SDP bindings (combined total of mesh and spoke bindings) per service site on an SR NE is 100.

Note 2 — In 5620 SAM release 9.0 R5, the maximum number of sites that can be automatically meshed (mesh SDP bindings) on a VPLS is 100. The previous limit was 50. Automatic creation of a full mesh on a VPLS can be performed in one pass or in several steps, depending on your requirements.

Alcatel-Lucent recommends that users perform the automatic meshing on only 50 sites at a time, since auto-meshing 100 sites may incur a substantial delay in building the network.

Note 3 — You cannot create a mesh SDP binding on a 7450 ESS, 7250 SAS-ES or 7250 SAS-ESA site.

32 To create a redundant spoke SDP binding under an endpoint, perform steps 4 to 43 of Procedure 71-5.

33 To create a spoke SDP binding for the site, perform steps 8 to 43 of Procedure 71-5.

Note 1 — You cannot create a spoke SDP binding on an MVPLS site that runs MSTP, or enable MSTP on a site that has a spoke SDP binding.

Note 2 — You cannot enable MSTP on a SAP that has a non-zero encapsulation value.

34 To add a Video interface for the site, perform steps 4 to 12 of Procedure 36-3.

35 Click on the OK button. The VPLS Site (Create) form closes, and a dialog box appears.

36 Click on the OK button. The VPLS Site (Create) form displays the new site on the navigation tree under the Sites icon.

37 To configure the site for BGP Auto-Discovery, BGP VPLS or as part of a BGP VPLS Multi-homing configuration, you must first complete the creation of the site and then perform either Procedure 71-6 or Procedure 71-7, as applicable.

Note — You can see a list of all current BGP VPLS Multi-homing sites in a VPLS multi-homing service on the BGP Multi-homing Sites tab.

38 Repeat steps 12 to 36 to create an additional site for the VPLS, as required.

39 Add protected MAC addresses at the service level, if required. Protected MAC addresses that you add on the site level, as performed in step 16, are automatically added to the service-level MAC protection list.

i Click on the Forwarding Control tab button.

ii Click on the MAC Protection tab button.

iii Click on the Create button. The MAC Protection (Create) form opens.

iv Configure the Protected Mac Address parameter.

v Click on the OK button. The MAC Protection (Create) form closes and the protected MAC address is listed on the VPLS (Create) form.

40 To reserve tunnel bandwidths, click on the Bandwidth tab.

Note 1 — The ability to reserve tunnel bandwidth is only applicable to B-sites on a VPLS configured as a PBB tunnel (that is, as a B-VPLS).

Note 2 — The Bandwidth tab is only available if service CAC is configured; see chapter 6 for information about enabling and disabling service CAC.

i Click on the Bandwidth Reserved Tunnel sub-tab button.

ii For each CoS, enter a value for the CoS Reserved Bandwidth (Mbps) to specify how much bandwidth this tunnel will reserve in the network.

iii Click on the Reserve Bandwidth button. This action checks to ensure that all the active links in the B-VPLS have enough bandwidth to admit the tunnel into the network and book the bandwidth. The tunnel status will be updated appropriately, based on the outcome of the action. Once the bandwidth is reserved, the BW Utilization tab on the applicable Physical Link properties form will also show this tunnel and the bandwidth information (refer to Procedure 5-37).

Note 1 — The reserved bandwidth of the tunnel can be changed at anytime after the service creation. However, if a change to the reserved bandwidth causes the used bandwidth to be greater than the requested change, or if there is insufficient bandwidth in the network to facilitate this change, then it will be denied and an appropriate message is displayed.

Note 2 — Once bandwidth is reserved on the tunnel, any changes to the topology of the B-VPLS (for example, uplinks added, STP state changes, and so forth) will be updated automatically with the correct bandwidth information on the underlying physical links. If there is insufficient bandwidth available when the changes happen, the bandwidth will still be booked on the physical links and the appropriate alarms will be raised.

Note 3 — To unreserve bandwidth of the tunnel after the service creation, you can set all of the configured Cos Reserved Bandwidth parameters back to 0. However, this can only be done when there are no longer any i-services riding on this PBB Tunnel.

Note 4 — After the service has been created, the Tunnel Usage sub-tab shows all the i-services currently using this tunnel and the specific bandwidth usage per service.

41 Click on the OK button. The VPLS Service (Create) form closes.

Procedure 71-2 To create a VPLS on a 7210 SAS device

This procedure applies to 7210 SAS-E and 7210 SAS-D devices.

1 Choose Create→Service→VPLS from the 5620 SAM main menu. The VPLS Service (Create) form opens.

2 Click on the Select button to choose a customer to associate with the VPLS. The Select Customer - VPLS Service form opens.

3 Choose a customer for the VPLS and click on the OK button. The Select Customer - VPLS Service form closes and the VPLS Service (Create) form reappears with the customer information displayed on the General tab.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Default Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Automatic Mesh SDP Binding Creation
- Profile Name
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled and the Profile Name parameter is left blank.
- GSMP Administrative State
- PIM Snooping Enabled
- OLC State
  This parameter is configurable when you click on the Apply button.

5 On the navigation tree, right-click on the Sites icon and choose Create VPLS Site. The Select Network Elements - VPLS Service - Subscriber form opens with a list of available NEs.

6 Choose a 7210 SAS-E and click on the OK button. The VPLS Site (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- SAP Type
- Customer VID

8 Configure MFIB, STP, and FIB parameters for the site, if required.

i Click on the Forwarding Control tab button. The MFIB tab is displayed.

ii Configure the parameters:

- Table size (entries)
- High Watermark (%)
- Low Watermark (%)

iii Click on the STP tab button to configure STP parameters for the site, if required. Otherwise, go to step v.

iv Configure the parameters.

- Bridge Forward Delay (seconds)
- Bridge Hello Time (seconds)
- Bridge Max Age (seconds)
- Priority
- STP Mode
- Maximum BPDUs (PDUs/Hello Interval)
- Administrative State

Note — Alcatel-Lucent STP in a VPLS interoperates with customer STP implementations as a mechanism for loop detection and prevention. The bridge-level parameters balance the STP resiliency and speed of convergence. Modifying the bridge-level parameters must be done within the constraints of the following formulas:

- 2 × (Bridge Forward Delay - 1.0 s) >= Bridge Max Age
- Bridge Max Age >= 2 × (Bridge Hello Time + 1.0 s)

v Click on the FIB tab button to configure FIB parameters, if required. Otherwise, go to step 9.

vi Configure the parameters:

- High Watermark (%)
- Low Watermark (%)
- Local Age Time (seconds)
- Remote Age Time (seconds)
- Size (entries)
- Aging Enabled
- Learning Enabled
- Discard Unknown Destinations
- Move Frequency
- Retry Timeout
- Administrative State

9 Configure IGMP snooping for the site, if required.

i Click on the IGMP Snooping tab button.

ii Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Robust Count
- Report source address

10 Click on the OK button. The VPLS Site (Create) form closes and a dialog box appears.

11 Click on the OK button. The VPLS Service (Create) form reappears.

12 To create a non-7210 SAS-E or 7210 SAS-D site for the VPLS, perform the following steps.

i Right-click on the Sites icon and choose Create VPLS Site. The Select Network Elements - VPLS Service - Subscriber form opens to display a list of available NEs.

Note 1 — The NE that you choose must be physically connected to the 7210 SAS-E or 7210 SAS-D by a port or LAG.

Note 2 — An NE that is physically connected to a 7210 SAS-E must be exclusively terminating.

ii Choose an NE other than a 7210 SAS-E or 7210 SAS-D and click on the OK button. The VPLS Site (Create) form opens with the General tab displayed.

iii Configure the site, as described in steps 14 to 36 of Procedure 71-1.

13 Right-click on Access Interfaces below the site and choose Create VPLS L2 Access Interface. The VPLS L2 Access Interface (Create) form opens with the General tab displayed.

14 Configure the parameters:

- Description
- Administrative State

Note — If the 7210 SAS-E or 7210 SAS-D sites are connected in a ring network, you must configure an uplink SAP between each pair of 7210 SAS-E or 7210 SAS-D sites.

15 Click on the Port tab button.

16 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - VPLS L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

17 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form displays the port information.

18 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Transit SAP

Note — The Outer Encapsulation Value and Inner Encapsulation Value parameters must be configured to values of 0 and *, respectively, in order to configure MSTP on an MVPLS. See Procedure 71-10 for more information.

19 Create an L2 access interface on each 7210 SAS-E or 7210 SAS-D and terminating site. Perform steps 5 to 54 in Procedure 71-3, as required.

Note 1 — Some steps and parameters in Procedure 71-3 are not configurable on a 7210 SAS-D 6F 4T ETR or 7210 SAS-E.

Note 2 — IGMP snooping is not supported for the 7210 SAS-D 6F 4T ETR.

20 Click on the OK button. The VPLS Service (Create) form closes.

Procedure 71-3 To create a VPLS or MVPLS L2 access interface

Perform this procedure to create a VPLS or an MVPLS L2 access interface. Depending on the device type on which you configure an MVPLS, some tabs are not available.

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactivate until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 68-25 for more information about deleting MSAPs.

Note — The following tab buttons are supported on the OS 9700E and OS 9800E NEs for the creation of a VPLS L2 access interface:

- General
- Port
- Forwarding Control
- Templates
- Faults

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

For information on adding a GNE service interface to a VPLS service, see Procedure 71-15.

5 Right-click on Access Interfaces and choose Create VPLS L2 Access Interface. The VPLS L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Description
- Administrative State
- Calling Station ID
- MC Ring Node
- PPPoE Circuit ID

7 On the Split Horizon Group panel, choose an SHG for the interface, if required.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group Name - VPLS L2 Access Interface list form opens.

Note — You must configure an SHG or residential SHG for a VPLS if you plan to create a spoke circuit from this VPLS site to a VLL or another VPLS.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group Name - VPLS L2 Access Interface list form closes, and the VPLS L2 Access Interface (Create) form refreshes with the SHG name.

8 Configure the SAP Sub Type parameter.

Note — When you choose Capture as the SAP Sub Type, the displayed form changes to allow configuration of the Capture SAP. To create a Capture SAP, see Procedure 68-20.

9 Select an application profile for the L2 access interface.

i Click on the Select button next to the Application Profile parameter. The Application Profile String: - VPLS L2 Access Interface form opens.

ii Configure the filter criteria. A list of application profiles appears.

iii Choose an application profile from the list and click on the OK button. The Application Profile String: - VPLS L2 Access Interface form closes and VPLS L2 Access Interface (Create) form refreshes with the application profile information.

Note — The Application Profile String: - VPLS L2 Access Interface service form displays only local profiles on the NE.

10 Associate an AA transit prefix policy with the L2 access interface, if required.

Note 1 — To bind a transit policy to an access interface, a port must already exist on the interface.

Note 2 — You can bind a transit policy to only one access interface or spoke SDP binding per node.

Note 3 — The transit policy and the application profile must belong to the same application assurance group or partition.

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit prefix policy and click on the OK button.

11 Configure the parameters in the ETH-CFM MIP panel:

- MIP
- MIP MAC Address

Note — The MIP and MIP MAC Address parameters are configurable only when a port is assigned to the interface.

12 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Name
- Subscriber Class
- Subscriber Type
- Total Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab button.

13 Perform one of the following:

a Select an operational group for the L2 access interface to join as a member. Go to step 14.

b Select an operational group for the L2 access interface to monitor. Go to step 15.

14 Select an operational group for the L2 access interface to join as a member. Perform the following steps.

i Click on the Select button next to the Member Group Name parameter. The Select Operational Group - VPLS L2 Access Interface form opens.

ii Configure the filter criteria. A list of operational groups appears.

iii Choose an operational group from the list and click on the OK button. The Select Operational Group - VPLS L2 Access Interface form closes and the VPLS L2 Access Interface (Create) form refreshes with the operational group information.

15 Select an operational group for the L2 access interface to monitor. Perform the following steps.

i Click on the Select button next to the Monitored Group Name parameter. The Select Operational Group - VPLS L2 Access Interface form opens.

ii Configure the filter criteria. A list of operational groups appears.

iii Choose an operational group from the list and click on the OK button. The Select Operational Group - VPLS L2 Access Interface form closes and the VPLS L2 Access Interface (Create) form refreshes with the operational group information.

16 Click on the Port tab button.

17 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - VPLS L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

18 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form displays the port information.

Note — If you select an Ethernet Tunnel Endpoint, the Port form is refreshed and an Ethernet Tunnel tab is added.

19 If the L2 access interface is on a 7250 SAS-ES or 7250 SAS-ESA, configure the following parameters; otherwise, go to step 21:

- Encapsulation Tagging
- Set Default VLAN to VPLS Tag
- VPLS Mode

The VPLS Mode parameter is configurable on the first L2 access interface associated with a port on the 7250 SAS-ES or 7250 SAS-ESA, Release 3.0 R4 or later.

20 If the L2 access interface is on a 7250 SAS-ES or 7250 SAS-ESA, go to step 52.

21 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)

When the selected port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. If you choose this, the system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form.

If the port you have chosen is an Ethernet Tunnel Endpoint, you will be able to set the Outer Encapsulation Value to 8191. This automatically enables the Ethernet Tunnel Endpoint Control SAP parameter.

If you are configuring the port for an L2 Access Interface in a Control VPLS for an Ethernet ring, the Outer Encapsulation Value and Inner Encapsulation Value for the port in each L2 Access Interface must have the same value as the R-APS Tag (Outer Encapsulation Value) and R-APS Tag (Inner Encapsulation Value) respectively, that you use for the particular path endpoint. This defines the interface as a Control SAP for the Ethernet ring. Refer to Procedure 33-10 for additional information.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with Q in Q encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only when the port is an ATM port.

If the port you have chosen is an Ethernet port and uses ATM, dot1q or Q in Q encapsulation, you can enable ingress VLAN translation, if required. Configure the parameters:

- Translation
- Translation ID

22 Configure the Ethernet Tunnel Endpoint Control SAP parameter, if required.

Note — Enabling the Ethernet Tunnel Endpoint Control SAP parameter creates the control L2 Access Interface (also known as a Control SAP). It also automatically sets the value of the Outer Encapsulation Value parameter to 8191.

If you are currently creating a same-fate SAP or an L2 Access Interface for an Ethernet ring, the Ethernet Tunnel Endpoint Control SAP parameter must not be enabled.

23 Depending on the port that you have chosen, the Egress Multicast Group tab is configurable. Configure the EMG, if required.

i Click on the Egress Multicast Group tab button. The Select Egress Multicast Group-L2 Access Interface form opens.

ii Choose an EMG and click on the OK button. The Select Egress Multicast Group-L2 Access Interface form closes, and the Egress Multicast Group tab refreshes with the EMG name.

Note — The Egress Multicast Group-L2 Interface form lists only EMGs that have the same egress filter and encapsulation type as the interface.

24 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab button.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

Note — If you select a bundle in step 18, only the Scheduling Class parameter is configurable.

25 If you are creating this L2 Access Interface for the Control VPLS of an Ethernet ring or for a data service using the ring, configure the ID parameter in the Ethernet Ring Element section to select the required Ethernet Ring Element. Refer to Procedure 33-7 for additional information.

26 Click on the QoS tab button to assign ingress and egress QoS policies to the interface, if required, and perform one of the following:

a To configure a 7450 ESS, 7705 SAR, 7710 SR, or 7750 SR, perform the following steps.

i Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use Shared Queue
- Use Multipoint Shared Queue

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is dot1q, BCP dot1q, or Q in Q.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

ii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - VPLS L2 Access Interface form opens.

iii Choose an ingress QoS policy and click on the OK button. The Select Ingress Policy - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the ingress QoS policy name.

Note — If you choose an access ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that port that you are configuring for the VPLS L2 access interface has the access ingress queue group with the same name created on it.

See Procedure 20-1 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

iv Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - VPLS L2 Access Interface form opens.

v Choose an egress QoS policy and click on the OK button. The Select Egress Policy - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the egress QoS policy name.

Note — If you choose an access egress policy which has a forwarding class mapped to an egress queue group, you must ensure that port that you are configuring for the VPLS L2 access interface has the access egress queue group with the same name created on it.

See Procedure 20-1 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

vi If you are configuring an L2 access interface for a 7710 SR or 7705 SAR, or if the port you selected in step 18 is not an HSMDA port, then go to step 27.

vii Configure the Packet Byte Offset (bytes) parameter, if required. Before you can configure the parameter, you must select the associated Override check box.

viii Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

ix Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the WRR policy information displayed.

x Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xi Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

b To configure a 7210 SAS-D 6F 4T ETR, 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP, perform the following steps.

i Click on the Select button in the 7210 Specific panel to choose a SAS ingress policy. The Select SAS Ingress Policy - VPLS L2 Access Interface form opens.

ii Choose a SAS ingress policy and click on the OK button. The Select SAS Ingress Policy - VPLS L2 Access Interface form closes and the information is displayed.

Note — To support H-metering, you must choose a SAS ingress policy with all meter rate modes set to trtcm2.

iii Configure the following parameters in the Aggregate Rate Limit panel:

- Ingress Meter
- Ingress Meter Rate (kbps)
- Ingress Meter Burst

Note 1 — The Ingress Meter parameter is configurable only during SAP creation on a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP. The parameter must be set to true to support H-metering.

Note 2 — On a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP, the Ingress Meter Rate (kbps) and Ingress Meter Burst parameters are configurable only after SAP creation.

27 Click on the Schedulers tab button to configure scheduling, if required; otherwise, go to step 29.

Note 1 — The Schedulers tab is configurable only when a port is assigned to the interface.

Note 2 — For the 7210 SAS-X, the port is enabled only when you select the SAP based type in the Egress Scheduler Mode.

28 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 18 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 18 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - VPLS L2 Access Interface form opens.

iv Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 18 is an HSMDA port, go to step 29.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - VPLS L2 Access Interface form opens.

ix Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 29.

b Specify that an access scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 18 is an HSMDA port. Go to step 29.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - VPLS L2 Access Interface form opens.

iii Choose an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

29 Assign ingress and egress ACL filters to the interface, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - VPLS L2 Access Interface form opens.

iii Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the ingress ACL filter name.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - VPLS L2 Access Interface form opens.

v Choose an egress ACL filter and click on the OK button. The Select Egress Filter - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the egress ACL filter name.

vi Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - VPLS L2 Access Interface form opens.

vii Choose an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - VPLS L2 Access Interface form closes and the VPLS L2 Access Interface (Create) form reappears with the IPv6 ingress ACL filter information displayed.

viii Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - VPLS L2 Access Interface form opens.

ix Choose an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - VPLS L2 Access Interface form closes and the VPLS L2 Access Interface (Create) form reappears with the IPv6 egress ACL filter information displayed.

30 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab button.

ii Click on the Select button to choose an accounting policy. The Select Accounting Policy - VPLS L2 Access Interface form opens.

iii Choose an accounting policy and click on the OK button. The Select Accounting Policy - VPLS L2 Access Interface form closes, and the VPLS L2 Access Interface (Create) form refreshes with the accounting policy name.

iv Configure the Collect Accounting Statistics parameter.

v If you are configuring statistics collection for a 7210 SAS-E, go to step vi. Otherwise, go to step 31.

vi Configure the parameters:

- Enable Egress Packets Forwarding
- Ingress Counter Mode

31 Assign a time of day suite to the interface, if required.

i Click on the TOD Suite tab button.

ii Click on the Select button beside the Name parameter. The Select Time Of Day Suite - VPLS L2 Access Interface list form opens.

iii Choose a time of day suite and click on the OK button. The Select Time Of Day Suite - VPLS L2 Access Interface list form closes, and the VPLS L2 Access Interface (Create) form refreshes with the time of day suite name.

Note 1 — You cannot assign a ToD suite to a L2 access interface if accounting statistics collection is enabled on the L2 access interface; you must first disable the Collect Accounting Statistics parameter in step 30.

Note 2 — SapEgrQosPlcyStats and SapIngQosPlcyStats statistics will only be collected if a Time Of Day Suite is applied on the SAP.

32 Configure BPDU Termination, STP and FIB parameters for the interface, if needed.

i Click on the Forwarding Control tab button. Depending on the device being configured, the BPDU Termination tab is displayed. Otherwise, go to step iii.

ii Configure the parameters:

- L2 Protocol Termination
  When the L2 Protocol Termination parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.
- BPDU Translation
- Force L2PT on Managed L2 Access Interface
  The Force L2PT on Managed L2 Access Interface parameter is only available for MVPLS L2 access interfaces. When the Force L2PT on Managed L2 Access Interface parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.

iii Click on the STP tab button.

iv Configure the parameters:

- Path Cost
- Port Number
- Priority
- Edge Port
- Edge Capability Detection
- Link Type
- Root Guard
- Administrative State

v Click on the FIB tab button.

vi Configure the parameters:

- Aging Enabled
- Learning Enabled
- Maximum Entries
- Limit Mac Move
- Limit Mac Move Level
- Discard Unknown Source
- Restrict Protected Source
- Restrict Protected Source Action
- Restrict Unprotected Destination

vii If you are creating an MVPLS to run MSTP, the MST Instances tab button is configurable. Otherwise, go to step 33.

viii Click on the MST Instances tab button to edit a SAP MST instance.

ix Select an MST instance and click on the Properties button.

x The L2 Access Interface MST Instance (Edit) form opens. Configure the parameters:

- Path Cost
- Priority

xi Click on the OK button to close the L2 Access Interface MST Instance (Edit) form. A dialog box appears.

xii Click on the OK button. The L2 Access Interface (Create) form refreshes with the new MST instance.

33 Configure residential subscriber management for the interface, if required.

i Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

ii Select the SHCV Enabled parameter to enable SHCV, if required. Otherwise, go to step x.

iii Configure the parameters:

- SHCV Interval (minutes)
- SHCV Source
- SHCV Source MAC Address
- SHCV Action
- SHCV Retry Timeout (seconds)
- SHCV Retry Count

iv Click on the IGMP Host Tracking tab button.

v Click on the Select button to choose the import policy used to filter IGMP packets. The Select SapIgmpHostTracking form opens.

vi Configure the filter criteria and click on the Search button. A list of import policies appears.

vii Choose a policy and click on the OK button. The selected import policy name appears.

viii Configure the parameters:

- Expiry Time
- Max Number of Groups
- Max Number of Sources per Group
- Disable Router Alert Check

ix Click on the Host Tracking Info tab button to view a list of hosts that are being tracked on this L2 access interface.

x Click on the Profiles tab button.

xi Configure the parameters:

- Admin Status
- Service Model
- Subscriber Limit
- Default Subscriber Identification Type
- Default Subscriber Id
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id
- Profiled Traffic only
- Non-Subscriber Traffic Identification
- LAG link selection

xii Click on the Select button in the Default Subscriber Profile panel to choose a default subscriber profile for the interface, if required. The Select Default Subscriber Profile form opens with the list of available subscriber profiles displayed.

xiii Choose a subscriber profile and click on the OK button. The Select Default Subscriber Profile form closes, and the subscriber profile name appears in the Default Subscriber Profile panel.

xiv Click on the Select button in the Default SLA Profile panel to choose a Default SLA profile for the SAP, if required. The Select Default SLA Profile form opens with the list of available SLA profiles displayed.

xv Choose an SLA profile and click on the OK button. The Select Default SLA Profile form closes, and the SLA profile name appears in the Default SLA Profile panel.

xvi Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy for the SAP, if required. The Select Subscriber Identification Policy form opens with the list of available subscriber identification policies displayed.

xvii Choose a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy form closes, and the subscriber identification policy name appears in the Subscriber Identification Policy panel.

xviii Click on the Select button in the Default Application Profile panel to choose a default application profile for the SAP, if required. The Select Default Application Profile form opens with the list of application profiles on the NE displayed.

xix Choose an application profile and click on the OK button. The Select Default Application Profile form closes, and the application profile name appears in the Default Application Profile panel.

xx Click on the Select button in the Non-Subscriber Traffic Subscriber Profile panel to choose a non-subscriber subscriber profile for the SAP, if required. The Select Non-Subscriber Traffic Subscriber Profile form opens with the list of available subscriber profiles displayed.

xxi Choose a subscriber profile and click on the OK button. The Select Non-Subscriber Traffic Subscriber Profile form closes, and the subscriber profile name appears in the Non-Subscriber Traffic Subscriber Profile panel.

xxii Click on the Select button in the Non-Subscriber Traffic SLA Profile panel to choose a Non-Subscriber Traffic SLA profile for the SAP, if required. The Select Non-Subscriber Traffic SLA Profile form opens with the list of available SLA profiles displayed.

xxiii Choose an SLA profile and click on the OK button. The Select Non-Subscriber Traffic SLA Profile form closes, and the SLA profile name appears in the Non-Subscriber Traffic SLA Profile panel.

xxiv Click on the Select button in the Non-Subscriber Traffic Application Profile panel to choose a non-subscriber traffic application profile for the SAP, if required. The Select Non-Subscriber Traffic Application Profile form opens with the list of application profiles on the NE displayed.

xxv Choose an application profile and click on the OK button. The Select Non-Subscriber Traffic Application Profile form closes, and the application profile name appears in the Non-Subscriber Traffic Application Profile panel.

34 Assign a DoS protection policy to the interface, if required.

> **Note —** A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - VPLS L2 Access Interface form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - VPLS L2 Access Interface form closes and the policy ID is displayed on the VPLS L2 Access Interface (Create) form.

iv Configure the MAC Monitoring parameter.

35 Configure an Ethernet tunnel.

> **Note —** You can only configure Ethernet tunnel SAP path parameters if you are creating a same-fate SAP.

i Click on the Ethernet Tunnel tab.

ii If you are configuring a fate-sharing Ethernet Tunnel Endpoint SAP (also referred to as same-fate SAP) then go to step iii. Otherwise, go to step 36.

iii Click on the Create button. The Ethernet Tunnel (Create) form opens.

iv Configure the parameters:

- Path ID
- Tag (Outer Encapsulation Value)
- Tag (Inner Encapsulation Value)

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The VPLS L2 Access Interface (Create) form refreshes with the Ethernet Tunnel entry.

36 Configure a redundant VLAN range, if required.

> **Note —** If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation. The redundant VLAN range defines the range of VC IDs for VPLS SAPs that the MVPLS manages.

i Click on the Redundancy tab button.

ii Click on the Create button. The RedundantVlanRange (Create) form opens.

iii Configure the parameters:

- Min VLAN ID
- Max VLAN ID

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The VPLS L2 Access Interface (Create) form refreshes with the redundant VLAN range entry.

37 The ATM tab is configurable when the interface port is an ATM port. Specify OAM functionality and assign ingress and egress ATM policies to the interface, if required.

i Click on the ATM tab button.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Choose an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the VPLS L2 Access Interface (Create) form refreshes with the ingress ATM policy name.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Choose an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the VPLS L2 Access Interface (Create) form refreshes with the egress ATM policy name.

38 Configure IGMP snooping for the interface, if required.

i Click on the IGMP Snooping tab button. The General tab is displayed.

ii Configure the parameters as they apply to a specific NE:

- Import Policy
- Fast Leave
- Disable Router Alert Check
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- IGMP Version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups
- Maximum Number of Sources per Group

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and IGMP Version parameters are configurable when the Send Queries parameter is enabled.

iii Click on the Select button in the Mcast CAC panel to choose a multicast CAC policy, if required. The Select Multicast CAC Policy form opens with the list of available multicast CAC policies displayed.

iv Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy form closes and the multicast CAC policy information appears on the VPLS L2 Access Interface (Create) form.

v Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)

vi Click on the Static Mcast Group tab button to configure a static multicast group, if required. Otherwise, go to step 40.

vii Click on the Create button. The Access Interface Igmp Snooping Mcast Group Display (Create) form opens.

viii Configure the parameters:

- Group Address
- Source Address

ix Click on the Apply button if you want to create additional entries. A dialog box appears. Otherwise, go to step xii.

x Click on the OK button.

xi Repeat steps vii to ix to create an additional entry, if required.

xii Click on the OK button. A dialog box appears.

xiii Click on the OK button. The Static Mcast Group tab refreshes with the new multicast group entries.

39 Configure the ARP host for the interface, if required.

i Click on the ARP Host Configuration tab button.

ii Configure the parameters:

- Administrative State
- ARP Host Limit
- Minimum Authentication Interval (minutes)

40 Configure DHCP for the interface, if required.

i Click on the DHCP tab button. The General tab is displayed.

ii Configure the parameters:

- Administrative State
- Description
- Snooping
- Enable
- Enable Lease Populate
- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String

The Enable Lease Populate parameter is configurable when the Enable parameter is enabled.

The Remote ID String parameter is configurable when the Remote ID parameter is set to Remote IDString.

iii Depending on the type and version of the device that you are configuring, the Subscriber Authentication Policy panel appears. Otherwise, go to step vii.

iv Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - L2 Access I/F DHCP Relay Config form opens.

v Click on the Search button.

vi Choose a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - L2 Access I/F DHCP Relay Config form closes, and the VPLS L2 Access Interface (Create) form refreshes with the subscriber authentication policy name.

vii Click on the Server tab button to configure the VPLS L2 access interface proxy server.

Note — You can configure a VPLS L2 access interface proxy server on a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, 7710 SR, or 7750 SR.

viii Configure the parameters:

- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time RADIUS Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

41 Depending on the type of device that you are configuring, the MVR tab is configurable. Configure MVR for the SAP, if required.

i Click on the MVR tab button.

ii Click on the Select button in the Source MVR VPLS panel to associate an MVR VPLS with the SAP. The Select Source MVR VPLS form opens.

iii Choose a source MVR VPLS and click on the OK button. The Select Source MVR VPLS closes, and the VPLS L2 Access Interface (Create) form refreshes with the source MVR VPLS information.

iv Click on the Select button in the Proxy MVR SAP panel to choose a proxy MVR SAP to which the multicast traffic will be sent. The Select Proxy MVR SAP form opens.

v Choose a proxy MVR SAP and click on the OK button. The Select Proxy MVR SAP form closes, and the VPLS L2 Access Interface (Create) form refreshes with the proxy MVR SAP information.

Note — If the SAP already has an MVR proxy SAP or is the MVR proxy SAP of another SAP, the SAP cannot be an MVR proxy SAP.

42 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab button.

ii Configure the parameters:

- Anti-Spoofing
- ARP Reply Agent
- MAC Pinning

The ARP Reply Agent parameter is configurable only when an IP address is specified for the static hosts on the SAP.

iii Click on the Static Hosts tab button to configure a static subscriber host entry for each subscriber host that is not managed by DHCP. Otherwise, go to step 44.

iv Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

v Configure the parameters:

- IP Address
- MAC Address
- Subscriber Identification
- Use SAP ID as Subscriber ID
- ANCP String
- Intermediate Destination ID

Note — You must specify at least one IP address or MAC address for each static host. The values that are specified for the Anti-Spoofing and ARP Reply Agent parameters determine the type of address entry that is required for the static host. For example, if you set the Anti-Spoofing parameter to Source Ip Addr, you must specify at least the IP address for the static host.

vi Configure residential subscriber management for the static host, if required. Otherwise, go to step 44.

vii Click on the Select button in the Subscriber Profile panel to choose a subscriber profile for the static host, if required. The Select Subscriber Profile - AntiSpoofingStaticHosts form opens with the list of available subscriber profiles displayed. Otherwise, go to step ix.

viii Choose a subscriber profile and click on the OK button. The Select Subscriber Profile - AntiSpoofingStaticHosts form closes, and the subscriber profile name appears in the Subscriber Profile panel.

ix Click on the Select button in the SLA Profile panel to choose an SLA profile for the static host, if required. The Select SLA Profile - AntiSpoofingStaticHosts form opens with the list of available SLA profiles displayed. Otherwise, go to step xiii.

x Choose an SLA profile and click on the OK button. The Select SLA Profile - AntiSpoofingStaticHosts form closes, and the SLA profile name appears in the SLA Profile panel.

xi Click on the Select button in the Application Profile panel to choose an application profile for the static host, if required. The Select Application Profile - AntiSpoofingStaticHosts form opens with the list of application profiles on the NE displayed. Otherwise, go to step xiii.

xii Choose an application profile and click on the OK button. The Select Application Profile - AntiSpoofingStaticHosts form closes, and the application profile name appears in the Application Profile panel.

xiii Click on the Apply button if you want to create additional entries. A dialog box appears. Otherwise, go to step xvi.

xiv Click on the OK button.

xv Repeat steps v to xiv for each additional entry that you want to create.

xvi Click on the OK button. A dialog box appears.

xvii Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes, and the VPLS L2 Access Interface (Create) form refreshes with the new static host entries in a list.

43 Specify the queue overrides.

i Click on the Override Policy Items tab button.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

ii Set the queue overrides, as described in Procedure 47-44.

44 Associate a MEP with the L2 Access interface, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step x.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab button.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

x Click on the OK button. The MEP (Create) form closes.

Note — If you have configured a SAP, the SAP information is filled in when you configure the MEP.

45 Enable facility tunnel MEP with the L2 Access interface, if required.

i Click on the General tab button.

ii Right-click Tunnel Fault Notification and select Accept from the contextual menu.

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

46 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

47 Click on the MIPs tab button.

48 Perform one or more of the following, if required:

a Click the Search button to list available MIPs.

b View the current status of a specific MIP entry.

i Select a MIP from the list.

ii Click the Properties button to display the MIP information.

c Click the Resync button to resync the latest MIPs configured on the node.

49 Configure PIM snooping for the interface, if required.

i Click on the PIM Snooping tab button. The General tab is displayed.

ii Configure the Max Number of Groups parameter.

iii Click on the OK button.

50 Configure MLD snooping for the interface, if required.

i Click on the MLD Snooping tab button. The General tab is displayed.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Disable Router Alert Check
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- MLD version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and MLD version parameters are configurable when the Send Queries parameter is enabled.

iii Click on the Static Mcast Group tab button to configure a static multicast group, if required. Otherwise, go to step 51.

iv Click on the Create button. The Access Interface Mld Snooping Mcast Group Display (Create) form opens.

v Configure the parameters:

- Group Address
- Source Address

vi Click on the Apply button if you want to create an additional entry. A dialog box appears. Otherwise, go to step ix.

vii Click on the OK button.

viii Repeat steps v to vii to create additional entries, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Static Mcast Group tab refreshes with the new multicast group entries.

51 Depending on the type of device that you are configuring, the MVR (MLD) tab is configurable. Use the MVR (MLD) tab to use MLD snooping on the SAP. Configure MVR for the SAP, if required.

i Click on the MVR (MLD) tab button.

ii Click on the Select button in the Source MVR VPLS panel to associate an MVR VPLS with the SAP. The Select Source MVR VPLS form opens.

iii Choose a source MVR VPLS and click on the OK button. The Select Source MVR VPLS closes, and the VPLS L2 Access Interface (Create) form refreshes with the source MVR VPLS information.

iv Click on the Select button in the Proxy MVR SAP panel to choose a proxy MVR SAP to which the multicast traffic will be sent. The Select Proxy MVR SAP form opens.

v Choose a proxy MVR SAP and click on the OK button. The Select Proxy MVR SAP form closes, and the VPLS L2 Access Interface (Create) form refreshes with the proxy MVR SAP information.

Note — If the SAP already has an MVR proxy SAP or is the MVR proxy SAP of another SAP, the SAP cannot be an MVR proxy SAP.

52 Click on the OK button. The VPLS L2 Access Interface (Create) form closes and a dialog box appears.

53 Click on the OK button. The VPLS (Create) form reappears.

54 Repeat steps 5 to 53 for each additional access interface that you want to create.

55 Click on the OK button. A dialog box appears.

56 Click on the Yes button. The VPLS (Create) form closes.

Procedure 71-4 To create a VPLS mesh SDP binding

The value of the Automatic Mesh SDP Binding Creation parameter determines the way that mesh SDP binding creation occurs in the VPLS.

Note — The following tab buttons are supported on the OS 9700E and OS 9800E NEs for the creation of a mesh SDP binding:

- General
- Return
- States
- Frame Sizes
- Forwarding Control
- Templates
- Faults

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the mesh SDP binding; expand the entries for that site.

5 Right-click on Mesh SDP Bindings below the site and choose Create Mesh SDP Binding. The Mesh SDP Binding (Create) form opens with the General tab displayed.

6 If automatic mesh SDP binding creation is enabled on the VPLS, a dialog box appears. The message in the dialog box discourages manual mesh SDP binding creation when automatic mesh SDP binding creation is specified for a VPLS. Perform one of the following.

   a Choose not to override automatic SDP binding creation. Alcatel-Lucent recommends this action.

      i Click on the No button.

      ii Click on the cancel button to abort the operation and close the VPLS management form.

   b Choose to override automatic SDP binding creation. Alcatel-Lucent does not recommend this action.

      i Click on the Yes button. The Mesh SDP Binding (Create) form opens.

      ii Consult an Alcatel-Lucent technical representative before proceeding.

7 Specify a destination node for the mesh SDP binding:

   a If the destination node is a managed node, choose from a list of managed nodes.

      i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Mesh SDP Binding form opens.

      ii Select a destination node and click on the OK button. The Select Destination Network Element - Mesh SDP Binding form closes and the Mesh SDP Binding (Create) form refreshes with the tunnel termination site (the destination node) identifier displayed.

   b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

8 Configure the parameters:

- Description
- VC Type
- VLAN VC Tag
- Ingress Label
- Egress Label

9 Perform one of the following to specify a transport tunnel for the mesh SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Mesh SDP Binding form opens.

ii Select a service tunnel for the mesh SDP binding and click on the OK button. The Select Tunnel - Mesh SDP Binding form closes, and the Mesh SDP Binding (Create) form refreshes with the service tunnel identifier.

10 Configure the parameters:

- Egress Label
- Enable Hash Label
- Enable Signal Capability
- Force VLAN VC Forwarding

Note — The Force VLAN VC Forwarding parameter does not appear if you are creating a Mesh SDP binding for a B-site.

11 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

a Let the 5620 SAM configure the transport tunnel automatically.

i Click on the Return tab.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Return tab.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Mesh SDP Binding form opens.

iii Select a service tunnel for the mesh SDP binding and click on the OK button. The Select Return Tunnel - Mesh SDP Binding form closes and the Mesh SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

12 Specify whether the mesh SDP binding is in or out of service.

i Click on the States tab button.

ii Configure the Administrative State parameter.

13 Click on the Pseudowire OAM tab button.

14 Configure the Control Word parameter.

15 Assign ingress and egress ACL filters to the mesh SDP binding, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Mesh SDP Binding form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - Mesh SDP Binding form closes, and the Mesh SDP Binding (Create) form refreshes with the ingress ACL filter name.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Mesh SDP Binding form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - Mesh SDP Binding form closes, and the Mesh SDP Binding (Create) form refreshes with the egress ACL filter name.

vi Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - Mesh SDP Binding form opens.

vii Select an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - Mesh SDP Binding form closes and the Mesh SDP Binding (Create) form reappears with the IPv6 ingress ACL filter information displayed.

viii Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - Mesh SDP Binding form opens.

ix Select an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - Mesh SDP Binding form closes and the Mesh SDP Binding (Create) form reappears with the IPv6 egress ACL filter information displayed.

16 Configure anti-spoofing for the mesh SDP binding, if required.

i Click on the Anti-Spoofing tab button.

ii Configure the MAC Pinning parameter.

17 Assign an accounting policy to the mesh SDP binding, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Mesh SDP Binding form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - Mesh SDP Binding form closes, and the Mesh SDP Binding (Create) form refreshes with the accounting policy name.

18 Click on the Forwarding Control tab button if you need to add or delete MFIB allowed daughter cards or configure MRP, otherwise go to step 19.

Note 1 — The single-slot models of the 7450 ESS and 7750 SR support the addition or deletion of MFIB allowed daughter cards.

Note 2 — The MFIB Allowed Daughter Card tab does not appear if you are creating a Mesh SDP binding for a B-site.

i Click on the MFIB Allowed Daughter Card tab button.

ii Click on the Create button. The SDP Binding MFIB Allowed Daughter Card (Create) form opens.

iii Click on the Select button. The Select Daughter Card form opens. Select a daughter card and click OK. The Select Daughter Card form closes.

iv Click on the OK button. The SDP Binding MFIB Allowed Daughter Card (Create) form closes and a dialog box appears.

v Click on the OK button. The Mesh SDP Binding (Create) form displays the new allowed daughter card in the list.

vi Click on the MRP tab if you are configuring a Mesh SDP binding for a B-site.

vii Configure the parameters:

- MRP Join Time (tenths of a second)
- MRP Leave Time (tenths of a second)
- MRP Leave All Time (tenths of a second)
- MRP Periodic Time (tenths of a second)
- MRP Periodic Enabled

viii Click on the Select button to select an PBB MRP Policy. The Select PBB MRP Policy form opens.

ix Choose the desired policy and click OK.

19 Configure DHCP for the mesh SDP binding, if required.

i Click on the DHCP tab button.

Note — The DHCP tab does not appear if you are creating a Mesh SDP binding for a B-site.

ii Configure the parameters:

- Description
- Snooping

20 Configure IGMP Snooping for the mesh SDP binding, if required.

i Click on the IGMP Snooping tab button.

Note — The IGMP Snooping tab does not appear if you are creating a Mesh SDP binding for a B-site.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Disable Router Alert Check
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- IGMP Version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and IGMP Version parameters are configurable when the Send Queries parameter is enabled.

iii Configure a multicast CAC policy, if required. Otherwise, go to step 23.

iv Click on the Select button. The Select Multicast CAC Policy form opens.

v Select a multicast CAC policy from the list and click on the OK button. The Select Multicast CAC Policy form closes.

vi Click on the Properties button to edit the existing multicast CAC policy, if required. See chapter 49 for information about creating a multicast CAC policy.

vii Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)

21 Associate a MEP with the mesh SDP binding, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step x.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab button.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

x Click on the OK button. The MEP (Create) form closes.

22 Configure MLD Snooping for the mesh SDP binding, if required.

i Click on the MLD Snooping tab button. The General tab is displayed.

Note — The MLD Snooping tab does not appear if you are creating a Mesh SDP binding for a B-site.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Disable Router Alert Check
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- MLD version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and MLD version parameters are configurable when the Send Queries parameter is enabled.

iii Click on the Static Mcast Group tab button to configure a static multicast group, if required. Otherwise, go to step 23.

iv Click on the Create button. The Circuit Mld Snooping Mcast Group Display (Create) form opens.

v Configure the parameters:

- Group Address
- Source Address

vi Click on the Apply button if you want to create an additional entry. A dialog box appears. Otherwise, go to step ix.

vii Click on the OK button.

viii Repeat steps v to vii to create additional entries, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Static Mcast Group tab refreshes with the new static multicast group entries in a list.

23 Click on the OK button. The Mesh SDP Binding (Create) form closes, and a dialog box appears.

24 Click on the OK button. The VPLS (Edit) form reappears.

25 Repeat steps 5 to 24 for each additional mesh SDP binding that you want to create.

26 Click on the OK button. A dialog box appears.

27 Click on the Yes button. The VPLS (Edit) form closes.

28 Close the Manage Services form.

Procedure 71-5 To create a VPLS spoke SDP binding

Note 1 — You cannot create a spoke SDP binding on an MVPLS site that runs MSTP. Likewise, you cannot enable MSTP for a site that has a spoke SDP binding, or on a SAP with a non-zero encapsulation value.

Note 2 — For services employing BGP AD and BGP VPLS: You should create SDP bindings manually at non-BGP AD or BGP VPLS enabled sites, or to other BGP AD or BGP VPLS sites where auto-created pseudowires are not expected to be created.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 If you are creating a redundant spoke SDP binding under an endpoint, go to step 5. Otherwise go to step 8.

Note — Redundant spoke SDP bindings under an endpoint are only valid for VPLS regular sites and B-Sites. They do not apply to I-Sites.

5 On the navigation tree, click on the site where you want to create a redundant spoke SDP binding under an endpoint; expand the entries for that site.

6 Select an endpoint for the required site.

7 Right-click on Spoke SDP Bindings below the endpoint and choose Create Spoke SDP Bindings. The Spoke SDP Binding (Create) form opens with the General tab displayed. Go to step 10.

8 On the navigation tree, click on the site where you want to create a VPLS spoke SDP binding; expand the entries for that site.

9 Right-click on Spoke SDP Bindings below the site and choose Create Spoke SDP Bindings. The Spoke SDP Binding (Create) form opens with the General tab displayed.

10 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Select a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

11 Configure the parameters:

- Description
- Auto-Assign ID
- VC ID
- VC Type
- MTU
- VLAN VC Tag
- Ingress Label
- Egress Label

Note — The MTU parameter does not appear if you are creating a Spoke SDP binding for a B-Site or an I-Site.

12 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

Note 1 — If you are creating a Spoke SDP binding for a B-site, the Tunnel Auto-Selection Transport Preference must be either MPLS:LDP or MPLS:RSVP. For I-sites, you can use MPLS:LDP, MPLS:RSVP, GRE, or Any.

Note 2 — The Auto-Select Transport Tunnel parameter supports only values of Any or MPLS:RSVP on a Spoke SDP binding that originates from 7250 SAS-ES or 7250 SAS-ESA sites.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

13 Perform one of the following:

a Select an operational group for the Spoke SDP Binding to join as a member. Go to step 14.

b Select an operational group for the Spoke SDP Binding to monitor. Go to step 15.

14 Select an operational group for the Spoke SDP Binding to join as a member. Perform the following steps.

i Click on the Select button next to the Member Group Name parameter. The Select Operational Group - VPLS Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of operational groups appears.

iii Choose an operational group from the list and click on the OK button. The Select Operational Group - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the operational group information.

15 Select an operational group for the Spoke SDP Binding to monitor. Perform the following steps.

i Click on the Select button next to the Monitored Group Name parameter. The Select Operational Group - VPLS Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of operational groups appears.

iii Choose an operational group from the list and click on the OK button. The Select Operational Group - VPLS Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the operational group information.

16 If you are creating the spoke SDP binding for a B-Site or an I-Site, go to step 21.

17 If you are configuring a spoke SDP binding that originates from a 7250 SAS-ES or 7250 SAS-ESA perform the following steps:

i Configure the Active State parameter.

ii Go to step 41.

18 If you are creating the spoke SDP binding under an endpoint, go to step 20.

19 Click on the Select button in the Redundancy panel to select the desired endpoint from the drop-down menu.

20 Configure the parameters:

- Ignore Standby Signalling
- Precedence

21 Choose an SHG for the spoke SDP binding, if required.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group Name - Spoke SDP Binding form opens.

Note — You must configure an SHG or residential SHG on a spoke SDP binding for an HVPLS that includes another VPLS or a VLL service.

ii Select an SHG and click on the OK button. The Select Split Horizon Group Name - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the SHG name.

22 Configure the parameters:

- Enable Hash Label
- Enable Signal Capability
- Enable PW Status Signaling
- Force VLAN VC Forwarding
- MIP

Note — The Force VLAN VC Forwarding parameter do not appear if you are creating a Spoke SDP binding for a B-Site or an I-Site.

23 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note 1 — You can create a return tunnel only between sites that are in the same service. If the sites are not in the same service, the Return tab does not appear.

Note 2 — If you are creating a Return SDP binding for a B-site, the Return Tunnel Auto-Selection Transport Preference must be either MPLS:LDP or MPLS:RSVP. For I-sites, you can use MPLS:LDP, MPLS:RSVP, GRE, or Any.

a Let the 5620 SAM configure the transport tunnel automatically.

i Click on the Return tab.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Return tab.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

24 Select an application profile for the spoke SDP binding.

i Click on the Select button next to the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of application profiles appears.

iii Choose an Application Profile from the list and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding - VPLS service form displays only local profiles on the NE.

25 Associate an AA transit prefix policy with the spoke SDP binding, if required.

Note 1 — You can bind a transit policy to only one access interface or spoke SDP binding per node.

Note 2 — The transit policy and the application profile must belong to the same application assurance group or partition.

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit prefix policy and click on the OK button.

26 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Name
- Subscriber Class
- Subscriber Type
- Total Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

27 Specify whether the spoke SDP binding is in or out of service.

- **i** Click on the States tab button.
- **ii** Configure the Administrative State parameter.
- **iii** Configure the Block On Mesh Failure parameter.

Note — The Block On Mesh Failure parameter does not appear if you are creating a Spoke SDP binding for a B-site or an I-site.

28 Click on the Pseudowire OAM tab button.

29 Configure the Control Word parameter.

30 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

- **i** Click on the ACL tab button.
- **ii** Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.
- **iii** Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the ingress ACL filter name.
- **iv** Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.
- **v** Select an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the egress ACL filter name.
- **vi** Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - Spoke SDP Binding form opens.
- **vii** Select an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the IPv6 ingress ACL filter information displayed.
- **viii** Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - Spoke SDP Binding form opens.
- **ix** Select an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the IPv6 egress ACL filter information displayed.

31 Configure anti-spoofing for the spoke SDP binding, if required.

- **i** Click on the Anti-Spoofing tab button.
- **ii** Configure the MAC Pinning parameter.

32 Assign an accounting policy to the spoke SDP binding, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Spoke SDP Binding form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the accounting policy name.

33 Configure BPDU Termination, STP, FIB, MRP, and MFIB Allowed Daughter Card parameters for the spoke SDP binding, if required.

i Click on the Forwarding Control tab button. Depending on the device being configured, the BPDU tab is displayed.

ii Configure the parameters:

- L2 Protocol Termination
- BPDU Translation

iii Click on the STP tab button.

iv Configure the parameters:

- Path Cost
- Port Number
- Priority
- Edge Port
- Edge Capability Detection
- Link Type
- Administrative State

v Click on the FIB tab button.

vi Configure the parameters:

- Aging Enabled
- Learning Enabled
- Maximum Entries
- Limit Mac Move
- Limit Mac Move Level
- Discard Unknown Source

Note — The Maximum Entries parameter does not appear if you are creating a Spoke SDP binding for a B-site.

vii Click on the MFIB Allowed Daughter Card tab button to configure allowed daughter cards; otherwise, go to step 34.

Note 1 — The MFIB Allowed Daughter Card tab does not appear if you are creating a Spoke SDP binding for a B-Site.

Note 2 — The single-slot models of the 7450 ESS and 7750 SR support the addition or deletion of MFIB allowed daughter cards.

viii Click on the Create button. The SDP Binding MFIB Allowed Daughter Card (Create) form opens.

ix Click on the Select button. The Select Daughter Card form opens.

x Select a daughter card in the list and click on the OK button. The Select Daughter Card form closes.

xi Click on the OK button. The SDP Binding MFIB Allowed Daughter Card (Create) form closes and the MFIB Allowed Daughter Card tab displays the newly-added daughter card in the list.

xii Click on the MRP tab if you are configuring a Spoke SDP binding for a B-site.

Note — The MRP tab does not appear if you are creating a Spoke SDP binding for an I-site.

xiii Configure the parameters:

- MRP Join Time (tenths of a second)
- MRP Leave Time (tenths of a second)
- MRP Leave All Time (tenths of a second)
- MRP Periodic Time (tenths of a second)
- MRP Periodic Enabled

xiv Click on the Select button to select an PBB MRP Policy. The Select PBB MRP Policy form opens.

xv Choose the desired policy and click OK.

34 Configure IGMP Snooping for the spoke SDP binding, if required.

Note — The IGMP Snooping tab does not appear if you are creating a Spoke SDP binding for a B-Site.

i Click on the IGMP Snooping tab button. The General tab is displayed.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Disable Router Alert Check
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- IGMP Version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups
- Maximum Number of Sources per Group

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and IGMP Version parameters are configurable when the Send Queries parameter is enabled.

iii If you are creating this spoke SDP binding for a B-Site or an I-Site, go to step viii.

iv Configure a multicast CAC policy, if required. Otherwise, go to step 35.

v Click on the Select button. The Select Multicast CAC Policy form opens.

vi Select a multicast CAC policy from the list and click on the OK button. The Multicast CAC Policy form closes.

vii Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)

viii Click on the Static Mcast Group tab button to configure a static multicast group, if required. Otherwise, go to step 35.

ix Click on the Create button. The Circuit Igmp Snooping Mcast Group Display (Create) form opens.

x Configure the parameters:

- Group Address
- Source Address

xi Click on the Apply button if you want to create additional entries. A dialog box appears. Otherwise, go to step xiv.

xii Click on the OK button.

xiii Repeat steps x to xii to create additional entries, if required.

xiv Click on the OK button. A dialog box appears.

xv Click on the OK button. The Static Mcast Group tab refreshes with the new static multicast group entries in a list.

35 Configure DHCP for the spoke SDP binding, if required.

Note — The DHCP tab does not appear if you are creating a Spoke SDP binding for a B-Site or an I-Site.

i Click on the DHCP tab button.

ii Configure the parameters:

- Description
- Snooping

36 Associate a MEP with the spoke SDP binding, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step x.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab button.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

x Click on the OK button. The MEP (Create) form closes.

37 Click on the MIPs tab button.

38 Perform one or more of the following, if required:

a Click the Search button to list available MIPs.

b View the current status of a specific MIP entry.

i Select a MIP from the list.

ii Click the Properties button to display the MIP information.

c Click the Resync button to resync the latest MIPs configured on the node.

39 Configure PIM snooping for the spoke SDP binding, if required.

i Click on the PIM Snooping tab button. The General tab is displayed.

Note — The PIM Snooping tab does not appear if you are creating a Spoke SDP binding for a B-Site or an I-Site.

ii Configure the Max Number of Groups parameter.

iii Click on the OK button.

40 Configure MLD Snooping for the spoke SDP binding, if required.

i Click on the MLD Snooping tab button. The General tab is displayed.

Note — The MLD Snooping tab does not appear if you are creating a Spoke SDP binding for a B-Site or an I-Site.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Disable Router Alert Check
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- MLD version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and MLD version parameters are configurable when the Send Queries parameter is enabled.

iii Click on the Static Mcast Group tab button to configure a static multicast group, if required. Otherwise, go to step 35.

iv Click on the Create button. The Circuit Mld Snooping Mcast Group Display (Create) form opens.

v Configure the parameters:

- Group Address
- Source Address

vi Click on the Apply button if you want to create additional entries. A dialog box appears. Otherwise, go to step ix.

vii Click on the OK button.

viii Repeat steps v to vii to create additional entries, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Static Mcast Group tab refreshes with the new static multicast group entries in a list.

41 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

42 Click on the OK button. The VPLS (Edit) form reappears.

43 Repeat steps 9 to 42 for each additional spoke SDP binding that you want to create.

44 Click on the OK button. A dialog box appears.

45 Click on the Yes button. The VPLS (Edit) form closes.

46 Close the Manage Services form.

Procedure 71-6 To configure a site for BGP AD or BGP VPLS

This procedure provides the steps required to enable BGP Auto Discovery or configure BGP VPLS on a VPLS site.

- BGP AD enables a VPLS PE router to discover other PE routers that are part of the same VPLS domain. T-LDP based label signaling is used for the pseudowire.
- BGP VPLS provides the mechanism for service member auto-discovery based on Route Target. MP-BGP based label signaling is used for the pseudowire.

Note 1 — This procedure can only be performed for an existing site, not during the creation of a new site.

Note 2 — BGP AD and BGP VPLS implementations only apply to regular VPLS sites and B-Sites, but not to I-Sites. For BGP VPLS, the B-Site cannot be used as a backbone for an I-Site or Epipe.

1 Prior to configuring a site for BGP AD or BGP VPLS, you must complete the following actions:

a Create a routing policy to define the required community members. See Procedure 30-11. This defines the VSI Import/Export Routing Targets.

b Enable BGP on the routing instance of each NE in the VPLS or BGP VPLS. See Procedure 31-1 for more information.

c Configure global-level BGP on each NE in the VPLS or BGP VPLS. See Procedure 31-2 for more information. The following items are required for BGP AD implementation.

- On the VPN tab of the Routing Instance form, you must enable the L2 VPN parameter in the Family block and in the Rapid Update Address Family block.
- Create a peer group under BGP. This peer group is used to collectively define the peers involved in the VPLS.
- Create the required peers under the peer group. These peers are the NEs involved in the VPLS.

d Create a PW template. See chapter 58 for information about PW templates.

e Distribute the PW Template to each NE that is or will be a component of the VPLS or BGP VPLS.

2 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

3 Configure the filter criteria. A list of services appears.

4 Select a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

5 On the navigation tree, right-click on the required site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

6 Click on the BGP tab button.

7 Configure the Route Distinguisher parameter.

8 Click the Configuration button to configure the Route Targets and the PW Templates. The BGP Configuration form opens, with the VSI Import Policies tab displayed.

a Select up to five import policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

b Perform one of the following:

i Enter the Import Route Target name manually in the provided field. The format be “target:x:y”.

ii Click on the Import Route Target Select button. The Select ...-BGP Info form opens. Click on the Search button to display the available import route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select ...-BGP Info form closes.

c Click on the VSI Export Policies tab and select up to five export policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

d Perform one of the following:

i Enter the Export Route Target name manually in the provided field. The format must be “target:x:y”.

ii Click on the Export Route Target Select button. The Select ...-BGP Info form opens. Click on the Search button to display the available export route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select ...-BGP Info form closes.

e Click on the PW Template Binding tab button.

f Perform one of the following:

i To use an existing PW Template Binding, go to step g.

ii To add a new PW Template Binding, go to step h.

g For an existing PW Template Binding:

i Click the Search button. A list of applicable PW Template Bindings is displayed.

ii Select the required entry or entries from the list.

iii Go to step i.

h To create a new PW Template Binding:

i Click the Create button. The PW Template Binding (Create) form opens with the General tab displayed.

ii Enter a Split Horizon Group name, if required.

iii Click the Select button. The Select PW Template form is displayed.

iv Click the Search button. A list of applicable PW Templates is displayed.

v Select the PW Template you created in step 1.

vi Click OK to accept the selection. The Select PW Template form close and the Policy ID field is populated by your choice.

vii Click on the Select button next to the Member Group Name parameter. The Select Operational Group - PW Template Binding form opens.

viii Configure the filter criteria. A list of operational groups appears.

ix Choose an operational group from the list and click on the OK button. The Select Operational Group - PW Template Binding form closes and the PW Template Binding (Create) form refreshes with the operational group information.

x Click on the PW Templates Binding Route Target tab and click the Create button. The PW Template Binding Route Target (Create) form is displayed.

Note — This Import Route Target is used by the NE to decide which PW Template to use to create SDP bindings. If a far-end neighbor has a matching export target (that is, to the PW Template Import Target being defined here), then this PW Template is selected by the NE to create the pseudowire that is used to link both sites of the VPLS. If nothing is entered, and multiple PW Templates are defined, the first one found by the NE is used (most likely the one with the lowest PW Template Policy ID).

Enter the required Import Route Target in the field and click OK. The PW Template Binding Route Target (Create) form closes and the entered Import Route Target is displayed in the table on the PW Template Binding Route Target tab.

xi Click OK to accept the selection. The PW Template Binding (Create) form closes and the new PW Template Binding is displayed in the table on the PW Template Binding tab.

xii Repeat steps i to xi to create additional PW Template Bindings, as required.

xiii Select the required entry or entries from the list.

i Click the OK button to apply the configuration changes you have made. The BGP Configuration form closes.

9 If you are configuring a BGP VPLS, go to step 10. Otherwise go to step 13.

10 Enable the Enable BGP VPLS parameter. The BGP VPLS section is displayed.

11 Configure the parameters:

- VE Name
- Max VE ID
- VE ID
- Administrative State

12 Select an operational group for the BGP site to monitor. Perform the following steps.

i Click on the Select button next to the Monitored Group Name parameter. The Select Operational Group - BGP Multi-homing VPLS site form opens.

ii Configure the filter criteria. A list of operational groups appears.

iii Choose an operational group from the list and click on the OK button. The Select Operational Group - BGP Multi-homing VPLS site form closes and the BGP Multi-homing VPLS site (Create) form refreshes with the operational group information.

13 If you are configuring BGP AD, go to step 14. Otherwise go to step 17.

14 Enable the Enable BGP AD parameter. The BGP AD section is displayed.

15 Configure the parameters:

- VPLS ID
- Formatted VSI ID Prefix
- Administrative State

Note 1 — The Global Service VPLS ID is set to the value defined at the service level.

Note 2 — If VPLS ID is defined at the service level, then the 5620 SAM ensures that each site has the same VPLS ID. If a site has a different VPLS ID, an alarm is raised and the ID mismatch is indicated in the Status panel of the VPLS site properties form.

The same VPLS ID value is propagated to each site in a VPLS. If you change the VPLS ID of a site without using the 5620 SAM, the 5620 SAM displays a warning form.

16 Click on the OK button. The VPLS Site (Edit) form closes.

17 Click on the OK button. A dialog box appears.

18 Close the VPLS Service (Edit) form.

Procedure 71-7 To configure a site for BGP VPLS Multi-homing

This procedure provides the steps required to configure a site for BGP VPLS Multi-homing.

BGP VPLS Multi-homing provides redundancy support through the configuration of a number of multi-homed sites, rather than through the use of MC-LAG or MC-Ring as access mechanisms. Dual-homing between a CE device and a pair of VPLS PE devices (potentially in different autonomous systems) is an example of such a configuration.

Note 1 — This procedure can only be performed for an existing site, not during the creation of a new site.

Note 2 — Only regular VPLS sites and B-Sites can be configured for BGP VPLS Multi-homing. However, the B-Sites cannot be used as a backbone for an I-Site or Epipe.

Note 3 — I-VPLS and MVPLS services cannot be configured for this application.

Note 4 — An RD or RT configured under the BGP of a VPLS site cannot be removed as long as there is a multi-homing site ID configured whose administration state is up.

Note 5 — You can see a list of all current BGP VPLS Multi-homing sites in a multi-homing VPLS service by viewing the BGP Multi-homing Sites tab on the service configuration form.

1 Prior to configuring a site for BGP VPLS Multi-homing, you must complete the following actions:

a Create a routing policy to define the required community members. See Procedure 30-11. This defines the VSI Import/Export Routing Targets.

b Enable BGP on the routing instance of each NE in the VPLS or BGP VPLS. See Procedure 31-1 for more information.

c Configure global-level BGP on each NE in the VPLS or BGP VPLS. See Procedure 31-2 for more information. The following items are required:

- On the VPN tab of the Routing Instance form, you must enable the L2 VPN parameter in the Family block.

Note — For optimal processing while a BGP multi-homing site is activated or de-activated, or the system is rebooted, you should also:

- Enable the L2 VPN parameter in the Rapid Update Address Family block on the BGP site's VPN tab.
- Enable the Enable Rapid Withdrawal parameter on the BGP site's Behavior tab.

- Create a peer group under BGP. This peer group is used to collectively define the peers involved in the VPLS.
- Create the required peers under the peer group. These peers are the NEs involved in the VPLS.

d Create a PW template. See chapter 58 for information about PW templates.

e Distribute the PW Template to each NE that is or will be a component of the VPLS or BGP VPLS.

f Create SDPs for the BGP VPLS Multi-homing site(s), if manually-provisioned service tunnels are required. Refer to Procedure 33-1.

2 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

3 Configure the filter criteria. A list of services appears.

4 Select the required VPLS or HVPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

5 On the navigation tree, right-click on the required site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

6 Click on the BGP tab button. The General sub-tab is displayed.

7 Configure the Route Distinguisher parameter.

8 Click the Configuration button to configure the Route Targets and the PW Templates. The BGP Configuration form opens, with the VSI Import Policies tab displayed.

  a Select up to five import policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

  b Perform one of the following:

    i Enter the Import Route Target name manually in the provided field. The format must be “target:x:y”.

    ii Click on the Import Route Target Select button. The Select... -BGP Configuration form opens. Click on the Search button to display the available import route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select... -BGP Configuration form closes.

  c Click on the VSI Export Policies tab and select up to five export policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

  d Perform one of the following:

    i Enter the Export Route Target name manually in the provided field. The format must be “target:x:y”.

    ii Click on the Export Route Target Select button. The Select... -BGP Configuration form opens. Click on the Search button to display the available export route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select... -BGP Configuration form closes.

  e Click on the PW Template Binding tab button.

  f Perform one of the following:

    i To use an existing PW Template Binding, go to step g.

    ii To create a new PW Template Binding, go to step h.

g For an existing PW Template Binding:

i Click the Search button. A list of applicable PW Template Bindings is displayed.

ii Select the required entry or entries from the list.

iii Go to step i.

h To create a new PW Template Binding:

i Click the Create button. The PW Template Binding (Create) form opens with the General tab displayed.

ii Enter a Split Horizon Group name, if required.

iii Click the Select button. The Select PW Template form is displayed.

iv Click the Search button. A list of applicable PW Templates is displayed.

v Select the PW Template you created in step 1.

vi Click OK to accept the selection. The Select PW Template form close and the Policy ID field is populated by your choice.

vii Click on the PW Templates Binding Route Target tab and click the Create button. The PW Template Binding Route Target (Create) form is displayed.

Note — This Import Route Target is used by the NE to decide which PW Template to use to create SDP bindings. If a far-end neighbor has a matching export target (that is, to the PW Template Import Target being defined here), then this PW Template is selected by the NE to create the pseudowire that is used to link both sites of the VPLS. If nothing is entered, and multiple PW Templates are defined, the first one found by the NE is used (most likely the one with the lowest PW Template Policy ID).

Enter the required Import Route Target in the field and click OK. The PW Template Binding Route Target (Create) form closes and the entered Import Route Target is displayed in the table on the PW Template Binding Route Target tab.

viii Click OK to accept the selection. The PW Template Binding (Create) form closes and the new PW Template Binding is displayed in the table on the PW Template Binding tab.

ix Repeat steps i to viii to create additional PW Template Bindings, as required.

x Select the required entry or entries from the list.

i Click the OK button to apply the configuration changes you have made. The BGP Configuration form closes.

9 Click on the Multi-homing sub-tab button.

10 Click on the Create button. The BGP Multi-homing VPLS Site (Create) form opens.

11 Configure the parameters:

- Multi-homing Site Name
- Multi-homing ID
- Enable Multi-homing to

12 Click the Select button to specify a SAP, Spoke SDP, or a Split Horizon Group, based on the option you selected for the Enable Multi-homing to parameter.

13 Configure the parameters:

- Failed Threshold
- Use Node Level Boot Timer
- Boot Timer (seconds)
- Use Node Level Site Activation Timer
- Activation Timer (seconds)
- Administrative State

If you enable either the Use Node Level Boot Timer and/or Use Node Level Site Activation Timer parameters, then the associated Boot Timer (seconds) and/or Activation Timer (seconds) parameters will not be configurable. These parameter values will be inherited from the network element configuration.

The Boot Timer (seconds) and Activation Timer (seconds) parameters can be configured for an NE on the BGP Multi-homing sub-tab under the Redundancy tab in the Network Element (Edit) form. See Procedure 17-2 for more information on changing device properties.

14 Click on the Apply button. A dialog box appears.

15 Click on the OK button. The BGP Multi-homing VPLS Site (Create) form refreshes.

16 Check the following indicators:

- Operational State: indicates the operational status of the multi-homing site.
- Designated Forwarder: indicates whether this site has been declared as designated forwarder, depending on the result of the BGP election.

17 Click on the OK button. The BGP Multi-homing VPLS Site (Create) form closes.

18 Click on the OK button. The VPLS Site (Edit) form closes.

19 Close the VPLS Service (Edit) form.

Procedure 71-8 To re-evaluate the PW Templates associated with a BGP AD or BGP VPLS

Use this procedure to re-evaluate changes made to the Route Targets associated with the PW Template bindings of an existing site with BGP configuration. This procedure can only be performed on an existing VPLS that has been configured with BGP AD or BGP VPLS. The procedure allows you to make configuration changes and propagate them to the service without having to shutdown and then turn up a site.

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on the required site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

5 Click on the BGP tab button.

6 Click the Configuration button to open the BGP Configuration form.

7 Make any required changes to the Route Targets or PW Template bindings. Refer to Procedures 71-6 or 71-7 as required, for detailed instructions on configuring these items.

8 Click the PW Template Binding tab and click the Apply button to apply the changes you have made.

9 Perform one of the following:

- **i** If you need to update the PW Templates under other sites for this service, repeat steps 4 to 8 as required, then go to step 13.
- **ii** If you do not need to update the PW Templates under other sites for this service go to step 10.

10 Click the Re-evaluate PW Template button to run an evaluation of the PW Template bindings. A pop-up window appears indicating if the re-evaluation was successful. If it was not, the reason for the failure is displayed.

If you make any subsequent modifications, you can re-evaluate the template again.

11 Click OK. The BGP Configuration form closes.

12 Click the OK button to close the VPLS Service (Edit) form. The procedure is complete.

13 Return to the VPLS (Edit) form.

14 Click the Re-evaluate PW Template button. The Add form opens to allow you to select one of the PW Templates you modified.

15 Click the Search button to display a list of PW Templates and select the required one.

16 Click the OK button to run an evaluation of the selected PW Template. A pop-up window appears indicating if the re-evaluation was successful. If it was not, the reason for the failure is displayed.

17 Repeat steps 14 to 16 for any other sites that you want to re-evaluate a PW Template for.

18 Click the OK button to close the VPLS Service (Edit) form.

Procedure 71-9 To create an HVPLS

Perform this procedure to create an HVPLS. An HVPLS consists of a VPLS in which one or more sites connect to other sites in the same VPLS, different VPLS, or to VLL services.

Note — One VPLS site in an HVPLS must be configured with an SHG. See "Split horizon groups" in this chapter for more information.

1 Add a VPLS to the HVPLS.

a Create a new VPLS.

i Perform Procedure 71-1.

Caution — If you are creating an HVPLS that includes two sites in the same VPLS connected by spoke SDPs, do not create mesh SDP bindings between the sites. Mesh SDP binding functionality is available in the spoke SDP bindings between the sites.

ii Go to step 2.

b Use an existing VPLS. Go to step 3.

2 Create another service for inclusion in the HVPLS, if required.

a Create a VPLS.

i Perform Procedure 71-1.

ii Go to step 3.

b Create a VLL.

i Perform the appropriate VLL creation procedure in chapter 70.

ii Go to step 3.

3 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens with the General tab displayed.

4 Configure the filter criteria. A list of services appears.

5 Select a VPLS that you want to include in the HVPLS and click on the OK button. The VPLS (Edit) form opens.

6 Right-click on Spoke SDP Bindings below the site and choose Create Spoke SDP Bindings. The Spoke SDP Binding (Create) form opens with the General tab displayed.

7 Perform Procedure 71-5 beginning with step 10. Choose the destination node for the site that you want to include in the HVPLS as the Tunnel Termination Site.

8 Perform this procedure as required to add sites to the HVPLS.

Procedure 71-10 To create an MVPLS

An MVPLS runs RSTP or MSTP to manage traffic blocking on the associated VPLS. Perform this procedure to create an MVPLS to run MSTP, or to run RSTP and manage traffic on the associated VPLS SAPs or redundant spoke SDPs. The procedure also applies to the I-Sites and B-Sites used in PBB.

1 Choose Create→Service→MVPLS from the 5620 SAM main menu. The MVPLS (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the MVPLS. The Select Customer - MVPLS form opens.

3 Select a customer for the MVPLS and click on the OK button. The Select Customer - MVPLS form closes, and the MVPLS (Create) form refreshes with the customer name.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Default Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Per Service Hashing for LAG Enabled
- OLC State
  This parameter is configurable when you click on the Apply button.

5 On the navigation tree, right-click on Sites under MVPLS and choose one of the following, as required:

- Create MVPLS B-Site
- Create MVPLS I-Site
- Create MVPLS Site

The Select Network Elements - MVPLS form opens with a list of available sites.

6 Select a site and click on the OK button. Depending on your selection in step 5, the MVPLS B-Site (Create), MVPLS I-Site (Create), or MVPLS Site (Create) form opens with the General tab displayed.

7 Perform one of the following:

a Create an RSTP site for the MVPLS.

i For regular VPLS sites, perform steps 14 to 35 of Procedure 71-1. Specify RSTP as the value for the STP Mode parameter in step 16. Go to step iv when completed.

ii For B-Sites, perform steps 8 to 20 of Procedure 71-11. Specify RSTP as the value for the STP Mode parameter in step 11iv. Go to step iv when completed.

iii For I-Sites, perform steps 8 to 19 of Procedure 71-12. Specify RSTP as the value for the STP Mode parameter in step 12 iv. Go to step iv when completed.

iv Repeat step i, ii, or iii, as required, for each site that you want to create in the MVPLS.

b Create an MSTP site for the MVPLS.

Note — MSTP is configurable only on the 7210 SAS-D, 7210 SAS-E, 7450 ESS, and 7750 SR.

i For regular VPLS sites, perform steps 14 to 35 of Procedure 71-1. Specify MSTP as the value for the STP Mode parameter in step 16. Go to step iv when completed.

ii For B-Sites, perform steps 8 to 20 of Procedure 71-11. Specify MSTP as the value for the STP Mode parameter in step 11iv. Go to step iv when completed.

iii For I-Sites, perform steps 8 to 19 of Procedure 71-12. Specify MSTP as the value for the STP Mode parameter in step 12iv. Go to step iv when completed.

iv Repeat step i, ii, or iii, as required, for each site that you want to create in the MVPLS.

8 Click on the OK button. The MVPLS (Create) form reappears.

9 If the MVPLS site is to manage traffic on associated VPLS SAPs, create a SAP for the MVPLS with a defined redundant VLAN range.

Note — If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation in the MVPLS.

- **i** For regular VPLS sites, perform steps 5 to 52 of Procedure 71-3. Ensure that you perform step 36 to specify a redundant VLAN range. Go to step iv when completed.
- **ii** For B-Sites, perform steps 5 to 27 of Procedure 71-13. Ensure that you perform step 22 to specify a redundant VLAN range. Go to step iv when completed.
- **iii** For I-Sites, perform steps 5 to 30 of Procedure 71-14. Ensure that you perform step 24 to specify a redundant VLAN range. Go to step iv when completed.
- **iv** Click on the OK button. The MVPLS (Create) form reappears.

10 Click on the OK button. The MVPLS (Create) form closes.

Procedure 71-11 To create a B-site for VPLS or MVPLS

1 Choose Create→Service→VPLS from the 5620 SAM main menu. The VPLS service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VPLS. The Select Customer - VPLS service form opens.

3 Select a customer for the VPLS and click on the OK button. The Select Customer - VPLS service form closes, and the VPLS service (Create) form displays the customer information.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Default Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Automatic Mesh SDP Binding Creation
- Profile Name
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Perform one of the following.

a Create a B-site for the VPLS. Go to step 6.

b Complete service creation if B-sites, B-L2 access interfaces, and SDP bindings for the VPLS are to be created later. Go to step 23.

6 On the navigation tree, right-click on the Sites icon and choose Create VPLS B-Site from the contextual menu. The Select Network Elements - VPLS form opens with a list of available sites.

7 Select a site and click on the OK button. The B-Site (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Name
- Description
- MTU
- Default Mesh VC ID
- Administrative State
- Monitor Access Interface Operational State
- Per Service Hashing for LAG Enabled

9 Click on the Backbone tab button.

10 Configure the backbone parameters:

- Source MAC Address
- Use SAP Backbone MAC Address
- Administrative State
- MAC Notification Interval (seconds)
- MAC Notification Count

Note 1 — The Source MAC Address should not be duplicated for other B-sites within the same B-VPLS.

Note 2 — The Source MAC Address parameter is the only applicable parameter when configuring PBB on a 7210 SAS-M or a 7210 SAS-X.

Note 3 — The Use SAP Backbone MAC Address parameter is configurable only on the 7750 SR, 7750 SR-c12, or 7450 ESS. The NE must also be configured with an IOM 3 MDA.

11 Configure MFIB, STP, FIB, and MRP parameters for the B-site, if required.

i Click on the Forwarding Control tab button. The MFib tab is displayed.

ii Configure the parameters:

- Table size (entries)
- High Watermark (%)
- Low Watermark (%)

iii Click on the STP tab button to configure STP parameters for the B-site, if required. Otherwise, go to step v.

iv Configure the bridge-level STP parameters for the B-site.

Alcatel-Lucent STP in a VPLS interoperates with customer STP implementations as a mechanism for loop detection and prevention. The bridge-level parameters balance the STP resiliency and speed of convergence. Modifying the bridge-level parameters must be done within the constraints of the following formulas:

- 2 × (Bridge Forward Delay – 1.0 s) >= Bridge Max Age
- Bridge Max Age >= 2 × (Bridge Hello Time + 1.0 s)

Note 1 — If you are configuring an MVPLS B-site, set the STP Mode parameter to RSTP or MSTP, depending on the MVPLS type. The MSTP option is available only if you are creating an MVPLS. See Procedure 71-10 for more information about creating an MVPLS.

Note 2 — MSTP is configurable only on the 7450 ESS, 7710 SR, and 7750 SR.

- Bridge Forward Delay (seconds)
- Bridge Hello Time (seconds)
- Bridge Max Age (seconds)
- Priority
- STP Mode
- Maximum BPDUs (PDUs/Hello Interval)
- Administrative State

v Click on the FIB tab button to configure FIB parameters for the B-site, if required. Otherwise, go to step 12.

vi Configure the parameters:

- High Watermark (%)
- Low Watermark (%)
- Local Age Time (seconds)
- Remote Age Time (seconds)
- Size (entries)
- Aging Enabled
- Learning Enabled
- Discard Unknown Destinations
- MAC Flush on fail
- Propagate MAC Flush

vii Depending on the type of device being configured, the Mac Move panel appears. Configure the MAC move parameters, if required:

- Move Frequency
- Retry Timeout
- Number Of Retries
- Administrative State
- Primary Ports Cumulative Factor
- Secondary Ports Cumulative Factor

viii If you are configuring an MVPLS B-site that requires MSTP, click on the MSTP tab button. Otherwise, go to step 12.

Note — MSTP is configurable only on the 7450 ESS, 7710 SR, and 7750 SR.

ix Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

x Click on the MST Instances tab button.

xi Click on the Create button. The MST Instance (Create) form opens with the General tab displayed.

xii Configure the parameters:

- Instance Index
- Priority

xiii Click on the VLAN Ranges tab button. Click on the Create button. The MST Instance Managed VLAN range (Create) form opens.

xiv Configure the parameters:

- Min. VLAN Tag
- Max. VLAN Tag

xv Click on the OK button. The MST Instance Managed VLAN Range (Create) form closes, and a dialog box appears.

xvi Click on the OK button. The MST Instance (Create) form refreshes with the new managed VLAN range.

xvii Click on the OK button. The MST Instance (Create) form closes and a dialog box appears.

xviii Click on the OK button. The MVPLS Site (Create) form refreshes with the new MST instance.

xix Click on the MRP tab button.

xx Configure the parameters:

- MRP Admin Status
- MRP Max Attributes
- MRP Flood Time (seconds)
- MRP Attribute-Table-Low-Watermark
- MRP Attribute-Table-High-Watermark
- MMRP Endstation Only

Note — You can view information regarding MMRP Entries for the access interface and/or SDP Binding by clicking on the MMRP Entries tab button.

12 Create an endpoint for redundancy (dual homing) on the B-site, if required.

i Click on the Endpoints tab button.

ii Click on the Create button. The Endpoint (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Name
- Description
- Revert Time (seconds)
- Suppress Standby Signalling
- Ignore Standby Signalling
- MAC Pinning

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Endpoint (Create) form closes and the B-Site (Create) form reappears with the new endpoint displayed in the list.

13 If you are configuring an MVPLS B-site, go to step 17.

14 Configure an SHG on the site, if required.

Note — You must configure an SHG or RSHG if you plan to create a spoke circuit from this VPLS B-site to a VLL or to another VPLS.

i Click on the Split Horizon Groups tab button.

ii Click on the Create button. The Site, New Split Horizon Group (Create) form opens.

iii Configure the parameters:

- Name
- Description

iv Click on the OK button. The Site, New Split Horizon Group (Create) form closes.

Note — You can view information about the I-Sites and Epipe sites associated with the B-Site by clicking on the Associated Sites tab button.

15 To create a B-L2 access interface for the site, perform steps 5 to 29 of Procedure 71-13.

16 To create a mesh SDP binding for the site, perform steps 5 to 25 of Procedure 71-4.

17 To create a redundant spoke SDP binding under an endpoint, perform steps 4 to 43 of Procedure 71-5.

18 To create a spoke SDP binding for the site, perform steps 7 to 43 of Procedure 71-5.

Note 1 — You cannot create a spoke SDP binding on an MVPLS site that runs MSTP, or enable MSTP on a site that has a spoke SDP binding.

Note 2 — You cannot enable MSTP on a SAP that has a non-zero encapsulation value.

19 Create a virtual MEP on the site, if required. For more information about virtual MEPs, see chapter 46.

i Click on the Virtual MEP tab button.

ii Click on the Create button. The MEP (Create) form opens.

iii Click on the Select button. The Select Maintenance Entity Group form opens.

iv Choose a MEG from the list.

Note — The B-VPLS site must be added to the MEG during MEG configuration. Otherwise, the virtual MEP cannot be created on the B-site. See chapter 38 for more information.

v Configure the parameters:

- Auto-Assign ID
- ID
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- Mac Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi Click on the OK button. The Select Maintenance Entity Group form closes, and the MEG information is displayed on the MEP (Create) form.

vii Click on the OK button. The MEP (Create) form closes, and the virtual MEP is created on the B-VPLS site.

20 Click on the OK button. The B-Site (Create) form closes, and a dialog box appears.

21 Click on the OK button. The VPLS (Create) form displays the new site on the navigation tree under VPLS.

22 Repeat steps 6 to 21 to create additional sites for the B-VPLS.

23 Click on the OK button. The VPLS (Create) form closes.

24 Close the Manage Services form.

Procedure 71-12 To create an I-VPLS

1 Choose Create→Service→VPLS from the 5620 SAM main menu. The VPLS Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VPLS. The Select Customer - VPLS Service form opens.

3 Select a customer for the VPLS and click on the OK button. The Select Customer - VPLS Service form closes, and the VPLS Service (Create) form displays the customer information.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Default Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Automatic Mesh SDP Binding Creation
- Profile Name
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled and the Profile Name parameter is left blank.
- OLC State
  This parameter is configurable when you click on the Apply button.

5 Perform one of the following.

a Create an I-site for the VPLS. Go to step 6.

b Complete service creation if I-sites, I-L2 access interfaces, and SDP bindings for the VPLS are to be created later. Go to step 24.

6 On the navigation tree, right-click on Sites and choose Create VPLS I-Site from the contextual menu. The Select Network Elements - VPLS form opens with a list of available sites.

7 Select a site and click on the OK button. The I-Site (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- Per Service Hashing for LAG Enabled
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault propagation from the facility tunnel MEP.

9 Click on the Backbone tab button.

10 Select the Backbone VPLS site.

i Click on the Select button. The Select Backbone VPLS Site - I-Site form is displayed.

ii Click the Search button. A list with all the B-VPLSs that can be used by the I-VPLS is displayed. You can narrow the search by using the using the filtered properties shown in the form. Only B-VPLSs that are present in PEs that have the I-Sites of the VPLS is shown.

iii Select a B-VPLS and click on OK. The Select Backbone VPLS Site - I-Site form closes and the Service ID of the chosen B-VPLS appears on the I-Site (Create) form.

Note — The selection of the B-site in this step must be repeated for each I-site you create, since you must select the B-VPLS site that is within the same site as the I-site.

11 Configure the parameters:

- Send Flush All From Me
- Send Flush All But Mine
- Administrative ISID
- Backbone STP
- Force Q Tag Forwarding

Note 1 — The Force Q Tag Forwarding parameter is only displayed if the NE for this site is in chassis mode D or higher or Sparrow.

Note 2 — Only the Administrative ISID and Backbone STP parameters are applicable when configuring PBB on a 7210 SAS-M or a 7210 SAS-X.

12 Configure MFib, STP, FIB, and MAC Protection parameters for the I-site, if required.

i Click on the Forwarding Control tab button. The MFib tab is displayed.

ii Configure the parameters:

- Table size (entries)
- High Watermark (%)
- Low Watermark (%)

iii Click on the STP tab button to configure STP parameters for the I-site, if required. Otherwise, go to step v.

iv Configure the bridge-level STP parameters for the I-site.

Alcatel-Lucent STP in a VPLS interoperates with customer STP implementations as a mechanism for loop detection and prevention. The bridge-level parameters balance the STP resiliency and speed of convergence. Modifying the bridge-level parameters must be done within the constraints of the following formulas:

- 2 × (Bridge Forward Delay – 1.0 s) >= Bridge Max Age
- Bridge Max Age >= 2 × (Bridge Hello Time + 1.0 s)

Note 1 — If you are configuring an MVPLS I-site, set the STP Mode parameter to RSTP or MSTP, depending on the MVPLS type. The MSTP option is available only if you are creating an MVPLS. See Procedure 71-10 for more information about creating an MVPLS.

Note 2 — MSTP is configurable only on the 7450 ESS, 7710 SR, and 7750 SR.

- Bridge Forward Delay (seconds)
- Bridge Hello Time (seconds)
- Bridge Max Age (seconds)
- Priority
- STP Mode
- Maximum BPDUs (PDUs/Hello Interval)
- Administrative State

v Click on the FIB tab button to configure FIB parameters for the I-site, if required. Otherwise, go to step 16.

vi Configure the parameters:

- High Watermark (%)
- Low Watermark (%)
- Local Age Time (seconds)
- Remote Age Time (seconds)
- Size (entries)
- Aging Enabled
- Learning Enabled
- Discard Unknown Destinations
- MAC Flush on fail
- Propagate MAC Flush

vii Depending on the type of device being configured, the Mac Move panel appears. Configure the MAC move parameters, if required:

- Move Frequency
- Retry Timeout
- Number Of Retries
- Administrative State
- Primary Ports Cumulative Factor
- Secondary Ports Cumulative Factor

viii Click on the MAC Protection tab to configure the list of protected MAC addresses.

ix Click on the Create button. The MAC Protection (Create) form opens.

x Configure the Protected Mac Address parameter.

xi Click on the OK button to close the form and add the MAC address to the list of protected MAC addresses.

xii If you are configuring an MVPLS I-site that requires MSTP, click on the MSTP tab button. Otherwise, go to step 15.

Note — MSTP is configurable only on the 7450 ESS, 7710 SR, and 7750 SR.

xiii Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

xiv Click on the MST Instances tab button.

xv Click on the Create button. The MST Instance (Create) form opens with the General tab displayed.

xvi Configure the parameters:

- Instance Index
- Priority

xvii Click on the VLAN Ranges tab button. Click on the Create button. The MST Instance Managed VLAN range (Create) form opens.

xviii Configure the parameters:

- Min. VLAN Tag
- Max. VLAN Tag

xix Click on the OK button. The MST Instance Managed VLAN Range (Create) form closes, and a dialog box appears.

xx Click on the OK button. The MST Instance (Create) form refreshes with the new managed VLAN range.

xxi Click on the OK button. The MST Instance (Create) form closes and a dialog box appears.

xxii Click on the OK button. The MVPLS Site (Create) form refreshes with the new MST instance.

13 Configure ingress multicast forwarding, if required.

Note — An Operational Channels tab appears when you access the VPLS I-Site form in the Edit mode. It displays data for the operational channels when traffic from a specific multicast source for a specific multicast group passes through the service. You must click on the Search button to refresh the data. See chapter 46 for information about listing the operational channel parameters.

i Click on the Mcast Path Mgmt tab button.

ii Click on the Select button to choose a multicast info policy. The Select Ingress Info Policy form opens.

iii Select a policy in the list and click on the OK button. The Select Ingress Info Policy form closes and the policy identifier is displayed on the Site (Create) form.

14 Configure IGMP snooping for the site, if required.

i Click on the IGMP Snooping tab button.

ii Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Robust Count
- Report source address
- Use query source address
- Query source address

The Query source address parameter is configurable when the Use query source address parameter is enabled.

15 If you are configuring an MVPLS I-site, go to step 17.

16 Configure an SHG on the site, if required.

Note — You must configure an SHG or RSHG if you plan to create a spoke circuit from this VPLS I-site to a VLL or to another VPLS.

i Click on the Split Horizon Groups tab button.

ii Click on the Create button. The Site, New Split Horizon Group (Create) form opens.

iii Configure the parameters:

- Name
- Description
- Restrict Protected Source
- Restrict Protected Source Action
- Restrict Unprotected Destination

iv Click on the OK button. The Site, New Split Horizon Group (Create) form closes.

17 To create an I-L2 access interface for the I-site, perform steps 4 to 32 of Procedure 71-14.

18 To create a spoke SDP binding between the I-site and regular VPLS sites, click on the Components tab and perform steps 9 to 43 of Procedure 71-5, as required. I-sites can only use spoke SDP bindings.

Note 1 — You cannot create a spoke SDP binding on an MVPLS site that runs MSTP, or enable MSTP on a site that has a spoke SDP binding.

Note 2 — You cannot enable MSTP on an access interface that has a non-zero encapsulation value.

19 Click on the OK button. The I-Site (Create) form closes, and a dialog box appears.

20 Click on the OK button. The VPLS (Create) form displays the new I-site on the navigation tree under VPLS.

21 Repeat steps 6 to 20 to create additional I-sites for the I-VPLS.

22 Add protected MAC addresses at the service level, if required. Protected MAC addresses that you add on the site level, as performed in step 12, are automatically added to the service-level MAC protection list.

i Click on the Forwarding Control tab button.

ii Click on the MAC Protection tab button.

iii Click on the Create button. The MAC Protection (Create) form opens.

iv Configure the Protected Mac Address parameter.

v Click on the OK button. The MAC Protection (Create) form closes and the protected MAC address is listed on the VPLS (Create) form.

23 To configure bandwidth for the service if required, click on the Bandwidth tab. The Required Bandwidth sub-tab is displayed. Proceed as follows:

Note 1 — The Bandwidth tab is only available if service CAC is configured; see chapter 6 for information about enabling and disabling service CAC.

Note 2 — The ability to configure required bandwidth is only applicable to l-sites.

i For each CoS, enter the value for the CoS Bandwidth (Mbps), as required.

ii Click on the General tab to determine the CAC status.

If the Verify CAC button is enabled, the CAC has not been verified. The Probable Cause and CAC Status fields provide details.

The CAC Status field describes the current CAC status of the service. CAC statuses are as follows.

- CAC Verified indicates that all tunnels have sufficient bandwidth to admit service and that requested bandwidth for the service is booked on the appropriate physical links.
- CAC Failed indicates that the attempt made to admit service into the network was unsuccessful. The most likely cause for this is insufficient bandwidth. See the Probable Cause field for more specific information.
- BW Defined, No CAC Request indicates that the required bandwidth is defined on the service; however, a CAC request has not occurred.
- CAC To be Verified indicates that a tunnel has been configured on the service either manually or through the CLI; however, the required bandwidth has not been verified in the network.

The Probable Cause field describes possible reasons for the current CAC state. Probable causes are as follows.

- No Candidate Tunnels Found indicates that the autobind tunnel function was found, but no suitable tunnels were found.
- Different PBB Tunnels Applied to Service indicates that two or more different PBB tunnels are configured on this service.
- Not Enough Bandwidth on any Candidate Tunnels indicates that one or more candidate tunnels were found, but the available bandwidth was insufficient to admit the service.
- Automatic PBB Tunnel Selection Failed indicates that a suitable PBB tunnel was found, but there were errors when attempting to assign the tunnel to the service. A dialog box will provide more details.
- Site Missing Tunnel indicates that at least one selected site is not configured with a PBB tunnel.
- All PBB Tunnels have not been Verified indicates that all sites within the service have a tunnel configured, but the available bandwidth has not been booked or verified in the network.

iii To manually verify the CAC, click on the Verify CAC button if it is enabled. The 5620 SAM will attempt to find the most appropriate PBB tunnel for the service based on available bandwidth, and to automatically bind the tunnel to the service if one has not already been assigned.

24 Click on the OK button. The VPLS (Create) form closes.

25 Close the Manage Services form.

Procedure 71-13 To create a VPLS or MVPLS B-L2 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

5 Right-click on Access Interfaces and choose Create B-L2 Access Interface. The B-L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Description
- Administrative State
- MC Ring Node
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault propagation from the facility tunnel MEP.

7 Choose a transit prefix policy for the interface, if required.

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy - B-L2 Access Interface list form opens.

ii Select a transit prefix policy and click on the OK button.

8 Choose an SHG for the interface, if required.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group Name - B-L2 Access Interface list form opens.

Note — You must configure an SHG or residential SHG for a VPLS if you plan to create a spoke circuit from this VPLS site to a VLL or another VPLS.

ii Select an SHG and click on the OK button. The Select Split Horizon Group Name - B-L2 Access Interface list form closes, and the B-L2 Access Interface (Create) form refreshes with the SHG name.

9 Click on the Port tab button.

10 Click on the Select button to choose a port for the B-L2 access interface. The Select Terminating Port - VPLS B-L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

11 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPLS B-L2 Access Interface form closes, and the VPLS B-L2 Access Interface (Create) form displays the port information.

12 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactivate until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 68-25 for more information about deleting MSAPs.

For a B-L2 access interface, only Null, dot1q, and Q in Q encapsulation are supported.

When the selected port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. If you choose this, the system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form.

13 Depending on the port that you have chosen, the Egress Multicast Group tab is configurable. Configure the EMG, if required.

i Click on the Egress Multicast Group tab button. The Select Egress Multicast Group-B-L2 Access Interface form opens.

ii Select an EMG and click on the OK button. The Select Egress Multicast Group-B-L2 Access Interface form closes, and the Egress Multicast Group tab refreshes with the EMG name.

Note — The Egress Multicast Group-L2 Interface form lists only EMGs that have the same egress filter and encapsulation type as the interface.

14 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab button.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

15 Assign ingress and egress QoS policies to the interface, if required.

i Click on the QoS tab button.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use Shared Queue
- Use Multipoint Shared Queue

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is dot1q or Q in Q.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - B-L2 Access Interface form opens.

iv Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the ingress QoS policy name.

Note — If you select an access ingress policy that has a forwarding class mapped to an ingress queue group, the port that you choose for the VPLS L2 access interface must use the same access ingress queue group.

See Procedure 20-1 for information about configuring Ethernet ports. See chapter 46 for information about queue group template policies.

v Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - B-L2 Access Interface form opens.

vi Select an egress QoS policy and click on the OK button. The Select Egress Policy - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the egress QoS policy name.

Note — If you select an access egress policy that has a forwarding class mapped to an egress queue group, the port that you choose for the VPLS L2 access interface must use the same access egress queue group.

See Procedure 20-1 for information about configuring Ethernet ports. See chapter 46 for information about queue group template policies.

vii If the port you selected in step 10 is not an HSMDA port then go to step 16.

viii Configure the Packet Byte Offset (bytes) parameter, if required. Before you can configure the parameter, you must select the associated Override check box.

ix Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

x Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the WRR policy information displayed.

xi Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xii Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

16 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 18.

Note — The Schedulers tab is configurable only when a port is assigned to the interface.

17 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 10 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 10 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - B-L2 Access Interface form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS B-L2 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 10 is an HSMDA port, go to step 18.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - B-L2 Access Interface form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS B-L2 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 18.

b Specify that an access scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 10 is an HSMDA port. Go to step 18.

i Set the Aggregation parameter to on.

ii Configure the Frame-Based Accounting parameter.

iii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - B-L2 Access Interface form opens.

iv Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

18 Assign ingress and egress ACL filters to the interface, if required.

Note — Only MAC filters are allowed for B-L2 Access Interfaces.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - B-L2 Access Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the ingress ACL filter name.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - B-L2 Access Interface form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the egress ACL filter name.

19 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - B-L2 Access Interface form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the accounting policy name.

20 Configure BPDU Termination, STP, FIB, and MRP parameters for the interface, if required.

i Click on the Forwarding Control tab button. Depending on the device being configured, the BPDU Termination tab is displayed. Otherwise, go to step iii.

ii Configure the parameters:

- L2 Protocol Termination
  When the L2 Protocol Termination parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.
- BPDU Translation
- Force L2PT on Managed L2 Access Interface
  The Force L2PT on Managed L2 Access Interface parameter is only available for MVPLS B-L2 access interfaces. When the Force L2PT on Managed L2 Access Interface parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.

iii Click on the STP tab button.

iv Configure the parameters:

- Path Cost
- Port Number
- Priority
- Edge Port
- Edge Capability Detection
- Link Type
- Root Guard
- Administrative State

v Click on the FIB tab button.

vi Configure the parameters:

- Aging Enabled
- Learning Enabled
- Limit Mac Move
- Limit Mac Move Level
- Discard Unknown Source

vii If you are creating an MVPLS to run MSTP, the MST Instances tab button is configurable. Otherwise, go to step xiv.

viii Click on the MST Instances tab button to edit a SAP MST instance.

ix Select an MST instance and click on the Properties button.

x The B-L2 Access Interface MST Instance (Edit) form opens. Configure the parameters:

- Path Cost
- Priority

xi Click on the OK button to close the B-L2 Access Interface MST Instance (Edit) form. A dialog box appears.

xii Click on the OK button. The B-L2 Access Interface (Create) form refreshes with the new MST instance.

xiii If you are configuring an MVPLS B-L2 access interface, go to step 21.

xiv Click on the MRP tab button.

xv Configure the parameters:

- MRP Join Time (tenths of a second)
- MRP Leave Time (tenths of a second)
- MRP Leave All Time (tenths of a second)
- MRP Periodic Time (tenths of a second)
- MRP Periodic Enabled

Note — You can view information regarding MMRP Entries by clicking on the MMRP tab button.

xvi Click on the Select button to select an PBB MRP Policy. The Select PBB MRP Policy form opens.

xvii Choose the desired policy and click OK.

21 Assign a DoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - B-L2 Access Interface form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - B-L2 Access Interface form closes and the policy ID is displayed on the B-L2 Access Interface (Create) form.

iv Configure the MAC Monitoring parameter.

22 Configure a redundant VLAN range, if required.

Note — If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation. The redundant VLAN range defines the range of VC IDs for VPLS SAPs that the MVPLS manages.

i Click on the Redundancy tab button.

ii Click on the Create button. The RedundantVlanRange (Create) form opens.

iii Configure the parameters:

- Min VLAN ID
- Max VLAN ID

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The B-L2 Access Interface (Create) form refreshes with the redundant VLAN range entry.

23 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab button.

ii Configure the MAC Pinning parameter.

24 Specify the queue overrides.

i Click on the Override Policy Items tab button.

Note — The Override Policy Items tam contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

ii See Procedure 47-44 for information about setting queue overrides.

25 Associate a MEP with the B-L2 Access interface, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button. The Select Maintenance Entity Group list form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group list form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Interface Type

Note — The Interface Type parameter is automatically selected based on whether the MEP is created on a SAP, SDP binding, or Ethernet Tunnel Path Endpoint.

vi Click on the Select button. The Select SAP - MEP form opens.

vii Select a SAP in the list and click on the OK button. The MEP form displays the SAP information.

viii If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step xii.

ix Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

x Click on the AIS tab button.

xi Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

xii Click on the OK button. The MEP (Create) form closes.

26 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button. The ANCP Static Map (Create) form opens.

ii Configure the ANCP String parameter.

iii Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

- **iv** Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

- **v** Click on the OK button. The ANCP Static Map form closes.

27 Click on the OK button. The B-L2 Access Interface (Create) form closes and a dialog box appears.

28 Click on the OK button. The VPLS (Edit) form reappears.

29 Repeat steps 4 to 28 for each additional B-L2 access interface that you want to create.

30 Click on the OK button. A dialog box appears.

31 Click on the Yes button. The VPLS (Edit) form closes.

32 Close the Manage Services form.

Procedure 71-14 To create a VPLS I-L2 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

5 Right-click on Access Interfaces and choose Create I-L2 Access Interface. The I-L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Description
- Administrative State
- MC Ring Node
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept.

7 Choose a transit prefix policy for the interface, if required.

- **i** Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy - VPLS I-L2 Access Interface list form opens.

- **ii** Select a transit prefix policy and click on the OK button.

8 Choose an SHG for the interface, if required.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group Name - I-L2 Access Interface list form opens.

Note — You must configure an SHG or residential SHG for a VPLS if you plan to create a spoke circuit from this VPLS site to a VLL or another VPLS.

ii Select an SHG and click on the OK button. The Select Split Horizon Group Name - I-L2 Access Interface list form closes, and the I-L2 Access Interface (Create) form refreshes with the SHG name.

9 Click on the Port tab button.

10 Click on the Select button to choose a port for the I-L2 access interface. The Select Terminating Port - VPLS I-L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

11 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPLS I-L2 Access Interface form closes, and the VPLS I-L2 Access Interface (Create) form displays the port information.

Note — If you select an Ethernet Tunnel Endpoint, the Port form is refreshed and an Ethernet Tunnel tab is added.

12 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactivate until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 68-25 for more information about deleting MSAPs.

For an I-L2 access interface, only Null, dot1q, and Q in Q encapsulations are supported. In the case of I-MPVLS L2-access interfaces, Null encapsulation is not supported. I-MPVLS L2-access interfaces with MSTP configured support Q in Q. These ports must also be of Ethernet type PBB.

When the selected port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. If you choose this, the system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet with Q in Q encapsulation.

If the port you have chosen is an Ethernet Tunnel Endpoint, you will be able to set the Outer Encapsulation Value to 8191. This automatically enables the Ethernet Tunnel Endpoint Control SAP parameter.

13 Configure the Ethernet Tunnel Endpoint Control SAP parameter, if required.

Note — Enabling the Ethernet Tunnel Endpoint Control SAP parameter creates the control L2 Access Interface (also known as a Control SAP). It also automatically sets the value of the Outer Encapsulation Value parameter to 8191.

If you are currently creating a same-fate SAP, the Ethernet Tunnel Endpoint Control SAP parameter must not be enabled.

14 Depending on the port that you have chosen, the Egress Multicast Group tab is configurable. Configure the EMG, if required.

i Click on the Egress Multicast Group tab button. The Select Egress Multicast Group-I-L2 Access Interface form opens.

ii Select an EMG and click on the OK button. The Select Egress Multicast Group-I-L2 Access Interface form closes, and the Egress Multicast Group tab refreshes with the EMG name.

Note — The Egress Multicast Group-L2 Interface form lists only EMGs that have the same egress filter and encapsulation type as the interface.

15 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab button.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

16 Assign ingress and egress QoS policies to the interface, if required.

i Click on the QoS tab button.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use Shared Queue
- Use Multipoint Shared Queue

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is dot1q or Q in Q.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - I-L2 Access Interface form opens.

iv Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the ingress QoS policy name.

Note — If you select an access ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that port that you are configuring for the VPLS L2 access interface has the access ingress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

v Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - I-L2 Access Interface form opens.

vi Select an egress QoS policy and click on the OK button. The Select Egress Policy - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the egress QoS policy name.

Note — If you select an access egress policy which has a forwarding class mapped to an egress queue group, you must ensure that port that you are configuring for the VPLS L2 access interface has the access egress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

vii If the port you selected in step 11 is not an HSMDA port then go to step 17.

viii Configure the Packet Byte Offset (bytes) parameter, if required. Before you can configure the parameter, you must select the associated Override check box.

ix Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

x Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the WRR policy information displayed.

xi Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xii Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

17 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 19.

Note — The Schedulers tab is configurable only when a port is assigned to the interface.

18 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 11 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 11 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - I-L2 Access Interface form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS I-L2 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 11 is an HSMDA port, go to step 19.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - I-L2 Access Interface form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS I-L2 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 19.

b Specify that an access scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 11 is an HSMDA port. Go to step 19.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - I-L2 Access Interface form opens.

iii Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

19 Assign ingress and egress ACL filters to the interface, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - I-L2 Access Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the ingress ACL filter name.

- **iv** Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - I-L2 Access Interface form opens.

- **v** Select an egress ACL filter and click on the OK button. The Select Egress Filter - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the egress ACL filter name.

- **vi** Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - I-L2 Access Interface form opens.

- **vii** Select an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - I-L2 Access Interface form closes and the I-L2 Access Interface (Create) form reappears with the IPv6 ingress ACL filter information displayed.

- **viii** Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - I-L2 Access Interface form opens.

- **ix** Select an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - I-L2 Access Interface form closes and the I-L2 Access Interface (Create) form reappears with the IPv6 egress ACL filter information displayed.

20 Assign an accounting policy to the interface, if required.

- **i** Click on the Accounting tab button.

- **ii** Configure the Collect Accounting Statistics parameter.

- **iii** Click on the Select button to choose an accounting policy. The Select Accounting Policy - I-L2 Access Interface form opens.

- **iv** Select an accounting policy and click on the OK button. The Select Accounting Policy - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the accounting policy name.

21 Configure BPDU Termination, STP, and FIB parameters for the interface, if required.

- **i** Click on the Forwarding Control tab button. Depending on the device being configured, the BPDU Termination tab is displayed. Otherwise, go to step iii.

- **ii** Configure the parameters:

  - L2 Protocol Termination
    When the L2 Protocol Termination parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.
  - BPDU Translation
  - Force L2PT on Managed L2 Access Interface
    The Force L2PT on Managed L2 Access Interface parameter is only available for MVPLS I-L2 access interfaces. When the Force L2PT on Managed L2 Access Interface parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.

- **iii** Click on the STP tab button.

iv Configure the parameters:

- Path Cost
- Port Number
- Priority
- Edge Port
- Edge Capability Detection
- Link Type
- Root Guard
- Administrative State

v Click on the FIB tab button.

vi Configure the parameters:

- Aging Enabled
- Learning Enabled
- Maximum Entries
- Limit Mac Move
- Limit Mac Move Level
- Discard Unknown Source
- Restrict Protected Source
- Restrict Protected Source Action
- Restrict Unprotected Destination

vii If you are creating an MVPLS to run MSTP, the MST Instances tab button is configurable. Otherwise, go to step 22.

viii Click on the MST Instances tab button to edit a SAP MST instance.

ix Select an MST instance and click on the Properties button.

x The I-L2 Access Interface MST Instance (Edit) form opens. Configure the parameters:

- Path Cost
- Priority

xi Click on the OK button to close the I-L2 Access Interface MST Instance (Edit) form. A dialog box appears.

xii Click on the OK button. The I-L2 Access Interface (Create) form refreshes with the new MST instance.

22 Assign a DoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - I-L2 Access Interface form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - I-L2 Access Interface form closes and the policy ID is displayed on the I-L2 Access Interface (Create) form.

iv Configure the MAC Monitoring parameter.

23 Configure an Ethernet tunnel.

Note — You can only configure Ethernet tunnel SAP path parameters if you are creating a same-fate SAP.

i Click on the Ethernet Tunnel tab.

ii If you are configuring a fate-sharing Ethernet Tunnel Endpoint SAP (also referred to as same-fate SAP) then go to step iii. Otherwise, go to step 24.

iii Click on the Create button. The Ethernet Tunnel (Create) form opens.

iv Configure the parameters:

- Path ID
- Tag (Outer Encapsulation Value)
- Tag (Inner Encapsulation Value)

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The L2 Access Interface (Create) form refreshes with the Ethernet Tunnel entry.

24 Configure a redundant VLAN range, if required.

Note — If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation. The redundant VLAN range defines the range of VC IDs for VPLS SAPs that the MVPLS manages.

i Click on the Redundancy tab button.

ii Click on the Create button. The RedundantVlanRange (Create) form opens.

iii Configure the parameters:

- Min VLAN ID
- Max VLAN ID

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The I-L2 Access Interface (Create) form refreshes with the redundant VLAN range entry.

25 Configure IGMP snooping for the interface, if required.

i Click on the IGMP Snooping tab button. The General tab is displayed.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Mrouter attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust Count
- IGMP Version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups
- Maximum Number of Sources per Group

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust Count, and IGMP Version parameters are configurable when the Send Queries parameter is enabled.

iii Click on the Static Mcast Group tab button to configure a static multicast group, if required. Otherwise, go to step 26.

iv Click on the Create button. The Access Interface Igmp Snooping Mcast Group Display (Create) form opens.

v Configure the parameters:

- Group Address
- Source Address

vi Click on the Apply button if you want to create additional entries. A dialog box appears.

vii Click on the OK button.

viii Repeat steps iv to vii to create an additional entry, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Static Mcast Group tab refreshes with the new multicast group entries.

26 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab button.

ii Configure the MAC Pinning parameter.

27 Specify the queue overrides.

i Click on the Override Policy Items tab button.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

ii See Procedure 47-44 for information about setting queue overrides.

28 Associate a MEP with the I-L2 Access interface, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button. The Select Maintenance Entity Group list form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group list form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Interface Type

Note — The Interface Type parameter is automatically selected based on whether the MEP is created on a SAP, SDP binding, or Ethernet Tunnel Path Endpoint.

vi Click on the Select button beside the Name parameter. The Select SAP - MEP form opens with a list of service access interfaces for the MEP.

vii Choose a service access interface from the list.

viii Click on the OK button. The MEP form is refreshed with the SAP information.

ix If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step xiii.

x Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

xi Click on the AIS tab button.

xii Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

xiii Click on the OK button. The MEP (Create) form closes.

29 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

30 Click on the OK button. The I-L2 Access Interface (Create) form closes and a dialog box appears.

31 Click on the OK button. The VPLS (Edit) form reappears.

32 Repeat steps 4 to 31 for each additional I-L2 access interface that you want to create.

33 Click on the OK button. A dialog box appears.

34 Click on the Yes button. The VPLS (Edit) form closes.

35 Close the Manage Services form.

Procedure 71-15 To configure a GNE site on a VPLS service

Use this procedure to add a GNE site and GNE service interfaces to an existing VPLS service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS service and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on VPLS Service and choose Create GNE Site. The Select Network Elements - VPLS Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

i Click on the GNE Service Interfaces tab button and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

ii Configure the parameters:

- Name
- Description
- Type

iii Click on the Ports tab button and then click on the Select button next to the Interface Index field. The Select Generic NE Interface form appears.

iv Select an interface from the list and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

v Configure the parameters:

- Encap Type
- Outer Encapsulation Value
- Inner Encapsulation Value

vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab button to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The VPLS (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The VPLS (Edit) form closes.

You can use the topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 71-16 To force a switchover to a redundant spoke SDP binding

This procedure can only be performed on a VPLS that has been configured with endpoints that are associated redundant spoke SDP bindings.

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site where you want to perform the switchover; expand the entries for that site.

5 Right-click on the redundant spoke SDP binding under an endpoint for the site that you want to perform the switchover for.

6 Select Force Switchover from the popup menu.

7 You can clear the switchover at a later time by performing steps 1 to 5 again and then select the Clear Forced Switchover item from the popup menu.

Note — You must clear a manually forced switchover by using the Clear Forced Switchover button when the active spoke SDP binding is restored. The 5620 SAM cannot automatically switch to another active spoke SDP binding if this is not done.

8 Click on the OK button to close the Spoke SDP Binding (Edit) form.

9 Click on the OK button to close the VPLS (Edit) form.

Procedure 71-17 To run a VPLS service OAM validation test

An OAM validator test suite must be created for the tested entity. See chapter 78 for more information about how to create a validator test suite.

Note — OAM validation tests are not supported for HVPLS.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 Click on the More Actions button and choose Validate. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

  i Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form appears.

  ii Configure the filter criteria. A list of OAM validator test suites appears.

  iii Select an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failed indicator.

6 Click on the Tests tab button. The Test Suite tab is displayed.

7 Click on the Validation Result tab button.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab button to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result form.

14 Close the VPLS (Edit) form.

15 Close the Manage Services form.

Procedure 71-18 To add or modify FIB entries associated with a VPLS

1 Choose Manage→Service→FIB Entries from the 5620 SAM main menu.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 Click on the Forwarding Control tab button.

5 Click on the FIB Entries tab button.

6 Click on the Find button. A list of FIB entries appears.

7 Add or modify FIB entries as required.

 a To add a FIB entry:

  i Click on the Create button. The FibEntry (Create) form opens.

  ii Configure the parameters:

   - MAC Address
   - Auto Complete

  iii Choose an interface, service circuit, or endpoint from the list on the L2 Interfaces, Service Circuits, or Endpoints tab.

  iv Click on the OK button. The FibEntry (Create) form closes, and the FIB Entries form refreshes with the new FIB entry.

 b To modify FIB entries:

  i Select a FIB entry on the FIB Entries tab and click on the Properties button. The FibEntry (Edit) form opens.

  ii Configure the parameters and view the information as required.

  iii Click on the OK button. A dialog box appears.

  iv Click on the OK button to close the VPLS (Edit) form.

Procedure 71-19 To list FIB entries associated with a VPLS

1 Choose Manage→Service→FIB Entries from the 5620 SAM main menu.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 Click on the Sites tab button.

5 Click on the VPLS, B-VPLS, or I-VPLS tab buttons, if required.

6 Select the site can click on the Properties button. The VPLS Site (Edit) form opens with the General tab displayed.

7 Click on the Forwarding Control tab button.

8 Click on the FIB Entries tab button.

9 Click on the Resync button for the FIB entries on the right side of the form. The Resync button on the bottom of the form is for re synchronizing the entire VPLS site.

10 Click on the Find button. A list of FIB entries appears.

Procedure 71-20 To view the service topology associated with a VPLS service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPLS and click on the Topology View button. The Service Topology map opens.

See chapter 5 for more information about service topology views.

Note — In the VPLS topology map view, a redundant spoke SDP binding under an endpoint displays differing colors, depending on whether it is in the active or backup state. Backup spoke SDP bindings are shown in purple.

4 Close the Service Topology form.

5 Close the Manage Services form.

Procedure 71-21 To view the VPLS service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a service and click on the Properties button. The VPLS (Edit) form opens.

4 View the Aggregated Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab button to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab button to view the alarms for the object. The Object Alarms tab is displayed.

7 Click on the Aggregated Alarms tab button to view the aggregated alarms for the object, if required.

8 Click on the Tests tab button if the OAM Validation Failed indicator is enabled. You can view the OAM validation test suite results by clicking on the Validation Result tab.

Note — You can run the OAM Validation test suite for this service from this form by clicking on the More Actions > Validate button.

9 Close the VPLS (Edit) form.

10 Close the Manage Services form.

Procedure 71-22 To view IGMP snooping queriers

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria. A list of services appears.

3 Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on a site. The Site (Edit) form opens with the General tab displayed.

5 Click on the IGMP Snooping tab button. The General tab is displayed.

6 Click on the MRouters tab button. The MRouters table displays a list of IGMP snooping queriers and their properties.

7 Click on the Refresh button to view periodic updates to the Mrouters table.

8 Close the Site (Edit) form.

9 Close the VPLS (Edit) form.

Procedure 71-23 To view MLD snooping queriers

1. Choose Manage→Service→Services from the 5620 SAM main menu.
2. Configure the filter criteria. A list of services appears.
3. Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.
4. On the navigation tree, click on a site. The Site (Edit) form opens with the General tab displayed.
5. Click on the MLD Snooping tab button. The General tab is displayed.
6. Click on the MRouters tab button. The MRouters table displays a list of MLD snooping queriers and their properties.
7. Click on the Refresh button to view periodic updates to the Mrouters table.
8. Close the Site (Edit) form.
9. Close the VPLS (Edit) form.

Procedure 71-24 To modify a VPLS

Caution — Modifying parameters can be service-affecting.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria. A list of services appears.
3. Select a VPLS and click on the Properties button. The VPLS (Edit) form opens with the General tab displayed.

The following tabs contain parameter information for the service:

- General tab—displays the general service properties
- MVR tab—displays multicast package policy information for the service
- Tests tab—allows the creation and execution of service-specific diagnostic tests
- Forwarding Control tab—lists the FIB and STP instances
- Sites tab—lists the sites that belong to the service
- L2 Access Interfaces tab—lists the L2 access interfaces that belong to the service
- L2 Management Interfaces tab—lists the L2 management interfaces that belong to the service
- Mesh SDP Bindings tab—displays the mesh SDP bindings that belong to the service
- Spoke SDP Bindings tab—displays the spoke SDP bindings that belong to the service, including active and backup SDP bindings associated with endpoints.
- Endpoints tab—displays the endpoints associated with the service
- Template tab—displays the template used to create the service, if applicable
- Faults tab—displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Navigate to related components for the service using the navigation tree, as required.

Certain service components have related objects that can be easily examined using the navigation tree. For such objects, right-clicking them in the navigation tree offers a “Navigate to ...” option in the contextual menu. If you select this option, the properties form for the related object is displayed. This can be very convenient, especially for complex services containing many sites and components.

The VPLS components for which you can navigate to such related objects include:

- I-Sites: you can navigate to the associated B-VPLS or B-(M)VPLS
- L2 Access Interfaces: you can navigate to the opposite SAP in a VLAN Uplink configuration
- Redundant L2 Access Interfaces: you can navigate to the opposite SAP.
- Mesh SDP Bindings: you can navigate to the opposite (return) mesh SDP
- Spoke SDP Bindings: you can navigate to the opposite (return) spoke SDP

5 Modify the components and parameters for the service, as required.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The VPLS (Edit) form closes, and the Manage Services form reappears.

8 Close the Manage Services form.

Procedure 71-25 To modify a VLPS using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPLS and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains a number of sub-procedures describing the various components that can be created and modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating site components. Go to step 10.
- Creating SDP bindings. Go to step 23.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- VPLS Site
- VPLS B-Site
- VPLS I-Site

5 Select the required option. The Select Network Elements form appears.

6 Select one or more sites to add to the service and click OK. The VPLS Site (Create), VPLS I-Site (Create), or VPLS B-Site (Create) form is displayed, depending on your menu item selection. If you selected more than one site, the VPLS Site (Multiple Instances) (Create), VPLS I-Site (Multiple Instances) (Create), or VPLS B-Site (Multiple Instances) (Create) form is displayed, depending on your menu item selection.

7 Click on OK. The VPLS Site (Create) (or VPLS Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

8 If you want to perform detailed configuration of site properties for the new site, right-click the site icon and select Properties from the contextual menu. The VPLS Site (Edit) form opens. Refer to Procedure 71-1 for detailed site configuration information.

9 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

Creating site components

10 Right-click on any site icon in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- VPLS L2 Access Interface (this choice will actually display as either a regular L2 Access Interface, or a B-L2 or I-L2 variant, depending on the site you select). Go to step 11.
- VPLS L2 Management Interface. Go to step 15.
- VPLS Endpoint. Go to step 19.

11 If you choose to create a VPLS L2 Access Interface, then the VPLS L2 Access Interface (Create) form is displayed. If the selected site is a B-Site or I-Site, then the B-L2 or I-L2 Access Interface (Create) form is displayed accordingly.

12 Click on the Port tab and assign a port to the interface.

Refer to Procedure 71-3 (or Procedure 71-13 or 71-14 for B-L2 or I-L2 Access Interfaces respectively) for detailed information on further configuring the interface, if required.

13 Click OK. The VPLS L2 Access Interface (Create) form closes.

14 Go to step 22.

15 If you choose to create a VPLS L2 Management Interface, then the VPLS L2 Management Interface (Create) form is displayed.

16 Click on the Port tab and assign a port to the interface.

Refer to Procedure 71-3 for detailed information on further configuring the interface, if required.

17 Click OK. The VPLS L2 Management Interface (Create) form closes.

18 Go to step 22.

19 If you choose to create a VPLS Endpoint, then the Endpoint (Create) form is displayed.

20 Configure the Name parameter for the endpoint.

Refer to Procedure 71-1 (or 71-11 for B-Sites) for detailed information on further configuring the endpoint, if required.

21 Click OK. The Endpoint (Create) form closes and the new endpoint is displayed in the topology view.

22 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

Creating SDP bindings

23 Select the sites you want to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note 1 — If you intend to create either a spoke or a mesh binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

Note 2 — If you intend to create a full mesh between sites, then the order in which you select the sites is not important.

Note 3 — If you intend to add a service site to an existing mesh of sites, then the first site you select must be the one that is not currently a part of the mesh. The second site you select can be any member of the existing mesh.

24 Select Connect from the contextual menu. Depending on the sites you selected, one or more of the following options are available:

- Create Spoke SDP Binding. Go to Step 25.
- Create Mesh SDP Binding. Go to Step 32.
- Create Full Mesh. Go to Step 39.
- Add To Existing Mesh. Go to Step 46.

25 If you choose the Create Spoke SDP Binding option, then the Spoke SDP Binding (Create) form is displayed.

Note 1 — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

Note 2 — You can also create a spoke SDP binding between a site icon and an endpoint icon, or between two endpoint icons in the topology view. Appropriate endpoints must first exist or be created to enable this.

26 Enable the Auto-Select Transport Tunnel parameter.

27 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedure 71-5 for more detailed information on creating and configuring spoke SDP bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

28 Assuming that the spoke SDP binding was successfully created in step 27, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a spoke binding for the return tunnel.

29 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

30 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

31 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

32 If you choose the Create Mesh SDP Binding option, then the Mesh SDP Binding (Create) form is displayed.

Note — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

33 Enable the Auto-Select Transport Tunnel parameter.

34 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Mesh SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedure 71-4 for more detailed information on creating and configuring mesh bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

35 Assuming that the mesh SDP binding was successfully created in step 34, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a mesh binding for the return tunnel.

36 Right-click on the second site you selected and choose the Create Mesh SDP Binding ... option from the contextual menu. The Mesh SDP Binding (Create) form is displayed.

37 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Mesh SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

38 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

39 If you choose the Create Full Mesh option, the Complete Vpls Mesh for Service Component form is displayed.

40 Configure the Transport Type parameter.

41 Click the Select button to display the Tunnel Selection Profiles form, if required.

42 Click Search to display a list of available Tunnel Selection Profiles.

43 Click on the desired profile entry and click OK. The Tunnel Selection Profiles form closes and your selection is displayed in the Complete Vpls Mesh for Service Component form.

44 Click OK to accept your selection and close the Complete Vpls Mesh for Service Component form. One of the following will result:

- If available transport tunnels exist between the selected sites, then the new mesh bindings between the sites are created and displayed in the topology view. Refer to Procedure 71-4 for more detailed information on creating and configuring mesh bindings, if required.
- If available transport tunnels do not exist between all the sites, then the new bindings that can be created are displayed, and an error message is also displayed informing you that the full mesh could not be completed. Refer to Chapter 33 for information on how to create the required tunnels. Once the tunnels are created, you can repeat this sub-procedure.

45 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

46 If you choose the Add To Existing Mesh option, the Complete Vpls Mesh for Service Component form is displayed.

47 Configure the Transport Type parameter.

48 Click the Select button to display the Tunnel Selection Profiles form, if required.

49 Click Search to display a list of available Tunnel Selection Profiles.

50 Click on the desired profile entry and click OK. The Tunnel Selection Profiles form closes and your selection is displayed in the Complete Vpls Mesh for Service Component form.

51 Click OK to accept your selection and close the Complete Vpls Mesh for Service Component form. One of the following will result:

- If available transport tunnels exist between the selected sites, then the new mesh bindings between the sites are created and displayed in the topology view. Refer to Procedure 71-4 for more detailed information on creating and configuring mesh bindings, if required.
- If available transport tunnels do not exist between the selected sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnels. Once the tunnels are created, you can repeat this sub-procedure.

52 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

53 Close the Service Topology form.

54 Close the Manage Services form.

Procedure 71-26 To delete a VPLS

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

Note — A VPLS cannot be deleted if the L2 access interface has MSAPs that are in an active state. See chapter 68 for more information about MSAPs.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

- **a** For services with a low priority, go to Step 5.
- **b** For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.
- **c** For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services, regardless of the priority configuration, acknowledge the check box that prompts you to confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

72 — Mirror service management

72.1 Mirror service overview

The 5620 SAM GUI implementation of service mirroring provides mirroring of service traffic packets from any service type.

Caution — Service mirroring can affect performance across the network and in the source and destination devices, so must be planned accordingly.

In a mirror service, packets from one or more sources are forwarded to their normal destinations and a copy of the entire packet, or a specified portion of the packet, is sent to the mirror destination. The mirrored packet can be viewed using a packet-decoding device, typically called a sniffer, that is attached to the destination port. The 5620 SAM does not limit the number of destination and source sites added under a mirror service. The mirrored packets are transported unidirectionally through the core network using IP or MPLS tunneling.

With pseudo-wire redundancy support, an ICB can be enabled in the mirror service spoke and remote source, which can provide bidirectional service that enables support for active and standby PE redundancy. An endpoint can be used to group the redundant objects, which may be of mirror SDP bindings or SDP and SAP. In the mirror map view, the color for the active and backup states of the redundant mirror SDP differ.

Service mirroring can be used to do the following:

- Troubleshoot problems with customer packet delivery and content.
- Help service providers meet regulations by providing itemized call records and wiretaps, as authorized by investigative authorities.
- Simplify the complex traffic-analysis networks that are often implemented as overlays to the customer-facing network.

The 5620 SAM supports end-to-end mirror service configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Preconfigured template. A user that is assigned the admin role, or mirror service management with the template management role can create a mirror service template.
- A separate lawful intercept management scope of command role allows a LI user to view and configure LI sources on existing mirror services. Information that is mirrored is hidden from all users who do not have LI user privileges. See chapter 34 for more information about configuring a LI user.

The mirror service operational status is aggregated based on the status of each site.

- Aggregate status is down if all destination sites are down.
- Aggregate status is up if one of the redundant destination site is up.
- Aggregate status is down if all source sites are down.
- Aggregate status is up if one of the redundant source sites is up.
- Aggregate status is unknown if no sites are added to the service.

Consider the following information before you implement a mirror service:

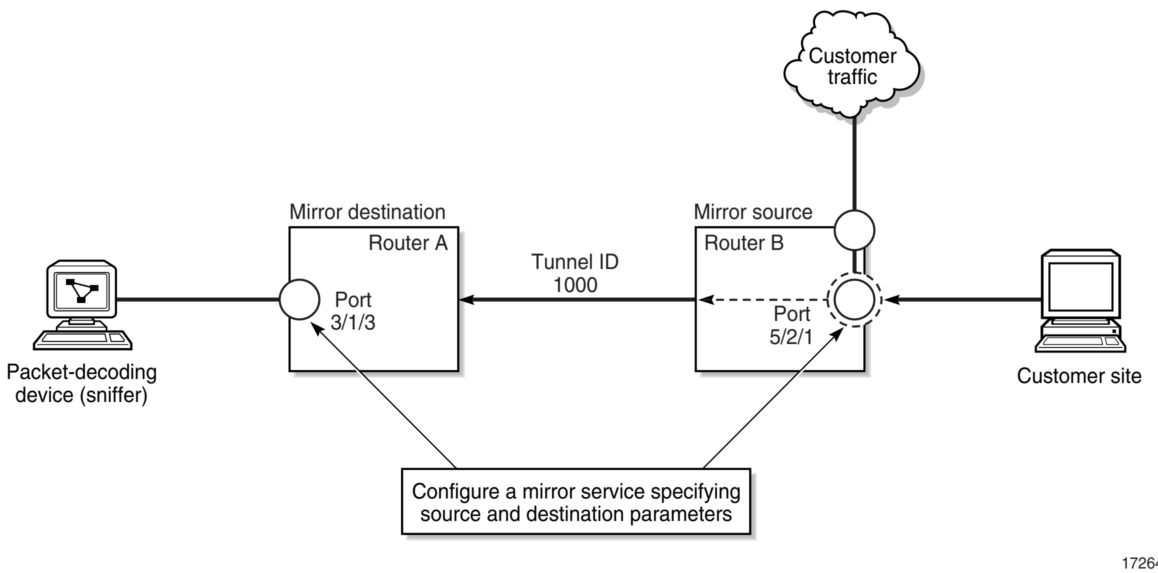
- The default customer is automatically associated with a mirror service. You cannot associate a different customer with a mirror service.
- You can configure one endpoint per mirror site.
- You can configure the endpoint in the destination site with SAP and SDP with ICB.
- An endpoint cannot have more than one SAP.
- You can create a mirror SDP under the endpoint in the destination site.
- You can create up to four mirror SDPs under the endpoint in the source site. One mirror SDP must have ICB. Another option is to create one mirror SDP under the source site.
- When the mirror SDP binding is under an endpoint, the STP cannot be enabled on the spoke.
- Mirror sites with valid SAP are considered as destination sites during discovery.
- You can configure site as destination without SAP in the mirror service. During re-synchronization, site type will be kept as destination.
- Auto-SDP creation is restricted to one destination.
- You can change the redundancy setting of a mirror SDP binding by deleting and adding the mirror SDP binding on an endpoint.
- You cannot delete an MC-LAG SAP if an ICB is on the same endpoint.
- You cannot have a SAP with non-ICB mirror spoke on the same endpoint.
- The destination of a mirror service must be an L2 SAP.
- You must be assigned the administrator or mirror service management scope of command role to create or modify a mirror service, or to view any mirror-related objects in the 5620 SAM.
- You can mirror the ingress or egress traffic on SAPs and ports.
- You can mirror the ingress or egress traffic that is associated with one or more subscriber hosts.
- You can specify match criteria, such as IP addresses, MAC addresses, or MPLS ingress labels, to filter the mirrored traffic.
- Mirror service IDs are obtained from the same pool of IDs that is used by other services. When you manually assign an ID value, ensure that you do not assign an ID that belongs to another service.
- Use the packet-slicing option to copy a specific packet size from each frame. This option is useful for monitoring network usage without copying the customer data. It also limits the amount of mirrored traffic that travels through the core network.
- When the mirror destination is not on the same NE as the mirror source, a mirror service requires a service tunnel between the source and destination NEs.
- The 5620 SAM can automatically create a service tunnel between the source and destination sites when the following conditions are met:
  - Automatic mesh SDP binding creation is enabled.
  - GRE or LDP is the transport type.
  - No other service tunnel is available between the source and destination sites.
- The mirror service source and destination encapsulation types must be the same.

- After an NE reboot or CPM activity switch, the debug configuration file for a mirror service is not by default reloaded on the NE. The 5620 SAM raises an alarm when this occurs. To ensure that the NE reloads the debug configuration file, you must specify the location of the file in the base 5620 SAM configuration. See chapter 6 for more information.
- When multiple mirror services reference the same packet, for example, from a SAP and from a port, the packet is mirrored only once, based on the following criteria in the following non-configurable order:
  - MAC or IP filters
  - MPLS ingress label
  - SAP
  - port
- For IP-only mirroring:
  - Requires chassis mode C or D to be enabled.
  - By using “IP Only” as the encapsulation type, users can specify that only the IP packet is mirrored, without its original ATM/FR/POS/Ethernet DLC header.
  - When IP-only is configured on the source site, users can configure various mirroring sources, including subscribers and SAPs from Ipipe, IES, VPRN, VPLS, and MVPLS services. However, source ports and VLL services including Apipe, Epipe, and Fpipe cannot be configured.
  - For local IP-only mirroring, the source and destination MAC addresses must be configured.
  - For remote IP-only mirroring in a VPRN service, an IP mirror interface on the VPRN destination node is used to receive the IP mirror packets and route them to the appropriate sniffer. If there are multiple sniffers connected to the VPRN using L3 interfaces, users need to configure the routing policy to have IP mirror packets routed to the correct sniffer.
- For LI source configuration:
  - You must be assigned the lawful intercept management scope of command role to view, create or modify any LI-related objects in the 5620 SAM.
  - LI source configurations are saved on an NE when the poller policy for the NE specifies LI Local Save Allowed. See chapter 13 for information about configuring in-band and out-of-band polling policies.

72.2 Sample mirror service configuration

Figure 72-1 shows a sample mirror service configuration.

Figure 72-1 Sample mirror service configuration



In this sample, Router B is the mirror source that carries the customer packets. Router A is the mirror destination. The ingress and egress traffic on Port 5/2/1 is mirrored on the destination, Port 3/1/3. Table 72-1 lists the high-level tasks to configure the sample mirror service.

Table 72-1 Sample mirror service configuration

Task	Description
1. Connect the packet sniffer to the mirror destination.	The packet sniffer is attached to Router A, Port 3/1/3.
2. Configure the mirror destination parameters.	Port 3/1/3 on Router A is specified as the mirror destination. Specify the Tunnel ID 1000 as the transport tunnel to the mirror destination. All the parameters required to configure the type of mirroring, for example, slicing and mirror classification, are specified in the destination parameters.
3. Specify the source entity that is to be mirrored.	The egress and ingress traffic on Port 5/2/1 is to be mirrored.

72.3 Workflow to create a mirror service

The following workflow lists the high-level steps required to create a mirror service. As a prerequisite for creating a mirror service, this workflow assumes the following:

- a group or customer with the required user access privileges has been set up; see chapter 9 for more information.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 33-1.

- the access ports for the service are created; see chapter 20 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 46 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 31 for more information about protocol configuration.
- the network services the mirror service will use are created.
- a packet-sniffing device at the L2 SAP that is the destination of the mirror service is configured.
- the SAP with the attached packet-sniffing device as the mirror destination is specified.
- the source of the packets to be mirrored is configured.

1 Create the mirror service. See Procedure 72-1.

i Define the general properties for the mirror service.

ii Specify the services for inclusion in the mirror service. You can specify multiple services in one operation.

iii Enable one or more routing protocols for the mirror site.

iv Specify an endpoint on the site as a mirror source.

v Specify one or more SAPs on the site as a mirror source.

vi Specify one or more ports on the site as a mirror source.

vii Specify one or more IP filters for the source site.

viii Specify one or more MAC filters for the source site.

ix Specify one or more MPLS ingress labels for the source site.

x Specify one or more subscribers or subscriber hosts as mirror sources

xi Turn up the mirror service.

2 As required, view mirror service information:

a View the service topology map associated with a Mirror Service. See Procedure 72-2.

b View the mirror service operational status. See Procedure 72-3.

c To view LI mirrored subscriber hosts configured with a RADIUS server. See Procedure 72-4.

3 As required, run an OAM validation test for a mirror service. See Procedure 72-5.

4 As required, modify a mirror service. See Procedure 72-6.

5 As required, delete a mirror service. See Procedure 72-7.

72.4 Mirror service procedures

Use the following procedures to create, delete, view, and modify mirror services.

Procedure 72-1 To create a mirror service

1 Choose Create→Service→Mirror from the 5620 SAM main menu. The Mirror Service (Create) form opens with the General tab displayed.

2 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Automatic SDP Binding Creation
- OLC State
  This parameter is configurable when you click on the Apply button.

3 Perform one of the following:

a Leave the Automatic SDP Binding Creation parameter disabled.

When you leave the Automatic SDP Binding Creation parameter disabled, you must create SDP bindings for the service and bind the SDPs to a service tunnel in step 45 of this procedure.

b Enable the Automatic SDP Binding Creation parameter.

When you enable the Automatic SDP Binding Creation parameter, SDP bindings for the service are automatically created and bound to service tunnels.

i Configure the Transport Type parameter.

Note 1 — You must select GRE or LDP as the transport type to allow the 5620 SAM to automatically create SDP bindings between the source and destination sites. Automatic creation of SDP bindings cannot be configured if a service tunnel already exists between the source and destination sites.

Note 2 — To use MPLS:RSVP as the transport type, you must bind LSPs to service tunnels during service tunnel configuration. See chapter 33 for more information.

ii Configure the Use Bandwidth-Reserved Paths parameter, if applicable.

The Use Bandwidth-Reserved Paths parameter is configurable only when the Transport Type parameter is set to MPLS:RSVP or Any.

4 On the navigation tree, right-click on Destination Site and choose Create Destination Site from the contextual menu. The Select Network Elements - Mirror Service form opens with a list of available sites displayed.

5 Select a site and click on the OK button. The Select Network Elements - Mirror Service form closes and the Mirror Site (Create) form opens with the system identifier of the selected site displayed in the Network Element panel.

6 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- Encapsulation Type

7 Click on the Mirroring Configuration tab button.

8 Configure the parameters.

- Source Administrative State
- Slice Size
- Forwarding Class
- Enable Port ID Mirroring

Choose the default of 0 for the Slice Size parameter when you configure a destination mirror site, unless slicing at the destination is necessary. Packet slicing reduces the amount of mirrored traffic that traverses the network.

Note — The Slice Size parameter is not displayed if the Encapsulation Type parameter is set to IP Only.

The Port Id Mirroring and remote source are mutually exclusive. If Enable Port ID Mirroring is set to true on the destination site, then a remote source site cannot be added to the service. If a remote source site is already on the service, then Enable Port ID Mirroring cannot be set to true. Also, if remote mirror is used, then Enable Port ID Mirroring must be configured on all source sites.

9 Click on the Source Far Ends tab button.

10 Click on the Create button. The Remote Source (Create) form appears.

11 Configure the parameters.

- Remote Site ID
- Ingress Label
- Remote VC ID
- Remote ICB

12 Click on the OK button. The Remote Source (Create) form closes and a dialog box appears.

13 Click on the OK button. The Mirror Site (Create) form displays the remote source information.

14 Click on the OK button. The Site (Create) form closes and a dialog box appears.

15 Click on the OK button. The Mirror Service (Edit) form reappears with the service navigation tree displayed.

16 Expand the Destination Site object to reveal the newly created site.

17 Expand the newly created destination site object.

18 Configure an L2 access interface as the mirror destination by selecting L2 Access Interface (Test Equipment Interface) under the destination site in the service navigation tree, right-clicking on it and choosing Create L2 Access Interface from the contextual menu. The L2 Access Interface (Create) form opens with the General tab displayed.

19 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

20 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

21 Configure the parameters.

- Outer Encapsulation Value
- Auto-Assign ID
- Inner Encapsulation Value

The Auto-Assign ID parameter is configurable if the port uses dot1q encapsulation. When the parameter is enabled, the 5620 SAM automatically configures the Outer Encapsulation Value parameter using the lowest unassigned value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with Q in Q encapsulation.

22 Assign an egress QoS policy to the interface, if required.

i Click on the QoS tab button.

ii Configure the Egress Mark QinQ Top Bits Only parameter.

iii Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - L2 Access Interface form opens.

iv Configure the filter criteria. A list of egress policies appear at the bottom of the Select Egress Policy - L2 Access Interface form.

v Select an egress policy and click on the OK button. The Select Egress Policy - L2 Access Interface form closes and the L2 Access Interface (Create) form refreshes with the egress QoS policy information displayed.

23 Assign a time of day suite to the interface, if required.

i Click on the TOD Suite tab button.

ii Click on the Select button beside the Name parameter. The Select Time Of Day Suite - L2 Access Interface form opens.

iii Select a time of day suite and click on the OK button. The Select Time Of Day Suite - L2 Access Interface form closes and the L2 Access Interface (Create) form refreshes with the time of day suite information displayed.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Mirror (Create) form refreshes with the L2 access interface information displayed below L2 Access Interface (Test Equipment Interface) in the service navigation tree.

24 Click on the Schedulers tab button, if required.

25 Configure the Aggregate Rate Limit (kbps) parameter.

26 Click on the IP Mirror MAC Addresses tab, if you are configuring local mirroring and you chose IP Only as the encapsulation type in step 6. Otherwise, go to step 28.

Note — If you want to configure remote mirroring in a VPRN service, you must create an IP Mirror Interface in that service. See chapter 74 for more information.

27 Configure the parameters:

- Destination MAC Address
- Source MAC Address

Note — The Source and Destination MAC addresses on L2 Access Interface must be both null or neither null. Both null means that there are no source or destination MAC addresses configured on the interface.

28 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

29 Create an endpoint on the mirror site for redundancy support, if required.

i On the navigation tree, right-click on the Endpoints object below the site and choose Create Endpoints. The Endpoint (Create) form opens.

ii Configure the parameters.

- Name
- Description
- Revert Time (seconds)
- Disable Revert Time

iii Click on the Ok button.

For the destination site, the L2 Access Interface (Test Equipment Interface) and Mirror SDP Binding objects appear under the Endpoints object.

For the source site, the Mirror SDP Binding object now appears under the Endpoints object.

iv To create an L2 access interface as the mirror destination, right-click on the L2 Access Interface (Test Equipment Interface) object under the Endpoints object and choose Create L2 Access Interface from the contextual menu. The L2 Access Interface (Create) form opens with the General tab displayed.

v Click on the Port tab button.

vi Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

vii Use the configurable filter and Search button to choose a port, and click on the Search button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

viii Configure other parameters, as required.

ix Click on the OK button on the L2 Access Interface (Create) form. The form closes and a dialog box appears.

x Click on the OK button. The SAP object appears under the L2 Access Interface object.

xi To create a mirror SDP binding on the endpoint, right-click on the Mirror SDP Binding object under the Endpoints object in the service navigation tree and choose Create Mirror SDP Binding from the contextual menu. The Mirror SDP Binding (Create) form opens.

xii Configure the parameters.

- Tunnel Termination Site
- VC ID
- Auto-Assign ID
- Ingress Label
- Egress Label
- Inter-Chassis Backup
- Precedence

xiii Click on the OK button. The Mirror SDP Binding (Create) form closes and a dialog box appears.

xiv Click on the OK button. The Mirror Service (Edit) form reappears with the service navigation tree displayed.

30 A mirror source can be on the same site as the mirror destination. If no mirror sources are on the destination site, go to step 37.

31 Specify a SAP on the site as a mirror source, if required. Perform one of the following:

a Right-click on the Source SAPs object below the site in the service navigation tree and choose Create Source Interface from the contextual menu. The Source Interface (Create) form opens. Go to step i.

b Right-click on the LI Source SAPs object below the site in the service navigation tree and choose Create LI Source Interface from the contextual menu. The LI Source Interface (Create) form opens. Go to step i.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

i Click on the Select button to choose an access interface to associate with the source interface. The Select Mirrored Interface - Source Interface form opens.

ii Use the configurable filter and Search button to choose an access interface, and click on the OK button. The Select Mirrored Interface - Source Interface form closes and the Source Interface (Create) form refreshes with the selected interface information displayed.

iii Configure the parameters.

- Enable Egress
- Enable Ingress

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Mirror Service (Create) form refreshes with the source SAP displayed below Source SAPs in the service navigation tree.

vi Repeat steps i to v to specify an additional source SAP for the site.

32 Specify a port on the site as a mirror source, if required.

i Right-click on the Source Ports object below the site in the service navigation tree and choose Create Source Port from the contextual menu. the Source Port (Create) form opens

ii Click on the Select button to choose a port. The Select - Source Port form opens.

A source port can be one of the following:

- physical port
- channel
- LAG
- bundle
- CCAG

iii Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Source Port form closes and the Source Port (Create) form displays the port information.

iv Configure the parameters.

- Enable Egress
- Enable Ingress

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Mirror Service (Create) form refreshes with the source port displayed below Source Ports in the service navigation tree.

vii Repeat steps i to v to specify an additional source port for the site.

33 Specify an IP filter entry for the mirror source, if required. Perform one of the following:

a Right-click on the Source IP Filters object below the site in the service navigation tree and choose Create Source IP Filter from the contextual menu. The Source IP Filter (Create) form opens. Go to step i.

b Right-click on the LI Source IP Filters object below the site in the service navigation tree and choose Create LI Source IP Filter from the contextual menu. The LI Source IP Filter (Create) form opens. Go to step i.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

i Click on the Select button to choose an IP filter entry. The Select Filter - Source IP Filter form opens.

ii Use the configurable filter and Search button to choose an IP filter entry, and click on the OK button. The Select Filter - Source IP Filter form closes and the Source IP Filter (Create) form refreshes with the selected IP filter ID and IP filter entry ID displayed.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The Mirror (Create) form refreshes with the source IP filter displayed below Source IP Filters in the service navigation tree.

v Repeat steps i to iv to specify an additional source IP filter.

34 Specify a MAC filter entry for the mirror site, if required. Perform one of the following:

a Right-click on the Source MAC Filters object below the site in the service navigation tree and choose Create Source MAC Filter from the contextual menu. The Source MAC Filter (Create) form opens. Go to step i.

b Right-click on the LI Source MAC Filters object below the site in the service navigation tree and choose Create LI Source MAC Filter from the contextual menu. The LI Source MAC Filter (Create) form opens. Go to step i.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

i Click on the Select button to choose a MAC filter entry. The Select Filter - Source Mac Filter form opens.

ii Use the configurable filter and Search button to choose a MAC filter entry, and click on the OK button. The Select Filter - Source Mac Filter form closes and the Source MAC Filter (Create) form refreshes with the selected MAC filter ID and MAC filter entry ID displayed.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The Mirror (Create) form refreshes with the source MAC filter displayed below Source MAC Filters in the service navigation tree.

v Repeat steps i to iv to specify an additional source MAC filter.

35 Specify an MPLS ingress label for the mirror, if required.

i Right-click on the Source MPLS Ingress Labels object below the site in the service navigation tree and choose Create Source Ingress Label from the contextual menu. The Source Ingress Label (Create) form opens.

ii Configure the Ingress Label parameter.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The Mirror (Create) form refreshes with the MPLS ingress label displayed below Source MPLS Ingress Labels in the service navigation tree.

v Repeat steps i to iv to specify an additional source MPLS ingress label.

36 Specify a subscriber as a mirror source, if required. Perform one of the following:

a Right-click on the Source Subscribers object below the site in the service navigation tree and choose Create Source Subscriber from the contextual menu. The Source Subscriber (Create) form opens. Go to step i.

b Right-click on the LI Source Subscribers object below the site in the service navigation tree and choose Create LI Source Subscriber from the contextual menu. The LI Source Subscriber (Create) form opens. Go to step i.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

i Configure the following parameters:

- Subscriber Identification String
- Forwarding Classes
- Enable Egress
- Enable Ingress

ii You can further restrict the mirrored subscriber host traffic associated with the subscriber identification string by specifying SAP or SLA-profile criteria. To specify an SLA profile as a match criterion, go to step viii.

Note — You can configure parameters in the SAP/Subscriber Host Match Criteria panel or the SLA Profile Match Criteria panel, but you cannot configure parameters in both panels.

iii Click on the Select button in the SAP/Subscriber Host Match Criteria panel to specify a SAP on which to mirror subscriber host traffic. The Select SAP ID/Encap Value - Source Subscriber form opens.

iv Configure the filter criteria and click on the Select button. A list of SAPs is displayed.

Note — The form lists only dot1q- or Q in Q-encapsulated SAPs that have subscriber management enabled.

v Select a SAP in the list and click on the OK button. The Select SAP ID/Encap Value - Source Subscriber form closes and the SAP information is displayed on the Source Subscriber (Create) form.

vi Configure the parameters in the SAP/Subscriber Host Match Criteria panel to specify the subscriber host match criteria for the SAP:

- Host IP Address
- Host MAC Address

Note — The 5620 SAM does not accept the parameter values unless a SAP is specified in step v.

vii Go to step x.

viii Click on the Select button in the SLA Profile Match Criteria panel. The SLA Profile - Source Subscriber form opens.

ix Select an SLA profile in the list and click on the OK button. The Select SLA Profile - Source Subscriber form closes and the SLA profile name is displayed on the Source Subscriber (Create) form.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The Mirror Service (Create) form refreshes with the source subscriber listed below Source Subscribers in the service navigation tree.

xii Repeat steps viii to xi to specify an additional source subscriber, if required.

37 To configure a mirror source on a site other than the destination site, right-click on Source Sites in the service navigation tree and choose Create Source Site from the contextual menu. Otherwise, go to step 59.

38 The Select Network Elements - Mirror form opens with a list of available sites displayed. Select a site and click on the OK button. The Select Network Elements - Mirror form closes and the Mirror Site (Create) form opens with the system identifier of the selected site displayed.

39 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- Encapsulation Type

40 Click on the Mirroring Configuration tab button.

41 Configure the parameters.

- Source Administrative State
- Slice Size
- Forwarding Class
- Enable Port ID Mirroring

Note — The Slice Size parameter is not displayed if the Encapsulation Type parameter is set to IP Only.

The Port Id Mirroring and remote source are mutually exclusive. If Enable Port ID Mirroring is set to true on the destination site, then a remote source site cannot be added to the service. On the other hand, if a remote source site is already on the service, then Enable Port ID Mirroring cannot be set to true. Also, if remote mirror is used, then Enable Port ID Mirroring must be configured on all source sites.

42 Click on the OK button. A dialog box appears.

43 Click on the OK button. The Mirror Site (Create) form closes, and the Mirror Service (Create) form reappears with the selected site displayed on the navigation tree under Source Sites.

44 Expand the newly created site object.

45 Perform one of the following:

a If the Automatic SDP Binding Creation parameter was disabled in step 3, choose an SDP binding for the mirror source by selecting Mirror SDP Binding under the source site in the service navigation tree and then right-clicking and choosing Create Mirror SDP Binding from the contextual menu.

b Go to step 51.

46 The Mirror SDP Binding (Create) form opens. Specify a destination node for the mesh SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter to choose a destination for the SDP binding. The Select Destination Network Element - Mirror SDP Binding form opens.

ii Select a node and click on the OK button. The Select Destination Network Element - Mirror SDP Binding form closes and the Mirror SDP Binding (Create) form refreshes with the destination node ID displayed in the Tunnel Termination Site panel.

b If the destination node is not managed by the 5620 SAM, specify the system ID of the destination node for the Tunnel Termination Site parameter.

47 Configure the parameters.

- VC ID
- Auto-Assign ID
- Ingress Label
- Egress Label
- Inter-Chassis Backup
- Precedence

48 Perform one of the following to specify a transport tunnel for the mirror SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Mirror SDP Binding form opens.

ii Select a service tunnel for the mirror SDP binding and click on the OK button. The Select Tunnel - Mirror SDP Binding form closes, and the Mirror SDP Binding (Create) form refreshes with the service tunnel identifier.

49 Click on the OK button. A dialog box appears.

50 Click on the OK button. The Mirror SDP Binding (Create) form closes and the Mirror (Create) form refreshes with the mirror SDP binding displayed under Mirror SDP Binding for the site.

51 To specify an endpoint on the site as a mirror source, perform step 29.

52 To specify one or more SAPs on the site as mirror sources, perform step 31.

53 To specify one or more ports on the site as mirror sources, perform step 32.

54 To specify one or more IP filters for the source site, perform step 33.

55 To specify one or more MAC filters for the source site, perform step 34.

56 To specify one or more MPLS ingress labels for the source site, perform step 35.

57 To specify one or more subscribers or subscriber hosts as mirror sources, perform step 36.

58 Perform one of the following:

a Configure an additional source site for the mirror service. Perform steps 37 to 56.

b Complete the mirror service configuration. Go to step 59.

59 Click on the OK button. A dialog box appears.

60 Click on the Yes button. The Mirror Service (Create) form closes.

Procedure 72-2 To view the service topology associated with a mirror service

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter parameters and click on the Search button. A list of services appears at the bottom of the Manage Mirror Services form.

3 Select a mirror service and click on the Topology View button. A Topology View dialog box appears.

4 Click on the Yes button to proceed. The Service Topology - *Service Name* map opens.

See chapter 5 for more information about service topology views.

Procedure 72-3 To view the mirror service operational status

The Aggregated Service Site Operational State and State Cause indicators on the General tab of the mirror service management form display information about service faults.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria. A list of mirror services appears at the bottom of the Manage Mirror Services form.

3 Select a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens.

4 View the Aggregated Service Site Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab button to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab button to view the alarms for the object. The alarms are grouped into various categories.

7 Close the Mirror Service (Edit) form.

8 Close the Manage Mirror Services form.

Procedure 72-4 To view LI mirrored subscriber hosts configured with a RADIUS server

Note 1 — You must have 5620 SAM LI user privileges to perform this procedure.

Note 2 — Before you can perform this procedure, at least one LI user account must exist on the NE.

Note 3 — Before you can perform this procedure, a 5620 SAM LI user must enable LI discovery for the NE using Procedure 34-6.

Note 4 — Only PPPoE subscriber hosts can be mirrored with RADIUS.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of mirror services appears.

3 Choose a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens with the General tab displayed.

4 Click on the Sites tab button. A list of mirror service sites are displayed.

5 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

6 If an LI source configuration object has not been created, the LI Source Configuration tab button is dimmed. Click on the Create LI Source Configuration button at the bottom of the form. A dialog box appears.

Note 1 — You must create an LI source configuration object for the NE to mirror subscriber hosts for LI.

Note 2 — The Create LI Source Configuration button is a toggle that also lets you delete an LI source configuration object. If you delete an LI source configuration object, all associated LI source objects are deleted.

Note 3 — An LI source configuration object is automatically created when an LI source object is created.

7 Click on the OK button. The LI Source Configuration tab button is enabled, and an LI source configuration object is created.

8 Click on the LI Source Subscribers Via RADIUS tab button.

9 Configure the filter criteria, if required, and click on the Search button. A dialog box appears.

10 Click on the OK button. A list of subscribers appears.

11 Choose a subscriber and click on the Properties button. The LI Source Subscriber Host form opens.

12 View the information on the form.

13 Close the LI Source Subscriber Host form.

Procedure 72-5 To run an OAM validation test for a mirror service

An OAM validator test suite must be created for the tested entity. See chapter 78 for more information about how to create an OAM validator test suite.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Mirror Services form.

3 Select a service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Click on the Validate button. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

- **i** Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form appears.
- **ii** Configure the filter criteria. A list of OAM validator test suites appears.
- **iii** Select an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab button.

7 Click on the Validation Result tab button.

8 Select an entry and click on the Properties button. The Tested Entity Result form opens and displays information about the validation test.

9 Close the Tested Entity Result form.

10 Close the Mirror Service (Edit) form.

11 Close the Manage Mirror Services form.

Procedure 72-6 To modify a mirror service

Caution — Modifying parameters can be service-affecting.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria. A list of mirror services appears at the bottom of the Manage Mirror Services form.

3 Select a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the other tab buttons to edit additional properties, as required.

5 Modify the parameters on the appropriate tab, as required.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button to confirm the action. The Mirror *Service Name* (Edit) form closes and the Manage Mirror Services form reappears.

8 Click on the Close button to close the Manage Mirror Services form.

Procedure 72-7 To delete a mirror service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

- **a** For services with a low priority, go to Step 5.
- **b** For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.
- **c** For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

73 — IES management

73.1 IES management overview

An IES is a routed connectivity service in which the customer traffic passes through an L3 IP router interface to the Internet.

IES allows customer-facing IP interfaces in the same routing instance to be used for service network core-routing connectivity. IES requires that the IP addressing scheme that is used by the customer be unique among other provider addressing schemes and potentially the entire Internet.

Packets that arrive at the edge device are associated with an IES based on the access interface on which they arrive. An access interface is uniquely identified using:

- port
- service ID
- IP address

IES configuration

The 5620 SAM supports end-to-end IES configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Preconfigured template. A user that is assigned the template management role can create a service template. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

The 5620 SAM supports the configuration in IES of an L3 aggregation mechanism called routed CO. Routed CO uses DHCP relay to manage dynamic subscriber hosts; the network resources for static subscriber hosts are explicitly provisioned. Routed CO supports all residential subscriber management functions of the 5620 SAM. See chapter 68 for more information about residential subscriber management and routed CO.

Routed CO uses a subscriber interface that defines up to 256 subnets. A subscriber interface has child objects called group interfaces. A group interface supports the configuration of multiple SAPs as child objects. A SAP in a group interface supports all residential subscriber management functions. A group interface does not allow the specification of IP subnets or addresses, but inherits the addressing scheme of the parent subscriber interface. The 5620 SAM service topology map displays IES subscriber interfaces, group interfaces, and the associated SAPs.

You can configure Network Address Translation, or NAT, for dynamic subscriber hosts in a routed CO deployment. NAT implementation in an IES requires a NAT configuration on the NE base routing instance and a NAT policy that is associated with a subscriber profile. See chapter 30 for information about configuring and deploying NAT on a base routing instance. See chapter 46 for information about configuring a NAT policy. See chapter 68 for information about associating a NAT policy with a subscriber profile.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default Service Tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology views. See chapter 76 for more information about the hierarchical organization of composite services.

Common to all device services, such as IES, are policies that are assigned to the service. Policies are defined at a global level and can then be applied to components of the service, such as interfaces or circuits, when the service is configured or modified. The following policies are common to all device services:

- QoS policies define ingress classification, policing, shaping, and marking on the ingress side of the interface. QoS policies are configured using the Access Ingress Policy form, the Access Egress Policy form, and the ATM QoS Policy form.
- Policer control policies to control access ingress policers and access egress policers under a common hierarchy. Policer control policies are configured using the Policer Control Policy Manager.
- Scheduling policies define hierarchical rate limiting and scheduling to govern the scheduling of queues. Scheduler policies are configured using the Scheduler Policy form.
- Port scheduler policies define hierarchical bandwidth allocation and scheduling at the egress port level. Port scheduler policies are configured using the Port Scheduler Policy form.
- Filter policies control network traffic into or out of an interface or circuit based on IP or MAC matching criteria. Filter policies are configured using the ACL IP Filter form and the ACL MAC Filter form.
- Accounting policies measure the traffic on a service to ensure proper billing and enforcement of SLAs. Accounting policies are configured using the Accounting Policy form.
- ANCP policies provide status and control information based on port-up and port-down messages and current line rate changes between the edge device and the access node. ANCP policies are configured using the Manage Subscriber Policies form.
- Routing policies control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination. Routing policies are configured using the Routing Policy Manager.
- Time of day suites specify time and day restriction policies that are assigned to QoS policies and schedulers, ACL filters, and aggregation schedulers. Time of day suites and time range policies are configured using the Time of Day Suite form and Time Range form, respectively.

See chapter 46 for more information about policies.

Although IES is part of the routing domain, the usable IP address space may be limited. IES allows a portion of the service provider address space to be reserved for service IP provisioning and to be administered by a separate, but subordinate, address authority.

Multiple IESs can be created to separate customer-owned IP interfaces. More than one IES can be created for one customer. More than one IP interface can be created in one IES. All IP interfaces created in an IES belong to the same customer.

The IES IP interfaces are restricted to the routing protocols that can be defined on the interface based on the fact that the customer has a different routing domain for this service. The IP interfaces support the following routing protocols:

- RIP
- OSPF

- BGP
- IS-IS
- PIM
- IGMP

Customer routes can be advertised to the network core using static routes, RIP, or BGP. BGP and static routes are the most commonly used routing methods.

IPCP extensions allow you to configure IP addresses and DNS names of remote devices to enable inter-operability with other networks. Specifically setting an IPCP extension is necessary to connect to a mobile service provider network. Routers for mobile services rely on other network routers to provide IP addresses and DNS names (primary and secondary) for a PPP link.

When an IPCP extension is configured, an edge device configured with PPP/MLPPP can signal a far end device.

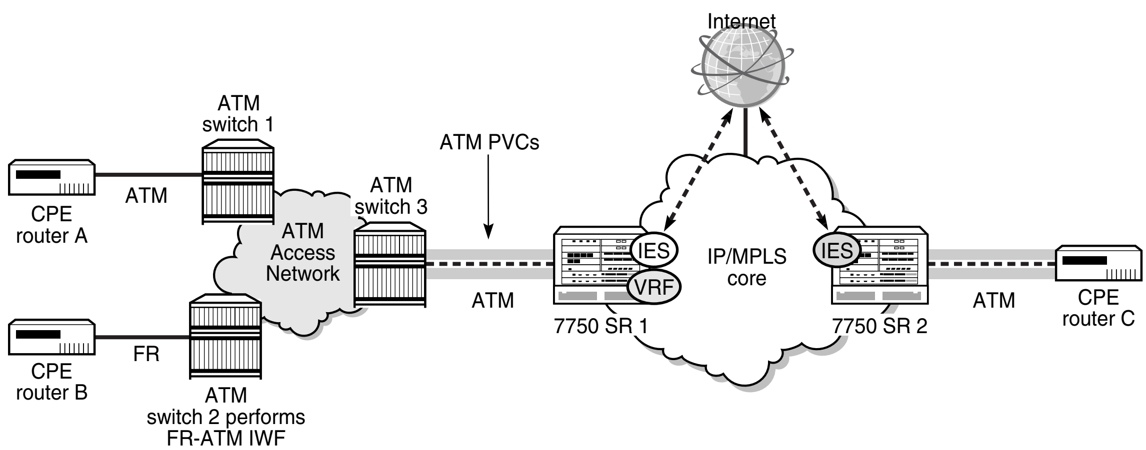
An IES can be connected to a VLL service or to a VPLS by an internal cross-connect through a CCAG adapter. This configuration eliminates the need for the physical port, cable, and other MDA-specific components and results in a less costly and more reliable interconnection. See chapter 76 for information about joining services to form composite services.

ATM SAP terminations for IES

CE routers that have access to an ATM network can connect with an IES service using ATM SAP terminations on a 7750 SR or 7710 SR. The interconnection between ATM point-to-point and L3 services uses RFC 2684-encapsulated IPv4 traffic over an ATM PVC that terminates on a specially configured SAP. All RFC 2684-encapsulated traffic can be routed over ATM networks, frame relay, and directly through ATM connections.

Figure 73-1 shows how CPE router A in an existing ATM network can access L3 IP services, such as an IES, using a statically configured ATM PVC on a 7750 SR (SR #1). CPE router B is connected to a Frame Relay, which connects to ATM switch 2 through IWF (service interworking). The RFC 2684-encapsulated traffic moves from both CPE routers through the ATM access network to a SAP configured on a 7750 SR #1 to serve a specific IES. At the same time, SDPs on the router are configured to a service to forward traffic over the IP/MPLS core. Destination CPE router C can receive RFC 2684-encapsulated traffic over an IP network over an ATM switch connected directly using 7750 SR #2.

Figure 73-1 ATM SAP network connection to an IES

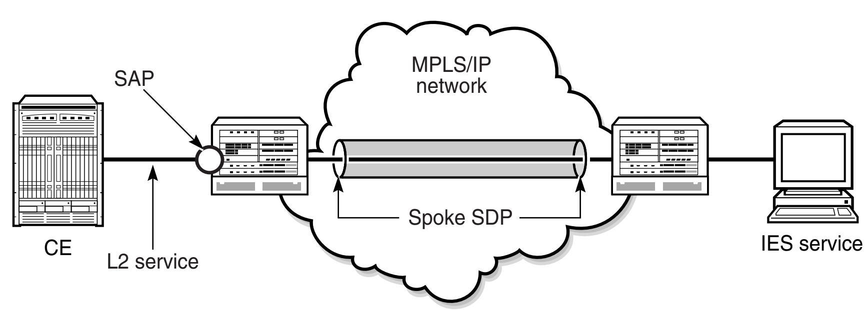


The two connection methods used between an ATM network and the IES router: LLC/SNAP encapsulation and VC multiplexing.

A VLL Epipe service can terminate directly on an IES service using an SDP spoke on the 7750 SR or 7450 ESS. Traffic that terminates on an IES service is identified by the interface ID of the SDP on the L2 access router and the VC ID label in the service packet. All routing protocols supported by IES are also supported for spoke SDP termination.

Figure 73-2 shows a spoke SDP terminating directly on an IES. The spoke SDP could be tied to VLL Epipe or VPLS. No configuration is required for the CE-to-PE connection on the SAP.

Figure 73-2 SDP spoke termination on an L2 service



Routed CO dual homing using SRRP

Subscriber Router Redundancy Protocol (SRRP) allows two separate connections to an access NE such as DSLAM to operate in an active/standby configuration similar to the way in which VRRP interfaces operate. SRRP is a collection of functions and messaging protocols that allows a system to create a set of redundant gateway IP addresses that are shared by a local and remote NE.

Each SRRP instance is created within the context of a subscriber group IP interface and is identified by a unique SRRP instance ID, which must be unique within the NE. This SRRP instance controls the redundant routing for all subscriber subnets configured or associated with the group interface. One SRRP instance is supported for each group interface and the SRRP ID must be the same as the SRRP instance ID on the group IP interface on the redundant NE.

A subscriber subnet redundant gateway IP host address is assigned at the subscriber IP interface level and is used for each SRRP instance associated with the subscriber subnet. The redundant IP host address must be configured for a subscriber subnet before it can be associated with an SRRP instance.

When SRRP is active on a group interface, the SRRP instance advertises to a remote NE using in-band messaging on the group-interface SAPs and out-of-band messaging on the group-interface redundant interface. If the remote NE uses the same SRRP instance ID, one NE enters a master state, while the other NE enters a backup state. Since the NEs share a common SRRP gateway MAC address (used for the SRRP gateway IP address and for proxy ARP functions), either NE can act as the default gateway for the attached subscriber hosts. This functionality helps to preserve subscriber QoS enforcement. The master state allows routing to and from the subscriber hosts associated with the group IP interface. The backup state stops ingress forwarding for packets destined to the SRRP gateway MAC and causes all packets destined to subscriber hosts on the group IP interface to be forwarded to a redundant IP interface associated with the group IP interface.

Normally, when anti-spoofing is enabled on a group-interface SAP, the SAP drops SRRP packets because they do not contain a subscriber MAC or IP address. However, you can use a configuration option to enable anti-spoofing for subscriber hosts on a group-interface SAP that participates in SRRP advertisements.

The underlying mechanism that controls state transitions is based on a dynamic priority level that an SRRP instance maintains. The SRRP instance with the highest priority level assumes the master operating state. An SRRP instance with a higher current priority level always preempts an SRRP instance with a lower priority level. If the priority levels are equal, the SRRP instance with the lowest source SRRP host IP address assumes the master state. The local SRRP instance priority may also be controlled by associating the instance with an existing VRRP policy.

To prevent a flood of AccessInterfaceDown alarms that an SRRP fault or link failure may generate for LAG-based MSAPs, the 5620 SAM performs alarm suppression. See chapter 68 for more information.

The redundant IP interface is a special interface that connects two systems with one or more common SRRP instances. The interface is configured with a /31 address and a spoke SDP binding, creating an Ethernet pseudowire shortcut between the redundant NEs. When the SRRP instance is in backup state, the group interface associated with this instance is not allowed to forward or route traffic downstream towards the subscriber. As a result of this, the packets are shunted across the redundant interface so that the active group interface does the forwarding or routing.

If the redundant IP interface goes down, the system allows the group IP interfaces associated with the down interface to forward locally downstream, when they are in the backup SRRP state. While forwarding downstream in the backup state, the system uses the MAC address associated with the group IP interface, not the SRRP redundant gateway MAC address.

SRRP is supported on the 7450 ESS in mixed mode, 7710 SR and 7750 SR.

DoS protection

The 7450 ESS-7, 7450 ESS-12, 7750 SR-7, and 7750 SR-12 support DoS protection policies.

To protect an IES from a high incoming packet rate that characterizes a DoS attack, you can use the 5620 SAM to create DoS protection policies for the IES L3 access interfaces. A DoS protection policy limits the number of control-plane packets that an interface receives each second, and optionally logs a violation notification if a policy limit is exceeded. You can use the NE System Security form to view the violations for a specific NE.

You can configure a DoS protection policy to control the following on an IES L3 access interface:

- the control-plane packet arrival rate per subscriber host on the interface
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

Each IES L3 access interface on an NE that supports DoS protection is automatically assigned a default DoS protection policy. This default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified. See Procedure 21-3 for information about creating a DoS protection policy.

Local DHCP servers

The 5620 SAM supports configuring local DHCP servers on the 7710 SR, 7750 SR, and the 7450 ESS. The local DHCP server leases IP addresses to clients in the network. Options are configured to define the IP address properties, such as, the length of time an IP address is active and which DNS server must be used. A local user database is used to authenticate and authorize clients requesting IP addresses from the local DHCP server. If the local DHCP server does not use the local user database, the server can use the GI address to assign free IP addresses, however it is not possible to configure match or authentication parameters.

Three applications are targeted for the Local DHCP server.

- Subscriber aggregation in a single node or TPSDA.
- Business services running VPRN and locally attached to the host can request and obtain IP addresses directly from the server.
- The DHCP server identifies an IP request from a PPPoE client and provides an IP address and options.

DHCP servers can be integrated with Enhanced Subscriber Management for DHCP and PPPoE clients. A local DHCP server can be created in the routing instance window or VPRN service site window. A local DHCP server created in the VPRN service site can be associated with the L3 access interface on a VPRN service only. A local DHCP server created in the routing instance window can be associated with a network interface or L3 access interface on IES.

Local user database

The 5620 SAM supports the configuration of a local user database on the 7450 ESS, 7750 SR, and 7710 SR. A local database is configured and associated with the local DHCP server to provide local authentication. The local DHCP server must have a pool of IP addresses configured or it is not able to lease IP addresses.

A create local user database configuration form is available from the Manage Residential Subscribers form. After a local user database is configured, it can be associated with a local DHCP server and PPPoE configurations on group interfaces.

When a local user database is not configured, you can use GI addresses to access free IP addresses, however the clients requesting the IP address are not authenticated.

PPPoE protocol on IES

An IES can be configured to support PPPoE. PPPoE is used in subscriber networks to encapsulate PPP frames inside Ethernet frames. PPPoE combines the point-to-point protocol used by DSL sessions with Ethernet framing to support multiple subscribers in a LAN. Using the group interface configuration form, you can assign a PPPoE policy and a local user database to authenticate PPPoE subscribers.

L2TP configuration for IES

An IES group interface can be configured to terminate LNS PPP sessions. L2TP is a session-layer protocol that extends the PPP model by allowing L2 and PPP endpoints to reside on different devices that are interconnected by a PSN. L2TP extends the PPP sessions between the CPE and PPP/L2TP termination points on the L2TP network server (LNS), via an intermediate L2TP access concentrator (LAC). The LAC is the initiator of session-generated L2TP tunnels; the LNS is the server that waits for new tunnels. Manually configured and initiated L2TP tunnels can be initiated or stopped from either the LNS or LAC.

After a tunnel is established, the network traffic between the peers is bidirectional. If a tunnel carrying a session fails, another tunnel from the same tunnel group re-establishes the session. Within each L2TP tunnel, one or more L2TP sessions can exist. Each L2TP session transports PPP packets.

At least one ISA-LNS group must be configured for the LNS NE.

On an LNS NE, L2TP destinations configured for L2TP tunnel profiles can include the following:

- loopback L3 access interfaces for a VPRN or IES service
- loopback interfaces configured for a base routing instance

Note — If the LAC NE is a Release 7.0 7750 SR, each L2TP tunnel must have the local IP address set to the system interface IP address.

See chapter 18 for more information about ISA-LNS groups. See Procedure 18-7 for information about creating and configuring an ISA-LNS group. See chapter 31 for more information about L2TP. See Procedure 73-8 for information about configuring an IES group interface to terminate LNS PPP sessions.

73.2 Sample IES configuration

Figure 73-3 shows a sample IES configuration.

Figure 73-3 Sample IES configuration

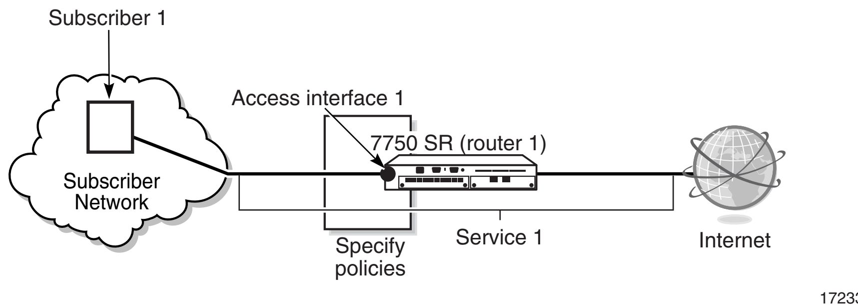


Table 73-1 lists the high-level tasks necessary to configure this sample IES.

Table 73-1 Sample IES configuration

Task	Description
1. Configure policies as required	Policies should be configured prior to creating a service. Participation in policies by access interfaces is defined when you configure or modify access interfaces during service creation or modification. The following key policies can be applied to resources that are part of an IES. • QoS access ingress and egress interface policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress to open these forms. • Scheduler policy. Choose Policies→QoS→SROS QoS→Scheduler to open the scheduler policy form. • ACL IP filter policies. Choose Policies→Filter→ACL IP Filter to open the IP filter form. • Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form. • ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.
2. Create and configure Subscriber 1	Choose Manage→Service→Customers to open the customer manager form and create a customer.

(1 of 2)

Task	Description

3. Create and configure Service 1	Ensure that the operator creating the service has Service Mgmt and Interface Mgmt user group privileges. See chapter 9 for more information about user and user group privileges.
	Choose Create→Service→IES. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure Service 1.
	• Choose Subscriber 1 as the customer for the IES.
	• Choose router 1 as the site for the IES.
	• Create and configure Access interface 1. You do the following to configure an access interface:
	  • Configure general parameters such as a name, ID, and MAC address.
	  • Assign an application profile, if required.
	  • Assign a transit IP or transit prefix policy, if required.
	  • Specify a port that is in access or hybrid mode.
	  • Add unicast routing protocols as required.
	  • Assign ingress and egress QoS policies, as required.
	  • Add multicast routing protocols as required.
	  • Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
	  • Assign ACL filter policies as required.
	  • Assign an accounting policy, if required.
	  • Specify a local DHCP server, if required.
	  • Specify a ToD suite, if required.
	  • Configure subscriber management parameters, if required.
	  • Specify a DoS protection policy, if required.
	  • Specify one or more IP addresses for the IES access interface: one primary IP address and, optionally, multiple secondary IP addresses.
	  • Specify BFD parameters as required.
	  • Configure the ARP timeout and proxy ARP settings, if required.
	  • Configure IPCP parameters, if required.
	  • Configure ICMP parameters, if required.
	  • Configure DHCP parameters, if required.
	  • Configure ARP host configuration, if required.
	  • Configure VRRP parameters, if required.
	  • Configure anti-spoofing parameters, if required.
	  • Create a MEP, if required.
	  • Configure router advertisement parameters.
	  • Create QoS policy overrides, if required.
	  • Configure ANCP parameters, if required.

(2 of 2)

73.3 Workflow to create an IES

The following workflow lists the high-level steps required to create an IES. As a prerequisite for creating a IES, this workflow assumes the following:

- a group or customer with the required user access privileges has been set up; see chapter 9 for more information.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 33-1.
- the access ports for the service are created; see chapter 20 for more information.

- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 46 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 31 for more information about protocol configuration.

1 Create the IES. See Procedure 73-1.

i Choose a customer to associate with the IES.

ii Define the general properties for the IES.

iii Choose a router as the IES site.

iv Create an L3 access interface.

v Apply policies to the IES as required.

vi Turn up the IES service.

2 Perform one or more of the following.

a Apply routing protocols, such as OSPF, RIP, or IS-IS, to an IES site, if required. See Procedure 73-2.

b Apply routing protocols, such as OSPF, RIP, or IS-IS, to an IES L3 interface, if required. See Procedure 73-3.

c Add an IGMP interface to an IES. See Procedure 73-4.

d Add a PIM interface to an IES. See Procedure 73-5.

e Create an L2 SDP spoke termination on an IES service. See Procedure 73-6.

f Add a subscriber interface to an IES. See Procedure 73-7.

g Add a group interface to an IES. See Procedure 73-8.

h Configure a GNE site on an IES service. See Procedure 73-9.

i Implement dual homing using SRR. See Procedure 73-10.

j Create and enable a video interface for the IES site, if required. See Procedure 36-2.

3 As required, view IES information:

a View the IES service operational status. See Procedure 73-11.

b View the service topology map associated with an IES. See Procedure 73-12.

4 As required, modify a IES:

a Using the Manage Services form. See Procedure 73-13.

b Using the topology view. See Procedure 73-14.

5 As required, delete an IES. See Procedure 73-15.

73.4 IES management procedures

Use the following procedures to perform IES creation and management tasks.

Note — To configure a port in the 7210 SAS-M access uplink mode see Procedure 73-1. The 7210 SAS-M does not support IES in Network mode.

Procedure 73-1 To create an IES

1. Choose Create→Service→IES from the 5620 SAM main menu. The IES Service (Create) form opens with the General tab displayed.

2. Click on the Select button to choose a customer to associate with the IES. The Select Customer - IES Service form opens.

3. Select a customer for the IES and click on the OK button. The Select Customer - IES Service form closes, and the IES Service (Create) form reappears with the customer information displayed in the Customer panel.

4. Configure the parameters:

   - Service ID
     This parameter is configurable when the Auto-Assign ID parameter is disabled.
   - Auto-Assign ID
   - SVC Mgr Service ID
     This parameter is configurable when the Auto-Assign ID parameter is disabled.
   - Service Name
   - Description
   - Service Tier
   - Service Prioirity
   - Administrative State
   - OLC State
     This parameter is configurable when you click on the Apply button.

5. To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

   i. Click on the 5670 RAM Parameters tab button.

   ii. Click on the General tab button.

   iii. Configure the parameters:

      - Enable Application Performance Reporting
      - Report Customer Name

6 Perform one of the following:

a Create a site for the IES. Go to step 7.

b Complete service creation if sites and access interfaces for the IES are to be created later. Go to step 61.

For information on adding a GNE site to an IES service, see Procedure 73-9.

7 On the navigation tree, right-click IES Service and choose Create IES Site. The Select Network Elements - IES Service form opens with a list of available sites.

8 Select a site and click on the OK button. The IES Site (Create) form opens with general information about the site displayed in the Network Element panel.

9 Configure the parameters:

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

10 Click on the IGMP Host Tracking tab button.

11 Configure the parameters:

- Administrative State
- Expiry Time

12 Perform one of the following steps.

a Create an access interface for the site. Go to step 13.

b Complete site creation if access interfaces for the site are to be created later. Go to step 54.

13 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

14 RIght-click on Access Interfaces and choose Create IES L3 Access Interface. The IES L3 Access Interface (Create) form opens with the General tab displayed.

15 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Allow Directed Broadcasts
- Loopback Enabled
- Cflowd Type
- Class
- Trusted
- IPv6 Allowed
- Admin Link Local Address
- Admin Link Local Address Preferred
- FlowSpec Validate Enabled
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6
- Calling Station ID
- Configured IP MTU (Octets)
- Unnumbered Type
- IP Address
- Interface Name
- URPF Check State
- URPF Check Mode
- Tunnel Fault Notification

Note 1 — The Unnumbered Type parameter is configurable when the Class parameter is set to Unnumbered.

Note 2 — The IP Address parameter is configurable when the Unnumbered Type parameter is set to IP Address.

Note 3 — The Interface Name parameter is configurable when the Unnumbered Type parameter is set to Name.

Note 4 — The Admin Link Local Address and Admin Link Local Address Preferred parameters are only configurable when the IPv6 Allowed parameter is enabled.

Note 5 — The FlowSpec Validate Enabled parameter is available only when a port is configured on the interface. You may have to complete steps 23 to 27 before configuring this parameter.

Note 6 — The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

16 If the Loopback Enabled parameter in step 15 is enabled, you cannot associate a port with the L3 interface. Go to step 40.

17 Bind an application profile to the IES L3 access interface, if required:

i Click on the Select button beside the Application Profile parameter in the Application Assurance panel. The Application Profile String: - IES L3 Access Interface list form opens.

ii Select a profile from the list and click on the OK button. The Application Profile String - IES L3 Access Interface list form closes and the L3 Access Interface (Create) form is refreshed with the Application Profile information.

Note — The Application Profile String: - IES L3 Access Interface list form only displays local profiles that already exist on the NE.

18 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — To bind a transit policy to an L3 access interface, a port must already exist on the interface.

Note 3 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 4 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Select a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit IP policy and click on the OK button.

19 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab button.

20 Configure Unicast RPF if required.

- URPF Check State
- URPF Check Mode

Note — The URPF Check State parameter must be enabled to display the URPF Check Mode parameter.

21 Click on the OK button. A dialog box appears.

22 Click on the OK button. The IES L3 Access Interface (Create) form closes, and the IES Site (Create) form displays the new access interface.

23 Click on the Port tab button.

24 Click on the Select button to choose a port for the L3 access interface. The Select Terminating Port - IES L3 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

25 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form displays the port information.

26 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

If the port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. The system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with Q in Q encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

27 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab button.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

Note — If a bundle was selected in step 25, only the Scheduling Class parameter are configurable.

28 Bind an IES L3 access interface to a VPLS site, if required.

Note 1 — The operational state of the IP interface binding will not be turned up until the parameter Enable IP Interface Binding is set to true.

Note 2 — You can create and manage a routed VPLS connector from the navigation tree on the Composite Service (Edit) form.

i Click on the Routed VPLS tab button.

ii Enter a VPLS site name or click on the Select button next to the VPLS Name parameter to choose a VPLS site with a configured site name. The Routed VPLS String - IES L3 Access Interface form opens.

iii Select a VPLS site and click on the OK button. The VPLS site is displayed.

iv In the Ingress - IPv4 Filter panel, click on the Select button. The Select IPv4 Filter - IES L3 Access Interface form opens.

v Select an IPv4 filter and click on the OK button. The IPv4 filter information is displayed.

vi In the Ingress - IPv6 Filter panel, click on the Select button. The Select IPv6 Filter - IES L3 Access Interface form opens.

vii Select an IPv6 filter and click on the OK button. The IPv6 filter information is displayed.

viii In the Egress - QoS Policy panel, click on the Select button. The Select QoS Policy - IES L3 Access Interface form opens.

ix Select a QoS Policy and click on the the OK button. The QoS Policy information is displayed.

29 Some devices support the application of QoS and accounting policies, queue schedulers, ANCP policies, ACL filters to interfaces and associating a local DHCP server.

a If your device supports these functions, go to step 30.

b If your device does not support these functions, the QoS, Schedulers, ACL, ANCP policies, Local DHCP server and Accounting tabs are not present. Go to step 40.

30 Assign ingress and egress QoS policies to the interface, if required.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

i Click on the QoS tab button.

Note — The QoS tab is configurable only when a port is assigned to the interface.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID
- Use Multipoint Shared Queue

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - IES L3 Access Interface form opens.

iv Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port selected in step 25 uses the same access ingress queue group.

See Procedure 20-1 in chapter 20 for information about configuring Ethernet ports. See chapter 46 for information about queue group template policies.

v Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - IES L3 Access Interface form opens.

vi Select an egress QoS policy and click on the OK button. The Select Egress Policy - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the egress QoS policy information displayed.

Note — If you select an egress policy that has a forwarding class mapped to an egress queue group, you must ensure that the port selected in step 25 uses the same access egress queue group.

See Procedure 20-1 in chapter 20 for information about configuring Ethernet ports. See chapter 46 for information about queue group template policies.

vii If you are configuring an L3 access interface for a 7710 SR or 7705 SAR, or if the port you selected in step 25 is not an HSMDA port, then go to step 31.

viii Configure the Packet Byte Offset (bytes) parameter, if required. You must enable the associated Override check box if you need to configure this parameter.

ix Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

x Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the IES L3 Access Interface (Create) form reappears with the WRR policy information displayed.

xi Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xii Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the IES L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

31 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 33.

Note — The Schedulers tab is configurable only when a port is assigned to the interface.

32 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

Note — The Aggregation parameter is not configurable if the port you selected in step 25 is an HSMDA port.

i Set the Aggregation parameter to off.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 25 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - IES L3 Access Interface form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the IES L3 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 25 is an HSMDA port, go to step 33.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - IES L3 Access Interface form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the IES L3 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 33.

b Specify that an aggregation scheduler policy is applied to the interface.

i Set the Aggregation parameter to on.

Note — You cannot specify an access scheduler policy if the port you selected in step 25 is an HSMDA port. Go to step 33.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - IES L3 Access Interface form opens.

iii Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

33 Assign ingress and egress ACL filters to the interface, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - IES L3 Access Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - IES L3 Access Interface form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the egress ACL filter information displayed.

vi Click on the Select button in the IPv6 Ingress Filter panel to choose an ingress IPv6 ACL filter. The Select IPv6 Ingress Filter - IES L3 Access Interface form opens.

vii Select an ingress IPv6 ACL filter and click on the OK button. The Select IPv6 Ingress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the ingress IPv6 ACL filter information displayed.

viii Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - IES L3 Access Interface form opens.

ix Select an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the IPv6 egress ACL filter information displayed.

34 To associate a local DHCPv4 or DHCPv6 server to the IES L3 interface, if required, click on the Local DHCP tab button and perform one of the following steps.

Note — To associate local DHCPv6 servers the IPv6 Allowed parameter must be enabled.

a For local DHCPv4 servers

i Click on the Select button in the Local DHCP Server panel to choose a local DHCP server. The Select Local DHCP Server - IES L3 Access Interface form opens.

ii Select a local DHCP server and click on the OK button. The Select Local DHCP Server - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the local DHCP server information displayed.

b For local DHCPv6 servers

Note — You cannot associate a local DHCPv4 server to the L3 group Interface if the Administrative State parameter in the Local Proxy Service panel is up. Go to step 47 to set the Administrative State.

i Click on the Select button in the Local DHCPv6 Server panel to choose a local DHCPv6 server. The Select Local DHCPv6 Server - IES L3 Access Interface form opens.

ii Select a local DHCPv6 server and click on the OK button. The Select Local DHCPv6 Server - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the local DHCPv6 server information displayed.

Note — The following parameters are configurable when the Lease Time parameter is set to Specified Time Period.

- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

35 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - IES L3 Access Interface form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the accounting policy information displayed.

36 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

37 Assign a time of day suite to the interface, if required.

i Click on the TOD Suite tab button.

ii Click on the Select button beside the Name parameter. The Select Time Of Day Suite - IES L3 Access Interface list form opens.

iii Select a time of day suite and click on the OK button. The Select Time Of Day Suite - IES L3 Access Interface list form closes, and the IES L3 Access Interface (Create) form refreshes with the time of day suite name.

Note 1 — You cannot assign a ToD suite to a L3 access interface if accounting statistics collection is enabled on the L3 access interface. You must first disable the Collect Accounting Statistics parameter in step 35.

Note 2 — SapEgrQosPlcyStats and SapIngQosPlcyStats statistics will only be collected if a Time Of Day Suite is applied on the SAP.

38 Configure residential subscriber management for the interface, if required.

i Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

ii Select the SHCV Enabled parameter to enable SHCV, if required. Otherwise, go to step 39.

iii Configure the parameters:

- SHCV Interval (minutes)
- SHCV Source
- SHCV Action

iv Click on the Profiles tab button. If the Profiles tab is not enabled, go to step 39.

v Configure the parameters:

- Admin Status
- Service Model
- Subscriber Limit
- Default Subscriber Identification Type
- Default Subscriber Id
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id
- Profiled Traffic only
- Non-Subscriber Traffic Identification
- LAG link selection

39 Assign a DoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - IES L3 Access Interface form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - IES L3 Access Interface form closes and the policy ID is displayed on the IES L3 Access Interface (Create) form.

40 Assign an IP address to the interface.

i Click on the Addresses tab button.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Broadcast Address Format
- EUI-64
- IP Address Preferred

Note 1 — The Broadcast Address Format parameter only appears if the IP Address parameter is set to an IPv4 address.

Note 2 — The EUI-64 IP Address Preferred parameters only appear if the IP Address parameter is set to an IPv6 address.

Note 3 — The secondary IP addresses must not overlap with the primary IP address.

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The IES L3 Access Interface (Create) form reappears with the assigned IP addresses displayed.

41 Configure Bi-directional Forwarding Detection for the interface, if required.

i Click on the BFD tab button.

ii Click on the Configuration tab button.

iii Configure the parameters:

- Administration Status
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier

iv To view local and remote session peers, click on the BFD Session tab button. 5620 SAM retrieves information from local and remote nodes and displays a list of BFD current sessions on router interfaces or L3 interfaces.

v Click on a session. A properties form opens for the session. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

vi Click on the OK button.

Note 1 — You cannot enable BFD on an interface if BFD is not configured on the interface. You cannot set the administration status of an interface to disabled when protocols using the interface have BFD enabled. See chapter 31 for information about enabling and disabling BFD for routing protocols.

Note 2 — If the IPv6 Allowed parameter in step 15 is enabled, you can configure the above BFD parameters for IPv6.

42 Configure IPv4 ICMP for the interface, if required.

i Click on the ICMP tab button.

ii Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

43 If the IPv6 Allowed parameter in step 15 is enabled, the ICMPv6 tab is configurable. Configure IPv6 ICMP, if required. Otherwise, go to step 44.

Configure the parameters:

- Redirects
- Unreachables
- Packet Too Big
- Param Problem
- Time Exceeded
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of Packet Too Big
- Packet Too Big Time (seconds)
- Number of Param Problem
- Param Problem Time (seconds)
- Number of Time Exceeded
- Time Exceeded Time (seconds)

44 Configure IPCP for the interface, if required. IPCP is available only on the ASAP MDA of 7750 SR, and 7710 SR.

i Click on the IPCP tab button.

ii Configure the parameters:

- Peer Address
- Primary DNS Address
- Secondary DNS Address

Note — Primary and secondary DNS addresses have similar functionality. However, they are assigned independently. When both are present, the primary DNS address is used to resolve address names. If the primary DNS address cannot be used the secondary DNS address is used.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button to confirm the action.

The IPCP tab is available when the SAP and port is configured with Null or IPCP encapsulation.

45 Configure ARP for the interface, if required.

i Click on the ARP tab button. The General tab is displayed.

ii Configure the Timeout (seconds) parameter.

iii To add a static ARP entry, click on the Create button. The Static ARP (Create) form opens.

iv Configure the parameters:

- IP Address
- Physical Address

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Static ARP (Create) form closes, and the General tab refreshes with the configured static hosts displayed in a list.

vii Repeat steps iii to vi to create additional entries, if required.

viii Click on the OK button. A dialog box appears.

ix Click on the Proxy ARP tab button.

x Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1
- Proxy ARP Policy 2
- Proxy ARP Policy 3
- Proxy ARP Policy 4
- Proxy ARP Policy 5

46 If the IPv6 Allowed parameter in step 15 is enabled, the Neighbor Discovery tab is configurable. Configure neighbor discovery, if required. Otherwise, go to step 47.

i Click on the Neighbor Discovery tab button.

ii Click on the Create button. The Neighbor Discovery (Create) form opens.

iii Configure the parameters:

- IP Address
- Physical Address

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Neighbor Discovery (Create) form closes, and the IES L3 Access Interface (Create) form refreshes with the neighbor entry.

vi If the Proxy ND tab is present, click on the Proxy ND tab button. Otherwise, go to step viii.

vii Configure the parameters:

- Enable Local Proxy
- Policy 1
- Policy 2
- Policy 3
- Policy 1
- Policy 5

Note — Do not leave an empty policy parameter between two configured policy parameters. For example, do not configure the Policy 1 and Policy 3 parameters and leave the Policy 2 parameter unconfigured, or the 5620 SAM reorders the policies and move the policy specified for the Policy 3 parameter to the Policy 2 parameter.

viii Repeat steps i to vii for each neighbor entry you want to create.

47 Configure IPv4 DHCP for the interface, if required.

i Click on the DHCP tab button. The General tab is displayed.

ii Configure the parameters:

- Enable DHCP Relay
- Description
- Trusted
- Lease Populate
- Enable
- Relay Plain BOOTP
- Use ARP

Note — The Lease Populate parameter is configurable when the Enable parameter is enabled.

iii Depending on the type and version of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step viii.

iv Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form opens.

v Configure the filter criteria.

vi Select a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form closes, and the L3 Access Interface (Create) form refreshes with the subscriber authentication policy name.

vii Configure the parameters:

- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address
- Use as source

Note — The Remote ID String parameter is configurable when the Remote ID parameter is set to Remote IDString.

viii Click on the Server tab button.

ix Configure the parameters:

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

Note — The following parameters are configurable when the Lease Time parameter is set to Specified Time Period.

- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

48 The ATM tab is configurable when the interface port is an ATM port. Specify OAM functionality and assign ingress and egress ATM policies to the interface, if required.

i Click on the ATM tab button.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Select an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the L3 Access Interface (Create) form refreshes with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Select an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the L3 Access Interface (Create) form refreshes with the egress ATM policy information displayed.

49 Click on the VRRP tab button to create a VRRP instance on the current L3 interface for a virtual router. You must know the VRID for an existing virtual router and ensure that the interface is a member of the same subnet as the virtual router.

Note — The following configurations are required for the operation of the IPv6 VRRP instance:

- Two sub-tabs are available under the VRRP tab, one for IPv4 instances and the other for IPv6 instances. You can only create an IPv6 VRRP Instance if you enable the IPv6 Allowed parameter in step 15.
- The Link Local Address on the parent interface has to be set to preferred and configured as one of the backup addresses (or same subnet) for the IPv6 VRRP instance. To do this, the Admin Link Local Address and Admin Link Local Address Preferred parameters in step 15 must be set accordingly.
- The IPv6 address on the parent interface must be set to preferred to be used as a backup address (on same subnet) for the IPv6 VRRP instance. The IP Address and IP Address Preferred parameters in step 40 must be set accordingly.
- The Send Advertisement and Use Virtual MAC Address parameters must be enabled in step 51 for the router advertisement on the parent interface.

See chapter 39 for additional configuration information about VRRP instances and virtual routers.

i Click on the Create button. The VRRP Instance (Create) form opens with the General tab displayed.

ii Configure the Virtual Router ID parameter.

iii Perform steps 8 to 15 of Procedure 39-2.

Note — You can use the VR Instances tab to create, modify, and view VR instances.

iv Click on the OK button. The VRRP Instance (Create) form closes and the L3 Access Interface- Subscriber (Create) form reappears.

50 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab button.

ii Configure the parameters:

- Anti-Spoofing
- ARP Populate

Note — The ARP Populate parameter is configurable when all of the IP addresses of the defined static hosts on the interface are in one of the subnets configured for the interface.

iii Click on the Static Hosts tab button to configure static subscriber host entries, if subscriber entries are not available through DHCP lease management. Otherwise, go to step 54.

iv Click on the Create button. The Access Interface Anti-Spoofing Static Host (Create) form opens.

v Configure the parameters:

- IP Address
- MAC Address

Note 1 — At least one IP address or MAC address must be specified for each static host. The values specified for the Anti-Spoofing and ARP Populate parameters determine the type of address entry that is required for the static host. For example, when you set the Anti-Spoofing parameter to Source Ip Addr, you must specify at least the IP address for the static host.

Note 2 — You can configure a static host on a SAP only when no static ARP entries exist on the IP interface.

Note 3 — When the ARP Populate parameter is enabled, the IP address of the new static host must be in one of the subnets that is configured for the interface in step 40.

vi Click on the Apply button if you want to create additional entries. A dialog box appears. Otherwise, go to step ix.

vii Click on the OK button.

viii Repeat steps v to vii to create additional entries, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes, and the Static Hosts tab refreshes with the configured static hosts displayed in a list.

51 Configure router advertisement, if required.

i Click on the Advertisement tab button.

ii Click on the Create button to add a router advertisement entry. The Router Advertisement (Create) form opens.

iii Configure the parameters:

- Send Advertisement
- Min Interval (seconds)
- Reachable Time (milliseconds)
- Managed Address Config
- MTU
- Use Virtual MAC Address
- Max Interval (seconds)
- Retransmit Time (milliseconds)
- Other Stateful Config
- Current Hop Limit
- Lifetime (seconds)

Note — If you are configuring the L3 interface for an IPv6 VRRP instance, then the Send Advertisement and Use Virtual MAC Address parameters must both be enabled.

iv Click on the Prefix tab button.

v Click on the Create button. The Router Advertisement Prefix (Create) form opens.

vi Configure the parameters:

- IPv6 Prefix
- On-Link Determination
- Prefix Length
- Autonomous Address Configuration
- Lifetime (seconds) in Preferred Lifetime panel
- No Expiry in Preferred Lifetime panel
- Lifetime (seconds) in Valid Lifetime panel
- No Expiry in Valid Lifetime panel

Note — Each Lifetime (seconds) parameter is configurable when the associated No Expiry parameter is disabled.

52 Click on the OK button. A dialog box appears.

53 Click on the OK button. The Router Advertisement Prefix (Create) form closes.

54 Click on the OK button. A dialog box appears.

55 Click on the OK button. The IES L3 Access Interface (Create) form refreshes with the router advertisement entry.

56 Specify queue overrides by clicking on the Override Policy Items tab button.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

Set the queue overrides, as described in Procedure 47-44.

57 If the IPv6 Allowed parameter in step 15 is enabled, the DHCPv6 tab is configurable. Configure IPv6 DHCP, if required. Otherwise, go to step 20.

i Click on the DHCPv6 tab button. The DHCPv6-Prefix tab is displayed.

ii Click on the Create button. The DhcpRelayV6PrefixDelegation (Create) form opens.

iii Configure the parameters:

- Prefix Address
- Prefix Length
- Prefix DUID
- Prefix IAID
- Prefix Life Time (seconds)
- Prefix Valid Life Time (seconds)

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The L3 Access Interface (Create) form reappears.

vi Click on the DHCPv6-Relay tab button.

vii Configure the parameters:

- Enable DHCPv6 Relay
- Description
- Lease Populate
- Maximum Number of Leases
- Interface Id Option
- Interface Id String
- Remote ID
- Source IP Address
- Neighbor Resolution
- Prefix Option

viii Click on the Server tab button.

ix Configure the Server 1 through Server 8 parameters.

x Configure the interface name for each DHCPv6 server that you configured in step ix by clicking on the Select button in the Zone Index panel. The Select Zone Index - DhcpRelayV6Configuration form opens with a list of configured interfaces.

xi Select an interface from the list and click on the OK button. The Select Zone Index - DhcpRelayV6Configuration list form closes and the L3 Access Interface form refreshes with the interface information.

xii Click on the OK button. A dialog box appears.

xiii Click on the OK button. The L3 Access Interface (Create) form reappears.

58 Add a Video interface to the IES site, if required. See Procedure 36-2 for more information.

59 Click on the OK button. The IES Site (Create) form closes, and the IES Service (Create) form reappears with the new site information displayed in the service navigation tree.

60 Perform one of the following steps.

a Create an additional site for the IES. Go to step 7.

b Complete service creation. Go to step 61.

61 Click on the OK button. A dialog box appears.

62 Click on the Yes button to confirm the action. The IES Service (Create) form closes.

Procedure 73-2 To apply OSPF, RIP, or IS-IS to an IES

Note — OSPF, RIP, or IS-IS must be enabled at the routing instance level before you can apply OSPF, RIP, or IS-IS to an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES in the list and click on the Properties button. The IES Site (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the Sites tab button.

5 Select a site in the list and click on the Properties button. The IES Site (Edit) form opens.

6 Click on the Protocols tab button.

7 Click on the Create button. The Create Interface form opens.

8 Specify the interface type by configuring the What type of interface would you like to create? parameter.

9 Click on the OK button. The Interface (Create) form opens. See section 31.2 for information about configuring specific routing protocols.

Procedure 73-3 To apply OSPF, RIP, or IS-IS to an IES L3 interface

Note — OSPF, RIP, or IS-IS must be enabled at the routing instance level before you can apply OSPF, RIP, or IS-IS to an L3 interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria.A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the L3 Access Interfaces tab button.

5 Select an L3 interface in the list and click on the Properties button. The L3 Access Interface (Edit) form opens.

6 Click on the Protocols tab button.

7 Click on the Create button. The Create Interface form opens.

8 Specify the interface type by configuring the What type of interface would you like to create? parameter.

9 Click on the OK button. The Interface (Create) form opens. See section 31.2 for information about configuring specific routing protocols.

Procedure 73-4 To add an IGMP interface to an IES

Note — IGMP must be enabled on the NE routing instance before you can create an IGMP interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the Sites tab button.

5 Select a site in the list and click on the Properties button. The IES Site (Edit) form opens.

6 Click on the Multicast tab button.

7 Click on the Interfaces tab button.

8 Click on the Create button. The Create Interface form opens.

9 Set the What type of interface would you like to create? parameter to IGMP.

10 Click on the OK button. The IGMP Interface (Create) form opens with the General tab displayed.

11 Click on the Select button to specify an interface. The Select Interface form opens.

12 Click the Search button. A list of interfaces appears at the bottom of the Select Interface form.

13 Select an interface and click the OK button. The Select Interface form closes and the Interface panel refreshes with the interface parameters.

14 Configure the parameters:

- Description
- Administrative State
- Administrative Version
- Maximum Number of Groups
- Subnet Check

15 Click on the Behavior tab button.

16 Configure the Import Policy parameter.

17 Click on the Multicast CAC tab button to add a multicast CAC policy, if required. The General tab is displayed.

18 Click on the Select button in the Select Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - IGMP Interface form opens.

19 Choose a multicast CAC policy from the list and click on the OK button. The Select Multicast CAC Policy - IGMP Interface form closes and the IGMP Interface, Routing Instance (Create) form appears.

20 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

21 Click on the Static Group/Source tab button to add a static multicast group or source, if required.

22 Click on the Create button to add a new entry. The StaticGrpSrc, Interface ID - 6, Routing Instance (Create) form opens.

23 Configure the parameters:

- Static Multicast Group
- Static Source

24 Click on the OK button. The StaticGrpSrc, Routing Instance (Create) form closes and a dialog box appears.

25 Click on the OK button to confirm the action. The IGMP Interface, Routing Instance (Create) form reappears.

26 Click on the OK button to close the IGMP Interface, Routing Instance (Create) form.

27 Click on the OK button to close the IGMP Interface (Create) form.

28 Click on the Group Interfaces tab button to identify an IGMP group interface for the IES service, if required.

29 Click on the Create button and configure the parameters in the IGMP Group Interface - Routing Instance (Create) form:

- Description
- Administrative State
- Name

30 Click on the Select button next to the Interface ID field to select a group interface from the Select IGMP Group Interface - IGMP Group Interface - Routing Instance form.

31 Click on the OK button to close the Site (Edit) form.

32 Click on the OK button to close the IES (Edit) form. A dialog box appears.

33 Click on the Yes button to confirm the action. The IES (Edit) form closes.

34 Close the Manage Services form.

Procedure 73-5 To add a PIM interface to an IES

Note — Before you can add a PIM interface to an IES, PIM must be applied to All or IES during the PIM configuration at the routing instance level. See Procedure 31-33 for more information.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES in the list and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the Sites tab button.

5 Select a site in the list and click on the Properties button. The IES Site (Edit) form opens.

6 Click on the Multicast tab button.

7 Click on the Create button. The Create Interface form opens.

8 Set the What type of interface would you like to create? parameter to PIM.

9 Click on the OK button. The PIM Interface (Create) form opens with the General tab displayed.

10 Click on the Select button to specify an interface. The Select Interface - PIM Interface form opens.

11 Configure the filter criteria. A list of available L3 access interfaces appears at the bottom of the Select Interface - PIM Interface form.

12 Select an interface and click on the OK button. The Select Interface - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the L3 access interface information.

13 Configure the parameters:

- Description
- Administrative State
- Administrative State IPv4
- BFD Enabled
- IPv6 BFD Enabled

14 Click on the Behavior tab button.

15 Configure the parameters:

- Hello Interval (seconds)
- Tracking Support
- BSM Check Router Alert
- Improved assert
- Max Groups
- Three Way Hello
- Multicast Senders
- Hello Multiplier
- Assert Period
- DR Priority
- Sticky DR
- Sticky DR Priority

Note — The Sticky DR Priority parameter is configurable when the Sticky DR parameter is enabled.

16 Click on the Neighbor tab button, if present, to view and edit information. The Neighbor tab is present only when a neighbor PIM interface exists.

17 Click on the Multicast CAC tab button to add a multicast CAC policy, if required. The General tab is displayed.

18 Click on the Select button in the Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - PIM Interface form opens.

19 Choose a multicast CAC policy from the list and click on the OK button. The Select Multicast CAC Policy - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form reappears.

20 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

21 Click on the IPv6 Specifics tab button.

22 Configure the IPv6 Administrative State parameter.

23 Click on the OK button to close the PIM Interface (Create) form.

24 Click on the OK button to close the IES Site (Edit) form.

25 Click on the OK button to close the IES Service (Edit) form. A dialog box appears.

26 Click on the Yes button to confirm the action. The IES Service (Edit) form closes.

27 Close the Manage Services form.

Procedure 73-6 To create an L2 SDP spoke termination on an IES service

Ensure that a service and site have been created in the IES. To terminate an L2 service on an IES SDP spoke, you must identify the VC and an interface belonging to the VC. The interface must not have an associated port.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site to which you want to add the L2 SDP spoke termination; expand the entries for that site.

5 Right-click on Spoke Sdp Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding (Create) form opens with the General tab displayed.

6 Specify a source interface for the spoke SDP binding.

i Click on the Select button in the Source Interface panel. The Select Source Interface - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of source interfaces appears at the bottom of the Select Source Interface - Spoke SDP Binding form.

iii Choose a source interface from the list and click on the OK button. The Select Source Interface - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

7 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed node, choose from a list of managed nodes.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element form opens.

ii Select a destination node and click on the OK button. The Select Destination Network Element form closes, and the Spoke SDP Binding (Create) form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

8 Configure the parameters:

- Description
- VC ID
- VC Type
- Auto-Assign ID
- Ingress Label
- Egress Label
- Enable Hash Label
- FlowSpec Validate Enabled
- Enable Signal Capability

The Enable Hash Label and Enable Signal Capability parameters can only be configured for spoke-SDP bindings that are access interface terminated.

9 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

10 Specify an application profile for the spoke SDP binding.

i Click on the Select button next to the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of application profiles appears.

iii Choose an application profile from the list and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding - IES service form displays only local profiles on the NE.

11 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — To bind a transit policy to an L3 access interface, a port must already exist on the interface.

Note 3 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 4 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Select a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit IP policy and click on the OK button.

12 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab button.

13 Click on the States tab button.

14 Configure the Administrative State parameter.

15 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes, and the L3 Access Interface (Create) form reappears with the egress ACL filter information displayed.

16 Assign an accounting policy to the spoke SDP binding, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Spoke SDP Binding form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - Spoke SDP Binding form closes, and the L3 Access Interface (Create) form reappears with the accounting policy information displayed.

17 Associate a MEP with an SDP binding, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step 18.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab button.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

18 Click on the OK button. The MEP (Create) form closes.

19 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

20 Click on the OK button. The IES Service (Edit) form reappears with the new information displayed in the service navigation tree.

Procedure 73-7 To add a subscriber interface to an IES

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a subscriber interface in an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Properties button. The IES Service Subscriber (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the subscriber interface; expand the entries for that site.

5 Right-click on the Subscriber Interfaces icon below the site to which you want to add the subscriber interface, and choose Create IES Subscriber Interface. The IES Subscriber Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Auto-Assign ID
- Interface ID
- Name
- Description
- Administrative State
- Default Primary DNS Server Address
- Default Secondary DNS Server Address
- Tunnel Fault Notification

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

Note 1 — The Name value for a subscriber interface must be unique in the NE.

Note 2 — You must configure the Default Primary DNS Server Address parameter before you can configure the Default Secondary DNS Server Address parameter.

7 Configure IPv6 forwarding on the subscriber interface, if required.

i Configure the IPv6 Allowed and IPv6 Delegated Prefix Length parameters.

- IPv6 Allowed
- IPv6 Delegated Prefix Length
- Admin Link Local Address

The Admin Link Local Address parameter is only configurable when the IPv6 Allowed parameter is enabled.

ii Click on the IPv6 Subscriber Prefixes tab button.

iii Select a subscriber prefix from the list and click on the Properties button, or click on the Create button to create a new subscriber prefix.

iv In the Subscriber Prefix [Edit|Create] form, configure the parameters:

- Address ID
- IP Address
- Prefix Length
- WAN Host
- Prefix Delegation

8 Configure the Interface Class parameters, if required.

i Configure the Class parameter.

ii If you selected a value of Unnumbered for the Class parameter, configure the Unnumbered Type parameter.

iii Configure the Interface Name parameter or the IP Address parameter.

9 Create IP addresses for the subscriber interface that are inherited by the SAPs in the group interfaces that are child objects of the subscriber interface.

i Click on the Addresses tab button.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Populate Host Routes
- Track SRRP Instance
- Hold Up Time (milliseconds)
- Gateway IP Address
- Broadcast Address Format

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The IES Subscriber Interface (Create) form reappears with the assigned IP addresses displayed.

vi Repeat steps ii to v for each additional IP address that you want to create.

10 Click on the DHCP tab button.

11 Configure the parameters:

- IP address
- Use as source

12 Click on the OK button. The IES Subscriber Interface (Create) form closes, and a dialog box appears.

13 Click on the OK button. The IES Service (Edit) form reappears with the new subscriber interface displayed in the service navigation tree.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The IES Service (Edit) form closes, and the Manage Services form reappears.

16 Close the Manage Services form.

Procedure 73-8 To add a group interface to an IES

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a group interface in an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the group interface; expand the entries for that site.

5 Right-click on the subscriber interface to which you want to add a group interface, and choose Create IES Subscriber Interface. The IES Subscriber Interface (Create) form opens with the General tab displayed.

6 Click on the Group Interfaces tab button.

7 Click on the Create button. The IES Group Interface (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Auto-Assign ID
- Interface ID
- Name
- Description
- Administrative State
- MAC Address
- Trusted
- Operational State UP While Empty
- LNS
- IPv6 Allowed
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6

Note — The LNS parameter defines the type of group interface. This parameter is set at creation time and cannot be modified. Regular group interfaces cannot configure LNS attributes, and an LNS group interface does not allow PPPoE configuration or SAPs.

9 Configure IPv6 router advertisement and DHCPv6 on the group interface, if required.

i Configure the IPv6 Allowed parameter.

ii Click on the IPv6 Advertisement tab button and configure the parameters:

- Administrative State
- Current Hop Limit
- Managed Address Config
- Max Interval (seconds)
- Min Interval (seconds)
- Link MTU
- Other Stateful Config
- Reachable Time (milliseconds)
- Retransmit Time (milliseconds)
- Router Lifetime (seconds)
- Autonomous Address Configuration
- Preferred Life Time
- Valid Life Time

iii Click on the DHCPv6 tab button.

iv Click on the Select button and select a local user database from the Select Local User Database form.

v Click on the Proxy Server tab button and configure the parameters:

- Administrative State
- Renew Timer
- Rebind Timer
- Valid Life Time
- Preferred Life Time
- Client Applications

vi Click on the Relay tab button and configure the parameters:

- Administrative State
- Description
- Remote ID
- Client Applications

vii Configure the DHCP Server 1 through DHCP Server 8 parameters:

- Server 1 through Server 8
- Configure the interface name for each DHCPv6 server by clicking on the Select button in the Zone Index panel. The Select Zone Index - GrplfDhcpv6RelayCfg form opens with a list of local L3 access interfaces and network interfaces.
- Select an interface from the list and click on the OK button. The Select Zone Index - GrplfDhcpv6RelayCfg form closes and the IES Group Interface form refreshes with the interface name.

Note — If you have entered a Unicast address, then the Interface Name parameter is not required.

10 Click on the Anti-Spoofing tab button.

11 Configure the ARP Populate parameter.

12 Click on the Subscriber Management tab button.

13 Configure the parameters:

- SHCV Enabled
- SHCV Interval (minutes)
- SHCV Source
- SHCV Action

Note — The SHCV Interval (minutes), SHCV Source, and SHCV Action parameters are configurable only when the SHCV Enabled parameter is set to enabled.

14 Configure SRRP for the group interface, if required.

i Configure the parameters in the Routing panel:

- Enabled
- Hold Time (seconds)

ii Click on the SRRP tab button.

iii Click on the Create button in the SRRP Instance panel. The SRRP Instance (Create) form opens with the General tab displayed.

iv Configure the parameters:

- SRRP ID
- Description
- Administrative State

v Click on the Select button in the Operational Group panel. The Select Monitored Group Name - SRRP Instance form opens.

vi Select a Monitored Group Name and click on the OK button. The Select Monitored Group Name - SRRP Instance form closes.

vii Configure the Priority Step parameter.

viii Click on the Behavior tab button.

ix Configure the General parameters:

- Gateway MAC Address
- Keep Alive Interval
- Priority
- Preempt
- FIB Population Mode
- One Gratuitous ARP Per SAP

x Click on the Select button in the Message Path panel. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site.

xi Select the SAP you want to use for the in-band messaging between the sites and click on the OK button. The Select Message Path Pointer - SRRP Instance form closes.

xii Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 1 - SRRP Instance form opens.

xiii Select an entry and click on the OK button. The Select Policy Pointer 1 - SRRP Instance form closes.

xiv Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 2 - SRRP Instance form opens.

xv Select an entry and click on the OK button. The Select Policy Pointer 2 - SRRP Instance form closes.

xvi Click on the OK button. The SRRP Instance (Create) form closes and a dialog box appears.

xvii Click on the OK button.

15 Configure ICMP for the group interface, if required.

i Click on the ICMP tab button.

ii Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

16 Configure ARP for the group interface, if required.

i Click on the ARP tab button. The General tab is displayed.

ii Configure the Timeout (seconds) parameter.

iii Click on the Proxy ARP tab button.

iv Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1 through Proxy ARP Policy 5

17 Configure DHCP relay for the group interface, if required.

i Click on the DHCP tab button. The General tab is displayed.

ii Configure the parameters:

- Enable DHCP Relay
- Description
- Match Circuit ID
- Trusted
- Lease Populate
- L2 Header
- Anti-Spoof MAC Address

iii Depending on the type and version of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Select Subscriber Authentication Policy, if required. Otherwise, go to step xiii.

iv Click on the Select button in the Subscriber Authentication Policy panel. The Select Subscriber Authentication Policy - GrpltfDhcpRelayCfg form opens.

v Configure the filter criteria.

vi Click the Search button. A list of subscribers is listed.

vii Select a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - GrpltfDchpRelayCfg form closes, and the IES Group Interface (Create) form refreshes with the subscriber authentication policy name.

viii Configure the parameters:

- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address
- Use as source

Note — The Remote ID String parameter is configurable when the Remote ID is set to Remote IDString.

ix Click on the Select button in the Local User Database panel to choose a local user database. The Select localUserDbPointer - GrpItfDhcpRelayCfg form opens.

x Configure the filter criteria.

xi Click the Search button. A list of available databases appears.

xii Select a database and click on the OK button. The Select localUserDbPointer - GrpItfDhcpRelayCfg form closes, and the IES Group Interface (Create) form reappears with the database name information displayed.

xiii Click on the Server tab button.

xiv Configure the parameters:

- Server 1 to Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

Note — The following parameters are configurable when the Lease Time parameter is set to Specified Time Period.

- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

18 Click on the Client Applications tab button. Configure the Client Applications parameter.

19 Click on the PPP tab button.

20 Configure the Description and Administrative State parameters.

21 Click on the Select button in the PPPoE Policy panel. The Select PPPoE Policy form opens.

22 Select a PPPoE policy from the list and click on the OK button. The Select PPPoE Policy form closes.

23 Click on the Select button in the PPPoE Local User DB panel. The Select PPPoE Local User DB form opens.

24 Select a PPPoE Local User DB from the list and click on the OK button. The Select PPPoE Local User DB form closes.

25 Click on the Select button in the PPP Policy panel. The Select PPP Policy form opens.

26 Select a PPP policy from the list and click on the OK button. The Select PPP Policy form closes.

27 Click on the Select button in the PPP Local User DB panel. The Select PPP Local User DB form opens.

28 Select a PPP Local User DB from the list and click on the OK button. The Select PPP Local User DB form closes.

29 Configure the remaining parameters:

- Session Limit
- Session Limit per SAP

30 Configure the ARP host for the group interface, if required.

i Click on the ARP Host Configuration tab button.

ii Configure the parameters:

- Administrative State
- ARP Host Limit
- Minimum Authentication Interval (minutes)
- SAP ARP Host Limit

31 If you set the parameter LNS to TRUE in step 8, perform the following steps to configure LNS for the group interface.

Note — After you create an LNS group interface, you must configure the L2TP tunnel group profile or L2TP tunnel profile to terminate sessions for the LNS group interface; see Procedure 31-30 for more information. You can also configure the termination of sessions on a group interface using a RADIUS server.

i Click on the LNS tab button.

ii Configure the Description parameter.

iii Click on the Select button in the Default Subscriber Profile panel. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form opens.

iv Select a subscriber profile from the list and click on the OK button. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the Subscriber Profile displayed.

v Click on the Select button in the Default SLA Profile panel. The Select Default SLA Profile (Terminate LNS PPP Sessions) form opens.

vi Select an SLA profile from the list and click on the OK button. The Select Default SLA Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the SLA Profile displayed.

vii Click on the Select button in the Subscriber Identification Policy panel. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form opens.

viii Select a subscriber identification policy from the list and click on the OK button. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the subscriber identification policy displayed.

ix Click on the Select button in the Default Application Profile panel. The Select Default Application Profile (Terminate LNS PPP Sessions) form opens.

x Select a default application profile from the list and click on the OK button. The Select Default Application Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the default application profile displayed.

32 Configure the Default Subscriber Identification String parameter.

33 Click on the Service Access Points tab button to configure SAPs for the group interface.

34 Click on the Create button. The IES Service Access Point (Create) form opens with the General tab displayed.

35 Configure the parameters:

- Name
- Description
- Administrative State
- Calling Station ID

36 Click on the Port tab button.

37 Click on the Select button to choose a port for the SAP. The Select Terminating Port - IES Service Access Point form opens.

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactivate until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 68-25 for more information about deleting MSAPs.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

38 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - IES Service Access Point form closes, and the IES Service Access Point (Create) form displays the port information.

39 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

If the port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. The system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with Q in Q encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

40 Assign ingress and egress QoS policies to the SAP, if required.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once. Choose and right-click the components in the service navigation tree, choose Properties, and configure the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

i Click on the QoS tab button.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID

iii Click on the Select button in the Ingress Policy panel. The Select Ingress Policy - IES Service Access Point form opens.

iv Configure the filter criteria and click on the Search button. A list of available ingress policies appear.

v Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - IES Service Access Point form closes, and the IES L3 Service Access Point (Create) form reappears with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you selected in step 38 has the access ingress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

vi Click on the Select button in the Egress Policy panel. The Select Egress Policy - IES L3 Service Access Interface form opens.

vii Configure the filter criteria and click on the Search button. A list of available egress policies is displayed.

viii Select an egress QoS policy and click on the OK button. The Select Egress Policy - IES Service Access Point form closes, and the IES Service Access Point (Create) form reappears with the egress QoS policy information displayed.

Note — If you select an egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you selected in step 38 has the access egress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

41 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 43.

Note — The Schedulers tab is displayed only if a port is assigned to the SAP earlier in the procedure.

42 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the SAP.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 38 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are displayed only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 38 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - IES Service Access Point form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - IES Service Access Point form closes, and the IES Service Access Point (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Ingress Policer Control Policy form opens.

vi Select a policer control policy and click on the OK button. The Select Ingress Policer Control Policy form closes and the IES Service Access Point (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 38 is an HSMDA port, go to step 43.

viii Click on the Select button in the Select Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - IES Service Access Point form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - IES Service Access Point form closes, and the IES Service Access Point (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Egress Policer Control Policy form opens.

xi Select a policer control policy and click on the OK button. The Select Egress Policer Control Policy form closes and the IES Service Access Point (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 43.

b Specify that an aggregation scheduler policy is applied to the SAP.

Note — You cannot specify an access scheduler policy if the port you selected in step 38 is an HSMDA port. Go to step 43.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - IES Service Access Point form opens.

iii Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - IES Service Access Point form closes, and the IES Service Access Point (Create) form refreshes with the aggregation scheduler information displayed.

43 Assign ingress and egress ACL filters to the SAP, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter from the Select Ingress Filter - IES Service Access Point form.

iii Click on the Select button in the Egress Filter panel to choose an egress ACL filter from the Select Egress Filter - IES Service Access Point form.

44 Click on the Accounting tab button to assign an accounting policy to the SAP.

i Click on the Select button to choose an accounting policy. The Select Accounting Policy - IES Service Access Point form opens.

ii Select an accounting policy and click on the OK button. The Select Accounting Policy - IES Service Access Point form closes, and the IES Service Access Point (Create) form reappears with the accounting policy information displayed.

iii Configure the Collect Accounting Statistics parameter.

45 Click on the Anti-Spoofing tab button to configure anti-spoofing for the SAP. The Anti-Spoofing tab opens with the General tab displayed.

i Configure the Anti-Spoofing parameter.

ii Click on the Static Hosts tab button to configure a static subscriber host entry for each subscriber host that is not managed by DHCP.

iii Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

iv Configure the parameters:

- IP Address
- MAC Address
- Subscriber Identification
- Use SAP ID as Subscriber ID
- ANCP String
- Intermediate Destination ID

v Click on the Select button in the Subscriber Profile panel to choose a subscriber profile for the static host, if required. The Select Subscriber Profile - AntiSpoofingStaticHosts form opens with the list of available subscriber profiles displayed.

vi Select a subscriber profile and click on the OK button. The Select Subscriber Profile - AntiSpoofingStaticHosts form closes, and the subscriber profile name appears in the Subscriber Profile panel.

vii Click on the Select button in the SLA Profile panel to choose an SLA profile for the static host. The Select SLA Profile - AntiSpoofingStaticHosts form opens with the list of available SLA profiles displayed.

viii Select an SLA profile and click on the OK button. The Select SLA Profile - AntiSpoofingStaticHosts form closes, and the SLA profile name appears in the SLA Profile panel.

ix Click on the Select button in the Application Profile panel to choose an application profile for the static host. The Select Application Profile - AntiSpoofingStaticHosts form opens with the list of application profiles on the NE displayed.

x Select an application profile and click on the OK button. The Select Application Profile - AntiSpoofingStaticHosts form closes, and the application profile name appears in the Application Profile panel.

xi Click on the OK button. A dialog box appears.

xii Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes.

46 Assign a DoS protection policy to the SAP, if required.

Note — A default DoS protection policy is automatically assigned to the SAP.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - IES Service Access Point form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - IES Service Access Point form closes and the Policy ID is displayed on the IES Service Access Point (Create) form.

iv Configure the MAC Monitoring parameter.

47 Associate a MEP to the SAP, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

48 If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step 52.

49 Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

50 Click on the AIS tab button.

51 Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

52 Click on the OK button. The MEP (Create) form displays the SAP information.

53 Click on the OK button. The MEP (Create) form closes.

54 Click on the Subscriber Management tab button to configure residential subscriber management on the SAP. The IGMP Host Tracking tab is displayed.

i Click on the Select button to choose the import policy used to filter IGMP packets. The Select SapIgmpHostTracking form opens.

ii Configure the filter parameters and click on the Search button. A list of import policies appears.

iii Choose a policy and click on the OK button. The selected import policy name appears.

iv Configure the parameters:

- Expiry Time
- Max Number of Groups
- Max Number of Sources per Group
- Disable Router Alert Check

v You can click on the Host Tracking Info tab button to view a list of hosts that are being tracked on this service access point.

vi Click on the Profiles tab button.

vii Configure the parameters:

- Admin Status
- Service Model
- Subscriber Limit
- Default Subscriber Identification Type
- Default Subscriber Id
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id
- Profiled Traffic only
- Non-Subscriber Traffic Identification

viii Click on the Select button in the Default Subscriber Profile panel to choose a default subscriber profile for the SAP, if required. The Select Default Subscriber Profile form opens with the list of available subscriber profiles displayed.

ix Select a subscriber profile and click on the OK button. The Select Default Subscriber Profile form closes, and the subscriber profile name appears in the Default Subscriber Profile panel.

x Click on the Select button in the Default SLA Profile panel to choose a Default SLA profile for the SAP, if required. The Select Default SLA Profile form opens with the list of available SLA profiles displayed.

xi Select an SLA profile and click on the OK button. The Select Default SLA Profile form closes, and the SLA profile name appears in the Default SLA Profile panel.

xii Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy for the SAP, if required. The Select Subscriber Identification Policy form opens with the list of available subscriber identification policies displayed.

xiii Select a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy form closes, and the subscriber identification policy name appears in the Subscriber Identification Policy panel.

xiv Click on the Select button in the Default Application Profile panel to choose a default application profile for the SAP, if required. The Select Default Application Profile form opens with the list of application profiles on the NE displayed.

xv Select an application profile and click on the OK button. The Select Default Application Profile form closes, and the application profile name appears in the Default Application Profile panel.

xvi Click on the Select button in the Non-Subscriber Traffic Subscriber Profile panel to choose a non-subscriber subscriber profile for the SAP, if required. The Select Non-Subscriber Traffic Subscriber Profile form opens with the list of available subscriber profiles displayed.

xvii Select a subscriber profile and click on the OK button. The Select Non-Subscriber Traffic Subscriber Profile form closes, and the subscriber profile name appears in the Non-Subscriber Traffic Subscriber Profile panel.

xviii Click on the Select button in the Non-Subscriber Traffic SLA Profile panel to choose a Non-Subscriber Traffic SLA profile for the SAP, if required. The Select Non-Subscriber Traffic SLA Profile form opens with the list of available SLA profiles displayed.

xix Select an SLA profile and click on the OK button. The Select Non-Subscriber Traffic SLA Profile form closes, and the SLA profile name appears in the Non-Subscriber Traffic SLA Profile panel.

xx Click on the Select button in the Non-Subscriber Traffic Application Profile panel to choose a non-subscriber traffic application profile for the SAP, if required. The Select Non-Subscriber Traffic Application Profile form opens with the list of application profiles on the NE displayed.

xxi Select an application profile and click on the OK button. The Select Non-Subscriber Traffic Application Profile form closes, and the application profile name appears in the Non-Subscriber Traffic Application Profile panel.

55 Assign an ANCP policy to the SAP, if required.

i Click on the ANCP Static Map tab button.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

56 Configure ATM on the SAP, if required.

i Click on the ATM tab button.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Select an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the IES Service Access Point (Create) form refreshes with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Select an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the IES Service Access Point (Create) form refreshes with the egress ATM policy information displayed.

57 Modify PPPoE Sessions that have been generated by the NE, for the group interface, if required. See chapter 68 for more information about viewing and configuring a PPPoE session.

58 Click on the OK button. The IES Service Access Point (Create) form closes, and a dialog box appears.

59 Click on the OK button. The IES Group Interface (Create) form refreshes to display the SAP.

60 To configure additional SAPs in the group interface, go to step 34.

61 Click on the OK button. The IES Group Interface (Create) form closes, and a dialog box appears.

62 Click on the OK button. The IES Service (Edit) form refreshes to display the SAP below the group interface.

63 Click on the OK button. A dialog box appears.

64 Click on the Yes button. The IES Service (Edit) form closes.

65 Close the Manage Services form.

Procedure 73-9 To configure a GNE site on an IES service

Use this procedure to add a GNE site and GNE service interfaces to an existing IES service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select an IES service and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on IES Service and choose Create GNE Site. The Select Network Elements - IES Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

i Click on the GNE Service Interfaces tab button and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

ii Configure the parameters:

- Name
- Description
- Type

iii Click on the Ports tab button and then click on the Select button next to the Interface Index field. The Select Generic NE Interface form appears.

iv Select an interface from the list and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

v Configure the parameters:

- Encap Type
- Outer Encapsulation Value
- Inner Encapsulation Value

vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab button to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The IES (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The IES (Edit) form closes.

You can use the topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 73-10 To implement dual homing using SRRP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Specify the pair of sites that are to participate in dual homing.

Note — The sites can be from different services.

5 Ensure that the pair of sites each contains a properly configured subscriber interface and SAPs underneath the group interface that will be participating in the redundant configuration.

6 Ensure that all subscriber interface IP addresses have a gateway address configured on them.

7 Create the Redundant Interface (used for SRRP out-of-band messaging) between the two routers.

i On the navigation tree, click on the site; expand the entries for that site.

ii Right-click on the Redundant Interfaces item for one site of the redundant pair, and choose Create Redundant Interface. The Redundant Interface (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

iv Click on the Addresses tab button.

v Click on the Create button. The IP Address (Create) form opens.

vi Specify IP addresses for the redundant interface on the current and remote sites. Configure the parameters:

- Address ID
- IP Address (in the form d.d.d.d, where d is a value from 0 to 255)
- Prefix Length
- Remote IP Address
  This must be on the same subnet as the current site's redundant interface IP Address. For example, if the current site's IP Address is 7.7.7.7, with a Prefix Length of 24, then the remote site's redundant interface address must be 7.7.7.d, where d is a value from 0 to 255, excluding 7.
- Broadcast Address Format

vii Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

viii Click on the OK button. The Redundant Interface (Create) form reappears with the assigned redundant interface IP addresses displayed.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Redundant Interface (Create) form for the current site closes.

8 Create an SDP spoke binding between the current and remote sites. The Source Interface is the Redundant Interface you created in step 7 and the Tunnel Termination SIte is the remote site. The Return Tunnel must come from the remote site.

9 Assign the Redundant Interface to the Group Interface for the current site.

i On the navigation tree under Subscriber Interfaces, right-click on the group interface you want to use and choose Properties. The IES Group Interface (Edit) form opens with the General tab displayed.

ii Click on the Select button in the Redundant Interface panel. The Select Redundant Interface - IES Group Interface form opens.

iii Configure the list filter parameters if required and click on the Search button. A list of redundant interfaces on the site appears at the bottom of the form.

iv Select the Redundant Interface you created in step 7 and click on the OK button. The Select Redundant Interface - IES Group Interface form closes and the interface you selected appears in the Redundant Interface field.

v Click on the OK button. The IES Group Interface (Edit) form closes.

10 Create an SRRP Instance for the current site.

i On the navigation tree under group interfaces, right-click on the SRRP Instances item for the current site, and choose Create SRRP Instance. The SRRP Instance (Create) form opens with the General tab displayed.

ii Configure the parameters:

- SRRP ID
  The SRRP ID must be the same value for both the current and remote sites.
- Description
- Administrative State

iii Click on the Behavior tab button.

iv Configure the parameters:

- Gateway MAC Address
- Keep Alive Interval
- Priority
- FIB Population Mode

v Configure the message path by clicking the Select button in the Message Path panel. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site.

vi Select the SAP you want to use for the in-band messaging between the sites.

- **vii** Click on the OK button. The Select Message Path Pointer - SRRP Instance form closes.
- **viii** Configure policy pointer 1, if required, by clicking the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 1 - SRRP Instance form opens, displaying the pointers available on the site.
- **ix** Select the pointer you want to use.
- **x** Click on the OK button. The Select Policy Pointer 1 - SRRP Instance form closes.
- **xi** Configure policy pointer 2, if required, by clicking the Select button in the Policy Pointer 2 panel. The Select Policy Pointer 2 - SRRP Instance form opens, displaying the pointers available on the site.
- **xii** Select the pointer you want to use.
- **xiii** Click on the OK button. The Select Policy Pointer 2 - SRRP Instance form closes.
- **xiv** Click on the OK button. The SRRP Instance (Create) form closes, and a dialog box appears.
- **xv** Click on the OK button. The IES (Edit) form reappears with the SRRP Instance displayed.

11 Click on the Turn Up button to activate the SRRP instance.

12 Repeat steps 7 to 11 for the remote site.

Note 1 — When you repeat steps 7 to 11 for the remote site, that site becomes the current site and the previously configured site is the remote site.

Note 2 — After the two sites have been properly set up, you can examine the SRRP peer associations at any time by right-clicking an SRRP Instance in the service's navigation tree. This opens the SRRP Instance - Edit form, which contains a read-only field called SRRP Peer. The Site ID, Service ID, and Operational State of the associated peer appear in this field.

You can also examine the state of an SRRP Instance by checking the Operational Flags field. The flags indicate specific problems that might occur with the SRRP Instance, as follows:

- Duplicate Subscriber IF Address: one of the local subscriber IP addresses is the same as a subscriber IP address on the remote node.
- Redundant Interface Mismatch: the local SRRP instance and remote SRRP instance have mismatched redundant interfaces.
- SAP Mismatch: the local SRRP instance is backing a different set of SAPs than the peer.
- Subnet Mismatch: one of the subnets that SRRP is backing up does not have a match with the peer.
- Dual Master: both SRRP instances are master at the same time.
- SAP Tag Mismatch: the local SRRP instance is backing a set of SAPs with different remote and local tags.
- SRRP ID Mismatch: the peer has a different SRRP instance ID backing the same subnet.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The IES (Edit) form closes.

Procedure 73-11 To view the service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a service and click on the Properties button. The IES Service (Edit) form opens.

4 View the Aggregated Service Site Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab button to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab button to view the alarms for the object. The Object Alarms tab is displayed.

7 Click on the Aggregated Alarms tab button to view the aggregated alarms for the object. The Aggregated Alarms tab is displayed.

8 Close the IES Service (Edit) form.

9 Close the Manage Services form.

Procedure 73-12 To view the service topology

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Topology View button. A Topology View dialog box appears.

4 Click on the Yes button to proceed. The Service Topology - map opens.

See chapter 5 for more information about service topology views.

Procedure 73-13 To modify an IES

Caution — Modifying parameters can be service-affecting.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

The following tabs list the service elements that can be individually or collectively selected and configured:

- General tab — displays general customer and service information
- Sites tab — lists the sites that are included in the service
- L3 Access Interfaces tab — lists the L3 access interfaces that are included in the service
- Spoke SDP Bindings tab — displays the spoke SDP bindings that are associated with the service
- Addresses tab — lists the IP addresses that are associated with the service

  Note — You cannot remove an IP address from an interface when the IP address of a static host is defined in the subnet of the interface IP address and the ARP Populate parameter is enabled on the Anti-Spoofing tab.

- Subscriber Interfaces tab — allows the creation and configuration of subscriber and group interfaces for L3 aggregation
- Redundant Interfaces tab — allows the creation and configuration of redundant interfaces
- Template tab — displays the template used to create the service, if applicable.
- Faults tab — displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Modify the parameters for the service, as required.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The IES Service (Edit) form closes, and the Manage Services form reappears.

7 Click on the Close button to close the Manage Services form.

Procedure 73-14 To modify an IES using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select an IES and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains two sub-procedures describing the components that can be created and modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating spoke SDP bindings. Go to step 9.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the Create IES Site option.

The Select Network Elements form appears.

5 Select one or more sites to add to the service and click OK. The IES Site (Create) form for the new site is displayed. If you selected more than one site, the IES Site (Multiple Instances) (Create) form for the new sites is displayed.

6 Click on OK. The IES Site (Create) (or IES Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

7 If you want to perform detailed configuration of site properties for the new site, right-click the site icon and select Properties from the contextual menu. The Site (Edit) form opens. Refer to Procedure 73-1 for detailed site configuration information.

8 Go to step 9 if you want to create spoke SDP bindings or go to step 16 to finish.

Creating spoke SDP bindings

9 Select the sites you want to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note — When you create a spoke binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

10 Select Connect from the contextual menu and choose the Create Spoke SDP Binding option.

The Spoke SDP Binding (Create) form is displayed.

Note — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

11 Enable the Auto-Select Transport Tunnel parameter.

12 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedure 73-6 for more detailed information on creating and configuring spoke SDP bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

13 Assuming that the spoke SDP binding was successfully created in step 12, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a spoke binding for the return tunnel.

14 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

15 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

16 Close the Service Topology form.

17 Close the Manage Services form.

Procedure 73-15 To delete an IES

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

  a For services with a low priority, go to Step 5.

  b For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.

  c For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

74 — VPRN service management

74.1 VPRN service management overview

The 5620 SAM supports the creation of VPRN services using the 7450 ESS in mixed mode, 7750 SR and 7710 SR as a PE and provider core (P) router. VPRNs, also called IP VPNs or BGP/MPLS VPNs, are defined in RFC 2547bis. This standard describes a method of forwarding data and distributing routing information across an IP/MPLS service provider core network.

The 5620 SAM does not support the configuration of CE routers or devices.

VPRN services use BGP to exchange the VPRN routes among the PE routers that participate in the VPRN. This is done in a way that ensures that routes from different VPRNs remain distinct and separate, even if two VPRNs have an overlapping address space. PE routers distribute routes to CE routers in the VPRN. Since the CE routers do not peer with each other, there is no overlay visible to the VPRN's routing algorithm. The PE routers use BGP, RIP, or OSPFv2 as the IGP to distribute internal routes to the CE routers.

Each route in a VPRN service is assigned an MPLS label. When BGP distributes a VPRN route, it also distributes an MPLS label for that route. Before a customer data packet travels across the backbone network, it is encapsulated with the MPLS label that corresponds, in the customer VPRN, to the route that best matches the destination address of the packet.

The MPLS packet is further encapsulated with either another MPLS label or with an IP or GRE tunnel header, so that it gets tunneled across the backbone to the proper PE router. Each route exchanged by the MP-BGP protocol includes an RD that identifies the VPRN association. Thus the backbone core routers do not need to know the VPRN routes.

The 5620 SAM supports end-to-end VPRN configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Pre-configured template. A user that is assigned the template management role can create a service template. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

The 5620 SAM supports the configuration in a VPRN of an L3 aggregation mechanism called routed CO. Routed CO uses DHCP relay to manage dynamic subscriber hosts; the network resources for static subscriber hosts are explicitly provisioned. Routed CO supports all residential subscriber management functions of the 5620 SAM. See chapter 68 for more information about residential subscriber management and routed CO.

Routed CO uses a subscriber interface that defines up to 256 subnets. A subscriber interface has child objects called group interfaces. A group interface supports the configuration of multiple SAPs as child objects. A SAP in a group interface supports all residential subscriber management functions. A group interface does not allow the specification of IP subnets or addresses, but inherits the addressing scheme of the parent subscriber interface. The 5620 SAM service topology map displays VPRN subscriber interfaces, group interfaces, and the associated SAPs.

You can configure Network Address Translation, or NAT, for dynamic subscriber hosts in a routed CO deployment. NAT implementation in a VPRN service requires a NAT configuration on the VPRN routing instance and a NAT policy that is associated with a subscriber profile. See chapter 30 for general information about configuring and deploying NAT. See chapter 46 for information about configuring a NAT policy. See chapter 68 for information about associating a NAT policy with a subscriber profile. See Procedure 74-1 for information about configuring NAT on a VPRN routing instance.

A VPRN routed CO allows a service provider to resell wholesale carrier services while providing direct DSLAM connectivity. You can create a VPRN service for the retailer and also define subscriber access and configuration information for the retailer network. See Procedure 74-13 for more information on how to define a wholesale and retail VPRN configuration.

IPCP extensions allow you to configure IP addresses and DNS names of remote devices to enable inter-operability with other networks. Specifically setting an IPCP extension is necessary to connect to a mobile service provider network. Routers for mobile services rely on other network routers to provide IP addresses and DNS names (primary and secondary) for a PPP link.

When an IPCP extension is configured, an edge device configured with PPP/MLPPP can signal a far end device.

The General tab of the 5620 SAM service management form displays useful information about the operational state of the service and its sites through the Aggregated Operational State and State Cause indicators.

The 5620 SAM provides OAM tools for service validation and for troubleshooting service and network transport issues. You can run an OAM Validation test suite for the service by clicking on the More Actions > Validate button. If a check mark appears beside the OAM Validation Failed state cause indicator, the test has failed. The Validation Result tab on the Tests tab displays detailed information about the OAM test result. See chapter 38 for general information about fault management using OAM tools. See chapter 78 for more information about how to configure OAM validation test suites.

The Aggregated Operational State indicator has four possible values: Up, Down, Partially Down, and Unknown. The value is derived from the operational states of the sites that are part of the service, as follows:

- Up—all sites are operationally up
- Partially Down—at least one site is operationally down
- Down—all sites are operationally down
- Unknown—the service has no provisioned sites

When the Aggregated Service Site Operational State is Partially Down or Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator. You can view alarms on the Faults page.

When the Aggregated Operational State is Partially Down or Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default Service Tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology views. See chapter 76 for more information about the hierarchical organization of composite services.

Common to all device services, such as VPRN, are policies that are assigned to the service. Policies are defined at a global level and can then be applied to components of the service, such as interfaces or circuits, when the service is configured or modified. The following policies are common to all device services:

- QoS policies define ingress classification, policing, shaping, and marking on the ingress side of the interface. QoS policies are configured using the Access Ingress Policy form, the Access Egress Policy form, and the ATM QoS Policy form.
- Policer control policies to control access ingress policers and access egress policers under a common hierarchy. Policer control policies are configured using the Policer Control Policy Manager.
- Scheduling policies define hierarchical rate limiting and scheduling to govern the scheduling of queues. Scheduler policies are configured using the Scheduler Policy and HSMDA Scheduler Policy forms.
- Port scheduler policies define hierarchical bandwidth allocation and scheduling at the egress port level. Port scheduler policies are configured using the Port Scheduler Policy form.
- Filter policies control network traffic into or out of an interface or circuit based on IP or MAC matching criteria. Filter policies are configured using the ACL IP Filter form and the ACL MAC Filter form.
- Accounting policies measure the traffic on a service to ensure proper billing and enforcement of SLAs. Accounting policies are configured using the Accounting Policy form.
- ANCP policies provide status and control information based on port-up and port-down messages and current line rate changes between the edge device and the access node. ANCP policies are configured using the Manage Subscriber Policies form.
- Routing policies control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination. Routing policies are configured using the Routing Policy Manager.

See chapter 46 for more information about policies.

VPRN service routers

A VPRN service consists of CE routers or devices connected to PE routers. PE routers connected to P routers transport data across the IP/MPLS provider core network in service tunnels.

Packets that arrive at an edge 7450 ESS, 7710 SR or 7750 SR are associated with a VPRN service based on the access interface on which they arrive. An access interface is uniquely identified by the following parameters:

- physical Ethernet port or POS port and channel
- encapsulation type
- encapsulation identifier (if required)

Table 74-1 describes the general functions performed by PE, P, and CE routers in a VPRN. See Figure 74-4 in this chapter for a sample VPRN. See the appropriate hardware services guide for more detailed information about VPRN functionality on the supported managed devices.

Table 74-1 VPRN router functionality

Router type	Functionality
PE	• Are directly connected to PE, CE, and P routers • Learn VPRN routes from CE devices using e-BGP, RIP, OSPFv2, or static routes • Maintain a separate routing table, called a VRF, for each service • Exchange multicast VPRN route information with PE routers in other autonomous systems using MP-BGP • Distribute MPLS inner labels using MP-BGP. Before data traverses the IP/MPLS backbone, it is encapsulated with the MPLS label that corresponds, within the VPRN, to the route that best matches the packet's destination address. • Distribute MPLS outer labels using RSVP-TE or LDP. Before the MPLS packet traverses the IP/MPLS backbone, it is further encapsulated with either another MPLS label or with a GRE or MPLS LSP service tunnel header, so that it is tunneled across the backbone to the appropriate PE router. • Use RDs to identify the VPRN associations • Use RTs to determine when a received route is destined for a VPRN • Terminate RFC 2684-encapsulated IPv4 traffic from ATM access network on SAPs
P	• Are directly connected to PE and P routers • Act as transit LSRs • Maintain routes to PE routers and are unaware of specific VPRN routing information
CE	• Are directly connected to PE routers • Provide customer access to the VPRN

Inter-AS connections

You can connect VPRN service sites (or VRFs) on multiple ASs using EGBP. ASs set up mutual connections by exchanging routing information, such as routes and labels. Labeled VPN-IPv4 routes are distributed within an AS on a PE router using IGBP and between ASs using EGBP on an ASBR. The ASBR redistributes VPN-IPv4 routes to an ASBR in another AS, which in turn distributes the routes to PE routers in its own AS or to an ASBR.

When a VPRN inter-AS connection is between two service providers, the ASs must be on private peering points. For an LSP to operate between ASBRs on the AS borders, EBGP peering must be set up between the ASBRs and MPLS label exchange must be supported. Furthermore, an LSP must run from a packet's ingress PE router to its egress PE router.

You can enable inter-AS connections from the BGP settings in Procedure 74-5.

MP-BGP Multicast IPv4

The MP-BGP multicast extension allows for a network topology that supports both multicast and unicast routing. Routes from the unicast routing table can be imported into the multicast routing table, and routes from the multicast routing table can be imported into the unicast routing table. An ASBR can be configured to advertise VPRN routes to peers in other ASs, redistributing unicast routes learned by BGP into MP-BGP routes, and MP-BGP routes into unicast routes. This configuration enables the support of the two sets of routing information.

The MP-BGP multicast extension specifies that BGP can exchange routing information for the multicast IPv4 address family within and between BGP ASs. All configurations entered in a multicast IPv4 address family for a BGP instance affect multicast services and are applied to the multicast routing table. See chapter 31 for more information about the configuration of BGP and the MP-BGP multicast extension.

IPv6 support

The 5620 SAM supports IPv6 configuration of the following functions in VPRN services on the 7710 SR and 7750 SR, and on the 7450 ESS in mixed mode:

- addressing for static routes, L3 access interfaces, and BGP peerings
- router advertisement, ICMP, DHCP, neighbor discovery, and ACL filtering

To configure IPv6 in a VPRN, you must first enable VPN IPv6 for BGP on the base routing instance of each device that acts as a site in the VPRN.

A customer can use an SNMP utility to manage the IPv6 objects in a VPRN service. SNMP mediation of VPRN objects requires the configuration of a community string on each site in the VPRN, regardless of the IP or SNMP version. SNMPv3 mediation of VPRN IPv6 objects, however, requires the additional configuration of an SNMP context for the VPRN using a CLI. See chapter 14 for information about configuring an SNMPv3 context for a VPRN.

PIM for VPRN

The PIM protocol can be applied to a VPRN service to create a private multicast distribution network. PIM uses an MDT group address to identify multicast traffic for the VPRN instance to prevent flooding of multicast packets to PE devices in the VPRN. VRFs with the same MDT address are members of that group and receive multicast traffic from each other. The MDT address cannot be in the SSM range.

By default, the PIM protocol only uses the information in the unicast routing table to determine the RPF interface. PIM can be configured to use the separate multicast and unicast routing tables built by MP-BGP to perform RPF lookups for multicast-capable sources to build and maintain distribution trees for multicast traffic forwarding. See chapter 31 for more information about configuring PIM to use multicast or unicast routing tables in RPF lookups.

Data-MDT

A data-MDT is a tunnel for high-bandwidth source traffic through the P-network to interested PE routers. Data-MDTs do not broadcast customer multicast traffic to all PE routers in a multicast domain.

Note — Data-MDTs are only supported for VPRN services.

Multicast data transmission from a CE router is typically delivered to all CE routers in the same multicast group. Some CE routers do not require the delivery of a specific multicast stream because there no downstream receivers for the multicast group. You can prune a PE router from the MDT if the router does not deliver multicast traffic to the attached CE routers. This task is beneficial for high-traffic multicast applications.

A data-MDT allows you to configure a traffic threshold in Kb/s. The 5620 SAM signals the data-MDTs when the bandwidth for the SSM group exceeds the configured threshold. The PE router sends an MDT join TLV, at 60 s intervals, over the default MDT to all PE routers. The routers respond with the following actions:

- PE routers that require the SSM group specified in the MDT join TLV; join the data-MDT used by the PE router to transmit the SSM group
- PE routers that do not require the SSM group specified in the MDT join TLV; do not join the data-MDT, pruning the PEs from the MDT

The transmitting PE router switches the multicast stream to the data-MDT after allowing the PE routers to join the data MDT. You can configure the data-MDT delay interval using the 5620 SAM.

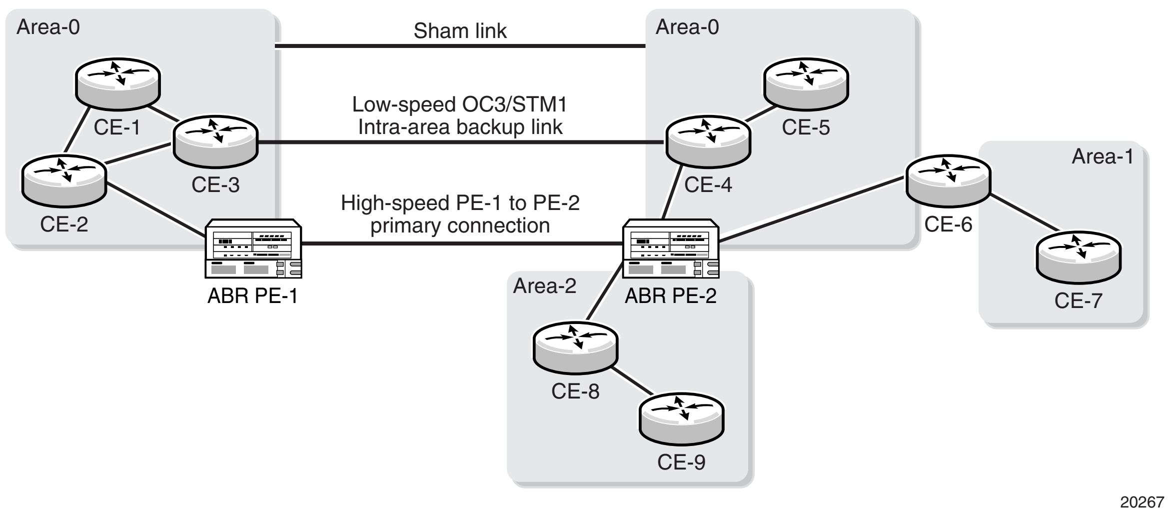
The PE router stops sending the MDT join TLV when the transmission bandwidth no longer exceeds the configured threshold. The PE routers using the data-MDT leave the group and transmission resumes over the default MDT.

OSPF sham link support

You can use the OSPF protocol to connect CE routers to PE routers over an MPLS VPN backbone. This can be useful for customers who subscribe to a VPN service and want to use OSPF as their intra-site routing protocol to exchange routing information between their sites. However, there is a potential configuration issue associated with this approach.

OSPF PE-CE connections assume that the only path between two client sites is across the MPLS VPN backbone. OSPF treats a link through a Layer 3 VPN as an inter-area link. However, other paths between VPN sites may also exist. For example, in Figure 74-1, the link between CE-3 and CE-4 (two CE routers in the same OSPF area) might be a low-speed OC3/STM1 intra-area backup link. OSPF preferentially utilizes intra-area links over inter-area links, and since it establishes an intra-area route connection between CE-3 and CE-4, the potentially high-speed PE-1 to PE-2 primary connection is not utilized.

Figure 74-1 Sham link configuration example



OSPF sham links can be created to resolve this problem. By creating and configuring a sham link as an intra-area link between PE-1 and PE-2, a normal OSPF adjacency is formed, and the link-state database is exchanged across the MPLS VPN. As a result, the desired intra-area connectivity is created between PE-1 and PE-2. In addition, the cost of the CE-3/CE-4 and PE-1/PE-2 links can be managed by the use of a numerical metric. You could then configure the service so that the CE-3/CE-4 link becomes a standby link only in event that the VPN fails.

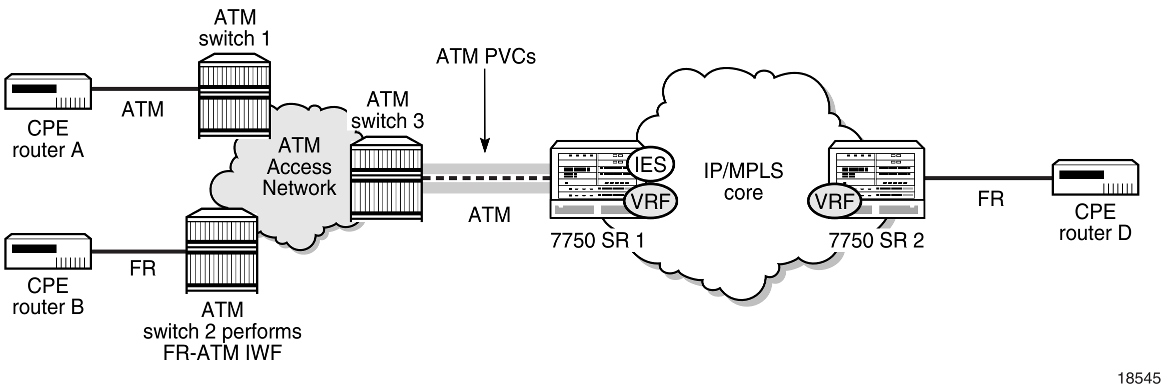
The use of OSPF sham links in the VPRN context is only applicable to 7450 ESS, 7710 SR and 7750 SR nodes.

ATM SAP terminations for VPRN

CE routers that have access to an ATM network can connect with a VPRN using ATM SAP terminations on a 7750 SR or 7710 SR. The interconnection between ATM point-to-point and L3 services uses RFC 2684-encapsulated IPv4 traffic over an ATM PVC that terminates on a specially configured SAP. All RFC 2684-encapsulated traffic can be routed over ATM networks, frame relay, or directly through ATM connections.

Figure 74-2 shows how CPE Router A in an ATM network can access L3 IP services, such as a VPRN, using a statically configured ATM PVC on a 7750 SR (SR#1). A SAP is configured on SR #1 to serve a specific VPRN as identified by the VRF. Destination CPE router D can receive RFC 2684-encapsulated traffic over an IP network through a Frame Relay over 7750 SR 2.

Figure 74-2 ATM SAP network connection to a VPRN



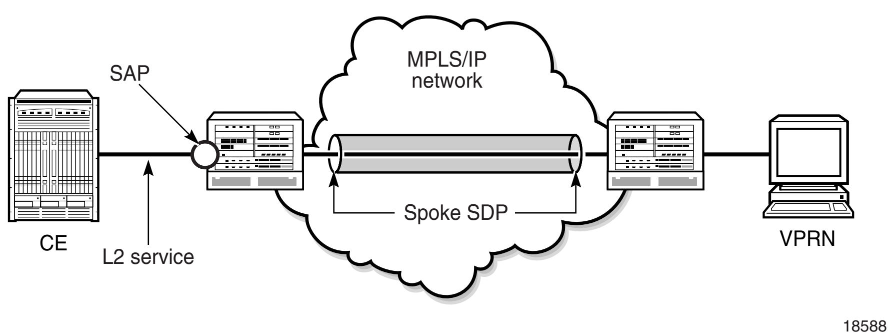
The two connection methods used between ATM and VPRN, which appear in 5620 SAM as AAL5 Encapsulation parameters: LLC/SNAP encapsulation and VC-multiplexing.

Epipe SDP spoke termination on VPRN services

A VLL Epipe service can terminate directly on a VPRN service using an SDP spoke on the 7750 SR, 7450 ESS, or 7710 SR. Traffic that terminates on a VPRN service is identified by the interface ID of the SDP on the L2 access router and the VC ID label in the service packet. All routing protocols supported by VPRN are also supported for spoke SDP termination.

Figure 74-3 shows a spoke SDP terminating directly on a VPRN. The spoke SDP could be tied to an Epipe or VPLS. No configuration is required for the CE-to-PE connection on the SAP.

Figure 74-3 SDP spoke termination on an L2 service



Routed CO dual homing using SRRP

Subscriber Router Redundancy Protocol (SRRP) allows two separate connections to an access NE such as DSLAM to operate in an active/standby configuration similar to the way in which VRRP interfaces operate. SRRP is a collection of functions and messaging protocols that allows a system to create a set of redundant gateway IP addresses that are shared by a local and remote NE.

Each SRRP instance is created within the context of a subscriber group IP interface and is identified by a unique SRRP instance ID, which must be unique within the NE. This SRRP instance controls the redundant routing for all subscriber subnets configured or associated with the group interface. One SRRP instance is supported for each group interface and the SRRP ID must be the same as the SRRP instance ID on the group IP interface on the redundant NE.

A subscriber subnet redundant gateway IP host address is assigned at the subscriber IP interface level and is used for each SRRP instance associated with the subscriber subnet. The redundant IP host address must be configured for a subscriber subnet before it can be associated with an SRRP instance.

When SRRP is active on a group interface, the SRRP instance advertises to a remote NE using in-band messaging on the group-interface SAPs and out-of-band messaging on the group-interface redundant interface. If the remote NE uses the same SRRP instance ID, one NE enters a master state, while the other NE enters a backup state. Since the NEs share a common SRRP gateway MAC address (used for the SRRP gateway IP address and for proxy ARP functions), either NE can act as the default gateway for the attached subscriber hosts. This functionality helps to preserve subscriber QoS enforcement. The master state allows routing to and from the subscriber hosts associated with the group IP interface. The backup state stops ingress forwarding for packets destined to the SRRP gateway MAC and causes all packets destined to subscriber hosts on the group IP interface to be forwarded to a redundant IP interface associated with the group IP interface.

Normally, when anti-spoofing is enabled on a group-interface SAP, the SAP drops SRRP packets because they do not contain a subscriber MAC or IP address. However, you can use a configuration option to enable anti-spoofing for subscriber hosts on a group-interface SAP that participates in SRRP advertisements.

The underlying mechanism that controls state transitions is based on a dynamic priority level that an SRRP instance maintains. The SRRP instance with the highest priority level assumes the master operating state. An SRRP instance with a higher current priority level always preempts an SRRP instance with a lower priority level. If the priority levels are equal, the SRRP instance with the lowest source SRRP host IP address assumes the master state. The local SRRP instance priority may also be controlled by associating the instance with an existing VRRP policy.

To prevent a flood of AccessInterfaceDown alarms that an SRRP fault or link failure may generate for LAG-based MSAPs, the 5620 SAM performs alarm suppression. See chapter 68 for more information.

The redundant IP interface is a special interface that connects two systems with one or more common SRRP instances. The interface is configured with a /31 address and a spoke SDP binding, creating an Ethernet pseudowire shortcut between the redundant NEs. When the SRRP instance is in backup state, the group interface associated with this instance is not allowed to forward or route traffic downstream towards the subscriber. As a result of this, the packets are shunted across the redundant interface so that the active group interface does the forwarding or routing.

If the redundant IP interface goes down, the system allows the group IP interfaces associated with the down interface to forward locally downstream, when they are in the backup SRRP state. While forwarding downstream in the backup state, the system uses the MAC address associated with the group IP interface, not the SRRP redundant gateway MAC address.

SRRP is supported on the 7450 ESS in mixed mode, 7710 SR and 7750 SR.

DoS protection

The 7450 ESS-7, 7450 ESS-12, 7750 SR-7, and 7750 SR-12 support DoS protection policies.

To protect a VPRN from a high incoming packet rate that characterizes a DoS attack, you can use the 5620 SAM to create DoS protection policies for the VPRN L3 access interfaces. A DoS protection policy limits the number of control-plane packets that an interface receives each second, and optionally logs a violation notification if a policy limit is exceeded. You can use the NE System Security form to view the violations for a specific NE.

You can configure a DoS protection policy to control the following on a VPRN L3 access interface:

- the control-plane packet arrival rate per subscriber host on the interface
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

Each VPRN L3 access interface on an NE that supports DoS protection is automatically assigned a default DoS protection policy. This default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified. See Procedure 21-3 for information about creating a DoS protection policy.

Local DHCP servers

The 5620 SAM supports configuring local DHCP servers on the 7710 SR and 7750 SR, and on the 7450 ESS. The local DHCP server leases IP addresses to clients in the network. Options are configured to define the IP address properties, such as, the length of time an IP address is active and which DNS server must be used. A local user database is used to authenticate and authorize clients requesting IP addresses from the local DHCP server. If the local DHCP server does not use the local user database, the server can use the GI address to assign free IP addresses, however it is not possible to configure match or authentication parameters.

Three applications are targeted for the Local DHCP server.

- Subscriber aggregation in a single node or TPSDA.
- Business services running VPRN and locally attached to the host can request and obtain IP addresses directly from the server.
- The DHCP server identifies an IP request from a PPPoE client and provides an IP address and options.

DHCP servers can be integrated with Enhanced Subscriber Management for DHCP and PPPoE clients. A local DHCP server can be created in the routing instance window or VPRN service site window. A local DHCP server created in the VPRN service site can be associated with the L3 access interface on a VPRN service only. A local DHCP server created in the routing instance window can be associated with a network interface or L3 access interface on IES.

Local user database

The 5620 SAM supports the configuration of a local user database on the 7710 SR and 7750 SR, and on the 7450 ESS. The local database is configured and associated with the local DHCP server to provide local authentication. The local DHCP server must have a pool of IP addresses configured, otherwise it is not able to lease IP addresses.

A create local user database configuration form is available from the Manage Residential Subscribers form. After a local user database is configured, it can be associated with a local DHCP server and PPPoE configurations on group interfaces.

When a local user database is not configured, you can use GI addresses to access free IP addresses, however the clients requesting the IP address are not authenticated.

PPPoE protocol on VPRN services

A VPRN service can be configured to run PPPoE protocol. PPPoE is used in subscriber networks to encapsulate PPP frames inside Ethernet frames. PPPoE combines the point-to-point protocol used with DSL sessions with the Ethernet protocol used to support multiple subscribers in a local area network. From the group interface configuration form you can assign a PPPoE policy and a local user database to authenticate PPPoE subscribers.

PPPoE termination in a business VPRN environment is also supported. This ability targets applications such as PPPoE VPRN with IP overlap, where there are two participants in the service:

- The “Wholesale VPRN”, which is a VPRN that provides access to the SAP.
- The “Retail VPRN”, which is a business VPRN that routes the packets belonging to the PPPoE sessions terminating in it. The Retail VPRNs may have overlapping IP addresses.

In this configuration, the PPPoE subscriber host terminates in a Retail VPRN and provides a routed path to the customer site. The VPRN service-id that carries it is determined by the service configuration, specifically:

- If a local user database is used, the Retail Service ID property that you specify in the PPPoE host configuration provides a reference to the VPRN service-id that should be used.
- If RADIUS is used for authentication, the retailer service-id is provided by an Alcatel-Lucent VSA.
- If MSAP is used, the SAP is created in the wholesale VPRN using the information from RADIUS.

The PPPoE session is negotiated with the parameters defined by the Wholesale VPRN interface. Since the IP address space of the subscriber management host may overlap between VPRN services, the node anti-spoofs the packets at access ingress with the session-id.

L2TP on VPRN services

The 5620 SAM supports the configuration of L2TP on a Release 8.0 or later 7710 SR or 7750 SR, and on the 7450 ESS in mixed mode. L2TP is a session-layer protocol that extends the PPP model by allowing L2 and PPP endpoints to reside on different devices that are interconnected by a PSN. L2TP extends the PPP sessions between the CPE and PPP/L2TP termination points on the L2TP network server (LNS), via an intermediate L2TP access concentrator (LAC). The LAC is the initiator of session-generated L2TP tunnels; the LNS is the server that waits for new tunnels. Manually configured and initiated L2TP tunnels can be initiated or stopped from either the LNS or LAC.

At least one ISA-LNS group must be configured for the LNS NE.

On an LNS NE, L2TP destinations configured for L2TP tunnel profiles can include the following:

- loopback L3 access interfaces for a VPRN or IES service
- loopback interfaces configured for a base routing instance

Note — On a Release 7.0 7750 SR that acts as an LAC NE, each L2TP tunnel must have the local IP address set to the system interface IP address.

See chapter 18 for more information about ISA-LNS groups. See Procedure 18-7 for information about how to create and configure an ISA-LNS group. See chapter 31 for more information about L2TP.

See Procedure 74-1 for information about enabling L2TP on a VPRN router instance site. See Procedure 74-13 for information about configuring a VPRN group interface to terminate LNS PPP sessions.

IPsec

You can configure a VPRN with a tunnel interface for secure and encrypted tunneling between sites. An IPsec VPRN allows you to share secure and encrypted VPN traffic among multiple sites.

IPsec VPRN services include:

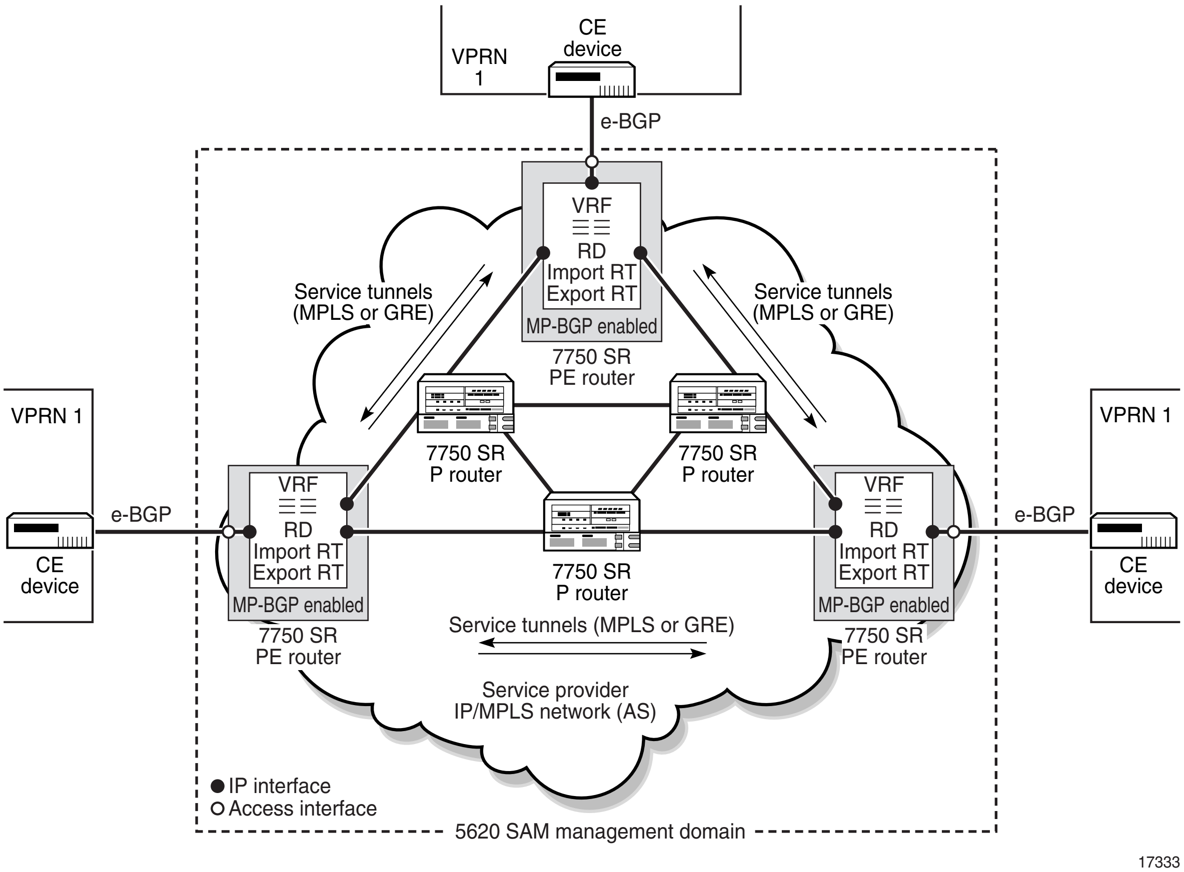
- NAT traversal
- DES, 3DES, AES-128, AES-192 and AES-256 encryption methods
- HMAC-MD5 and HMAC-SHA1 authentication and hashing methods
- Diffie-Hellman key generation algorithms
- Pre-shared keys and IKE shared secret with PFS key management authentication methods

See chapter 35 for more information about IPsec configuration.

74.2 Sample VPRN service configuration

Figure 74-4 shows a sample VPRN service configuration.

Figure 74-4 Sample VPRN Configuration



Assuming the core IP/MPLS or GRE network is already configured, Table 74-2 lists the high-level tasks that are required to configure the sample VPRN service.

Table 74-2 Sample VPRN service configuration

Task	Description

1. Configure policies as required	Policies should be configured before you create a service. Participation in policies is defined when you configure or modify resources, such as access interfaces or circuits, during service creation or modification. The following key policies can be applied to resources that are part of a VPRN.
	• Routing policies.
	  • Choose Policies→Routing→Statement to open the routing policy-statements form.
	  • Choose Policies→Routing→Prefix List to open the routing policy-prefix lists form.
	  • Choose Policies→Routing→Community to open the routing policy-communities form.
	  • Choose Policies→Routing→Damping to open the routing policy-dampings form.
	  • Choose Policies→Routing→AS Path to open the routing policy-AS paths form.
	• Access ingress and egress interface policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress to open these forms.
	• Scheduler policies. Choose Policies→QoS→SROS QoS→Scheduler to open the scheduler policy form.
	• ACL IP filter policies. Choose Policies→Filter→ACL IP Filter to open the ACL form.
	• Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form.
	• ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.

2. Configure ports as access ports for use in the service	Right-click on a port from the equipment navigation tree and choose Properties. Specify the port as an access port and optionally specify an encapsulation type.
3. Configure service tunnels as required	Choose Manage→Service Tunnels to create service tunnels. Service tunnels carry service traffic between edge-managed routers by circuits aggregated in unidirectional service tunnels. Circuits can be associated with service tunnels during service configuration.
4. Configure MP-BGP for PE-to-PE routing.	Perform the following steps. See chapter 31 for more information about protocol configuration. • Right-click on a router instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the Protocols tab and select the BGP check mark box. • Right-click on the BGP instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the VPN tab and enable VPN IPv4 or VPN IPv6 as required. Enable Multicast IPv4 or Multicast IPv6 to apply a multicast definition to this BGP routing instance. Click on the Behavior tab and set the Enable Inter AS VPRN parameter to true. • Right-click on the BGP Peer Group instance in the Routing view of the network navigation tree and choose Create Peer. In the Peer form that opens, configure the Peer Address and other parameters.
5. Create and configure customers	Choose Manage→Service→Customers to open the customer manager form and create a customer.

(1 of 2)

Task	Description

6. Create and configure VPRN 1.	Ensure that the operator creating the service has Service Mgmt and Interface Mgmt user group privileges. See chapter 9 for more information about user and user group privileges.
	Choose Create→Service→VPRN. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure VPRN 1.
	• Specify the newly created customer as the customer for the VPRN 1.
	• Specify and configure the VPRN service sites. Perform the following for each VRF:
	  • Configure autobinding to specify that the service is automatically bound to service tunnels.
	  • Configure routing properties.
	  • Configure the route distinguisher.
	  • Configure VRF targets.
	  • Configure import and export route targets.
	  • Configure import and export routing policies.
	  • Configure BGP on the PE VPRN sites for PE-to-CE routing. See chapter 31 for information about routing protocol configuration.
	  • If required, configure a GSMP group and a GSMP group neighbor
	  • If required, configure PIM to create a multicast domain within the VPRN.
	  • If required, configure the RPF Lookup Sequence parameter to specify which routing tables PIM uses for standard multicast and unicast RPF lookups.
	  • If required, configure an override source IP address or L3 interface used by IP applications to communicate with the site.
	• Create and configure an access interface on each VPRN service site.
	  • Configure general parameters such as a name, ID, and MAC address.
	  • Assign an application profile, if required.
	  • Assign an AA transit IP or transit prefix policy, if required.
	  • Specify a port that is in access or hybrid mode.
	  • Assign ingress and egress QoS policies as required.
	  • Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
	  • Assign ACL filter policies as required.
	  • Assign an accounting policy, if required.
	  • Specify a local DHCP server, if required.
	  • Specify a ToD suite, if required.
	  • Configure subscriber management parameters, if required.
	  • Specify a DoS protection policy, if required.
	  • Configure a local IP address.
	  • Configure the ARP timeout and proxy ARP settings, if required.
	  • Configure ICMP parameters, if required.
	  • Configure IPCP parameters, if required.
	  • Configure DHCP parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure anti-spoofing parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure router advertisement parameters.
	  • Configure ANCP parameters, if required.

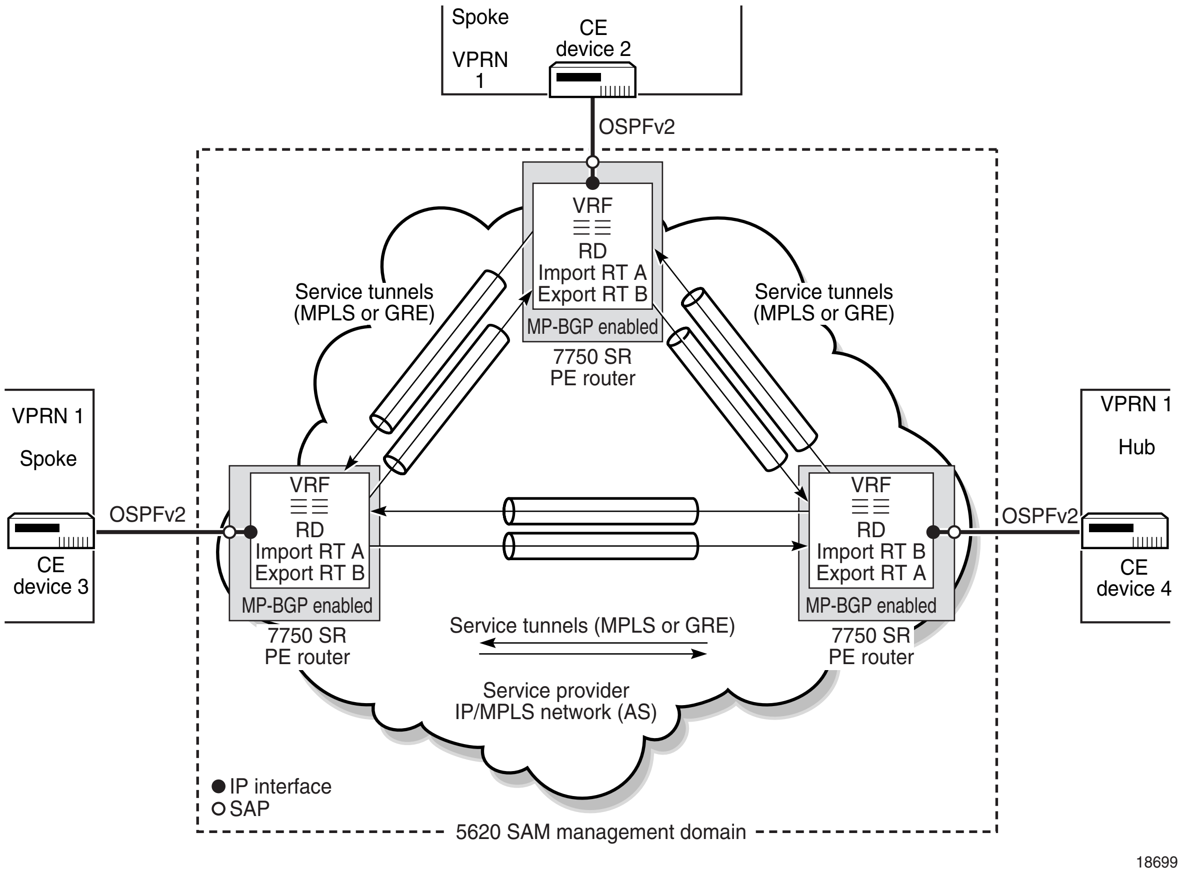
(2 of 2)

74.3 Sample hub-and-spoke VPRN configuration

In a hub-and-spoke VPRN, the majority of the traffic is exchanged between the hub (for example, headquarters) and spoke sites (for example, branches). Traffic between spoke sites passes through the hub site. Spoke sites advertise their routes to the hub site, which in turn advertises these routes to the other spoke sites.

Figure 74-5 shows a sample hub-and-spoke VPRN service configuration. Your configuration will vary depending on your network requirements.

Figure 74-5 Sample hub-and-spoke VPRN Configuration



Assuming the core IP/MPLS or GRE network is already configured, Table 74-3 lists the high-level tasks that are required to configure this sample hub-and-spoke VPRN service.

Table 74-3 Sample hub-and-spoke VPRN service configuration

Task	Description

1. Configure policies as required	Policies should be configured before you create a service. Participation in policies is defined when you configure or modify resources, such as access interfaces or circuits, during service creation or modification. The following key policies can be applied to resources that are part of a VPRN.
	• Routing policies.
	  • Choose Policies→Routing→Statement to open the routing policy-statements form.
	  • Choose Policies→Routing→Prefix List to open the routing policy-prefix lists form.
	  • Choose Policies→Routing→Community to open the routing policy-communities form.
	  • Choose Policies→Routing→Damping to open the routing policy-dampings form.
	  • Choose Policies→Routing→AS Path to open the routing policy-AS paths form.
	• Access ingress and egress interface policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress to open these forms.
	• Scheduler policies. Choose Policies→QoS→SROS QoS→Scheduler to open the scheduler policy form.
	• ACL IP filter policies. Choose Policies→Filter→ACL IP Filter to open the ACL form.
	• Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form.
	• ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.
	• DoS protection policy. Choose Administration→Security→NE DoS Protection to open the NE DoS protection form.

2. Configure ports as access ports for use in the service	Right-click on a port in the equipment navigation tree and choose Properties. Specify the port as an access port and specify an encapsulation type, if required.
3. Configure service tunnels as required	Choose Manage→Service Tunnels to create service tunnels. Service tunnels carry service traffic between edge-managed routers by circuits aggregated in unidirectional service tunnels. Circuits can be associated with service tunnels during service configuration.
4. Configure MP-BGP for PE-to-PE routing.	Perform the following steps. See chapter 31 for more information about protocol configuration. • Right-click on a router instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the Protocols tab and select the BGP check mark box. • Right-click on the BGP instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the VPN tab and enable VPN IPv4 or VPN IPv6 as required. Enable Multicast IPv4 or Multicast IPv6 to apply a multicast definition to this BGP routing instance. Click on the Behavior tab and set the Enable Inter AS VPRN parameter to true. • Right-click on the BGP Peer Group instance in the Routing view of the network navigation tree and choose Create Peer. In the Peer form that opens, configure the Peer Address and other parameters.
5. Create and configure customers	Choose Manage→Service→Customers to open the customer manager form and create a customer.

(1 of 2)

Task	Description

6. Create and configure VPRN 1	Ensure that the operator creating the service has Service Mgmt and Interface Mgmt user group privileges. See chapter 9 for more information about user and user group privileges.
	Choose Create→Service→VPRN. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure VPRN 1.
	• Specify the newly created customer as the customer for the VPRN 1.
	• Specify and configure the sites for VPRN 1. For each VRF:
	  • Configure autobinding to specify that the service is automatically bound to service tunnels.
	  • Configure routing properties.
	  • Configure the route distinguisher.
	  • Configure VRF targets.
	  • Configure import and export route targets.
	  • Configure import and export routing policies.
	  • Configure BGP on the PE VPRN sites for PE-to-CE routing. See chapter 31 for information about routing protocol configuration.
	  • Configure other routing protocols on the sites, as required.
	  • If required, configure a GSMP group and a GSMP group neighbor
	  • If required, configure PIM to create a multicast domain within the VPRN.
	  • If required, configure the RPF Lookup Sequence parameter to specify which routing tables PIM uses for standard multicast and unicast RPF lookups. See chapter 31 for more information about protocol configuration.
	  • If required, configure an override source IP address or L3 interface used by IP applications to communicate with the site.
	• Create and configure one or more access interface on each VPRN service site.
	  • Configure general parameters such as a name, ID, and MAC address.
	  • Assign an application profile, if required.
	  • Assign an AA transit IP or transit IP policy, if required.
	  • Specify a port that is in access or hybrid mode.
	  • Assign ingress and egress QoS policies as required.
	  • Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
	  • Assign ACL filter policies as required.
	  • Assign an accounting policy, if required.
	  • Specify a local DHCP server, if required.
	  • Specify a ToD suite, if required.
	  • Configure subscriber management parameters, if required.
	  • Specify a DoS protection policy, if required.
	  • Configure a local IP address.
	  • Configure the ARP timeout and proxy ARP settings, if required.
	  • Configure ICMP parameters, if required.
	  • Configure IPCP parameters, if required.
	  • Configure DHCP parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure anti-spoofing parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure router advertisement parameters.
	  • Configure ANCP parameters, if required.

(2 of 2)

74.4 Workflow to create a VPRN service

The following workflow lists the high-level steps required to create a VPRN service. As a prerequisite for creating a VPRN service, this workflow assumes the following:

- a group or customer with the required user access privileges has been set up; see chapter 9 for more information.
- the IP or IP/MPLS core network exists.

- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 33-1 for more information.
- the access ports for the service are created; see chapter 20 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 46 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 31 for more information about protocol configuration.

1 Create the VPRN service. See Procedure 74-1 for more information.

i Choose a customer to associate with the VPRN service

ii Define the general properties for the VPRN service.

iii Configure NAT on the VPRN Site.

iv Configure multicasting for the VPRN service, if required.

v Enable one or more routing protocols on the VPRN site.

vi Configure a GSMP group on the site, if required.

vii Configure a local DHCP server or DHCP v6 server on the routing instance, if required.

viii Turn up the VPRN service.

2 Perform one or more of the following, as required.

a create an L3 access interface for the VPRN site; see Procedure 74-2 for more information

b create an L3 network interface for the VPRN site; see Procedure 74-3 for more information

c add a GNE site and GNE service interfaces to an existing VPRN service; see Procedure 74-4 for more information

d configure BGP, OSPFv2, OSPFv3, PIM, IGMP, RIP or L2TP in the VPRN routing instance; see Procedure 74-5 for more information

e configure IGMP on a VPRN routing instance; see Procedure 74-6 for more information

f add a Global Route Table to a VPRN site; see Procedure 74-7 for more information

g add a PIM interface to the VPRN; see Procedure 74-8 for more information

h add an IGMP interface to the VPRN; see Procedure 74-9 for more information

i create a VPRN spoke SDP binding; see Procedure 74-10 for more information

- **j** create an L2 SDP spoke termination on a VPRN service; see Procedure 74-11 for more information
- **k** add a subscriber interface to the VPRN; see Procedure 74-12 for more information
- **l** add a group interface to the VPRN (only the 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a group interface in a VPRN); see Procedure 74-13 for more information
- **m** collect and view PPP ATM SAP statistics and information for a VPRN group interface; see Procedure 74-14 for more information
- **n** add an IP mirror interface to the VPRN; see Procedure 74-15 for more information
- **o** to implement dual homing using SRRP; see Procedure 74-16 for more information
- **p** create an intra-area OSPF sham link between two VPRN sites; see Procedure 74-17 for more information
- **q** add a tunnel interface to a VPRN; see Procedure 35-6 for more information
- **r** Create and enable a video interface for the VPRN, if required. See Procedure See Procedure 36-1 for more information.

3 As required, run an OAM validation test for a VPRN. See Procedure 74-18 for more information.

4 As required, view VPRN service information:

- **a** view the service topology map associated with a VPRN service; see Procedure 74-19 for more information
- **b** view the VPRN service operational status; see Procedure 74-20 for more information
- **c** view the DHCPv6 prefixes that the server has given out; see Procedure 74-21 for more information
- **d** view the lease not owner and pool unknown log events for local DHCPv6 servers; see Procedure 74-22 for more information

5 As required, modify a VPRN service:

- **a** using the Manage Services form; see Procedure 74-23 for more information
- **b** using the topology view; see Procedure 74-24 for more information

6 As required, delete a VPRN service. See Procedure 74-25 for more information.

74.5 VPRN service management procedures

Use the following procedures to perform VPRN creation and management tasks.

Procedure 74-1 To create a VPRN service

1 Choose Create→Service→VPRN from the 5620 SAM main menu. The VPRN Services (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VPRN. The Select Customer - VPRN Service form opens.

3 Select a customer for the VPRN and click on the OK button. The Select Customer - VPRN Service form closes and the VPRN Services (Create) form refreshes with the customer information.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Prioirity
- Administrative State
- Automatic SDP Binding Creation
- IP Address Overlap Avoidance Enabled
- Profile Name
  This parameter is configurable when the Automatic SDP Binding Creation parameter is enabled.
- OLC State
  This parameter is configurable when you click on the Apply button on the VPRN Service (Create) form.

5 To configure parameters for AA reporting to the 5670 RAM, perform the following steps.

i Click on the 5670 RAM Parameters tab button.

ii Click on the General tab button.

iii Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name

6 Perform one of the following:

a Create a site for the VPRN. Go to step 7.

b Complete service creation, if sites and access interfaces for the VPRN are to be created later. Go to step 82.

For information on adding a GNE site to a VPRN service, see Procedure 74-4.

7 On the navigation tree, right-click on the Site icon and choose Create VPRN Site. The Select Network Elements - VPRN Service form opens with a list of available sites displayed.

8 Select a site and click on the OK button. The VPRN Site (Create) form opens with the General tab displayed.

9 Configure the parameters:

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- Enable Hash Label
- GSMP Administrative State
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

10 To configure NAT on the VPRN Site, click on the NAT Configuration tab button. Otherwise, go to step 23.

Note — NAT configuration is supported only on a Release 8.0 or later 7750 SR-7 or 7750 SR-12 in chassis mode B or higher.

11 Click on the Create button. The NAT Configuration (Create) form opens with the General tab displayed.

12 Click on the Select button to choose a NAT policy. The Select NAT policy form opens.

13 Select a policy in the list and click on the OK button. The Select NAT policy form closes, and the policy name is displayed on the NAT Configuration (Create) form.

14 Click on the Apply button. A dialog box appears.

15 Click on the Yes button.

16 Perform the following steps to configure static port forwarding, if required.

Note — You can configure NAT static port forwarding only for large-scale NAT.

i Click on the NAT Static Port Forwarding tab button.

ii Click on the Create button. The NAT Static Port Forwarding Display (Create) form opens.

iii Configure the parameters:

- Inside IP Address
- Outside IP Address
- Inside Port
- Protocol
- Outside Port
- Lifetime (seconds)

Note — You cannot specify the same set of Inside Port and Protocol values in more than one static port mapping to an Inside IP Address.

You can specify the same Outside Port value in multiple mappings to an Inside IP Address.

iv Click on the OK button. The NAT Static Port Forwarding (Create) form closes, and the new entry is listed on the NAT Configuration form.

17 Perform the following steps to synchronize NAT static port forwards, if required.

i Choose a static port forward from the list and click on the Sync button. The NAT Static Port Forwarding Sync form opens.

ii Click on the Select button in the Targeted Router Instance panel. The Select Targeted Router Instance form opens.

iii Select a router instance from the list and click on the OK button. The Select Targeted Router Instance form closes and the NAT Static Port Forwarding Sync form reappears with the router instance information displayed.

iv Configure the Lifetime (seconds) parameter and click on the OK button. A dialog box appears.

v Click on the OK button.

18 Perform the following steps to configure a NAT pool.

i Click on the NAT Pools tab button.

ii Click on the Create button. The NAT Pool (Create) form opens.

iii Configure the parameters:

- Displayed Name
- Description
- NAT Pool Type
- Administrative State
- Port Reservation Type
- Port Reservation Value
- Port Forward Range End
- High Watermark
- Low Watermark

iv Click on the Select button to choose an ISA-NAT group. The Select ISA-NAT group form opens.

- **v** Select an ISA-NAT group in the list and click on the OK button. The Select ISA-NAT group form closes, and the ISA-NAT group name is displayed on the NAT Pool (Create) form.
- **vi** Click on the NAT Pool Ranges tab button.
- **vii** Click on the Create button. The NAT Pool Range (Create) form opens.
- **viii** Configure the parameters:
    - Description
    - Range Start
    - Range End
- **ix** Click on the OK button. A dialog box appears.
- **x** Click on the OK button. The NAT Pool Range (Create) form closes, and the NAT Pool (Create) form lists the pool range.
- **xi** Click on the OK button. A dialog box appears.
- **xii** Click on the OK button. The NAT Pool (Create) form closes, and the NAT Configuration (Create) form lists the NAT pool.
- **xiii** Repeat steps vii to xii to add another pool, if required.

19 Perform the following steps to add an IP address for L2-aware NAT forwarding, if required.

- **i** Click on the L2 Aware IP Addresses tab button.
- **ii** Click on the Create button. The L2 Aware IP (Create) form opens.
- **iii** Configure the parameters:
    - Inside IP Address
    - Prefix Length
- **iv** Click on the OK button. A dialog box appears.
- **v** Click on the OK button. The L2 Aware IP (Create) form closes, and the NAT Configuration (Create) form lists the IP address.
- **vi** Repeat steps ii to v to add another IP address, if required.

20 Perform the following steps to add a NAT destination address.

- **i** Click on the NAT Destinations tab button.
- **ii** Click on the Create button. The NAT Destination (Create) form opens.
- **iii** Configure the parameters:
    - Inside IP Address
    - Prefix Length
- **iv** Click on the OK button. A dialog box appears.

v Click on the OK button. The NAT Destination (Create) form closes, and the NAT Configuration (Create) form lists the destination.

vi Repeat steps ii to v to add another destination, if required.

21 Click on the OK button. A dialog box appears.

22 Click on the Yes button. The NAT Configuration (Create) form closes, and the NAT configuration is listed on the VPRN Site form.

23 If the VPRN site is to support multicasting, click on the MVPN tab button and perform steps 24 to 34; otherwise go to step 35.

24 Click on the Routing sub-tab to configure an MVPN VRF instance.

25 Configure the MVPN VRF Target Type parameter:

Note 1 — Route targets are used to identify the VRFs of a VPRN. A PE router that is not a route reflector or an AS border router installs a VPRN route only when its import target matches the target of the route.

Note 2 — A fully-meshed VPRN requires one target for all participating VRFs. A hub-and-spoke VPRN requires VRF import and export targets. The export target of the hub VRF must be the same as the import target of the spoke VRFs. The import target of the hub VRF must be the same as the export target of the spoke VRF. VPRN VRF targets must not overlap.

a Specify None if you do not want to specify a VRF target for the site. Go to step 29.

b Specify Define Default if you want to specify a default VRF target for the site. Go to step 26.

c Specify Define Import and Export if you want to specify import and export VRF targets for the service site. Go to step 27.

26 Configure the Target Format parameter by performing one of the following steps:

a To specify a two-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value
- Target Extended Community Value

The Target AS Value is the Autonomous System number of the PE node. For the Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 45.

b To specify an IP Address for the default target, if required:

i Configure the parameters:

- Target IP Address
- Target Community Value

ii Go to step 45.

c To specify a four-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value (4Byte)
- Target Community Value

The Target AS Value (4Byte) is the Autonomous System number of the PE node. For the Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 45.

27 Configure the Import Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF import target format for the site, then go to step 28.

b Choose AS as the two-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value
- Import Target Extended Community Value

The Import Target AS Value is the two-byte Autonomous System number of the PE node. For the Import Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 28.

c Choose IP Address as the import target format for the site.

i Configure the parameters:

- Import Target IP Address
- Import Target Community Value

ii Go to step 28.

d Choose AS-4Byte as the four-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value (4Byte)
- Import Target Community Value

The Import Target AS Value (4Byte) is the four-byte Autonomous System number of the PE node. For the Import Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 28.

28 Configure the Export Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF export target format for the site, then go to step 29.

b Choose AS as the two-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value
- Export Target Extended Community Value

The Export Target AS Value parameter is the two-byte Autonomous System number of the PE node. For the Export Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 29.

c Choose IP Address as the export target format for the site.

i Configure the parameters:

- Export Target IP Address
- Export Target Community Value

ii Go to step 29.

d Choose AS-4Byte as the four-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value (4Byte)
- Export Target Community Value

The Export Target AS Value (4Byte) parameter is the four-byte Autonomous System number of the PE node. For the Export Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 29.

29 Click on the Import Policies sub-tab.

30 Configure the Import Unicast parameter. If you set the parameter to True, go to step 32.

31 Specify up to five Unicast import policies by using the Select button to choose a policy from the filtered list.

32 Click on the Export Policies sub-tab.

33 Configure the Export Unicast parameter. If you set the parameter to True, go to step 35.

34 Specify up to five VRF export policies by using the Select button to choose a policy from the filtered list.

35 If the VPRN site is to support IPv6 addressing (for router advertisement or neighbor discovery) or VRRP objects, perform the following sub steps to configure an SNMP community for mediating the IPv6 objects.

i Click on the SNMP Community tab button.

ii Click on the Create button. The SNMP Community (Create) form opens.

iii Configure the SNMP Community String parameter.

iv Click on the OK button. The SNMP community string entry is displayed on the Site (Create) form and a dialog box appears.

v Click on the OK button. The SNMP Community (Create) form closes.

Note — When the 5620 SAM uses SNMPv2 for device mediation, you must configure one and only one SNMP community string for the VPRN site. Otherwise, there is no mediation of the VPRN IPv6 objects on the site, and the 5620 SAM raises an alarm. The alarm is cleared and mediation resumes after the configuration is modified so that exactly one SNMP community string is associated with the VPRN site.

36 Perform the following sub stages to enable one or more routing protocols on the VPRN site.

i Click on the Protocols tab button.

ii Configure the parameters:

- BGP Enabled
- OSPFv2 Enabled
- OSPFv3 Enabled
- RIP Enabled
- L2TP Enabled

When you choose a protocol, the site and the protocols that are enabled on the site appear in the list panel.

iii If both the OSPFv2 Enabled parameter and the OSPFv3 Enabled parameter are disabled, navigate to the Components view of the VPRN, right-click on Protocols, then select Create OSPF. The OSPF Routing Instance (Create) form opens. In the OSPF Instance panel, configure the Version parameter.

iv Configure multicast for the site, if required. Click on the Multicast tab button.

v Configure the parameters:

- PIM Enabled
- IGMP Enabled

When you choose a protocol, the site and the protocols that are enabled on the site appear in the list panel.

37 Click on the Routing tab button to configure a routing instance. The General tab is displayed.

38 Configure the parameters:

- Router ID
- Maximum Number Of Equal Cost Routes
- Autonomous System
- FIB Priority
- Type
- Label Mode
- Carrier Carrier VPN
- Route Distinguisher Type
- Enforce Maximum Number Of Routes
- Enforce Maximum Number Of Multicast Routes
- Maximum Number Of IPv6 Routes
- Log Only
- Threshold (%)

You cannot configure the Carrier Carrier VPN parameter on a VPRN site if there are any pre-existing interfaces configured on the site.

When you set the Route Distinguisher Type parameter to Type 0, the following configurable parameters appear:

- Type 0 Administrative Value
- Type 0 Assigned Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique RD from the drop-down menu.

The Type 0 Administrative Value is the Autonomous System (AS) number of the PE node. For the Type 0 Assigned Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

When you set the Route Distinguisher Type parameter to Type 1, the following configurable parameters appear:

- Type 1 IP Address
- Type 1 Assigned Value

When you set the Route Distinguisher Type parameter to Type 2, the following configurable parameters appear:

- Type 2 Administrative Value
- Type 2 Assigned Value

When you select the Enforce Maximum Number Of Routes parameter, the following configurable parameters appear:

- Maximum Number Of Routes
- Log Only
- Threshold (%)

When you select the Enforce Maximum Number Of Multicast Routes parameter, the following configurable parameters appear:

- Maximum Number Of Multicast Routes
- Log Only
- Threshold (%)

39 Configure the parameters:

- Single SFM Overload Admin State
- Hold-Off Time (seconds)

The Hold-Off Time (seconds) parameter and read-only attributes Overload State, Overload Start, and Overload Duration are only displayed when the Single SFM Overload Admin State parameter is set to Up.

40 Click on the VRF Target tab button to configure a VRF instance.

41 Configure the VRF Target Type parameter:

Note 1 — Route targets are used to identify the VRFs of a VPRN. A PE router that is not a route reflector or an AS border router installs a VPRN route only when its import target matches the target of the route.

Note 2 — A fully-meshed VPRN requires one target for all participating VRFs. A hub-and-spoke VPRN requires VRF import and export targets. The export target of the hub VRF must be the same as the import target of the spoke VRFs. The import target of the hub VRF must be the same as the export target of the spoke VRF. VPRN VRF targets must not overlap.

a Specify None if you do not want to specify a VRF target for the site. Go to step 45.

b Specify Define Default if you want to specify a default VRF target for the site. Go to step 42.

c Specify Define Import and Export if you want to specify import and export VRF targets for the service site. Go to step 43.

42 Configure the Target Format parameter by performing one of the following steps:

a To specify a two-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value
- Target Extended Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Target AS Value is the Autonomous System number of the PE node. For the Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 45.

b To specify an IP Address for the default target, if required:

i Configure the parameters:

- Target IP Address
- Target Community Value

ii Go to step 45.

c To specify a four-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value (4Byte)
- Target Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Target AS Value (4Byte) is the Autonomous System number of the PE node. For the Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 45.

43 Configure the Import Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF import target format for the site, then go to step 44.

b Choose AS as the two-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value
- Import Target Extended Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Import Target AS Value is the two-byte Autonomous System number of the PE node. For the Import Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 44.

c Choose IP Address as the import target format for the site.

i Configure the parameters:

- Import Target IP Address
- Import Target Community Value

ii Go to step 44.

d Choose AS-4Byte as the four-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value (4Byte)
- Import Target Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Import Target AS Value (4Byte) is the four-byte Autonomous System number of the PE node. For the Import Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 44.

44 Configure the Export Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF export target format for the site, then go to step 45.

b Choose AS as the two-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value
- Export Target Extended Community Value

The Export Target AS Value parameter is the two-byte Autonomous System number of the PE node. For the Export Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 45.

c Choose IP Address as the export target format for the site.

i Configure the parameters:

- Export Target IP Address
- Export Target Community Value

ii Go to step 45.

d Choose AS-4Byte as the four-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value (4Byte)
- Export Target Community Value

The Export Target AS Value (4Byte) is the four-byte Autonomous System number of the PE node. For the Export Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 45.

45 Configure ingress multicast forwarding, if required.

i Click on the Mcast Path Mgmt tab button.

ii Click on the Select button beside the Name parameter. The Select Ingress Info Policy - Service L3 Routing list form opens.

iii Choose an ingress info policy and click on the OK button. The Select Ingress Info Policy - Service L3 Routing list form closes.

Note — The Mcast Path Mgmt Channels tab displays data on the operational channels after actual traffic from a specific multicast source for a specific multicast group passes through the virtual router. You must click on the Search button to refresh the data. See chapter 46 for a listing of the displayed operational channel parameters.

46 Click on the Auto-Bind tab button to configure the binding of the site to service tunnels.

47 Configure the Transport parameter.

a Choose None to explicitly specify service tunnels and circuits for the service.

b Choose LDP for the service to be automatically bound to MPLS service tunnels utilizing LDP.

Note — To use MPLS as the transport type, you must bind LSPs to service tunnels during service tunnel configuration. See Procedure 33-1 for more information.

c Choose RSVP-LSP for the service to be automatically bound to MPLS service tunnels utilizing RSVP-LSP.

Note — The RSVP-LSP option is available only on the 7450 ESS in mixed mode, the 7710 SR, and 7750 SR.

d Choose RSVP or LDP for the service to be bound to MPLS service tunnels utilizing either RSVP or LDP.

This choice provides the ability to simultaneously support both tunnel options, in networks that have a mixture of LDP and RSVP-TE in place. 5620 SAM always tries to resolve the VPN route by using RSVP-LSP tunnels first (lowest metric). If no RSVP-LSP service tunnels are available, then tunnels configured for LDP are used. If RSVP-LSP tunnels subsequently become available again, then the route resolution automatically returns to RSVP-LSP.

Note — The RSVP or LDP option is available only on the a 7450 ESS in mixed mode, and on the Release 7.0 R3 or later 7710 SR and 7750 SR.

e Choose GRE for the service to be automatically bound to GRE service tunnels.

48 Click on the VRF Import Policies tab button.

49 Specify up to five VRF import policies by using the Select button to choose a policy from the filtered list.

50 Click on the VRF Export Policies tab button.

51 Specify up to five VRF export policies by using the Select button to choose a policy from the filtered list.

52 Configure static routes, if required.

i Click on the Static Routes tab button.

ii Click on the Create button to define a static route that the PE VRF is to exchange with the CE. The Static Route (Create) form opens.

iii Configure the parameters:

- Auto-Assign ID
- Static Route ID
- BFD Enabled
- Forwarding Class Name
- Forwarding Class Priority
- Multicast Capable Peers
- Destination
- Prefix Length
- Type
- IP Address
- Preference
- Metric
- Administrative State
- Tag
- Enable CPE Check
- Target IP Address
- Target IP Address
- Drop Count
- Log
- Prefix List Name
- Prefix List Flag

The IP Address parameter is configurable when the Type parameter is set to an option other than Black Hole.

The Target IP Address, Interval (seconds), Drop Count, and Log parameters are only displayed when Enable CPE Check is enabled.

You cannot specify a Prefix List if either BFD Enabled or Enable CPE Check parameters are enabled for the static route.

The Prefix List Flag Prefix List Name parameter is configured.

iv Click on the OK button. The Static Route (Create) form closes and the Site (Create) form reappears.

53 Configure a GSMP group on the site, if required.

i Click on the GSMP tab button.

ii Click on the Create button. The GSMP Group (Create) form opens with the General tab displayed.

iii Configure the following parameters:

- Displayed Name
- Description
- Administrative State
- Keep-Alive (seconds)
- Hold Multiplier
- OAM Administrative State
- Dynamic Topology Discovery

iv Click on the GSMP Group Neighbor tab button.

v Click on the Create button. The GSMP (Create) form opens with the General tab displayed.

vi Configure the following parameters:

- IP Address
- Description
- Administrative State
- Local Address
- Priority Type
- Priority Precedence
- Priority Dscp

vii Click on OK button. The GSMP (Create) form closes.

viii Click on OK button. The GSMP Group (Create) form closes.

54 Click on the Local DHCP Servers tab button and perform one of the following steps to configure a local DHCP server on the routing instance, if required or applicable.

Note — DHCPv6 server configuration is supported only on a Release 9.0 R1 or later 7750 SR or 7450 ESS in mixed mode.

a To configure a local DHCPv4 server on the routing instance go to step 55.

b To configure a local DHCPv6 server on the routing instance go to step 56.

55 Perform the following steps to configure a local DHCPv4 server on the VPRN routing instance, if required.

i Click on the Local DHCP V4 tab button.

ii Click on the Create button. The Local DHCP Server (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Server Name
- Description
- Administrative State
- Use GI Address

iv Click on the Select button. The Select Local User Database form opens.

v Select a local user database in the list and click on the OK button. The Select Local User Database form closes and the local user database information is displayed on the Local DHCP Servers (Create) form.

vi Configure the following parameters:

- Allow Send Force Renews
- Use Pool From Client

vii Click on the IP Address Pools tab button to assign one or more IP addresses to the local DHCP server.

viii Click on the Create button. The IP Address Pool (Create) form opens with the General tab displayed.

ix Configure the following parameters:

- Pool Name
- Description

x Configure the parameters in the Minimum Lease Time panel:

- Days
- Hours
- Minutes
- Seconds

xi Configure the parameters in the Maximum Lease Time panel:

- Days
- Hours
- Minutes
- Seconds

xii Configure the parameters in the Offer Time panel:

- Minutes
- Seconds

xiii Configure the parameters in the Pool Minimum Free panel:

- Type
- Threshold

xiv Click on the Subnets tab button to add subnets to the DHCP server pool.

xv Click on the Create button. The Subnet (Create) form opens with the General tab displayed.

xvi Configure the parameters:

- IP Address
- Prefix Length
- Free Addresses Minimum Type
- Free Addresses Minimum Threshold
- Maximum Declined Addresses Stored

xvii Click on the Address Ranges tab button.

xviii Click on the Create button. The Subnet Address Range (Create) form opens.

xix Configure the parameters:

- Action
- Start Address
- End Address

Note — You must exclude static IP addresses from the subnet address range because static IP addresses are dedicated.

xx Click on the OK button. The Subnet Address Range (Create) form closes and a dialog box appears.

xxi Click on the OK button. The Subnet (Create) form reappears.

xxii Click on the Options tab button.

xxiii Click on the Create button. The Subnet Option (Create) form opens.

xxiv Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xxv Click on the OK button. The Subnet Option (Create) form closes and a dialog box appears.

xxvi Click on the OK button. The Subnet (Create) form reappears.

xxvii Click on the OK button. The Subnet (Create) form closes and a dialog box appears.

xxviii Click on the OK button. The IP Address Pool (Create) form reappears.

xxix Click on the Options tab button.

xxx Click on the Create button. The IP Address Pool Option (Create) form opens.

xxxi Configure the Option parameter.

xxxii If you set the Option parameter to Custom Option, configure the following parameters:

- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xxxiii If you set the Option parameter to DNS Name Servers or Netbios Name Server, configure the following parameters:

- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

xxxiv If you set the Option parameter to Domain Name, configure the Value parameter.

xxxv If you set the Option parameter to Lease Time, Lease Renew Time, or Lease Rebind Time, configure the following parameters:

- Days
- Hours
- Minutes
- Seconds

xxxvi If you set the Option parameter to Netbios Node Type, configure the Netbios Node Type parameter.

xxxvii Click on the OK button. The IP Address Pool Option (Create) form closes and a dialog box appears.

xxxviii Click on the OK button. The IP Address Pool (Create) form reappears.

xxxix Click on the OK button. The IP Address Pool (Create) form closes and a dialog box appears.

xl Click on the OK button. The Local DHCP Server (Create) form reappears.

xli Click on the OK button. The Local DHCP Server (Create) form closes and a dialog box appears.

xlii Click on the OK button. The VPRN Site (Create) form reappears.

56 Perform the following steps to configure a local DHCP v6 server on the routing instance, if required or applicable.

Note — DHCPv6 server configuration is supported only on a Release 9.0 R1 or later 7750 SR or 7450 ESS in mixed mode.

i Click on the DHCP V6 tab button.

ii Click on the Create button. The Local DHCPv6 Server (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Server Name
- Description
- Administrative State
- Use Pool From Client

iv Configure the parameters in the Lease Hold Time panel:

- Days
- Hours
- Minutes
- Seconds

v Click on the IPv6 Address Pools tab button to assign one or more pools to the local DHCPv6 server.

vi Click on the Create button. The IPv6 Address Pool (Create) form opens with the General tab displayed.

vii Configure the following parameters:

- Pool Name
- Description

viii Click on the Prefixes tab button to add prefixes to the DHCPv6 server pool.

ix Click on the Create button. The Prefix (Create) form appears with the General tab displayed.

x Configure the following parameters:

- IPv6 Address
- Prefix Length

xi Configure the parameters in the Preferred Life Time panel:

- Days
- Hours
- Minutes
- Seconds

xii Configure the parameters in the Valid Life Time panel:

- Days
- Hours
- Minutes
- Seconds

xiii Configure the parameters in the Renew Timer panel:

- Days
- Hours
- Minutes
- Seconds

xiv Configure the parameters in the Rebind Timer panel:

- Days
- Hours
- Minutes
- Seconds

xv Click on the Apply button. A dialog box appears.

xvi Click on the OK button.

xvii Click on the Options tab button.

xviii Click on the Create button. The Prefix Option (Create) form appears.

xix Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String or Domain.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xx Click on the OK button. The Prefix Option (Create) form closes and a dialog box appears.

xxi Click on the OK button. The Prefix (Create) form reappears with Options tab displayed.

xxii Click on the OK button. The Prefix (Create) form closes and a dialog box appears.

xxiii Click on the OK button. The IPv6 Address Pool (Create) form reappears with Prefix tab displayed.

xxiv Click on the Options tab button.

xxv Click on the Create button. The IPv6 Address Pool Option (Create) form appears.

xxvi Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String or Domain.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xxvii Click on the OK button. The IPv6 Address Pool Option (Create) form closes and a dialog box appears.

xxviii Click on the OK button. The IPv6 Address Pool (Create) form reappears with Options tab displayed.

xxix Click on the OK button. The IPv6 Address Pool (Create) form closes and a dialog box appears.

xxx Click on the OK button. The DHCP V6 Server (Create) form reappears with IPv6 Address Pool tab displayed.

xxxi Click on the OK button. The DHCP V6 Server (Create) form closes and a dialog box appears.

xxxii Click on the OK button. The VPRN Site (Create) form reappears.

57 Click on the Self Generated Traffic tab button. The DSCP Marking tab is displayed with a list of all the applications for which the DSCP can be set.

58 Choose an application to view or edit the DSCP setting.

59 Click on the Properties button. An Application DCSP Marking form opens.

60 Configure the DSCP parameter.

61 Click on the Apply button. A dialog box appears. Click on the OK button.

62 Click on the DSCP Mapping tab. A list of DSCP types and corresponding forwarding classes is displayed.

63 Choose a DSCP to view or edit the forwarding class.

64 Click on the Properties button. An Application DCSP Marking form opens.

65 Configure the Forwarding Class parameter.

66 Click on the Apply button. A dialog box appears. Click on the OK button.

67 Click on the Dot1p Marking tab button. A list of applications for which the Dot1p can be set is displayed.

68 Choose a Dot1p to view or edit the setting.

69 Click on the Properties button. An Application Dot1p Marking form opens.

70 Configure the dot1p parameter.

71 Click on the OK button. A dialog box appears. Click on the OK button.

72 Configure an override source IP address or L3 interface for use by a selected IP application, if required.

  i Click on the Source Addresses tab button.

  ii Click on the Create button. The Source Address (Create) form opens.

73 Choose an IP application from the Source IP Application drop-down menu.

74 Specify the source address for the IP application server by performing one of the following steps:

Note — If you choose the interface index option, the router used for this VPRN must already have an access interface created for its routing instance.

a Choose IP Address in Source Address Termination to specify the source IP address of the IP application server.

i Enter a valid IP address that the VPRN virtual routing instance will identify in the Source IP Address field.

ii Go to step 75.

Note 1 — An IPv6 address option for the Source IP Address parameter is available when the IPv6 Allowed parameter is set during network interface creation. See chapter 30 for more information about creating a network interface.

Note 2 — You must select an IPv6 Source IP Address before you can select IPv6 Source IP Applications.

b Choose Interface Index in Source Address Termination to use the primary address of the L3 network interface as the source address of the IP application server.

i Click on the Select button to choose an interface. The Select Source Address VPRN Interface - Source Address form opens. Choose an interface from the list and click on the OK button. The IP address and Interface ID of the L3 interface appear on the form.

ii Go to step 75.

75 Click on the OK button. The Source Address (Create) form closes and the Site (Create) form reappears. The IP application source address and parameters appear on the form.

76 Click on the IGMP Host Tracking tab button.

77 Configure the parameters:

- Expiry Time
- Administrative State

78 Click on the Route Aggregation tab button to configure route aggregates for the VPRN service.

Route aggregation allows you to group a number of routes with common IP prefixes into a single entry in the routing table. This reduces the number of routes that need to be advertised by the hosting router and reduces the number of routes in the routing tables of downstream routers.

Note — Route aggregation for VPRN sites is supported on 7450 ESS in mixed mode, 7750 SR and 7710 SR nodes.

i Click on the Create button. The Aggregation (Create) form opens.

ii Configure the parameters:

- IP Address Prefix
- Mask
- Summary Only
- As Set
- Aggregator
- Aggregator AS
- Aggregator IP Address

The IP Address Prefix you enter must be an IPv4 address in the form x.x.x.0, where the last integer is the host bits and must have a value of 0.

The Aggregator AS and Aggregator IP Address parameters are configurable when the Aggregator parameter value is set to True.

79 Click on the OK button. A dialog box appears.

80 Click on the OK button. The Site (Create) form closes, and the VPRN (Create) form reappears with the new site information displayed in the service navigation tree.

81 Perform one of the following:

a Create an additional site for the VPRN. Go to step 7.

b Go to step 82.

82 Click on the OK button. A dialog box appears.

83 Click on the Yes button to confirm the action. The VPRN (Create) form closes.

Procedure 74-2 To create a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service.

4 Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

For information on adding a GNE service interface to a VPRN service, see Procedure 74-4.

6 Right-click on Access Interfaces and choose Create L3 Access Interface. The L3 Access Interface (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Allow Directed Broadcasts
- Loopback Enabled
- Cflowd Type
- Trusted
- Class
- IPv6 Allowed
- Admin Link Local Address
- Admin Link Local Address Preferred
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6
- Calling Station ID
- Configured IP MTU (Octets)
- Unnumbered Type
- IP Address
- Interface Name
- URPF Check State
- URPF Check Mode
- Tunnel Fault Notification

The Unnumbered Type parameter is configurable when the Class parameter is set to Unnumbered.

The IP Address parameter is configurable when the Unnumbered Type parameter is set to IP Address.

The Interface Name parameter is configurable when the Unnumbered Type parameter is set to Name.

The Admin Link Local Address and Admin Link Local Address Preferred parameters are only configurable when the IPv6 Allowed parameter is enabled.

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

8 If the Loopback Enabled parameter in step 7 is enabled, you cannot associate a port with the L3 interface. Go to step 18.

9 Perform the following steps to bind an application profile to the VPRN L3 access interface, if required:

i Click on the Select button beside the Application Profile parameter in the Application Assurance panel. The Application Profile String: - VPRN L3 Access Interface list form opens.

ii Select a profile from the list and click on the OK button. The Application Profile String - VPRN L3 Access Interface list form closes and the L3 Access Interface (Create) form is refreshed with the Application Profile information.

Note — The Application Profile String: - VPRN L3 Access Interface list form only displays local profiles that already exist on the NE.

10 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — To bind a transit policy to an L3 access interface, a port must already exist on the interface.

Note 3 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 4 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Select a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit IP policy and click on the OK button.

11 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab button.

12 Configure the Unicast RPF parameters, if required.

- URPF Check State
- URPF Check Mode

Note — The URPF Check State parameter must be enabled to display the URPF Check Mode parameter.

13 Click on the Port tab button.

14 Click on the Select button to choose a port for the L3 access interface. The Select Terminating Port - VPRN L3 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

15 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPRN L3 Access Interface form closes, and the VPRN L3 Access Interface (Create) form displays the port information.

16 Configure the parameters:

- Auto-Assign ID
- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

The Auto-Assign ID parameter is configurable if the port uses dot1q encapsulation. When the parameter is enabled, the 5620 SAM automatically configures the Outer Encapsulation Value parameter using the lowest unassigned value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with Q in Q encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

17 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab button.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

Note — If a bundle is selected in step 15, only the Scheduling Class parameter is configurable.

18 Assign ingress and egress QoS policies to the interface, if required.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab.

i Click on the QoS tab button.

Note — The QoS tab is configurable only if a port is assigned to the interface.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID
- Use Multipoint Shared Queue

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is BCP dot1q, dot1q, or Q in Q.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - L3 Access Interface form opens.

iv Use the configurable filter and Search button to choose a policy, and click on the OK button. The Select Ingress Policy - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you selected in step 15 has the access ingress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

v Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - L3 Access Interface form opens.

vi Use the configurable filter and Search button to choose a QoS policy, and click on the OK button. The Select Egress Policy - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the egress QoS policy information displayed.

Note 1 — If you select an egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you selected in step 15 has the access egress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

Note 2 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

vii If you are configuring an L3 access interface for a 7710 SR or 7705 SAR, or if the port you selected in step 15 is not an HSMDA port, then go to step 19.

viii Configure the Packet Byte Offset (bytes) parameter, if required. You must enable the associated Override check box if you need to configure this parameter.

ix Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

x Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPRN L3 Access Interface (Create) form reappears with the WRR policy information displayed.

xi Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xii Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

19 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 21.

Note — The Schedulers tab is configurable only if a port is assigned to the SAP earlier in the procedure.

20 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 15 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 15 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - VPRN L3 Access Interface form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - L3 Access Interface form closes, and the VPRN L3 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPRN L3 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 15 is an HSMDA port, go to step 21.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - L3 Access Interface form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - L3 Access Interface form closes, and the L3 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPRN L3 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 21.

b Specify that an aggregation scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 15 is an HSMDA port. Go to step 21.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - L3 Access Interface form opens.

iii Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - L3 Access Interface form closes, and the L3 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

21 Assign ingress and egress ACL filters to the interface, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress IPv4 ACL filter. The Select Ingress Filter - L3 Access Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the ingress IPv4 ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress IPv4 ACL filter. The Select Egress Filter - L3 Access Interface form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the egress IPv4 ACL filter information displayed.

vi If the L3 Access Interface supports IPv6 addressing, perform the following substeps. Otherwise, go to step 23.

vii Click on the Select button in the IPv6 Ingress Filter panel to choose an ingress IPv6 ACL filter. The Select IPv6 Ingress Filter - L3 Access Interface form opens.

viii Select an ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the ingress IPv6 ACL filter information displayed.

ix Click on the Select button in the IPv6 Egress Filter panel to choose an egress IPv6 ACL filter. The Select IPv6 Egress Filter - L3 Access Interface form opens.

x Select an egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the egress IPv6 ACL filter information displayed.

22 Bind a VPRN L3 access interface to a VPLS site, if required.

Note 1 — The operational state of the IP interface binding will not be turned up until the Enable IP Interface Binding parameter is set to true.

Note 2 — You can create and manage a routed VPLS connector from the navigation tree on the Composite Service (Edit) form.

i Click on the Routed VPLS tab button.

ii Enter a VPLS site name or click on the Select button next to the VPLS Name parameter to choose a VPLS site. The Routed VPLS String - VPRN L3 Access Interface form opens.

iii Select a VPLS site and click on the OK button. The VPLS site is displayed.

iv In the Ingress - IPv4 Filter panel, click on the Select button. The Select IPv4 Filter - VPRN L3 Access Interface form opens.

v Select an IPv4 filter and click on the OK button. The IPv4 filter information is displayed.

vi In the Ingress - IPv6 Filter panel, click on the Select button. The Select IPv6 Filter - VPRN L3 Access Interface form opens.

vii Select an IPv6 filter and click on the OK button. The IPv6 filter information is displayed.

viii In the Egress - QoS Policy panel, click on the Select button. The Select QoS Policy - VPRN L3 Access Interface form opens.

ix Select a QoS Policy and click on the the OK button. The QoS Policy information is displayed.

23 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - L3 Access Interface form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - L3 Access Interface form closes and the L3 Access Interface (Create) form reappears with the accounting policy information displayed.

24 To associate a local DHCPv4 or DHCPv6 server to the L3 interface, if required, click on the Local DHCP tab button and perform one of the following steps.

Note — To associate local DHCPv6 servers the IPv6 Allowed parameter must be enabled.

a For local DHCPv4 servers

i Click on the Select button in the Local DHCP Server panel to choose a local DHCP server. The Select Local DHCP Server - L3 Access Interface form opens.

ii Select a local DHCP server and click on the OK button. The Select Local DHCP Server - L3 Access Interface form closes, and the L3 Access Interface (Create) form reappears with the local DHCP server information displayed.

b For local DHCPv6 servers

i Click on the Select button in the Local DHCPv6 Server panel to choose a local DHCPv6 server. The Select Local DHCPv6 Server - L3 Access Interface form opens.

ii Select a local DHCPv6 server and click on the OK button. The Select Local DHCPv6 Server - L3 Access Interface form closes, and the L3 Access Interface (Create) form reappears with the local DHCPv6 server information displayed.

Note — You cannot associate a local DHCPv4 server to the L3 group Interface if the Administrative State parameter in the Local Proxy Service panel is up. Go to step 7 to set the Administrative State.

25 Assign a time of day suite to the interface, if required.

i Click on the TOD Suite tab button.

ii Click on the Select button beside the Name parameter. The Select Time Of Day Suite - L3 Access Interface list form opens.

iii Select a time of day suite and click on the OK button. The Select Time Of Day Suite - L3 Access Interface list form closes, and the L3 Access Interface (Create) form refreshes with the time of day suite name.

Note 1 — You cannot assign a ToD suite to a L3 access interface if accounting statistics collection is enabled on the interface. You must first disable the Collect Accounting Statistics parameter in step 23.

Note 2 — SapEgrQosPlcyStats and SapIngQosPlcyStats statistics will only be collected if a Time Of Day Suite is applied on the SAP.

26 Configure residential subscriber management for the interface, if required. Residential subscriber management is supported on the 7450 ESS in mixed mode, 7750 SR, and 7710 SR.

i Click on the Subscriber Management tab button. The Host Connectivity tab is displayed.

ii Select the SHCV Enabled parameter to enable SHCV, if required. Otherwise, go to step 28.

iii Configure the parameters:

- SHCV Interval (minutes)
- SHCV Source
- SHCV Action

27 Assign a DoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - L3 Access Interface form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - L3 Access Interface form closes and the policy ID is displayed on the L3 Access Interface (Create) form.

28 Assign an IP address to the interface.

i Click on the Addresses tab button.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Broadcast Address Format
- EUI-64
- IP Address Preferred

The Broadcast Address Format parameter only appears if the IP Address parameter is set to an IPv4 address.

The EUI-64 IP Address Preferred parameters only appear if the IP Address parameter is set to an IPv6 address.

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The L3 Access Interface (Create) form reappears with the assigned IP addresses displayed.

29 Configure IPv4 ICMP for the interface, if required.

i Click on the ICMP tab button.

ii Configure the parameters:

- Mask Reply
- Redirects
- Number of Redirects
- Redirects Time (seconds)
- Unreachables
- Number of Unreachables
- Unreachables Time (seconds)
- TTL Expired
- Number of TTL Expired
- TTL Expired Time (seconds)

30 If the IPv6 Allowed parameter in step 7 is enabled, the ICMPv6 tab is configurable. Configure IPv6 ICMP, if required. Otherwise, go to step 31.

Configure the parameters:

- Redirects
- Number of Redirects
- Redirects Time (seconds)
- Unreachables
- Number of Unreachables
- Unreachables Time (seconds)
- Packet Too Big
- Number of Packet Too Big
- Packet Too Big Time (seconds)
- Param Problem
- Number of Param Problem
- Param Problem Time (seconds)
- Time Exceeded
- Number of Time Exceeded
- Time Exceeded Time (seconds)

31 Configure IPCP for the interface, if required. IPCP is available only on the ASAP MDA on the 7750 SR and 7710 SR.

i Click on the IPCP tab button.

ii Configure the parameters:

- Peer Address
- Primary DNS Address
- Secondary DNS Address

Note — Primary and secondary DNS addresses have similar functionality however they are assigned independently. When both are present, the primary DNS address is used to resolve address names. If the primary DNS address cannot be used the secondary DNS address is used.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button to confirm the action.

The IPCP tab is available when the SAP and port is configured with Null or IPCP encapsulation.

32 Configure Bi-directional Forwarding Detection for the interface, if required.

i Click on the BFD tab button.

ii Click on the Configuration tab button.

iii Configure the parameters:

- Administration Status
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier

The Transmit Interval, Receive Interval, Receive Interval, Echo Interval, and Multiplier parameters are configurable only when the Administration Status is set to Up.

iv To view local and remote session peers that are managed by the 5620 SAM. Click on the BFD Session tab button. A list of BFD current sessions on a router interface or an L3 interface appears.

v Click on a session. The properties form for the session opens. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

vi Close the form.

Note 1 — You cannot configure BFD for an interface if BFD is disabled. See chapter 31 for information about enabling and disabling BFD for routing protocols.

Note 2 — If the IPv6 Allowed parameter in step 7 is enabled, you can configure the above BFD parameters for IPv6.

33 Configure ARP for the interface, if required.

i Click on the ARP tab button. The General tab is displayed.

ii Configure the Timeout (seconds) parameter.

iii Click on the Proxy ARP tab button.

iv Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1
- Proxy ARP Policy 2
- Proxy ARP Policy 3
- Proxy ARP Policy 4
- Proxy ARP Policy 5

34 If the IPv6 Allowed parameter in step 7 is enabled, the Neighbor Discovery tab is configurable. Configure neighbor discovery, if required. Otherwise, go to step 35.

i Click on the Neighbor Discovery tab button.

ii Click on the Create button. The Neighbor Discovery (Create) form opens.

iii Configure the parameters:

- IP Address
- Physical Address

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Neighbor Discovery (Create) form closes, and the L3 Access Interface (Create) form refreshes with the neighbor entry.

vi Click on the Proxy ND tab button.

vii Configure the parameters:

- Enable Local Proxy
- Policy 1
- Policy 1
- Policy 1
- Policy 1
- Policy 1

Note — Do not leave an empty policy parameter between two configured policy parameters. For example, do not configure the Policy 1 and Policy 1 parameters and leave the Policy 1 parameter unconfigured, or the 5620 SAM reorders the policies and move the policy specified for the Policy 1 parameter to the Policy 1 parameter.

viii Repeat steps i to vii for each neighbor entry you want to create.

35 Configure IPv4 DHCP for the interface, if required.

i Click on the DHCP tab button. The General tab is displayed.

ii Configure the parameters:

- Enable DHCP Relay
- Description
- Trusted
- Lease Populate
- Enable
- Relay Plain BOOTP
- Use ARP

The Lease Populate parameter is configurable when the Enable parameter is enabled.

iii Depending on the type and version of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step viii.

iv Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form opens.

v Click on the Search button.

vi Select a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form closes, and the L3 Access Interface (Create) form refreshes with the subscriber authentication policy name.

vii Configure the parameters:

- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address
- Use as source

The Remote ID String parameter is configurable when the Remote ID is set to Remote ID String.

viii Click on the Server tab button.

ix Configure the parameters:

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time RADIUS Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

36 The ATM tab is configurable when the interface port is an ATM port. Specify OAM functionality and assign ingress and egress ATM policies to the interface, if required.

i Click on the ATM tab button.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Select an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes and the L3 Access Interface form reappears with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Select an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes and the L3 Access Interface (Create) form reappears with the egress ATM policy information displayed.

37 Click on the VRRP tab button to create a VRRP instance on the current L3 interface for a virtual router. You must know the VRID for an existing virtual router and ensure that the interface is a member of the same subnet as the virtual router.

Note — The following configurations are required for the operation of the IPv6 VRRP instance:

- Two sub-tabs are available under the VRRP tab, one for IPv4 instances and the other for IPv6 instances. You can only create an IPv6 VRRP Instance if you enable the IPv6 Allowed parameter in step 7.
- The Link Local Address on the parent interface has to be set to preferred and configured as one of the backup addresses (or same subnet) for the IPv6 VRRP instance. To do this, the Admin Link Local Address and Admin Link Local Address Preferred parameters in step 7 must be set accordingly.
- The IPv6 address on the parent interface must be set to preferred to be used as a backup address (on same subnet) for the IPv6 VRRP instance. The IP Address and IP Address Preferred parameters in step 28 must be set accordingly.
- The Send Advertisement and Use Virtual MAC Address parameters must be enabled in step 39 for the router advertisement on the parent interface.

See chapter 39 for configuration information about VRRP instances and virtual routers.

i Click on the Create button. The VRRP Instance (Create) form opens with the General tab displayed.

ii Configure the Virtual Router ID parameter.

iii Perform steps 8 to 15 of Procedure 39-2.

Note — You can use the VR Instances tab to create, modify, and view VR instances.

iv Click on the OK button. The VRRP Instance (Create) closes and the L3 Access Interface (Create) form reappears.

38 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab button.

ii Configure the parameters:

- Anti-Spoofing
- ARP Populate

The ARP Populate parameter is configurable when all of the IP addresses of the defined static hosts on the interface are in one of the subnets configured for the interface.

iii Click on the Static Hosts tab button to configure static subscriber host entries, if subscriber entries are not available through DHCP lease management. Otherwise, go to step 39.

iv Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

v Configure the parameters:

- IP Address
- MAC Address

Specify at least one IP address or MAC address for each static host. The values specified for the Anti-Spoofing and ARP Populate parameters determine the type of address entry that is required for the static host. For example, when you set the Anti-Spoofing parameter to Source Ip Addr, you must specify at least the IP address for the static host.

Note — You can configure a static host on a SAP only when no static ARP entries exist on the IP interface.

When the ARP Populate parameter is enabled, the IP address of the new static host must be in one of the subnets that is configured for the interface in step 28.

vi Click on the Apply button if you want to create additional entries. A dialog box appears. Otherwise, go to step ix.

vii Click on the OK button.

viii Repeat steps v to vii to create additional entries, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes and the Static Hosts tab refreshes with the configured static hosts displayed.

39 Configure router advertisement, if required.

i Click on the Advertisement tab button.

ii Click on the Create button to add a router advertisement entry. The Router Advertisement (Create) form opens.

iii Configure the parameters:

- Send Advertisement
- Min Interval (seconds)
- Reachable Time (milliseconds)
- Managed Address Config
- MTU
- Use Virtual MAC Address
- Max Interval (seconds)
- Retransmit Time (milliseconds)
- Other Stateful Config
- Current Hop Limit
- Lifetime (seconds)

If you are configuring the L3 interface for an IPv6 VRRP instance, then the Send Advertisement and Use Virtual MAC Address parameters must both be enabled.

iv Click on the Prefix tab button.

v Click on the Create button. The Router Advertisement Prefix (Create) form opens.

vi Configure the parameters:

- IPv6 Prefix
- On-Link Determination
- Prefix Length
- Autonomous Address Configuration
- Lifetime (seconds) in Preferred Lifetime panel
- No Expiry in Preferred Lifetime panel
- Lifetime (seconds) in Valid Lifetime panel
- No Expiry in Valid Lifetime panel

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Router Advertisement (Create) form reappears.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Router Advertisement (Create) form closes and the L3 Access Interface (Create) form refreshes with the router advertisement entry.

40 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab button.

ii Click on the Create button. The ANCP Static Map (Create) form opens with the General tab displayed.

iii Configure the ANCP String parameter.

iv Click on the Select button in the ANCP Policy panel to choose an ANCP policy. The Select ANCP Policy - ANCP Static Map list form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The ANCP Static Map (Create) form closes.

41 Specify queue overrides by clicking on the Override Policy Items tab button.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

Set the queue overrides, as described in Procedure 47-44.

42 If the IPv6 Allowed parameter in step 7 is enabled, the DHCPv6 tab is configurable. Configure IPv6 DHCP, if required. Otherwise, go to step 43.

i Click on the DHCPv6 tab button. The General tab is displayed.

ii Configure the parameters:

- Enable DHCPv6 Relay
- Description
- Lease Populate
- Maximum Number of Leases
- Interface Id Option
- Interface Id String
- Remote ID
- Source IP Address
- Neighbor Resolution
- Prefix Option

iii Click on the Server tab button.

iv Configure the Server 1 through Server 8 parameters.

v Configure the interface name for each DHCPv6 server that you configured in step iv by clicking on the Select button in the Zone Index panel. The Select Zone Index - DhcpRelayV6Configuration form opens with a list of configured interfaces.

vi Select an interface from the list and click on the OK button. The Select Zone Index - DhcpRelayV6Configuration list form closes and the L3 Access Interface form refreshes with the interface information.

vii Click on the DHCPv6-Prefix tab button.

viii Click on the Create button. The DhcpRelayV6PrefixDelegation (Create) form opens.

ix Configure the parameters:

- Prefix Address
- Prefix Length
- Prefix DUID
- Prefix IAID
- Prefix Life Time (seconds)
- Prefix Valid Life Time (seconds)

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The L3 Access Interface (Create) form reappears.

43 Click on the OK button. The L3 Access Interface (Create) form closes, and the Site (Create) form reappears with the new interface information displayed in the service navigation tree.

Repeat steps 6 to 43 to create another L3 access interface for the site in the VPRN service.

Note — If you are creating the L3 access interface during service creation, return to Procedure 74-1.

Procedure 74-3 To configure a VPRN network interface

Note — You cannot configure at network interface on a VPRN service if there are any pre-existing interfaces configured on the service. Once a network interface is configured on a VPRN service, no other interface types can be configured on the service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service.

4 Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

5 Click on the Sites tab button.

6 Select a VPRN site from the list and then click on the Properties button. The VPRN Site (Edit) form opens with the General tab displayed.

7 Click on the Routing tab button.

8 On the General subtab, configure the Carrier Carrier VPN parameter.

The Carrier Carrier VPN parameter is only available if there are no other interfaces configured on the site.

9 Click OK on the VPRN Site (Edit) form. You are returned to the VPRN Service (Edit) form.

10 Click on the Network Interfaces tab button and then click on the Create button. The Network Interface (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Allow Directed Broadcasts
- Class
- Loopback Enabled
- PIM RP Delayed Up Period
- Cflowd Type
- Trusted
- Enable Ingress Flowspec
- LSR IP Load Balancing
- URPF Check State
- URPF Check Mode

12 Click on the Port tab button.

Note — If the Loopback Enabled parameter is selected on the General tab, the Port port tab does not appear. Skip to step 15.

13 Click on the Select button and select a terminating port for the interface from the Select Terminating Port form.

14 Configure the parameters:

- Outer Encapsulation Value
- Auto-Assign ID
- Inner Encapsulation Value

15 Click on the Policies tab button.

i Click on the Select button in the Network Policy panel to list and choose a network policy for the interface. Network policies are used to determine QoS settings based on the packet DSCP bits on the ingress and egress of the network.

Note — If you select a network policy with a forwarding class mapped to a queue group queue ID, you must ensure that the mapping queue group queue ID is in the selected Queue Group Template Policy.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

ii Click on the Select button beside the Queue Group Template Policy to list and choose a network egress queue group template policy for the interface. Queue group template policies allow SAP or IP interface forwarding classes to be redirected from the typical queue mapping to a shared queue.

Note — You must ensure that the port you selected in step 13 has a network egress queue group with the same name as the Queue Group Template policy created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

iii Click on the Select buttons to list and choose Ingress and Egress ACL filters for the interface. ACL filters are used to filter out IP traffic that matches user-defined criteria.

16 Assign a DoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab button.

ii Click on the Select button next to the Policy ID field and select a policy from the Select NE DoS Protection - Network Interface form.

17 Configure Bi-directional Forwarding Detection for the interface, if required.

i Click on the BFD tab button.

ii Configure the parameters:

- Administrative State
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier

The Transmit Interval, Receive Interval, Receive Interval, Echo Interval, and Multiplier parameters are configurable only when the Administrative State parameter is set to Up.

iii To view local and remote session peers that are managed by the 5620 SAM. Click on the BFD Session tab button. A list of BFD current sessions on the interface appears.

iv Click on a session. The properties form for the session opens. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

v Close the form.

Note — You cannot configure BFD for an interface if BFD is disabled. See chapter 31 for information about enabling and disabling BFD for routing protocols.

18 Click on the ARP tab button.

i Configure the Timeout (seconds) parameter.

ii Click on the Create button to statically associate an IP or MAC address to the interface. The Static ARP (Create) form opens.

Configure the parameters:

- IP Address
- Physical Address

iii Click on the OK button. The Static ARP (Create) form closes.

19 Click on the Addresses tab button to assign IP addresses to the interface:

i Click on the Create button. The IP Address, Routing Instance (Create) form opens.

ii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- IGP Inhibit
- Broadcast Address Format

iii Click on the OK button to save the changes. A dialog appears.

iv Click on the OK button. The IP Address, Routing Instance (Create) form closes. The Network Interface (Create) form reappears with the assigned IP addresses displayed.

20 Click on ICMP tab button and configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

21 Click NTP tab button.

22 Configure the Broadcast parameter.

Note — When the Broadcast parameter is enabled, a time protocol such as NTP or SNTP must be enabled and configured on the device, or the device ignores broadcast time packets received on the interface. See chapter 13 for information about configuring NTP or SNTP on a device.

23 Click on the OK button. The Network Interface [Create] form closes. The VPRN Service (Create) form reappears with the assigned network interface displayed.

Procedure 74-4 To configure a GNE site on a VPRN service

Use this procedure to add a GNE site and GNE service interfaces to an existing VPRN service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on VPRN Service and choose Create GNE Site. The Select Network Elements - VPRN Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

i Click on the GNE Service Interfaces tab button and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

ii Configure the parameters:

- Name
- Description
- Type

iii Click on the Ports tab button and then click on the Select button next to the Interface Index field. The Select Generic NE Interface form appears.

iv Select an interface from the list and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

v Configure the parameters:

- Encap Type
- Outer Encapsulation Value
- Inner Encapsulation Value

vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab button to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The VPRN (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The VPRN (Edit) form closes.

You can use the topology maps to view the service. See chapter 5 for more information about service topology maps.

Procedure 74-5 To configure BGP, OSPFv2, OSPFv3, PIM, RIP, or L2TP on a VPRN routing instance

Note — To configure IGMP on a VPRN routing instance, see Procedure 74-6.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.
3. Select a VPRN service.
4. Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.
5. On the navigation tree, click on the site to which you want to add the routing instance; expand the entries for that site.
6. Expand the Routing Instance icon.
7. Right-click on the Protocols icon and perform one of the following from the contextual menu:
    a. Choose Create BGP Site to configure BGP on the VPRN routing instance, and then perform steps 4 to 28 of Procedure 31-2.
    b. Choose Create OSPF Site to configure OSPFv2 on the VPRN routing instance, and then perform steps 5 to 19 of Procedure 31-22.
    c. Choose Create OSPF Site to configure OSPFv3 on the VPRN routing instance, and then perform steps 5 to 11 and steps 13 to 19 in Procedure 31-22.
    d. Choose Create PIM Site to configure PIM on the VPRN routing instance, and then perform steps 4 to 81 in Procedure 31-33.
    e. Choose Create RIP Site to configure RIP on the VPRN routing instance, and then perform steps 4 to 15 in Procedure 31-8.
    f. Choose Create L2TP Site to configure L2TP on the VPRN routing instance, and then perform steps 3 to 18 in Procedure 31-30.
8. Click on the OK button. The protocol configuration form closes, and a dialog box appears.
9. Click on the OK button. The VPRN (Edit) form reappears.
10. Click on the OK button. A dialog box appears.
11. Click on the Yes button to confirm the action. The VPRN (Edit) form closes.
12. Close the Manage Services form.

Procedure 74-6 To configure IGMP on a VPRN routing instance

Note — PIM-SSM for IPv6 is currently not supported in VPRN services.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.
3. Select a VPRN service.
4. Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.
5. On the navigation tree, click on the site to which you want to add the routing instance; expand the entries for that site.
6. Expand the Routing Instance icon.
7. Right-click on the Protocols icon and choose Create IGMP Site from the contextual menu. The IGMP Site (Edit) form opens with the General tab displayed.
8. Configure the parameters:
   - Administrative State
   - Query Interval (seconds)
   - Last Member Query Interval (seconds)
   - Query Response Interval (seconds)
   - Robust Count
9. Click on the SSM Translation tab button to configure SSM, if required.
   - **i** Click on the Create button to create a new entry. The SSM Translation (Create) form opens.
   - **ii** Configure the parameters:
     - Start Mcast Address
     - End Mcast Address
     - Configured Source
   - **iii** Click on the OK button. A dialog box appears.
   - **iv** Click on the OK button. The new SSM entry appears on the form.
10. Click on the Interfaces tab button to add an interface, if required.
    - **i** Click on the Create button.
    - **ii** Perform steps 4 to 15 of Procedure 31-39.
    - **iii** Click on the OK button. The new interface entry appears on the form.

11 Click on the Group Interfaces tab button to identify an IGMP group interface for a VPRN service, if required.

12 Click on the Create button and configure the parameters in the IGMP Group Interface - Routing Instance (Create) form:

- Description
- Administrative State
- Forwarding Service ID
- Name

13 Click on the OK button. The Group Interfaces tab reappears.

14 Click on the Select button next to the Interface ID field to select a group interface from the Select IGMP Group Interface - IGMP Group Interface - Routing Instance form.

15 Click on the following tab buttons to view and edit information.

- Multicast Group/Source
- Statistics
- Faults

16 Click on the OK button. The protocol configuration form closes, and a dialog box appears.

17 Click on the OK button. The VPRN (Edit) form reappears.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button to confirm the action. The VPRN (Edit) form closes.

20 Close the Manage Services form.

Procedure 74-7 To add a Global Route Table to a VPRN site

Packets within a VRF are able to perform a parallel lookup against a Global Route Table (GRT), as well as within the local VRF table. A successful routing table match found in the local VRF is typically preferred over any match found in the GRT. However, a static route can be used to allow for specific prefixes covered by the static route to fail the lookup in the local VRF table, thus resulting in the guaranteed use of a route from the GRT.

The GRT is populated by defining export policies for each participating VPRN service, and the maximum number of routes that are exported from a specific VRF can be limited.

Note — The addition of a GRT to a VPRN service is supported only on a 7450 ESS in mixed mode, and on a Release 8.0 or later 7710 SR or 7750 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose the required VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the GRT; expand the entries for that site.

5 Right-click on the routing instance to which you want to add the GRT and select Properties. The VPRN Site (Edit) form opens, with the General tab displayed.

6 Click on the Routing tab.

7 Configure the Enable GRT Lookup parameter in the General sub-tab.

8 Click on the GRT Export Policies sub-tab.

9 Configure the Max Number of Exported Policies parameter.

10 Specify up to five export policies by using the Select button to choose policies from the filtered list and then clicking on the OK button.

11 Click on the OK button. A dialog box appears.

12 Click on the OK button. The VPRN Site (Edit) form closes and a dialog box appears.

13 Click on the OK button. The VPRN Service (Edit) form closes.

14 Close the Manage Services form.

Procedure 74-8 To add a PIM interface to a VPRN

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service.

4 Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, click on the site to which you want to add the PIM; expand the entries for that site.

6 Expand the Routing Instance icon.

7 Expand the Protocols icon.

8 Right-click on a PIM instance in the service navigation tree and choose Create PIM Interface. The PIM Interface, Routing Instance (Create) form opens.

9 Assign an L3 access interface to the PIM interface by clicking on the Select button in the Interface panel. The Select Interface - PIM Interface form opens.

10 Configure the filter criteria. A list of available L3 access interfaces appears at the bottom of the Select Interface - PIM Interface form.

11 Select an interface and click on the OK button. The Select Interface - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the L3 access interface information.

12 Configure the parameters:

- Description
- Administrative State
- BFD Enabled

13 Click on the Behavior tab button.

14 Configure the parameters:

- Hello Interval (seconds)
- Tracking Support
- BSM Check Router Alert
- Improved assert
- Max Groups
- Three Way Hello
- Multicast Senders
- Hello Multiplier
- Assert Period
- DR Priority
- Sticky DR
- Sticky DR Priority

The Sticky DR Priority parameter is configurable when the Sticky DR parameter is enabled.

15 Click on the Multicast CAC tab button to add a multicast CAC policy, if required. The General tab is displayed.

16 Click on the Select button in the Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - PIM Interface form opens.

17 Choose a multicast CAC policy from the list and click on the OK button. The Select Multicast CAC Policy - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the multicast CAC policy information.

18 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

19 Click on the OK button. A dialog box appears.

20 Click on the OK button.

21 Click on the OK button to close the VPRN (Edit) form. A dialog box appears.

22 Click on the Yes button to confirm the action. The VPRN (Edit) form closes.

23 Click on the Close button to close the Manage Services form.

Procedure 74-9 To add an IGMP interface to a VPRN

Note — IGMP must be enabled at the routing instance level before you can create an IGMP interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN and click on the Properties button. The VPRN (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the IGMP interface; expand the entries for that site.

5 Right-click on an IGMP instance and choose Create IGMP Interface. The IGMP interface, Routing Instance (Create) form opens with the General tab displayed.

6 Assign an L3 access interface to the PIM interface by clicking on the Select button in the Interface panel. The Select Interface - PIM Interface form opens.

7 Configure the filter criteria. A list of available L3 access interfaces appears at the bottom of the Select Interface - PIM Interface form.

8 Select an interface and click on the OK button. The Select Interface - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the L3 access interface information.

9 Configure the parameters:

- Description
- Administrative State
- Administrative Version
- Maximum Number of Groups
- Subnet Check

10 Click on the Behavior tab button to add an import policy, if required.

11 Click on the Select button in the Properties panel to choose an import policy. The Select - IGMP Interface form opens.

12 Configure the filter criteria. A list of import policies appears at the bottom of the Select - IGMP Interface form.

13 Choose an import policy from the list and click on the OK button. The Select - IGMP Interface form closes and the IGMP Interface, Routing Instance (Create) form reappears.

14 Click on the Multicast CAC tab button to add a multicast CAC policy, if required.

15 Click on the Select button in the Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - IGMP Interface form opens.

16 Choose a multicast CAC policy from the list and click on the OK button. The Select Multicast CAC Policy - IGMP Interface form closes and the IGMP Interface, Routing Instance (Create) form refreshes with the multicast CAC policy information.

17 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

18 Click on the Static Group/Source tab button to add a static multicast group or source, if required.

19 Click on the Create button to add a new entry. The StaticGrpSrc, Routing Instance (Create) form opens.

20 Configure the parameters:

- Static Multicast Group
- Static Source

21 Click on the OK button. The StaticGrpSrc, Routing Instance (Create) form closes and a dialog box appears.

22 Click on the OK button to confirm the action.

23 Click on the OK button to close the IGMP Interface, Routing Instance (Create) form. A dialogue box opens.

24 Click on the OK button to confirm the action. The VPRN (Edit) form reappears.

25 Click on the OK button to close the VPRN (Edit) form. A dialog box appears.

26 Click on the Yes button to confirm the action. The VPRN (Edit) form closes and the Manage Services form reappears.

27 Close the Manage Services form.

Procedure 74-10 To create a VPRN spoke SDP binding

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN and click on the Properties button. The VPRN (Edit) form opens.

4 On the navigation tree, click on the site to which you want to add the spoke SDP binding; expand the entries for that site.

5 Right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding from the contextual menu. The Spoke SDP Binding (Create) form opens with the General tab displayed.

6 Specify a source interface for the SDP binding:

   i Click on the Select button in the Source Interface panel. The Select Source Interface - Spoke SDP Binding form opens.

   ii Configure the filter criteria. A list of interfaces appears at the bottom of the form.

   iii Select an entry and click on the OK button. The Select Source Interface - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the source interface information.

   iv Configure the parameters:

   - VC ID
   - Auto-Assign ID
   - VC Type
   - Enable Hash Label
   - Enable Signal Capability

   The Enable Hash Label and Enable Signal Capability parameters can only be configured for spoke-SDP bindings that are access interface terminated.

7 Specify a destination node for the spoke SDP binding:

   a If the destination node is a managed node, choose from a list of managed nodes.

      i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

      ii Select a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

   b If the destination node is an unmanaged node, specify its system ID in the Tunnel Termination Site parameter.

8 Configure the Description parameter.

9 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

10 Specify an application profile for the spoke SDP binding.

i Click on the Select button next to the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of application profiles appears.

iii Choose an application profile from the list and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding - VPRN service form displays only local profiles on the NE.

11 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 3 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Select a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit IP policy and click on the OK button.

12 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab button.

ii Click on the Reporting tab button.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab button.

13 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

> **Note —** You can create a return tunnel only between sites that are within the same service. If the sites are not in the same service, the Return tab does not appear.

a Let the 5620 SAM configure the transport tunnel automatically.

i Click on the Return tab.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure either the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Return tab.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

14 Click on the States tab button.

15 Configure the Administrative State parameter.

16 Associate a MEP to the spoke SDP binding, if required.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

17 If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab button. Otherwise, go to step 21.

18 Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

19 Click on the AIS tab button.

20 Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

21 Click on the OK button. A dialog box appears.

22 Click on the OK button. The MEP (Create) form closes.

23 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

24 Click on the OK button.

Procedure 74-11 To create an L2 SDP spoke termination on a VPRN service

Ensure that a service and site have been created in the VPRN. To terminate an L2 service on a VPRN SDP spoke, you must identify the VC and an interface belonging to the VC. The interface must not have an associated port.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN and click on the Properties button. The VPRN (Edit) form opens.

4 On the navigation tree, click on the site to which you want to create an L2 SDP spoke termination; expand the entries for that site.

5 Right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding (Create) form opens with the General tab displayed.

6 Click on the Select button in the Source Interface panel to select an interface with no port assigned.

If you are creating this spoke SDP binding for use with an IP mirror interface, select the required IP mirror interface as the source interface.

7 Click on the OK button. The Select Interface - Spoke SDP Bindings form closes and the Spoke SDP Bindings (Create) form reappears with the interface information displayed.

8 Specify a destination node for the spoke SDP binding by performing one of the following tasks.

a If the destination node is a managed node, choose from the list of managed nodes.

i Click on the Select button in the Tunnel Termination Site panel. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

c If you are configuring IP mirroring, select a mirror source site as the tunnel termination site.

9 Configure the parameters:

- Auto-Assign ID
- VC ID
- VC Type
- Ingress Label
- Egress Label
- Enable Hash Label
- Enable Signal Capability

  The Enable Hash Label and Enable Signal Capability parameters can only be configured for spoke-SDP bindings that are access interface terminated. They cannot be configured on mirroring interfaces.

If you are configuring IP mirroring, set the VC ID parameter to the mirror service ID.

10 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure either the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Select a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

11 Select an Application Profile for the spoke SDP binding.

i Click on the Select button next to the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of Application Profiles appears.

iii Choose an application profile from the list and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding - VPRN service form displays only local profiles on the NE.

12 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 3 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Select a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Select a transit IP policy and click on the OK button.

13 Click on the States tab button.

14 Configure the Administrative State parameter.

15 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.

iii Select an ingress ACL filter. If you are configuring IP mirroring, you can optionally select an ingress IP filter. This is a packet mirroring option which specifies that packets matching the IP filter are mirrored to the mirror destination. Click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes and the L3 Access Interface (Create) form reappears with the egress ACL filter information displayed.

16 If you are configuring IP mirroring, go to step 18.

17 Assign an accounting policy to the spoke SDP binding, if required.

i Click on the Accounting tab button.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Spoke SDP Binding form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - Spoke SDP Binding form closes and the L3 Access Interface (Create) form reappears with the accounting policy information displayed.

18 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

19 Click on the OK button. The VPRN (Edit) form reappears with the new information displayed in the service navigation tree.

Procedure 74-12 To add a subscriber interface to a VPRN

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a subscriber interface in a VPRN.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Sreach button. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN and click on the Properties button. The VPRN Service Subscriber (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the subscriber interface; expand the entries for that site.

5 Right-click on the Subscriber Interfaces icon and choose Create VPRN Subscriber Interface. The VPRN Subscriber Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Default Primary DNS Server Address
- Default Secondary DNS Server Address
- Tunnel Fault Notification

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with Q in Q encapsulation.

If you are configuring a facility tunnel MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the facility tunnel MEP.

Note 1 — The Name value for a subscriber interface must be unique in the context on the VPRN Service Site. That is, there cannot be another L3 access interface, subscriber interface, or group interface with the same name on the same VPRN site.

Note 2 — You must configure the Default Primary DNS Server Address parameter before you can configure the Default Secondary DNS Server Address parameter.

7 Configure IPv6 forwarding on the subscriber interface, if required.

i Configure the IPv6 Allowed and IPv6 Delegated Prefix Length parameters.

- IPv6 Allowed
- IPv6 Delegated Prefix Length
- Admin Link Local Address

The Admin Link Local Address parameter is only configurable when the IPv6 Allowed parameter is enabled.

ii Click on the IPv6 Subscriber Prefixes tab button.

iii Select a subscriber prefix from the list and click on the Properties button, or click on the Create button to create a new subscriber prefix.

iv In the Subscriber Prefix [Edit|Create] form, configure the parameters:

- Address ID
- IP Address
- Prefix Length
- WAN Host
- Prefix Delegation

8 Configure the Interface Class parameters, if required.

i Configure the Class parameter.

ii If you selected a value of Unnumbered for the Class parameter, configure the Unnumbered Type parameter.

iii Configure the Interface Name parameter or the IP Address parameter.

9 Perform one of the following:

a Create a subscriber interface for a wholesale and retail VPRN.

When you configure the routing instance for the VPRN, you can set the Type parameter to Subscriber Split Horizon to enable the forwarding service and forwarding subscriber information. The subscriber split horizon VPRN controls the flow of traffic for wholesale subscriber applications. See Procedure 74-1 for more information on how to configure this parameter.

Note — You cannot create a group interface under a forwarding subscriber interface.

Go to step 10.

b Create a subscriber interface for a traditional VPRN. Go to step 12.

10 Assign a forwarding service to the subscriber interface if you are configuring a wholesale and retail configuration for the VPRN.

i Click on the Select button in the Forwarding Service panel to choose a service. The Select Forwarding Service - VPRN Subscriber Interface form opens.

ii Select a service and click on the OK button. The Select Forwarding Service - VPRN Subscriber Interface form closes, and the VPRN Subscriber Interface (Create) form reappears with the service information displayed.

iii Configure the Private Retail Subnet parameter that appears after you have assigned a forwarding service.

11 Assign a forwarding subscriber interface to the VPRN subscriber interface.

i Click on the Select button in the Forwarding Subscriber Interface panel to choose a subscriber. The Select Forwarding Subscriber Interface - VPRN Subscriber Interface form opens.

ii Select a subscriber and click on the OK button. The Select Forwarding Subscriber Interface - VPRN Subscriber Interface form closes, and the VPRN Subscriber Interface (Create) form reappears with the subscriber information displayed.

12 Create IP addresses for the subscriber interface that are inherited by the SAPs in the group interfaces that are child objects of the subscriber interface.

i Click on the Addresses tab button.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Populate Host Routes
- Track SRRP Instance
- Hold Up Time (milliseconds)
- Gateway IP Address
- Broadcast Address Format

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The Subscriber Interface (Create) form reappears with the assigned IP addresses displayed.

vi Repeat steps ii to v for each additional IP address that you want to create.

13 Configure IPv4 DHCP for the interface, if required.

i Click on the DHCP tab button.

ii If you specified a forwarding service in step 10, the General tab is configurable. Configure the parameters that define the forwarding service information. Otherwise go to step vii.

- Enable DHCP Relay
- Description
- Lease Populate

iii If you specified a forwarding service in step 10 and depending on the type and version of the device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step vii.

iv Click on the Select button in the Subscriber Authentication Policy panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - SubItfDhcpRelayCfg form opens.

v Configure the filter criteria. A list of available policies appears.

vi Select a policy and click on the OK button. The Select Subscriber Authentication Policy - SubItfDhcpRelayCfg form closes, and the VPRN Subscriber Interface (Create) form refreshes with the subscriber authentication policy name.

vii Configure the parameters:

- IP Address
- Use as source

viii Click on the Server tab button.

ix Configure the parameters.

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time RADIUS Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

x Click on the Client Applications tab button.

xi Configure the Client Applications parameter. You can enable either or both of the PPPoE or DHCP choices.

14 Configure PPPoE for the interface, if required.

Note — PPPoE is only configurable on a VPRN subscriber interface if the interface is a retailer interface.

i Click on the PPPoE tab button.

ii Configure the parameters:

- Description
- Session Limit

15 Configure the ARP host for the interface, if required.

Note — The ARP host is only configurable on a VPRN subscriber interface when the interface is a retailer interface.

i Click on the ARP Host Configuration tab button.

ii Configure the parameters:

- Administrative State
- ARP Host Limit

16 Click on the OK button. The VPRN Subscriber Interface (Create) form closes, and a dialog box appears.

17 Click on the OK button. The VPRN (Edit) form reappears with the new subscriber interface displayed in the service navigation tree.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button. The VPRN (Edit) form closes, and the Manage Services form reappears.

20 Close the Manage Services form.

Procedure 74-13 To add a group interface to a VPRN

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a group interface in a VPRN.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN and click on the Properties button. The VPRN (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the group interface; expand the entries for that site.

5 Right-click on the subscriber interface to which you want to add a group interface, and choose Create VPRN Subscriber Interface. The VPRN Subscriber Interface (Create) form opens with the General tab displayed.

6 Click on the Group Interfaces tab button.

7 Click on the Create button and the VPRN Group Interface (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Trusted
- LNS
- IPv6 Allowed
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6

Note — The LNS parameter defines the type of group interface (regular or LNS). This parameter is set at creation time and cannot be modified. Regular group interfaces cannot configure LNS attributes and an LNS group interface does not allow PPPoE configuration or SAPs.

9 Configure IPv6 router advertisement and DHCPv6 on the group interface, if required.

i Configure the IPv6 Allowed parameter.

ii Click on the IPv6 Advertisement tab button and configure the parameters:

- Administrative State
- Current Hop Limit
- Managed Address Config
- Max Interval (seconds)
- Min Interval (seconds)
- Link MTU
- Other Stateful Config
- Reachable Time (milliseconds)
- Retransmit Time (milliseconds)
- Router Lifetime (seconds)
- Autonomous Address Configuration
- Preferred Life Time
- Lifetime (seconds)

iii Click on the DHCPv6 tab button.

iv Click on the Select button and select a local user database from the Select Local User Database form.

v Click on the Proxy Server tab button and configure the parameters:

- Administrative State
- Renew Timer
- Rebind Timer
- Valid Life Time
- Preferred Life Time
- Client Applications

vi Click on the Relay tab button and configure the parameters:

- Administrative State
- Description
- Remote ID
- Client Applications

vii Configure the DHCP Server 1 through DHCP Server 8 parameters:

- Server 1 through Server 8
- Configure the interface name for each DHCPv6 server by clicking on the Select button in the Zone Index panel. The Select Zone Index - GrplfDhcpv6RelayCfg form opens with a list of local L3 access interfaces.
- Select an interface from the list and click on the OK button. The Select Zone Index - GrplfDhcpv6RelayCfg form closes and the VPRN Group Interface form refreshes with the interface name.

Note — If you have entered a Unicast address, then the Interface Name parameter is not required.

10 Click on the Anti-Spoofing tab button.

11 Configure the ARP Populate parameter.

12 Click on the Subscriber Management tab button.

13 Configure the parameters:

- SHCV Enabled
- SHCV Interval (minutes)
- SHCV Source
- SHCV Action

14 Configure ICMP for the group interface, if required.

i Click on the ICMP tab button.

ii Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

15 Configure ARP for the group interface, if required.

i Click on the ARP tab button. The General tab is displayed.

ii Configure the Timeout (seconds) parameter.

iii Click on the Proxy ARP tab button.

iv Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1 through Proxy ARP Policy 1

16 Configure IPv4 DHCP relay for the group interface, if required.

i Click on the DHCP tab button. The DHCP form opens with the General tab displayed.

ii Configure the parameters:

- Enable DHCP Relay
- Description
- Match Circuit ID
- Trusted
- Lease Populate
- L2 Header
- Anti-Spoof MAC Address
- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address
- Use as source

iii Depending on the type and version of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step x.

iv Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - GrpItfDhcpRelayCfg form opens.

v Configure the filter criteria. A list of available policies appears.

vi Select a policy and click on the OK button. The Select Subscriber Authentication Policy - GrpItfDhcpRelayCfg form closes, and the VPRN Group Interface (Create) form reappears with the policy name information displayed.

vii Click on the Select button in the Local User Database panel to choose a local user database. The Select localUserDbPointer - GrpItfDhcpRelayCfg form opens.

viii Configure the filter criteria. A list of available databases appears.

ix Select a database and click on the OK button. The Select localUserDbPointer - GrpItfDhcpRelayCfg form closes, and the VPRN Group Interface (Create) form reappears with the database name information displayed.

x Click on the Server tab button.

xi Configure the parameters:

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time RADIUS Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time RADIUS Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

xii Click on the Client Applications tab button.

xiii Configure the Client Applications parameter.

17 Click on the PPP tab button.

18 Configure the Description and Administrative State parameters:

19 Click on the Select button in the PPPoE Policy panel. The Select PPPoE Policy form opens.

20 Select a PPPoE policy from the list and click on the OK button. The Select PPPoE Policy form closes.

21 Click on the Select button in the PPPoE Local User DB panel. The Select PPPoE Local User DB form opens.

22 Select a PPPoE Local User DB from the list and click on the OK button. The Select PPPoE Local User DB form closes.

23 Click on the Select button in the PPP Policy panel. The Select PPP Policy form opens.

24 Select a PPP policy from the list and click on the OK button. The Select PPP Policy form closes.

25 Click on the Select button in the PPP Local User DB panel. The Select PPP Local User DB form opens.

26 Select a PPP Local User DB from the list and click on the OK button. The Select PPP Local User DB form closes.

27 Configure the remaining parameters:

- Session Limit
- Session Limit per SAP

28 Configure the ARP host for the group interface, if required.

i Click on the ARP Host Configuration tab button.

ii Configure the parameters:

- Administrative State
- ARP Host Limit
- Minimum Authentication Interval (minutes)
- SAP ARP Host Limit

29 If you set the LNS parameter to TRUE in step 8, perform the following steps to configure LNS for the group interface.

> **Note —** After you create an LNS group interface, you must configure the L2TP tunnel group profile or tunnel profile to terminate sessions for the LNS group interface that you just created; see Procedure 31-30. You can also configure the termination of sessions on a group interface using a RADIUS server.

i Click on the LNS tab button.

ii Configure the Description parameter.

iii Click on the Select button in the Default Subscriber Profile panel. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form opens with a list of available profiles.

iv Choose a subscriber profile from the list and click on the OK button. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the Subscriber Profile displayed.

v Click on the Select button in the Default SLA Profile panel. The Select Default SLA Profile (Terminate LNS PPP Sessions) form opens with a list of available SLA profiles.

vi Choose an SLA profile from the list and click on the OK button. The Select Default SLA Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the SLA Profile displayed.

vii Click on the Select button in the Subscriber Identification Policy panel. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form opens with a list of available subscriber identification policies.

viii Choose a subscriber identification policy from the list and click on the OK button. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the subscriber identification policy displayed.

ix Click on the Select button in the Default Application Profile panel. The Select Default Application Profile (Terminate LNS PPP Sessions) form opens with a list of available default application profiles.

x Choose a default application profile from the list and click on the OK button. The Select Default Application Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the default application profile displayed.

30 Configure the Default Subscriber Identification String parameter.

31 Click on the Service Access Points tab button to configure SAPs for the group interface.

32 Click on the Create button. The VPRN Service Access Point (Create) form opens with the General tab displayed.

33 Configure the parameters:

- Name
- Description
- Administrative State
- Calling Station ID

34 Click on the Port tab button.

35 Click on the Select button to choose a port for the L3 access interface. The Select Terminating Port - VPRN L3 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

36 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPRN L3 Access Interface form closes, and the VPRN L3 Access Interface (Create) form displays the port information.

37 Configure the parameters:

- Auto-Assign ID
- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

The Auto-Assign ID parameter is configurable if the port uses dot1q encapsulation. When the parameter is enabled, the 5620 SAM automatically configures the Outer Encapsulation Value parameter using the lowest unassigned value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with Q in Q encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

38 Assign ingress and egress QoS policies to the SAP, if required.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once. Choose and right-click the components in the service navigation tree, choose Properties, and configure the parameters on the appropriate tab.

i Click on the QoS tab button.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is BCP dot1q, dot1q, or Q in Q.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - VPRN Service Access Point form opens.

iv Configure the filter criteria and click on the Search button. A list of available ingress policies appear.

v Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form reappears with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you selected in step 36 has the access ingress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

vi Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - VPRN Service Access Point form opens.

vii Configure the filter criteria and click on the Search button. A list of available egress policies is displayed.

viii Select an egress QoS policy and click on the OK button. The Select Egress Policy - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form reappears with the egress QoS policy information displayed.

Note — If you select an egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you selected in step 36 has the access egress queue group with the same name created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

39 Click on the Schedulers tab button to configure scheduling; otherwise, go to step 41.

Note — The Schedulers tab is configurable only if a port is assigned to the SAP earlier in the procedure.

40 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the SAP.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 36 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 36 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - VPRN Service Access Point form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Ingress Policer Control Policy form opens.

vi Select a policer control policy and click on the OK button. The Select Ingress Policer Control Policy form closes and the VPRN Service Access Point (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 36 is an HSMDA port, go to step 41.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - VPRN Service Access Point form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Egress Policer Control Policy form opens.

xi Select a policer control policy and click on the OK button. The Select Egress Policer Control Policy form closes and the VPRN Service Access Point (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 41.

b Specify that an aggregation scheduler policy is applied to the SAP.

i Set the Aggregation parameter to on.

Note — You cannot specify an access scheduler policy if the port you selected in step 36 is an HSMDA port. Go to step 41.

ii Configure the Frame-Based Accounting parameter.

iii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - VPRN Service Access Point form opens.

iv Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form refreshes with the aggregation scheduler information displayed.

41 Assign ingress and egress ACL filters to the SAP, if required.

i Click on the ACL tab button.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter from the Select Ingress Filter - VPRN Service Access Point form.

iii Click on the Select button in the Egress Filter panel to choose an egress ACL filter from the Select Egress Filter - VPRN Service Access Point form.

42 Click on the Accounting tab button to assign an accounting policy to the SAP.

i Configure the Collect Accounting Statistics parameter.

ii Click on the Select button to choose an accounting policy. The Select Accounting Policy - VPRN Service Access Point form opens.

iii Select an accounting policy and click on the OK button. The Select Accounting Policy - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form reappears with the accounting policy information displayed.

43 Click on the Anti-Spoofing tab button to configure anti-spoofing for the SAP.

i Configure the Anti-Spoofing parameter.

To configure residential subscriber management for static hosts, the Anti-Spoofing parameter must be set to at least IP-address matching, or optionally, to IP- and MAC-address matching.

ii Click on the Static Hosts tab button to add a static host to the SAP.

iii Click on the Static Hosts tab button to configure a static subscriber host entry for each subscriber host that is not managed by DHCP.

iv Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

v Configure the parameters:

- IP Address
- MAC Address
- Subscriber Identification

vi Configure residential subscriber management for the static host.

vii Click on the Select button in the Subscriber Profile panel to choose a subscriber profile for the static host, if required. The Select Subscriber Profile - AntiSpoofingStaticHosts form opens with the list of available subscriber profiles displayed. Otherwise, go to step 44.

viii Select a subscriber profile and click on the OK button. The Select Subscriber Profile - AntiSpoofingStaticHosts form closes, and the subscriber profile name appears in the Subscriber Profile panel.

ix Click on the Select button in the SLA Profile panel to choose an SLA profile for the static host. The Select SLA Profile - AntiSpoofingStaticHosts form opens with the list of available SLA profiles displayed.

x Select an SLA profile and click on the OK button. The Select SLA Profile - AntiSpoofingStaticHosts form closes, and the SLA profile name appears in the SLA Profile panel.

xi Click on the Select button in the Application Profile panel to choose an application profile for the static host. The Select Application Profile - AntiSpoofingStaticHosts form opens with the list of application profiles on the NE displayed.

xii Select an application profile and click on the OK button. The Select Application Profile - AntiSpoofingStaticHosts form closes, and the application profile name appears in the Application Profile panel.

44 Click on the OK button. A dialog box appears.

45 Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes.

46 Assign a DoS protection policy to the SAP, if required.

Note — A default DoS protection policy is automatically assigned to the SAP.

i Click on the Security tab button.

ii Click on the Select button. The Select NE DoS Protection - VPRN Service Access Point form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - VPRN Service Access Point form closes and the policy ID is displayed on the L3 Access Interface (Create) form.

iv Configure the MAC Monitoring parameter.

47 Click on the Subscriber Management tab button to configure residential subscriber management on the SAP. The IGMP Host Tracking tab is displayed.

i Click on the Select button to choose the import policy used to filter IGMP packets. The Select SapIgmpHostTracking form opens.

ii Configure the filter parameters and click on the Search button. A list of import policies appears.

iii Choose a policy and click on the OK button. The selected import policy name appears.

iv Configure the parameters:

- Expiry Time
- Max Number of Groups
- Max Number of Sources per Group
- Disable Router Alert Check

v You can click on the Host Tracking Info tab button to view a list of hosts that are being tracked on this service access point.

vi Click on the Profiles tab button.

vii Configure the parameters:

- Admin Status
- Service Model
- Subscriber Limit
- Profiled Traffic only
- Non-Subscriber Traffic Identification
- Default Subscriber Identification Type
- Default Subscriber Id
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id

viii Click on the Select button in the Default Subscriber Profile panel to choose a default subscriber profile for the SAP, if required. The Select Default Subscriber Profile form opens with the list of available subscriber profiles displayed.

ix Select a subscriber profile and click on the OK button. The Select Default Subscriber Profile form closes, and the subscriber profile name appears in the Default Subscriber Profile panel.

x Click on the Select button in the Default SLA Profile panel to choose a Default SLA profile for the SAP, if required. The Select Default SLA Profile form opens with the list of available SLA profiles displayed.

xi Select an SLA profile and click on the OK button. The Select Default SLA Profile form closes, and the SLA profile name appears in the Default SLA Profile panel.

xii Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy for the SAP, if required. The Select Subscriber Identification Policy form opens with the list of available subscriber identification policies displayed.

xiii Select a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy form closes, and the subscriber identification policy name appears in the Subscriber Identification Policy panel.

xiv Click on the Select button in the Default Application Profile panel to choose a default application profile for the SAP, if required. The Select Default Application Profile form opens with the list of application profiles on the NE displayed.

xv Select an application profile and click on the OK button. The Select Default Application Profile form closes, and the application profile name appears in the Default Application Profile panel.

xvi Click on the Select button in the Non-Subscriber Traffic Subscriber Profile panel to choose a non-subscriber subscriber profile for the SAP, if required. The Select Non-Subscriber Traffic Subscriber Profile form opens with the list of available subscriber profiles displayed.

xvii Select a subscriber profile and click on the OK button. The Select Non-Subscriber Traffic Subscriber Profile form closes, and the subscriber profile name appears in the Non-Subscriber Traffic Subscriber Profile panel.

xviii Click on the Select button in the Non-Subscriber Traffic SLA Profile panel to choose a Non-Subscriber Traffic SLA profile for the SAP, if required. The Select Non-Subscriber Traffic SLA Profile form opens with the list of available SLA profiles displayed.

xix Select an SLA profile and click on the OK button. The Select Non-Subscriber Traffic SLA Profile form closes, and the SLA profile name appears in the Non-Subscriber Traffic SLA Profile panel.

xx Click on the Select button in the Non-Subscriber Traffic Application Profile panel to choose a non-subscriber traffic application profile for the SAP, if required. The Select Non-Subscriber Traffic Application Profile form opens with the list of application profiles on the NE displayed.

xxi Select an application profile and click on the OK button. The Select Non-Subscriber Traffic Application Profile form closes, and the application profile name appears in the Non-Subscriber Traffic Application Profile panel.

xxii Click on the Subscriber Hosts tab button to view active hosts for the subscriber instance, if required.

48 Configure ATM on the SAP, if required.

i Click on the ATM tab button.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Select an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the VPRN Service Access Point (Create) form refreshes with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Select an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the VPRN Service Access Point (Create) form refreshes with the egress ATM policy information displayed.

49 Click on the OK button. The VPRN Service Access Point (Create) form closes and a dialog box appears.

50 Click on the OK button. The VPRN Group Interface (Create) form refreshes to display the SAP.

51 To configure an additional SAP in the group interface, go to step 32.

52 Click on the SRRP tab button.

53 Configure the parameters in the Routing panel:

- Enabled
- Hold Time (seconds)

54 Click on the Create button in the SRRP Instance panel. The SRRP Instance (Create) form opens with the General tab displayed.

55 Configure the parameters:

- SRRP ID
- Description
- Administrative State

56 Click on the Select button in the Operational Group panel. The Select Monitored Group Name - SRRP Instance form opens.

57 Select a Monitored Group Name and click on the OK button. The Select Monitored Group Name - SRRP Instance form closes.

58 Configure the Priority Step parameter.

59 Click on the Behavior tab button.

60 Configure the General parameters:

- Gateway MAC Address
- Keep Alive Interval
- Priority
- Preempt
- FIB Population Mode
- One Gratuitous ARP Per SAP

61 Click on the Select button in the Message Path panel. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site.

62 Select the SAP you want to use for the in-band messaging between the sites and click on the OK button. The Select Message Path Pointer - SRRP Instance form closes.

63 Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 1 - SRRP Instance form opens.

64 Select an entry and click on the OK button. The Select Policy Pointer 1 - SRRP Instance form closes.

65 Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 2 - SRRP Instance form opens.

66 Select an entry and click on the OK button. The Select Policy Pointer 2 - SRRP Instance form closes.

67 Click on the OK button. The SRRP Instance (Create) form closes and a dialog box appears.

68 Click on the OK button.

69 Click on the OK button. The VPRN Group Interface (Create) form closes and a dialog box appears.

70 Click on the OK button. The VPRN (Edit) form refreshes to display the SAP below the group interface.

71 Click on the OK button. A dialog box appears.

72 Click on the Yes button. The VPRN (Edit) form closes.

73 Close the Manage Services form.

Procedure 74-14 To collect and view PPP ATM SAP statistics and information for a VPRN group interface

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Choose VPRN Service (VPRN) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of VPRN services appears.

4 Select a service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

5 On the navigation tree, click on a group interface. The VPRN Group Interface (Edit) form opens.

6 Click on the Statistics tab button.

7 Choose PPP ATM SAP (Service Management) from the object drop-down list.

8 Click on the Collect button to collect the PPP ATM SAP statistics.

9 Select a statistics record and click on the Properties button to view the record. The statistics record form opens.

10 View the statistics information.

11 Click on the Close button to close the statistics record form.

12 Repeat steps 9 to 11 for each statistics record that you want to view.

13 Close the VPRN Group Interface (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 74-15 To add an IP mirror interface to a VPRN

Perform this procedure to configure an IP mirror interface in a VPRN service. This is a spoke terminated interface used to receive mirrored packets from a remote source.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN and click on the Properties button. The VPRN (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the IP mirror interface; expand the entries for that site.

5 Right-click on IP Mirror Interfaces and choose Create IP Mirror Interface. The IP Mirror Interface (Create) form opens.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

Note — The Name value for an IP mirror interface must be unique in VPRN site. There cannot be another L3 access interface, subscriber interface, or group interface with the same name on the VPRN site.

7 Click on the OK button. The IP Mirror Interface (Create) form closes and a dialog box appears.

8 Click on the OK button. The VPRN (Edit) form reappears with the IP mirror interface displayed in the service navigation tree.

9 Create a spoke SDP binding for the interface by performing steps 5 to 19 of Procedure 74-11.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The VPRN (Edit) form closes, and the Manage Services form reappears.

12 Close the Manage Services form.

Procedure 74-16 To implement dual homing using SRRP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service and click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

4 Create the redundant interface used for SRRP out-of-band messaging between the two NEs.

Note 1 — The two sites that participate in the dual homing configuration do not have to be part of the same service.

Note 2 — Ensure that the pair of sites each contains a properly configured subscriber interface and SAPs underneath the group interface that are participating in the redundant configuration.

Note 3 — Ensure that all subscriber interface IP addresses have a gateway address configured on them.

i On the navigation tree, click on the sites to which you want to add the redundant pair; expand the entries for that site.

ii Right-click on Redundant Interfaces for one site of the redundant pair, and choose Create Redundant Interface. The Redundant Interface (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

iv Click on the Addresses tab button.

v Click on the Create button. The IP Address (Create) form opens.

vi Specify IP addresses for the redundant interface on the current and remote sites. Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Remote IP Address
  This must be on the same subnet as the redundant interface IP address of the current site. For example, if the IP address of the current site is 7.7.7.7, with a prefix length of 24, then the redundant interface IP address of the remote site must be 7.7.7.d, where d is a value from 0 to 255, excluding 7.
- Broadcast Address Format

vii Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

viii Click on the OK button. The Redundant Interface (Create) form reappears with the assigned redundant interface IP addresses listed.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Redundant Interface (Create) form for the current site closes.

5 Create an SDP spoke binding between the current and remote sites. The Source Interface is the Redundant Interface you created in step 4 and the Tunnel Termination SIte is the remote site. The Return Tunnel must come from the remote site. See Procedure 74-10 for more information.

6 Assign the Redundant Interface to the Group Interface for the current site.

i On the navigation tree under the Subscriber Interface, right-click on the Group Interface you want to use and choose Properties. The VPRN Group Interface (Edit) form opens with the General tab displayed.

ii Click on the Select button in the Redundant Interface block. The Select Redundant Interface - VPRN Group Interface form opens.

iii Configure the list filter parameters if required and click on the Search button. A list of Redundant Interfaces on the site appears at the bottom of the form.

iv Select the Redundant Interface you created in step 4. The Select Redundant Interface - VPRN Group Interface form closes and the interface you selected appears in the Redundant Interface field.

v Click on the OK button. The VPRN Group Interface (Edit) form closes.

7 Create an SRRP Instance for the current site.

i On the navigation tree under Group Interfaces, right-click on the SRRP Instances item for the current site, and choose Create SRRP Instance. The SRRP Instance (Create) form opens with the General tab displayed.

ii Configure the parameters:

- SRRP ID
- Description
- Administrative State

Note — The SRRP ID value must be the same for the current and remote sites.

iii Click on the Behavior tab button.

iv Configure the General parameters:

- Gateway MAC Address Default is 00-00-00-00-00-00.
- Keep Alive Interval
- Priority
- FIB Population Mode

v Configure the Message Path by clicking the Select button adjacent to the Port field. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site. Select the SAP you want to use for the in-band messaging between the sites.

vi Configure the Policy Pointers for the SRRP Instance, if required.

vii Click on the OK button. The SRRP Instance (Create) form closes, and a dialog box appears.

viii Click on the OK button. The VPRN (Edit) form reappears with the SRRP Instance displayed.

8 Click on the Turn Up button to activate the SRRP instance.

9 Repeat steps 4 to 8 for the remote site.

Note 1 — When you repeat steps 4 to 8 for the remote site, that site becomes the current site and the previously configured site is the remote site.

Note 2 — After the two sites have been properly set up, you can examine the SRRP peer associations at any time by right-clicking an SRRP Instance in the service's navigation tree. This opens the SRRP Instance - Edit form, which contains a read-only field called SRRP Peer. The Site ID, Service ID, and Operational State of the associated peer appear in this field.

You can also examine the state of an SRRP Instance by checking the Operational Flags field. The flags indicate specific problems that might occur with the SRRP Instance, as follows:

- Duplicate Subscriber IF Address: one of the local subscriber IP addresses is the same as a subscriber IP address on the remote node.
- Redundant Interface Mismatch: the local SRRP instance and remote SRRP instance have mismatched redundant interfaces.
- SAP Mismatch: the local SRRP instance is backing a different set of SAPs than the peer.
- Subnet Mismatch: one of the subnets that SRRP is backing up does not have a match with the peer.
- Dual Master: both SRRP instances are master at the same time.
- SAP Tag Mismatch: the local SRRP instance is backing a set of SAPs with different remote and local tags.
- SRRP ID Mismatch: the peer has a different SRRP instance ID backing the same subnet.

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The VPRN (Edit) form closes.

Procedure 74-17 To create an OSPF sham link

Perform this procedure to create an intra-area OSPF sham link between two VPRN sites. See "OSPF sham link support" in section 74.1 for more information.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service.

4 Click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, choose the first site that to participate in the sham link. If you need to create the site, perform steps 7 to 82 of Procedure 74-1.

6 Choose an L3 access interface for the site. If you need to create the L3 access interface, perform steps 5 to 43 of Procedure 74-2.

7 Configure OSPFv2 for the site. Perform to steps 6 to 9 of Procedure 74-5. Ensure that you select sub-step b in step 7.

8 Right-click on the OSPFv2 icon under the Protocols icon and choose Create Sham Link. The ShamLink (Create) form opens with the General tab displayed.

9 Click on the Select button to configure the Remote Neighbor IP Address parameter. This is the IP Address of the other site participating in the sham link.

10 Click on the Select button in the Interface block to configure the Interface Name parameter. The Select Interface - ShamLink form opens.

11 Click on the Search button.

12 Select an interface from the displayed list and click on the OK button. The Select Interface - ShamLink form closes and the ShamLink (Create) form refreshes with the selected Interface Name displayed.

13 Click on the Select button in the Area block to configure the Area ID parameter. The Select Area - ShamLink form opens.

14 Click on the Search button.

15 Select an area from the displayed list and click on the OK button. The Select Area - ShamLink form closes and the ShamLink (Create) form refreshes with the selected Area ID displayed.

16 Configure the Administrative State parameter.

17 Click on the Protocol Properties tab button.

18 Configure the parameters:

- Metric
- Hello Interval (seconds)
- Router Dead Interval (seconds)
- Retransmission Interval (seconds)
- Transit Delay (seconds)

19 The Authentication tab is configurable, depending on the OSPF version. Click on the Authentication tab button to configure authentication for the sham link, if required. Otherwise, go to step 22.

20 Configure the Authentication Type parameter. Perform one of the following:

a Click on the Authentication Type menu button and choose MD5-based Authentication from the drop-down menu.

i Click on the Create button to create an MD5 authentication key. The Md5Key (Create) form opens.

ii Configure the parameters:

- Key Index
- Key
- Re-enter Key

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Md5Key (Create) form closes, and the new authentication key appears in the list.

b Click on the Authentication Type menu button and choose Simple Password from the drop-down menu.

i Click on the Change Password button to enter a password. The Password (Create) form opens.

ii Configure the parameters:

- Password
- Re-enter Password

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Password (Create) form closes.

21 You can click on the Virtual Neighbor tab button to view OSPF configuration information on neighbor sites, if required.

22 Click on the OK button. A dialog box appears.

23 Click on the Yes button. The ShamLink (Create) form closes, and the 5620 SAM displays an icon for the new sham link in the navigation tree.

24 Repeat steps 5 to 23 for the second site participating in the sham link.

25 Click on the OK button. A dialog box appears.

26 Click on the Yes button to confirm the action. The VPRN (Edit) form closes and the Manage Services form reappears.

27 Click on the Close button to close the Manage Services form.

Procedure 74-18 To run an OAM validation test for a VPRN service

An OAM validator test suite must be created for the tested entity. See chapter 78 for more information about how to create an OAM validator test suite.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a service and click on the Properties button. The VPRN (Edit) form opens with the General tab displayed.

4 Click on the More Actions button and choose Validate. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

- **i** Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form appears.
- **ii** Configure the filter criteria. A list of OAM validator test suites appears.
- **iii** Select an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab button.

7 Click on the Validation Result tab button.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab button to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise, go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result form.

14 Close the VPRN (Edit) form.

15 Close the Manage Services form.

Procedure 74-19 To view the service topology map associated with a VPRN service

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.
3. Select a VPRN service and click on the Topology View button. A Topology View dialog box appears.
4. Click on the Yes button to proceed. The Service Topology - map opens.

   See chapter 5 for more information about service topology views.

Procedure 74-20 To view the VPRN service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.
3. Select a service and click on the Properties button. The VPRN (Edit) form opens.
4. View the Aggregated Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.
5. Click on the appropriate tab button to view or edit an object that is identified as faulty by a State Cause indicator.
6. Click on the Faults tab button to view the alarms for the object. The Object Alarms tab is displayed.
7. Click on the Aggregated Alarms tab button to view the aggregated alarms for the object. The Aggregated Alarms tab is displayed.
8. Close the VPRN (Edit) form.
9. Click on the Close button to close the Manage Services form.

Procedure 74-21 To view DHCPv6 leases

This procedure describes how to view the DHCPv6 prefixes that the server has given out.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service and click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site where you want to view DHCPv6 leases; expand the entries for that site.

5 Choose Routing Instance from the navigation tree.

6 Click on the Local DHCP Servers tab button.

7 Click on the DHCP V6 tab button. The list of associated DHCPv6 servers is displayed.

8 Select a DHCPv6 server from the list and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

9 Click on the More Actions button and choose Show Leases. The DHCPv6 Server Show Leases form opens.

10 Perform one of the following:

   a To view the entire list of leases that are active on the DHCPv6 server, click OK.

   b To view the lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server and click OK.

   Note — If the prefix does not exist in the list of leases, a message displays.

   c To view the detailed lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server, select the Detail check box, and click OK. The form displays the CLI details for the specific prefix.

11 Close the DHCPv6 Server Show Leases form.

12 Close the Local DHCPv6 Server (Edit) form.

Procedure 74-22 To view DHCPv6 log events

This procedure describes how to view lease not owner and pool unknown log events for local DHCPv6 servers.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service and click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site where you want to view DHCPv6 log events; expand the entries for that site.

5 Choose Routing Instance from the navigation tree.

6 Click on the Local DHCP Servers tab button.

7 Click on the DHCP V6 tab button. The list of associated DHCPv6 servers is displayed.

8 Select a DHCPv6 server from the list and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

9 Click on the Logs tab button. The Lease Not Owner Log and Pool Unknown Log tabs display.

10 Click on the tab button for the type of log that you wish to display. Configure the filter criteria and click on the Search button. A list of NE SHCV event logs appears.

11 Configure the filter criteria and click on the Search button. A list of event logs appears.

12 Select a log entry and click on the Properties button. The Log form opens.

13 View the log entry.

14 Close the Log form.

15 Close the Local DHCPv6 Server (Edit) form.

Procedure 74-23 To modify a VPRN service

Caution 1 — Modifying parameters can be service-affecting.

Caution 2 — The behavior of the VPRN service may become unpredictable if modifications to the configuration affect the IPsec portion of the service configuration. For example, if a VPRN service is configured with IPsec tunnels, IPsec SAPS, and policies are deleted, the service is not deleted from the 5620 SAM and the service will be in an inconsistent state. The IPSEC portion of the VPRN configuration must be deleted using CLI scripts or the CLI before the VPRN service can be deleted from the 5620 SAM.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service and click on the Properties button. The VPRN (Edit) form opens with the general properties of the service displayed on the General tab.

The following tabs list the service elements that can be individually or collectively selected and configured:

- Tests tab — allows the creation and execution of service-specific diagnostic tests
- Sites tab — lists the sites that are included in the service
- L3 Access Interfaces tab — lists the L3 access interfaces that are included in the service
- Spoke SDP Bindings tab — displays the spoke SDP bindings that are associated with the service
- Addresses tab — lists the IP addresses that are associated with the service

Note — You cannot remove an IP address from an interface when the IP address of a static host is defined in the subnet of the interface IP address and the ARP Populate parameter is enabled on the Anti-Spoofing tab.

- Template tab — displays the template used to create the service, if applicable.
- Faults tab — displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Modify the parameters for the service, as required.

To configure items in the tabs that contain lists of service elements, select the items and click on the Properties button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The VPRN (Edit) form closes and the Manage Services form reappears.

7 Click on the Close button to close the Manage Services form.

Procedure 74-24 To modify a VPRN service using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Select a VPRN service and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains a number of sub-procedures describing the various components that can be viewed, created, or modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating site components. Go to step 9.
- Creating spoke SDP bindings. Go to step 36.
- Viewing the route target topology. Go to step 44.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the Create VPRN Site option.

The Select Network Elements form appears.

5 Select one or more sites to add to the service and click OK. The VPRN Site (Create) form for the new site is displayed. If you selected more than one site, the VPRN Site (Multiple Instances) (Create) form for the new sites is displayed.

6 Click on OK. The VPRN Site (Create) (or VPRN Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

7 If you want to perform detailed configuration of site properties for the new site, right-click the site icon and select Properties from the contextual menu. The Site (Edit) form opens. Refer to Procedure 74-1 for detailed site configuration information.

8 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

Creating site components

9 Right-click on any site icon in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- VPRN L3 Access Interface. Go to step 10.
- Tunnel Interface. Go to step 15.
- VPRN Subscriber Interface. Go to step 20.
- Redundant Interface. Go to step 24.
- IP Mirror Interface. Go to step 28.
- Video Interface. Go to step 32.

10 If you choose to create a VPRN L3 Access Interface, then the VPRN L3 Access Interface (Create) form is displayed.

11 Configure the Name parameter on the General tab.

12 Click on the Port tab and assign a port to the interface.

Refer to Procedure 74-2 for detailed information on further configuring the interface, if required.

13 Click OK. The VPRN L3 Access Interface (Create) form closes and the new L3 access interface is displayed in the topology view.

14 Go to step 35.

15 If you choose to create a tunnel interface, then the Tunnel Interface (Create) form is displayed.

16 Configure the Name parameter on the General tab.

17 Click on the Port tab and assign a port to the interface.

Refer to Procedure 35-6 in Chapter 35 for detailed information on further configuring the interface, if required.

18 Click OK. The Tunnel Interface (Create) form closes and the new tunnel interface is displayed in the topology view.

19 Go to step 35.

20 If you choose to create a VPRN Subscriber Interface, then the VPRN Subscriber Interface (Create) form is displayed.

21 Configure the Name parameter for the interface.

Refer to Procedure 74-12 for detailed information on further configuring the interface, if required.

22 Click OK. The VPRN Subscriber Interface (Create) form closes and the new subscriber interface is displayed in the topology view.

23 Go to step 35.

24 If you choose to create a Redundant Interface, then the Redundant Interface (Create) form is displayed.

25 Configure the Name parameter for the interface.

Refer to Procedure 74-16 for detailed information on further configuring the interface, if required.

26 Click OK. The Redundant Interface (Create) form closes and the new redundant interface is displayed in the topology view.

27 Go to step 35.

28 If you choose to create an IP Mirror Interface, then the IP Mirror Interface (Create) form is displayed.

29 Configure the Name parameter for the interface.

Refer to Procedure 74-15 for detailed information on further configuring the interface, if required.

30 Click OK. The IP Mirror Interface (Create) form closes.

31 Go to step 35.

32 If you choose to create a Video Interface, then the Video Interface (Create) form is displayed.

33 Configure the Name parameter for the interface.

Refer to Procedure 36-1 in Chapter 36 for detailed information on further configuring the interface, if required.

34 Click OK. The Video Interface (Create) form closes and the new video interface is displayed in the topology view.

35 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

Creating spoke SDP bindings

36 Select the sites you want to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note — When you create a spoke binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

37 Select Connect from the contextual menu and choose the Create Spoke SDP Binding option.

The Spoke SDP Binding (Create) form is displayed.

Note — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

38 Enable the Auto-Select Transport Tunnel parameter.

39 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedure 74-10 for more detailed information on creating and configuring spoke SDP bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

40 Assuming that the spoke SDP binding was successfully created in step 39, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a spoke binding for the return tunnel.

41 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

42 You can manually configure other parameters here if required, or just click on OK. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 33 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

43 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

Viewing the route target topology

44 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the Highlight Route Target Topology option.

This option essentially draws dotted lines to represent the route target topology between NEs. For example, for two NEs A and B, if the import and export route targets match, then two dotted lines will be drawn on the map. One will represent the route target going from A to B, and the other from B to A.

45 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

46 Close the Service Topology form.

47 Close the Manage Services form.

Procedure 74-25 To delete a VPRN service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

Note 1 — You cannot delete a VPRN service when IPsec security policies, interfaces, or tunnels are configured. See the appropriate node documentation for more information about modifying or deleting IPsec configurations.

For example, if a VPRN service is configured with IPsec tunnels, IPsec SAPS, and policies is deleted, the service is not deleted from the 5620 SAM and the service will be in an inconsistent state. The IPSEC portion of the VPRN configuration must be deleted using the CLI scripts or through the CLI before the VPRN service can be deleted from the 5620 SAM.

Note 2 — The L3 interface properties for the IPSEC SAP cannot be configured using the 5620 SAM.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

- **a** For services with a low priority, go to Step 5.
- **b** For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.
- **c** For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

75 — PW routing and dynamic MS-PW service management

75.1 PW routing and dynamic MS-PW service management overview

Service providers require a solution for interconnecting customer sites that span different domains, such as MAN-WAN or Inter-AS (in the same Service Provider or Inter-Provider). The 5620 SAM supports two methods for interconnecting customers sites:

- PW routing
- MS-PW routing

PW routing

Prior to 5620 SAM release 9.0 R5, the Alcatel-Lucent SR 7x50 provided inter-domain services for VLL through the use of VLL spoke switching, which allows creation of a VLL service by cross-connecting two spoke SDPs. However, this required statically configuring the PW switching points at the gateway S-PEs between domains. See “VLL spoke switching” in chapter 70 for more information.

MS-PW routing

Multi-Segment Pseudo-Wire routing provides solutions for inter-domain services by using dynamic MS-PW routing and signaling, in which the switching points are automatically instantiated in the Switching-Provider Edge (S-PE) NEs. The path of the MS-PW is dynamically signaled end-to-end by T-LDP, using PW routing information stored in the S-PEs by MP-BGP. Per-PW configuration is only required at the endpoints of the MS-PW in the Termination-Provider Edge (T-PE) NEs.

Dynamic MS-PWs are characterized by the following:

- They are supported for VLL Epipe services
- Dynamic and static routes, as well as explicit paths for MS-PWs are supported
- Dynamic MS-PWs may be established across LDP or RFC 3107 labeled BGP SDPs
- Dynamic MS-PWs may be used as a part of a set of PWs for PW redundancy, including MC-LAG. Diverse routes for the active and standby MS-PWs can be configured by using explicit paths, or dynamically by using a BGP route distinguisher.
- Diverse routes for the active and standby MS-PWs can be achieved by using explicit paths or dynamically using a BGP route distinguisher.

Dynamic MS-PWs are supported on all NE release 9.0 R3 7750 SR, 7450 ESS, and 7710 SR chassis that support Epipe services.

Dynamic MP-PW services

Spoke SDP FEC configuration will bind a service to an existing Service Distribution Point (SDP), using a dynamic MS-PW. When using dynamic MS-PWs, the particular SDP to bind to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under the Spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP should be defined that can reach the first hop of the MS-PW. The SR 7x50 will create a spoke SDP binding in order to associate an SDP with a service. If an SDP to that does not exist, the SR 7x50 will create one based on the parameters specified in the spoke SDP FEC (such as the SAII/TAII, Path, PW template, and so forth). The Creation Mode attribute for such an SDP will indicate Multi-Segment PW.

This differs from the regular spoke SDP binding creation in that it creates a spoke SDP binding using a PW with the FEC128. However, the Spoke SDP FEC enables PWs with other FEC types to be used. At release 5620 SAM 9.0 R5, only FEC129 is supported.

Spoke SDP FEC configuration is currently only applicable to an Epipe site. It can be configured under the Epipe service or at a service endpoint of an Epipe site, with or without ICB. The creation under an Epipe service is demonstrated in the following steps.

75.2 Workflow to configure PW routing and dynamic MS-PW services

The following workflow lists the high-level steps required to configure PW routing and dynamic MS-PW services. Enabling MS-PW support requires configuration in the following areas:

- network commissioning
- SR NE pre-provisioning
- dynamic MS-PW service
- optional PW routing and MS-Service tasks

Network commissioning

1 To use PW routing to establish dynamic pseudo-wires from source to destination, without using static routes and a specified path:

a Enable BGP on the routing instance of the required node. See Procedure 31-1 for more information.

b Configure the BGP Family parameter to include the options MS-PW and IPv4. This must be done on the BGP site, associated BGP groups, and BGP peers.

Refer to the following procedures:

- BGP Site configuration: See step 17 in Procedure 31-2
- BGP Peer Group configuration: See step 13 in Procedure 31-4
- BGP Peers configuration: See step 12 in Procedure 31-5

2 If more than one equal cost route is required for the PW routing, configure the following:

a In the routing instance for the required NE, set the Maximum Number of Equal Cost Routes parameter to a value greater than 1. See step 18 in Procedure 30-2.

b For the required BGP Site, set the Multi Path parameter to a value greater than 1. See step 6 in Procedure 31-2.

3 Configure a routing policy with the Family parameter having the MS-PW option enabled. This will then be exported under the BGP site. See step 21 in Procedure 30-11.

4 If path diversity is required for primary/standby MS-PWs, perform the following:

a Configure a routing policy having multiple statement entries, each associated with a different community, from a different neighbour, with family including MS-PW and a local preference. The communities configured here are used further on in the procedure when configuring a MS-PW local prefix. See Procedure 30-11 for more information, with attention to steps 22 and 23.

b Import the above policy under the BGP site. See Procedure 31-2 for more information.

5 If there are ASBRs, set Next Hop Self to True under each peer group. For example, set one for the inner-AS and one for the external-AS. Without this setting, the SDPs created by MS-PW routing only reach to the BGP interface's IP address, but not the system ID. See step 9 in Procedure 31-4. Refer also to Chapter 74 for information on ASBRs.

6 If all T-PEs and S-PEs are within the same AS, then the S-PEs must be configured as route reflectors (RR). Perform the following:

a Set the Cluster ID parameter on the BGP site or BGP peer group that includes the T-PEs as BGP peers on the S-PE. See step 4 in Procedure 31-2.

Note — Two T-PEs can not be configured as BGP peers to each other. They must be configured as BGP peers of the RR.

b Configure a routing policy with Advertise Next Hop Self set to true and Action set to Accept, and then export this policy under the BGP site. See step 9 in Procedure 30-11.

This completes the summary of essential network commissioning requirements.

SR NE pre-provisioning

7 Configure PW routing:

a using the navigation tree (see Procedure 75-1)

b using the Manage Services form (see Procedure 75-2)

Configure a dynamic MS-PW service

8 Configure a dynamic MS-PW service using PW routing. See Procedure 75-3.

Optional PW routing and MS-Service tasks

9 As required, perform one or more of the following:

a On-demand resync of the MS-PW routing table for a specified NE is supported and can be accessed from a number of places in the 5620 SAM. See Procedure 75-4 for information on displaying MS-PW routing tables.

b Conduct various spoke SDP FEC operations from the endpoint of an Epipe site. See Procedure 75-5.

c Discover and manage MS-PW switching sites. See Procedure 75-6.

d Run an OAM VCCV Ping or Trace validation test for the MS-PW service. See Procedure 75-7.

75.3 PW routing and dynamic MS-PW service management procedures

This section contains the configuration and management procedures required to configure PW routing and dynamic MS-PW services using the 5620 SAM.

Procedure 75-1 To configure PW routing using the navigation tree

This procedure creates service routes for the MS-PW routing on the NE using the navigation tree. Configuration of the following steps is required on the T-PE or S-PE, as detailed.

1 Right-click on a discovered device in the navigation tree and choose Properties from the contextual menu. The properties form for the device opens.

2 Click on the Globals tab and then the Service sub-tab.

3 Click on the PW Routing sub-tab and then its General sub-tab.

4 Configure the parameters:

- SPE Address
- Boot Timer (seconds)
- Retry Timer (seconds)
- Retry Count

The SPE Address must be unique in the network. This parameter must be configured on all T-PEs and S-PEs that are involved in this PW routing.

The Number of BGP Routes, Number of Static Routes, Number of Local Routes, and Number of Host Routes attributes are for information only and can be resync-ed from the NE.

5 Click on the Local Prefixes sub-tab under PW Routing.

6 Click the Create button. The PW Routing NE Local Prefix (Create) form opens.

7 Configure the Local Prefix parameter.

You must configure this parameter to enable the MS-PW routing configuration on a T-PE node. This Local Prefix is also used in other portions of the MS-PW configuration, such as setting static routes on the remote T-PE or intermediate S-PEs, and setting Source Attachment Individual Identifier (SAII) and Target Attachment Individual Identifier (TAII) addresses on a spoke SDP FEC on the T-PE.

8 Click the Create button in the BGP RD block. The PW Routing NE BGP RD (Create) form opens.

A route distinguisher must be configured to enable this local prefix to be advertised by MP-BGP to the network.

9 Configure the Route Distinguisher parameter.

10 Click the Select button to configure the BGP Community parameter.

The Community can only be selected from the list. Members were created as part of the routing policy configuration in Procedure 30-11 and importing the routing policy under the BGP site in Procedure 31-2.

11 Click on OK.

12 Repeat steps 8 to 11 to create up to four route distinguishers per local prefix.

13 Repeat steps 5 to 13 to create up to 16 local prefixes per NE. The local prefixes you create must be unique in the network.

14 Click the OK button. The PW Routing NE Local Prefix (Create) form closes.

At this point the NE can start to advertise the defined local prefix to its BGP peers.

15 Click on the Static Routes sub-tab under PW Routing.

16 Click the Create button. The PW Routing NE Static Route Configuration (Create) form opens.

A static route can be configured on both the T-PE and S-PE, based on your requirements.

17 Click the Select button to configure the Target T-PE’s PW Address parameter.

This specifies the local prefix defined in the remote T-PE. It can be selected from a managed T-PE or S-PE, or directly entered.

18 Click the Select button to configure the Next Hop parameter.

This specifies the system IP address of the next-hop S-PE or T-PE. It can be selected from a managed T-PE or directly entered.

19 Click the OK button. The PW Routing NE Static Route Configuration (Create) form closes.

At this point the NE can start to advertise the defined static route to its BGP peers.

20 Click on the Configured Paths sub-tab under PW Routing if you need to configure an explicit path. All such configured paths are displayed in the list.

The path should be configured on the T-PEs, which is then used in the spoke SDP FEC to establish a pseudo-wire through the specified path.

21 Click the Create button. The PW Routing NE Path Configuration (Create) form opens, with the General tab displayed.

22 Specify a Path Name.

23 Click the Create button in the Hops block. The PW Routing Hop (Create) form opens.

24 Configure the Hop ID parameter.

25 Configure the Hop Address parameter.

This specifies the system IP address of the next-hop S-PE or T-PE (where the T-LDP session to a given S-PE terminates). It can be entered directly or chosen from the managed S-PE or T-PE by clicking the Select button.

26 Click the OK button. The PW Routing Hop (Create) form closes.

27 Repeat steps 23 to 26 to create the required hops.

28 Click the OK button. The PW Routing NE Path Configuration (Create) form closes.

Procedure 75-2 To create, modify, or view a PW routing NE configuration using the Manage Services form

Perform this procedure to create, modify, or view a PW Routing NE configuration using the Manage PW Routing NE Configuration form. This is an alternative approach to the SR NE pre-provisioning section detailed in the procedural workflow in Procedure 75-1.

1 Choose Manage→Service→PW Routing NE Configuration from the 5620 SAM main menu. The Manage PW Routing NE Configuration form opens.

2 Configure the drop-down filter criteria for PW Routing NE Path Configuration and click the Search button. A list of PW Routing NE configurations appears in the form.

3 Choose the required PW Routing NE configuration and click on the Properties button. The PW Routing NE Configuration (Edit) form opens with the General tab displayed.

4 Configure the parameters, as required:

- SPE Address
- Boot Timer (seconds)
- Retry Timer (seconds)
- Retry Count

5 Click the Local Prefixes tab.

6 Click the Search button and then Properties for an existing prefix, or the Create button for a new one from this tab. If you are creating a new local prefix, configure the Local Prefix parameter on the General tab of the PW Routing NE Local Prefix form.

Whether you are working with an existing or a new local prefix, you can also search for or create new BGP RDs for the current prefix.

7 Click the Search button and then Properties for an existing BGP RD, or the Create button for a new one from this tab. If you are creating a new BGP RD, configure the Route Distinguisher and Community parameters in the PW Routing NE BGP RD (Create) form.

8 Click OK to close the PW Routing NE BGP RD (Create) form. The new BGP RD appears in the list.

9 If there are local spoke SDP FECs associated with this local prefix, click the Local Spoke SDP FECs tab to list them. Select an item from the list and click Properties to view the object information, if required.

10 Click the Static Routes tab.

11 Click the Search button and then Properties for an existing static route, or the Create button for a new one from this tab. If you are creating a static route, configure the Target T-PE's PW Address and Next Hop parameters in the PW Routing NE Static Route Configuration (Create) form.

12 Click OK to close the PW Routing NE Static Route Configuration (Create) form. The new static route appears in the list.

13 Click the Configured Paths tab.

14 Click the Search button and then Properties for an existing path configuration, or the Create button for a new one from this tab. If you are creating a new path configuration, configure the Path Name parameter on the General tab of the PW Routing NE Path Configuration form.

Whether you are working with an existing or a new path configuration, you can also search for or create new Hops for the current configuration.

15 Click the Search button and then Properties for an existing Hop, or the Create button for a new one from this tab. If you are creating a new Hop, configure the Hop ID and Hop Address parameters in the PW Routing Hop (Create) form.

16 Click OK to close the PW Routing Hop (Create) form. The new Hop appears in the list.

17 If there are spoke SDP FECs associated with this path configuration, click the Spoke SDP FECs tab to list them. Select an item from the list and click Properties to view the object information, if required.

18 Click OK to close PW Routing NE Configuration (Edit) form.

Procedure 75-3 To configure a dynamic MS-PW service using PW routing

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria for Service→VLL (VLL)→Epipe Service→(Epipe). A list of services appears at the bottom of the Manage Services form.

3 Choose the required VLL Epipe service that contains the T-PE site and click on the Properties button. The Epipe Service (Edit) form opens with the General tab displayed.

4 Click on the Spoke SDP FECs tab.

5 Click the Create button. The Spoke SDP FEC (Create) form opens.

Note — Only one spoke can be configured on the terminating site, including both regular spoke SDP bindings and spoke SDP FECs.

6 Configure the parameters:

- PW ID
- Auto-Assign ID
- SAII Address
- SAII AC ID
- Auto Config
- TAII Address
- TAII AC ID
- Administrative State
- Signaling Type
- Retry Timer (seconds)
- Retry Count
- Path
- PW Template

The Auto Config parameter enables automatic endpoint configuration. This allows the configuration of a spoke SDP endpoint without specifying the TAII associated with that spoke SDP. In this mode, the far end T-PE actively initiates MS-PW signaling and will send the initial label mapping message using T-LDP, while the T-PE for which Auto Config is specified will act as the passive T-PE. The Auto Config parameter cannot be enabled if the Signaling Type is set to Master or if the TAII Address is specified.

If you are going to use SAII and TAII addresses instead of Auto Config, then you must decide which method will be used for the PW routing.

- For dynamic PW routing, the local prefix associated with the SAII/TAII address should be configured with a route distinguisher, with an optional community (refer to steps 8 to 12 in Procedure 75-1). The SAII and TAII addresses must be unique in the network.
- For static routing, the local prefix should be associated with static routes configured under PW routing (refer to steps 15 to 19 in Procedure 75-1). A spoke SDP FEC cannot be turned up if no local prefix is configured under PW routing.
- When using a specified path, the Path parameter must be configured. The associated Select button allows you to select a path that will be used for this spoke SDP and which is configured under PW Routing. If no path is configured, then each next hop of the MS-PW used by the spoke SDP will be chosen locally at each S-PE and T-PE, using dynamic PW routing.

7 If redundancy is required, specify an Endpoint using the associated Select button.

8 Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State
- Enable PW Standby Signaling Slave

9 Click the Return Spoke SDP FEC tab to configure a return spoke SDP FEC, as required.

This tab is only displayed when the TAII Address configured in step 6 was set by selection for the current spoke SDP FEC.

10 Configure the PW ID parameter for the return spoke SDP FEC and click Apply.

When a valid PW ID for the return spoke SDP FEC is entered, additional parameters are displayed. If the PW ID is not valid, then the return spoke SDP FEC will not be created.

11 Configure the parameters:

- Signaling Type
- Auto Config
- Path
- PW Template
- Set ICB

12 Specify an Endpoint using the associated Select button.

When the return spoke SDP FEC is created, it will have corresponding attributes such as the SAII and TAII Address values and AC ID cross-matching with the current spoke SDP FEC.

13 Click OK to apply the configurations and close the Spoke SDP FEC (Create) form.

When a spoke SDP FEC is successfully created, it will be listed under the Spoke SDP FECs tab for this Epipe site.

14 Select the spoke SDP FEC from the list and click Properties.

The spoke SDP FEC should contain the following tabs: General, Spoke SDP Associated, Tests, and Faults.

The Spoke SDP Associated tab will list the spoke SDP bindings created by using this Spoke SDP FEC for MS-PW routing. All such spoke SDP bindings have their Creation Mode attribute set as Multi-Segment PW. The related SDP FEC Auto-bind tab shows the associated SAII or TAII defined in the Spoke SDP FEC.

The Faults tab will display any mis-configuration alarms associated with this spoke SDP FEC.

15 Close the Epipe Service (Edit) form.

When the configuration for both T-PEs is complete, the NEs can start negotiating and establishing the spoke SDP bindings from T-PE to S-PE and from S-PE to T-PE.

Procedure 75-4 To display MS-PW routing tables

On-demand resync of the MS-PW routing table for a specified NE is supported and can be accessed from a number of places in the 5620 SAM.

1 Select an applicable NE from one of the following locations:

- Navigation tree
- Physical Topology map
- Service Tunnel map

2 Right-click the NE to open the pop-up menu.

3 Click on the Show MS-PW Routes and select one of the following show commands:

- BGP
- Service

The Service Routing rtr BGP or Service Routing rtr Service form opens accordingly. The requested routing table information is presented, along with a detailed status/error report.

4 Close the Service Routing rtr report form.

Procedure 75-5 To perform spoke SDP FEC operations from an endpoint

Perform this procedure to conduct various spoke SDP FEC operations from the endpoint of an Epipe site.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2. Configure the filter criteria for Service→VLL (VLL)→Epipe Service→(Epipe). A list of services appears at the bottom of the Manage Services form.

3. Choose the required VLL Epipe service that contains the primary and backup spoke SDP FECs and click on the Properties button. The Epipe Service (Edit) form opens with the General tab displayed.

4. Expand the Spoke SDP FECs item under the required Epipe site in the navigation tree.

5. Right-click the required Spoke SDP FEC. A pop-up menu appears. Select the required action:

    - Force Switchover
    - Clear Forced Switchover
    - Turn Up
    - Shut Down
    - Delete
    - Resync
    - Properties

    The Forced Switchover and Clear Forced Switchover options are only applicable where the Epipe site has been configured for redundancy, as detailed in Procedure 75-1. The switchover applies to the primary and backup spoke SDP FECs configured on the Epipe site.

6. Close the Epipe Service (Edit) form.

Procedure 75-6 To discover and manage MS-PW switching sites

With PW routing configured on T-PEs and S-PEs, and spoke SDP FECs configured on the T-PEs, the SR 7x50 will establish the pseudo-wires between T-PEs. This includes creating switching sites between two T-PEs. A switching site for MS-PW is a read-only site (nothing can be modified) and it cannot be deleted. It is controlled by the NE.

Use the following method to discover such sites, if required.

Note 1 — The switching sites and spoke SDP bindings created by MS-PW routing are tagged with their Creation Mode attribute indicating Multi-Segment PW (as opposed to Manual for non-MS-PW entities).

Note 2 — When a switching site is discovered, the associated spoke SDP bindings under it are also discovered and re-synced. The 5620 SAM will create a composite service and connector(s) if there are matching spoke SDP bindings found in other Epipe services (based on cross-matching of the spoke SDP ingress/egress labels). The related service is added to the newly-created composite service.

1 Conduct an RCA Audit to discover switching sites, if required. This is done within the Epipe service that contains the T-PEs having MS-PW configured. The audit will find all MS-PW switching sites associated with T-PEs in this service and provide management solutions.

Refer to Procedure 81-1 for details on configuring an RCA audit.

2 Perform Procedure 81-2.

Procedure 75-7 To conduct MS-PW routing OAM tests

The MS-PW routing configuration can be tested using OAM VCCV Ping and Trace tests.

1 To conduct a VCCV Ping test refer to Procedure 38-23.

The test can be created either from the Service Test Manager or from a configured Epipe service, Epipe site, or a Spoke SDP FEC.

If you choose a spoke SDP binding created by MS-PW routing, the VCCV ping is specifically for MS-PW, and the SAII and TAII parameters will be auto-filled. This allows you to conduct a MS-PW VCCV Ping on an S-PE.

If the test is created from a configured Spoke SDP FEC, the test object will be auto-filled with the configured spoke SDP FEC.

Alternatively, if the test is created from the Service Test Manager, an Epipe service, or an Epipe site (both the termination site and the switching site), then you must select a spoke SDP FEC (only for T-PE) or a spoke SDP binding of type FEC 129 created by the MS-PW routing.

2 To conduct a VCCV Trace test refer to Procedure 38-24.

The test can be created either from the Service Test Manager or from a configured Epipe service, Epipe site, or a Spoke SDP FEC.

If the test is created from a configured Spoke SDP FEC, the test object will be auto-filled with the configured spoke SDP FEC.

Alternatively, if the test is created from the Service Test Manager, an Epipe service, or an Epipe site (both the termination site and the switching site), then you must select a spoke SDP FEC (only for T-PE) or a spoke SDP binding of type FEC 129 created by the MS-PW routing.

Note 1 — When configuring either a VCCV Ping or VCCV Trace test for dynamic MS-PW from an S-PE, the Reply Type must be set to IP.

Note 2 — If the selected spoke SDP binding is created by MS-PW routing, you can only conduct a VCCV ping for MS-PW FEC129, not for FEC128.

Note 3 — If a PW template is used in the Spoke SDP FEC configuration, it must have its Enable Control Word parameter enabled, since both VCCV Ping and Trace require Control Word support.

3 To create a Test Suite refer to Procedures 78-8 and 78-12.

A Test suite can be generated based on the selected policy for a specified VLL Epipe service.

If the selected policy has its Entity Type set to VLL Service, then the VCCV Ping and VCCV Trace tests that are generated will adhere to the following:

- No tests are generated for spoke SDP bindings created by MS-PW routing.
- Both VCCV Ping and VCCV Trace tests for MS-PW will be generated if there are spoke SDP FECs in the specified Epipe service.

If the selected policy has its Entity Type set to Service Connector, then there is also no test generated for the spoke SDP bindings created by MS-PW.

76 — Composite service management

76.1 Composite service management overview

A composite service is a set of linked services. Composite service functionality supports complex applications that require a combination of services, such as VLAN connections to an HVPLS, an IES spoke into a VPLS, or a VPRN-to-VPLS interconnection.

Services that are owned by different customers can be connected to form a composite service. An example is an HVPLS in which the core VPLS belongs to one customer and the satellite VPLS instances belong to other customers. An HVPLS is considered to be a composite service by the 5620 SAM.

Composite services consist of customer services, called SCs in the context of a composite service, and connectors. A connector is a bidirectional logical link between two SCs, such as a pair of PW spokes that carry traffic in opposite directions between VLL and VPLS instances, a dot1q-encapsulated link between a VLAN and a VPLS, or an internal cross-connect.

The term SCP describes a type of connector endpoint. In the case of the services that are available on the 7450 ESS, 7710 SR, 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7210 SAS-X24F2XFP, or the 7750 SR, an SCP is a service interface or SAP. For L2 switches, such as the 7250 SAS or Telco, an SCP may be a network interface, such as an uplink port.

Composite services exist only in the context of the 5620 SAM and are configured through the 5620 SAM GUI or an OSS application. They are unknown to individual network devices. To simplify composite service configuration and to ensure that non-5620 SAM device configuration does not disrupt the management of composite services, the following rules apply to the creation, deletion, modification, and presentation of composite services.

- A composite service can have zero SCs.
- A composite service can have zero connectors.
- Two connected SCs can belong to only one composite service.
- A connector between two SCs belongs to only one composite service.
- An SC cannot be removed from a composite service until its connector to the composite service is removed.
- A group of connected services can be moved from one composite service to another.

The 5620 SAM supports composite-service configuration using the following methods.

- Tabbed configuration forms with an embedded navigation tree that provides a logical, hierarchical view of the composite service and acts as a configuration interface. When you right-click on an object in the navigation tree, a menu specific to the object appears. When you choose an object in the menu, the related configuration form opens.
- Connector creation and configuration from within the composite service's flat topology view
- Pre-configured template. A user that is assigned the service management scope of command role can create a composite-service template. The service management user can also create a connector template. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with creating and using templates.

If a service that is specified for inclusion in a composite service does not currently belong to a composite service, it is added to the composite service regardless of its administrative or operational state. If the specified service is part of an existing composite service, it can be moved to a different composite service. However, SCs that are connected to the specified service are also moved to the new composite service upon confirmation of the action by the 5620 SAM operator. The 5620 SAM performs no such action confirmation for OSS applications.

When services within a composite service have the same service ID, the 5620 SAM raises an alarm. For example, a VPLS with service ID 5 on one NE and an IES service with service ID 5 on another NE are combined to create a composite service. The operational status of the composite service is up and the composite service functions correctly, however, an alarm is raised because the 5620 SAM does not support the configuration of two services using the same service ID. This situation may arise when services are created on NEs using a CLI rather than through the 5620 SAM.

Hierarchical organization of composite services

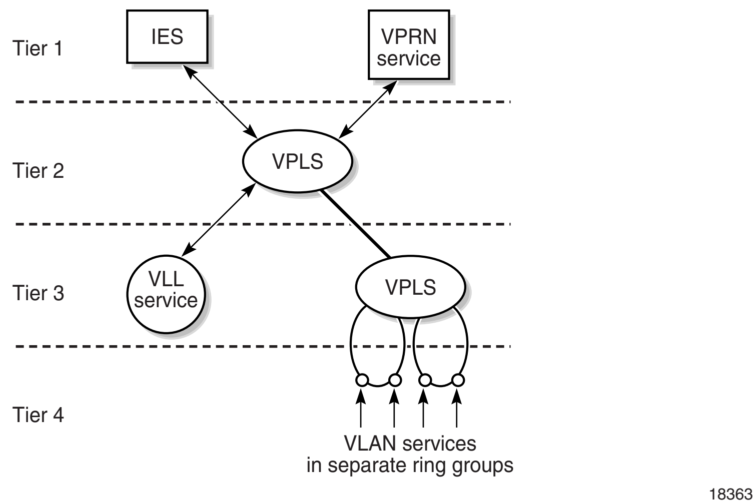
The 5620 SAM organizes the SCs in a composite service by tiers within a hierarchy during network discovery and for display purposes. When you add an SC to a composite service, the 5620 SAM assigns a default tier value to the SC according to the service type. Table 76-1 lists the default tiers for different service types.

Table 76-1 Default tiers for service types

Service type	Default tier
IES and VPRN	1
VPLS and MVPLS	2
VLL	3
VLAN	4

The default tier values reflect common deployment configurations. Figure 76-1 shows a composite service hierarchy. SCs are not restricted to the default tiers, as in the case of the VPLS in Tier 3 that forms an HVPLS with the VPLS in Tier 2.

Figure 76-1 Default SC tier assignments



You can change the tier of an SC at any time and can specify a value other than one of the defaults that the 5620 SAM assigns; composite services can have many tiers.

The tier value of an SC determines the relative position of the SC within a composite service topology map. The 5620 SAM displays SCs in rows by tier, in numerical order from the top of the panel downward, beginning with tier 1.

You can move SC icons in a composite service topology map from one tier to another for a customized view, then use the Rearrange by Service Tiers button to organize the SC icons in the map panel according to tier.

Caution — The composite service topology map is redrawn when you click on the Rearrange by Service Tiers button, and you cannot revert to the former layout of the composite service topology map.

See chapter 5 for more information about 5620 SAM map management.

Network discovery of composite services

The 5620 SAM associates SCs and connectors with composite services during network discovery. The following rules apply to this process.

- When the 5620 SAM discovers a valid connector between two services that do not belong to a composite service, a composite service that contains the services and connector is automatically created.
- When the 5620 SAM discovers a valid connector between two services and one of the services belongs to a composite service, the other service is added as an SC of the composite service.
- When the 5620 SAM discovers a valid connector between two services and the two services are SCs of different composite services, an alarm is raised and the connector is excluded from the 5620 SAM database.

The 5620 SAM assigns a default tier value to a service upon creation and to a new SC during network discovery. The tiered hierarchy provides a common framework for service configurations that are provisioned through the 5620 SAM and CLI. A 5620 SAM operator can assign a different tier value to an SC after discovery.

A composite service has Aggregated Operational State, Connection State, and Service Component Degraded status indicators. The General tab of the Composite Service management form displays these indicators.

The Aggregated Operational State indicator has four possible values: Up, Down, Partially Down, and Unknown. The value is derived from the aggregated SC operational states as follows.

- Up—All SCs are operationally up
- Partially Down—At least one SC is operationally down
- Down—All SCs are operationally down
- Unknown—The status of at least one SC is undetermined

The Connection State indicator displays one of three values, as follows:

- No Connection—None of the SCs is connected to any other SC
- Partially Connected—One SC is not able to communicate directly or indirectly with all other SCs
- Strongly Connected—All SCs are able to communicate

For example, a composite service has five services named A, B, C, D, and E. A is connected to B, C is connected to D, and D is connected to E. The Connection State in this case is Partially Connected. When A or B becomes connected to C, D, or E, the Connection State becomes Strongly Connected.

The Service Component Degraded indicator shows whether there is an operational flag set on any of the service sites under this composite service.

Connector types

The following types of connectors join SCs in a composite service:

- SCP-to-SCP
- internal cross-connect
- PW spoke
- routed VPLS

SCP-to-SCP connectors

SCP-to-SCP connectors can join any two SC types that have service interfaces on the same device or on different devices. A connector between VPLS and VPRN SAPs is an SCP-to-SCP connector, as is a connector between a dot1q-encapsulated VPLS SAP and L2 switch uplink port in a VLAN ring group. Table 76-2 describes the supported encapsulation types.

Table 76-2 Supported encapsulation types

SAP type	Encapsulation type
Ethernet	dot1q
	Q in Q
	Null
ATM	VPI/VCI
	VPI
FR	DLCI
SONET/SDH	BCP Null
	BCP dot1q
	IPCP
	PPP Auto
	cHDLC
	WAN Mirror
LAG	Null
	dot1q

The operational status of an SCP-to-SCP connector depends on the operational status of its endpoints. An alarm raised against one of the endpoints causes an alarm to be raised against the connector. Such alarms are aggregated within the composite service.

Internal cross-connect connectors

An internal cross-connect connector can join any SC types. It uses a CCAG to join two SCs that have SAPs or network interfaces on the same device. This functionality is available in the 7450 ESS, 7710 SR, and 7750 SR. The following rules apply to internal cross-connect connectors.

- A SAP can be connected to another SAP or to a network interface using a CCAG.
- When a SAP or network interface is deleted, the connector associated with it is also deleted.
- The deletion of an internal cross-connect connector causes the associated interfaces and SAPs to be deleted.

The operational state of an internal cross-connect connector depends on the operational state of the CCAG. An alarm raised against the CCAG causes an alarm to be raised against the connector. Such alarms are aggregated within the composite service.

PW spoke connectors

A PW spoke connector generally joins VPLS instances to create an HVPLS. In the 7450 ESS, 7710 SR, 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7210 SAS-X24F2XFP, and 7750 SR, a PW spoke can, for example, connect IES and VPLS instances to provide distributed Internet access service. The endpoints of a PW spoke connector must be on different devices. PW spoke connectors are subject to restrictions on the SC types that they can join. Table 76-3 shows the SC types that can be linked by PW spoke connectors.

Table 76-3 Valid PW spoke interconnections

SC type	Valid PW spoke SC interconnections
VLL	IES, VPLS
VLAN	—
VPLS	IES, VLL, VPLS
MVPLS	MVPLS
IES	VLL, VPLS
VPRN	VLL, VPLS

The operational state of a PW spoke connector depends on the operational state of the underlying SDP bindings. An alarm raised against one of the SDP bindings causes an alarm to be raised against the connector. Such alarms are aggregated within the composite service.

Routed VPLS connectors

A routed VPLS connector joins an L3 access interface within an IES or VPRN service context to a VPLS on the same site. When an IES or VPRN IP interface is bound to a VPLS site name, the site name cannot be bound to another IP interface. Although an IES or VPRN IP interface can only be bound to a single VPLS site, the service context that contains the IP interface can have other IP interfaces bound to other VPLS sites. Both the IES or VPRN IP interface and VPLS site must be located on the same NE.

If a VPLS site name does not exist within the system, the binding between the IP interface and the VPLS site remains operationally down until a VPLS site name is assigned to the VPLS site. When an IP interface is bound to a VPLS site, the operational state of the binding depends on the operational state of the VPLS site, or whether the IP interface binding is enabled on the VPLS site.

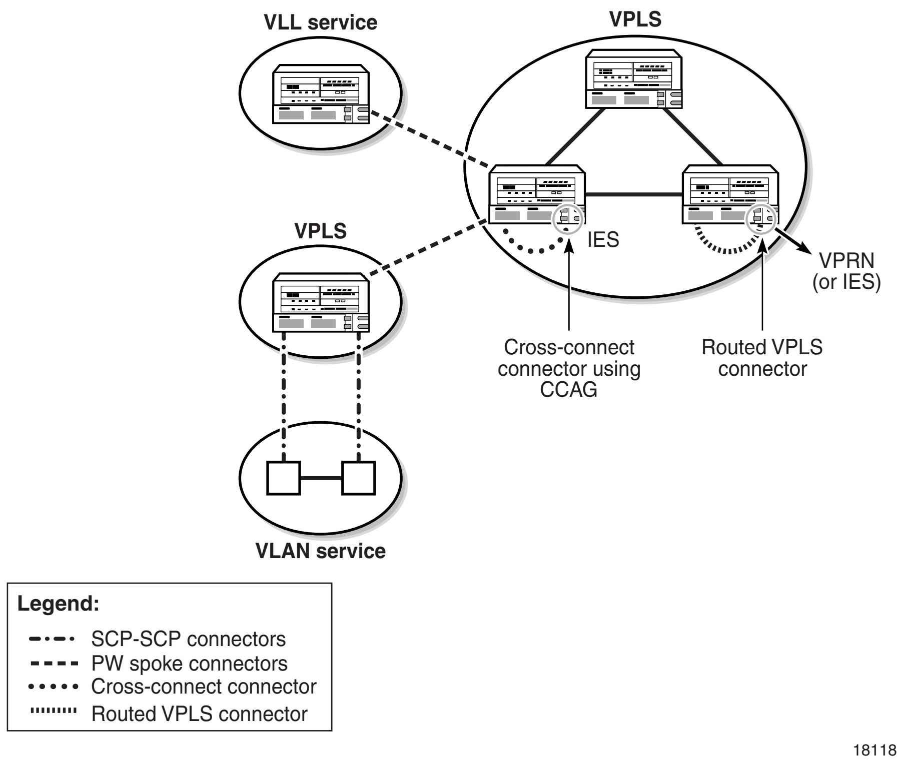
The operational state of the routed VPLS connector depends on the operational state of the binding and the operational state of the L3 IP interface.

The routed VPLS connector function is supported for IOM3 cards in a Release 8.0R4 or later 7450 ESS in mixed mode, a Release 8.0R4 or later 7750 SR, or a Release 8.0R5 or later 7750 SR-c4.

76.2 Sample composite service configuration

Figure 76-2 shows a sample composite service configuration that involves a variety of customer services and uses the three SC connector types.

Figure 76-2 Sample composite service configuration



76.3 Workflow to create a composite service

The following workflow lists the high-level steps required to create a composite service. As a prerequisite for creating a composite service, this workflow assumes the following:

- a group or customer with the required user access privileges has been set up; see chapter 9 for more information.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 33-1 for more information.
- the access ports for the service are created; see chapter 20 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 46 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.

- any required MP-BGP for PE-to-PE routing is configured; see chapter 31 for more information about protocol configuration.
- the other network services that are to be the SCs of the composite service are created.

1 Create the composite service. See Procedure 76-1 for more information.

  i Define the general properties for the composite service.

  ii Specify the services for inclusion in the composite service. You can specify multiple services in one operation.

  iii Create connectors to link the SCs of the composite service.

  iv Turn up the composite service.

2 View the service topology map associated with a composite service. See Procedure 76-2 for more information.

3 As required, run an OAM validation test for a composite service. See Procedure 76-3 for more information.

4 As required, modify a composite service:

  a using the navigation tree; see Procedure 76-4 for more information

  b using the flat topology view; see Procedure 76-5 for more information

5 As required, delete a composite service. See Procedure 76-6 for more information.

76.4 Composite service management procedures

Use the following procedures to perform composite service creation and management tasks.

Procedure 76-1 To create a composite service

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Click on the Create button. The Composite Service (Create) form opens.

3 Configure the parameters.

- Composite ID
- Auto-Assign ID
- Name
- Description

4 Click on the Apply button. The form title changes to Composite Service *Service Name* (Edit) and the form displays an additional tab button and Status and OLC panels.

5 Configure the OLC State parameter.

6 Perform one of the following:

a Add an SC to the composite service. Go to step 7.

b Complete composite service creation if SCs and connectors are to be added later. Go to step 18.

7 In the navigation tree, right-click on the Services icon and choose Add Services. The Add Services form opens.

Note — You can also create a service for inclusion in the composite service by right-clicking on the Services icon and choosing Create *Service Type*.

8 Click on the Search button. A list of available services is displayed.

9 Select a service and click on the OK button. You can select multiple services. The CompositeService - *Service Name* (Edit) form refreshes with the SC information displayed.

10 Perform one of the following:

a Add a connector to the composite service. Go to step 11.

b Complete composite service creation if connectors are to be created later. Go to step 18.

11 Right-click on the Connector icon in the navigation tree and choose one of the following options:

a Create CrossConnect. Go to step 12.

b Create RoutedVplsConnector. Go to step 13.

c Create ScpConnector. Go to step 14.

d Create SpokeConnector. Go to step 15.

12 The Cross Connect (Create) form opens.

Note — The service endpoints of a cross-connect connector must be on the same NE.

i Configure the parameters.

- Name
- Description

ii Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - Cross Connect form opens with a list of available SCs displayed.

iii Choose an SC and click on the OK button. The Select Service A - Cross Connect form closes and the Cross Connect (Create) form refreshes.

iv Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - Cross Connect form opens with a list of available SCs displayed.

v Choose an SC and click on the OK button. The Select Service B - Cross Connect form closes and the Cross Connect (Create) form refreshes.

vi Click on the Select button in the Site A panel to choose a site to associate with the connector. The Select Site - Cross Connect form opens with a list of available sites displayed.

vii Choose a site and click on the OK button. The Select Site - Cross Connect form closes and the Cross Connect (Create) form refreshes.

viii Click on the Select button in the Site B panel to choose an SC to associate with the connector. The Select Site - Cross Connect form opens with a list of available sites displayed.

ix Choose a site and click on the OK button. The Select Site - Cross Connect form closes and the Cross Connect (Create) form refreshes.

x Click on the Transport tab button.

xi Click on the Select button to choose a CCAG for the connector. The Select CCAG - Cross Connect form opens with a list of available CCAGs displayed.

xii Choose a CCAG and click on the OK button. The Select CCAG - Cross Connect (Create) form closes and the Cross Connect (Create) form refreshes.

xiii Configure the parameters.

- CC ID
- Auto-Assign ID

xiv Click on the OK button. The Cross Connect (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

xv Go to step 17.

13 The RoutedVplsConnector (Create) form opens.

i Configure the parameters:

- Name
- Description

ii Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - RoutedVplsConnector form opens with a list of available SCs displayed.

iii Select an SC and click on the OK button. The Select Service A - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

iv Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - RoutedVplsConnector form opens with a list of available SCs displayed.

v Select an SC and click on the OK button. The Select Service B - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

vi Click on the Select button in the Site A panel to choose a site to associate with the connector. The Select Site - RoutedVplsConnector form opens with a list of available sites displayed.

vii Select a site and click on the OK button. The Select Site - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

viii Click on the Select button in the Site B panel to choose a site to associate with the connector. The Select Site - RoutedVplsConnector form opens with a list of available sites displayed.

ix Select a site and click on the OK button. The Select Site - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

Note — The sites that you select in substeps vii and ix must be located on the same NE.

x Click on the Routed-VPLS L3 Connection Point tab button.

xi Click on the Select button to choose an interface for the connector. The Select L3 Access Interface - RoutedVplsConnector form opens with a list of available L3 Access Interfaces displayed.

xii Select an L3 Access Interface and click on the OK button. The RoutedVplsConnector (Create) form refreshes.

xiii Click on the OK button. The RoutedVplsConnector (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

xiv Go to step 17.

14 The ScpConnector (Create) form opens.

i Configure the parameters.

- Name
- Description

ii Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - ScpConnector form opens with a list of available SCs displayed.

iii Select an SC and click on the OK button. The Select Service A - Scp Connector (Create) form closes and the ScpConnector (Create) form refreshes.

iv Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - ScpConnector form opens with a list of available SCs displayed.

v Select an SC and click on the OK button. The Select Service B - Scp Connector (Create) form closes and the ScpConnector (Create) form refreshes.

vi Click on the Select button in the Site A panel to choose a site to associate with the connector. The Select Site - ScpConnector form opens with a list of available sites displayed.

vii Select a site and click on the OK button. The Select Site - Scp Connector (Create) form closes and the ScpConnector (Create) form refreshes.

viii Click on the Select button in the Site B panel to choose a site to associate with the connector. The Select Site - ScpConnector form opens with a list of available sites displayed.

ix Select a site and click on the OK button. The Select Site - Scp Connector form closes and the ScpConnector (Create) form refreshes.

x Click on the Service Connection Point tab button.

xi Click on the Select button in the Service Connection Point A panel to choose an SCP to associate with the connector. The Select Service Connection Point A - Scp Connector form opens with a list of available SCPs displayed.

xii Select an SCP and click on the OK button. The Select Service Connection Point A - Scp Connector form closes and the ScpConnector (Create) form refreshes.

xiii Click on the Select button in the Service Connection Point B panel to choose an SCP to associate with the connector. The Select Service Connection Point B - Scp Connector form opens with a list of available SCPs displayed.

xiv Select an SCP and click on the OK button. The Select Service Connection Point B - Scp Connector form closes and the ScpConnector (Create) form refreshes.

xv Click on the OK button. the ScpConnector (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

xvi Go to step 17.

15 The SpokeConnector (Create) form opens.

Note — The service endpoints of a spoke connector must be on different NEs.

i Configure the parameters.

- Name
- Description

ii Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - Spoke Connector form opens with a list of available SCs displayed.

iii Select an SC and click on the OK button. The Select Service A - Spoke Connector (Create) form closes and the SpokeConnector (Create) form refreshes.

iv Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - Spoke Connector form opens with a list of available SCs displayed.

v Select an SC and click on the OK button. The Select Service B - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

vi Click on the Select button in the Site A panel to choose a site from service A to associate with the connector. The Select Site - Spoke Connector form opens with a list of available sites displayed.

vii Select a site and click on the OK button. The Select Site - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

viii Click on the Select button in the Site B panel to choose a site from service B to associate with the connector. The Select Site - Spoke Connector form opens with a list of available sites displayed.

ix Select a site and click on the OK button. The Select Site - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

x Click on the Transport tab button.

xi Configure the parameters.

- VC ID
- Auto-Assign ID
- Auto Select Tunnels
- Transport Type

The Transport Type parameter is configurable when the Auto Select Tunnels parameter is enabled.

xii If the Auto Select Tunnels parameter is enabled, go to step xvii.

xiii Click on the Select button in the Tunnel A panel to choose a service tunnel to associate with the connector. The Select Tunnel From Site A - Spoke Connector form opens with a list of available service tunnels displayed.

xiv Select a tunnel and click on the OK button. The Select Tunnel From Site A - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

xv Click on the Select button in the Tunnel B panel to choose a service tunnel to associate with the connector. The Select Tunnel From Site B - Spoke Connector (Create) form opens with a list of available service tunnels displayed.

xvi Select a tunnel and click on the OK button. The Select Tunnel From Site B - Spoke Connector (Create) form closes and the SpokeConnector (Create) form refreshes.

xvii The First L3 Access Interface panel is present, if one of the SCs in the composite service is an IES. If the First L3 Access Interface panel is not present, go to step xxii.

xviii Click on the Select button in the First L3 Access Interface panel to choose an access interface to associate with the spoke connector. The Select First L3 Access Interface - Spoke Connector (Create) form opens with a list of available L3 access interfaces displayed.

xix The Second L3 Access Interface panel is present, if another of the SCs in the composite service is an IES. If the Second L3 Access Interface panel is not present, go to step xxii.

xx Click on the Select button in the Second L3 Access Interface panel to choose an access interface to associate with the spoke connector. The Select Second L3 Access Interface - Spoke Connector (Create) form opens with a list of available L3 access interfaces displayed.

xxi Select an L3 access interface and click on the OK button. The Select L3 Access Interface - Spoke Connector (Create) form closes and the SpokeConnector (Create) form refreshes.

xxii Click on the OK button. The SpokeConnector (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

16 Configure alarm aggregation for the composite service components, if required.

i Choose Administration→System Preferences from the 5620 SAM main menu. The System Preferences form opens.

ii Enable the Alarm Aggregation to Composite Service parameter.

iii Click OK. A confirmation window is displayed.

iv Click Yes. The System Preferences form closes.

17 Perform one of the following:

a Add an SC to the composite service. Repeat steps 7 to 9.

b Add a connector to the composite service. Go to step 11.

c Complete site creation. Go to step 18.

18 Click on the OK button. The CompositeService - *Service Name* (Edit) form closes and a dialog box appears.

19 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

20 Close the Manage Composite Services form.

Procedure 76-2 To view the service topology map associated with a composite service

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria. A list of composite services appears at the bottom of the Manage Composite Services form.

3 Select a composite service and perform one of the following steps:

  a Click on the Topology View button. A Composite Service Topology - *Service Name* map opens.

  b Click on the Topology View Flat button. A Composite Service Flat Topology - *Service Name* map opens. The Flat Topology map is a flattened view of a composite service, meaning that all the service objects are displayed simultaneously, along with the service sites, access interfaces, and the links or groups of links between them.

  See chapter 5 for more information about composite service topology views.

Procedure 76-3 To run an OAM validation test for a composite service

A validator test suite must be created for the tested entity. See chapter 78 for more information about how to create a validator test suite.

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click Search. A list of composite services appears in the Manage Composite Services form.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 Click on the Action button and select Validate. If a validator test suite is not associated to the composite service, a dialog box appears. Perform the following steps:

  i Click on the OK button to associate the composite service with an existing validator test suite. The Choose Validator Test Suite form appears.

  ii Configure the filter criteria. A list of validator test suites appears.

  iii Select a validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the Operational Flags indicators. If the validation test fails, a check mark appears beside the OAM Validation Failed indicator.

6 Click on the Tests tab button.

7 Click on the Validation Result tab.

8 Select an entry and click on the Properties button. The Tested Entity Result form opens and displays information about the validation test.

9 Close the Tested Entity Result form.

10 Close the Composite Service (Edit) form.

11 Close the Manage Composite Services form.

Procedure 76-4 To modify a composite service using the navigation tree

Caution — Modifying parameters can be service-affecting.

Note — You can also modify composite service components and add service connectors from the flat topology view. Refer to Procedure 76-5.

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria. A list of composite services appears at the bottom of the Manage Composite Services form.

3 Select a composite service and click on the Properties button. The CompositeService - *Service Name* (Edit) form opens with the General tab displayed.

4 To configure parameters for an item, in the navigation tree, select and right-click on the item, and choose Properties from the contextual menu.

Using the contextual menu, you can also:

- Add SCs and connectors to a composite service
- Create services for inclusion in the composite service. When you create services by using the contextual menu, the services are automatically added to the composite service.
- Remove SCs and connectors from a composite service
- Move SCs to another composite service
- Delete SCs

Warning — Deleting an SC is not the same as removing an SC from a composite service. Deleting an SC removes the service from the 5620 SAM database. To avoid a service outage, be certain of the action that you are taking.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The CompositeService - *Service Name* (Edit) form closes and the Manage Composite Services form reappears.

7 Click on the Close button to close the Manage Composite Services form.

Procedure 76-5 To modify a composite service using the flat topology view

You can modify composite service components and add service connectors from the flat topology view. The main advantage of creating connectors using the flat topology view is that most of the parameters in the associated configuration forms are automatically populated when you select an item in the map.

Caution — Modifying parameters can be service-affecting.

Note — You can also modify and add composite service components using the navigation tree. Refer to Procedure 76-4.

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria. A list of composite services appears at the bottom of the Manage Composite Services form.

3 Select a composite service and click on the Properties button. The CompositeService - *Service Name* (Edit) form opens with the General tab displayed.

4 Click the Flat Topology View button. The Composite Service Flat Topology map opens.

5 To configure parameters for any item on the map, right-click on the item, and choose Properties from the contextual menu. The configuration form for the item is displayed.

6 Edit the parameters as required. Refer to Procedure 76-1 for detailed configuration information on creating and configuring components.

7 Add service connectors to the composite service, if required.

Depending on the sites or ports you select, when you right-click on a component, the contextual menu contains one or more of the following choices:

- Create Cross Connect. Go to step 8.
- Create Routed Vpls Connector. Go to step 9.
- Create Scp Connector. Go to step 10.
- Create Spoke Connector. Go to step 11.

Click on the required item in the contextual menu and proceed to the associated step indicated in this list.

Note — If you need to modify any of the automatically-populated parameters in the associated configuration forms while creating these connectors, refer to Procedure 76-4 for detailed information.

8 To create a Cross Connect Connector:

i Select the two site icons that you want to create the Cross Connect Connector for. These icons represent the same physical NE that exists in two separate services, since service endpoints of a Cross Connect Connector must be on the same NE.

ii Right-click on either of the icons and select Create Cross Connect from the contextual menu.

The CrossConnect (Create) form opens with the General tab displayed.

iii Configure the parameters.

- Name
- Description (optional)

iv Click on the Transport tab button.

v Click on the Select button to choose a CCAG for the connector. The Select CCAG - Cross Connect form opens with a list of available CCAGs displayed.

vi Select a CCAG and click on the OK button. The Select CCAG - Cross Connect (Create) form closes and the CrossConnect (Create) form refreshes.

vii Click on the OK button. The CrossConnect (Create) form closes and the new Cross Connect Connector is displayed on the map.

viii Go to step 15.

9 To create a Routed Vpls Connector:

i Select a VPLS site icon and an L3 Access Interface icon that you want to create the Routed Vpls Connector for. These icons must belong to the same NE.

ii Right-click on either of the icons and select Create Routed Vpls Connector from the contextual menu.

The RoutedVplsConnector (Create) form opens with the General tab displayed.

iii Configure the parameters.

- Name
- Description (optional)

- **iv** Click on the OK button. The RoutedVplsConnector (Create) form closes and the new Routed Vpls Connector is displayed on the map.
- **v** Go to step 15.

10 To create a Scp Connector:

- **i** Select the port icons for the two sites that you want to create the Scp Connector for.
- **ii** Right-click on either of the icons and select Create Scp Connector from the contextual menu.

  The ScpConnector (Create) form opens with the General tab displayed.
- **iii** Configure the parameters.
  - Name
  - Description (optional)
- **iv** Click on the OK button. The ScpConnector (Create) form closes and the new Scp Connector is displayed on the map.
- **v** Go to step 15.

11 To create a Spoke Connector:

- **i** Select the two site icons that you want to create the Spoke Connector for. These icons must be two different NEs that exist in two separate services.
- **ii** Right-click on either of the icons and select Create Spoke Connector from the contextual menu.

  The SpokeConnector (Create) form opens with the General tab displayed.
- **iii** Configure the parameters.
  - Name
  - Description (optional)
- **iv** Click on the OK button. The SpokeConnector (Create) form closes and the new Spoke Connector is displayed on the map.

12 Create new services within the composite service view, if required.

- **i** Right-click on the flat topology map background and choose Create from the menu. A list of services appears.
- **ii** Click on the service type you want to create. The appropriate Service (Create) form appears.
- **iii** Configure the parameters for the service as required and then click on the OK button in the Service (Create) form.

See the appropriate service management chapter for information about creating a specific service type.

iv The Service (Create) form closes and the new service is displayed on the map.

13 Add services to the composite service, if required.

i Right-click on the flat topology map background and choose Add→Service(s) from the menu. An Add Services - Composite Services form appears.

ii Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Add Services - Composite Services form.

iii Select a service and click on the OK button. The Add Services - Composite Services form closes and the service is displayed on the map. If the service includes service sites, the sites are also displayed on the map.

14 Add service sites to an existing service in the composite service, if required.

i Right-click on the flat topology map background and choose Add→Service Site(s) from the menu. A Find Service form appears.

ii Configure the filter criteria and click on the Search button. A list of services that are already part of the composite service appears at the bottom of the Find Service form.

iii Select a service and click on the OK button. The Find Service form closes and a Select Network Elements form appears with a list of available NEs.

iv Select one or more NEs and then click on the OK button. A Service Site (Create) form appears. If more than one NE is selected, a Service Site, Multiple Instances (Create) form appears.

v Configure the service site and click on the OK button. The new service site is displayed on the map.

See the appropriate service management chapter for information about configuring a specific service site type.

15 Click on the OK button in the CompositeService - *Service Name* (Edit) form. A dialog box appears.

16 Click on the Yes button to confirm your changes. The CompositeService - *Service Name* (Edit) form closes and the Manage Composite Services form reappears.

17 Click on the Close button to close the Manage Composite Services form.

Procedure 76-6 To delete a composite service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

   a For services with a low priority, go to Step 5.

   b For services with a medium priority, configure the "Enter the highest priority of the service being deleted" text field by typing: Medium. Go to Step 5.

   c For services with a high priority, configure the "Enter the highest priority of the service being deleted" text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

77 — Application assurance

77.1 Application assurance overview

Application Assurance, or AA, is a service-enabling technology that is available for the 7450 ESS and 7750 SR. This technology enhances the existing hierarchical per-subscriber, per-service, and per-application QoS capabilities with granular, per-AQP control. In addition to QoS capability enhancement, AA provides traffic divert, application identification, and statistics collection.

AA can be introduced in existing deployments of the Alcatel-Lucent TPSDA to evolve the HSI legacy into an EIS model that can support bandwidth-intensive Internet-based applications and content delivery.

AA enables deep packet inspection of subscriber traffic where policies are applied to specific types of HSI traffic on a per-subscriber basis to determine the action to perform on the traffic. A subscriber can be associated with one of the following services:

- IES
- VPLS
- VLL
- VPRN

AA and dynamic subscriber policy control allow a broadband network to provide application-based subscriber management for Internet access. The benefits of AA for residential and business service providers are:

- enhanced application-level SLAs through policy-based network traffic controls and improved QoS sophistication at the application and site level
- traffic flow thresholds and threshold crossing notification
- application-aware reporting and performance analysis tools
- complementary security aspects to existing network security
- scalability to support a large number of services, and flexibility to control network costs

The 5620 SAM can manage AA on all 7450 ESS and 7750 SR chassis types except the 7450 ESS-1 and 7750 SR-1.

NE traffic is selected to be processed by AA and then undergoes deep packet inspection on an ISA-AA MDA in the NE. See chapter 18 for information about using the 5620 SAM to configure an ISA-AA group that contains one or more ISA-AA MDAs.

You can configure Cflowd v10 on an ISA-AA group. AA Cflowd supports basic Cflowd sampling as well as TCP performance data collection for AA applications and application groups. Each ISA-AA group supports one Cflowd instance.

You must enable Cflowd globally on an NE before you can configure AA Cflowd collectors. Each collector is deleted when Cflowd is disabled. See chapter 17 for information about enabling and configuring global Cflowd on an NE, and see chapter 18 for information about enabling and configuring AA Cflowd on an ISA-AA group.

Note — AA policies can only be configured on an NE if an ISA-AA group is already configured on the system.

The two elements of AA processing are:

- identification of the traffic on a per-flow or per-session basis
- policy treatment of the identified traffic

Functional components

The 5620 SAM supports the creation and configuration of AA components using configuration forms and scripts.

Figure 77-1 shows the AA functional components.

Figure 77-1 AA functional components

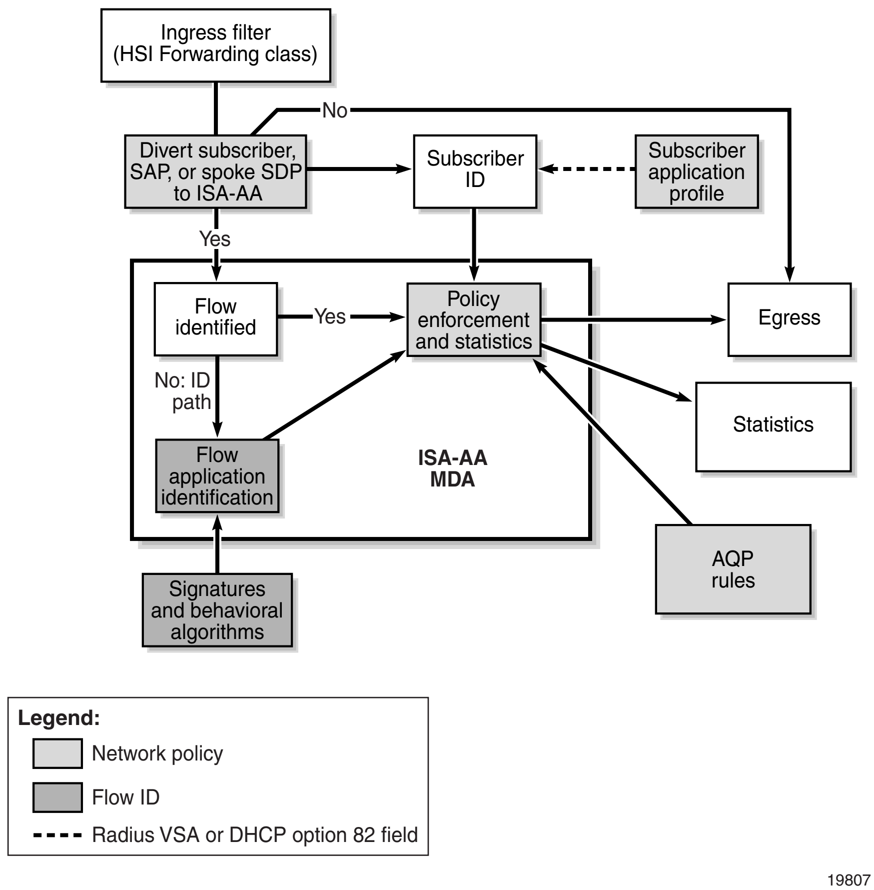


Figure 77-2 shows the relationship between the AA components that are used to identify applications and configure AA-related capabilities.

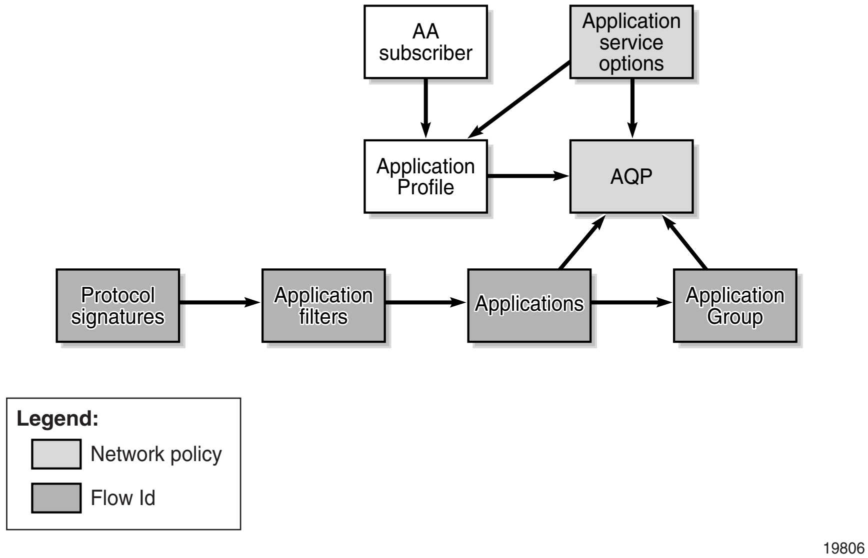
Figure 77-2 AA policy structure



ISA-AA groups and partitions

The 5620 SAM supports ISA-AA partitions. An ISA-AA partition is a unique child object of an ISA-AA group that can be assigned its own AA policy. There is no relationship between partitions of different ISA-AA groups. You can partition an ISA-AA group into AA policy partitions with one partition for each VPN-specific AA service. The partition supports VPN-specific custom protocols, applications, application group definitions, policy definitions and reporting. Each partition policy can be divided into multiple application QoS policies using ASOs. Multiple ISA-AA groups are used to scale the number of VPN-specific AA policies.

Multiple ISA-AA groups

The following operations can be performed at the ISA-AA group level

- Define one or more ISA-AA groups to allow AA resource partitioning and reservation of different types of AA service.
- Assign physical ISA-AAs to a group.
- Specify forwarding classes to be diverted for inspection by the AA subscribers that belong to the group and choose the AA policy to be applied to the group.
- Configure redundancy and bypass mode features to protect against equipment failure.
- Configure QoS on IOMs that host ISA-AA traffic.
- Configure ISA capacity planning using low and high thresholds.
- Enable ISA-AA partitions for ISA-AA groups.

Residential services are an example where all AA services can be configured as part of a single group that encompasses all ISA-AAs. The configuration provides the management of common applications and reporting for all subscribers and services, with common or per-customer AQP (uses ASO characteristics to divide the AQP of the ISA-AA into per-application profile QoS policies).

Multiple ISA-AA groups can also be used to create separate services based on different sets of common applications, traffic diversion needs, or different redundancy models. Multiple ISA-AA groups can be used for:

- a mix of residential and business customers
- different business VPN verticals
- business services with a common template base but different levels of redundancy, forwarding class diversion, or scaling over what is supported per single group

ISA-AA partitions

ISA-AA groups and partitions improve the scaling of policies. If partitions are not configured, the ISA-AA group acts as a single partition. When partitions are configured, application identification, and policy and statistics configuration apply only to the partition and not any other partitions that are configured under the same AA group. Although the definition of application profiles and related ASO characteristics is in the context of a partition, the application profile names must be unique for the NE. Definition of applications, application groups, and AQPs are also specific and only apply to a specific partition.

The following operations can be performed at the ISA-AA partition level

- Define unique applications and application groups per partition.
- Define AQP policies per partition.
- Define common applications and application groups with per partition processing and accounting.

ISA-AA partitions support accounting and customized reporting for every AA subscriber associated with a partition. You can perform the following operations:

- Define different types of reporting and accounting policies for different partitions in a single AA group.
- Display AA group level protocol statistics with partition visibility (for example, you can view protocol counts that are reported for each partition of the group).

When you create or delete an ISA-AA partition, a default AA accounting policy is automatically created in or deleted from the ISA-AA partition. See Procedure 18-2 for information about how to create and configure ISA-AA groups and partitions.

AA protocol signatures

The 5620 SAM generates a set of signatures that identify AA protocols. The signature set includes:

- protocol support summary—list of protocols that can be identified with the load using a combination of pattern and behavioral techniques. The protocols are used to generate statistics by protocol and as input in combination with other information to identify applications.
- pattern signatures—set of pattern-match signatures used in analysis
- behavior signatures—set of diagnostic techniques used in analysis

Dynamic upgrades of protocol signatures are implemented by using an admin application-assurance upgrade command and then performing ISA-AA activity switches. Protocol signatures are updated as part of an ISSU that only updates ISA-AA software. Signature upgrades without an NE upgrade can be performed within a major release independent of system ISSU limits.

Because protocol signatures are intended to be the most basic block of application identification, other AA components, such as application filters, are provided to further customize protocol signatures. Customization reduces the need for a new protocol signature load when a new application may need to be identified.

Each protocol can be referenced in the definition of one or more applications by the application filter definition. The assignment of each supported protocol to an application filter or application is optional, allowing for the addition of new signature protocols without the need to update the application filter and applications.

Protocol shutdown

The 5620 SAM supports signature upgrades without automatically affecting policy behavior. All post-R1 new signatures are disabled, by default, during an upgrade to ensure that policies or services are not affected.

The protocols that are included in R1 of a release are designated as parent signatures and cannot be disabled. Within a major release, all protocols introduced after R1 of a release as part of an isa-aa.tim ISSU are, by default, shut down. When shut down, protocols introduced after R1 do not change AA behavior. For example, traffic maps to the parent protocol on which the new signature is based. Enabling or disabling a new protocol takes affect for new flows only. The protocols must be enabled on a per-protocol basis to take effect. Perform Procedure 77-18 to enable AA protocols.

AA group policies

An AA group policy includes the following components:

- application filters
- applications
- application groups
- application profiles
- application service options
- application QoS policies
- custom protocols

Application filters

Application filters are provided as an indirect action between protocols and applications to allow the addition of variable parameters (for example, port numbers and IP addresses) to an application definition. Application filters are numbered rule entries that define the use of protocol signatures and other application criteria. Multiple application filter entries can be used to define an application, but each application filter entry maps to one application.

A traffic flow may have multiple rules. The rule with the lowest entry number that matches is applied. A traffic flow can only be assigned to one application.

Applications

Applications define and assign a description to the application names that are supported by the application filter entries. Each application is associated with one of the application groups. Applications are used by AA to identify the type of IP traffic in the subscriber traffic.

The application name is a key match criterion within the AQP rules that are applied to the IP traffic of a subscriber. The application name is also the unique identifier of the application object for northbound reporting systems such as the 5670 RAM. Changing an application name results in the loss of the previous application and the creation of a new application.

One predefined application (“unknown”) is provided by AA. The unknown application cannot be modified. All other applications must be configured. An application must be configured before the associated application filter is defined.

Network operators can:

- change the application group that an application is associated with
- view which application filters are defining the application

Application groups

An application group is a container for multiple applications. A set of default application groups is provided by AA. At least one default application group (“unknown”) must be associated with each NE. The default application groups cannot be modified.

Multiple applications can be assigned to an application group. An application can only belong to one group. Applications that are not assigned to an application group are automatically placed in the “unknown” application group.

Application profiles

Application profiles enable AA service for traffic to and from an ESM subscriber, SAP, or spoke SDP. Each application profile is unique and defines the AA service that the AA subscriber receives. The type of traffic is configured in the system-wide configuration of QoS forwarding classes to be diverted to the ISA-AA MDA for subscribers with AA enabled. The forwarding class is used for any subscriber traffic that a service provider needs to inspect using AA.

An ESM subscriber can be assigned to an application profile that affects every host of the subscriber. For SAP or spoke SDP AA subscribers, an application profile can be assigned that affects the traffic originating from or destined over the SAP or spoke SDP.

For subscribers with application profiles that enable AA, traffic is diverted to the active ISA-AA MDA using ingress QoS policy filters. The filters identify forwarding and sub-forwarding classes that can be diverted for AA. The system identifies and diverts only traffic for any subscriber who is treated by the ISA-AA MDA, according to the application profile of the subscriber. Diversion to the ISA-AA MDA depends on the ISA-AA MDA status. If a subscriber is not configured to divert traffic to the ISA-AA MDA, normal ingress forwarding occurs.

The characteristics of application profiles are:

- By default, subscribers are not assigned to an application profile and traffic is not diverted for AA analysis.
- One or more application profiles can be configured.
- Application profiles are customer-defined and created using the configured application service options characteristics.
- Application profiles allow ASO characteristics to be associated with AA subscribers.
- Local instances of the application profile are configured to bind to specific objects of an NE (for example, L2 access interface, SAP, local subscriber explicit map entry, and so on).
- Application profiles can only be assigned when ISA-AA cards are assigned to an ISA-AA group
- Global application profiles must be manually distributed to the NEs.
- Application profiles can be assigned a capacity cost for subscriber load balancing among ISAs within the AA group.

ASOs

Application service options (ASOs) are used to define service provider and customer network functionality that is common among sets of subscribers. ASOs prevent subscribers from requiring each subscriber-specific entry in the application QoS policies for standard network services.

In a typical application, ASOs define the HSI service parameters.

- ASOs are optional; AA can check the subscriber IP traffic without the use of application service options.
- ASOs can be configured for each AA group policy.
- ASOs are a series of user-defined application characteristics.
- ASO characteristics are used to create application profiles and provide information to user-defined AQP rules.
- The set of ASOs represent network-wide menus of service capabilities that are available to subscribers.

Some examples of ASOs are:

- entry for each application group to be managed; for example, VoIP, P2P, and HTTP
- multiple entries (typically less than 20) where specific applications in an application group can be individually managed as service parameters; for example, HTTP content from a specific content provider or streaming video from network television or games
- HSI tiers (for example, Gold, Silver, and Bronze) that specify bandwidth levels
- bandwidth parameters for each service option

ASO characteristics are used:

- as input to application profiles
- by application QoS policies to influence how specific traffic is checked and how policies are applied

ASOs are defined and assigned to one or more values to define service offerings to customers.

You can configure ASO characteristics for an AA subscriber using an AA subscriber policy override. An AA subscriber policy override can be configured for a SAP or spoke SDP binding, but not for an ESM subscriber. The AA subscriber must have an application profile assigned, or the subscriber policy override is rejected.

You can retrieve on demand the ASO values that are assigned to an AA subscriber from the Edit form of the SAP or spoke SDP binding AA subscriber.

AQPs

Application Qos Policies, or AQPs, are lists of rules that define the match criteria and action to be performed on all traffic flows. The AQP rules use as the match criteria the application groups, applications, and so on. The output of the AQP rules defines the policy actions to perform.

AQP rules consist of match and action criteria:

- Match—Refers to the criteria used to identify a flow in order to apply actions such as dropping, forwarding, mirroring, and policing of bandwidth and flow. Matches cannot be made against protocols. Match criteria can be a combination of the following:
  - applications or application groups
  - ASO characteristics
  - flow direction
  - AA subscribers
  - flow source or destination IP address and/or port
- Action—Defines AA actions to be applied to traffic. For example, you can apply a set of actions such as bandwidth policing, packet discards, QoS remarking, and flow count, and/or rate limiting to a flow.

Custom protocols

Custom protocols are supported using configurable strings (up to 16 hexadecimal octets) for pattern-matched application identification in the payload of TCP- or UDP-based applications. The match is specified for the client-to-server, server-to-client, or any direction for TCP based applications, and in the “any” direction for UDP-based applications.

You can configure a custom protocol description, custom protocol ID and shutdown. When a custom protocol’s administrative status is disabled, traffic is identified as if the protocol is not configured.

Custom protocols and Alcatel-Lucent-provided protocols are distinct in that the span of a custom protocol is limited to the group or partition associated with an AA policy, while Alcatel-Lucent-provided protocols span all groups and partitions. Custom protocols are used in the application definition without limitations. All application filter entries, except strings, are supported. Custom protocol statistics collection on an ISA-AA partition group or special study subscriber is supported.

Reporting attributes

Reporting attributes are metadata parameters for reporting data to the 5670 RAM. The parameters are used to enhance the granularity of data analysis and are not deployable to devices. Reporting attributes can be found and configured individually in the 5670 RAM Parameters tab in the properties forms of the following objects:

- residential subscriber instances
- services
- SAPs
- customers
- applications
- application groups

Reporting attributes for service class and bandwidth are found on AA reporting objects that you can configure in the Reporting subtab of the 5670 RAM Parameters tab in the properties forms of the following objects:

- spoke SDP bindings
- L3 access interfaces
- VPN-type transit prefix subscribers

Note 1 — You must associate an application profile with the following objects before you can configure AA reporting objects.

Note 2 — You cannot create more than one AA reporting object for a service or subscriber object.

See the configuration procedures for the above objects for more information about configuring reporting attributes.

Usage-based billing

The 5620 SAM supports application-specific reporting to the 5670 RAM based on configurable charging groups. The 5620 SAM automatically assigns a set of eight default charging groups to each application profile. You can configure charging groups with specific usage quotas and thresholds, and assign the charging groups to applications and application groups. Applications and application groups are assigned to the first charging group by default, and can only be assigned to one charging group. You cannot create additional charging groups.

Policy Sync Group

Policy sync groups allow AA group policy components to be centrally defined and used across multiple ISA-AA groups and partitions. Policy sync groups define common AA group policy components by specifying a group policy as the master policy. The applications, application groups, custom protocols, and application filters of the master AA group are available to other AA groups that are members of the same policy sync group.

Use the Policy Sync Group menu option to designate an AA group policy as the master policy and add one or more AA group policies to Policy Sync Group members. You can overwrite or add the contents of the master policy to one or more of its members.

AA policers

AA policers can be bandwidth or flow limiting, and can have one of the following scopes:

- system scope—limits all traffic entering the ISA-AA MDA
- subscriber scope—limits apply to the traffic of a subscriber

After a policer is referred to by an AQP for one traffic direction, the same policer cannot be referred to in the other direction. AQP rules with policer actions must specify a traffic direction other than “both”.

AA accounting policies

The AA accounting statistics provide information required to understand the application use in a network. You can configure AA accounting to collect and report statistics when at least one ISA-AA MDA is active. The AA accounting statistics provide information about application use on a SAP or spoke SDP, or by a subscriber during a collection interval. The collected information can be viewed in graphical or tabular form using the 5620 SAM GUI, or sent to a module such as the 5670 RAM for reporting and trend analysis.

AA accounting collects statistics on traffic flows. The 5620 SAM can collect the following AA statistics types:

- AA application
- AA application group
- AA protocol
- AA subscriber protocol (special-study)

- AA subscriber application (special-study)
- AA subscriber custom record

AA uses the existing 5620 SAM and NE accounting statistics and logging capabilities to collect statistics. See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting accounting statistics. See Procedure 77-5 for information about configuring an AA accounting policy.

The 5620 SAM can be configured to generate statistics for each protocol and application for a specific subscriber. You can enable AA statistics collection on a specific NE for a subset of subscribers for detailed traffic monitoring. An NE can have one policy for each AA statistics type that is enabled.

The AA subscriber protocol and AA subscriber application statistics are special study statistics for detailed accounting statistics collection on a limited number of subscribers, SAPs , or spoke SDPs on an NE. The number of subscribers, SAPs, or spoke SDPs is limited to constrain the volume of generated statistics.

Special study statistics are enabled by adding subscribers, SAPs, or spoke SDPs to a list in an ISA-AA group on an NE for AA debugging purposes. When a subscriber is on a special study list, the ISA-AA creates one statistics record for each application and application group that is associated with the subscriber. When a SAP or spoke SDP is on a special-study list, the ISA-AA creates one statistics record for each application, application group, and protocol flow on the SAP or spoke SDP. See Procedure 18-2 for information about configuring special study objects in an ISA-AA group.

An AA custom record subscriber accounting policy applies to all subscribers, SAPs and spoke SDPs in an ISA-AA group for a specified set of AA protocols, applications, and application groups. The policy enables statistics collection on only the specified objects, which limits the volume of collected data and the statistics collection processing load. For example, a 5620 SAM operator may require statistics for only three application groups and 10 applications. You can view and configure the AA statistics objects from the AA Subscriber Stats Objects tab on the properties form of an ISA-AA group.

AA flow watermark policies

AA supports the configuration of high and low thresholds (watermarks) for logs and traps when there is a high consumption of the flow table. The flow table has a limited size and the thresholds are established to alert users that the flow table is approaching maximum capacity. When the high threshold is reached, an alarm is generated. The alarm is cleared when the flow table capacity has dropped below the specified low threshold.

AA transit IP and transit prefix policies

AA transit IP and transit prefix policies define how AA transit subscribers are created by an NE. Transit IP policies can be configured to discover dynamic transit subscribers via DHCP or RADIUS, and can also be configured with a list of static transit subscribers. Transit prefix policies allow you to specify transit subscribers by using network or subscriber IP ranges.

AA transit subscribers can persist in the 5620 SAM database. Transit subscriber aggregators allow you to aggregate multiple database persisted transit subscriber instances for VPN sites.

Application performance reporting

Application performance reporting adds a layer of route configuration to the handling of AA TCP performance, RTP/UDP performance, and flow-based volume reporting to the 5670 RAM. You can enable application performance reporting on service objects, and the configure default DCP groups with address rules to apply a DCP subnet group to an entire network, an IP address range, or a single IP address for Internet or intranet traffic.

You can also create custom DCP subnet groups and bind them to individual L3 access interfaces and spoke SDP bindings. The 5670 RAM ignores application performance reporting configuration and objects on services that do not, or cannot, have an associated application profile.

AA HTTP error redirect policies

AA HTTP error redirect policies allow you to specify templates for local NE termination of HTTP errors and web browser redirection to customized error pages according to HTTP error codes.

77.2 Workflow to configure application assurance

1 Configure ISA-AA groups on NEs. See Procedure 18-2.

2 Configure AA group policies by performing Procedure 77-1. As required, configure the following components:

i ASOs and ASO overrides

ii application profiles

iii application groups

iv applications

v application filters

vi custom protocols

3 Configure AA policers. See Procedure 77-2.

4 Configure AQPs for AA group policies. See Procedure 77-3.

5 Create a policy sync group. See Procedure 77-4.

6 Create an AA accounting policy to specify when statistics are to be collected on the ISA-AA MDA. See Procedure 77-5.

7 Configure an AA flow watermark policy. See Procedure 77-6.

8 Configure AA transit IP policies and transit prefix policies as required.

i Configure AA transit IP policies. See Procedure 77-7.

ii Configure AA transit prefix policies. See Procedure 77-8.

iii Configure database persisted transit subscriber aggregators. See Procedure 77-9.

iv Associate database persisted transit subscribers with aggregators. See Procedure 77-10.

v Configure reporting attributes for AA reporting on a database persisted transit subscriber. See Procedure 77-11.

vi As required, view the database persisted transit subscriber information. See Procedure 77-12.

9 Configure usage-based billing as required:

i Enable usage-based billing at the application profile level. See Procedure 77-13.

ii Associate applications and application groups with charging groups. See Procedure 77-14.

10 Configure application performance reporting on a service. See Procedure 77-15.

11 Create a custom DCP subnet group for application performance reporting on a service and related objects. See Procedure 77-16.

12 Configure AA HTTP error redirect policies. See Procedure 77-17.

13 Configure AA protocol signatures and enable inactive protocols, as required. See Procedure 77-18.

14 As required, view AA results:

a view AA summary information for subscribers, transit subscribers, SAPs, and spoke SDPs on ISA-AA MDAs; see Procedure 77-19 for more information

b view the AA special study statistics data for subscribers, transit subscribers, SAPs, or spoke SDPs on an ISA-AA MDA; see Procedure 77-20 for more information

c view application filter hit counts on local definitions of AA group policies; see Procedure 77-21 for more information

d view application filter hit counts on local definitions of AA group policies; see Procedure 77-22 for more information

15 As required, delete AA objects or records:

a delete an AA application, application group, or custom protoco; see Procedure 77-23 for more information

b remove the record of an inactive AA transit subscriber from the 5620 SAM database; see Procedure 77-24 for more information

77.3 Application assurance procedures

Use the following procedures to configure AA policies and parameters in the 5620 SAM.

Procedure 77-1 To configure an AA group policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list and click on the Search button. A list of AA group policies is displayed.

> **Note —** The 5620 SAM does not create local AA Group policies for each applicable managed NE. Instead, the local AA Group Policy is created/deleted when the ISA-AA group is created/deleted.

3 Select the policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

4 Configure the Description parameter.

5 Perform the following steps to create an application group.

- **i** Click on the Application Groups tab button.

- **ii** Click on the Create button. The Application Group (Create) form opens.

> **Note —** You can also create an application group from the AA Identification Components tab of the AA Group Policy (Edit) form by selecting Application Groups and using the right-click contextual menu. This tab also allows for the deletion, modification, and resynchronization of Application Groups.

- **iii** Configure the parameters:
  - Displayed Name
  - Description

- **iv** Click on the 5670 RAM Parameters tab button.

- **v** Configure the parameters:
  - Charging Group
  - Traffic Type

- **vi** Click on the OK button. A dialog box appears.

- **vii** Click on the OK button. The AA Group Policy (Edit) form reappears.

6 Repeat step 5 to create additional application groups, as required.

7 Perform the following steps to create an application.

i Click on the Applications tab button.

ii Click on the Create button. The Application (Create) form opens.

Note — You can also create an application from the AA Identification Components tab of the AA Group Policy (Edit) form by selecting Applications and using the right-click contextual menu. This tab also allows for the deletion, modification, and resynchronization of Applications.

iii Configure the parameters:

- Displayed Name
- Description

iv Click on the Application Groups tab button.

v Click on the Select button in the Application Group panel to choose an application group. The Select Application Group search form opens.

vi Select an application group in the list and click on the OK button. The Select Application Group form closes and the application group information appears on the Application (Create) form.

vii Click on the 5670 RAM Parameters tab button.

Note — The 5670 RAM can perform an application performance index analysis on an AA application. An application performance index configuration is not distributed to an NE as part of a policy distribution.

The 5670 RAM provides a comparative analysis of TCP and UDP application usage. For each application, you can specify whether the application is TCP or UDP. TCP or UDP data is not distributed to an NE as part of a policy distribution.

viii Configure the parameters:

- Application Flag
- Traffic Type
- Round Trip Time Tolerated (milliseconds)
- Mean Total Delay Tolerated (milliseconds)
- Total Delay Standard Deviation Tolerated (milliseconds)
- Packet Loss Tolerated (%)
- Charging Group
- Threshold Administrative State
- Frustrated (milliseconds)
- Frustrated (milliseconds)
- Frustrated (milliseconds)
- Frustrated (%)

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The AA Group Policy (Edit) form reappears.

8 Repeat step 7 to create additional applications, as required.

9 Perform the following steps to create an application filter.

i Click on the Application Filters tab button.

ii Click on the Create button. The Application Filter (Create) form opens.

Note — You can also create an application filter from the AA Identification Components tab of the AA Group Policy (Edit) form by selecting Application Filters and using the right-click contextual menu. This tab also allows for the deletion, modification, and resynchronization of Application Filters.

iii Configure the parameters:

- Entry ID
- Description
- Administrative State

iv Click on the General Properties tab button.

v Configure the parameters:

- Flow Set-up Direction
- IP Protocol Operator
- IP Protocol Number
- Protocol Operator
- Protocol Type
- Server Address Operator
- Server Address
- Server Address Mask
- Server Port Operator
- Server Port Value Type
- Server Port/Low Value
- Server Port High Value
- Server Port First Packet Policy

vi Click on the Select button in the Protocol panel to choose a protocol. The Select Protocol form opens.

vii Select a protocol in the list and click on the OK button. The Select Protocol form closes and the protocol information appears on the Application Filter (Create) form.

viii Click on the Select button in the Protocol panel to choose a custom protocol name. The Select Custom Protocol form opens.

ix Select a custom protocol in the list and click on the OK button. The Select Custom Protocol form closes and the protocol information appears on the Application Filter (Create) form.

x Click on the Application tab button.

xi Click on the Select button in the Application panel to choose an application. The Select Application search form opens.

xii Select an application in the list and click on the OK button. The Select Application form closes and the application information appears on the Application Filter (Create) form.

xiii Click on the Application Filter Expressions tab button.

xiv Click on the Create button. The Application Filter Expression (Create) form opens.

xv Configure the parameters:

- Index
- Type
- Operator
- String

xvi Click on the OK button. The Application Filter Expression (Create) form closes and the expression information appears on the Application Filter (Create) form.

xvii Repeat step 9 xiv to xvi to create an additional application filter expression, if required. The maximum number of application filter expressions that can be created is 3.

xviii Click on the OK button. A dialog box appears.

xix Click on the OK button. The Application Filter (Create) form reappears.

10 Repeat step 9 to create an additional application filter, if required.

11 Perform the following steps to create an application service option.

i Click on the Application Service Options tab button.

ii Click on the Create button. The Application Service Option (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Displayed Name
- ASO Characteristic Default Value

iv Click on the Application Service Option Value Entries tab button.

v Click on the Create button. The Application Service Option Value Entry (Create) form opens.

vi Configure the ASO Characteristic Value parameter.

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Application Service Option Value Entry (Create) form closes and the entry information appears on the Application Service Option (Create) form.

ix Repeat steps 11 iv to viii to create an additional application service option value entry.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The AA Group Policy form reappears.

12 Repeat step 11 to create an additional application service option.

13 Perform the following steps to create an application profile.

i Click on the Application Profiles tab button.

ii Click on the Create button. The Application Profile (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Displayed Name
- Description
- Divert
- Capacity Cost

iv Click on the Characteristics tab button.

v Click on the Create button. The Application Profile Characteristic (Create) form opens.

vi Click on the Select button beside the ASO Characteristic parameter. The Select Application Service Option search form opens.

vii Select an application service option in the list and click on the OK button. The Select Application Service Option form closes and the application service option information appears on the Application Profile Characteristic form.

viii Click on the Select button beside the ASO Characteristic Value parameter. The Select Application Service Option Characteristic Value search form opens.

ix Select an ASO characteristic value in the list and click on the OK button. The Select Application Service Option Characteristic Value form closes and the ASO characteristic value information appears in the Application Profile Characteristic form.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The Application Profile Characteristic (Create) form closes and the entry information appears on the Application Profile (Create) form.

xii Repeat steps 13 v to xi to create an additional application profile characteristic, if required.

xiii Click on the OK button. A dialog box appears.

xiv Click on the OK button. The AA Group Policy form reappears.

14 Repeat step 13 to create an additional application profile, if required.

15 Create custom protocols.

i Click on the Custom Protocols tab button.

ii Click on the Create button. The Custom Protocol (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Entry ID
- Description
- IP Protocol Number
- Administrative State

iv Click on the Custom Protocol Expressions tab button.

v Click on the Create button. The Custom Protocol Expressions (Create) form opens.

vi Configure the parameters:

- Index
- Custom Protocol Expression Offset
- Custom Protocol Expression Direction
- Operator
- String

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Custom Protocol Expression (Create) form closes and the entry information appears on the Custom Protocol (Create) form.

ix Click on the OK button. The AA Group Policy form reappears.

16 Modify a local instance of an AA group policy, as required.

i Click on the Local Definitions tab. The AA policies for each managed NE are listed.

ii Select an AA policy in the list and click on the Properties button to modify the local instance of the policy.

iii Perform steps 4 to 14. Go to step 17.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The AA Group Policy form closes and the Application Assurance Policies form reappears.

19 Close the Application Assurance Policies form.

Procedure 77-2 To create an AA policer policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Policer (Application Assurance) from the object drop-down list

3 Click on the Create button and choose Create AA Policer. The AA Policer (Create) form opens with the General tab displayed.

4 Configure the parameters:

- ISA-AA Group ID
- Displayed Name
- Type
- Granularity
- Description

Note — The distribution of an AA policer fails if the ISA-AA group ID it refers to does not exist on the NE.

5 Perform one of the following:

a If the Type parameter was set to Dual Bucket Bandwidth, go to step 7.

b If the Type parameter was set to Flow Count Limit, configure the Flow Count (flows) parameter.

c If the Type parameter was set to Flow Rate Limit, go to step 9.

d If the Type parameter was set to Single Bucket Bandwidth, go to step 11.

6 Go to step 12.

7 Configure the parameters:

- MBS (KB)
- CBS (KB)
- PIR (Kbps)
- CIR (Kbps)
- PIR
- CIR

8 Go to step 12.

9 Configure the parameters:

- MBS (flows)
- PIR (Kbps)
- PIR

10 Go to step 12.

11 Configure the parameters:

- Action
- MBS (KB)
- PIR (Kbps)
- PIR

12 Click on the OK button to close the AA Policer (Create) window.

13 Close the Application Assurance Policies form.

Procedure 77-3 To create an AQP

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list and click on the Search button. A list of AA group policies is displayed.

Note — The 5620 SAM does not create local AA Group policies for each applicable managed NE. Instead, the local AA Group Policy is created/deleted when the ISA-AA group is created/deleted.

3 Select the policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

4 Click on the Application QoS Entries tab button.

5 Click on the Create button. The Application QoS Policy (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Entry ID
- Description
- Administrative State

7 Click on the Match Criteria tab button.

8 Configure the parameters:

- Traffic Direction
- Application Operator

9 Click on the select button beside the Displayed Name parameter in the Application panel. The Select Application Name - Application QoS Policy list form opens.

10 Select an application from the list and click on the OK button. The Select Application Name - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Displayed Name information.

11 Configure the Application Group Operator parameter.

12 Click on the select button beside the Displayed Name parameter in the Application panel. The Select Application Group Name - Application QoS Policy list form opens.

13 Select an application group from the list and click on the OK button. The Select Application Group Name - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Displayed Name information.

14 Configure the parameters in the DSCP panel:

- DSCP Operator
- DSCP

15 Click on the AA Subscriber tab button.

16 Configure the SubscriberType parameter.

Note 1 — The SAP and Spoke SDP Binding options are valid for the SubscriberType parameter only when you create a local AQP entry.

Note 2 — If the SubscriberType parameter is set to None, the values of all parameters on the AA Subscriber tab are reset.

17 Perform one of the following:

a If the SubscriberType parameter is set to ESM, go to step 18.

b If the SubscriberType parameter is set to SAP, go to step 20.

c If the SubscriberType parameter is set to Spoke SDP Binding, go to step 21.

d If the SubscriberType parameter is set to Transit, go to step 22.

e If the SubscriberType parameter is set to None, go to step 23.

18 Configure the parameters:

- Subscriber Operator
- ESM Subscriber

19 Go to step 23.

20 Configure the parameters:

- Subscriber Operator
- SAP Subscriber

21 Configure the parameters:

- Subscriber Operator
- Spoke Subscriber

22 Configure the parameters:

- Subscriber Operator
- Transit Subscriber

23 Click on the Source and Destination tab button.

24 Configure the parameters in the Source Address panel:

- Address Operator
- Address
- Address Length

25 Configure the parameters in the Source Port panel:

- Port Operator
- Port Value Type
- Port Value/Low Value
- Port High Value

26 Configure the parameters in the Destination Address panel:

- Address Operator
- Address
- Address Length

27 Configure the parameters in the Destination Port panel:

- Port Operator
- Port Value Type
- Port Value/Low Value
- Port High Value

28 Click on the Characteristics tab button.

29 Click on the Create button.

30 Configure the parameters:

- ASO Characteristic
- ASO Characteristic Operator
- Capacity Cost

31 Click on the Action tab.

32 Configure the Drop parameter.

33 Click on the Select button beside the Displayed Name parameter in the Bandwidth Limit Policer panel. The Select Bandwidth Limit Policer - Application QoS Policy list form opens.

34 Select a bandwidth limit policer from the list and click on the OK button. The Select Bandwidth Limit Policer - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Displayed Name information.

35 Click on the Select button beside the Displayed Name parameter in the Flow Rate Limit Policer panel. The Select Flow Rate Limit Policer - Application QoS Policy list form opens.

36 Select a flow rate limit policer from the list and click on the OK button. The Select Flow Rate Limit Policer - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Displayed Name information.

37 Click on the Select button beside the Displayed Name parameter in the Flow Count Limit Policer panel. The Select Flow Count Limit Policer - Application QoS Policy list form opens.

38 Select a flow count limit policer from the list and click on the OK button. The Select Flow Count Limit Policer - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Displayed Name information.

39 Click on the Select button beside the Displayed Name parameter in the HTTP Error Redirect panel. The Select HTTP Error Redirect - Application QoS Policy list form opens.

40 Select an HTTP error redirect policy from the list and click on the OK button. The Select HTTP Error Redirect - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Displayed Name information.

41 Click on the Select button beside the Service ID parameter in the Mirror Source panel. The Select Service ID - Application QoS Policy list form opens.

42 Select a mirror service from the list and click on the OK button. The Select Service ID - Application QoS Policy list form closes and the Application QoS Policy (create) form is refreshed with the Service ID information.

Note — The Service ID parameter can only be configured when creating a local AQP entry.

43 Configure the parameters:

- Mirror Source All Inclusive
- Forwarding Class
- Priority
- Remark DSCP In Profile
- Remark DSCP Out Profile

44 Click on the OK button to close the Application QoS Policy (create) form.

45 Click on the OK button to close the AA Group Policy (Edit) form.

46 Close the Application Assurance Policies form.

Procedure 77-4 To create a policy sync group

1 Choose Policies→Policy Sync Group from the 5620 SAM main menu. The Policy Sync Groups form opens.

2 Perform the following steps to create a Policy Sync Group.

i Click on the Create→Create Policy Sync Group. The Policy Sync Group (Create) form opens.

ii Configure the parameters:

- Auto-Assign ID
- Description
- Displayed Name

iii Click on the Select button in the Master Policy panel to choose a master policy. The Select Master Policy - Policy Sync Group form opens.

iv Choose a master policy in the list and click on the OK button. The Select Master Policy - Policy Sync Group closes and the Policy Sync Group (Create) form reappears.

v Click on the OK button. The Policy Sync Group Manager form reappears.

3 Add a member to a master AA group policy.

i From the Policy Sync Group Manager form, choose a Policy Sync Group from the list and click on the Properties button. The Policy Sync Group (Edit) form opens with the General tab displayed.

ii Click on the Members tab.

iii Click on the Create button. The Select AA Group Policy - Policy Sync Group form opens.

iv Choose one or more AA group policies in the list and click on the OK button. A dialog box appears.

v Choose one of the options and click on the OK button. The Select AA Group Policy - Policy Sync Group form closes and the member is displayed on the Policy Sync Group (Edit) form.

Note 1 — The Sync Members button performs the same function as the “Listed master policy classes will overwrite member classes” option. The Add to Members button performs the same function as the “Listed master policy classes will be added to member classes” option.

Note 2 — The Sync Members, Add to Members, and Update Master actions performed on an AA group policy only affect the classes listed under the Included Classes tab button.

4 Audit and compare a master AA group policy and its members for the classes listed under the Included Classes tab.

Note 1 — The Audit button displays the differences between a master AA group policy and its members.

Note 2 — The Compare button compares two selected policies between master-member, or member-member.

Note 3 — The Update Master button adds the contents of a selected AA group policy to the included classes of a master policy.

i Click on the Audit button. A dialog box appears.

ii Click on the Yes button. An Audit dialog box appears.

iii Click on the OK button.

iv View the alarm window to display the alarms raised against the member policy, if required.

5 Compare and view detailed differences between two policies.

i Hold down the Shift key to choose two policies in the list and click on the Compare button. The Compare - AA Group Policy form opens.

ii Click on the Compare button to view the differences between Policy A and Policy B.

Note 1 — You can use the Swap button to switch Policy A and Policy B.

Note 2 — You can use the Difference drop-down list to choose a category that you need to filter on.

iii Choose a result and and click on the Properties button. The Difference - AA Group Policy (*class type*) form opens.

iv View the differences between the two policies.

Note — After a Sync Member or Add to Member action, the member policy mode changes to Draft. When the policy is in Draft mode, you must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 46 for more information.

Procedure 77-5 To configure an AA accounting policy

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting accounting statistics.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Accounting Policy (Application Assurance) from the object drop-down list.

3 Perform one of the following:

a To create an AA accounting policy, click on the Create button and choose Create AA Accounting Policy from the object drop-down list. The AA Accounting Policy (Create) form opens.

b To modify an AA accounting policy:

i Click on the Search button. The AA accounting policies are displayed.

ii Select an AA accounting policy in the list and click on the Properties button. The AA Accounting Policy (Edit) form opens.

4 Configure the parameters:

- Group ID
- Partition ID
- Description

5 Click on the Apply button. The form displays additional tabs.

6 Click on the Accounting Policies tab button. A list of accounting policies is displayed.

7 Configure each accounting policy in the list, if required.

i Select the accounting policy and click on the Properties button. The AA Accounting Configuration form is displayed.

ii Configure the parameters:

- Description
- Collect Accounting Statistics

iii Configure the following policy-specific parameters, if required:

- Administrative State
- Collect Aggregate Statistics
- Collect Maximum Throughput Statistics

iv Click on the Select button to choose an accounting policy. The Select Accounting Policy form opens.

v Select an accounting policy in the list and click on the OK button. The Select Accounting Policy form closes and the accounting policy information appears on the AA Accounting Configuration form.

vi Click on the OK button. The AA Accounting Configuration (Edit) form closes.

8 Click on the Apply button. A dialog box appears.

9 Click on the Yes button.

10 Click on the General tab button.

11 Click on the Switch Mode button. A dialog box appears.

12 Click on the Yes button.

13 Click on the Distribute button to manually distribute the policy to one or more NEs. The Distribute - AA Accounting form opens.

14 Select one or more NEs in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The NEs move to the Selected Nodes panel.

15 Click on the Distribute button. The policy is distributed to the NEs.

16 Modify a local instance of the AA accounting policy, if required.

i Click on the Local Definitions tab button. The AA accounting policies for each managed NE are listed.

ii Select an AA accounting policy in the list and click on the Properties button to modify the local instance of the policy. The AA Accounting Configuration (Edit) form opens.

iii Click on the Switch Mode button.

iv Perform steps 4 to 12.

17 Click on the OK button. The AA Accounting Configuration (Edit) form closes and the Application Assurance Policies form reappears.

18 Close the Application Assurance Policies form.

Procedure 77-6 To configure an AA flow watermark policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Flow Watermark (Application Assurance) from the object drop-down list.

3 Specify a filter to create a filtered list of flow watermark configurations, and click on the Search button. A list of flow watermark configurations is displayed.

4 Select an entry in the list and click on the Properties button. The AA Flow Watermark (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Flow Full High Watermark
- Flow Full Low Watermark
- Flow Setup High Watermark
- Flow Setup Low Watermark
- Packet Rate High Watermark
- Packet Rate Low Watermark
- Bit Rate High Watermark
- Bit Rate Low Watermark

6 Click on the Apply button. A dialog box appears.

7 Click on the Yes button.

8 Click on the General tab button.

9 Click on the Switch Mode button. A dialog box appears.

10 Click on the Yes button.

11 Click on the Distribute button to manually distribute the policy to one or more NEs. The Distribute - AA Flow Watermark form opens.

12 Select one or more NEs in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The NEs move to the Selected Nodes panel.

13 Click on the Distribute button. The policy is distributed to the NEs.

14 Modify a local instance of the AA flow watermark configuration, if required.

i Click on the Apply button.

ii Click on the Local Definitions tab. The AA flow watermark configurations for each managed NE are listed.

iii Select a managed NE in the list and click on the Properties button to modify the local instance of the flow configuration.

iv Perform step 5.

v Click on the OK button. The Application Assurance Flow Configuration form closes.

15 Click on the OK button. The Application Assurance Flow Configuration form closes and the Application Assurance Policies form reappears.

16 Close the Application Assurance Policies form.

Procedure 77-7 To configure an AA transit IP policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create an AA transit IP policy:

i Click on the Create button and choose AA Transit IP Policy from the object drop-down list. The AA Transit IP Policy (Create) form opens with General tab displayed.

ii Configure the parameters:

- Group ID
- Partition ID
- Auto-Assign ID
- Policy ID
- Description

b Modify an AA transit IP policy:

i Choose AA Transit IP Policy (Application Assurance) from the object drop-down list.

ii Click on the Search button to display a list of AA transit IP policies.

iii Select an AA transit policy in the list and click on the Properties button. The AA Transit IP Policy (Edit) form opens.

3 Click on the Select button in the Default Application Profile panel to choose an application profile. The Select Default Application Profile - AA Transit IP Policy form opens.

4 Choose an application profile from the list and click on the OK button.

Note — Only application profiles with the same Group ID and Partition ID values as the AA transit IP policy can be selected.

5 Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy. The Select Subscriber Identification Policy form opens.

6 Choose a subscriber identification policy from the list and click on the OK button.

7 Configure the parameters:

- DHCP
- RADIUS

Note — The DHCP and RADIUS parameters cannot be set to Enabled at the same time.

8 If the RADIUS parameter is set to Enabled, click on the Select button in the Subscriber Authentication Policy panel. The Select Subscriber Authentication Policy form opens.

9 Choose a subscriber authentication policy from the list and click on the OK button.

10 Add static subscribers to the AA transit IP policy:

i Click on the Subscribers tab button.

ii Click on the Create button. The Transit Subscriber (Create) form opens with the General tab displayed.

iii Configure the Displayed Name parameter.

iv Click on the Select button in the Application Profile panel. The Select Application Profile form opens.

v Choose an application profile from the list and click on the OK button.

vi Click on the IP Addresses tab button.

vii Click on the Create button. The Transit IP Address (Create) form opens.

viii Configure the Address parameter.

ix Click on the OK button.

x Return to step vii and add more addresses, as required.

xi Click on the OK button. The Transit Subscriber (Create) form closes.

11 Repeat step 10 to add more static subscribers to the AA transit IP policy, as required.

12 Click on the Apply button to save the AA transit IP policy. If you are modifying a transit IP policy, a dialog box appears.

13 Click on the Yes button, if required.

14 Click on the General tab button.

15 Click on the Switch Mode button. A dialog box appears.

16 Click on the Yes button.

17 Click on the More Actions button and choose Distribute to manually distribute the policy to one or more NEs. The Distribute - AA Transit IP Policy form opens.

18 Select one or more NEs in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The NEs move to the Selected Nodes panel.

19 Click on the Distribute button. The policy is distributed to the NEs.

20 Modify a local instance of the AA transit IP policy, if required.

- **i** Click on the Local Definitions tab button. The AA transit IP policies for each managed NE are listed.
- **ii** Choose an AA transit IP policy from the list and click on the Properties button to modify the local instance of the policy. The AA Transit IP Policy (Edit) form opens.
- **iii** Click on the Switch Mode button.
- **iv** Perform steps 3 to 16.

21 Click on the OK button. The AA Transit IP Policy (Edit) form closes and the Application Assurance Policies form reappears.

22 Close the Application Assurance Policies form.

Procedure 77-8 To configure an AA transit prefix policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

- **a** Create an AA transit prefix policy:
  - **i** Click on the Create button and choose AA Transit Prefix Policy. The AA Transit Prefix Policy (Create) form opens with the General tab displayed.
  - **ii** Configure the parameters:
    - Group ID
    - Partition ID
    - Auto-Assign ID
    - Policy ID
    - Description

iii Click on the Apply button. The form changes to the AA Transit Prefix Policy (Edit) and refreshes with additional tabs.

iv Go to step 3.

b Configure an existing AA transit prefix policy:

i Choose AA Transit Prefix Policy (Application Assurance) from the object drop-down list.

ii Configure the filter criteria, if required, and click on the Search button to generate a list of AA transit prefix policies.

iii Select an AA transit prefix policy from the list and click on the Properties button. The AA Transit Prefix Policy (Edit) form opens with the General tab displayed.

iv Go to step 3.

3 Perform the following steps to configure subscribers:

i Click on the Subscribers tab button.

ii Click on the Create button. The Transit Prefix Subscriber (Create) form opens.

iii Configure the parameters:

- Displayed Name
- Remote

iv Click on the Select button in the Application Profile panel. The Select Application Profile - Transit Prefix Subscriber form opens.

v Configure the filter criteria, if required, and click on the Search button to generate a list of application profiles.

vi Select an application profile from the list and click on the OK button. the Select Application Profile - Transit Prefix Subscriber form closes and the Transit Prefix Subscriber (Create) form refreshes with the selected application profile.

vii Click on the OK button.

viii Repeat steps ii to vii to create additional transit prefix subscribers, as required.

4 Perform the following steps to create transit prefix entries:

i Click on the Entries tab button.

ii Click on the Create button. The Transit Prefix Policy (Create) form opens.

iii Click on the Select button in the Subscriber panel. The Select Subscriber - Transit Prefix Entry form opens.

iv Configure the filter criteria, if required, and click on the Search button to generate a list of subscribers.

v Select a subscriber and click on the OK button.

vi Configure the parameters:

- Auto-Assign ID
- Match Subscriber Address
- Subscriber Address Prefix Length
- Network Address
- ID
- Subscriber Address
- Match Network Address
- Network Address Prefix Length

vii Click on the OK button.

viii Repeat steps ii to vii to create additional transit prefix entries, as required.

5 Click on the Apply button. If you are modifying an AA transit prefix policy, a dialog box appears.

6 Click on the Yes button. if required.

7 Click on the General tab button.

8 Click on the Switch Mode button. A dialog box appears.

9 Click on the Yes button.

10 Click on the Distribute button to manually distribute the policy to one or more NEs. The Distribute - AA Transit Prefix Policy form opens.

11 Select one or more NEs in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The NEs move to the Selected Nodes panel.

12 Click on the Distribute button. The policy is distributed to the NEs.

13 Modify a local instance of the AA transit prefix policy, if required.

i Click on the Local Definitions tab button. The AA transit prefix policies for each managed NE are listed.

ii Choose an AA transit prefix policy from the list and click on the Properties button to modify the local instance of the policy. The AA Transit Prefix Policy (Edit) form opens.

iii Click on the Switch Mode button.

iv Perform steps 3 to 9.

14 Click on the OK button. The AA Transit Prefix Policy (Edit) form closes and the Application Assurance Policies form reappears.

15 Close the Application Assurance Policies form.

Procedure 77-9 To configure a database persisted transit subscriber aggregator

1 Choose Manage→AA Transit Subscriber from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Perform one of the following:

a Create a database persisted transit subscriber aggregator:

i Click on the Create button and choose Transit Subscriber Aggregator. The Database Persisted Transit Subscriber Aggregator (Create) form opens with the General tab displayed.

ii Configure the Name parameter.

iii Click on the Apply button. The form refreshes as the Database Persisted Transit Subscriber Aggregator (Edit) form.

iv Go to step 3.

b Modify a database persisted transit subscriber aggregator:

i Choose Database Persisted Transit Subscriber Aggregator (Application Assurance) from the object drop-down list.

ii Configure the filter criteria, if required, and click on the Search button. A list of database persisted transit subscriber aggregators is displayed.

iii Select a database persisted transit subscriber aggregator from the list and click on the Properties button. The Database Persisted Transit Subscriber Aggregator (Edit) form opens with the General tab displayed.

iv Go to step 3.

3 Configure the parameters:

- Description
- Keyword List

4 Click on the Apply button. A dialog box appears.

5 Click on the Yes button.

6 Click on the Transit Subscribers tab button.

7 Configure the filter criteria, if required, and click on the Search button. A list of the database persisted transit subscribers that are associated with the database persisted transit subscriber aggregator is displayed.

8 Close the Database Persisted Transit Subscriber Aggregator (Edit) form.

9 Close the Manage AA Transit Subscribers form.

Procedure 77-10 To associate a database persisted transit subscriber with an aggregator

Note — You can only associate an aggregator object with database persisted transit subscribers that belong to ISA-AA groups that are configured with a Subscriber Scale of VPN.

1 Choose Manage→AA Transit Subscriber from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Choose Database Persisted Transit Subscriber (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. A list of database persisted transit subscribers is displayed.

4 Select a database persisted transit subscriber from the list and click on the Properties button. The Database Persisted Transit Subscriber (Edit) form opens with the General tab displayed.

5 Click on the 5670 RAM Parameters tab button.

6 Click on the Select button. The Select Database Persisted Transit Subscriber Aggregator form opens.

7 Configure the filter for the Keywords List column and click on the Search button. A list of database persisted transit subscriber aggregators is displayed.

8 Select an aggregator from the list and click on the OK button.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button.

11 Repeat steps 3 to 10 to associate more database persisted transit subscribers with aggregators, as required.

12 Close the Manage AA Transit Subscribers form.

Procedure 77-11 To configure reporting attributes for AA reporting on a database persisted transit subscriber

Note — You can only perform this procedure for VPN-type transit subscribers.

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Choose Database Persisted Transit Subscriber (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. A list of database persisted transit subscribers is displayed.

4 Select a database persisted transit subscriber from the list and click on the Properties button. The Database Persisted Transit Subscriber (Edit) form opens with the General tab displayed.

5 Click on the 5670 RAM Parameters tab button.

6 Click on the Reporting tab button.

7 Click on the Create button. The AA Reporting (Create) form opens.

8 Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

9 Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Database Persisted Transit Subscriber (Edit) form closes.

12 Close the Manage AA Transit Subscribers form.

Procedure 77-12 To view database persisted transit subscriber information

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Choose Database Persisted Transit Subscriber (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. A list of database persisted transit subscribers is displayed.

4 Select a database persisted transit subscriber from the list and click on the Properties button. The Database Persisted Transit Subscriber (Edit) form opens with the General tab displayed.

5 View the subscriber information, as required.

6 Close the Database Persisted Transit Subscriber (Edit) form.

7 Close the Manage AA Transit Subscribers form.

Procedure 77-13 To configure usage-based billing for an application profile

You must perform this procedure on an existing application profile. Perform Procedure 77-14 to assign applications and application groups to charging groups.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button to generate a list of AA group policies.

4 Select an AA group policy from the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

5 Click on the Application Profiles tab button.

6 Configure the filter criteria, if required, and click on the Search button to generate a list of application profiles.

7 Select an application profile from the list and click on the Properties button. The Application Profile (Edit) form opens with the General tab displayed.

8 Click on the 5670 RAM Parameters tab button.

9 Configure the Billing Reset Date parameter.

10 Click on the Charging Groups tab button. The form lists the default charging groups.

Note — The 5620 SAM creates charging groups on an application profile when the application profile is saved in the parent AA group policy.

11 Select a charging group from the list and click on the Properties button. The Charging Group (Edit) form opens.

12 Configure the parameters:

- Quota (GB)
- Threshold 1 (%)
- Threshold 2 (%)
- Threshold 3 (%)

13 Click on the OK button to save the changes and close the Charging Group (Edit) form.

14 Repeat steps 11 to 13 to configure additional charging groups, as required.

15 Click on the OK button to close the Application Profile (Edit) form.

16 Click on the OK button in the AA Group Policy (Edit) form. A dialog box appears.

17 Click on the Yes button to close the form.

Procedure 77-14 To associate an application or application group with a charging group

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button to generate a list of AA group policies.

4 Select an AA group policy from the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

5 To associate an application group with a charging group, perform the following steps:

   i Click on the Application Groups tab button.

   ii Select an application group from the list and click on the Properties button. The Application Group (Edit) form opens with the General tab displayed.

   iii Click on the 5670 RAM Parameters tab button.

   iv Configure the Charging Group parameter.

   v Click on the OK button to close the Application Group (Edit) form.

   vi Click on the Apply button in the AA Group Policy (Edit) form. A dialog box appears.

   vii Click on the Yes button to save the changes.

6 To associate an application with a charging group, perform the following steps:

   i Click on the Applications tab button.

   ii Select an application from the list and click on the Properties button. The Application (Edit) form opens with the General tab displayed.

   iii Click on the 5670 RAM Parameters tab button.

   iv Configure the Charging Group parameter.

   v Click on the OK button to close the Application (Edit) form.

vi Click on the Apply button in the AA Group Policy (Edit) form. A dialog box appears.

vii Click on the Yes button to save the changes.

7 Cloes the AA Group Policy (Edit) form.

Procedure 77-15 To configure application performance reporting on a service

Perform this procedure to enable application performance reporting on a service object and configure the default DCP subnet groups. Perform Procedure 77-16 to configure custom DCP subnet groups.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of services is displayed.

3 Select a service and click on the Properties button. The *service_type* Service (Edit) form opens with the General tab displayed.

4 Click on the 5670 RAM Parameters tab button.

5 Configure the Enable Application Performance Reporting parameter.

6 Click on the Apply button to save the changes. Default Internet and Intranet DCP subnet groups are created within the VLL if you have enabled the Enable Application Performance Reporting parameter.

7 Configure statistics collection on the default DCP subnet groups, as required.

i Click on the Default DCP Groups tab button.

ii Choose the default Internet or Intranet DCP subnet group from the list and click on the Properties form. The Default DCP Group (Edit) form opens with the General tab displayed.

iii Configure the Collect Stats parameter.

iv Click on the OK button to save the changes and close the form.

8 Configure address rules on the default DCP subnet groups, as required.

i Click on the Default DCP Groups tab button.

ii Choose the default Internet or Intranet DCP subnet group from the list and click on the Properties form. The Default DCP Group (Edit) form opens with the General tab displayed.

iii Click on the Address Rules tab button.

iv Click on the Create button. The DCP Address Rule (Create) form opens.

v Configure the parameters:

- Auto-Assign ID
- ID
- Description
- IP Address Low
- High
- Mask

vi Click on the OK button to save the address rule and close the form.

vii Repeat steps iv to vi to add more address rules to the DCP subnet group, as required.

viii Click on the OK button to save the changes to the DCP subnet group and close the form.

9 Click on the Apply button in the *service_type* Service (Edit) form. A dialog appears.

10 Click on the Yes button.

11 Close the *service_type* Service (Edit) form.

Procedure 77-16 To configure a custom DCP subnet group

Perform this procedure to create a custom DCP subnet group for application performance reporting on a service and related objects. You must bind a custom DCP subnet group to one or more access interface objects and/or a spoke SDP binding in order to apply the customized DCP settings of the DCP subnet group.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of services is displayed.

3 Select a service and click on the Properties button. The *service_type* Service (Edit) form opens with the General tab displayed.

4 Click on the 5670 RAM Parameters tab button.

5 Click on the Custom DCP Groups tab button.

6 Click on the Create button. The Custom DCP Group (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Auto-Assign ID
- ID
- Description
- Collect Stats

8 Associate the custom DCP subnet group with a SAP subscriber, if required.

i Click on the Select button in the SAP Subscriber panel. The Select SAP Subscriber - Custom DCP Group form opens.

ii Select a SAP subscriber and click on the OK button.

9 Associate the custom DCP subnet group with a spoke SDP binding subscriber, if required.

i Click on the Select button in the Spoke SDP Binding Subscriber panel. The Select Spoke SDP Binding Subscriber - Custom DCP Group form opens.

ii Select a spoke SDP binding subscriber and click on the OK button.

10 Associate the custom DCP subnet group with a transit subscriber, if required.

i Click on the Select button in the Transit Subscriber panel. The Select Transit Subscriber - Custom DCP group form opens.

ii Select a transit subscriber and click on the OK button.

11 Add address rules to the custom DCP subnet group, as required.

i Click on the Address Rules tab button.

ii Click on the Create button. The DCP Address Rule (Create) form opens.

iii Configure the parameters:

- Auto-Assign ID
- ID
- Description
- IP Address Low
- High
- Mask

iv Click on the OK button to save the address rule and close the form.

v Repeat steps ii to iv to add more address rules to the DCP subnet group, as required.

12 Click on the OK button to save the custom DCP subnet group and close the form.

Custom DCP subnet groups are listed Custom DCP Group tab of the *service_type* Service form.

13 Click on the Apply button in the *service_type* Service form. A dialog appears.

14 Click on the Yes button to confirm the action and save the changes to the VLL service.

15 Close the *service_type* Service (Edit) form.

Procedure 77-17 To configure an AA HTTP error redirect policy

You must associate an AA HTTP error redirect policy with an AQP. See Procedure 77-3 for more information.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose one of the following:

a Create an AA HTTP error redirect policy:

i Click on the Create button and choose AA HTTP Error Redirect. The AA HHTP Error Redirect (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name

iii Click on the Apply button. The form refreshes to display additional tabs and panels.

iv Go to step 3.

b Modify an AA HTTP error redirect policy:

i Choose AA HTTP Error Redirect (Application Assurance) from the object drop-down list.

ii Configure the filter criteria, if required, and click on the Search button. A list of AA HTTP Error Redirect policies is displayed.

iii Select a policy from the list and click on the Properties button. The AA HTTP Error Redirect (Edit) form opens with the General tab displayed.

iv Go to step 3.

3 Configure the parameters:

- Description
- Enabled
- HTTP Host
- Participant ID

4 Click on the Select button for the Template ID parameter. The Select Templated ID form opens.

5 Configure the filter criteria, if required, and click on the Search button. A list of templates is displayed.

6 Choose a template from the list and click on the OK button. The Template ID parameter is updated with the template ID.

7 To configure an HTTP error code, perform the following steps.

i Click on the HTTP Error Codes tab button.

ii Click on the Create button. The HTTP Redirect Error Code (Create) form opens.

iii Click on the Select button for the Redirect Error Code parameter. The Select Error Code form opens.

iv Configure the filter criteria, if required, and click on the Search button. A list of error codes is displayed.

v Choose an error code from the list and click on the OK button. The Redirect Error Code parameter is updated with the error code.

vi Configure the Message Size (octets) parameter, if required.

vii Click on the OK button. The error code is added to the list in the AA HTTP Error Redirect (Edit) form.

8 Click on the General tab button.

9 Click on the Switch Mode button. A dialog box appears.

10 Click on the Yes button.

11 Click on the More Actions button and choose Distribute to manually distribute the policy to one or more NEs. The Distribute - AA HTTP Error Redirect form opens.

12 Select one or more NEs in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The NEs move to the Selected Nodes panel.

13 Click on the Distribute button. The policy is distributed to the NEs.

14 Modify a local instance of the AA HTTP error redirect policy, if required.

i Click on the Local Definitions tab button. The AA HTTP error redirect policies for each managed NE are listed.

ii Choose an AA HTTP error redirect policy from the list and click on the Properties button to modify the local instance of the policy. The AA HTTP Error Redirect (Edit) form opens.

iii Click on the Switch Mode button.

iv Perform steps 3 to 10.

15 Click on the OK button. The AA HTTP Error Redirect (Edit) form closes and the Application Assurance Policies form reappears.

16 Close the Application Assurance Policies form.

Procedure 77-18 To configure AA protocol signatures

1 Choose Manage→ISA Functions→ISA-AA from the 5620 SAM main menu. The ISA-AA form opens.

2 Choose AA Protocol (Application Assurance) from the object drop-down list.

3 Specify a filter to create a filtered list of protocols, and click on the Search button. A list of protocols is displayed.

4 Select an entry in the list and click on the Properties button. The AA Protocol (Edit) form opens.

5 View the entry information.

6 Configure the Protocol Administrative State parameter, if required.

Note 1 — You can only configure the Protocol Administrative State parameter for a local protocol.

Note 2 — The Protocol Adminstrative State parameter is read-only for some protocols.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The AA Protocol (Edit) form closes and the ISA-AA form reappears.

9 Click on the Close button to close the ISA-AA form.

Procedure 77-19 To view AA summary information for subscribers, transit subscribers, SAPs, and spoke SDPs on ISA-AA MDAs

If the ISA-AA group is partitioned, the AA summary tabs appear on the partition. This information is typically used for AA debugging purposes. You can view debug statistics information on the Statistics tab of an AA object.

Caution — Alcatel-Lucent recommends that you consider the effect of resynchronizing an ISA-AA group. Resynchronizing an ISA-AA group typically involves the retrieval of an amount of information that is large enough to affect NE performance.

Note — You can view AA statistics using Stats Interval. Stats Interval allows you to choose realtime or snapshot for collecting AA statistics. Realtime specifies that the statistics retrieved include the sum of the statistics from the previous collection windows, the statistics for any closed flows since the last collection window, and the statistics accumulated from any currently open flows. Snapshot specifies that the statistics retrieved include the sum of the statistics from the previous collection windows, and the statistics for any closed flows since the last collection window.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to view AA summary information and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the ISA-AA Groups icon and click on the ISA-AA Group icon. The ISA-AA Group (Edit) form opens.

5 Click on the AA Summary tab button. The Subscribers, SAPs, Spoke SDP Bindings, and Transit Subscribers tabs are displayed.

6 Perform one of the following.

a View the summary information for a subscriber.

i Click on the Subscribers tab button. A list of subscribers is displayed.

ii Select an entry in the list and click on the Properties button. The AA Subscriber (Edit) form opens.

iii Click on the Properties button. The Residential Subscriber Instance (Edit) form opens.

b View the summary information for a SAP.

i Click on the SAPs tab button. A list of SAPs is displayed.

ii Select an entry in the list and click on the Properties button. The AA SAP (Edit) form opens.

iii Click on the Properties button. The Access Interface (Edit) form opens.

c View the summary information for a spoke SDP.

i Click on the Spoke SDP Bindings tab button. A list of spoke SDPs is displayed.

ii Select an entry in the list and click on the Properties button. The AA Spoke SDP Binding (Edit) form opens.

iii Click on the Properties button. The Spoke SDP Bindings (Edit) form opens.

d View the summary information for a transit subscriber.

i Click on the Transit Subscribers tab button. A list of transit subscribers is displayed.

ii Select an entry in the list and click on the Properties button. The AA Transit Subscriber (Edit) form opens.

iii Click on the Properties button. The Transit Subscriber (Edit) form opens.

7 Click on the Statistics tab button.

8 Choose an AA statistics class from the object drop-down list.

9 Perform one of the following:

a Click on the Collect button to perform an on-demand collection of the current performance statistics data. The collected statistics entries are listed on the form.

b Click on the Collect All button to collect one on-demand statistics record for each statistic type that the object supports. The collected statistics entries are listed on the form.

10 Select an entry from the list and click on the Properties button. The Statistics Record form opens.

11 View the statistics data.

12 Close the Statistics Record form.

13 Close the subscriber, SAP, or spoke SDP properties forms.

Procedure 77-20 To view the AA special study statistics data

Perform this procedure to view the AA special study statistics data for subscribers, transit subscribers, SAPs, or spoke SDPs on an ISA-AA MDA. If the ISA-AA group is partitioned, the AA special study tabs appear on the partition.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to view AA special study statistics data and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the ISA-AA Groups icon and click on the ISA-AA Group icon. The ISA-AA Group (Edit) form opens.

5 Click on the AA Special Study tab button. The Subscribers, SAPs, Spoke SDP Bindings, and Transit Subscribers tabs are displayed.

6 Perform one of the following.

a View the special study statistics for a subscriber.

i Click on the Subscribers tab button. A list of subscribers is displayed.

ii Select an entry in the list and click on the Properties button. The AA Special Study Subscriber Config (Edit) form opens.

iii Click on the Properties button. The Subscriber (Edit) form opens.

b View the special study statistics for a SAP.

i Click on the SAPs tab button. A list of SAPs is displayed.

ii Select an entry in the list and click on the Properties button. The AA Special Study SAP Config (Edit) form opens.

iii Click on the Properties button. The Access Interface (Edit) form opens.

c View the special study statistics for a spoke SDP.

i Click on the Spoke SDP Bindings tab button. A list of spoke SDPs is displayed.

ii Select an entry in the list and click on the Properties button. The AA Special Study Spoke SDP Binding Config (Edit) form opens.

iii Click on the Properties button. The Spoke SDP Binding (Edit) form opens.

d View the special study statistics for a transit subscriber.

i Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers list form opens.

ii Specify a filter to create a filtered list of transit subscribers, and click on the Search button. A list of transit subscribers is displayed.

iii Select an entry in the list and click on the Properties button. The Database Persisted Transit Subscriber form opens with the General tab displayed.

7 Click on the Statistics tab button.

8 Choose an AA statistics class from the object drop-down list.

9 Perform one of the following:

a Click on the Collect button to perform an on-demand collection of the current performance statistics data. The collected statistics entries are listed on the form.

b Click on the Collect All button to collect one on-demand statistics record for each statistic type that the object supports. The collected statistics entries are listed on the form.

10 Select an entry from the list and click on the Properties button. The Statistics Record form opens.

11 View the statistics data.

12 Close the Statistics Record form.

13 Close the subscriber, SAP, or spoke SDP forms.

Procedure 77-21 To view AA statistics data for ISA-AA groups or ISA-AA partitions

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to view AA statistics data and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the ISA-AA Groups icon and click on the ISA-AA Group icon. The ISA-AA Group (Edit) form opens with the General tab button displayed.

5 Perform one of the following:

   a View AA statistics data for an ISA-AA group.

      i Click on the Statistics tab button.

      ii Choose an AA statistics class from the object drop-down list.

   b Perform the following steps to view AA statistics data for an ISA-AA partition.

      i Click on the ISA-AA Partitions tab button. A list of ISA-AA partitions is displayed.

      ii Select an entry in the list and click on the Properties button. The ISA-AA Group Partition (Edit) form opens with the General tab button displayed.

      iii Click on the Statistics tab button.

      iv Choose an AA statistics class from the object drop-down list.

6 Perform one of the following:

   a Click on the Collect button to perform an on-demand collection of the current performance statistics data. The collected statistics entries are listed on the form.

   b Click on the Collect All button to collect one on-demand statistics record for each statistic type that the object supports. The collected statistics entries are listed on the form.

7 Select an entry from the list and click on the Properties button. The Statistics Record form opens.

8 View the statistics data.

9 Close the Statistics Record form.

10 Close the ISA-AA forms.

Procedure 77-22 To view AA statistics data for application filters

You can view application filter hit counts on local definitions of AA group policies.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. A list of AA group policies is displayed.

4 Select an AA group policy from the list and click on the Properties button. The AA Group Policy - Global Policy (Edit) form opens with the General tab displayed.

5 Click on the Local Definitions tab button.

6 Configure the filter criteria, if required, and click on the Search button. A list of local AA group policy definitions is displayed.

7 Select a local AA group policy from the list and click on the Properties button. The AA Group Policy - Local Policy (Edit) form opens with the General tab displayed.

8 Click on the Application Filters tab button.

9 Configure the filter criteria, if required, and click on the Search button. A list of NE application filters is displayed.

10 Select an application filter from the list and click on the Properties button. The Application Filter - Local Policy (Edit) form opens with the General tab displayed.

11 Click on the Statistics tab button.

12 Click on the Collect All button.

13 Click on the Search button. A list of collected statistics is displayed.

14 Select a statistics object from the list and click on the Properties button. The Statistics Record - AA Application Filter Stats form opens.

15 View the statistics data.

16 Close the Statistics Record - AA Application Filter Stats form.

17 Close the Application Filter - Local Policy (Edit) form.

18 Close the AA Group Policy - Local Policy (Edit) form.

19 Close the AA Group Policy - Global Policy (Edit) form.

20 Close the Application Assurance Policies form.

Procedure 77-23 To delete an AA application, application group, or custom protocol

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list and click on the Search button. A list of AA group policies is displayed.

Note — The 5620 SAM does not create local AA Group policies for each applicable managed NE. Instead, the local AA Group Policy is created/deleted when the ISA-AA group is created/deleted.

3 Select a policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a Delete an AA application.

i Click on the Applications tab button. A list of AA applications is displayed.

ii Choose an application in the list and click on the Delete button. A warning form appears.

iii Click on the View Dependencies button.

Note — When the AA application is on a global AA group policy, the counts include all of the dependencies on the global and local NEs. When the AA application is on a local AA group policy, the counts include all of the dependencies on the local NE only.

b Delete an application group.

i Click on the Application Groups tab button. A list of application groups is displayed.

ii Choose an application group in the list and click on the Delete button. A warning form appears.

iii Click on the View Dependencies button.

Note — If the application group is on a global AA group policy, the counts include all of the dependencies on the global and local NEs. If the application group is on a local AA group policy, the counts include all of the dependencies on the local NE only.

c Delete a custom protocol.

i Click on the Custom Protocols tab button. A list of custom protocols is displayed.

ii Choose a custom protocol in the list and click on the Delete button. A warning form appears.

iii Click on the View Dependencies button.

Note — If the custom protocol is on a global AA group Policy, the counts include all of the dependencies on the global and local NEs. If the custom protocol is on a local AA group policy, the counts include all of the dependencies on the local NE only.

5 Review the dependencies and click on the OK button.

6 Select the I understand the implications of this action check box.

7 Click on the Yes button, and then click on the OK button. The AA Group Policy (Edit) form appears.

8 Click on the Apply button, and then click on the Yes button.

9 If you deleted an AA application, application group, or custom protocol on a global AA group policy, you must distribute the changes to the local AA Group Policy. Go to step 10, otherwise, go to step 13.

10 Click on the General tab button.

11 Click on the Switch Mode button. A dialog box appears.

12 Click on the OK button.

13 Close the AA Group Policy (Edit) form.

Procedure 77-24 To delete an AA transit subscriber

Use this procedure to remove the record of an inactive AA transit subscriber from the 5620 SAM database. AA transit subscribers become inactive in the 5620 SAM when the subscriber is deleted from the AA transit IP policy.

Note 1 — Use a size constraint policy to ensure that the number of inactive AA transit subscribers in the 5620 SAM database remains at a manageable level. See chapter 61 for more information.

Note 2 — AA statistics data can be lost when you delete an AA transit subscriber instance before the 5620 SAM is finished collecting and processing AA statistics. Alcatel-Lucent recommends waiting at least two statistics collection intervals before deleting an inactive AA transit subscriber instance.

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Configure the filter criteria and click on the Search button. A list of AA transit subscribers appears.

The Active property indicates the status of each AA transit subscriber in the list. An inactive AA transit subscriber instance has no check mark under the Active heading.

3 Select the inactive AA transit subscriber you want to delete and click on the Delete button. The inactive AA transit subscriber instance is removed from the list.

4 Close the Manage AA Transit Subscribers form.

78 — Service Test Manager

78.1 Service Test Manager overview

The 5620 SAM service test manager (STM) provides the ability to group various OAM tests into test suites for network troubleshooting and for verifying compliance with SLAs. You can schedule the execution of a test suite to provide continual performance feedback, or run a test suite on demand to investigate service issues. The test results are logged for monitoring and trend analysis.

The grouping of tests into a test suite allows a 5620 SAM operator to use one schedule for the periodic execution of multiple OAM diagnostics against multiple network objects; for example, services, NEs, or transport components. An operator can choose to include existing tests, use the 5620 SAM to generate the tests that comprise a test suite, or both. Groups of tests in a suite can be configured to execute sequentially or concurrently. In addition, you can configure a test suite as an OAM validation test to verify the operational status of a service.

You can configure threshold-crossing parameters to generate alarms when rising or falling threshold values are reached due to the reach, latency, or jitter issues discovered by the OAM tests.

The 5620 SAM STM allows the deployment of the maximum number of tests to a 7450 ESS or 7750 SR. The 5620 SAM raises an alarm when the number of tests on an NE is 60% of the configured maximum. Attempts to create or execute a test using the 5620 SAM fail when the number of deployed tests on an NE is too high.

Test policies

To enable the automatic generation of tests for a test suite, the 5620 SAM requires a test policy that contains a set of test definitions and pre- and post-processing rules. A test policy also specifies the order of execution for the generated tests. A test policy applies to only one test suite, and a test suite can have only one associated test policy.

Test policy parameters can be configured to display test results only if a test fails or generates a threshold crossing alarm. In large networks, this can substantially reduce the amount of test data that the 5620 SAM needs to collect.

A test policy is specific to one type of entity; for example, a VLL service or service tunnel. The test definitions in the policy are restricted to the tests that apply to the entity type specified in the policy. A test policy is applied to a test suite during test suite creation.

Test suites

A test suite contains three test groups:

- **First-run tests**
  First-run tests are the tests in a suite that the 5620 SAM executes before the tests in the other groups. First-run tests are chosen from a list of existing tests and might typically include high-level diagnostics; for example, a service site ping or VPRN ping. No restrictions apply to the types of tests that are selectable as first-run tests.

- **Generated tests**

  Generated tests are created by the 5620 SAM for use against a specific network entity, based on the entity type specified in the suite and the specific tested entities that are named in the associated test policy. For example, a service site ping test policy associated with a three-site VPRN test suite causes the 5620 SAM to generate six tests: one site ping test from each site in the VPRN to the other two sites. When you change the configuration of a network entity, such as a service, you must regenerate the generated tests that apply to the entity. Test regeneration removes previously generated tests from a test suite.
- **Last-run tests**

  Last-run tests are the tests in a suite that the 5620 SAM executes after the tests in the other groups. Last-run tests are chosen from a list of existing tests and might typically include transport-layer diagnostics; for example, an LSP trace or a tunnel ping. No restrictions apply to the types of tests that are selectable as last-run tests.

To create a test suite that contains tests for different entity types, you can specify that the test suite applies to no specific entity type. In this way, you can create a group of disparate tests to which no test policy restrictions apply. Specifying none as the entity type in a test suite has the following effects.

- It allows you to choose any predefined test as a first-run or last-run test.
- It disables test generation in the test suite, because test generation requires a test policy that is based on a specific entity type.

Note — The 5620 SAM does not attempt to discover tests or test suites that are configured locally on an NE, for example, using a CLI.

To manage the system resources that test execution consumes, the 5620 SAM assigns a weight value to a test. When the 5620 SAM executes a test, it attempts to reserve the test weight from a resource pool, performs the test, then returns the test weight to the pool. The weight of a test suite is the sum of the weights of the individual tests in the suite. The 5620 SAM attempts to reserve the weight of the whole suite for the duration of suite execution. If the required weight for a test or test suite is unavailable, execution is halted and the Status value contained in the test result is set to Not Enough Resources.

You can create an OAM service validation test to verify the operational status of a service. The operational status of a service depends on the operational states of its service sites or instances. It is possible for a service to be operationally up when communication between sites is not operational. For example, a VRF can be operationally up but the routes to its peers might not be populated because of the routing policy, route target, or ACL configuration. The State Cause of the service indicates the success or failure of the OAM validation test, and therefore, service connectivity.

You can configure an OAM validation test when you create a test suite and run the OAM validation test from the service configuration form.

Note — OAM validation tests are not supported for HVPLS.

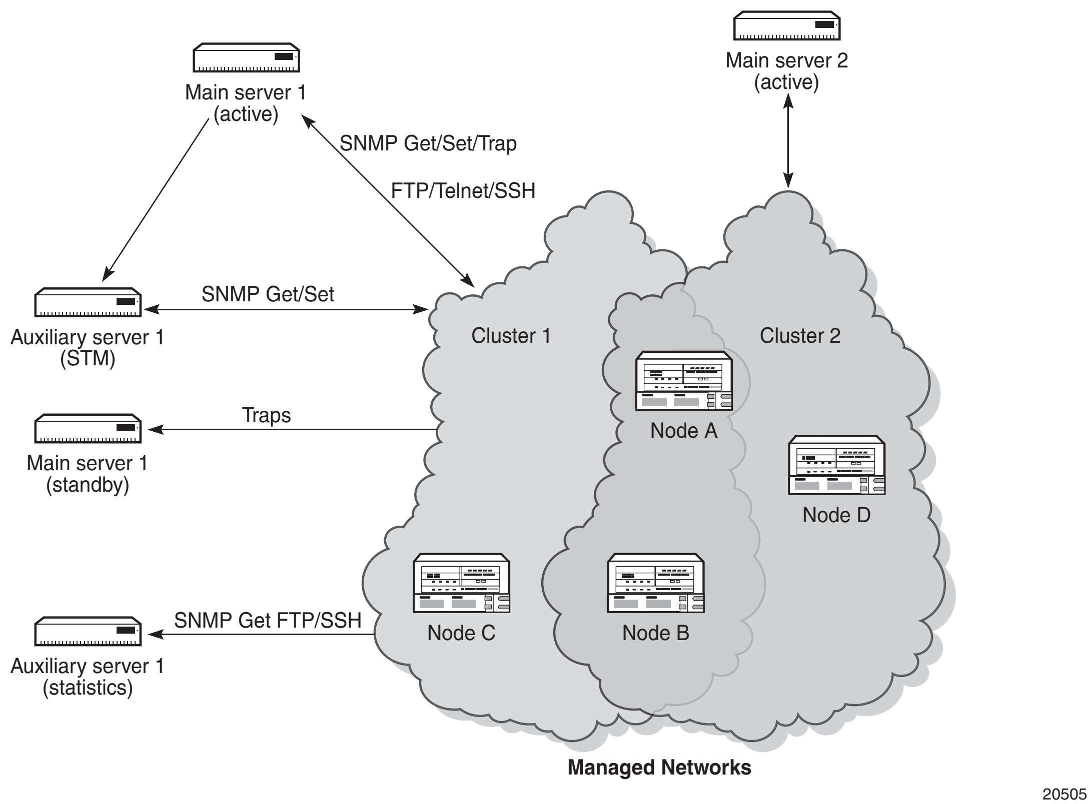
Consider the following when you create or execute test suites.

- A test, whether pre-existing or generated, is associated with only one test suite.
- You can execute a generated test on demand, not just in the context of a test suite.
- STM test suites can be configured as scheduled tasks. See chapter 79 for information about using the 5620 SAM to schedule tasks.
- Using an NE schedule does not ensure that the target NEs perform the actions in an associated STM scheduled task in the order specified; the NEs that execute an NE scheduled task operate independently and are not directed by the 5620 SAM. As soon as an NE completes an action in an NE scheduled task, it performs the next action.
- The 5620 SAM database logs test results only for scheduled test suites that are associated with SAM schedules. Logging for test suites that are associated with NE schedules is performed locally on each target NE.
- Size constraint policies control the number of historical records that the 5620 SAM retains in the database. You can configure size constraint policies to limit the number of database objects that are associated with specific test types. See chapter 46 for information about size constraint policies.
- A 5620 SAM user that is assigned the admin or QoS/ACL management scope of command role can create and modify all tests, test policies, and test suites. A user that is assigned the service management scope of command role can create and modify only STM components that are related to services. A user that is assigned the topology management role can create and modify only STM components that are related to network transport elements.
- OAM test suites in which the Validation Test Suite parameter is enabled are used to test the operational status of a service or service-related entity such as a service tunnel. The result of the test is indicated by the OAM Validation Failed state cause indicator on the General tab of the management form for the object.
- You can view test-suite results for an object from the Tests tab of the configuration form for the object.

OAM test ID ranges

You can configure a test ID for the OAM tests in multiple server environments. A test ID allows you to identify the source server that initiated the OAM test. Figure 78-1 shows an example of a network configuration on which a user could run OAM tests on Node A and Node B from the 5620 SAM main 1 or main 2 servers. In this example, Node A and Node B are members of two network clusters that are managed by separate 5620 SAM servers, Main server 1 (active) and Main server 2 (active).

Figure 78-1 Multiple STM implementation



You can execute OAM tests from the new main server after a redundancy switch from Main server 1 (active) tom Main server 1 (standby).

You can configure the nms-server.xml file to configure the range for the test IDs. You must use the same ID range for the 5620 SAM main and standby servers that are managing a distinct network cluster. The OAM tests always have a test ID in the specified range.

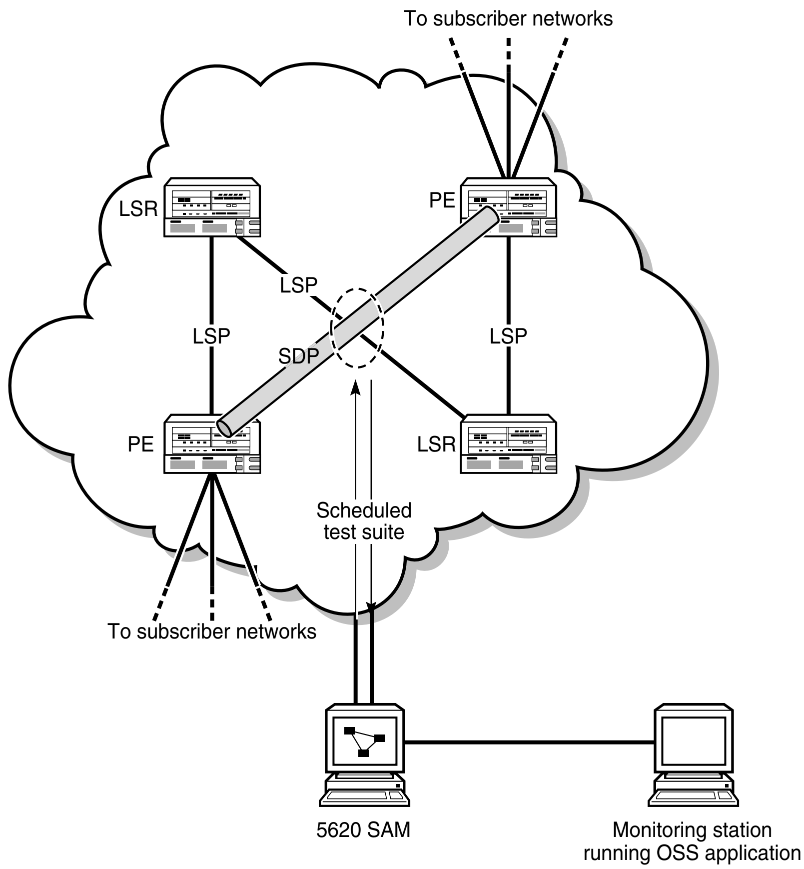
The 5620 SAM does not validate the range values for the test IDs. However, the 5620 SAM raises a major alarm upon receipt of a test with a test ID outside the range, or when the range is changed in the nms-server.xml file.

See Procedure 78-1 for info on how to change the test ID range.

78.2 Sample Service Test Manager implementation

Figure 78-2 shows a sample STM implementation that illustrates how you can use STM suites to verify service operation and identify network problems.

Figure 78-2 Sample STM implementation



In the sample network, two scheduled STM test suites run constantly to ensure that the transport elements are functioning properly. One test suite monitors the SDPs, and the other test suite monitors the LSPs. A 5620 SAM administrator can quickly update the test suites, as required, to reflect network topology changes by revising the list of tested entities in the suite and regenerating the tests. An OSS application collects the test result information which is then available for monitoring by NOC staff.

Note — This sample configuration uses a SAM schedule to create a scheduled task. See chapter 79 for information about SAM schedules.

The SDP test suite contains the following generated tests for each SDP:

- tunnel ping
- MTU ping

The LSP test suite contains the following generated test for each LSP path:

- LSP ping (tested entity type is LSP path)

NOC monitoring staff become aware that tunnel ping operations fail occasionally on one SDP. Packet loss is not yet significant enough to affect SLAs, but threatens to become so, based on the observed trend. NOC staff run a test suite against the LSPs in the affected LSP path. The test suite contains the following generated test for each LSP in the LSP path:

- LSP ping (tested entity type is LSP)

Test results show that the packet loss is related to a specific LSP in the path. Investigation of the LSP traffic pattern indicates that a recently provisioned service is causing the LSP to be oversubscribed. The problem is addressed by a network designer and is corrected through configuration changes.

Table 78-1 lists the high-level tasks necessary to configure and use the STM elements in this sample.

Table 78-1 Sample STM implementation configuration sequence

Task	Description
1. Scheduled STM test-suite creation	Create STM test policies for transport-layer elements. • Create a test policy for the SDPs. Specify Tunnel (SDP) as the Entity Type for the policy, and choose Tunnel Ping and MTU Ping as the test definitions. Create separate tunnel ping definitions for different forwarding classes, as required. • Create a test policy for the LSP paths. Specify LSP as the Entity Type for the policy and choose LSP Ping as the test definition. In the test definition, specify LSP Path as the Target Type. Create separate LSP ping definitions for different forwarding classes, as required. Create STM test suites for transport-layer elements. • Create a test suite for the SDPs. Specify Tunnel (SDP) as the Entity Type for the suite, choose the SDP test policy, choose the SDPs against which the suite is to run, and use the 5620 SAM to generate the tests in the suite. Create a schedule for the test suite according to network monitoring requirements, and apply the schedule to the test suite to create a scheduled task. • Create a test suite for the LSP paths. Specify LSP as the Entity Type for the suite, choose the LSP test policy, choose the LSP paths against which the suite is to run, and use the 5620 SAM to generate the tests in the suite. Create a schedule for the test suite according to network monitoring requirements, and apply the schedule to the test suite to create a scheduled task.
2. Data presentation	Customize the tabular display of test results in the 5620 SAM, or create an OSS application that retrieves test-result data from the 5620 SAM and presents it as information in graphical format for NOC staff.
3. Creation of non-scheduled STM test suite or individual OAM tests for network troubleshooting	Create an STM test policy for the LSPs for use during network troubleshooting. • Create a test policy for the LSPs. Specify LSP as the Entity Type for the policy and choose LSP Ping as the test definition. In the test definition, specify LSP as the Target Type. Create separate LSP ping definitions for different forwarding classes, as required. Create a non-scheduled STM test suite (or individual OAM tests, depending on the number of LSPs involved) for the LSPs in the LSP path. • Specify LSP as the Entity Type for the suite, choose the newly created LSP test policy, choose the LSPs in the LSP path against which the suite is to run, and use the 5620 SAM to generate the tests for the suite.
4. Network monitoring	Use the 5620 SAM to display the scheduled test results in tabular format, or use an OSS application to monitor the LSP ping, tunnel ping, and MTU ping diagnostic results in real time. Record inconsistencies and trends, and troubleshoot the network as required. Use the threshold-crossing alarm capabilities to raise alarms when traffic characteristics rise above or fall below specific values.

(1 of 2)

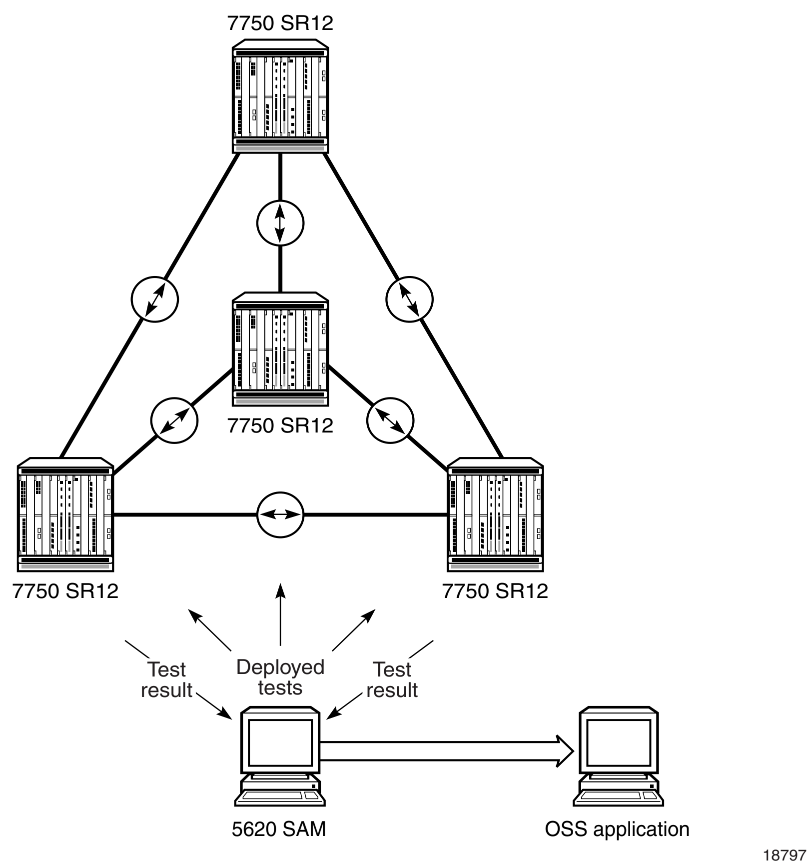
Task	Description
5. Network troubleshooting	When potential trouble arises, use a non-scheduled STM test suite or individual STM tests to help identify the cause. • Create individual tests or edit the existing non-scheduled test suite. Include as tested entities the LSPs that comprise the LSP path and regenerate the tests for the suite, as required. • Execute the non-scheduled test suite and monitor the test results. • Edit the test definition in the test policy. Change test parameter values as required, regenerate the tests in the suite, and re-execute the suite. Continue to refine the diagnostic test results until the problem manifests itself in the test results.

(2 of 2)

78.3 Sample network monitoring configuration

Figure 78-3 shows the high-level flow of tests and test results in a simple network topology that the network provider wants to continually monitor using the STM. See section 78.4 for the explicit steps required to create the STM configuration.

Figure 78-3 Continual network topology monitoring



A 5620 SAM administrator creates and schedules an STM test suite to monitor the LSP mesh and identify potential overloading and reachability problems before they affect service traffic. The test suite contains ping and trace test definitions for three different classes of in-profile traffic and is scheduled to run every 15 minutes.

Note — This sample configuration uses a SAM schedule to create a scheduled task. See chapter 79 for information about SAM schedules.

Because the same group of tests is to be run on multiple entities of the same type, the test suite consists of generated tests only. The test policy that the 5620 SAM uses to generate the tests contains the following six test definitions:

- LSP ping - be in
- LSP ping - af in
- LSP ping - nc in
- LSP trace - be in
- LSP trace - af in
- LSP trace - nc in

The 5620 SAM generates 72 tests for the test suite—3 ping tests and 3 trace tests for each of the 12 LSPs and LSP paths. Every 15 minutes, the 5620 SAM scheduler executes the tests and stores the results. An OSS application periodically retrieves the test results, performs trend analysis and presents the transport utilization information to NOC monitoring staff.

The 5620 SAM generates an alarm in the event of an LSP ping probe failure or an LSP trace path change, as specified in the test policy, so 5620 SAM operators become aware of new transport faults as they arise.

78.4 Sample network monitoring configuration steps

The following steps explicitly define the end-to-end configuration of the network monitoring sample in section 78.3. For conciseness, the procedure lists only the configuration steps and parameters that are specific to and necessary for the sample. See the procedures in section 78.11 for complete STM configuration information.

Create test policy for test generation

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Create Test Policy from the Create contextual menu. The Test Policy (Create) form opens.

4 Configure the parameters in Table 78-2 using the supplied values:

Table 78-2 Test policy General tab parameters

Parameter	Value	Comment
Name	LSP Test Policy	—
NE Schedulable	disabled	NE-schedulable test results are not returned to the 5620 SAM.
Entity Type	LSP	—

5 Click on the Test Definitions tab button.

6 Click on the Add button to add a test definition to the test policy. A menu appears.

7 Choose MPLS→Add LSP Ping. The LSP Ping Definition (Create) form opens with the General tab displayed.

In the sample configuration, the operator creates a separate LSP Ping test definition for each of the following forwarding classes:

- be (best effort - low priority, delivery not guaranteed)
- af (assured forwarding - medium priority, delivery guaranteed)
- nc (network control - high priority, delivery guaranteed)

8 Configure the parameters in Table 78-3 using the supplied values, most of which are common to the three test definitions:

Table 78-3 LSP Ping Definition parameters

Parameter	Value	Comment
General tab		
Name	LSP Ping - be in LSP Ping - af in LSP Ping - nc in	First test definition Second test definition Third test definition
Target Type	LSP	—
Test parameters tab		
Number of Test Probes	5	This provides more analysis granularity than a single test packet without affecting network performance.
Size (octets)	108	This is the minimum packet size for this type of test on the 7450 ESS and 7750 SR. The minimum packet size varies, depending on the type and version of device against which a test runs.
Forwarding Class	be af nc	For LSP Ping - be in test definition For LSP Ping - af in test definition For LSP Ping - nc in test definition To cover a range of traffic streams and to test different network queues, multiple test definitions are necessary. The sample configuration uses three LSP ping definitions that differ only by forwarding class.
Forwarding Profile	in	All test packets are marked in-profile. This means that they follow the same path as service traffic.

(1 of 2)

Parameter	Value	Comment
Results configuration tab		
Probe History Size (rows)	100	—
Trap Generation	Probe Failure	Test-probe failures provide early notification of LSP congestion or reachability issues to a 5620 SAM operator. OSS analysis of the results indicates trends for further investigation.

(2 of 2)

9 Click on the OK button. The LSP Test Definition (Create) form closes and a dialog box appears.

10 Click on the OK button. The test definition is listed on the Test Policy (Create) form.

11 Repeat steps 6 to 10 for the remaining test definitions listed in step 7.

12 Click on the Add button to add a test definition to the test policy. A menu appears.

13 Choose MPLS→Add LSP Trace. The LSP Trace Definition (Create) form opens with the General tab displayed.

In the sample configuration, the operator creates a separate LSP Trace test definition for each of the following forwarding classes:

- be (best effort - low priority, delivery not guaranteed)
- af (assured forwarding - medium priority, delivery guaranteed)
- nc (network control - high priority, delivery guaranteed)

14 Configure the parameters in Table 78-4 using the supplied values. Values that are not common to the three test definitions are so indicated.

Table 78-4 LSP Trace Definition parameters

Parameter	Value	Comment
General tab		
Name	LSP Trace - be in LSP Trace - af in LSP Trace - nc in	For first test definition For second test definition For third test definition
Target Type	LSP Path	—
Test parameters tab		
Number of Test Probes	5	This provides more analysis granularity than a single test packet without affecting network performance.
Size (octets)	108	This is the minimum packet size for this type of test on the 7450 ESS and 7750 SR. The minimum packet size varies, depending on the type and version of device against which a test runs.

(1 of 2)

Parameter	Value	Comment
Forwarding Class	be af nc	For LSP Trace - be in definition For LSP Trace - af in definition For LSP Trace - nc in definition To cover a range of traffic streams and to test different network queues, multiple test definitions are necessary. The sample configuration uses a different LSP ping definition for each forwarding class.
Forwarding Profile	in	All LSP ping test definitions in the sample involve in-profile traffic.
Results configuration tab		
Probe History Size (rows)	100	—
Trap Generation	Test Failure Path Change	A test failure trap may indicate a routing or congestion issue, but it also indicates test misconfiguration when the Maximum Time to Live parameter value is too low to allow a test probe to reach the destination LSP. A path change trap may indicate an intermittently congested or unresponsive LSP.

(2 of 2)

15 Click on the OK button. The LSP Test Definition (Create) form closes and a dialog box appears.

16 Click on the OK button. The test definition is listed on the Test Policy (Create) form.

17 Repeat steps 12 to 16 for the remaining test definitions listed in step 13.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button. The Test Policy (Create) form closes and the Service Test Manager form reappears.

Create schedule

20 Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

21 Click on the Create button and choose Create SAM Schedule. The SAM Schedule (Create) form opens.

22 Configure the parameters in Table 78-5 using the supplied values:

Table 78-5 SAM Schedule parameters

Parameter	Value	Comment
Name	LSP Assurance	—

(1 of 2)

Parameter	Value	Comment
Current Client Start Time	a future time	Specify the date and time at which the schedule is to be first triggered. This value is used to calculate the times of subsequent triggers, based on the Frequency parameter value. Compare this value and the Frequency parameter value with those in other 5620 SAM schedules to ensure that the schedule trigger times are staggered and the resulting NE task load is balanced.
Ongoing	enabled	This setting tells the 5620 SAM to continually trigger execution of the task associated with the schedule.
Frequency	Per Minute / 15	You must also select the Run Every Minutes radio button and specify 15 as the number of minutes for the triggering frequency.

(2 of 2)

23 Click on the OK button. The SAM Schedule (Create) form closes.

24 Close the Schedule form.

Create test suite

25 Click on the Create button in the Service Test Manager form and choose Create Test Suite from the contextual menu. The Test Suite (Create) form opens with the General tab displayed.

26 Configure the parameters in Table 78-6 using the supplied values.

Table 78-6 Test suite parameters

Parameter	Value	Comment
Name	LSP Test Suite	—
Entity Type	LSP	—
NE Schedulable	disabled	NE-schedulable test results are not returned to the 5620 SAM.

27 Click on the Test Policy tab button.

28 Click on the Add button to choose a test policy that governs the generation of tests in the test suite. The Select Test Policy - Test Suite form opens.

29 Configure the filter properties and click on the Search button. A list of test policies is displayed.

30 Select the LSP Test Policy entry and click on the OK button. The test policy is listed on the Test Suite (Create) form.

31 Click on the Tested Entities tab button.

32 Click on the Add button to choose the LSPs that are to be regularly assessed by the test suite. The Select Tested Entity - Test Suite form opens.

33 Configure the filter properties and click on the Search button to display a list of LSPs.

34 Select the LSPs that you want to include and click on the OK button. The LSPs are listed on the Test Suite (Create) form.

35 Click on the Apply button to save the changes. Additional buttons appear and the form name changes to Test Suite (Edit).

36 Click on the Generated Tests tab button.

37 Click on the Generate Tests button. The 5620 SAM generates a test for each LSP listed on the Tested Entities tab. The tests are listed on the form as they are generated.

Apply a span of control to a test suite

38 Click on the Spans tab button.

39 Click on the Add button. The Select Spans - Test Suite form opens with a list of available spans.

40 Select one or more spans to apply to the test suite.

41 Click on the OK button. The Select Spans - Test Suite form closes and a dialog box appears.

42 Click on the OK button to confirm the action.

Create scheduled task

43 Click on the Schedule button and choose Create SAM Scheduled Task. The SAM Scheduled Task (Create) form opens with LSP Test Suite displayed in the Task panel.

44 Configure the parameters in Table 78-7 using the supplied values.

Table 78-7 SAM scheduled task parameters

Parameter	Value	Comment
Scheduled Task Name	Periodic LSP Check	—
Administrative State	Enabled	The 5620 SAM executes the scheduled task at regular intervals based on the specified Current Client Start Time and Frequency.

45 Click on the Select button. The Select Schedule - SAM Scheduled Task form opens.

46 Select LSP Assurance and click on the OK button. The 5620 SAM automatically populates the Schedule panel with the schedule information.

47 Click on the OK button. The SAM Scheduled Task (Create) form closes and the Test Suite (Edit) form reappears.

48 Close the Test Suite (Edit) form.

49 Close the Service Test Manager form.

78.5 Sample SAA accounting files configuration

The following sample configuration focuses on the configuration of SAA accounting files that are to be collected following the generation of an NE schedulable test of VLL services.

A network provider wants to use the 5620 SAM to view test result information for a NE schedulable test of VLL services and wants the 5620 SAM to process the OAM results MIB entries and produce a compressed XML record that is stored in SAA accounting files on the nodes.

A 5620 SAM administrator must create an NE schedulable test for VLL services that records test result information in SAA accounting files. The administrator creates one accounting policy, one file policy, one test policy, and one test suite. Section 78.6 describes the steps that are required to create a test.

78.6 Sample SAA accounting files configuration steps

The following steps explicitly define the end-to-end configuration of the SAA accounting files sample in section 78.5. For conciseness, the procedure lists only the configuration steps and parameters that are specific to and necessary for the sample. See the procedures in section 78.11 for complete STM configuration information.

Create accounting policy

1. Choose Tools→Statistics→Accounting Policies from the 5620 SAM main menu. The Manage Accounting Policies form opens.

2. Click on the Create button. The Accounting Policy (Create) form opens.

3. Configure the parameters in Table 78-8 using the supplied values.

Table 78-8 Accounting policy parameters

Parameter	Value	Comment
Displayed Name	SAA Accounting Policy	—
Type	NE Schedulable Tests	You must choose this value to allow the configuration of SAA accounting files

4. Click on the Select button beside the File ID parameter. The Select A File Policy form opens.

5. Click on the Create button. The File Policy (Create) form opens.

6. Configure the Displayed Name parameter. For the purposes of this sample, the value shall be SAA File Policy.

7. Click on the OK button. The File Policy (Create) form closes and the Select A File Policy form reappears.

8. Select the SAA File Policy entry and click on the OK button. The Select A File form closes and the file policy is listed on the Accounting Policy (Create) form.

9 Click on the OK button. The Accounting Policy (Create) form closes and the Manage Accounting Policies form reappears.

10 Configure the filter properties and click on the Search button. A list of accounting policies is displayed

11 Select the SAA Accounting Policy entry and click on the Distribute button. The Distribute form opens.

12 Select the entities that you want to include and click on the OK button. The Distribute form closes.

13 Close the Manage Accounting Policies form.

Create test policy

14 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

15 Click on the Create button.

16 Choose Create Test Policy from the Create contextual menu. The Test Policy (Create) form opens.

17 Configure the parameters in Table 78-9 using the supplied values:

Table 78-9 Test policy parameters

Parameter	Value	Comment
Name	SAA Test Policy	—
NE Schedulable	enabled	You must enable this parameter to allow the configuration of SAA accounting files.
Entity Type	VLL Service	—
Accounting Files	enabled	You must enable this parameter to allow the configuration of SAA accounting files.

18 Click on the Test Definitions tab button.

19 Click on the Add button to add a test definition to the test policy. A menu appears.

20 Choose Service→Add VCCV Ping. The VCCV Ping Definition (Create) form opens with the General tab displayed.

21 Click on the OK button. The VCCV Ping Definition (Create) form closes and a dialog box appears.

22 Click on the OK button. The test definition is listed on the Test Policy (Create) form.

23 Click on the OK button. The Test Policy (Create) form closes and the Service Test Manager form reappears.

Create test suite

24 Click on the Create button in the Service Test Manager form and choose Create Test Suite from the contextual menu. The Test Suite (Create) form opens with the General tab displayed.

25 Configure the parameters in Table 78-10 using the supplied values:

Table 78-10 Test suite parameters

Parameter	Value	Comment
Name	SAA Test Suite	—
Entity Type	VLL Service	—
NE Schedulable	enabled	You must enable this parameter to allow the configuration of SAA accounting files.

26 Click on the Test Policy tab button.

27 Click on the Add button to choose a test policy that governs the generation of tests in the test suite. The Select Test Policy - Test Suite form opens.

28 Configure the filter properties and click on the Search button. A list of test policies is displayed.

29 Select the SAA Test Policy entry and click on the OK button. The test policy is listed on the Test Suite (Create) form.

30 Click on the Tested Entities tab button.

31 Click on the Add button. The Select Tested Entity - Test Suite form opens.

32 Configure the filter properties and click on the Search button to display a list of entities.

33 Select the nodes that were used in step 12 and click on the OK button. The nodes are listed on the Test Suite (Create) form.

34 Click on the Apply button to save the changes. Additional buttons appear and the form name changes to Test Suite (Edit).

35 Click on the Generated Tests tab button.

36 Click on the Generate Tests button. The 5620 SAM generates a test for each entity listed on the Tested Entities tab. The tests are listed on the form as they are generated.

78.7 Sample threshold-crossing alarm configuration

The following sample configuration focuses on the configuration of a threshold-crossing alarm that is to be included in a test suite. It does not describe the configuration of the test suite, schedule or scheduled task associated with the sample. No test policy is required for the configuration, as it does not involve generated tests.

A network provider wants to use the 5620 SAM to monitor a customer VPLS named VPLS 17 that carries VoIP traffic. He wants the 5620 SAM to raise an alarm when the round-trip jitter value rises above a specified threshold.

Network jitter values typically range from 10 to 15 ms, but are occasionally as high as 25 ms. Jitter buffers in the end-user VoIP sets can accommodate up to 80 ms of jitter. A network engineer determines that a jitter test threshold of 30 ms is low enough to allow NOC operators sufficient time for investigating a jitter increase, yet high enough to exclude spurious jitter events.

A 5620 SAM administrator wants to creates a scheduled CPE ping test suite for the VPLS that periodically measures the round-trip jitter between each VPLS site and an end device. The administrator creates one CPE ping test for each site in the VPLS. Section 78.8 describes the steps required to create one such test.

78.8 Sample threshold-crossing alarm configuration steps

The following procedure explicitly defines the configuration steps required to create the test with a threshold-crossing alarm described in section 78.7. See section 78.4 for information about sample test-suite, test policy, or scheduling configurations. See the procedures in section 78.11 for complete STM configuration information.

For conciseness, the procedure lists only the configuration steps and parameters that are specific to and necessary for the sample.

Create CPE ping test with threshold-crossing criteria

1 Click on the Create button in the Service Test Manager form and choose L2 Service→CPE ping from the contextual menu. The CPE Ping Test (Create) form opens with the General tab displayed.

2 Configure the parameters in Table 78-11 using the supplied values:

Table 78-11 General CPE Ping test parameters

Parameter	Value	Comment
General tab		
Name	CPE Ping Test - VPLS 17, Site A	A descriptive name such as this is helpful for quickly identifying the entity under test when viewing the test results.
NE Schedulable	enabled	You must enable this parameter to allow the configuration of threshold-crossing criteria.
Select button in Service panel	VPLS 17	Click on the Search button on the Select Service - CPE Ping form that opens to choose a service.
Select button in Site panel	Site A	Click on the Search button on the Select Site - CPE Ping form that opens to choose a service.
Destination Path Address	*IP address of an end device connected to Site A*	This is the IP address to which the CPE ping packets are sent.
Source IP Address	*IP address of the NE that originates the test packets*	This IP address must be in the same subnet as the Destination IP Address.

(1 of 2)

Parameter	Value	Comment
Source MAC Address	*MAC address of the NE that originates the test packets*	—
Test parameters tab		
Number of Test Probes	5	This provides more analysis granularity than a single test packet without affecting network performance.
Results configuration tab		
Probe History Size (rows)	100	This value provides a greater retained test-result history for occasional monitoring by a 5620 SAM operator.
Trap Generation	Probe Failure	Test-probe failures provide early notification of congestion or reachability issues to a 5620 SAM operator for troubleshooting purposes.

(2 of 2)

3 Click on the Apply button. Additional buttons and tab buttons appear, and the form name changes to CPE Ping *Test Name* (Edit).

4 Click on the Threshold Alarms tab button.

5 Click on the Add button to add threshold criteria. The NE Threshold Event (Create) form opens with the General tab displayed.

6 Configure the parameters in Table 78-12 using the supplied values:

Table 78-12 Threshold-crossing CPE Ping test parameters

Parameter	Value	Comment
Type	Round-Trip Jitter	—
Generate Alarm on Rising Threshold	enabled	This is the default setting. Alternatively or additionally, by enabling the Generate Alarm on Rising Threshold parameter, you can configure the 5620 SAM to generate an alarm when a test-result value falls below a specified threshold. You can also configure the 5620 SAM to clear a rising-threshold alarm when the test-result value falls below the value configured for the falling threshold.
Rising Threshold tab		
Threshold Value	30	This value specifies that the 5620 SAM is to generate an alarm when an individual test result contains a round-trip jitter value greater than 30 ms.

7 Click on the OK button. The NE Threshold Event (Create) form closes.

8 Close the CPE Ping *Test Name* (Edit) form.

78.9 Sample OS 6250M (Metro) device SLA testing

You can use the 5620 SAM STM to perform a CPE SLA Test-Head OAM test to validate and test customer SLAs used on OS 6250M devices in Metro Ethernet networks. The test is critical for provisioning or troubleshooting network services between customer endpoints. The CPE SLA Test-Head OAM test supports unidirectional traffic and IPv4.

You can perform the following tasks on the 5620 SAM without an external test-head device:

- Generate specific flow-based traffic across the network to help identify flow-based issues.
- Identify the impact of QoS settings (for example, SAP profile or QoS policies) on the overall traffic.
- Check the throughput across a provider network. The throughput is displayed on the 5620 SAM GUI for each iteration of the test.
- Debug flow-specific traffic forwarding across the provider network.
- Analyze the behavior of various user-defined traffic patterns across the provider network.
- Perform the handover testing after the initial deployment.
- Perform on-demand testing and results monitoring using a central entity.

You can perform a CPE SLA Test-Head test using one CPE test-head profile or a group of profiles. You can also run several tests for one CPE Test-Head profile or group of profiles.

The following conditions are applicable to the creation of a CPE SLA Test-Head profile or a group of profiles and their execution:

- A CPE SLA Test-Head Group profile can contain up to eight stream/flows.
- A CPE SLA Test-Head Group profile can contain up to eight analyzers.
- When you configure the STM test execution details, the analyzer test name and the generator test name must be the same.
- If the analyzer has a test (flow) which is not in the generator group profile, the test is not valid.
- When you run a CPE SLA test or test group, only one test can be run at a time. You cannot run concurrent tests on the same OS 6250M device.

The following steps describe how to create a CPE SLA Test-Head profile or a group of profiles (OS 6250M [Metro] devices only). The procedure lists only the configuration steps and parameters that are required for the sample. See the procedures in section 78.11 for complete STM configuration information.

Create a CPE SLA Test-Head profile

1 Choose Tools→AOS CPE Test-Head Profiles→CPE Test-Head Profile from the 5620 SAM main menu. The CPE Test-Head Profiles form opens.

2 Click on the Create button. The CPE Test-Head Profile, Global Policy (Create) form opens.

3 Configure the following parameters:

- Name
- Description
- Source Endpoint
- Destination Endpoint
- Source MAC
- Destination MAC
- Direction
- Role
- Tx Rate (kbps)
- Frame Size (bytes)

4 Configure the Frame Type parameter. The CPE Test-Head Profile, Global Policy (Create) form refreshes and displays additional parameters.

5 Configure the following parameters:

- VLAN-Tag
- Priority
- Pattern
- Drop Enable

6 Perform one of the following:

a If you set the Frame Type parameter to Ethernet, configure the Ether Type parameter.

b If you set the Frame Type parameter to IPV4, configure the following parameters.

- Source IP
- Destination IP
- Protocol
- TOS
- TTL
- Source Port
- Destination Port

The Source Port and Destination Port parameters appear when you set the Protocol parameter to TCP or UDP.

7 Click on the OK button. The CPE Test-Head Profiles form opens.

8 Click on the Search button to display the CPE Test-Head profile.

9 Choose the CPE Test-Head profile and click on the Released button to change the Global policy configuration mode to Released. Acknowledge the Warning message as required. You must release each CPE Test-Head test profile separately.

10 Distribute the CPE Test-Head profile locally to the managed OS 6250M devices.

Note — Policies are also automatically distributed to devices when the policies are used by resources on the device. See chapter 46 for more information about policies and policy distribution.

i Choose the CPE Test-Head profile and click on the Distribute button. The Distribute - CPE Test Head Profile form opens.

ii Choose the appropriate nodes from the Available Nodes column and click on the Move-right button.

iii Click on the Distribute button and close the form.

11 Configure the VLAN and port settings for the CPE Test-Head profile.

i Choose the CPE Test-Head profile and click on the Properties button to view the profile parameter settings.

ii Click on the Local Definitions tab button and click on the Search button. The OS 6250 devices to which the test policy was distributed in step 10 appears.

iii Choose an OS 6250M device from the list and click on the Properties button. The CPE Test-Head Profile form opens with the General tab displayed.

iv In the VLAN panel, click on the Select button for the Service ID parameter. The Select vlanSitePointer - CPE Test-Head Profile form opens.

v Click on the Search button to list the VLAN sites.

vi Choose a device and click on the OK button.

vii Click on the Local Audit On button to change the mode to Local Edit only.

viii Click on the Select button for the Port parameter. The Select vlan port - CPE Test-Head Profile form opens.

ix Click on the Search button to list the ports.

x Choose a port and click on the OK button.

xi Click on the Apply button and close the form.

12 As required, repeat steps 1 to 11 if you need to create additional CPE SLA Test-Head profiles. You can group profiles as described in step 13, otherwise, go to step 15.

Create a CPE SLA Test-Head Group profile

13 If required, create a CPE SLA Test-Head Group profile which can be use to bind individual CPE Test-Head profiles to form a group of tests.

i Choose Tools→AOS CPE Test-Head Profiles→CPE Test-Head Group Profile from the 5620 SAM main menu. The CPE Test-Head Group Profile form opens.

ii Click on the Create button. The CPE Test-Head Group Profile, Global Policy (Create) form opens.

iii Configure the following parameters:

- Name
- Description
- Source Endpoint
- Destination Endpoint
- Direction
- Role
- Tx Rate (kbps)

Note — If the Role parameter is set to the Generator option, perform step 14 otherwise, continue with step 13.

iv Click on the CPE Test Group Member tab button and click on the Create button. The Select Port - CPE Test Group Profile - Global Policy forms opens.

v Choose the appropriate CPE Test-Head profiles from the list and click on the OK button. The CPE Test-Head Group Profile, Global Policy (Create) form opens displaying the selected profiles.

vi Click on the OK button to save CPE Test-Head Group profile.

vii Click on the Search button to display the CPE Test-Head Group profile.

viii Choose the CPE Test-Head Group profile and perform steps 9, 10, and 11.

ix Go to step 15.

14 Configure the required feeder port for the generator.

i On the 5620 SAM network topology map, right-click on the appropriate OS 6250M device, and choose Properties from the contextual menu. The Network Element - <*Node Name*> (Edit) form appears.

ii Click on the Globals tab button.

iii Click on the AOS OAM tab button.

iv Click on the Select button that is associated with the Feeder Port Name parameter. The Select Feeder Port - Network Element - <*Node Name*> form appears.

v Click on the Search button to list the feeder ports.

vi Choose the appropriate feeder port and click on the OK button. The Network Element - <*Node Name*> (Edit) form reappears.

vii Click on the OK button to save the feeder port information.

viii Perform the rest of the substeps in step 13.

Configure the STM test execution details

15 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager (STM) form opens.

16 Click on the Create button and choose one of the following options:

a AOS CPE→CPE SLA Test—Allows you to run a test on a CPE test-head profile or a group of profiles. The CPE SLA Test, CPETest-0 (Create) form opens with the General tab displayed. Perform steps 17 to 20, and step 22 to configure this option.

b AOS CPE→CPE SLA Test Group—Allows you to run several tests on a on a CPE test-head profile or group of profiles. The CPE SLA Test Group, CPETest-0 (Create) form opens with the General tab displayed. Complete steps 17, 18, 20, 21, and step 22 to configure this option.

17 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- NE Persistent

18 In the Generator panel, click on the Select button. The Select Generator - CPE SLA Test - CPET Test-0 form opens.

i Click on the Search button to list the generator profiles.

ii Choose a generator profile and click on the OK button to close the form.

19 In the Analyzer panel, click on the Select button. The Select Analyzer - CPE SLA Test - CPET Test-0 form opens.

i Click on the Search button to list the analyzer profiles.

ii Choose an analyzer profile and click on the OK button to close the form.

20 Click on the Test Parameters tab button and configure the following parameters:

- Number of Test Iterations
- Test Iteration Duration
- Generator Tx Rate
- Generator Frame Size (bytes)
- Increase Tx Rate Every Iteration

21 Click on the CPE SLA Test Group Members tab button and click on the Create button. The CPE Test-Head Group Profile - CPE SLA Test Group CPETestGroup - 0 forms opens.

i Click on the Search button to display the CPE Test-Head Group profiles.

ii Choose the appropriate CPE Test-Head Group profiles and click on the OK button to close the form. The CPE SLA Test Group, CPETest-0 (Create) form reappears.

22 Click on the OK button to close the form.

Run the STM test and analyze the results

23 In the Service Test Manager (STM) form, choose one of the following options from the Test (Assurance) drop-down menu and click on the Search button.

a CPE SLA Test (AOS SAS)—This option displays all single CPE test-head profile tests that have been created.

b CPE SLA Test Group (AOS SAS)—This option displays all group CPE test-head profile tests that have been created.

24 Choose the appropriate CPE SLA test and click on the Execute button to start the test.

25 To view the test results, click on the Results tab.

78.10 Workflow to use the Service Test Manager

1 If you are configuring an OAM or an Ethernet CFM test, review the appropriate workflow.

a Review "Workflow to use OAM diagnostic tests" in chapter 38.

b Review "Workflow to configure Ethernet CFM" in chapter 78.

2 As required, configure the STM default settings to meet your operational requirements:

a Configure OAM test IDs if your 5620 SAM system is a redundant deployment. See Procedure 78-1 for more information.

b Modify the STM default system preferences. See Procedure 78-2 for more information.

c Enable the debug STM mode, which allows you to access more options on the STM form. See Procedure 78-3 for more information.

3 Create or modify an STM test policy to define the generated tests for the STM test suite. See Procedure 78-4 or 78-5 for more information.

4 As required, configure the threshold-crossing alarms for test policies, test definitions, and assurance tests.

a Configure threshold-crossing alarms on NE-schedulable OAM tests within a test policy. See Procedure 78-6 for more information.

b Configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy. See Procedure 78-7 for more information.

5 Create or modify an STM test suite. See Procedure 78-8 or 78-9 for more information.

- Choose the type of entity to which the suite applies.
    - Choose None if you want to include tests that are associated with different types of entities, such as VLL and Tunnel (SDP).
- As required, associate a test policy with the test suite
- As required, choose tests for the first-run test group.
- As required, generate tests for the test suite.
- As required, choose tests for the last-run test group.

6 As required, create a schedule for an STM test suite that you want to execute regularly for continual network monitoring. To schedule the execution of a test suite, you must first create the SAM schedule. See chapter 79 for information about creating schedules.

a Schedule the execution of a test suite using a SAM schedule. See Procedure 78-10 for more information.

b Configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy. See Procedure 78-11 for more information.

c As required, modify the default size constraint policy or create additional size constraint policies to control the database resource usage by scheduled STM tasks. The default size constraint policy limits the number of STM results to 50 000 to avoid system performance degradation. See chapter 46 for more information about creating size constraint policies to limit the space consumed by historical records in the 5620 SAM database.

d Enable the scheduled tasks.

e Apply schedules to test suites as required to create scheduled tasks.

7 Execute the STM test suite. See Procedure 78-12 more information.

8 Monitor the diagnostic results from the scheduled test suites and the alarm list for indications of network or service faults and threshold-crossing alarms.

a View aggregated test suite results. See Procedure 78-13 for more information.

b View and compare test suite results for a tested entity. See Procedure 78-14 for more information.

c View and compare test suite results. See Procedure 78-15 for more information.

78.11 Service Test Manager procedures

The following procedures describe how to perform 5620 SAM STM tasks.

Procedure 78-1 To configure OAM test IDs

Note — If the 5620 SAM system is a redundant deployment, you must perform this procedure on each 5620 SAM main server in the cluster.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3 Open the nms-server.xml file with a plain-text editor.

4 Locate the following tag that marks the beginning of the ID manager section:

```
<idManager>
```

5 Add the following before the end of the ID manager section:

```
<range name="testId" min="xx" max="yy"/>
```

where
xx is the minimum value for the test ID range; for example, 10000
yy is the maximum value for the test ID range; for example, 50000

Note 1 — The test ID ranges for the 5620 SAM servers must not overlap.

Note 2 — The primary and standby 5620 SAM servers must use the same test ID range.

6 Save and close the nms-server.xml file.

7 Open a console window.

8 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the console prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The 5620 SAM server reads the nms-server.xml file and puts the configuration change into effect.

10 Close the console window.

Procedure 78-2 To modify the STM default system preferences

1 Choose Administration→System Preferences from the 5620 SAM main menu. The System Preferences form opens.

2 Click on the Test Manager tab button.

3 As required, configure the following parameters:

   a Maximum Number of Results in Database

   b Default Test Result Storage

   c Log Retention Time (minutes)

   d Log Rollover Time (minutes)

4 Click on the OK button. A confirmation dialog box is displayed.

5 Click on Yes. The System Preferences form closes.

Procedure 78-3 To enable the debug STM mode

Perform this procedure to enable debug STM mode, which allows you to access more options from the Service Test Manager (STM) form.

1 Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.

2 Configure the Debug STM Mode parameter.

3 Click on the OK button. The User Preferences form closes.

Procedure 78-4 To create a STM test policy

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Test Policy from the Create contextual menu. The Test Policy (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NE Schedulable
- Entity Type
- Strategy
- Lightweight Execution
- Ignore Probe Results
- Accounting Files
- Continuously Executed
- Test Result Storage

The Strategy parameter is only configurable when the Entity Type parameter is set to VLL Services.

The Lightweight Execution, Ignore Probe Results, Accounting Files, Continuously Executed, and Test Result Storage parameters are configurable when the NE Schedulable parameter is enabled.

The Continuously Executed and Test Result Storage parameters are only configurable when the Accounting Files parameter is enabled.

Note 1 — You must enable the NE Schedulable parameter if the test suite that you create using the policy is to become an NE scheduled task.

Note 2 — If you are creating a CFM Ethernet test, you must enable the NE Schedulable parameter, and optionally you can configure the Accounting Files and Continuously Executed parameters. You must select VLL Service, VPLS, or Composite Service for the Entity Type parameter.

5 Click on the Test Definitions tab button.

6 Click on the Add button to add a test definition to the test policy. A cascading submenu appears.

7 Choose an option from one of the categories in the cascading submenu. The options vary, depending on the Entity Type and NE Schedulable parameter values you specified in step 4. For example, Ethernet CFM test definition options only appears if you selected either the VLL Service or VPLS option as the Entity Type and if you also enabled the NE Schedulable parameter.

Each option in this step has three tabs that contain configurable parameters: General, Test Parameters, and Results Configuration. Parameters that are common to all options are listed in the remainder of this step. Parameters that are specific to a particular option will be configured in step 8.

The following configurable parameters appear on the General tab of the configuration form for every option:

- Name
- NE Persistent
- Description
- NM Administrative State

The NE Persistent parameter is configurable only if you did not enable the NE Schedulable parameter in step 4.

The following configurable parameters appear on the Test Parameters tab of the configuration form for most options in this step:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)

A combination of the following configurable parameters appears on the Results Configuration tab of the configuration form for most options in this step:

- Probe History Size (rows)
- Test Failure Threshold
- Probe Failure Threshold
- Maximum Failures
- Trap Generation

8 Perform this step to configure the parameters that are specific to the particular test definition you are creating.

Choose the required test definition option from the following:

a Site ping test definition (Service→Add Site Ping) for a VLL service, VPLS, VPRN service, mirror service, service connector, or router:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Use Local Tunnel
- Use Remote Tunnel

iii Go to step 9.

b VCCV ping test definition (Service→Add VCCV Ping) for a VLL service:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Size (octets)
- Forwarding Class
- Forwarding Profile
- Reply Type

iii Go to step 9.

c VCCV trace test definition (Service→Add VCCV Trace) for a VLL service:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Size (octets)
- Forwarding Class
- Forwarding Profile
- Reply Type

iii Go to step 9.

d MAC ping test definition (Service→Add MAC Ping) for a VLL service or VPLS:

i Configure the following parameters on the General tab:

- Target MAC Address
- Source MAC Address

ii Click on the Test Parameters tab button.

iii Configure the parameters:

- Time To Live
- Forwarding Class
- Forwarding Profile
- Reply Control
- Control Plane

iv Go to step 9.

e MEF MAC ping test definition (L2 Service→Add MEF MAC Ping) for a VPLS:

Note — This test is only supported on 7250 SAS-ES and 7250 SAS-ESA, Release 3.0 nodes.

i Configure the Target MAC Address parameter on the General tab.

ii Click on the Test Parameters tab button.

iii Configure the Size (octets) parameter.

iv Click on the Results Configuration tab button.

v Configure the Trap Generation parameter.

vi Go to step 9.

f Multicast FIB ping test definition (Multicast→Add MFIB Ping) for a VPLS:

i Configure the following additional parameters on the General tab:

- Multicast Source
- Multicast Group

ii Click on the Test Parameters tab button.

iii Configure the parameters:

- Time To Live
- Reply Via Control Plane

iv Go to step 9.

g Ping test definition (L3 Service→Add VPRN Ping) for a VPRN:

  i Click on the Test Parameters tab button.

  ii Configure the parameters:

  - Time To Live
  - Reply Via Control Plane

  iii Go to step 9.

h Trace test definition (L3 Service→Add VPRN Trace) for a VPRN:

  i Click on the Test Parameters tab button.

  ii Configure the parameters:

  - Initial Time to Live
  - Maximum Time to Live
  - DiffServ Field
  - Reply Via Control Plane

  iii Go to step 9.

i Multicast routing information test definition (Multicast→Add mrinfo) for a VPRN or router:

  i There are no parameters that are specific to the mrinfo test definition.

  ii Go to step 9.

j Multicast trace test definition (Multicast→Add mtrace) for a VPRN or router:

  i Click on the Select button on the General tab to choose a multicast group to run the trace against.

  ii Click on the Test Parameters tab button.

  iii Configure the parameters:

  - Initial Time to Live
  - Maximum Number of Hops

  iv Go to step 9.

k ICMP ping test definition (ICMP→Add ICMP Ping) for a VPRN or router:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Size (octets)
- Rapid
- Time To Live
- Data Pattern
- Positional Data Pattern
- DiffServ Field
- Bypass Routing
- Do Not Fragment
- Forwarding Class
- Forwarding Profile

iii Go to step 9.

l ICMP trace test definition (ICMP→Add ICMP Trace) for a VPRN or router:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- DiffServ Field
- Time To Wait (milliseconds)

iii Go to step 9.

m Tunnel ping test definition (Service Transport→Add Tunnel Ping) for a service tunnel:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Size (octets)
- Forwarding Class
- Forwarding Profile

iii Go to step 9.

n MTU ping test definition (Service Transport→Add MTU Ping) for a service tunnel:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Size (octets)
- MTU Start Size (octets)
- MTU End Size (octets)
- MTU Step Size (octets)

iii Go to step 9.

o Ping test definition (MPLS→Add LSP Ping) for an LSP:

i In the General tab, configure the Target Type parameter.

ii Click on the Test Parameters tab button.

iii Configure the parameters:

- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

iv Go to step 9.

p Trace test definition (MPLS→Add LSP Trace) for an LSP:

i In the General tab, configure the Target Type parameter.

ii Click on the Test Parameters tab button.

iii Configure the parameters:

- Size (octets)
- Initial Time to Live
- Maximum Time to Live
- Forwarding Class
- Forwarding Profile

iv Go to step 9.

q Ping test definition (MPLS→Add P2MP LSP Ping) for a P2MP LSP:

i In the General tab, configure the Select All S2L Paths parameter.

ii Click on the Test Parameters tab button.

iii Configure the parameters:

- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

iv Go to step 9.

r Trace test definition (MPLS→Add P2MP LSP Trace) for a P2MP LSP:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Size (octets)
- Initial Time to Live
- Maximum Time to Live
- Forwarding Class
- Forwarding Profile

iii Go to step 9.

s Ping test definition (L1/L2→Add ATM Ping) for an ATM PVC:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Loopback Location (hex)
- Destination Type

iii Go to step 9.

t CFM loopback test definition (Ethernet CFM→Add CFM Loopback) for a VLL service or VPLS:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Size (octets)

iii Go to step 9.

u CFM link trace test definition (Ethernet CFM→Add CFM Link Trace) for a VLL service or VPLS:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- TTL

iii Go to step 9.

v CFM two way delay test definition (Ethernet CFM→Add CFM Two Way Delay Test) for a VLL service or VPLS:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile

iii Go to step 9.

w CFM two way SLM test definition (Ethernet CFM→Add CFM Two Way SLM) for a VLL service or VPLS:

i Click on the Test Parameters tab button.

ii Configure the parameters:

- Number of Test Probes
- Probe Interval (seconds)
- Probe Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Size (octets)

iii Go to step 9.

9 To configure threshold-crossing alarms as required, perform the following:

a Click on the Thresholds tab.

b Perform steps 9 to 15 of Procedure 78-7.

10 Click on the OK button. The Definition Create form closes and a dialog box appears.

11 Click on the OK button. The Test Policy (Create) form reappears with the new OAM test definition listed.

12 Perform steps 5 to 11 to add additional OAM test definitions to the policy.

13 If you added Ethernet CFM test definitions to the test policy then go to step 14. Otherwise go to step 18.

14 Click on the CFM Details tab.

15 Click the Select button to choose a MD Mgr Object ID. The Select Maintenance Domain form is displayed.

16 Click the Search button and choose the required maintenance domain from the list.

17 Click OK. The Select Maintenance Domain form closes and the selected MD Mgr Object ID is displayed in the CFM Details tab.

18 Click on the OK button. The Test Policy (Create) form closes.

19 Close the Service Test Manager form.

Procedure 78-5 To modify a test policy

Note — If you modify a test policy associated with a test suite, you must regenerate the Generated tests in the test suite.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Policy (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test policies appears.

5 Select a test policy and click on the Properties button. The Test Policy (Edit) form opens with the General tab displayed.

6 Configure the Name and Description parameters, as required.

7 Click on the Test Definitions tab button.

8 Perform one of the following:

- **a** Select a test definition in the list and click on the Properties button.
- **b** Click on the Add button to add a test definition to the test policy.

9 Click on the OK button to return to the Policy form.

10 Modify the parameters for the test definition, as required.

11 Click on the Update Test Suites button to apply the test policy changes to all test suites that are associated with the test policy.

Caution — The operation of scheduled test suites that use the test policy may be adversely affected if you modify the test policy while a scheduled task for the suite is enabled.

12 Click on the Usages tab button to view a list of the test suites that use the test policy.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button to confirm the action. The Test Policy (Edit) form closes and the Service Test Manager form reappears.

15 Click on the Close button to close the Service Test Manager form.

Procedure 78-6 To configure threshold-crossing alarms on NE-schedulable OAM tests within a test policy

Perform this procedure to configure threshold-crossing alarms for test policies, test definitions, and assurance tests that are NE-schedulable. An alarm is raised when a threshold is crossed, either because the value rose above or fell below the configured level.

Configuring threshold-crossing alarms on a test definition within the test policy creates a threshold definition that applies to generated tests. Configuring threshold-crossing alarms directly on a test that is NE-schedulable applies just to the test.

Note — If you modify a test policy associated with a test suite, you must regenerate the generated tests in the test suite.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Policy (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test policies is displayed.

5 Choose an NE-schedulable policy from the list and click on the Properties button. The Test Policy (Edit) form opens with the General tab displayed.

6 Click on the Test Definitions tab. A list of tests associated with the policy opens.

7 Select a test from the list and click on the Properties button. The Test Definition—Test Policy (Edit) form opens with the General tab displayed.

8 Click on the Thresholds tab.

9 Click on the Add button. The Threshold Event Definition (Create) form opens with the General tab displayed.

10 Configure the parameters:

- Type
- Generate Alarm on Rising Threshold
- Clear Alarm on Falling Threshold
- Update Test Result Status
- Include Falling Threshold

11 Click on the Rising Threshold tab.

12 Configure the Threshold Value parameter.

13 Click on the Falling Threshold tab.

Note — The Falling Threshold tab can be accessed only when the Include Falling Threshold parameter is enabled on the General tab of the Threshold Event Definition (Create) form.

14 Configure the Threshold Value parameter.

15 Click on the OK button. The Threshold Event Definition, (Create) form closes and a dialog box appears.

16 Click on the OK button. The test appears on the list.

17 Repeat steps 9 to 16 to configure threshold events on additional tests.

18 Click on the OK button. The Test Definition—Test Policy (Edit) form closes and the Test Policy (Edit) form reappears.

19 Click on the OK button. A dialog box appears.

20 Confirm the action. The Test Policy (Edit) form closes and the Service Test Manager form reappears.

21 Close the Service Test Manager form.

Procedure 78-7 To configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy

You can configure threshold-crossing alarms for test policies, test definitions, and assurance tests that are non-NE-schedulable. An alarm is raised when a threshold is crossed, either because the value rose above or fell below the configured level.

Non-NE-schedulable OAM tests can be configured as NE persistent. NE persistent tests are deployed to the network node after the first execution and remain on the node each time the test is executed. The type of threshold-crossing event available for selection depends on the test type.

Configuring threshold-crossing alarms on a test definition within the test policy creates a threshold definition that applies to generated tests. Configuring threshold-crossing alarms directly on a test that is non-NE-schedulable applies just to the test.

Note — If you modify a test policy associated with a test suite, you must regenerate the generated tests in the test suite.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Policy (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test policies is displayed.

5 Choose a non-NE-schedulable policy from the list and click on the Properties button. The Test Policy (Edit) form opens with the General tab displayed.

6 Click on the Test Definitions tab. A list of tests associated with the policy opens.

7 Select a test from the list and click on the Properties button. The Test Definition—Test Policy (Edit) form opens with the General tab displayed.

8 Click on the Thresholds tab.

Note — The Thresholds tab is enabled or disabled depending on the test type selected in step 7. Threshold alarm events can not be configured for Site Ping, mrinfo, mtrace, VPRN Trace and Mtu Ping tests.

9 Click on the Create button. The Threshold Event Definition (Create) form opens with the General tab displayed.

10 Configure the parameters.

- Type
- Generate Alarm on Rising Threshold
- Clear Alarm on Falling Threshold
- Update Test Result Status
- Include Falling Threshold

11 Click on the Rising Threshold tab.

12 Configure the Threshold Value parameter.

13 Click on the Falling Threshold tab.

Note — The Falling Threshold tab can be accessed only when the Include Falling Threshold parameter is enabled on the General tab of the Threshold Event Definition, (Create) form.

14 Configure the Threshold Value parameter.

15 Click on the OK button. The Threshold Event Definition, (Create) form closes and a dialog box appears.

16 Click on the OK button. The test appears on the list.

17 Repeat steps 9 to 16 to configure threshold events on additional tests in the policy.

18 Click on the OK button. The Test Definition, Test Policy (Edit) form closes and the Test Policy (Edit) form reappears.

19 Click on the OK button. A dialog box appears.

20 Confirm the action. The Test Policy (Edit) form closes and the Service Test Manager form reappears.

21 Close the Service Test Manager form.

Procedure 78-8 To create a test suite

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Test Suite from the contextual menu. The Test Suite (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NE Schedulable
- Entity Type
- Validation Test Suite
- Timeout (minutes)
- First Run Execution Sequence
- Last Run Execution Sequence

Note 1 — The Entity Type parameter specifies that only test policies created for the same entity type are available for the test suite. The parameter also restricts the predefined tests that are available as first-run or last-run tests to those that apply to the entity type.

Note 2 — To create a test suite that includes tests for different entity types, specify None as the Entity Type parameter value. This allows you to choose any predefined test as a first-run or last-run test.

Note 3 — Specifying None as the Entity Type parameter value disables the generation of tests in a test suite; the policy that STM uses to generate tests must be associated with a specific entity type.

Note 4 — The Validation Test Suite parameter specifies that the test suite is used to validate the connectivity of the tested service entity to which it is applied. OAM validation tests are not supported for HVPLS.

Click on the More Actions button and choose Validate on the associated service or service tunnel configuration form to run the OAM validation test. The results of the OAM validation test are indicated by the OAM Validation Failed operational flag.

Note 5 — First Run and Last Run tests can be added for test suites that have the Continuously Executed and Accounting Files options enabled can be added to test suites.

Note 6 — When issuing an Execute or Stop command for a test suite that has the Continuously Executed and Accounting Files options enabled, the execution or stopping of the First Run and Last Run tests will be triggered.

Note 7 — If you are creating an Ethernet CFM test suite, you must enable the NE Schedulable parameter.

5 To create a scheduled task, see procedure 78-10.

6 If you chose None as the Entity Type parameter value in step 4, go to step 17. To create a scheduled task, go to step 7.

7 Click on the Test Policy tab button.

8 Click on the Add button to choose a test policy to associate with the test suite. The Select Test Policy - Test Suite form opens.

9 Click on the Search button to display a list of available test policies.

Note — Only test policies that apply to the type of entity specified by the Entity Type parameter in step 4 appear in the list.

10 Choose a test policy from the list and click on the OK button. The test policy appears on the Test Policy tab.

11 Click on the Tested Entities tab button.

12 Click on the Add button to choose a service, transport element, or device as the object against which the test suite is run. The Add form opens.

13 Click on the Search button to display a list of available entities.

Note — Only entities that match the type of entity specified in the test policy appear in the list.

14 Choose an entity from the list and click on the OK button. The Add form closes and an entry for the entity appears in the list on the Tested Entities tab.

15 Ensure the item is selected in the list and click on the Lock Test Generation button, if required.

Note — Locking the test generation means that the initial settings you specify when creating the test suite will be retained, even if later on you change some attributes (for instance, if you are testing SDP tunnels and you extend the tested entities by selecting another SDP tunnel). All customized test attributes are retained when re-generating the tests.

The 5620 SAM auto-locks tested entities when generated tests are either modified or deleted.

The Test Re-generation locked field in the list will display a checkmark to indicate that the lock is enabled and the button's name changes to Unlock Test Generation. If you do not want to lock the test, then click the Unlock Test Generation button. The Test Re-generation locked field in the list will not display a checkmark.

16 Repeat steps 12 to 14 for each additional entity that you want to specify.

17 Click on the First Run Tests tab button.

18 Click on the Add button to choose a predefined test that is to execute before the generated tests in the suite. The Add form opens.

19 Click on the Search button to display a list of available tests.

20 Choose a test from the list and click on the OK button. The Add form closes and the test entry appears on the First Run Tests tab.

21 Repeat steps 18 to 20 for each additional first-run test that you want to specify.

22 When there is more than one test in the first-run list, the Move Up and Move Down buttons are active. Select a test entry and click on these buttons as needed to reorder the first-run test execution sequence, if required.

23 Click on the Last Run Tests tab button.

24 Click on the Add button to include a predefined test that is to execute after the other tests in the suite have completed. The Add form opens.

25 Click on the Search button to display a list of available tests.

26 Choose a test from the list and click on the OK button. The Add form closes and the test entry appears on the Last Run Tests tab.

27 Repeat steps 24 to 26 for each additional last-run test that you want to specify.

28 When there is more than one test in the last-run list, the Move Up and Move Down buttons are active. Select a test entry and click on these buttons as needed to reorder the last-run test execution sequence, if required.

29 Click on the Apply button to save the changes. Additional buttons at the bottom of the form become active.

30 If you chose None as the Entity Type parameter value in step 4, go to step 34.

31 Click on the Generated Tests tab button.

32 Click on the Generate Tests button. The 5620 SAM begins generating tests for the test suite based on the test policy. The tests appear in a list on the Generated Tests form as they are generated.

Note 1 — When the test policy or the configuration of an entity on the Tested Entities tab changes, you must regenerate the tests in the test suite by clicking on the Generate Tests button.

Note 2 — When tests have been generated in a Test Suite (which has a test policy already associated to it), these existing tests will not be altered (delete and recreated, or set to default tests), when the Generate Tests button is pressed again.

33 Click on the Generation Logs tab button to view the log file that the 5620 SAM creates during test generation, as required.

Note — Generation Logs messages only appear if any failures occur during the test generation process.

34 Click on the OK button to close the Test Suite (Create) form.

35 Close the Service Test Manager form.

Procedure 78-9 To modify a test suite

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Select a test suite and click on the Properties button. The Test Suite (Edit) form opens with the General tab displayed. Use the parameters on this tab to change the execution order of tests in the First run and Last run test groups, as required.

The following tabs list the test-suite components that you can individually or collectively add to or remove from the test suite:

- Test Policy tab — displays the test policy that is associated with the test suite
- Tested Entities tab — lists the entities that are objects of the tests in the test suite
- First Run Tests tab — lists the group of tests in the test suite that run first
- Generated Tests tab — lists the generated tests that are included in the test suite
- Last Run Tests tab — lists the group of tests in the test suite that run last

The following tabs display information about the creation and execution of the test suite:

- Results tab — lists the historical results that are returned by each execution of the test suite
- Generation Logs tab — lists the log entries that are created during test generation for the test suite
- Faults tab — displays the faults associated with the test suite

Note — Generation Logs messages only appear if any failures occur during the test generation process.

6 Modify the parameters for the test suite, as required.

To configure an item on a tab that contains a list of test-suite components, select the item and click on the Properties button.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button to confirm the action. The Test Suite (Edit) form closes and the Service Test Manager form reappears.

9 Click on the Close button to close the Service Test Manager form.

Procedure 78-10 To schedule the execution of a test suite using a SAM schedule

To schedule the execution of a test suite using a SAM schedule, you must first create the SAM schedule. See chapter 79 for information about creating schedules.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Double-click on the test suite that you want to schedule. The Test Suite (Edit) form opens with the General tab displayed.

6 Click on the Schedule button. The SAM Scheduled Task (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

Caution — Setting the Administrative State parameter to Enabled puts the scheduled task into effect according to the schedule parameters. Ensure that the test suite and the objects to which it applies are appropriately configured before you set the parameter to Enabled.

8 Click on the Select button. The Select Schedule - SAM Scheduled Task form opens.

9 Select a schedule and click on the OK button. The chosen schedule appears on the form.

10 Click on the OK button. The SAM Scheduled Task (Create) form closes and the Test Suite (Edit) form reappears.

11 Close the Test Suite (Edit) form.

12 Close the Service Test Manager form.

Procedure 78-11 To schedule the execution of a test suite using an existing NE schedule

To schedule the execution of a test suite using an existing NE schedule, perform Procedure 79-6 to turn up the NE scheduled task.

Procedure 78-12 To execute a STM test suite

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Select a test suite in the list and click on the Properties button. The Test Suite (edit) form opens with the General tab displayed.

6 Click on the Execute button. Execution of the test suite begins and the Test Suite (edit) form displays the Results tab. You can view the test results when the test execution is complete.

Note — You can run an OAM validation test from the Properties form of a service tunnel or an applicable service. See the applicable service management chapter for more information.

7 Close the Test Suite (edit) form.

Procedure 78-13 To view aggregated test suite results

Perform this procedure to view test suite results from the Test Suite Result (Edit) form.

Note 1 — You can also view the test suite results for an object from the Tests tab of the configuration form for the object.

Note 2 — You can reorder a column in a tabular information view by dragging the column heading to the desired position, then right-clicking on the column heading and choosing Save Table Preferences.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager (STM) form opens.

2 Choose Test Result (Assurance) from the object drop-down list.

3 Click on the Aggregated Result (Assurance) icon below the Result (Assurance) icon to expand the selection.

4 Choose one of the following objects in the tree display below Aggregated Result (Assurance).

   a Select Test Definition Result (Assurance) to create a search filter based on a test definition.

   b Select Test Policy Result (Assurance) to create a search filter based on a test policy.

   c Select Test Suite Result (Assurance) to create a search filter based on a test suite.

5 Configure the filter criteria.

Caution — Ensure that the filter properties chosen are sufficient to appropriately limit the number of returned result entries. Otherwise, the number of returned entries may exceed the maximum number that the 5620 SAM permits, and valid entries may not appear in the list.

6 Click on the Search button. A list of test suite results appears.

7 Select a test suite result and click on the Properties button. The Test Suite Result (Edit) form opens with the General tab displayed.

8 View the general results on the General tab.

Note — If the test suite uses a test policy with the Lightweight Execution parameter enabled, only the General and Failed Test tabs are available.

9 Click on the First Run Results tab button to view test results from individual tests in the first-run test group of the test suite.

10 Click on the Summary By Policy tab button to view test results for individual tests in the test suite, listed by test policy.

11 Click on the Summary By Definition tab button to view test results for individual tests in the test suite, listed by test definition.

12 Click on the Last Run Results tab button to view test results from individual tests in the last-run test group of the test suite.

13 Close the Test Suite Result (Edit) form.

14 Click on the Close button to close the Service Test Manager form.

Procedure 78-14 To view and compare test suite results for a tested entity

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down menu.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Choose a test suite in the list and click on the Properties button. The Test Suite (edit) form opens with the General tab displayed.

6 Click on the Tested Entities tab button to view a list of entities tested by the test suite.

7 Choose a tested entity from the list and click on the Show Results button. The Tested Entity Result (edit) form opens.

8 Configure the filter criteria.

9 Click on the Search button. A list of test results appears.

10 Choose a test result from the list and click on the Properties button. The result form for the selected test opens.

11 Close the result form.

12 If you need to compare the results of two tests of the same type, choose two results for the test from the displayed list and click on the Compare button; the Difference form opens. Otherwise, go to step 15.

13 Compare the results of the test results.

14 Close the Difference form.

15 Close the Tested Entity Result (edit) form.

16 Close the Test Suite (Edit) form.

17 Close the Service Test Manager (STM) form.

Procedure 78-15 To view and compare test suite results

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Result (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test results appears.

5 Choose a test result and click on the Properties button to view the properties of the test. The selected test type result (Edit) form opens.

6 If you need to compare the results of two tests within a test suite, choose two test results of the same type within a test suite and click on the Compare button; the Difference form opens. You can view the test values for each test. Otherwise, go to step 8.

7 Close the Difference form.

8 Close the test type result (Edit) form.

9 Close the Service Test Manager (STM) form.

Procedure 78-16 To delete a test suite

1 If the test suite is scheduled, you must remove the scheduled task associated with the test suite before you can delete the test suite. See chapter 79 for more information.

2 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

3 Choose Test Suite (Assurance) from the object drop-down list.

4 Configure the filter criteria.

5 Click on the Search button. A list of test suites appears.

6 Select a test suite in the list and click on the Delete button. A dialog box appears.

7 Click on the Yes button to confirm the action. The test suite is deleted and removed from the list.

8 Click on the Close button to close the Service Test Manager form.

79 — Scheduling

79.1 Scheduling overview

The 5620 SAM scheduling functions allow the creation of 5620 SAM-based schedules for the automatic execution of tasks at designated times.

You can associate a schedule that you create using the 5620 SAM with a task that supports scheduling. A task such as running an STM test suite can be immediately processed, scheduled for later execution, or retained for future use. A task that is associated with a schedule is called a scheduled task. A scheduled task must be created in the configuration form for the task. For example a STM test suite scheduled task must be created in the STM test suite configuration form. After scheduled tasks are created they are associated with a schedule.

A 5620 SAM schedule is configurable for one-time or ongoing task execution. You can optionally specify the time at which an ongoing schedule is to stop functioning.

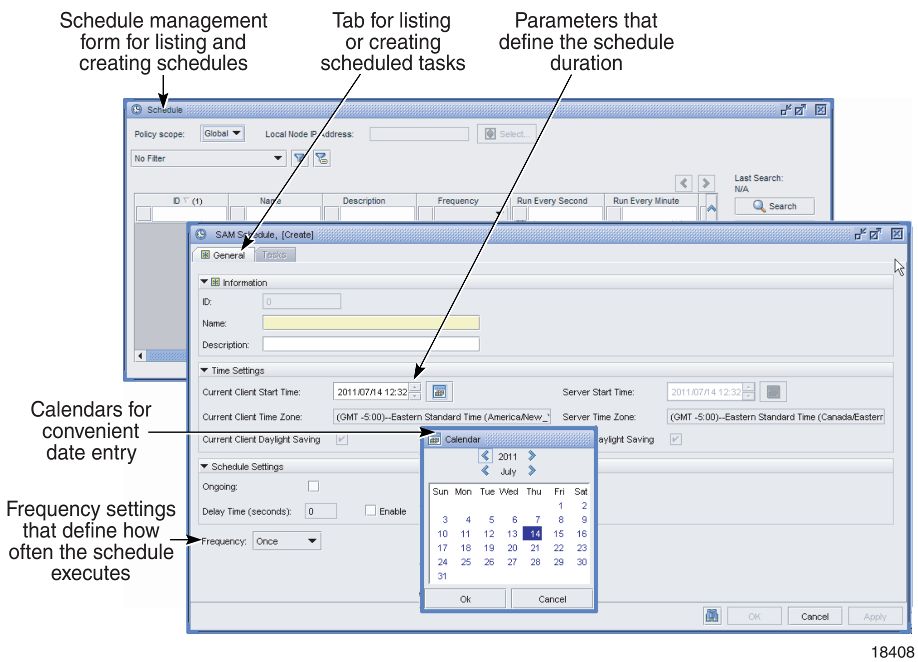
To simplify creating 5620 SAM-based schedules when the user and server are in different time zones, the 5620 SAM converts and displays schedule times specific to the user and server. For example, if a user in Ottawa wants to schedule a task on a 5620 SAM server in London, the 5620 SAM calculates the time difference and displays the user and server local times.

User time zones are configured in the user preferences form. If a time zone is not configured on the main server, the 5620 SAM uses the default time zone on the single-user client or client delegate server station, If the default time zone is not one of the 5620 SAM time zone options, the 5620 SAM displays the time zone ID and uses the UTC value without the time zone offset.

The 5620 SAM displays whether daylight saving time is in effect for the client and the server. Daylight saving time is specified for the user start time and is based on the client time zone. Daylight saving time does not specify the current time and end time.

Figure 79-1 shows the Schedule management form and the SAM Schedule configuration form.

Figure 79-1 Schedule management and configuration forms



SAM schedules

A SAM schedule exists only in the 5620 SAM and is not deployed to the target NEs. When a configured SAM schedule run time arrives, the 5620 SAM executes the associated task and compiles the task results for presentation to 5620 SAM clients.

A delay time for executing SAM scheduled runs can be configured to delay the execution of a run within a scheduled task in cases when a previously scheduled run is still executing. The 5620 SAM attempts to execute the new run at the configured delay time; if the run cannot execute at the delay time, the 5620 SAM skips the scheduled run. When a previous run completes and the next scheduled run is triggered, the run executes and is not delayed, whether a delay time is configured.

The SAM schedule functionality in the 5620 SAM uses the 5620 SAM server time zone to trigger the scheduled tasks.

A 5620 SAM-based schedule supports the following tasks:

- STM test suites. See chapter 78 for more information about STM test suites.
- NE software upgrades. See chapter 23 for more information about NE software upgrades.

Consider the following when you create a SAM schedule or a scheduled task.

- Ensure that scheduled tasks are run sufficiently far apart to allow one task to finish before the next starts. Otherwise, the next occurrence of the task is skipped or delayed, if the delay time is configured.
- Do not create schedules that overlap, as no validation is performed to ensure that a newly configured schedule does not overlap with an existing schedule.

- A new SAM scheduled task is shut down by default and must be turned up before it can be executed with one exception. Scheduled software upgrade tasks associated with all NE types are by default auto-enabled.
- Users with write access permissions to a specific schedule package can view or delete all the created schedules and scheduled tasks related to the package. Other users can only view schedules. See chapter 9 for more information about user permissions.
- By default, the 5620 SAM associates a scheduled task with the user account that is used to create the scheduled task. You can assign a different user account to a scheduled task. The user account must have the assigned scope of command role that is appropriate for the task, or the 5620 SAM does not execute the scheduled task.
- When you create a scheduled task that runs on a weekly or monthly schedule, you must reset the scheduled task when daylight savings time is in effect. See Procedure 79-9 for information about resetting schedules.
- If a schedule is not synchronized with the server time, you must reset the scheduled task. See Procedure 79-9 for information about resetting schedules
- SAM schedules are not distributed to the target NEs.
- You cannot delete a schedule that has a dependency, for example, one that is associated with a task.
- One minute is added to the default start and end time values of a 5620 SAM-based schedule to allow time for schedule configuration.
- A monthly SAM schedule with the Run Every Month or Run Every Months parameter configured uses a 30-day interval.
- When you create a monthly SAM schedule using the Run Every parameter and specify a date that does not exist for the specified months, the last date of the month is used. For example, if you create a monthly scheduled task, starting January 31st, the scheduled task will run on February 28th, March 31st and April 30th when those months are specified in the schedule.

79.2 Workflow to manage scheduling

1. Create a task, such as an STM test suite, that supports the 5620 SAM scheduling function.
2. Create or modify a SAM schedule. See Procedure 79-1 or 79-2 for more information.
3. Associate a task with the schedule. See Procedure 79-3 or 79-4 for more information.
4. For a SAM scheduled task that requires user account privileges other than the default privileges, assign a different user account to the scheduled task. See Procedure 79-5 for more information.
5. Turn up the scheduled task. See Procedure 79-6 for more information.

6 After the schedule executes the task, review the current status of the SAM scheduled task. See Procedure 79-7 for more information.

7 As required, perform one of the following.

a execute the scheduled task immediately; see Procedure 79-8 for more information

b reset the scheduled task; see Procedure 79-9 for more information

c delete the scheduled task; see Procedure 79-10 for more information

d delete the schedule; see Procedure 79-11 for more information

79.3 Scheduling procedures

Use the following procedures to manage 5620 SAM schedules and scheduled tasks.

Procedure 79-1 To create a SAM schedule

1 Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

2 Click on the Create button. A SAM Schedule (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Current Client End Time
- Current Client End Time
- Current Client Start Time
- Current Client End Time
- Ongoing
- Delay Time (seconds)
- Enable
- Frequency

The Current Client End Time parameter is configurable when the Ongoing parameter is disabled and the Frequency parameter value is set to something other than Once.

When a SAM Schedule is not Ongoing and is assigned to a task, the 5620 SAM raises an alarm when the Current Client End Time expires.

4 Perform one of the following that corresponds to the Frequency parameter value that is specified in step 3:

a When the parameter is set to Once, go to step 5.

b When the parameter is set to Per Second, configure the following parameters:

- Run Every Second
- Run Every Seconds

c When the parameter is set to Per Minute, configure the following parameters:

- Run Every Minute
- Run Every Minutes

d When the parameter is set to Per Hour, configure the following parameters:

- Run Every Hour
- Run Every Hours

e When the parameter is set to Per Day, configure the following parameters:

- Run Every Day
- Run Every Days
- Run Every

f When the parameter is set to Per Week, configure the following parameters:

- Run Every Week
- Run Every Weeks
- Run Every

The Run Every parameter is not configurable when the Ongoing parameter is enabled.

g When the parameter is set to Per Month, configure the following parameters:

- Run Every Month
- Run Every Months
- Run Every

The Run Every parameter is not configurable when the Ongoing parameter is enabled.

5 Click on the OK button to save the changes. The SAM Schedule (Create) form closes and the Schedule form reappears.

6 Close the Schedule form.

Procedure 79-2 To modify a schedule

Perform this procedure to change the configuration of a schedule. You cannot modify a schedule that is in use by a scheduled task.

Note — You can modify a schedule only when you are logged in as the user that is assigned to the schedule. To assign a different user account to the schedule, perform Procedure 79-5.

1. Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.
2. Choose SAM Schedule from the object drop-down list.
3. Configure the filter criteria. A list of schedules is displayed.
4. Select an entry in the list and click on the Properties button. The SAM Schedule (Edit) form opens.
5. Modify the parameters, as required.
6. Click on the OK button. The SAM Schedule (Edit) form closes and the Schedule form reappears.
7. Close the Schedule form.

Procedure 79-3 To associate a task with a 5620 SAM schedule

1. Perform one of the following.
   - **a** Assign a SAM schedule to a task.
     - **i** Open the properties form for a task that supports SAM schedules, such as an STM test suite.
     - **ii** Click on the Schedule button. The *task_name* (Edit) form opens, go to step 2.
   - **b** View scheduled tasks associated with a SAM schedule.
     - **i** Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.
     - **ii** Choose SAM Schedule (Schedule) from the object drop-down list.
     - **iii** Configure the filter criteria. Click on the Search button. A list of SAM schedules is displayed.
     - **iv** Select a SAM schedule in the list and click on the Properties button. The SAM Schedule (Edit) form opens.

v Click on the Tasks tab button. A list of scheduled tasks appears.

vi Choose a task from the list. Click on the Properties button to view the scheduled tasks.

2 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

Note — When you set the Administrative State parameter to Enabled, the scheduled task goes into effect, according to the schedule parameters. Ensure that the task is appropriately configured before you set the parameter to Enabled.

3 Click on the Select button to choose a schedule. The Select Schedule - STM Scheduled Task *task_name* form opens with a list of schedules.

Note — The form lists only the schedules that are associated with the current 5620 SAM user.

4 Select a schedule in the list and click on the OK button. The Select Schedule - STM Scheduled Task *task_name* form closes and the scheduled task is displayed on the STM Scheduled Task (Create) form.

5 Click on the OK button. The STM Scheduled Task (Create) form closes.

6 Close the SAM Schedule (Edit) or task properties form.

7 Close the Schedule form if the form is open.

Procedure 79-4 To modify a scheduled task

Note — You can modify a SAM scheduled task only when you are logged in as the user that is assigned to the SAM scheduled task. To assign a different user account to the SAM scheduled task, perform Procedure 79-5.

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria. A list of scheduled tasks is displayed.

4 Select a scheduled task in the list and click on the Properties button. The scheduled task (Edit) form opens.

5 Modify the parameters, as required.

6 Click on the OK button. The SAM Scheduled Task (Edit) form closes and the Scheduled Task form reappears.

7 Close the Scheduled Task form.

Procedure 79-5 To assign a different user account to a SAM scheduled task

Perform this procedure to associate a SAM scheduled task with a different user account. By default, the 5620 SAM associates a scheduled task with the user account that is active when the SAM scheduled task is created.

> **Note —** The 5620 SAM does not execute a SAM scheduled task unless the scheduled task is associated with an existing 5620 SAM user account. If you delete the user account that is associated with a SAM scheduled task, you must assign a different user account to the SAM scheduled task. A 5620 SAM user with an assigned administrator scope of command role can assign a user account to a SAM scheduled task.

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task list form opens.

2 Choose SAM Scheduled Task (schedule) from the object drop-down list.

3 Configure the filter criteria. A list of SAM scheduled tasks is displayed.

4 Select a scheduled task and click on the Reassign User button. A dialog box informs you that the new user must have the appropriate access permissions to manage the scheduled task. See “Scope of command” in section 9.1 for more information.

5 Set the Change Current User To parameter.

6 Click on the OK button.

Procedure 79-6 To turn up or shut down a scheduled task

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task (Schedule) from the object drop-down list.

3 Configure the filter criteria. A list of scheduled tasks is displayed.

4 Select an entry in the list and click on the Task Action button.

5 Choose one of the following from the menu that appears:

   a Turn Up—enable the scheduled task. The administrative state changes to enabled.

   b Shut Down—disable the scheduled task. The administrative state changes to disabled.

6 Close the Scheduled Task form.

Procedure 79-7 To view the current status of a SAM scheduled task

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria. A list of SAM scheduled tasks is displayed.

4 Select a SAM scheduled task in the list.

5 Click on the Task Action button and choose View Result from the menu that appears.

6 View the Execution Status indicator. The value is one of the following:

- None
- In Progress
- Skip Requested
- Skipped
- Stop Requested
- Stopped
- Succeeded
- Failed
- Delay Requested
- Delayed
- Started

7 View the Status indicator. The value is one of the following:

- Running—The scheduled task is running.
- Not Running—The scheduled task is not running.
- Completed—The scheduled task execution completed successfully.

8 Close the Scheduled Task form.

Procedure 79-8 To execute a SAM scheduled task

1 Turn up the SAM scheduled task, as described in Procedure 79-6.

2 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

3 Choose SAM Scheduled Task from the object drop-down list.

4 Configure the filter criteria. A list of SAM scheduled tasks is displayed.

5 Select an entry and click on the Task Action button.

6 Choose Execute from the menu that appears. The 5620 SAM executes the SAM scheduled task.

7 Close the Scheduled Task form.

8 Perform Procedure 79-7 to view the SAM scheduled task execution status, if required.

Procedure 79-9 To reset a scheduled task

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria to list tasks that the administrative state is enabled, and click on the Search button. A list of scheduled tasks is displayed.

4 Select a scheduled task in the list.

5 Click on the Task Action button and choose Shut Down from the menu that appears. The Turn Up button is enabled.

6 Click on the Task Action button and choose Turn Up from the menu that appears. The Shut Down button is enabled.

7 Close the Scheduled Task form.

Procedure 79-10 To delete a scheduled task

Note — You can delete a SAM scheduled task only when you are logged in as the user that is assigned to the SAM scheduled task. To assign a different user account to the SAM scheduled task, perform Procedure 79-5.

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria. A list of scheduled tasks is displayed.

4 Select a scheduled task in the list.

5 Click on the Task Action button and choose Shut Down from the menu that appears. The Delete button is enabled.

6 Click on the Delete button. A dialog box appears.

7 Click on the Yes button. The 5620 SAM deletes the scheduled task.

8 Close the Scheduled Task form.

Procedure 79-11 To delete a schedule

Note 1 — You cannot remove a schedule that is associated with a scheduled task; you must first delete the scheduled task.

Note 2 — You can delete a SAM scheduled task only when you are logged in as the user that is assigned to the SAM scheduled task. To assign a different user account to the SAM scheduled task, perform Procedure 79-5.

1 Perform Procedure 79-10 to delete the scheduled tasks associated with the schedule.

2 Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

3 Choose SAM Scheduled from the object drop-down list.

4 Configure the filter criteria. A list of schedules is displayed.

5 Select a schedule in the list and click on the Delete button. A dialog box appears.

6 Click on the Yes button. The 5620 SAM deletes the schedule.

7 Close the Schedule form.

80 — Ethernet CFM

80.1 Ethernet CFM overview

The 5620 SAM Ethernet Connectivity Fault Management, or Ethernet CFM, function is implemented based on the IEEE 802.1ag OAM standard. This standard describes protocols for detecting, isolating, and reporting connectivity faults in an Ethernet network. You can use Ethernet CFM for the following:

- path discovery
- fault detection
- fault isolation
- fault notification

The IEEE 802.1ag OAM standard partitions a network into eight hierarchical levels called maintenance domains, or MDs. An MD is a network, or part of a network, that is provisioned with a set of maintenance entity groups, or MEGs, which are groups of service sites.

Typically, a MEG represents one service and consists of a group of maintenance end points, or MEPs. Only one MEG can be associated with a service, but one service can be associated with multiple MEGs. MDs and MEGs are distributed to NEs using the 5620 SAM policy distribution framework.

Within a MEG, MEPs can be divided into logical groupings called MEG sub-groups. MEG sub-groups allow you to group managed MEPs and unmanaged remote MEPs so that Ethernet CFM can be directed to a specific area of a system, a MEG sub-group, rather than the entire system.

Ethernet CFM diagnostic tests detect connectivity failures between pairs of local and remote maintenance end points, or MEPs, in a MEG. Each MEP is a reference point that can initiate or terminate one of the following diagnostic tests:

- CFM continuity check
- CFM loopback
- CFM link trace
- CFM Eth test
- CFM two-way delay
- CFM one-way delay
- CFM single-ended loss (7705 SAR only)
- CFM two-way SLM

A CFM continuity check test is automatically generated when you create an MD. When you execute the test and a connectivity fault is present, the MEP that detects the fault raises an alarm. See Chapter 38 for information about a specific Ethernet CFM diagnostic test.

MEPs

MEPs are configured at the edge of an MD and perform the following functions:

- periodically send CFM continuity check messages
- validate CFM PDU replies
- discard CFM PDU messages that are not in the MEP configuration
- initiate and respond to CFM tests messages

MEPs can be added to services automatically or manually. The differentiator between these two options is the action results in associating a service with the MEG on all nodes versus associating a service with the MEG on a single node. See Procedure 80-1 for more information.

You can also add MEPs to services during Ethernet CFM test configuration from the Service Topology map. See “Working with Ethernet CFM objects” for more information.

Each MEP is assigned an up or down direction. An up MEP is provisioned on an ingress port, and monitors the forwarding path inside a bridge NE to the egress port. A down MEP is provisioned on an egress port, and monitors the forwarding path between bridge NEs. An up MEPs can be also provisioned on Virtual MEPs for B-VPLS, while a down MEP can be provisioned on facility MEPs

You can configure an initial MEP ID for automatic MEP ID assignment on an NE. See Procedure 80-2 for more information.

An up MEP can be associated with the following object types:

- Epipe and VPLS SAPs
- Epipe spoke SDP bindings
- VPLS mesh and spoke SDP bindings
- VPLS and MVPLS B-sites, as virtual MEPs
- B-L2 access interfaces
- OmniSwitch VLAN SAPs

A down MEP can be associated with the following object types:

- Epipe, Ipipe, IES, VPLS, and VPRN SAPs
- Epipe and IES spoke SDP bindings
- VPLS mesh and spoke SDP bindings
- B-L2 access interfaces
- MVPLS access interfaces
- OmniSwitch VLAN SAPs
- Network interfaces
- Ports
- LAGs

Virtual MEPs

A virtual MEP is an up MEP that is created on a B-VPLS or B-MVPLS site when a CFM continuity check test is run. Each virtual MEP transmits a CFM continuity check stream on all SAPs and SDPs of the site. A virtual MEP uses the site B-MAC address, if configured; otherwise, it uses the shelf MAC address. See chapter 71 for information about assigning virtual MEPs in B-VPLS and B-MVPLS.

The following rules apply to virtual MEP management:

- One virtual MEP can be configured on a VPLS or MVPLS B-site.
- All regular MEPs on SAPs and SDP bindings in the same MEG as a virtual MEP must be configured as up MEPs.

- Regular MEPs in the same MEG and on the same B-site as a virtual MEP cannot be enabled when the virtual MEP is enabled.
- Virtual MEPs can be created in a MEG only when MIP creation in the MEG is disabled.

Facility MEP

A facility MEP is a down MEP that is created on a network interface, port, or LAG. A facility MEP detects failure conditions for an Ethernet transport network using ETH-CCM or AIS and, where appropriate, propagates alarm conditions so that the services that share this common transport are aware of the failure.

A virtual facility Tunnel MEP is created by configuring a LAG MEP with a VLAN ID. In this instance the VLAN ID must match the outer encapsulation value of the SAP that is associated with the Tunnel MEP.

The following rules apply to facility MEP management:

- Only one facility MEP can be configured on a port, a LAG, or a network interface.
- A facility MEP can be configured on a port only if the MD level is 0.
- A facility MEP must be configured in the down direction.
- CCM is not supported if the MEP is configured on a network interface.
- Facility port MEPs are supported on ports in access or hybrid mode with Q in Q or dot1q encapsulation.
- Facility tunnel MEPs are supported on LAG ports configured with Q in Q encapsulation in access or hybrid mode.
- To configure MEPs on tunnels, the LAG VLAN ID must not be 0.
- Facility port MEPs cannot be configured on network elements that support Ethernet tunnels.
- The facility MEP ID must be unique within the same device.
- The facility tunnel MEP must have a lower MD level than any service MEPs that are created on the same LAG.

MIPs

Maintenance intermediate points, or MIPs, are internal points in an MD that perform the following functions:

- validate received CFM PDUs
- validate and respond to link trace messages
- validate and respond to loopback messages

A MIP consists of two half-function objects that allow the MIP to be recognized as a MIP in one MD level and as a MEP on a higher level.

Ethernet-CFM redundancy

When you configure Ethernet-CFM redundancy, you can link MEPs to the state of the resiliency mechanism that is supported in MC-LAGs. The state of the MEP does not affect the state of resiliency mechanism.

Ethernet-CFM redundancy is configured at the node level. When you configure Ethernet-CFM redundancy, the state of a MEP is the same as the state of the SAP, LAG, or MC-LAG with which it is associated. For example, if the redundant MC-LAG is in standby state, the MEP is also in standby state. When a MEP is in standby state, the MEP is idle, CCMs are not exchanged, and the MEP does not respond to CFM tests.

Note — The MEP, SAP, and LAG must reside within an MC-LAG that has Ethernet-CFM redundancy configured. See Procedure 43-1 to configure MC-LAGs.

When Ethernet-CFM redundancy is configured and the active state of an MC-LAG changes, the MC-LAG Inactive state on the MEP changes and any defects on the MEP are flagged.

The state of MEPs, SAPs, and LAGs that are configured for Ethernet-CFM redundancy appears in the MC-LAG Inactive field. The status of MC-LAGs that are configured for Ethernet-CFM redundancy appears in the Is Active field.

In addition to configuring Ethernet-CFM redundancy at the node level, you can configure Ethernet-CFM redundancy on tunnel MEPs. See Procedure 17-2 to configure Ethernet-CFM redundancy at the node level. See Procedure 18-14 to configure Ethernet-CFM redundancy on a tunnel MEP.

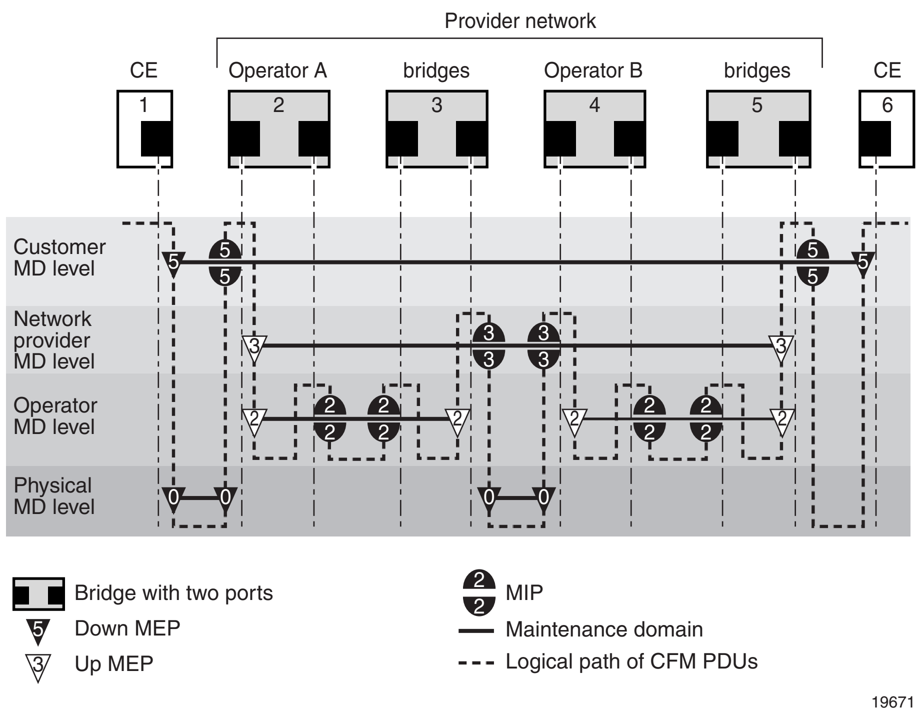
Sample Ethernet CFM implementation

Figure 80-1 shows an example of MDs, MEPs, and MIPs in a IEEE 802.1ag network that consists of two operator areas, for example, services in the provider network, that are joined to create a network path for customer traffic. The number on an object identifies the associated MD, which is one of the following:

- MD 5—end-to-end customer path
- MD 3—end-to-end network provider path
- MD 2—paths within services
- MD 0—physical path

MD 5 provides access to a down MEP on each CE device, and to a MIP on each PE bridge. MD 3 provides access to an up MEP on each PE bridge, and to a MIP on each bridge between groups of operator bridges. MD 2 provides access to the up MEPs and MIPs in each service. MD 0 provides access to MEPs for checking the physical connectivity between NEs.

Figure 80-1 Ethernet CFM objects in example network



Ethernet CFM implementation for composite services

End-to-end test suite generation for composite services is available for VPLS and VLL Epipe services. In this context, a composite service is a set of services connected by one or more of the following:

- Vlan uplinks
- Spoke bindings
- CCAG connectors

Creating test suites and test policies for composite services is very similar to creating these for a regular service. The Accounting Files and Continuously Executed options are also available when creating a test policy for a composite service.

Once tests have been ordered to generate, a MEG is created on each eligible endpoint SAP. Tests are then generated for this MEG that target all other eligible endpoint SAPs within the composite service. Results for individual tests can then be reviewed.

Note — If there is a previously-created MEG on one of the service sites (for example, perhaps one created for a service before it was included as a part of a composite service) and the Generate Tests button is selected, no tests will actually be generated. When a MEG with only a subset of the composite service already exists on one of the service SAPs, the generation of tests is blocked. That MEG must be first be deleted and the CFM tests can then be regenerated.

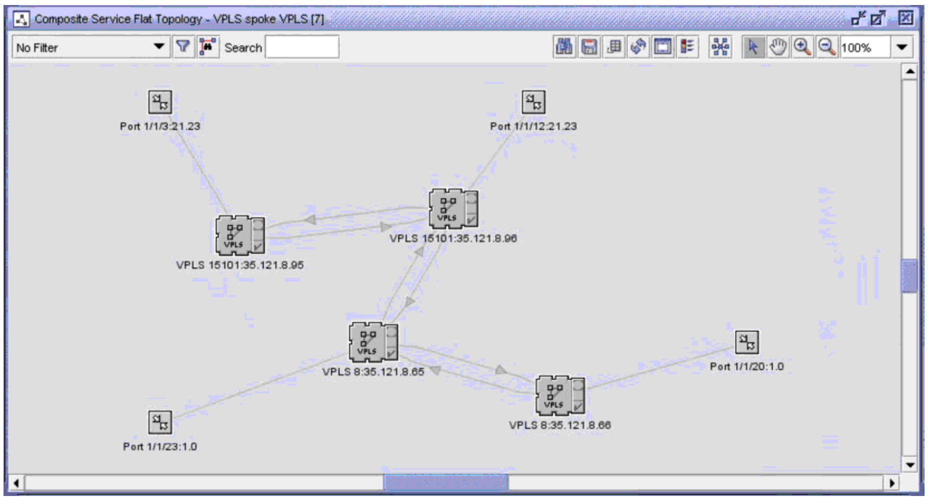
An overview and examples are provided to illustrate the steps and demonstrate the test generation rules and results for various configurations.

Examples of Ethernet CFM tests for composite services

The following examples illustrate how the Ethernet CFM test generation rules involving composite services are structured to operate.

The first is a simple configuration of two VPLSs (VPLS 8 and VPLS 15101) connected by a pair of spoke bindings between sites 35.121.8.96 and 35.121.8.65. It is shown in the flat topology view of Figure 80-2.

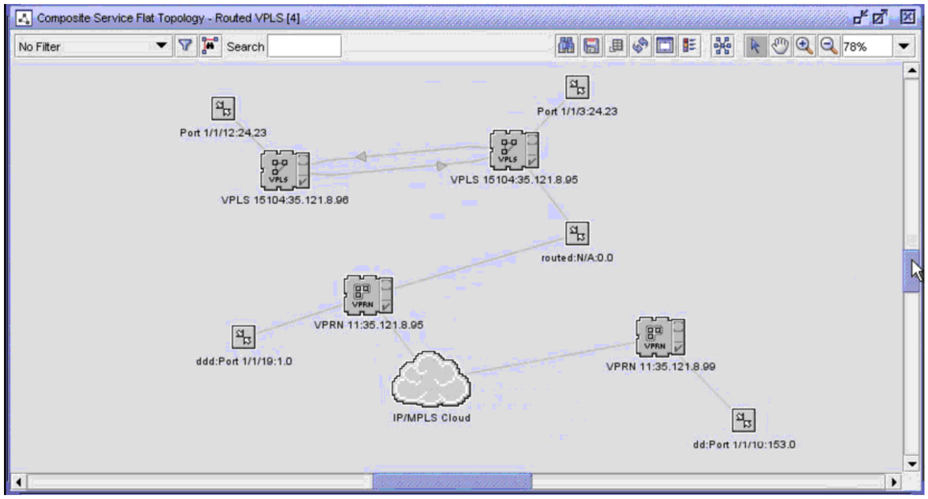
Figure 80-2 Composite service connected by spoke bindings



In this configuration, all four SAPs are considered as endpoints. Therefore MEPs are generated on each SAP and they all target each other. A total of twelve tests are generated. Double-clicking on an endpoint opens the interface configuration form and the MEP generated for this particular endpoint is displayed under the MEPs tab. If you then query the MEP's properties, the Tests tab in the MEP's configuration form displays the three tests that target the other MEPs in this composite service.

The second example is a routed VPLS configuration comprising a VPLS (VPLS 15104) and a VPRN (VPRN 11), and appears in Figure 80-3. The services are connected by a routed VPLS interface (shown as routed:N/A:0.0).

Figure 80-3 Routed VPLS composite service



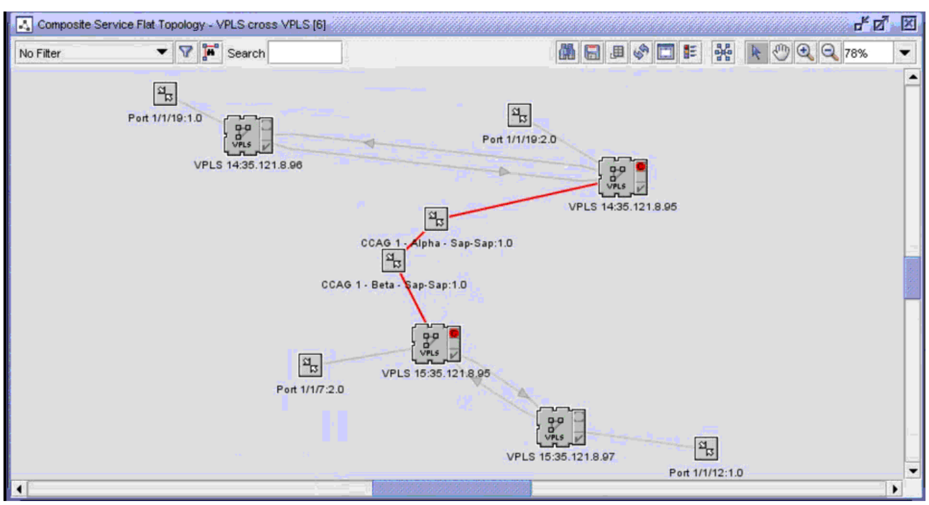
In this configuration, site 35.121.8.95 exists on both the VPLS and VPRN service. This is an overlapping site. The test generation rules would normally skip an overlapping site and no MEGs or tests would be generated for that site.

However in this case, the overlap for this site occurs in an unsupported service. The test generation rules for such a configuration will skip the unsupported VPRN service entirely and only generate tests for the supported VPLS, including site 35.121.8.95. Therefore, two MEPs and two tests (targeting each other) will be generated here, one for each of the SAPs on sites 35.121.8.96 and 35.121.8.95.

The test generation logs available in the test suite configuration form (under the Generation Logs tab) provide an explanation whenever the test generation rules cause items to be excluded from the tests. In this case, the log would state: “The CFM Composite Services Test Suite skipped the unsupported service”.

The third example is a cross-connected VPLS composite service configuration, and is shown in Figure 80-4.

Figure 80-4 Cross-connected VPLS composite service



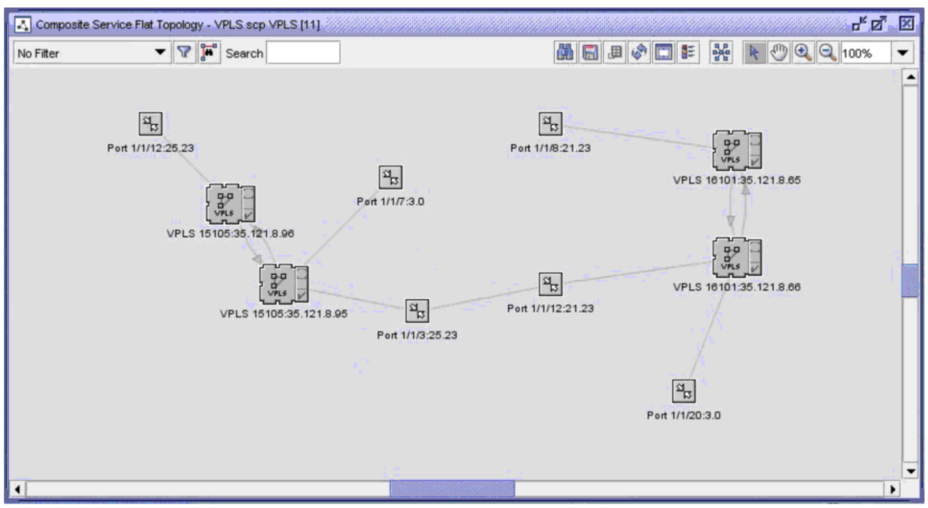
In this configuration, the two VPLSs (VPLS 14 and VPLS 15) are cross-connected by the SAPs CCAG 1-Alpha and CCAG 1-Beta. Both these SAPs originate from site 35.121.8.95, which exists in both services. It is therefore an overlapping site. The test generation rules skip overlapping sites, so no MEGs or tests are generated for any SAPs associated with that site.

Therefore, two MEPs and two tests (targeting each other) will be generated here, one for each of the SAPs on sites 35.121.8.96 and 35.121.8.97.

In addition, there will be two test generation logs available in the Generation Logs tab of the test suite configuration form. In this case, the logs would be identical, one stemming from each of the supported VPLSs. The logs would state: “Skipped overlapping service site”.

The fourth example is an SCP-connected VPLS composite service configuration, and is shown in Figure 80-5.

Figure 80-5 SCP-connected VPLS composite service



In this configuration, the two VPLSs (VPLS 15105 and VPLS 16101) are joined by an SCP connector between sites 35.121.8.95 and 35.121.8.66. The test generation rules skip any SAPs identified as part of a connector, since they are not endpoints. So no MEGs or tests are generated for either connector SAP.

MEGs and tests will however, be generated for each of the other four SAPs shown in the example. In total, four MEGs and twelve tests will be generated.

In addition, there will be two test generation logs available in the Generation Logs tab of the test suite configuration form. In this case again, the logs would be identical, one stemming from each of the supported VPLSs. The logs would state: “Skipped service connecting SAPs”.

80.2 Workflow to configure Ethernet CFM

This workflow describes the procedures to create and run an Ethernet CFM test.

Ethernet CFM tests are configured through the 5620 SAM Service Test Manager. See chapter 78 for more information.

1 Configure the initial MEP ID value on an NE for automatic MEP creation. See Procedure 80-2 for more information.

2 Create an Ethernet CFM MD and subordinate objects associated with the MD such as a Global MEG, MEG, and MEP for each level at which Ethernet connectivity is to be monitored. See Procedure 80-1 for more information.

- **i** Create one or more global MEGs in each MD. Each MEG must be associated with one service or Ethernet path. Creating a Global MEG generates a CFM continuity check test.
- **ii** Associate a service with the Global MEG.
- **iii** As required, add an Ethernet path to the Global MEG.
- **iv** As required, add a managed MEP to the MEG.
- **v** As required, add a remote MEP to the MEG.
- **vi** As required, add an unmanaged remote MEP to the Global MEG.
- **vii** As required, add a MEG sub-group to a Global MEG.

3 As required, change the MEG sub-group association for managed MEPs or unmanaged remote MEPs. See Procedure 80-3 for more information.

4 As required, configure a default NE-level MD on an OmniSwitch. See Procedure 80-4 for more information.

5 Create a test policy, specifying at least one of the following Ethernet CFM test definitions:

- CFM Loopback
- CFM Link Trace
- CFM Two Way Delay Test
- CFM Two Way SLM

See Procedure 78-4 for more information.

6 Create a test suite. See Procedure 78-8 for more information.

7 As required, execute the generated Ethernet CFM test suite. See Procedures 78-10 and 78-12 for more information.

8 As required, view the test results. See Procedures 78-13, 78-14, and 78-15 for more information.

80.3 Ethernet CFM procedures

The following procedures describe how to configure and manage Ethernet CFM.

Procedure 80-1 To configure an Ethernet CFM MD, and subordinate objects associated with the MD.

Perform this procedure to configure an Ethernet CFM MD, and subordinate objects associated with the MD such as a Global MEG, MEG, and MEP.

Note — This procedure assumes you have previously created a service to associate with the MD or subordinate objects.

1 Choose Tools→Ethernet CFM→Maintenance Domain from the 5620 SAM main menu. The Maintenance Domain Policies form opens.

2 Perform one of the following.

a To edit an existing MD, perform the following steps.

i Use the configurable filter to search for an MD and click on the Search button. A list of MD's appears.

ii Click on an MD and click on the Properties button. The Maintenance Domain Global Policy [Edit] form opens.

b To create a new MD, perform the following steps.

i Click on the Create button. The Maintenance Domain, Global Policy (Create) form opens.

ii Configure the parameters:

- MD Mgr Object ID
- Maintenance Domain ID
- Auto-Assign ID
- Name Type
- Name
- Level

If the MD is to be used for Y.1731 performance measurement tests, you must set the Name Type parameter to none.

iii Click on the Apply button. The form displays additional tabs, and the form name changes to Maintenance Domain Global Policy (Edit).

iv Click on the Switch Mode button. A dialog box appears to confirm that you want to continue.

v Click on the Yes button. The Configuration Mode changes to Released and the Maintenance Domain Global Policy [Edit] form reappears.

3 Configure the Description parameter and click on the OK button. A dialog box appears to confirm that you want to continue.

4 Click on the Yes button. The Maintenance Domain Global form reappears that lists the MD you created or edited.

5 To add a Global MEG to the MD, perform the following steps otherwise, go to step 18.

i Click on the MD you created or edited in step 2 and click on the Properties button. The Maintenance Domain Global Policy [Edit] form opens.

ii Click on the Global Maintenance Entity Group tab button.

iii Click on the Create button. The Global Maintenance Entity Group (Create) form opens with the General tab displayed.

iv Configure the following parameters:

- Auto-Assign ID
- Name
- Description
- Administrative State
- Name Format
- Name
- Initial CCM Interval
- Initial MHF-Creation
- Initial CFM Hold Down Timer (centiseconds)

Note 1 — When the Initial CCM Interval parameter is set to 10 ms or 100 ms, you cannot configure automatic MEP creation in step 7.

Note 2 — The Initial CFM Hold Down Timer (centiseconds) parameter can only be configured when the Initial CCM Interval is 10 ms or 100 ms.

v Click on the OK button. The Global MEG is listed on the Maintenance Domain Global Policy [Edit] form and a default MEG sub-group is added to the Global MEG

6 To add a MEG sub-group to a Global MEG, perform one of the following, otherwise go to step 7.

a To add a new MEG sub-group to a Global MEG manually, perform the following steps:

i Click on the Global MEG you created or edited in step 5 and click on the Properties button. The Global Maintenance Entity Group [Edit] form opens with the General tab displayed.

ii Click on the MEG Sub-Group tab button.

iii Click on the Create button. The MEG Sub-Group (Create) form opens with the General tab displayed.

iv Configure the following parameters:

- MEG Sub-Group ID
- Auto-Assign ID
- Name
- Ignore test generation and CCM test

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The MEG sub-group is listed on the Global Maintenance Entity Group (Edit) form.

b To automatically create a new MEG sub-group based on existing remote MEP lists perform the following steps:

Note — MEG sub-groups can be created using this method only if a valid remote MEP list exists where remote MEPs are listening to each other.

i Click on the Global MEG you created or edited in step 5 and click on the Properties button. The Global Maintenance Entity Group [Edit] form opens with the General tab displayed.

ii Click on the More Actions button and choose Discover MEG Sub Groups. If a valid remote MEP lists exists where remote MEPs are listening to each other, new MEG sub-groups are created and listed on the Global Maintenance Entity Group (Edit) form, otherwise no action will be taken by 5620 SAM.

7 To associate a service with the Global MEG, perform one of the following.

Note — The differentiator between these two options is the action results in associating a service with the MEG on all nodes versus associating a service with the MEG on a single node.

a To automatically associate a service with the Global MEG on all nodes, perform the following steps:

i Click on the MD you created or edited in step 2 and click on the Properties button. The Maintenance Domain Global Policy [Edit] form opens.

ii Click on the Global Maintenance Entity Group tab button.

iii Click on the Create button. The Global Maintenance Entity Group (Create) form opens with the General tab displayed.

iv Click on the Service tab button.

v Click on the Create button. The Service (Create) form opens.

vi Click on the Select button. The Select Service form opens.

vii Click on the Search button. A list of services is displayed.

viii Select a service in the list and click on the OK button. The Select Service form closes, and the service information is displayed on the Service (Create) form.

ix As required, configure the following parameters:

- Auto MEG Site Creation
- MEP(s) Creation on Access Interfaces
- Direction
- MEP(s) Creation on SDP Bindings
- Direction
- Virtual MEP(s) Creation on B-Sites
- MIP(s) Creation on Access Interfaces
- MIP(s) Creation on SDP Bindings

Note — When the Initial CCM Interval parameter is set to 10 ms or 100 ms, you cannot configure the MEP(s) Creation on Access Interfaces, MEP(s) Creation on SDP Bindings, or Virtual MEP(s) Creation on B-Sites parameters.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The service is listed on the Global Maintenance Entity Group (Create) form.

b To associate a service with the Global MEG on a single node, perform the following steps.

i Click on the MD you created or edited in step 2 and click on the Properties button. The Maintenance Domain Global Policy [Edit] form opens.

ii Click on the Global Maintenance Entity Group tab button. A list of MDs appears.

iii Select an MD and click on the Properties button. The Global Maintenance Entity Group [Edit] form appears.

iv Click on the Maintenance Entity Group tab button.

v Click on the Create button. The Maintenance Entity Group (Create) form opens.

vi Click on the Select button. The Select Site form opens.

vii Click on the Search button. A list of sites is displayed.

viii Select a site in the list and click on the OK button. The Select Site form closes, and the service information is displayed on the Maintenance Entity Group (Create) form.

ix Click on the Service tab button and click on the Create button. The MEG Service [Create] forms opens.

x Configure the following parameters:

- CCM interval
- VLAN ID
- MHF-Creation

xi Click on the OK button. A dialog box appears.

xii Click on the OK button. The service is listed on the Global Maintenance Entity Group (Create) form.

8 Perform the following steps to add an Ethernet path to the Global MEG, if required.

i Click on the Ethernet Path tab button.

ii Click on the Create button. The Ethernet Path (Create) form opens.

Note — You must specify an Ethernet tunnel path or Ethernet ring path on this form.

iii To add an Ethernet tunnel path, click on the Select button in the Ethernet Tunnel Path panel. The Select Ethernet Tunnel Path form opens. Otherwise, go to step 8 vi.

iv Select an Ethernet tunnel path in the list and click on the OK button. The Select Ethernet Tunnel Path form closes, and the Ethernet tunnel path is displayed on the Ethernet Path (Create) form.

v Go to step 8 viii.

vi Click on the Select button in the Ethernet Ring Path panel. The Select Ethernet Ring Path form opens.

vii Select an Ethernet ring path in the list and click on the OK button. The Select Ethernet Ring Path form closes, and the Ethernet ring path is displayed on the Ethernet Path (Create) form.

viii Configure the parameters:

- Auto-Assign ID
- Object ID
- Run Continuity Check Protocol
- Set Control MEP property on created MEPs

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Ethernet path is displayed on the Global Maintenance Entity Group (Create) form.

9 Perform the following steps to add a MEG to the MD.

i Click on the Maintenance Entity Group tab button.

ii Click on the Create button. The Maintenance Entity Group (Create) form opens with the General tab displayed.

iii Click on the Select button. The Select Site form opens.

iv Select an NE in the list and click on the OK button. The Select Site form closes, and the Maintenance Entity Group (Create) form displays the NE information.

v Configure the parameters:

- CCM interval
- VLAN ID
- MHF-Creation
- CFM Hold Down Timer (centiseconds)

> **Note —** The MHF-Creation and VLAN ID parameters are configurable only when the selected NE is an OmniSwitch.
>
> The CFM Hold Down Timer (centiseconds) parameter can only be configured when the CCM interval is 10 ms or 100 ms.

vi To associate a template with the MEG, click on the Templates tab button. Otherwise, go to step 9 ix.

vii Click on the Select button. The Select Associated Template - Maintenance Entity Group form opens.

viii Select a template in the list and click on the OK button. The Select Associated Template - Maintenance Entity Group form closes, and the Maintenance Entity Group (Create) form displays the template information.

ix Click on the Service tab button. A list of services is displayed.

x Click on the Create button. The MEG Service (Create) form opens.

xi Configure the parameters:

- Service ID
- MHF-Creation
- VLAN ID
- Id-Permission

xii Click on the OK button. The MEG Service (Create) form closes.

xiii Click on the Apply button. A dialog box appears.

xiv Click on the OK button. The form name changes to Maintenance Entity Group (Edit), and the service is listed on the form, which displays additional tab buttons.

10 Perform the following steps to add a managed MEP to the MEG, if required.

i Click on the Managed MEP tab button.

ii Click on the Create button. The MEP (Create) form opens.

iii Configure the parameters:

- ID
- Auto-Assign ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- Mac Address
- Fault Propagation
- Type
- Interface Type
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

Note — The Interface Type parameter is configurable when the Type parameter is set to Regular.

iv If the Type parameter is set to Virtual, go to step 9 ix.

v Click on the Select button in the bottom panel to choose an object of the type specified by the Interface Type parameter. The Select *object_type* form opens.

vi Click on the Search button. A list of objects is displayed.

vii Select an object in the list and click on the OK button. The Select *object_type* form closes, and the object information is displayed on the MEP (Create) form.

viii Go to step 9 ix.

ix Click on the Select button in the bottom panel to choose a site for the virtual MEP. The Select Service Site Pointer form opens.

x Click on the Search button. A list of sites is displayed.

xi Select a site in the list and click on the OK button. The Select Service Site Pointer form closes, and the site information is displayed on the MEP (Create) form.

xii If the MD has a Name Type of none and the Global MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable. Otherwise, go to step 9 xxiv.

xiii Click on the Y.1731 Tests tab button.

xiv Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

xv Click on the AIS tab button.

xvi Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

xvii Click on the OK button. A dialog box appears.

xviii Click on the OK button. The MEP (Create) form closes, and the managed MEP is listed on the Maintenance Entity Group (Edit) form.

11 Perform the following steps to add a remote MEP to the MEG, if required.

Note 1 — You can add only one entry to the remote MEP list for a 7705 SAR.

Note 2 — When you execute a CCM test or synchronize the managed and unmanaged remote MEP lists, the 5620 SAM automatically distributes the local MEP and the remote MEP to the remote MEP list, except for 7705 SAR NEs, which are excluded from automatic MEP -distribution.

Note 3 — When you execute a CCM test or synchronize the managed and unmanaged remote MEP lists within a MEG sub-group, the 5620 SAM automatically distributes the local MEP and the remote MEP within that MEG sub-group.

Note 4 — If a local MEP and the corresponding remote MEP are on the same OmniSwitch, deleting the remote MEP results also deletes the corresponding local MEP.

i Click on the Remote MEP tab button. The Remote MEP (Create) form opens.

ii Configure the MEP ID parameter.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The remote MEP is listed on the Maintenance Entity Group (Edit) form.

12 Click on the OK button. The Maintenance Entity Group (Edit) form closes, and the MEG is listed on the Global Maintenance Entity Group (Edit) form.

13 Perform the following steps to add an unmanaged remote MEP to the Global MEG, if required.

i Click on the Unmanaged Remote MEP tab button.

ii Click on the Create button. The Unmanaged Remote MEP (Create) form opens.

iii Configure the parameters:

- MEP ID
- MEP Mac Address

iv Click on the Select button in the bottom panel to associate the unmanaged remote MEP to a MEG sub-group. The Select MEG Sub-Group form opens.

v Click on the Search button. A list of MEG sub-groups is displayed.

vi Select a MEG sub-group in the list and click on the OK button. The Select MEG Sub-Group form closes, and the MEG sub-group information is displayed on the Unmanaged Remote MEP (Create) form.

Note — If a MEG sub-group is not selected, the unmanaged remote MEP is automatically associated with the default MEG sub-group.

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The unmanaged remote MEP is listed on the Global Maintenance Entity Group (Edit) form.

14 Perform the following steps to add a managed MEP to the Global MEG, if required.

i Click on the Managed MEP tab button.

ii Click on the Create button. The MEP (Create) form opens.

iii Click on the Select button. The Select Maintenance Entity Group form opens.

iv Select a MEG in the list and click on the OK button. The Select Maintenance Entity Group form closes, and the MEG information is displayed on the MEP (Create) form.

v Click on the Select button in the bottom panel to associate the managed MEP to a MEG sub-group. The Select MEG Sub-Group form opens.

vi Click on the Search button. A list of MEG sub-groups is displayed.

vii Select a MEG sub-group in the list and click on the OK button. The Select MEG Sub-Group form closes, and the MEG sub-group information is displayed on the MEP (Create) form.

Note — If a MEG sub-group is not selected, the managed MEP is automatically associated with the default MEG sub-group.

viii Configure the parameters:

- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- Mac Address
- Fault Propagation
- Type
- Interface Type
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

Note 1 — The Interface Type parameter is configurable when the Type parameter is set to Regular.

Note 2 — The Interface Type Port is only available if the MD level is 0.

Note 3 — For facility MEPs, the Direction parameter must be set to Down.

ix If the Type parameter is set to Virtual, go to step 14 xvi.

x If the Interface Type is set to LAG or Port, configure the Facility Fault Notify parameter.

xi If the Interface Type is set to LAG, configure the Facility VLAN ID.

Note — If you are configuring a tunnel facility MEP, Facility VLAN ID must match the outer encapsulation value of the SAP to which you are connecting the tunnel facility MEP.

xii Click on the Select button in the bottom panel to choose an object of the type specified by the Interface Type parameter. The Select *object_type* form opens.

xiii Click on the Search button. A list of objects is displayed.

xiv Select an object in the list and click on the OK button. The Select *object_type* form closes, and the object information is displayed on the MEP (Create) form.

xv Go to step 14 xix.

xvi Click on the Select button in the bottom panel to choose a site for the virtual MEP. The Select Service Site Pointer form opens.

xvii Click on the Search button. A list of sites is displayed.

xviii Select a site in the list and click on the OK button. The Select Service Site Pointer form closes, and the site information is displayed on the MEP (Create) form.

xix If the MD for the MEP has a Name Type of none and its Maintenance Association has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable. Otherwise, go to step 14 xxv.

xx Click on the Y.1731 TEST tab.

xxi Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

  The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

xxii Click on the AIS tab.

xxiii Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

  The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

xxiv Click on the OK button. A dialog box appears.

xxv Click on the OK button. The MEP is listed on the Global MEG (Create) form.

15 Click on the Synchronize Remote MEPs button to distribute the MEPs to the NEs.

Note — If the managed MEP or unmanaged remote MEP belongs to a MEG sub-group, the remote MEP synchronization will only occur within the MEG sub-group.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Global MEG (Create) form closes, and the Maintenance Domain (Edit) form reappears.

18 Close the Maintenance Domain (Edit) form.

19 Close the Manage Maintenance Domain Policies form.

Procedure 80-2 To configure automatic MEP ID assignment on an NE

Perform this procedure to configure an initial MEP ID value on an NE for automatic MEP creation.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure automatic MEP ID assignment and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab button.

4 Configure the MEP Id parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The NE properties form closes.

Procedure 80-3 To change the MEG sub-group association for managed MEPs or unmanaged remote MEPs

Perform this procedure to change the MEG sub-group association for managed MEPs or unmanaged remote MEPs.

1 Select Manage→Service→Services. The Manage Services form opens.

2 Click on the Search button. A list of services is displayed.

3 Select a service in the list and click on the Topology View button. The Service Topology map opens.

4 Select the OAM check box at the bottom left of the map window. MEG and MEP objects are added to the map.

5 Right-click the interface object that includes the MEP that you wish to move to another MEG sub-group and choose Ethernet CFM→Edit MEP from the contextual menu.The Select MEP (Edit) form opens.

6 In the MEG Sub-Group panel, click on the Clear button to remove the current MEG sub-group association.

7 Click on the Select button. The Select MEG Sub-Group form opens.

8 Click on the Search button. A list of MEG sub-groups is displayed.

9 Click on an MEG sub-group and click on the OK button. The Select MEG Sub-Group form closes and the MEG sub-group information is displayed in the MEG Sub-Group panel.

10 Select OK. The MEP (Edit) form closes, the MEP object color changes, and the MEP is moved to the newly selected MEG Sub-Group.

Procedure 80-4 To configure a default MD on an OmniSwitch

Perform the following procedure to configure a default NE-level MD on an OmniSwitch.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the device where you want to configure a default MD and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on the Globals tab button.

5 Click on the CFM tab button.

6 Configure the parameters:

- Level
- MHF-Creation
- Id-Permission

7 Close the Network Element (Edit) form.

81 — RCA audit

81.1 RCA audit overview

The 5620 SAM RCA audit tool allows you to perform on-demand or scheduled verifications of the configuration of services and physical links to identify possible configuration problems. Except for physical links, the 5620 SAM provides a solution, which, at your request, can automatically be implemented to make all the required configuration changes.

Note — The adjustments are made only to the 5620 SAM database and are not deployed to the network.

You can perform RCA audits of the following objects:

- VLL services
- VPLSs
- VPRN services
- physical links
- OSPF interfaces, areas, and area sites (5620 SAM/5650 CPAM integration only)
- IS-IS interfaces and sites (5620 SAM/5650 CPAM integration only)

Note — You need the 5650 CPAM license to perform the OSPF and IS-IS RCA audits. See the *5650 CPAM User Guide* for more information.

5620 SAM service audit

A 5620 SAM service is defined as a collection of service sites with the same customer ID, service type, and service ID. The 5620 SAM discovers services that are configured on a 7750 SR, 7450 ESS, 7710 SR, 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7210 SAS-X24F2XFP, and 7210 SAS-E using the service ID on the NE. Configuration errors may occur in networks where the services were created and deployed on the NEs using CLI before the NEs were managed by the 5620 SAM.

For example, when two VPLSs with the same service ID and the same mesh VC ID on an NE are discovered by the 5620 SAM, they are discovered as a single service in the 5620 SAM.

Another example of a configuration error is when a switching Epipe has multiple Epipe sites and multiple VC IDs for different segments. If different service IDs are used when the sites are created, the 5620 SAM assumes that the sites are connected and creates multiple VLL services within a composite service.

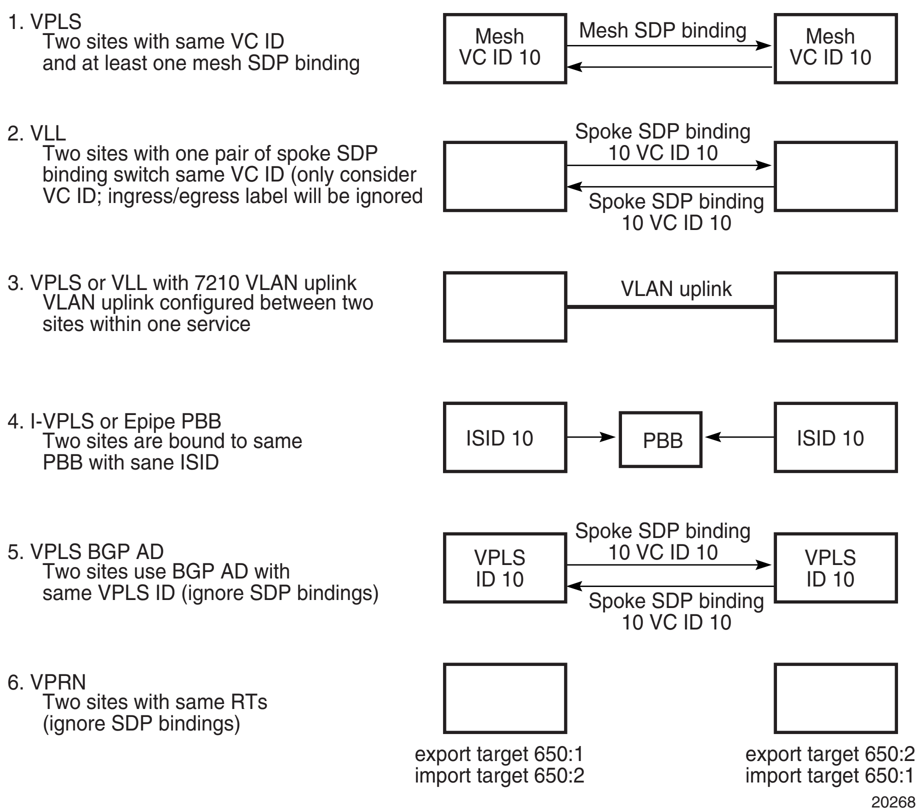
RCA audit policies allow you to modify the component membership of your 5620 SAM services to detect possible configuration problems. In addition, you can use the RCA audit to correct most configuration problems that are discovered in the audit.

Note — A 5620 SAM user that is assigned the Administrator or RCA scope of command role can create, modify, and execute all RCA audit policies. A 5620 SAM user that is assigned the Administrator or Service scope of command role can execute service audit adjustments.

Service membership rules

The 5620 SAM uses the rules in Figure 81-1 to identify whether two service sites are connected together. When two sites are identified as connected, they should belong to same service.

Figure 81-1 Rules to check whether two sites are connected



If service sites have different customer IDs, the 5620 SAM discovers the sites as belonging to different services. After the audit, the 5620 SAM generates a problem for each service. You can specify to which service the 5620 SAM should move the site and whether the empty service should be removed after the sites are moved.

For VPLS or VLL services, if the same service ID is used for two groups of sites that are not connected, the 5620 SAM detects a duplicate service ID. Two problems are generated for one of the group of sites, and the solution is to separate the services. If there are other groups of isolated sites, additional problems are generated for each group.

Consider the following when you perform an audit of a VPLS.

- Although different service IDs may be used, I-sites that are bound to same backbone VPLS and have the same ISID are considered to be in the same VPN.
- For VPLS sites that use BGP auto-discovery, the VPLS ID is used to determine service membership.
- H-VPLS is discovered as composite service in the 5620 SAM if different service IDs are used.

Consider the following when you perform an audit of a VLL service.

- Service sites with different customer IDs are discovered as two services, and can reconfigured as one service.
- More than two groups of sites that are connected can be detected and can be separated into different services.
- Redundant VLLs are not be affected by the audit and are considered correctly configured.
- If two Epipe sites are connected to the same PBB with same B-VPLS service ID, and the source and destination MAC addresses match, the 5620 SAM determines that the two sites are connected. If they are in different 5620 SAM services, a problem is generated during the audit.

Consider the following when you perform an audit of a VPRN service.

- VPRN service membership is based on the RTs defined in the VRFs.
- Sites that are in different services but have common import and export route targets. Import target of Site 1 is equal to the Export target of Site 2.

Physical link audits

Physical links represent the actual physical configuration of network connections between ports. You can view and manage physical links from the equipment window, physical topology map, and the Manage Equipment list form of the 5620 SAM, on each router using the CLI. Because several key parameters on each end of the physical link depend on each other, configuration errors are possible. The 5620 SAM RCA audit tool allows you to identify configuration errors in physical links. The 5620 SAM does not provide a solution for configuration problems that the RCA audit identifies for physical links. By default, the RCA audit detects the following configuration errors in physical links:

- **physical port parameters**
    - mismatched MTU values
    - mismatched speeds
- **Ethernet port parameters**
    - Auto-negotiate parameter misconfiguration
    - Duplex parameter misconfiguration

You can configure the RCA audit policy for the physical link to include additional physical link properties in the audit.

Viewing and analyzing RCA audit results

The RCA Audit Problem(s) indicator on the General tab of a network object properties form identifies whether configuration problems were detected in previous audits. The Last Audit Time indicator displays a timestamp of the last audit that was performed. The RCA Audit command is accessed from the More Actions button at the bottom of the service properties form.

After you associate an audit policy with the object, you can perform an RCA audit and view the results. If no problems are detected, the RCA Result tab does not appear.

The properties form of a problem displays the following information:

- problem severity
- probable cause
- description
- solution

The Caused By Objects tab lists the network objects that caused the problem. For service audits, the sites that should be moved out of a service, and the service they should move to, if there is only one destination service, are listed. If only one group of sites is listed, a new service is created and the sites are moved to the created service.

Table 81-1 describes the probable causes of problems.

Table 81-1 Probable causes

Probable cause	Description
Unknown	The probable cause could not be determined.
Underlying Resource Operational Down	The underlying resource of the object is operationally down.
Misconfiguration	There is a misconfiguration error.
Admin Down	The object is administratively down.
Underlying Resource Admin Down	The underlying resource of the object is administratively down.
Underlying Resource Missing	An underlying resource is missing.
Underlying Resource Problem	Problem with an underlying resource
Aggregated	Aggregated cause
Service Membership Misconfigured	The service membership is not configured correctly.

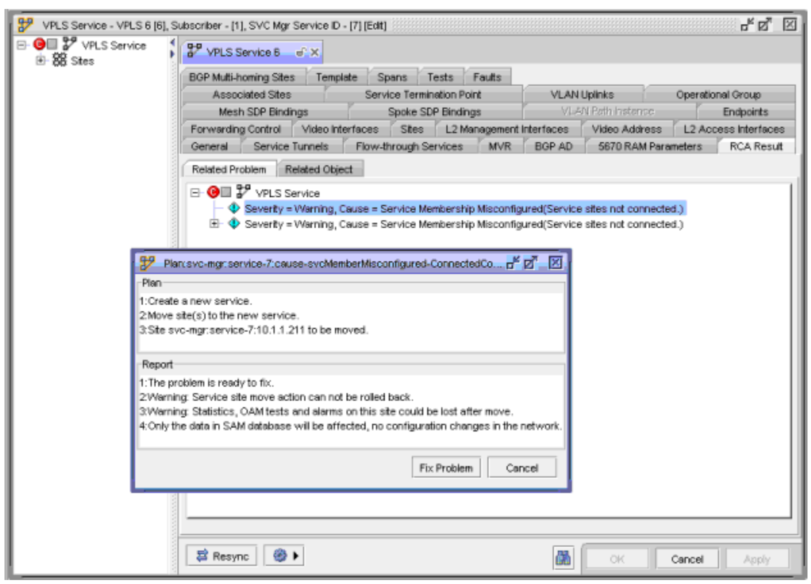
(1 of 2)

Probable cause	Description
Route Targets are misconfigured for VPLS BGP Multi-homing	One of the following misconfigurations exists: • No matching RT for peered multi-homing sites • There are multiple RTs configured for a VPLS site that has BGP multi-homing sites configured under it. Multiple RTs will make the BGP multi-homing sites appear under multiple topologies or multiple services. • Multi-homing sites have the same multi-homing ID but different RTs (different RTs mean the sites are in different topologies or services)
No valid Route Targets configured for VPLS BGP Multi-homing	No valid Route Targets currently exist for a VPLS site that has BGP multi-homing sites configured under it.
No members configured for this Multi-homing site	The BGP VPLS multi-homing site does not have other sites as members that share the same multi-homing ID in order to comprise a group.

(2 of 2)

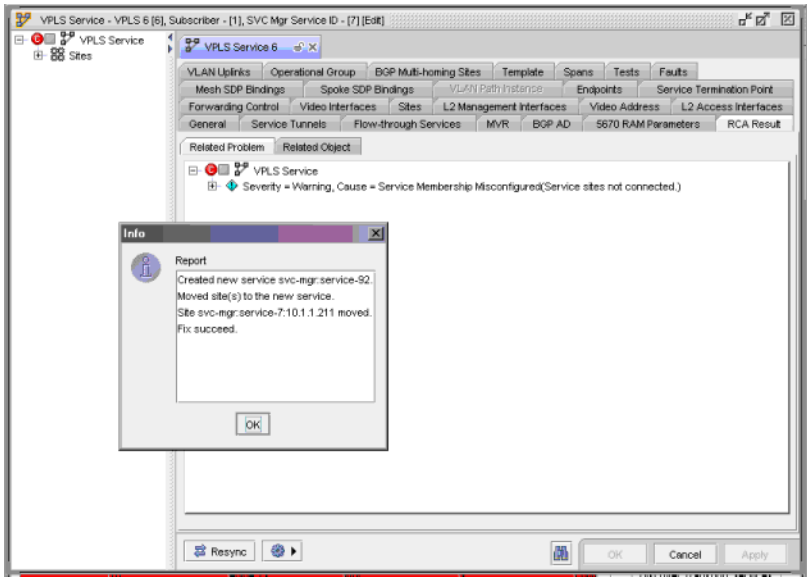
You can use the RCA audit tool to correct a detected configuration problem from the RCA Result tab on the network object properties form. The 5620 SAM lists the operations to fix the problem, as shown in Figure 81-2.

Figure 81-2 Correction plan for a problem



When you accept the proposed solution, a summary of the correction operation that the 5620 SAM implemented appears, as shown in Figure 81-3. To view the result in the server or client log, you must enable the logging option in the nms-server.xml or nms-client.xml file.

Figure 81-3 Correction report



81.2 Workflow to configure RCA audit

1. Create or configure an RCA audit policy. For service audits, configure one or more audit policies for each service type to detect different configuration problems. See Procedure 81-1 for more information.

2. Run the RCA audit policy for a specific service or object.

   a. Perform an RCA audit of a VLL service. See Procedure 81-2 for more information.

   b. P.erform an RCA audit of a VPLS. See Procedure 81-3 for more information.

   c. Perform an RCA audit of a VPRN service. See Procedure 81-4 for more information.

   d. Perform an RCA audit of multiple services. See Procedure 81-5 for more information.

   e. Perform an RCA audit of a physical link. See Procedure 81-6 for more information.

3. Alternatively, create a service audit to run at a scheduled time. See Procedure 81-7 for more information.

4. Identify the problems and view the suggested solutions. Solutions are not provided for physical links.

5. Implement the changes, as required.

81.3 RCA audit procedures

Use the following procedures to perform RCA audit tasks.

Procedure 81-1 To configure an RCA audit policy

1 Choose Policies→Network and Service Audits from the 5620 SAM main menu. The Network and Service Audits form opens.

2 Select Audit Policy (RCA) from the drop down list.

3 Perform one of the following.

   a To create an RCA audit policy, click on the Create button. The Audit Policy (Create) form opens with the General tab displayed.

   b To configure an existing RCA audit policy, click on the Search button and choose an entry from the list. Click on the Properties button. The Audit Policy (Edit) form opens with the General tab displayed. Go to step 5.

4 If you are creating an RCA audit policy, configure the following parameters. Otherwise, go to step 5.

- Auto-Assign ID
- ID

5 Configure the Description parameter.

6 If you are creating an RCA audit policy, click on the Select RCA Policy To Run The Audit button. Otherwise, go to step 11. The RCA Policy form opens.

7 Choose one of the following options:

- RCA Audit Physical Link
- RCA Audit ISIS
- RCA Audit OSPF
- RCA Audit VLL
- RCA Audit VPLS
- RCA Audit VPRN

Note — You require a 5650 CPAM license to create an RCA Audit ISIS or RCA Audit OSPF policy.

8 Double-click on an entry to modify the policy description, if required.

9 Click on the OK button. The RCA Policy form closes.

10 Click on the Apply button.

11 Click on the Entry tab button. Depending on the option specified in step 7, a list of RCA audit policy entries is displayed.

The RCA audit policy entry for a VLL RCA audit is: RCA Audit for VLL Service Membership.

The RCA audit policy entry for a VPRN RCA audit is: RCA Audit for VPRN Service Membership.

The following are the RCA audit policy entries for a VPLS RCA audit:

- RCA Audit for VPLS Service Membership
- RCA Audit for B-VPLS PBB
- RCA Audit for BGP Multi-homing

The following are the RCA audit policy entries for a physical link RCA audit:

- RCA Audit For Physical Ports of Physical Links
- RCA Audit For Ethernet Port Specifics of Physical Links

12 Choose an entry from the list and click on the Properties button. The Audit Policy Entry - RCA Audit Policy - RCA Audit For *Network_Object* (Edit) form opens with the General tab displayed.

13 Configure the parameters:

- Enabled
- Remove Empty Service

14 If you are configuring an RCA audit policy for physical links, perform the following steps. Otherwise, go to step 15.

i Click on the Attributes tab button. A list of default attributes for the physical link entry is displayed.

ii Perform one of the following:

- To configure default attributes, go to step iii.
- To add an attribute, go to step v.

iii Activate or deactivate the RCA audit for each attribute by enabling or disabling the check box in the Enabled column.

iv Choose one of the problem severity options for each attribute by clicking on the entry in the Severity column of the attribute. A contextual menu appears.

- Minor
- Conditional
- Info
- Critical
- Major
- Warning
- Indeterminate

v Click on the Add button to add an attribute. Otherwise, go to step 15. The Adding new Attribute(s) - RCA Audit For *entry_type* of Physical Links form opens with a list of attributes associated with the physical link entry.

vi Choose one or more attributes in the list and click on the OK button. The Adding new Attribute(s) - RCA Audit For *entry_type* of Physical Links form closes and the Audit Policy Entry - RCA Audit Policy - RCA Audit For *entry_type* of Physical Links (Edit) form refreshes with the attribute information.

15 Click on the OK button. The Audit Policy Entry - RCA Audit Policy - RCA Audit For *Network_Object* (Edit) form closes.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Audit Policy (Edit) form closes.

18 Close the RCA Audit Policy form.

Procedure 81-2 To perform an RCA audit of a VLL service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and choose VLL from the object drop-down list.

3 Click on the Search button. A list of VLL services appears.

4 Choose an entry from the list and click on the Properties button. The *VLL_type* (Edit) form opens with the General tab displayed.

5 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

6 Click on the More Actions button and choose RCA Audit. The Select RCA Policy list form appears with a list of configured policies.

7 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears.

8 Click on the OK button.

9 Click on the RCA Result tab button. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

10 If required, expand the VLL Service object in the problems tree to view the problems, the associated severity, and the cause.

11 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

12 Configure the Disable Fix Window parameter.

13 Click on the Related Problem tab button to view related problems.

14 Click on the Caused By Objects tab button to view a list of objects that are causing the problem.

15 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

16 Click on the tab buttons to view information about the configuration.

17 Configure the parameters, as required.

18 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

19 Click on the Yes button.

20 Close the Problem (Edit) form.

21 To fix a problem:

i Click on the Related Problem tab button.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 12.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

22 Close the *VLL_type* (Edit) form.

23 Close the Manage Services form.

Procedure 81-3 To perform an RCA audit of a VPLS

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Click on the Search button. A list of VPLS services appears.

> **Note —** In addition to the standard audit checks, for BGP VPLS multi-homing sites the audit also checks:
>
> - if no valid Route Targets are configured under a VPLS site that has BGP multi-homing sites configured under it.
> - if there are no matching RTs for peered multi-homing sites
> - if there are multiple RTs configured under a VPLS site that has BGP multi-homing sites configured under it. Multiple RTs will make the BGP multi-homing sites appear under multiple topologies (or multiple services, since the RT defines the service)
> - if multi-homing sites have the same multi-homing ID but different RTs (different RTs mean the sites are in different topologies or services)
> - if a multi-homing site does not have other sites as members (sharing the same multi-homing ID to comprise a group)

3 Choose an entry from the list and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

5 Click on the More Actions button and choose RCA Audit. The Select RCA Policy to run the audit list form appears with a list of configured policies.

6 Choose an entry and click on the OK button. The Select RCA Policy list form closes and the requested audit is performed. A dialog box appears.

7 Click on the OK button.

8 Click on the RCA Result tab button. The RCA audit information is displayed on the Related Problem tab.

> **Note —** The RCA Result tab appears only if the RCA audit detects one or more problems.

9 If required, expand the VPLS Service object in the problems tree to view the problems, the associated severity, and the cause.

10 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

11 Configure the Disable Fix Window parameter.

12 Click on the Related Problem tab button to view related problems.

13 Click on the Caused By Objects tab button to view a list of objects that are causing the problem.

14 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

15 Click on the tab buttons to view information about the configuration.

16 Configure the parameters, as required.

17 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

18 Click on the Yes button.

19 Close the Problem (Edit) form.

20 To fix a problem:

i Click on the Related Problem tab button.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 11.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

21 Close the VPLS Service (Edit) form.

22 Close the Manage Services form.

Procedure 81-4 To perform an RCA audit of a VPRN service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and choose VPRN from the object drop-down list.

3 Click on the Search button. A list of VPRN services appears.

4 Choose an entry from the list and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

5 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

6 Click on the More Actions button and choose RCA Audit. The Select RCA Policy list form appears with a list of configured policies.

7 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears.

8 Click on the OK button.

9 Click on the RCA Result tab button. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

10 If required, expand the VPRN Service object in the problems tree to view the problems, the associated severity, and the cause.

11 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

12 Configure the Disable Fix Window parameter.

13 Click on the Related Problem tab button to view related problems.

14 Click on the Caused By Objects tab button to view a list of objects that are causing the problem.

15 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

16 Click on the tab buttons to view information about the configuration.

17 Configure the parameters, as required.

18 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

19 Click on the Yes button.

20 Close the Problem (Edit) form.

21 To fix a problem:

i Click on the Related Problem tab button.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

> **Note —** The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 12.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

22 Close the VPRN Service (Edit) form.

23 Close the Manage Services form.

Procedure 81-5 To perform an RCA audit of multiple services

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and choose one of the following from the object drop-down list.

- AbstractVpls (VPLS)
- VPRN Service (VPRN)
- Vll (VLL)

3 Click on the Search button. A list of services appears.

4 Select the services that you want to audit.

5 Click on the RCA Audit button. The Select RCA Policy list form opens.

6 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears with the following information:

- number of services audited
- number of successful audits
- number of problems generated

7 Click on the OK button.

8 Scroll to the RCA Audit Problem column and set the filter to = true.

9 Click on the Search button. A list of services with problems appears.

10 Select a service and click on the OK button. The *Service* (Edit) form appears with the General tab displayed.

11 Click on the RCA Result tab button. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

12 If required, expand the *Service* object in the problems tree to view the problems, the associated severity, and the cause.

13 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

14 Configure the Disable Fix Window parameter.

15 Click on the Related Problem tab button to view related problems.

16 Click on the Caused By Objects tab button to view a list of objects that are causing the problem.

17 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

18 Click on the tab buttons to view information about the configuration.

19 Configure the parameters, as required.

20 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

21 Click on the Yes button.

22 Close the Problem (Edit) form.

23 To fix a problem:

i Click on the Related Problem tab button.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 14.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

24 Close the *Service* (Edit) form.

25 Close the Manage Services form.

Procedure 81-6 To perform an RCA audit of a physical link

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Click on the Select Object Type button and choose one of the following from the object tree.

- Physical Link (Network)
- Discovered Physical Link (Network)

3 Click on the Search button. A list of physical links appears.

4 Choose an entry from the list and click on the Properties button. The Physical Link (Edit) form opens with the General tab displayed.

5 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

6 Click on the More Actions button and choose RCA Audit. The Select RCA Policy list form appears with a list of configured policies.

7 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears.

8 Click on the OK button.

9 Click on the RCA Result tab button. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

10 If required, expand the Physical Link object in the problems tree to view the problems, the associated severity, and the cause.

11 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

12 Click on the Related Problem tab button to view related problems.

Note — The 5620 SAM does not provide a solution for physical link configuration errors.

13 Click on the Caused By Objects tab button to view a list of objects that are causing the problem.

14 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

15 Click on the tab buttons to view information about the configuration.

16 Configure the parameters, as required.

17 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

18 Click on the Yes button.

19 Close the Problem (Edit) form.

20 Close the Physical Link (Edit) form.

21 Close the Manage Equipment form.

Procedure 81-7 To create a service audit scheduled task

1 Choose Policies→Network and Service Audits from the 5620 SAM main menu.

2 The RCA Audit Policy form opens.

3 Specify a filter for the search, if required, and click on the Search button. A list of RCA audit policies appears.

4 Choose a service audit policy from the list and click on the Properties button. The Audit Policy (Edit) form opens with the General tab displayed.

5 Click on the Schedule button and choose Create Service Audit Schedule Task. The Service Audit Scheduled Task (Create) form opens.

6 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

7 Click on the Select button in the Schedule panel. The Select Schedule - Service Audit Scheduled Task form opens.

8 Perform one of the following.

a Create a schedule to associate with the scheduled task.

b Associate an existing schedule to the scheduled task. Go to step 10.

9 Create a schedule.

i Configure the parameters:

- Name
- Description
- Current Client Start Time
- Current Client End Time
- Delay Time (seconds)
- Enable
- Ongoing
- Frequency

The Current Client End Time parameter is configurable when the Ongoing parameter is disabled and the Frequency parameter value is set to something other than Once.

When a SAM Schedule is not Ongoing and is assigned to a task, the 5620 SAM raises an alarm when the Current Client End Time expires.

ii Perform the step that corresponds to the Frequency parameter value specified in step i.

- When the parameter is set to Once, go to step iii.
- When the parameter is set to Per Second, configure the following parameters:
  - Run Every Second
  - Run Every Seconds
- When the parameter is set to Per Minute, configure the following parameters:
  - Run Every Minute
  - Run Every Minutes
- When the parameter is set to Per Hour, configure the following parameters:
  - Run Every Hour
  - Run Every Hours
- When the parameter is set to Per Day, configure the following parameters:
  - Run Every Day
  - Run Every Days
  - Run Every
- When the parameter is set to Per Week, configure the following parameters:

  Note — The Run Every parameter is not configurable when the Ongoing parameter is enabled.

  - Run Every Week
  - Run Every Weeks
  - Run Every
- When the parameter is set to Per Month, configure the following parameters:

  Note — The Run Every parameter is not configurable when the Ongoing parameter is enabled.

  - Run Every Month
  - Run Every Months
  - Run Every

iii Click on the OK button to save the changes. The SAM Schedule (Create) form closes and the Select Schedule - Service Audit Scheduled Task form reappears.

10 Choose an entry from the list and click on the OK button. The Select Schedule - Service Audit Scheduled Task form closes and the Service Audit Scheduled Task (Create) form reappears.

11 Ensure that the Administrative State parameter is set to Enabled.

12 Click on the OK button. The Service Audit Scheduled Task (Create) form closes. The RCA Audit Policy form reappears with additional tab buttons.

13 To apply a filter to the schedule, perform the following.

i Click on the Schedule Filter tab button.

ii Click on the Select button in the Audit Filter panel. The Select Audit Filter - Audit Policy form opens.

iii Click on the Search button. A list of filters appears.

Note — If no filters appear, click on the Audit Filter button to create a new filter. See chapter 3 for more information about how to create a filter.

iv Choose an entry and click on the OK button. The Select Audit Filter - Audit Policy form closes and the Audit Policy (Edit) form reappears with additional tab buttons.

14 Click on the Scheduled Objects to be Audited tab button to view the services that are included in the audit.

15 Click on the Scheduled Result tab button to view the results of the scheduled audit.

16 Click on the Problems tab button to view the problems associated with the audit.

17 Close the Audit Policy (Edit) form.

18 Close the RCA Audit Policy form.

Appendices

A. Scope of command roles and permissions

A.1 Predefined scope of command profiles and roles

This appendix describes the predefined 5620 SAM scope of command profiles and roles, and the permissions for each predefined role. Predefined scope of command profiles and roles cannot be deleted.

Predefined scope of command profiles

Table A-1 lists the predefined scope of command profiles, the assigned roles for each profile, and a description for each profile.

Table A-1 Predefined scope of command profiles

Profile name	Assigned roles	Description
admin	Administrator	Default administrative scope of command profile with access to all objects from the 5620 SAM GUI. This profile has no OSSI access.
SAMqa	Administrator OSS Management	Default OSSI administrative scope of command profile.

Predefined scope of command roles

Table A-2 lists the predefined scope of command roles for 5620 SAM user security and provides a description for each role.

Table A-2 Predefined scope of command roles

Role	Access provided
Base Read-only	Read-only to all objects except for the objects in the SAM Security and Mirror Service Management roles.
Administrator	GUI access, but no OSSI access, to all objects.
User Management	5620 SAM user and group management.
SAM Management and Operations	Database functions such as backup, restore, reinstantiation, and switchover. Alarm administration such as acknowledgement, clearing, and setting severity-change thresholds. General NE management functions such as discovery, deployment, mediation, polling, statistics management, and security management that includes modifying spans.
Network Element Equipment Management	Physical equipment configuration and management.
Service Management	Service, service component, and service template management functions, excluding mirror-service management.
Old Service Template Management	Management of service templates deprecated; see Template Script Management in this table.
Subscriber Management	Customer and residential subscriber management.

(1 of 3)

Role	Access provided
QoS/ACL Policy Management	General QoS and ACL policy management, Ethernet service and time of day suite policy management.
Policy Management (except QoS/ACL)	Management of policies other than those in the QoS/ACL Policy Management role.
Routing Management	Routing protocol, L2 forwarding, and bandwidth management.
Tunnel Management	Service tunnel and underlying transport management.
SAM Management and Operations	Database management (Backups, Reinstantiation, and Switchovers), Alarm acknowledgement, Alarm clearing, and Severity Change Thresholds, Router administration (Scheduling, Backup Policies, Upgrade Policies, Deployment Policies, and Management Ping Policies), NE Security, LPS, and Mediation Policies, SNMP Poller/Stats Polices, Event Notification Policies, MIB Policies, SNMP Performance Statistics, SAM Performance Statistics, Statistics Plotter, Usage and Activity Records, as well as Span configuration.
Network Element Software Management	NE software management functions.
Fault Management	Functions such as alarm management and remote network monitoring.
Service Test Management	STM functions such as creating, running and scheduling OAM tests.
Script Management	XML API and CLI script management, excluding execution.
Script Execution	XML API and CLI script execution.
Mirror Service Management	Creation and management of mirror services and mirror-service components using the GUI.
OSS Management	Use of the OSSI.
Telnet/SSH Management	Telnet or SSH access to NEs from the GUI.
CPAM Management	Route Analysis of ISIS Topology, OSPF Topology, MPLS Topology, IP Path monitoring, LSP Monitoring, Checkpoints, and Impact Analysis Scenarios for CPAM managment.
CPAM OSS PCA	Route Analysis of ISIS Topology, OSPF Topology, and MPLS Topology for CPAM routing.
CPAM Topology Simulator	Route Analysis of ISIS Topology, OSPF Topology, and MPLS Topology for CPAM Topology Simulator.
Root Cause Analysis (RCA) Object Verification	RCA functions.
Lawful Interception Management	LI configuration for mirror services, mediation policies, and NE security.
Template Script Management	Service and tunnel template script management.
Service Template Script Execution	Service template script execution.
Tunnel Template Script Execution	Tunnel template script execution.
Application Assurance (AA) Management	AA policy management.
Format and Range Policy Management	Format and range policy management, service-creation span rules.
Work Order Activation	The ability to perform CM work order activation.
Configuration Snapshot Export	The ability to perform export CM configuration snapshots.
Create and Delete Access	The ability to create and/or delete eNodeB objects via 5620 SAM-O.
Configuration Management which causes node reset	The ability to configure objects which causes a full or partial reset of the node.
EPC Operator	Read and write permission on all Evolved Packet Core classes.

(2 of 3)

Role	Access provided
eNodeB NEM Operator	The ability to launch the 9400 NEM (parameter configuration tool for the eNodeB) from the 5620 SAM client GUI.

(3 of 3)

A.2 Permissions

Table A-3 lists the permissions that can be assigned to a 5620 SAM scope of command role and provides a functional description for each permission.

Table A-3 Permissions

Package.Class.Method/Property	Description
aapolicy	Application Assurance - AA policies, configuration, protocol, group, filter, and profiles.
accessuplink	Access Uplink - Configuration of 7210 Access Uplink Specifics for physical ports and LAG interfaces.
accounting	Accounting Policy - Statistics Accounting Policies.
aclfilter	ACL Filter Policy - MAC, IP, and IPv6 ACL Filters.
activation	Activation - Used to define, manage, and deploy work orders used in activation.
activation.Session	Activation Session - Used to manage activation sessions and activate work orders.
activation.Snapshot	Snapshot - Used to manage CM configuration snapshots.
activation.SnapshotEntity	Snapshot Entity - Used to manage snapshot entities.
activation.WebDAVSharedData	Activation. Web DAVShared Data - Ability to restrict access to CM data (CM work orders and configuration snapshots) via the WebDAV protocol.
activation.WorkOrder	Work Order - Used to manage work orders.
aengr	Access Egress Policy - Access Egress QoS Policies.
aingr	Access Ingress Policy - Access Ingress QoS Policies.
ancp	ANCP - Access Node Control Protocol (ANCP) policy and configuration.
ancp.AncpLoopback	ANCP Loopback - Access to ANCP Loopback tests, ANCP Loopback test definitions, and ANCP Loopback deployed tests.
antispoof	Anti-Spoofing - Anti-Spoofing for L2/L3 Access Interfaces and Filter configuration.
aosqos	AoS QoS - Quality of Service for Application over Signaling (AoS QoS) Policy and conditions, AoS QoS configuration for Physical Port and Layer 2 Bridge.
aossas	AOS SAS - OAM tests specific to AOS nodes.
aossas.CPETestGroupHead	CPE SLA Test Group - Access to CPE SLA tests, CPE SLA test definitions, and CPE SLA deployed tests.
aossas.CPETestHead	CPE SLA Test - Access to CPE SLA tests, CPE SLA test definitions, and CPE SLA deployed tests.

(1 of 20)

Package.Class.Method/Property	Description
apipe	APipe - All contained objects are listed. Package access is not currently used.
apipe.Apipe	Apipe Service - Access to VLL ATM Pipe (Apipe) Service objects themselves.
apipe.Site	Apipe Site - Access to Apipe Sites.
aps	APS - Automatic Protection Switching (APS) Groups.
arp	ARP - ARP host and configurations on service interfaces.
atm	ATM - ATM configuration for Service interfaces and routers, ATM Connections, ILMI Link, and other ATM related objects.
atm.AtmPing	ATM Ping - Access to ATM Ping tests, ATM Ping test definitions, and ATM Ping deployed tests.
atmpolicy	ATM QoS Policy - ATM Traffic Descriptor Policy.
audit	Resource Audit - Ability to execute audits and view audit results.
autoconfig	Automatic Configuration - Auto-Config Source and Target Node Profiles.
autoconfig.AutoConfigScriptManager.method_config ure	Automatic Configuration - method_configure - Ability to create/modify/delete an auto-config script.
autoconfig.AutoConfigScriptManager.method_copyC ontents	Automatic Configuration - method_copyContents - Ability to copy the contents of one auto-config script to new one.
bfd	BFD - Bi-Directional Forwarding Detection (BFD) can be configured on rtr.NetworkInterface, ies.L3AccessInterface, vprn.L3AccessInterface and vprn.NetworkInterface.
bgp	Routing Management: BGP - Border Gateway Protocol (BGP) configuriation for routers, policies, peers, groups, MD5, and Confederations.
bgp.Site	BGP Site - Access to a BGP protocol site on a router.
bulk	Bulk Operations - Not currently used.
bulk.BulkChange	Bulk Change - The abilty to create, modify, and/or delete bulk changes.
bulk.BulkManager.method_execute	Bulk Operations Manager - method_execute - The ability to execute bulk operations.
bulk.BulkManager.method_generateBatches	Bulk Operations Manager - method_generateBatches - The ability to generate batches for bulk operations.
bundle	Bundle - Bundle configuration for T1/E1 Multilink Group and channel members, APS, Multichassis and Service interfaces.
cac	CAC - CAC configuration for Physical Links, Physical Port and other CAC related objects.
ccag	CCAG - Cross-Connect Aggregation Group (CCAG) MDA card and forwarding path configuration.
cflowd	Cflowd - CFLOWD Objects.
cflowd.NeCflowd	Cflowd Configuration - Ability to configure cflowd params for SR.
cflowd.NeCollector	Cflowd Collector Configuration - Ability to configure collector for cflowd params for SR.
circem	CES - Configuration of Circuit Emulation Service (CES) properties for circuits and daughter cards.

(2 of 20)

Package.Class.Method/Property	Description
clear	Clear - Clear application commands and requests.
cli	CLI - Ability to connect to open NE sessions from SAM.
cli.SSH	Cli. SSH - Ability to open an SSH Telnet session to the node from SAM.
cli.Telnet	Cli. Telnet - Ability to open a Telnet session to the node from SAM.
connprof	Connection Profile - Connection Profile configuration.
cpipe	CPipe - Access to this package is for configuring CES Interface Specifics for Cpipe specific SAPs.
cpipe.Cpipe	Cpipe Service - Access to VLL Circuit Emulation Pipe (Cpipe) Service objects themselves.
cpipe.Site	Cpipe Site - Access to Cpipe Sites.
crdtctrl	Credit Control - Credit Control configuration.
customproperties	Custom Properties - Custom properties configuration.
db	Database - Configuration for Size contraint policies and Database file policies.
db.DatabaseManager.method_backup	Database Manager - method_backup - Ability to perform a database backup.
db.DatabaseManager.method_reinstantiateStandby	Database Manager - method_reinstantiateStandby - Ability to re-instantiate the standby database.
db.DatabaseManager.method_switchover	Database Manager - method_switchover - Ability to perform a database switchover.
dhcp	DHCP - Dynamic Host Configuration Protocol (DHCP) Server for rtr.VirtualRouter and vprn.Site.
diameter	Diameter - Access to this package is for configuring Diameter related configurations, e.g. Diameter Policy.
epipe	EPipe - Access to this package is for configuring CES Interface Specifics and FR Interface Specifics for Epipe specific SAPs.
epipe.Epipe	Epipe Service - Access to VLL Ethernet Pipe (Epipe) Service objects themselves.
epipe.PbbMacName	PBB MAC Name - Ability to configure the MAC Name Address for a Network Element.
epipe.Site	Epipe Site - Access to Epipe Sites.
equipment	Physical Equipment - General equipment configuration.
ethernetequipment	Ethernet Equipment - Ethernet Equipment configuration.
ethernetoam	Ethernet OAM - Maintenance Domains and Maintenance Entity Groups, autogeneration of the MEPs on each SAP or Binding in a Service.
ethernetoam.CcmTest	CFM Continuity Check - Access to Continuity Check tests, Continuity Check test definitions, and Continuity Check deployed tests.
ethernetoam.CcTest	Global Maintenance Entity Group - Access to Continuity Check tests, Continuity Check test definitions, and Continuity Check deployed tests.
ethernetoam.CfmEthTest	CFM Eth Test - Access to CFM EthTests, CFM EthTest definitions, and CFM EthTest deployed tests.

(3 of 20)

Package.Class.Method/Property	Description
ethernetoam.CfmLinkTrace	CFM Link Trace - Access to Link Trace tests, Link Trace test definitions, and Link Trace deployed tests.
ethernetoam.CfmLoopback	CFM Loopback - Access to CFM Loopback tests, CFM Loopback test definitions, and CFM Loopback deployed tests.
ethernetoam.CfmOneWayDelayTest	CFM One Way Delay Test - Access to CFM One Way Delay tests, CFM One Way Delay test definitions, and CFM One Way Delay deployed tests.
ethernetoam.CfmOneWaySlm	CFM One Way SLM Test - Access to CFM One Way SLM tests, CFM One Way SLM test definitions, and CFM One Way SLM deployed tests.
ethernetoam.CfmSingleEndedLossTest	CFM Single Ended Loss Test - Access to CFM Single Ended Loss tests, CFM Single Ended Loss test definitions, and CFM Single Ended Loss deployed tests.
ethernetoam.CfmTwoWayDelayTest	CFM Two Way Delay Test - Access to CFM Two Way Delay tests, CFM Two Way Delay test definitions, and CFM Two Way Delay deployed tests.
ethernetoam.CfmTwoWaySlm	CFM Two Way SLM Test - Access to CFM Two Way SLM tests, CFM Two Way SLM test definitions, and CFM Two Way SLM deployed tests.
ethernetservice	Ethernet Service Policy - SAP Profile and UNI Profile policies.
ethernettunnel	Ethernet Tunnel - Ethernet Tunnel configuration.
ethring	Ethernet Ring - Ethernet Ring Configuration.
fabricqos	Fabric QoS Policies - Fabric Profile QoS policy.
file	File Policy - File creation on the NE for events and accounting.
filter	Filter - Public search filters.
fm	Fault Management - Alarm policies, Severity change thresholds, Alarms, Notes, and History.
fm.AlarmHistoryDatabase.method_purge	Alarm History Database - method_purge - Ability to purge the alarm history database.
fm.FaultManager	Fault Manager - Access to assign OLC state, alter severity, clear, acknowledge, and remove faults.
fm.FaultManager.method_editNote	Fault Manager - method_editNote - Ability to edit an alarm note.
fm.GlobalPolicy	Global Alarm Behavior - Access to configure the global alarm behavior.
fm.SpecificPolicy	Specific Alarm Policy - Access to configure specific alarm policies.
fpipe	FPipe - All contained objects are listed. Package access is not currently used.
fpipe.Fpipe	Fpipe Service - Access to Frame Relay Pipe (Fpipe) Service objects themselves.
fpipe.Site	Fpipe Site - Access to Fpipe Sites.
fr	Frame Relay - Frame Relay configuration for Service interfaces and routers.
generic	Generic - Generic configuration for SAM objects, deployment, and administrative state changes for DHCP and Multichassis objects, Maintenance Association End Points (MEP), and SRRP instances.

(4 of 20)

Package.Class.Method/Property	Description
generic.GenericObject.method_collectData	GenericObject - method_collectData - Ability to collect and plot real-time statistics.
genericne	Generic NE - Generic NE Interface and Profile configuration.
gsmp	GSMP - General Switch Management Protocol (GSMP) configuration for VPLS, MVPLS and VPRN routing instances.
hip	Horizontal Integration Protocol - Access to HIP managed Element Managers and subtending nodes.
hip.EMServer	Element Manager - Access to HIP managed Element Managers.
hip.EMSystem	EM System - Access to HIP managed EM Systems.
hpipe	HPipe - All contained objects are listed. Package access is not currently used.
hpipe.Hpipe	Hpipe Service - Access to HPipe (Hpipe) Service objects themselves.
hpipe.Site	Hpipe Site - Access to Hpipe Sites.
icmp	ICMP - Internet Control Message Protocol (ICMP) and Domain Name System (DNS) test results.
icmp.DnsPing	DNS Ping - Access to DNS Ping tests, DNS Ping test definitions, and DNS Ping deployed tests.
icmp.IcmpPing	ICMP Ping - Access to ICMP Ping tests, ICMP Ping test definitions, and ICMP Ping deployed tests.
icmp.IcmpTrace	ICMP Trace - Access to ICMP Trace tests, ICMP Trace test definitions, and ICMP Trace deployed tests.
ies	IES - Access to this package is for configuring Group Interfaces, SAPs, MSAPs, IGMP Host Tracking on Sites and SAPs, and FR Interface Specifics for IES specific SAPs.
ies.Ies	IES Service - Access to Internet Enhanced Service (IES) Service objects themselves.
ies.L3AccessInterface	IES L3 Access Interface - Access to IES L3 Access Interfaces.
ies.Site	IES Site - Access to IES Sites.
ies.SubscriberInterface	IES Subscriber Interface - Access to IES Subscriber Interfaces.
igh	IGH - Interface-Group-Handlers.
igmp	IGMP - Internet Group Management Protocol (IGMP) configuration for Service interfaces and routers.
igmp.Site	IGMP Site - Access to IGMP Sites.
impact.FullReset	Impact. Full Reset - Ability to configure objects which will result in a full reset of the node. Currently applies to 9412 node.
impact.PartialReset	Impact. Partial Reset - Ability to configure objects which will result in a partial reset of impacted SW/HW unit. Currently applies to 9412 node.
ipipe	IPipe - Access to this package is for configuring IPCP on L2 Access Interfaces and FR Interface Specifics for Ipipe specific SAPs.
ipipe.Ipipe	Ipipe Service - Access to IP Interworking Pipe (Ipipe) Service objects themselves.
ipipe.L2AccessInterface	IPipe L2 Access Interface - Access to IPipe L2 Access Interfaces.
ipipe.Site	Ipipe Site - Access to Ipipe Sites.

(5 of 20)

Package.Class.Method/Property	Description
ipsec	IP Security - IKE Policy and IPsec Transform.
isa	ISA - ISA-IPsec, ISA-MG, and ISA-AA configuration on a MDA card for IP Security, LTE, and Application Assurance.
isa.MgGroupMember	ISA-MG Group Member - Configuration of ISA-MG Group Member.
isa.MgIsaGroup	ISA-MG Group - Configuration of ISA-MG Group.
isis	Routing Management: ISIS - IS-IS configuration for Service interfaces and routers, Area, Adjacency, Neighbors, Policies and other IS-IS related objects.
l2fib	L2 FIB - Layer 2 Forwarding Information Base (FIB) configuration for Multicast and Non-Multicast.
l2fwd	L2 Forwarding - All Layer 2 Forwarding configuration for Service interfaces and routers, ciruits, ports, Spanning Tree, Registration, FIB, Mac Protection, IGMP Snooping, etc.
l2tp	L2TP - L2TP configuration for Service interfaces and routers, Groups, Tunnels, PeersRPs, and other L2TP related objects.
l3fwd	L3 Forwarding - All Layer 3 Forwarding configuration for Service interfaces and routers, Import and Export policies, Dot1p and DSCP for VPRNs.
lag	LAG - Link Aggregation Group (LAG) configuration for Service interfaces and routers.
layer2	Layer 2 - All Layer 2 configuration: Bridges, Transparent LAN Service (TLS), and VLAN interfaces.
ldp	Routing Management: LDP - Label Distribution Protocol (LDP) configuration for Service interfaces and routers, Session, MD5 Key, Equal-Cost Multipath Routing (EMCP), Forwarding Equivalency Class (FEC), Policies, and Peers.
lldp	LLDP - Link Layer Discovery Protocol (LLDP) configuration on equipment.PhysicalPort.
localuserdb	Local User DB - DHCP or PPPoE configuration for Local User Databases on a router.
log	Statistics - Parent package for all statistics classes.
log.LogToFileManager.property_retention	LogToFileManager - property_retention - LogToFile preferences can only be modified by a user with an administrator role.
log.LogToFileManager.property_rollover	LogToFileManager - property_rollover - LogToFile preferences can only be modified by a user with an administrator role.
lps	LPS - Learned Port Security (LPS) configuration for layer2.Bridge and MAC Entries for ports.
lte	LTE - All LTE configurations and status.
lte.CallTraceDirectory	Call Trace Directory - Configuration of Call Trace Directory.
lte.DccaProfile	DCCA Profile - Configuration of DCCA Profile.
lte.DiameterPeerListEntry	Diameter Peer List Entry - Configuration of Diameter Peer List Entry.
lte.DiameterPeerProfile	Diameter Peer Profile - Configuration of Diameter Peer Profile.
lte.DiameterProfile	Diameter Profile - Configuration of Diameter Profile.
lte.DiscoveryLog	Drill Down Log - Creation of Drill Down Log.

(6 of 20)

Package.Class.Method/Property	Description
lte.DupRadiusAccServerGroup	Duplicate Accounting RADIUS Server Group - Configuration of Serving Gateway APN.
lte.ENBEquipment.method_launchNEM	ENB Equipment - method_launchNEM - Ability to launch NEM.
lte.EPSPathDiscoveredLinkComponent	EPS Path Discovery Link Component - Configuration of EPS Path Discovery Link Component.
lte.EPSPathDiscoveryHint	EPS Path Drill Down Hint - Configuration of EPS Path Drill Down Hint.
lte.EPSPathDiscoveryProfile	Path Drill Down Profile - Configuration of Path Drill Down Profile.
lte.EPSPathInterfaceComponent	EPS Path Interface Component - Configuration of EPS Path Interface Component.
lte.EPSPathLinkComponent	EPS Path Link Component - Configuration of EPS Path Link Component.
lte.EPSPathSapComponent	EPS SAP Component - Configuration of EPS SAP Component.
lte.EPSPathSegment	EPS Path Segment - Configuration of EPS Path Segment.
lte.EPSPathServiceComponent	EPS Path Service Component - Configuration of EPS Path Service Component.
lte.EPSPathSiteComponent	EPS Path Site Component - Configuration of EPS Path Site Component.
lte.GtpPrimaryServerListEntry	GTP Primary Server List Entry - Configuration of GTP Primary Server List Entry.
lte.GtpPrimeServerGroupProfile	GTP Prime Server Group Profile - Configuration of GTP Prime Server Group Profile.
lte.GtpProfile	GTP Profile - Configuration of GTP Profile.
lte.IpPool	IP Address Pool - Configuration of IP Address Pool.
lte.IpPoolBinding	IP Address Pool Binding - Configuration of IP Address Pool Binding.
lte.IpPoolEntry	IP Address Pool Entry - Configuration of IP Address Pool Entry.
lte.MobileNodeRegion	Mobile Node Region/Public Land Mobile Network (PLMN) - Configuration of Mobile Node Region.
lte.PdnApn	PDN APN - Configuration of PDN APN.
lte.PDNGateway	PDN Gateway - Configuration of PDN Gateway.
lte.PdnGxReferencePoint	PDN Gx Reference Point - Configuration of Pdn Gx Reference Point.
lte.PdnS5ReferencePoint	PDN S5 Reference Point - Configuration of PGW S5 Reference Point.
lte.PdnS8ReferencePoint	PDN S8 Reference Point - Configuration of PGW S8 Reference Point.
lte.PdnSignalling	PGW Signalling - Configuration of PGW Signalling.
lte.PgwChargingProfile	PGW Charging Profile - Configuration of PGW Charging Profile.
lte.PlmnListPolicy	PLMN List Profile - Configuration of PLMN List Profile.
lte.PlmnListPolicyGroup	PLMN List Group - Configuration of PLMN List Group.
lte.QciPolicy	QCI Policy - Configuration of QCI Policy.
lte.QciPolicyEntry	QCI Policy Entry - Configuration of QCI Policy Entry.
lte.S11ReferencePoint	S11 Reference Point - Configuration of S11 Reference Point.
lte.S1uReferencePoint	S1-u Reference Point - Configuration of S1u Reference Point.

(7 of 20)

Package.Class.Method/Property	Description
lte.ServingGateway	Serving Gateway - Configuration of Serving Gateway.
lte.SgwApn	Serving Gateway APN - Configuration of Serving Gateway APN.
lte.SgwChargingProfile	SGW Charging Profile - Configuration of SGW Charging Profile.
lte.SgwRfReferencePoint	SGW Rf - Configuration of SGW Rf Reference Point.
lte.SgwS5ReferencePoint	SGW S5 Reference Point - Configuration of SGW S5 Reference Point.
lte.SgwS8ReferencePoint	SGW S8 Reference Point - Configuration of SGW S8 Reference Point.
lte.SgwSignalling	Serving Gateway Signalling - Configuration of Serving Gateway Signalling.
lte.SubscAndEquipmentTraces	Subsc And Equipment Traces - Configuration of Call Traces.
lte.TrustedPeerListEntry	Trusted Peers - Configuration of Trusted Peer List Entries.
lte.TrustedPeerListEntryUnlisted	Unlisted Peer - Configuration of Unlisted Trusted Peer List Entries.
lte.TrustedPeerListPolicy	Trusted Peer List Policy - Configuration of Trusted Peer List Policy.
lteanr	LTE - Access to LTE ANR profiles.
lteggsn	LTE - All LTE configurations and status.
lteggsn.GnReferencePoint	Gn Reference Point - Configuration of Gn Reference Point.
lteggsn.PdnGyReferencePoint	Gy Reference Point - Configuration of Gy Reference Point.
lteggsn.PgwGaReferencePoint	PGW Ga Reference Point - Configuration of PGW Ga Reference Point.
lteggsn.SgwGaReferencePoint	SGW Ga Reference Point - Configuration of SGW Ga Reference Point.
lteli	LTE LI - All LTE LI configurations and status.
lteli.DFPeer	LTE LI Delivery Function Peer - Configuration of LTE LI Delivery Function Peer.
lteli.InterceptionTarget	LTE LI Interception Target - Configuration of LTE LI Interception Target.
ltemme	LTE - All LTE MME configurations.
ltemme.MmeInstance.method_abortMmeLoadBalance	MME Instance - method_abortMmeLoadBalance - Ability to abort MME load balancing operation.
ltemme.MmeInstance.method_interMmeLoadBalance	MME Instance - method_interMmeLoadBalance - Ability to perform inter MME load balancing operation.
ltemme.MmeInstance.method_intraMmeLoadBalance	MME Instance - method_intraMmeLoadBalance - Ability to perform intra MME load balancing operation.
ltemme.MmeInstance.method_lockMmeAggregateService	MME Instance - method_lockMmeAggregateService - Ability to lock the MME aggregate service.
ltemme.MmeInstance.method_unlockMmeAggregateService	MME Instance - method_unlockMmeAggregateService - Ability to unlock the MME aggregate service.
lteperf	LTE Performance Management - All LTE configurations : SGW, PGW, eNodeB.
ltepmip	LTE - All LTE configurations and status.
ltepmip.Pmipv6Profile	PMIPv6 Profile - Configuration of PMIPv6 Profile.

(8 of 20)

Package.Class.Method/Property	Description
ltepmip.S2aReferencePoint	S2a Reference Point - Configuration of S2a Reference Point.
ltepool	LTEPOOL - All LTE POOL configurations.
ltepool.MmeInstanceBinding	MME Instance Binding - Ability to configure associations between an MME Instance and an MME Pool.
ltepool.TaBinding	Tracking Area Binding - Ability to configure associations between a Tracking Area and an MME Pool.
lteradius	LTE - All LTE configurations and status.
lteradius.RadiusGroupProfile	RADIUS Group Profile - Configuration of Radius Group Profile.
lteradius.RadiusPeerProfile	RADIUS Peer Profile - Configuration of RADIUS Peer Profile.
lteradius.RadiusProfile	RADIUS Profile - Configuration of RADIUS Profile.
ltes1mme	LTES1MME - All LTE S1MME Configurations and Monitoring Status.
ltesecurity	LTE Security - All LTE configurations : SGW, PGW, Bearers, and more.
lteservice	LTE - All LTE configurations and status.
ltethreshold	LTE - All LTE configurations and status.
lteuserstats	LTE - All LTE configurations and status.
lteuserstats.UserStatsQuery	User Stat Query - Configuration of User Stats Queries.
lteuserstats.UserStatsQueryOutputSnapshot	User Query Output Snapshot - Configuration of User Stats Query Snapshots.
lteuserstats.UserStatsUserPgw	PGW User Data - Configuration of User Stats User Output.
lteuserstats.UserStatsUserSgw	SGW User Data - Configuration of User Stats User Output.
mediation	Router Admin: Policies - Router administration: Backup Policies, Upgrade Policies and Software images, Deployment Policies, and Management Ping Policies.
mirror	Mirror - All configurations for Service Mirroring.
mirror.Endpoint	Endpoint - Access to MIRROR Endpoints.
mirror.Mirror	Mirror Service - Access to Mirror Service objects themselves.
mirror.Site	Mirror Site - Access to Mirror Sites.
mld	MLD - Multicast Listener Discovery Protocol (MLD) configuration for a Service interfaces and routers.
mmepolicy	mmepolicy.
mmepolicy.MMEGTPProfile	MME GTP Profile - Configuration of GTP Profile.
mmepolicy.MMESCTPProfile	MME SCTP Profile - Configuration of SCTP Profile.
monitor	Monitor - Subscriber Host monitoring and SAP monitoring.
monpath	Monitored Path - IP path monitoring and LSP monitoring.
mpls	Path/Routing Management: MPLS - Multiprotocol Label Switching (MPLS) configuration on a rtr.VirtualRouter, LSPs, Segments, Hops, Tunnels, CrossConnects, and other MPLS related objects.
mpls.LdpTreeTrace	LDP Tree Trace - Access to LDP Tree Trace tests, LDP Tree Trace test definitions, and LDP Tree Trace deployed tests.
mpls.LspPing	LSP Ping - Access to LSP Ping tests, LSP Ping test definitions, and LSP Ping deployed tests.

(9 of 20)

Package.Class.Method/Property	Description
mpls.LspTrace	LSP Trace - Access to LSP Trace tests, LSP Trace test definitions, and LSP Trace deployed tests.
mpls.P2MPLspPing	P2MP LSP Ping - Access to P2MP LSP Ping tests, P2MP LSP Ping test definitions, and P2MP LSP Ping deployed tests.
mpls.P2MPLspTrace	P2MP LSP Trace - Access to P2MP LSP Trace tests, P2MP LSP Trace test definitions, and P2MP LSP Trace deployed tests.
mpr	9500 MPR - 9500 Microwave Packet Radio (MPR) VLAN Paths and Hops.
mpr.Al2AccessInterface	L2 Access Interface - Access to L2AccessInterface objects.
mpr.Apipe	9500 MPR Apipe Service - Access to vll ATM Pipe (Apipe) Service objects themselves.
mpr.Asite	Apipe Site - Access to the service instance objects.
mpr.Cpipe	9500 MPR Cpipe Service - Access to VLL Circuit Emulation Pipe (Cpipe) Service objects themselves.
mpr.El2AccessInterface	L2 Access Interface - Access to L2AccessInterface objects.
mpr.Epipe	9500 MPR Epipe Service - Access to VLL Ethernet Pipe Service objects themselves.
mpr.Esite	Epipe Site - Access to the service instance objects.
mpr.L2AccessInterface	L2 Access Interface - Access to L2AccessInterface objects.
mpr.Site	Cpipe Site - Access to the service instance objects.
msappolicy	MSAP Policy - MSAP policy configuration.
msdp	MSDP - Multicast Source Discovery Protocol (MSDP) configuration for a rtr.VirtualRouter, MD5 Key, Peers, Policies and Source.
multicast	Multicast - Multicast Connection Admission Control (CAC) Policies and Bandwidth Policies.
multicast.CustomerVlanTag	Customer Vlan Tag - Configuration of Customer VLAN Tags for a Multicast VLAN.
multicast.MfibPing	MFIB Ping - Access to MFIB Ping tests, MFIB Ping test definitions, and MFIB Ping deployed tests.
multicast.Mrinfo	Mrinfo - Access to Mrinfo tests, Mrinfo test definitions, and Mrinfo deployed tests.
multicast.Mtrace	Mtrace - Access to Mtrace tests, Mtrace test definitions, and Mtrace deployed tests.
multicastmgr	CPAM: Multicast - All CPAM Multicast related objects: PIM Domain, VPLS Domain, Groups, and Sources.
multichassis	Multi-Chassis - Multi-Chassis configuration for a router; LAGs, Rings, Syncs, Peers, VLAN Ranges.
mvpls	MVPLS - All contained objects are listed. Package access is not currently used.
mvpls.BL2AccessInterface	MVPLS B-L2 Access Interface - Access to MVPLS B-L2 Access Interfaces.
mvpls.BSite	MVPLS B-Site - Access to MVPLS B-Sites.
mvpls.IL2AccessInterface	MVPLS I-L2 Access Interface - Access to MVPLS I-L2 Access Interfaces.
mvpls.ISite	MVPLS I-Site - Access to MVPLS I-Sites.

(10 of 20)

Package.Class.Method/Property	Description
mvpls.L2AccessInterface	MVPLS L2 Access Interface - Access to MVPLS L2 Access Interfaces (except I and B).
mvpls.Mvpls	MVPLS Service - Access to Management Virtual Private LAN Service (MVPLS) Service objects themselves.
mvpls.Site	MVPLS Site - Access to MVPLS Sites (except I and B).
mvrp	MVRP - MVRP global configuration and for Interfaces(Ports and LAG's).
nat	Network Address Translation - NAT Policy.
netca	NE Threshold Crossing Alerts - Manage NE Threshold Crossing Alert profiles.
netw	Network - Network objects: groups and links.
netw.NetworkElement	Network Element - Access to Network Elements.
netw.NetworkElement.method_executeCli	Network Element - method_executeCli - Execute a single raw CLI command on this Network Element.
netw.NetworkElement.method_executeMultiCli	Network Element - method_executeMultiCli - Execute Multiple CLI commands on this Network Element.
netw.NetworkElement.method_GUICrossLaunch	Network Element - method_GUICrossLaunch - The ability to launch LTE web-browser based tools.
netw.NodeDiscoveryControl	Node Discovery Control - Control of Discovered Nodes.
netw.Topology	Discovery Manager - Access to the Discovery Manager.
netw.Topology.method_move	Discovery Manager - method_move - Ability to move a node or group on the SAM Client GUI maps.
netw.UplinkBofConfiguration	Uplink Bof Configuration - Ability to configure the Uplink BOF for a 7210 node.
netw.UplinkRouteConfiguration	Uplink Route Configuration - Ability to configure the Uplink Routes for a 7210 node.
niegr	Network Ingress/Egress Policy - Network Policies.
nodelog	Node Log Policy - Filter Log and Sys Log Target Policies.
nqueue	Network Queue Policy - Network Queue QoS Policies.
ntp	Network Time Protocol - Network Time Protocol.
optical	Optical Specifics - Optical NE Specific Information.
optical.DiverseService	Diverse Optical Transport Service - Access for all optical services.
optical.SubRateService	SubRate Optical Transport Service - Access for all optical services.
optical.TransportService	Optical Transport Service - Access for all optical services.
optical.YCableService	Diverse Optical Transport Service - Access for all optical services.
opticsperf	Optics Specifics - All 1830 PSS configurations.
ospf	Routing Management: OSPF - OSPF configuration for Service interfaces and routers, Area, Adjacency, MD5 Key, Virtual Links Neighbors, LSAs, Policies and other OSPF related objects.
ospf.Site	OSPF Site - Access to OSPF Sites.
oss	OSS - Ability to connect to the SAM Server through the OSS interface.

(11 of 20)

Package.Class.Method/Property	Description
pae802_1x	PAE 802.1x - Port Access Entity (PAE) configuration for a router and physical port; RADIUS Server Policy.
pim	PIM - PIM configuration for Service interfaces and routers, MDT Threshold, Policies, Neighbors, Groups, RPs, Multicast CAC Level and LAG Port Down events, and other PIM related objects.
pim.Site	PIM Site - Access to PIM Sites.
policing	Policing Policy - Policer Control.
policy	Policy - Parent package for all policies; Policy Audits.
policy.PolicyDefinition.method_setConfigurationModeToReleased	Policy Definition - method_setConfigurationModeToReleased - Ability set Configuration Mode to Released and distribute the global policy to the local definitions network-wide.
policy.PolicyDefinition.method_setDistributionModeToLocalEditOnly	Policy Definition - method_setDistributionModeToLocalEditOnly - Ability set Configuration Mode to Local Edit Only for local policies and ignore changes to the global policy.
policy.PolicyDefinition.method_setDistributionModeToSyncWithGlobal	Policy Definition - method_setDistributionModeToSyncWithGlobal - Ability set Configuration Mode to Sync with Global and synchronize local policies with the most recent released global policy.
policy.PolicySyncGroupManager	Policy Sync Group Manager - Ability to configure and control policy sync group.
port.RestrictModeConfigModify	Port. Restrict Mode Config Modify - Ability to restrict Port Mode modification for Ports with dependencies.
portscheduler	Port Scheduler Policy - Port Scheduler and HSMDA Scheduler Policies.
ppp	PPP - Point-to-Point Protocol (PPP) configuration on a router.
pppoe	PPP Policy and Session - Point-to-Point Protocol over Ethernet over ATM (PPPoE/PPPoEoA/PPPoA) Policies and Sessions.
propertyrules	Property Rules - Range and Format Value Policies.
ptp	ptp.
qgroup	Queue Group Policy - Queue Group Policies.
qosprofile	Multilink QoS Profile - Multilink PPP QoS Profiles and Multilink Frame Relay QoS Profiles.
radioequipment	Radio Equipment - Radio Equipment configuration.
radiusaccounting	Radius Accounting - Radius Accounting Policy.
ranlicense	NE License Management - Ability to manage NE licenses.
ranradiom	eNodeB Router Admin: radio measurement - eNodeB Router administration: radio measurement.
rca	RCA - Root Cause Analysis (RCA) for verification applications (OSPF Area,ISIS Area,BGP AS,...).
rca.RcaManager.method_fixProblem	RcaManager - method_fixProblem - Ability to fix a problem on an object.
rca.RcaManager.method_preFixProblem	RcaManager - method_preFixProblem - Ability to determine if a problem can be fixed, and the fix impact.
resiliency	HSDPA Resiliency - HSDPA Resiliency for services.
resources	SAM Resources - SAM Resource Pools as configured in the nms-server.xml file.

(12 of 20)

Package.Class.Method/Property	Description
ressubscr	Residential Subscriber - All Residential Subscriber configuation including Connectivity Verifications (SHCV), SAPs, Packages, Hosts, QoS, and other related objects.
ressubscr.BgpPeeringPolicy	BGP Peering Policy - Access to BGP Peering Policies.
ressubscr.HostTrackingPolicy	Host Tracking Policy - Access to Host Tracking Policies.
ressubscr.IgmpPolicy	IGMP Policy - Access to IGMP Policies.
ressubscr.SubMcastCacPolicy	Subscriber Multicast CAC Policy - Access to Subscriber Multicast CAC Policies.
rip	Routing Management: RIP - Routing Information Protocol (RIP) configuration for Service interfaces and routers, Authentication Key, Groups, Export and Import Policies.
rip.Site	RIP Site - Access to RIP Sites.
rmon	Remote Network Monitoring - Remote Network Monitoring Alarm and Event Policies.
rp	Routing Policy - Policy Statements, Prefix Lists, Communities, Damping, and AS Paths.
rsvp	Routing Management: RSVP - RSVP configuration for a rtr.VirtualRouter, Authentication Keys, and Neighbors.
rtr	Routing Management: General - General rtr.VirtualRouter configurations including Neighbor Discovery, DHCP Relays, Interfaces, Peers, Address Ranges and ARP, Routes and Router Advertisement.
rules	Rules - Rule Repository and Sets of rules that may get invoked when a rule engine is fired.
sas	Assurance - Parent package for all tests; Service Test Manager.
sas.TestManager.property_sasRetention	Service Test Manager - property_sasRetention - LogToFile preferences can only be modified by a user with an administrator role.
sas.TestManager.property_sasRollover	Service Test Manager - property_sasRollover - LogToFile preferences can only be modified by a user with an administrator role.
sasqos	7210 QoS - QoS Policies for 7210 nodes.
sasqos.QosPool	QoS Pool - Access to QoS Pools for 7210 nodes.
schedule	Schedule - All scheduled tasks; Cron Actions, OSS Commands, CLI Scripts and Schedules.
script	Scripting - Script Management and execution of Service and Tunnel Template, OSS, and CLI scripts.
script.AbstractScript.method_configureTarget	Script - method_configureTarget - Ability to configure targets and instances.
script.AbstractScript.method_configureTargets	Script - method_configureTargets - Ability to configure targets and instances.
script.Bundle	Script Bundle - Ability to configure script bundles.
script.ControlScript	Control Script - Ability to configure control scripts.
script.ControlScriptVersion	Control Script Version - Ability to configure Control script versions.
script.HandlerBinding	Handler Script Binding - Ability to configure associations between scripts and control scripts.

(13 of 20)

Package.Class.Method/Property	Description
script.InvokerBinding	Invoker Script Binding - Ability to configure associations between scripts and control scripts.
script.LargeTextTargetParameter	Large Text Target Parameter - Ability to configure target/instance large text parameters.
script.Result	Result - Ability to create script results.
script.Script	CLI Script - Ability to configure CLI scripts.
script.Script.method_createTargetScript	CLI Script - method_createTargetScript - Ability to configure targets.
script.Script.method_createTargetScripts	CLI Script - method_createTargetScripts - Ability to configure targets.
script.ScriptManager	Script Manager - Ability to configure and control scripts and script operations.
script.ScriptManager.method_configure	Script Manager - method_configure - Ability to configure scripts.
script.ScriptManager.method_copyContents	Script Manager - method_copyContents - Ability to copy scripts.
script.ScriptManager.method_exportBundle	Script Manager - method_exportBundle - Ability to export bundle.
script.ScriptManager.method_importBundle	Script Manager - method_importBundle - Ability to import bundle.
script.ScriptManager.method_importBundleSimulation	Script Manager - method_importBundleSimulation - Ability to import bundle.
script.ScriptScheduledTask	Script Scheduled Task - Ability to schedule a script.
script.TargetParameter	Target Parameter - Ability to configure target/instance parameters.
script.TargetParameterItem	Target Parameter Item - Ability to configure target/instance parameter items.
script.TargetParameterList	Target Parameter List - Ability to configure target/instance parameter lists.
script.TargetScript	Target Script - Ability to configure targets and instances.
script.TemplateBinding	Template Binding - Ability to configure associations between templates.
script.Version	Version - Ability to configure CLI script versions.
script.XmlApiConfigTemplate	Template - Ability to configure XML API templates.
script.XmlApiConfigTemplate.method_execute	Template - method_execute - Ability to create an object from a template.
script.XmlApiConfigTemplate.method_executeMulti	Template - method_executeMulti - Ability to create an object from a template.
script.XmlApiConfigTemplate.method_executeScript	Template - method_executeScript - Ability to create an object from a template.
script.XmlApiConfigTemplate.method_serviceTemplateExecute	Template - method_serviceTemplateExecute - Ability to execute a service template.
script.XmlApiConfigTemplate.method_tunnelTemplateExecute	Template - method_tunnelTemplateExecute - Ability to execute a tunnel template.
script.XmlApiScript	XMLAPI Script - Ability to configure XML API scripts.
script.XmlApiVersion	XMLAPI Version - Ability to configure XML API script versions.
security	Security - SAM User security including Sessions, TCP KeyChains, and SSH2 Known Host Keys.

(14 of 20)

Package.Class.Method/Property	Description
security.CpamLicense	CPAM License - Read-only view of the 5650 CPAM License.
security.CpamLicense.method_clearRouterLimitExceedDueToMultiAdditions	CPAM License - method_clearRouterLimitExceedDueToMultiAdditions - Ability to clear the isRouterLimitExceedDueToMultiAdditions flag on the license.
security.CpamLicenseScenario	CPAM License Scenario - Read-only view of the 5650 CPAM Imapct Analysis Application License.
security.MediationPolicy	Mediation Policy - Access to Mediation Policies. Used in conjunction with snmp.PollerManager.
security.MessagingConnection	Messaging Connection - Ability to view messaging connections.
security.RoleBasedAccess	Security. Role Based Access - Ability to restrict online object creation and deletion to a specific role. Currently applies to 9412 node.
security.ScopeOfCommandProfile	Profile - Access to Scope of Command Profile configuration.
security.ScopeOfCommandRole	Role - Access to Scope of Command Role configuration.
security.Span	Span - Access to Span configuration. Used in conjunction with security.SpanObjectBinding.
security.SpanObjectBinding	Span Objects - Access to Span object configuration. Used in conjunction with security.Span.
security.SpanOfControlProfile	Profile - Access to Span of Control Profile configuration.
security.User	User - Access to User object configuration and password changes.
security.UserGroup	UserGroup - Access to UserGroup configuration.
selfconfig	Self Config - Ability to configure self config objects.
server	SAM Server - SAM Servers (JMS, Main, Auxilary) as configured in the nms-server.xml file.
service	Service Management - Parent package for all services; Composite Services and Connectors and Access Policy Queue Override Policies.
service.CpePing	CPE Ping - Access to CPE Ping tests, CPE Ping test definitions, and CPE Ping deployed tests.
service.GneAccessInterface	GNE Service Interface - Access to GNE Service Interfaces.
service.GneSite	GNE Site - Access to GNE Sites.
service.MacPing	MAC Ping - Access to MAC Ping tests, MAC Ping test definitions, and MAC Ping deployed tests.
service.MacPopulate	MAC Populate - Access to MAC Populate tests, MAC Populate test definitions, and MAC Populate deployed tests.
service.MacPurge	MAC Purge - Access to MAC Purge tests, MAC Purge test definitions, and MAC Purge deployed tests.
service.MacTrace	MAC Trace - Access to MAC Trace tests, MAC Trace test definitions, and MAC Trace deployed tests.
service.MefMacPing	MEF MAC Ping - Access to MEF MAC Ping tests, MEF MAC Ping test definitions, and MEF MAC Ping deployed tests.
service.RedundantInterface	Redundant Interface - Access to Redundant Interface configuration between SRRP instances.

(15 of 20)

Package.Class.Method/Property	Description
service.Service.method_create	Service - method_create - Ability to create a service via the SAM Client GUI.
service.Service.method_highPriorityServiceDelete	Service - method_highPriorityServiceDelete - Ability to delete high priority Service.
service.Service.property_svcPriority	Service - property_svcPriority - Service priority can only be modified by a user with an administrator role.
service.ServiceManager.property_alarmAggregationCompositeService	ServiceManager - property_alarmAggregationCompositeService - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_autoDiscoverCompositeSvc	ServiceManager - property_autoDiscoverCompositeSvc - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_enableCac	ServiceManager - property_enableCac - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_maxNumberOfMoveSites	ServiceManager - property_maxNumberOfMoveSites - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_multiSegmentTunnelSelection	ServiceManager - property_multiSegmentTunnelSelection - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_propagateServiceNameToSites	ServiceManager - property_propagateServiceNameToSites - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_removeEmptyService	ServiceManager - property_removeEmptyService - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_supVprnSnmpCommunityStringMsg	ServiceManager - property_supVprnSnmpCommunityStringMsg - Service preferences can only be modified by a user with an administrator role.
service.ServiceManager.property_svcPriority	ServiceManager - property_svcPriority - Service priority can only be modified by a user with an administrator role.
service.ServiceMemberAuditPolicyEntry	Service Membership Audit Policy Entry - Access to Service Member Audit Policy Entry to configure service membership RCA audit behavior.
service.SitePing	Service Site Ping - Access to Service Site Ping tests, Service Site Ping test definitions, and Service Site Ping deployed tests.
service.TemplateService.method_constructServiceTemplate	Service Template - method_constructServiceTemplate - Ability to construct a Template from a Service.
service.TemplateService.method_constructTemplatedService	Service Template - method_constructTemplatedService - Ability to construct a Service from a Template.
shg	Split Horizon Group - Split Horizon Groups for VPLS services.
simulator	CPAM: Simulator - Parent package for all CPAM simulated objects; Scenarios, Sessions, Change and Action events.
simulator.SimSession	Session - Access to simulation sessions for 5650 CPAM Impact Analysis.
sitesec	NE Security - All Network Element security configuration including NE System Security, RADIUS, TACACS+ and AOS Authentication, Site Management Access and CPM Filters, DoS Protection, Password Policy, Users and Profiles.

(16 of 20)

Package.Class.Method/Property	Description
sitesec.LocalUser	NE User - Access to NE Site User configuration.
sitesec.UserProfile	Site User Profile - Access to NE Site User Profile configuration.
slaprofile	SLA Profile - SLA Profiles for QoS Policies.
slope	Slope Policy - WRED Slope, HSMDA WRED Slope, HSMDA Pool, and Named Buffer Pool Policies.
slope.QosPool	QoS Pool - Access to QoS Pools for 7450, 7750, and 7710 nodes.
snmp	SNMP - SNMP Poller Policies, Event Notification Policies, Statistics Poller Policies.
snmp.EventNotificationPolicy	Event Notification Policy - Access to Event Notification Policies.
snmp.PollerManager	Mediation - Access to Mediation Policies. Used in conjunction with security.MediationPolicy.
snmp.PollerManager.method_resync	Mediation - method_resync - Ability to resync a Network Element. Requires 'update' access on netw.NetworkElement.
sonet	SONET Sync - SONET Synchronization for Shelf and Processor Cards.
sonetequipment	SONET Equipment - SONET Equipment configuration.
spanrules	Span Rules - Span Rules for service creation.
squeue	Shared Queue Policy - Shared Queue Policies.
srmrmtauth	SAM Remote Authentication - Remote Authentication for SAM configuration of RADIUS and TACACS+ authentication servers.
srrp	SRRP - Subscriber Routed Redundancy Protocol (SRRP) configuration for IES and VPRN services.
statistics	SAM Performance Statistics - SAM Performance Statistics (Memory, Alarm Rate, Snmp Traps, and Node Resyncs).
subscr	Subscriber Management - Customers configuration.
subscr.Site	Subscriber Site - Access to Subscriber Sites.
subscrauth	Subscriber Authentication - Subscriber Authentication Policy using RADIUS for DHCP sessions.
subscrexpmap	Subscriber Explicit Map - Subscriber Explict Map Entry.
subscrident	Subscriber Identification - Subscriber Identification Policy.
subscrprofile	Subscriber Profile - Subscriber Profile, SLA Entries, Access Policy Queue Overrides and Scheduler Policy Entry Overrides.
sup	Supervision - SAM Supervision (Dashboard).
svq	Aggregation Scheduler - Service and Subscriber Aggregation Scheduler, Ingress and Egress Aggregation Scheduler Overrides.
svr	Service Routing - All contained objects are listed. Package access is not currently used.
svt	Service Tunnel Management - All Service Tunnel configruations including Clouds, Service Distribution Path (SDP) Bindings and Pseudo Wires.
svt.MeshSdpBinding	Mesh SDP Binding - Access to Mesh SDP Binding configuration.
svt.MirrorSdpBinding	Mirror SDP Binding - Access to Mirror SDP Binding configuration.
svt.MtuPing	MTU Ping - Access to MTU Ping tests, MTU Ping test definitions, and MTU Ping deployed tests.

(17 of 20)

Package.Class.Method/Property	Description
svt.SpokeSdpBinding	Spoke SDP Binding - Access to Spoke SDP Binding configuration.
svt.Tunnel	Tunnel - Access to Tunnel (or SDP object) configuration.
svt.TunnelPing	Tunnel Ping - Access to Tunnel Ping tests, Tunnel Ping test definitions, and Tunnel Ping deployed tests.
svt.VccvPing	VCCV Ping - Access to VCCV Ping tests, VCCV Ping test definitions, and VCCV Ping deployed tests.
svt.VccvTrace	VCCV Trace - Access to VCCV Trace tests, VCCV Trace test definitions, and VCCV Trace deployed tests.
sw	Router Admin: Software - Router administration: Backup Files, Card Software, Upgrade schedules, and Accounting Statistics Retrieval.
sw.BackupRestoreManager.method_backup	Backup/Restore Status - method_backup - Ability to perform a Network Element backup.
sw.BackupRestoreManager.method_restore	Backup/Restore Status - method_restore - Ability to perform a Network Element restore.
swran	eNodeB Router Admin: Software - eNodeB Router administration: Upgrade schedules.
taskmgmt	Task Management - Monitor the tasks being executed in the server.
tca	TCA Policy - Parent package for all TCA classes.
tca.TCAManager.property_maxTCAAlarmLimit	TCAManager - property_maxTCAAlarmLimit - TCA preferences can only be modified by a user with an administrator role.
tca.TCAManager.property_maxTCAAlarmResetInterv al	TCAManager - property_maxTCAAlarmResetInterval - TCA preferences can only be modified by a user with an administrator role.
tdmequipment	TDM Equipment - TDM Equipment configuration.
telcoacg	Telco Access Group - Access Groups for Ethernet Ports.
telcoaclfilter	Telco ACL Filter - 7250 SAS and Telco ACL Filters: Standard IP, Extended IP, IGMP, and MAC.
telcoqos	Telco QoS - 7250 SAS and Telco QoS Node Level Policy, QoS MAC Policy for layer2.Bridge, and QoS for Ethernet Ports.
template	Service Template - Deprecated 6.0: use XML API based configuration templates (see class script.XmlApiConfigTemplate).
tod	TOD - Time Of Day Range Policy.
todsuite	TOD Suite - Time Of Day Suite Policy for Egress and Ingress Entries.
topology	CPAM: Topology - All CPAM topology configurations including BGP, IS-IS, OSPF, CPAA, Links, Routers, Areas, Subnets, Checkpoints, and Route Alarms.
topology.Checkpoint.method_autoCreateCheckpoint s	Checkpoint - method_autoCreateCheckpoints - Ability to create checkpoints for protocols within the an IGP admin domain.
topology.IsisCheckpoint	ISIS Checkpoint - Access to snapshots (checkpoints) for a specific ISIS routing domain.
topology.IsisCpSchedulePolicy	ISIS Checkpoint Schedule Policy - Access to configure Checkpoint Schedule Policies for ISIS routing domains.
topology.OspfCheckpoint	OSPF Checkpoint - Access to snapshots (checkpoints) for a specific OSPF area.

(18 of 20)

Package.Class.Method/Property	Description
topology.OspfCpSchedulePolicy	OSPF Checkpoint Schedule Policy - Access to configure Checkpoint Schedule Policies for OSPF areas.
topologysim	CPAM: Simulated Topology - CPAM simulated IGP topology including Links, Routers, Areas, Subnets, and IP Paths.
trapmapper	Trap to Alarm Mapper - Trap to Alarm Mapper.
tunnelmgmt	Tunnel Management - All Tunnel related objects including Hubs, Spokes, Meshes, Chains, Rings, Two Neighbor, Class Forwarding and Rule-based Groups.
udprelay	UDP Relay - UDP Relay configuration and services for layer2.Bridge, DHCP Snooping for VLANs and Ports.
udptunnel	UDP Tunnel - Access to UDP Tunnel.
user	User Preference - SAM Client GUI preferences for Info Tables.
userlog	User Log - SAM Usage and Activity Logs.
vlan	VLAN - Access to this package is for configuring TLS, MVR, Super VLAN, Customer VLAN, SAP and MSAP, Network Interfaces (Uplink Ports) and VLAN configuration for a MST Instance.
vlan.EthernetService	VLAN Ethernet Service - Access to VLAN Ethernet Services.
vlan.L2AccessInterface	VLAN Access Interface - Access to VLAN Access Interfaces.
vlan.Site	VLAN Site - Access to VLAN Sites.
vlan.Vlan	VLAN Service - Access to Virtual LAN (VLAN) Service objects themselves.
vll	VLL - All contained objects are listed. Package access is not currently used.
vll.Endpoint	Endpoint - Access to VLL Endpoints.
vll.L2AccessInterface	L2 Access Interface - Access to VLL L2 Access Interfaces (except Ipipe).
vpls	VPLS - Access to this package is for configuring MLD Snooping, PIM Snooping, DHCP Relay, Multicast CAC Level and LAG Port Down events, and discovered VLAN Elements.
vpls.BL2AccessInterface	VPLS B-L2 Access Interface - Access to VPLS B-L2 Access Interfaces on a VPLS Service.
vpls.BSite	VPLS B-Site - Access to VPLS B-Sites on a VPLS Service.
vpls.Endpoint	VPLS Endpoint - Access to VPLS Endpoints on a VPLS Service.
vpls.IL2AccessInterface	VPLS I-L2 Access Interface - Access to VPLS I-L2 Access Interfaces on a VPLS Service.
vpls.ISite	VPLS I-Site - Access to VPLS I-Sites on a VPLS Service.
vpls.L2AccessInterface	VPLS L2 Access Interface - Access to VPLS L2 Access Interfaces (except I and B) on a VPLS Service.
vpls.L2ManagementInterface	VPLS L2 Management Interface - Access to VPLS L2 Management Interfaces on a VPLS Service.
vpls.Site	VPLS Site - Access to VPLS Sites (except I and B) on a VPLS Service.
vpls.Vpls	VPLS Service - Access to Virtual Private LAN Service (VPLS) Service objects themselves.

(19 of 20)

Package.Class.Method/Property	Description
vprn	VPRN - Access to this package is for configuring VPRN Router Instance Sites, SNMP Community, IPsec Interfaces, Group Interfaces, SAPs, MSAPs, IGMP Host Tracking on Sites and SAPs, and FR Interface Specifics for VPRN specific SAPs.
vprn.IPMirrorInterface	IP Mirror Interface - Access to VPRN IP Mirror Interfaces.
vprn.L3AccessInterface	VPRN L3 Access Interface - Access to VPRN L3 Access Interfaces.
vprn.Site	VPRN Site - Access to VPRN Sites.
vprn.SubscriberInterface	VPRN Subscriber Interface - Access to VPRN Subscriber Interfaces.
vprn.Vprn	VPRN Service - Access to Virtual Private Routed Network (VPRN) Service objects themselves.
vprn.VprnPing	VPRN Ping - Access to VPRN Ping tests, VPRN Ping test definitions, and VPRN Ping deployed tests.
vprn.VprnTrace	VPRN Trace - Access to VPRN Trace tests, VPRN Trace test definitions, and VPRN Trace deployed tests.
vrrp	VRRP - Virtual Router Redundancy Protocol (VRRP) configuration on rtr.NetworkInterface, IES and VPRN access interfaces, Authentication Keys, Priority Control Policies and Events.
vs	Scheduler Policy - Scheduler Policies.

(20 of 20)

A.3 Permissions of predefined scope of command roles

This section describes the permissions of each default scope of command role. Each permission can have the following access levels to an object package, class, method or property:

- Read-only—provides read access to an object class without the ability to create or delete objects.
- Read/write—provides full access to an object class that includes read, create, update/execute, and delete access.
- Read/update/execute—provides read and update/execute access to an object package or property, but does not provide delete access.
- Update/execute—provides update/execute access on class methods, and is typically combined with read access on the parent object package.
- No access.

Note — This appendix does not list permissions with read-only access. Permissions that are not listed for a predefined scope of command role have an access level of read-only.

Table A-4 lists the default scope of command roles and provides links to their respective permissions tables.

Table A-4 Scope of command roles

Role	Link
Base Read-only	Table A-5
Administrator	Table A-6
User Management	Table A-7
Network Element Equipment Manager	Table A-8
Service Management	Table A-9
Subscriber Management	Table A-10
QoS/ACL Policy Management	Table A-11
Policy Management (except QoS/ACL)	Table A-12
Routing Management	Table A-13
Tunnel Management	Table A-14
SAM Management and Operations	Table A-15
Network Element Software Management	Table A-16
Fault Management	Table A-17
Service Test Management	Table A-18
Script Management	Table A-19
Script Execution	Table A-20
Mirror Service Management	Table A-21
OSS Management	Table A-22
Telnet/SSH Management	Table A-23
CPAM Management	Table A-24
CPAM OSS PCA	Table A-25
CPAM Topology Simulator	Table A-26
Root Cause Analysis (RCA) Object Verification	Table A-27
Lawful Intercept Management	Table A-28
Template Script Management	Table A-29
Service Template Script Execution	Table A-30
Tunnel Template Script Execution	Table A-31
Application Assurance (AA) Management	Table A-32
Format and Range Policy Management	Table A-33
Work Order Activation	Table A-34
Configuration Snapshot Export	Table A-35
Create and Delete Access	Table A-36
Configuration Management which causes node reset	Table A-37
EPC Operator	Table A-38
eNodeB NEM Operator	Table A-39
