Alcatel·Lucent

Alcatel-Lucent 5620

SERVICE AWARE MANAGER | RELEASE 9.0 R7

USER GUIDE

3HE 06495 AAAG TQZZA Edition 01

Disclaimers

Alcatel-Lucent products are intended for commercial uses. Without the appropriate network design engineering, they must not be sold, licensed or otherwise distributed for use in any hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life-support machines, or weapons systems, in which the failure of products could lead directly to death, personal injury, or severe physical or environmental damage. The customer hereby agrees that the use, sale, license or other distribution of the products for any such application without the prior written consent of Alcatel-Lucent, shall be at the customer's sole risk. The customer hereby agrees to defend and hold Alcatel-Lucent harmless from any claims for loss, cost, damage, expense or liability that may arise out of or in connection with the use, sale, license or other distribution of the products in such applications.

This document may contain information regarding the use and installation of non-Alcatel-Lucent products. Please note that this information is provided as a courtesy to assist you. While Alcatel-Lucent tries to ensure that this information accurately reflects information provided by the supplier, please refer to the materials provided with any non-Alcatel-Lucent product and contact the supplier for confirmation. Alcatel-Lucent assumes no responsibility or liability for incorrect or incomplete information provided about non-Alcatel-Lucent products.

However, this does not constitute a representation or warranty. The warranties provided for Alcatel-Lucent products, if any, are set forth in contractual documentation entered into by Alcatel-Lucent and its customers.

This document was originally written in English. If there is any conflict or inconsistency between the English version and any other version of a document, the English version shall prevail.

When printed by Alcatel-Lucent, this document is printed on recycled paper.

Alcatel-Lucent License Agreement

SAMPLE END USER LICENSE AGREEMENT

1. LICENSE

1.1 Subject to the terms and conditions of this Agreement, Alcatel-Lucent grants to Customer and Customer accepts a nonexclusive, nontransferable license to use any software and related documentation provided by Alcatel-Lucent pursuant to this Agreement ("Licensed Program") for Customer's own internal use, solely in conjunction with hardware supplied or approved by Alcatel-Lucent. In case of equipment failure, Customer may use the Licensed Program on a backup system, but only for such limited time as is required to rectify the failure.

1.2 Customer acknowledges that Alcatel-Lucent may have encoded within the Licensed Program optional functionality and capacity (including, but not limited to, the number of equivalent nodes, delegate workstations, paths and partitions), which may be increased upon the purchase of the applicable license extensions.

1.3 Use of the Licensed Program may be subject to the issuance of an application key, which shall be conveyed to the Customer in the form of a Supplement to this End User License Agreement. The purchase of a license extension may require the issuance of a new application key.

2. PROTECTION AND SECURITY OF LICENSED PROGRAMS

2.1 Customer acknowledges and agrees that the Licensed Program contains proprietary and confidential information of Alcatel-Lucent and its third party suppliers, and agrees to keep such information confidential. Customer shall not disclose the Licensed Program except to its employees having a need to know, and only after they have been advised of its confidential and proprietary nature and have agreed to protect same.

2.2 All rights, title and interest in and to the Licensed Program, other than those expressly granted to Customer herein, shall remain vested in Alcatel-Lucent or its third party suppliers. Customer shall not, and shall prevent others from copying, translating, modifying, creating derivative works, reverse engineering, decompiling, encumbering or otherwise using the Licensed Program except as specifically authorized under this Agreement. Notwithstanding the foregoing, Customer is authorized to make one copy for its archival purposes only. All appropriate copyright and other proprietary notices and legends shall be placed on all Licensed Programs supplied by Alcatel-Lucent, and Customer shall maintain and reproduce such notices on any full or partial copies made by it.

3. TERM

3.1 This Agreement shall become effective for each Licensed Program upon delivery of the Licensed Program to Customer.

3.2 Alcatel-Lucent may terminate this Agreement: (a) upon notice to Customer if any amount payable to Alcatel-Lucent is not paid within thirty (30) days of the date on which payment is due; (b) if Customer becomes bankrupt, makes an assignment for the benefit of its creditors, or if its assets vest or become subject to the rights of any trustee, receiver or other administrator; (c) if bankruptcy, reorganization or insolvency proceedings are instituted against Customer and not dismissed within 15 days; or (d) if Customer breaches a material provision of this Agreement and such breach is not rectified within 15 days of receipt of notice of the breach from Alcatel-Lucent.

3.3 Upon termination of this Agreement, Customer shall return or destroy all copies of the Licensed Program. All obligations of Customer arising prior to termination, and those obligations relating to confidentiality and nonuse, shall survive termination.

4. CHARGES

4.1 Upon shipment of the Licensed Program, Alcatel-Lucent will invoice Customer for all fees, and any taxes, duties and other charges. Customer will be invoiced for any license extensions upon delivery of the new software application key or, if a new application key is not required, upon delivery of the extension. All amounts shall be due and payable within thirty (30) days of receipt of invoice, and interest will be charged on any overdue amounts at the rate of 1 1/2% per month (19.6% per annum).

5. SUPPORT AND UPGRADES

5.1 Customer shall receive software support and upgrades for the Licensed Program only to the extent provided for in the applicable Alcatel-Lucent software support policy in effect from time to time, and upon payment of any applicable fees. Unless expressly excluded, this Agreement shall be deemed to apply to all updates, upgrades, revisions, enhancements and other software which may be supplied by Alcatel-Lucent to Customer from time to time.

6. WARRANTIES AND INDEMNIFICATION

6.1 Alcatel-Lucent warrants that the Licensed Program as originally delivered to Customer will function substantially in accordance with the functional description set out in the associated user documentation for a period of 90 days from the date of shipment, when used in accordance with the user documentation. Alcatel-Lucent's sole liability and Customer's sole remedy for a breach of this warranty shall be Alcatel-Lucent's good faith efforts to rectify the nonconformity or, if after repeated efforts Alcatel-Lucent is unable to rectify the nonconformity, Alcatel-Lucent shall accept return of the Licensed Program and shall refund to Customer all amounts paid in respect thereof. This warranty is available only once in respect of each Licensed Program, and is not renewed by the payment of an extension charge or upgrade fee.

6.2 ALCATEL-LUCENT EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES, REPRESENTATIONS, COVENANTS OR CONDITIONS OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, WARRANTIES OR REPRESENTATIONS OF WORKMANSHIP, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, DURABILITY, OR THAT THE OPERATION OF THE LICENSED PROGRAM WILL BE ERROR FREE OR THAT THE LICENSED PROGRAMS WILL NOT INFRINGE UPON ANY THIRD PARTY RIGHTS.

6.3 Alcatel-Lucent shall defend and indemnify Customer in any action to the extent that it is based on a claim that the Licensed Program furnished by Alcatel-Lucent infringes any patent, copyright, trade secret or other intellectual property right, provided that Customer notifies Alcatel-Lucent within ten (10) days of the existence of the claim, gives Alcatel-Lucent sole control of the litigation or settlement of the claim, and provides all such assistance as Alcatel-Lucent may reasonably require. Notwithstanding the foregoing, Alcatel-Lucent shall have no liability if the claim results from any modification or unauthorized use of the Licensed Program by Customer, and Customer shall defend and indemnify Alcatel-Lucent against any such claim.

6.4 Alcatel-Lucent Products are intended for standard commercial uses. Without the appropriate network design engineering, they must not be sold, licensed or otherwise distributed for use in any hazardous environments requiring fail safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life-support machines, or weapons systems, in which the failure of products could lead directly to death, personal injury, or severe physical or environmental damage. The Customer hereby agrees that the use, sale, license or other distribution of the Products for any such application without the prior written consent of Alcatel-Lucent, shall be at the Customer's sole risk. The Customer also agrees to defend and hold Alcatel-Lucent harmless from any claims for loss, cost, damage, expense or liability that may arise out of or in connection with the use, sale, license or other distribution of the Products in such applications.

7. LIMITATION OF LIABILITY

7.1 IN NO EVENT SHALL THE TOTAL COLLECTIVE LIABILITY OF ALCATEL-LUCENT, ITS EMPLOYEES, DIRECTORS, OFFICERS OR AGENTS FOR ANY CLAIM, REGARDLESS OF VALUE OR NATURE, EXCEED THE AMOUNT PAID UNDER THIS AGREEMENT FOR THE LICENSED PROGRAM THAT IS THE SUBJECT MATTER OF THE CLAIM. IN NO EVENT SHALL THE TOTAL COLLECTIVE LIABILITY OF ALCATEL-LUCENT, ITS EMPLOYEES, DIRECTORS, OFFICERS OR AGENTS FOR ALL CLAIMS EXCEED THE TOTAL AMOUNT PAID BY CUSTOMER TO ALCATEL-LUCENT HEREUNDER. NO PARTY SHALL BE LIABLE FOR ANY INDIRECT, SPECIAL OR CONSEQUENTIAL DAMAGES, WHETHER OR NOT SUCH DAMAGES ARE FORESEEABLE, AND/OR THE PARTY HAD BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7.2 The foregoing provision limiting the liability of Alcatel-Lucent's employees, agents, officers and directors shall be deemed to be a trust provision, and shall be enforceable by such employees, agents, officers and directors as trust beneficiaries.

8. GENERAL

8.1 Under no circumstances shall either party be liable to the other for any failure to perform its obligations (other than the payment of any monies owing) where such failure results from causes beyond that party's reasonable control.

8.2 This Agreement constitutes the entire agreement between Alcatel-Lucent and Customer and supersedes all prior oral and written communications. All amendments shall be in writing and signed by authorized representatives of both parties.

8.3 If any provision of this Agreement is held to be invalid, illegal or unenforceable, it shall be severed and the remaining provisions shall continue in full force and effect.

8.4 The Licensed Program may contain freeware or shareware obtained by Alcatel-Lucent from a third party source. No license fee has been paid by Alcatel-Lucent for the inclusion of any such freeware or shareware, and no license fee is charged to Customer for its use. The Customer agrees to be bound by any license agreement for such freeware or shareware. CUSTOMER ACKNOWLEDGES AND AGREES THAT THE THIRD PARTY SOURCE PROVIDES NO WARRANTIES AND SHALL HAVE NO LIABILITY WHATSOEVER IN RESPECT OF CUSTOMER'S POSSESSION AND/OR USE OF THE FREEWARE OR SHAREWARE.

8.5 Alcatel-Lucent shall have the right, at its own expense and upon reasonable written notice to Customer, to periodically inspect Customer's premises and such documents as it may reasonably require, for the exclusive purpose of verifying Customer's compliance with its obligations under this Agreement.

8.6 All notices shall be sent to the parties at the addresses listed above, or to any such address as may be specified from time to time. Notices shall be deemed to have been received five days after deposit with a post office when sent by registered or certified mail, postage prepaid and receipt requested.

8.7 If the Licensed Program is being acquired by or on behalf of any unit or agency of the United States Government, the following provision shall apply: If the Licensed Program is supplied to the Department of Defense, it shall be classified as "Commercial Computer Software" and the United States Government is acquiring only "restricted rights" in the Licensed Program as defined in DFARS 227-7202-1(a) and 227.7202-3(a), or equivalent. If the Licensed Program is supplied to any other unit or agency of the United States Government, rights will be defined in Clause 52.227-19 or 52.227-14 of the FAR, or if acquired by NASA, Clause 18-52.227-86(d) of the NASA Supplement to the FAR, or equivalent. If the software was acquired under a contract subject to the October 1988 Rights in Technical Data and Computer Software regulations, use, duplication and disclosure by the Government is subject to the restrictions set forth in DFARS 252-227.7013(c)(1)(ii) 1988, or equivalent.

8.8 Customer shall comply with all export regulations pertaining to the Licensed Program in effect from time to time. Without limiting the generality of the foregoing, Customer expressly warrants that it will not directly or indirectly export, reexport, or transship the Licensed Program in violation of any export laws, rules or regulations of Canada, the United States or the United Kingdom.

8.9 No term or provision of this Agreement shall be deemed waived and no breach excused unless such waiver or consent is in writing and signed by the party claimed to have waived or consented. The waiver by either party of any right hereunder, or of the failure to perform or of a breach by the other party, shall not be deemed to be a waiver of any other right hereunder or of any other breach or failure by such other party, whether of a similar nature or otherwise.

8.10 This Agreement shall be governed by and construed in accordance with the laws of the Province of Ontario. The application of the United Nations Convention on Contracts for the International Sale of Goods is hereby expressly excluded.

Preface

The Preface provides general information about the 5620 Service Aware Manager documentation suite, including this guide.

Prerequisites

Readers of the 5620 SAM documentation suite are assumed to be familiar with the following:

- 5620 SAM software structure and components
- 5620 SAM GUI operations and tools
- typical 5620 SAM management tasks and procedures
- device and network management concepts

5620 SAM documentation suite

The 5620 SAM documentation suite describes the 5620 SAM and the associated network management of its supported devices. Contact your Alcatel-Lucent support representative for information about specific network or facility considerations.

Table 1 lists the documents in the 5620 SAM customer documentation suite.

Table 1 5620 SAM customer documentation suite

Guide	Description
5620 SAM core documentation	
5620 SAM Release Description	The *5620 SAM Release Description* provides information about the new features associated with a 5620 SAM software release.

(1 of 4)

Guide	Description
5620 SAM Planning Guide	The *5620 SAM Planning Guide* provides information about 5620 SAM scalability and recommended hardware configurations.
5620 SAM System Architecture Guide	The *5620 SAM System Architecture Guide* is intended for technology officers and network planners to increase their knowledge of the 5620 SAM software structure and components. It describes the system structure, software components, and interfaces of the 5620 SAM. In addition, 5620 SAM fault tolerance, security, and network management capabilities are discussed from an architectural perspective.
5620 SAM | 5650 CPAM Installation and Upgrade Guide	The *5620 SAM | 5650 CPAM Installation and Upgrade Guide* provides OS considerations, configuration information, and procedures for the following: • installing, upgrading, and uninstalling 5620 SAM and 5650 CPAM software in standalone and redundant deployments • 5620 SAM system migration to a different system • conversion from a standalone to a redundant 5620 SAM system
5620 SAM User Guide	The *5620 SAM User Guide* provides information about using the 5620 SAM to manage the service-aware IP/MPLS network, including GUI basics, commissioning, service configuration, and policy management. The *5620 SAM User Guide* uses a task-based format. Each chapter contains: • a workflow that describes the steps for configuring and using the functions • detailed procedures that list the configurable parameters on the associated forms 5620 SAM management information specific to LTE network elements is covered in the *5620 SAM LTE ePC User Guide* and *5620 SAM LTE RAN User Guide*. 5620 SAM management information specific to 1830 PSS network elements is covered in the *5620 SAM Optical User Guide*.
5620 SAM Integration Guide	The *5620 SAM Integration Guide* provides procedures to allow the 5620 SAM to integrate with additional components.
5620 SAM Supervision Module User Guide	The *5620 SAM Supervision Module User Guide* provides information about how to configure and use the web-based 5620 SAM Supervision Module for fault management and at-a-glance network element monitoring.
5620 SAM Scripts and Templates Developer Guide	The *5620 SAM Scripts and Templates Developer Guide* provides information that allows you to develop, manage, and execute CLI-based or XML-based scripts or templates. The guide is intended for developers, skilled administrators, and operators who are expected to be familiar with the following: • CLI scripting, XML, and the Velocity engine • basic scripting or programming • 5620 SAM functions
5620 SAM Parameter Guide	The *5620 SAM Parameter Guide* provides: • parameter descriptions that include value ranges and default values • parameter options and option descriptions • parameter and option dependencies • parameter mappings to the 5620 SAM-O XML equivalent property names There are dynamic links between the procedures in the *5620 SAM User Guide* and the parameter descriptions in the *5620 SAM Parameter Guide*. Parameters specific to LTE network elements are covered in the *5620 SAM LTE Parameter Reference*. Parameters specific to 1830 PSS network elements are covered in the *5620 SAM Optical Parameter Reference*.
5620 SAM Statistics Management Guide	The *5620 SAM Statistics Management Guide* provides information about how to configure performance and accounting statistics collection and how to view counters using the 5620 SAM. Network examples are included.

(2 of 4)

Guide	Description
5620 SAM Maintenance Guide	The *5620 SAM Maintenance Guide* provides procedures for: • generating baseline information for 5620 SAM applications • performing daily, weekly, monthly, and as-required maintenance activities for 5620 SAM-managed networks

5620 SAM Troubleshooting Guide	The *5620 SAM Troubleshooting Guide* provides task-based procedures and user documentation to:
	• help resolve issues in the managed and management networks
	• identify the root cause and plan corrective action for:
	  • alarm conditions on a network object or customer service
	  • problems on customer services with no associated alarms
	• list problem scenarios, possible solutions, and tools to help check:
	  • network management LANs
	  • network management platforms and operating systems
	  • 5620 SAM client GUIs and client OSS applications
	  • 5620 SAM servers
	  • 5620 SAM databases

5620 SAM Alarm Reference	The *5620 SAM Alarm Reference* provides a list of all alarms that the 5620 SAM can raise. The reference is organized by network element type.
5620 SAM Glossary	The *5620 SAM Glossary* defines terms and acronyms used in all of the 5620 SAM documentation, including 5620 SAM LTE documentation.
5620 SAM Network Element Compatibility Guide	The *5620 SAM Network Element Compatibility Guide* provides release-specific information about the compatibility of managed device features in 5620 SAM releases.
5620 SAM LTE documentation	
5620 SAM LTE RAN Release Description	The *5620 SAM LTE RAN Release Description* provides information about the LTE RAN features associated with the release.
5620 SAM LTE ePC User Guide	The *5620 SAM LTE ePC User Guide* describes how to discover, configure, and manage LTE ePC devices using the 5620 SAM. The guide is intended for LTE ePC network planners, administrators, and operators. Alcatel-Lucent recommends that you review the entire *5620 SAM LTE ePC User Guide* before you attempt to use the 5620 SAM in your LTE network.
5620 SAM LTE RAN User Guide	The *5620 SAM LTE RAN User Guide* describes how to discover, configure, and manage the Evolved NodeB, or eNodeB, using the 5620 SAM. The guide is intended for LTE RAN network planners, administrators, and operators. Alcatel-Lucent recommends that you review the entire *5620 SAM LTE RAN User Guide* before you attempt to use the 5620 SAM in your LTE network.
5620 SAM LTE Parameter Reference	The *5620 SAM LTE Parameter Reference* provides a list of all LTE ePC and LTE RAN parameters supported in the 5620 SAM.
5620 SAM-O documentation	
5620 SAM XML OSS Interface Developer Guide	The *5620 SAM XML OSS Interface Developer Guide* provides information that allows you to: • use the 5620 SAM XML OSS interface to access network management information • learn about the information model associated with the managed network • develop OSS applications using the packaged methods, classes, data types, and objects necessary to manage 5620 SAM functions
5620 SAM 3GPP OSS Interface Developer Guide	The *5620 SAM 3GPP OSS Interface Developer Guide* describes the components and architecture of the 3GPP OSS interface to the 5620 SAM. It includes procedures and samples to assist OSS application developers to use the 3GPP interface to manage LTE devices.

(3 of 4)

Guide	Description
5620 SAM 3GPP OSS Interface Compliance Statements	The *5620 SAM 3GPP OSS Interface Compliance Statements* document describes the compliance of the 5620 SAM 3GPP OSS interface with the 3GPP standard.
5620 SAM optical documentation	
5620 SAM Optical User Guide	The *5620 SAM Optical User Guide* describes how to discover, configure, and manage optical devices using the 5620 SAM. The guide is intended for optical network planners, administrators, and operators. Alcatel-Lucent recommends that you review the entire *5620 SAM Optical User Guide* before you attempt to use the 5620 SAM in your network.
5620 SAM Optical Parameter Reference	The *5620 SAM Optical Parameter Reference* provides a list of all optical device parameters supported in the 5620 SAM.
5650 CPAM documentation	
5650 CPAM User Guide	The *5650 CPAM User Guide* describes how to capture, inspect, visualize, and troubleshoot IGP and BGP topologies using the 5650 CPAM.
7701 CPAA Hardware Revision 1 Setup and Software Installation Instructions	The *7701 CPAA Hardware Revision 2 Setup and Software Installation Instructions* describes the hardware setup and software installation for the 7701 CPAA Hardware Revision 1, the route analyzer component of the 5650 CPAM.
7701 CPAA Hardware Revision 2 Setup and Software Installation Instructions	The *7701 CPAA Hardware Revision 2 Setup and Software Installation Instructions* describes the hardware setup and software installation for the 7701 CPAA Hardware Revision 2, the route analyzer component of the 5650 CPAM.

(4 of 4)

Obtaining customer documentation

You can obtain 5620 SAM customer documentation:

- from the product
- on the web

On-product documentation

The 5620 SAM on-product customer documentation is delivered in HTML and PDF. Choose Help→User Documentation from the 5620 SAM client GUI to open the help system in a web browser.

The help system opens to the User Documentation Index, which provides a summary of and links to all 5620 SAM customer documents.

Click on the Using the help system tab on the User Documentation Index page to find usage tips for navigating and searching within the on-product customer documentation.

You can return to the User Documentation Index at any time by clicking on the Home icon, shown in Figure 1.

Figure 1 Home icon

Documentation on the web

The 5620 SAM customer documentation is available for download in PDF format from the Alcatel-Lucent Customer Support Center: http://www.alcatel-lucent.com/myaccess. If you are a new user and require access to this service, please contact your Alcatel-Lucent support representative.

In addition to the guides listed in Table 1, Release Notices and other documents not delivered on-product are posted to this site.

Working with PDFs

You can download PDFs of individual guides from the Alcatel-Lucent Customer Support Center, or you can choose to download a zip of all PDFs for a particular release.

You can use the Search function of Acrobat Reader (File→Search) to find a term in a PDF of any 5620 SAM document. To refine your search, use appropriate search options (for example, search for whole words only or enable case-sensitive searching). You can also search for a term in multiple PDFs at once, provided that they are located in the same directory. For more information, see the Help for Acrobat Reader.

Cross-book hotlinks, for example, from a parameter name in the *5620 SAM User Guide* to a description of that parameter in the *5620 SAM Parameter Guide*, work only if both PDF files are in the same directory.

Note — Users of Mozilla browsers may receive an error message when opening the PDF files in the 5620 SAM documentation suite. The offline storage and default cache values used by the browsers are the cause of the error message.

Alcatel-Lucent recommends changing the Mozilla Firefox offline storage or Mozilla 1.7 cache value to 100 Mbytes to eliminate the error message.

Documentation conventions

Table 2 lists the conventions that are used throughout the documentation.

Table 2 Documentation conventions

Convention	Description	Example
Key name	Press a keyboard key	Delete
Italics	Identifies a variable	*hostname*
Key+Key	Type the appropriate consecutive keystroke sequence	CTRL+G
Key-Key	Type the appropriate simultaneous keystroke sequence	CTRL-G
*	An asterisk is a wildcard character, which means “any character” in a search argument.	log_file*.txt
↵	Press the Return key	↵

(1 of 2)

Convention	Description	Example
—	An em dash indicates there is no information.	—
→	Indicates that a cascading submenu results from selecting a menu item	Policies→Alarm Policies

(2 of 2)

Procedures with options or substeps

When there are options in a procedure, they are identified by letters. When there are substeps in a procedure, they are identified by Roman numerals.

Example of options in a procedure

At step 1, you can choose option a or b. At step 2, you must do what the step indicates.

1 This step offers two options. You must choose one of the following.

a This is one option.

b This is another option.

2 You must perform this step.

Example of substeps in a procedure

At step 1, you must perform a series of substeps within a step. At step 2, you must do what the step indicates.

1 This step has a series of substeps that you must perform to complete the step. You must perform the following substeps.

i This is the first substep.

ii This is the second substep.

iii This is the third substep.

2 You must perform this step.

Measurement conventions

Measurements in this document are expressed in metric units and follow the Système international d'unités (SI) standard for abbreviation of metric units. If imperial measurements are included, they appear in brackets following the metric unit.

Table 3 lists the measurement symbols used in this document.

Table 3 Bits and bytes conventions

Measurement	Symbol
bit	b
byte	byte
kilobits per second	kb/s

Important information

The following conventions are used to indicate important information:

Warning — Warning indicates that the described activity or situation may, or will, cause equipment damage or serious performance problems.

Caution — Caution indicates that the described activity or situation may, or will, cause service interruption.

Note — Notes provide information that is, or may be, of special interest.

Introduction

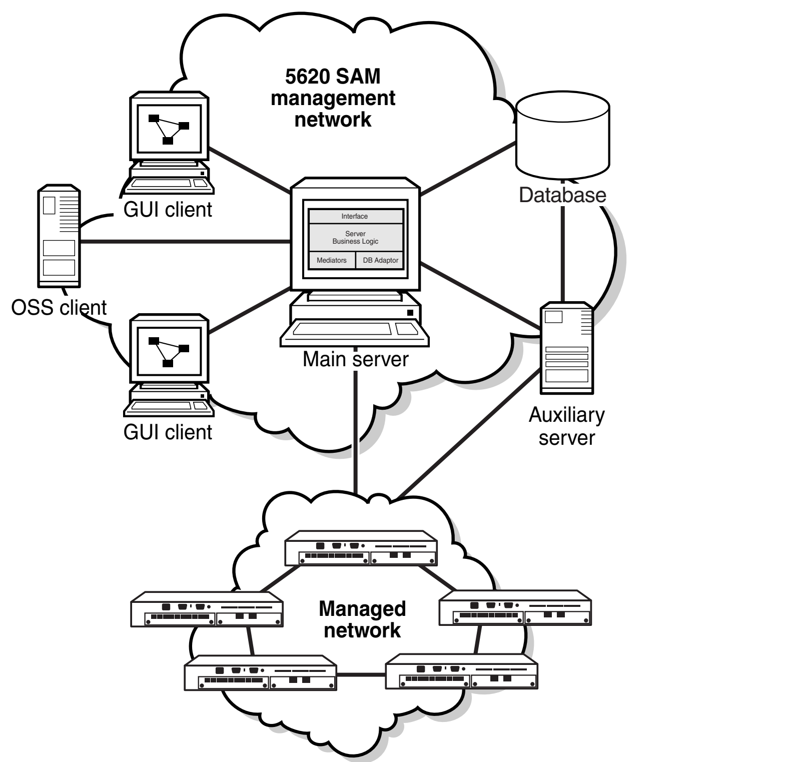
1 — 5620 SAM system overview

1.1 5620 SAM system overview

The 5620 SAM is a system that is designed to manage Alcatel-Lucent network elements, or NEs, such as routers and switches. The 5620 SAM also supports the management of some Telco devices, and provides limited management of other third-party devices, which are called generic NEs.

A 5620 SAM system has client, server, and database components that are deployed in a standalone or redundant configuration. Figure 1-1 shows a block diagram of a standalone 5620 SAM system and the network that it manages. The management network, which contains the 5620 SAM components, connects to the managed network of NEs from one or more points, depending on the deployment complexity.

Figure 1-1 Standalone 5620 SAM system



A 5620 SAM operator performs network management or system administration tasks using a GUI or OSS client that connects to a main server. The main server sends and receives NE management traffic, and directs optional auxiliary servers to perform intensive tasks such as NE statistics collection. Main and auxiliary servers store information in the same 5620 SAM database.

The 5620 SAM uses a Java-based technology that provides distributed, secure, and scalable processing. See the *5620 SAM System Architecture Guide* for system design information. See chapter 7 for information about 5620 SAM system redundancy.

1.2 About this guide

The *5620 SAM User Guide* describes the various 5620 SAM functions, explains the GUI operations associated with each function, and indicates whether the function is available through the OSSI. See the *5620 SAM XML OSS Interface Developer Guide* for information about using the OSSI to perform a 5620 SAM function.

5620 SAM User Guide procedures that contain configurable parameters have links to parameter descriptions in the *5620 SAM Parameter Guide*, where appropriate.

Note — The *5620 SAM User Guide* parameter links can function only when the *5620 SAM Parameter Guide* is in the same directory as the *5620 SAM User Guide*.

This guide contains the following volumes, which are ordered by functional area, from lowest to highest:

- Introduction—contains general 5620 SAM information such as the following:
    - a system overview
    - feature lists by release
    - basic GUI operation instructions
    - GUI map management
- 5620 SAM system management—contains information about 5620 SAM administration such as the following:
    - system configuration
    - system redundancy
    - system and user security
    - interworking with other systems
- Device management—contains information about device functions that are not directly related to networking, such as the following:
    - device support
    - preparing devices for 5620 SAM management
    - 5620 SAM device and equipment management functions
- Network management—contains information about network functions such as the following:
    - general routing and forwarding
    - protocol-specific routing and forwarding
    - traffic management using MPLS and service tunnels
    - fault management
    - OAM diagnostic tests
    - NE redundancy
- Policy management—contains information about configuring and applying 5620 SAM policies that define rules for NE, network, or 5620 SAM operation
- Service management—contains information about managing customer services, such as the following:
    - service creation and configuration
    - customer and subscriber management
    - service verification, troubleshooting, and root-cause analysis
    - scheduling of routine, service-related operations

1.3 Workflow for network management using the 5620 SAM

The following workflow describes the sequence of high-level tasks required to deploy the 5620 SAM and use it to perform network management.

You can use an OSS client to perform many of the functions described in this workflow. See the *5620 SAM XML OSS Interface Developer Guide* for more information.

You can use scripts and templates to perform complex CLI configuration of managed devices from the 5620 SAM. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

1 Plan your 5620 SAM deployment by considering things such as the following:

- the number of NEs the 5620 SAM is to manage
- the hardware required for the 5620 SAM system
- the redundancy requirements
- management network latency
- management network bandwidth requirements
- naming conventions for 5620 SAM objects that you create
- NE compatibility with the 5620 SAM software

See the *5620 SAM Planning Guide* and the *5620 SAM Network Element Compatibility Guide* for more information.

2 Install the 5620 SAM software, as described in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*.

3 Become familiar with GUI basics such as the following:

- navigating the GUI, using the GUI elements, and performing searches; see chapter 3 for more information
- using the equipment navigation tree; see chapter 4 for more information
- using topology maps; see chapter 5 for more information

4 As required, customize or configure the 5620 SAM operating environment.

a See chapter 6 for information about the following:

- viewing or changing 5620 SAM license information; see section 6.2 for more information
- using the auto-client update utility to define the configuration of each GUI client; see section 6.3 for more information
- securing 5620 SAM server/database communication; see section 6.3 for more information
- changing global network-management operating parameters; see section 6.4 for more information

b Manage 5620 SAM system redundancy; see chapter 7 for more information.

c Configure database logging, and manage other database administration functions such as backup and restore; see chapter 8 for more information.

d Create 5620 SAM user groups and accounts with privileges for specific operational scopes; see chapter 9 for more information.

e Configure SSL security for the 5620 SAM system; see chapter 10 for more information.

f Configure integration for the 5620 SAM and external systems such as the 5620 NM, the 5650 CPAM, and the 5780 DSC; see chapter 11 for more information.

5 Prepare the network devices for 5620 SAM management.

a Become familiar with the support that the 5620 SAM provides for various devices; see chapter 12 for more information.

b Commission devices for 5620 SAM management, and configure how and when the 5620 SAM polls the devices for MIB changes; see chapter 13 for more information.

c If required, perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 14 for more information.

d If required, use a Telnet or SSH CLI from the 5620 SAM to view and modify device configurations; see chapter 15 for more information.

6 Use the 5620 SAM to manage devices.

a View, manage, and configure equipment navigation tree objects such as the following:

- network objects; see chapter 16 for more information
- device objects; see chapter 17 for more information
- logical group objects; see chapter 18 for more information
- shelf, card, and daughter card objects; see chapter 19 for more information
- port and channel objects; see chapter 20 for more information

b Create equipment inventories of managed devices; see chapter 22 for more information.

c Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication; see chapter 21 for more information.

d If required, configure TCP enhanced authentication between NEs; see chapter 24 for more information.

e Perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices; see chapter 23 for more information.

f Perform additional device management functions such as the following:

- card migration; see chapter 25 for more information
- threshold crossing alert policy management; see chapter 26 for more information
- bulk configuration changes; see chapter 27 for more information
- object life cycle management; see chapter 28 for more information
- automatic provisioning; see chapter 29 for more information

7 As required, use the 5620 SAM to manage network functions.

a Configure basic NE routing and forwarding; see chapter 30 for more information.

b Configure NE protocols; see chapter 31 for more information.

c Configure MPLS and LSPs; see chapter 32 for more information.

d Configure service tunnels to carry service traffic; see chapter 33 for more information.

e Configure NE-specific network functions such as the following:

- Lawful Intercept; see chapter 34 for more information
- IPsec; see chapter 35 for more information
- ISA-Video; see chapter 36 for more information

f Configure 5620 SAM alarm policies, and use alarms to perform fault management; see chapter 37 for more information.

g Use OAM diagnostic tools to troubleshoot network problems; see chapter 38 for more information.

h Configure redundancy in the managed network using functions such as the following:

- VRRP; see chapter 39 for more information
- APS; see chapter 40 for more information
- MC peer, endpoint, LAG, synchronization, and ring groups; see chapters 41 to 45 for more information

8 Create 5620 SAM policies that define the conditions for 5620 SAM management functions that include the following:

- network—ACL filters, auto-tunnel, RMON
- service—QoS, multicast traffic management, residential subscriber
- 5620 SAM—time of day, size constraint, format and range

See chapter 46 for general information about 5620 SAM policy management. See chapters 47 to 63 for information about specific policy types.

9 Use the 5620 SAM to manage customer services and related functions.

a Become familiar with 5620 SAM service management concepts such as SAPs, the TPSDA model, and QoS delivery using shared queue groups; see chapters 64 and 65 for more information.

b Configure and manage virtual ports; see chapter 66 for more information.

c Configure and manage customers; see chapter 67 for more information.

d Configure and manage the residential subscribers of customer services; see chapter 68 for more information.

e Configure VLAN services for subscribers connected to 7250 SAS or Telco devices; see chapter 69 for more information.

f Configure VLL Apipe, Cpipe, Epipe, Fpipe, Ipipe, and Hpipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information.

g Configure VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information.

h Create mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information.

i Configure IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information.

j Configure VPRN services to provide a virtual IP network that connects multiple customer sites; see chapter 74 for more information.

k Interconnect customer sites that span different domains, such as MAN-WAN or Inter-AS; see chapter 75 for more information.

l Configure composite services to connect various types of services; see chapter 76 for more information.

m Configure Application Assurance to provide deep-packet inspection and application-based subscriber traffic management; see chapter 77 for more information.

n Configure 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information.

o Use the 5620 SAM Service Test Manager to group OAM diagnostic tests into suites of manual and automatically-generated tests; see chapter 78 for more information.

p Configure Ethernet CFM to detect, isolate, and report connectivity faults in Ethernet networks; see chapter 80 for more information.

q Use the RCA audit tool to perform on-demand verifications of the configuration of services and physical links; see chapter 81 for more information.

10 Collect 5620 SAM and NE statistics to monitor 5620 SAM, network and service performance, compile equipment usage and billing data, and ensure SLA compliance; see the *5620 SAM Statistics Management Guide* for more information.

2 — 5620 SAM features

2.1 New for 5620 SAM Release 9.0 R7

Table 2-1 lists the features and functions added in 5620 SAM Release 9.0 R7.

Table 2-1 5620 SAM Release 9.0 R7 features

Feature or function	Description	Reference for more information
GUI enhancements		
—	—	—
Map enhancements		
Discovered physical link referencing	Support for manual referencing and unreferencing of physical links discovered through LLDP or the 5650 CPAM.	See Procedure 5-38 for more information.
5620 SAM System management enhancements		
—	—	—
Device management enhancements		
Sync alarm and alarm aggregation on GNE	GNE alarm catalogue supports GNE MTIE Alarm type. The system can raise an alarm on a GNE using System Address and/or Interface Index varbind positions.	See Chapter 13 for more information.
7210 SAS-D enhancements		
Synchronous Ethernet	The 7210 SAS-D Release 3.0 R6 supports the configuration of synchronous Ethernet.	See Procedures 20-1 and 19-24 for more information.
7210 SAS-D, 7210 SAS-E, 7210 SAS-M, and 7210 SAS-X enhancements		
SAA accounting files	The 7210 SAS-D Release 4.0 R1 and later, the 7210 SAS-E Release 4.0 R1 and later, the 7210 SAS-M Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 support the configuration and distribution of the SAA accounting record type.	See Procedure 78-4 for more information.
7210 SAS-M enhancements		
IGMP snooping	The 7210 SAS-M Uplink Release 4.0 R1 and later supports IGMP snooping.	See Procedure 71-2 and 71-3.
7210 SAS-M and 7210 SAS-X enhancements		
Port loopback	The 7210 SAS-M Release 3.0 R6 and later, and the 7210 SAS-X Release 3.0 R6 and later support the configuration of timed loopback type parameter on Ethernet ports.	See Procedure 20-1 for more information.
Split horizon groups	The 7210 SAS-M Network Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of split horizon groups, which can be bound to ports, VPLS L2 access interfaces, and spoke SDP bindings.	See Procedures 20-1, 20-14, 20-16, 71-3, 71-5, 71-13, and 71-14 for more information.
Routing policy configuration	The 7210 SAS-M Network Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of Community, Damping, and AS Path routing policies.	See Procedures 30-13 to 30-15 for more information.
BGP site configuration	The 7210 SAS-M Network Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the creation of BGP sites.	See Procedures 31-1 to 31-6 for more information.

(1 of 5)

Feature or function	Description	Reference for more information
Ethernet sub-ring enhancements	The 7210 SAS-M Release 4.0 R2 and later, and the 7210 SAS-X Release 4.0 R2 and later support the creation of Ethernet sub-rings with interconnections.	See Procedures 33-5 and 33-7 for more information.
VPRN configuration	The 7210 SAS-M Network Release 4.0 R2 and later, and the 7210 SAS-X Release 4.0 R2 and later support the following VPRN functions: • configuration of VPRN OAM diagnostics • creation of VPRN services • creation of VPRN L3 Access Interfaces • configuration of BGP on VPRN routing instances • creation of spoke SDP bindings on VPRN services • collection of various statistics on VPRN services	See Procedures 38-14, 74-1, 74-2, 74-5, and 74-10 for more information.
7210 network policy enhancements	The 7210 SAS-M Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of additional ingress parameters on network interface type network policies.	See Procedure 47-7 for more information.
7450 ESS and 7750 SR enhancements		
ISA TMS daughter card support	The 5620 SAM supports the ISA TMS daughter card on the 7750 SR-7 and 7750 SR-12, Release 9.0 R5 or later. Mixed mode is not supported on the ISA TMS daughter card.	See chapter 19 for more information.
7705 SAR enhancements		
VLL Hpipe service	The 5620 SAM supports VLL Hpipe service on DS1 ASAP MDA and 7705 SAR-M. Supported in 7705 SAR, Release 5.0 R1 and later.	See chapter 70 for more information.
MDA Mode	The 5620 SAM supports two MDA modes for channelized ASAP MDAs and two MDA modes for the 10-port 1GigE 1-port 10GigE X-Adapter card.	See MDA modes for the 7705 SAR in chapter 19 and Procedure 19-24 for more information.
Graceful restart and helper mode for OSPFv2	The 5620 SAM supports graceful restart and helper mode options on OSPFv2 routing instances.	See Procedure 31-22 for more information.
STP for MVPLS	The 5620 SAM supports spanning tree protocol for MVPLS L2 access interfaces. Supported on the 7705 SAR, Release 5.0 R1 or later.	See Procedure 71-3 for more information.
Fpipe enhancements	The 5620 SAM supports FR encapsulation on the following 7705 SAR-8/18 MDAs: • 16/32 x Channelized DS1/E1 ASAP v2 • 4 x Channelized DS3/E3 ASAP • 12 x Serial Data configured with X.21 or V.35 serial types	See MDA modes for the 7705 SAR in chapter 19 and Procedure 70-6 for more information.
	The 5620 SAM supports FR encapsulation on the i16 x Channelized DS1/E1 ASAP on the 7705 SAR-M.	See MDA modes for the 7705 SAR in chapter 19 and Procedure 70-6 for more information.

(2 of 5)

Feature or function	Description	Reference for more information
Ipipe enhancements	The 5620 SAM supports Ipipe services on ports configured for FR encapsulation.	See Procedure 70-8 for more information.
	The 5620 SAM supports IPCP encapsulation on OC3 channels of the 2 x Channelized OC3/STM1 ASAP SFP card.	See chapter 20 for more information.
	The 5620 SAM supports Ipipe services on ports configured for cHDLC encapsulation on DS1/E1 MDAs. Supported in 7705 SAR Release 5.0 R1 and later.	See MDA modes for the 7705 SAR in chapter 19 and Procedure 70-8 for more information.
	The 5620 SAM supports two configurable SAPs on an Ipipe service on the 7705 SAR Release 5.0 R1. SDP bindings cannot be bound to SAPs on Ipipe services that support two SAPs.	See Procedure 70-8 for more information.
Apipe enhancements	The 5620 SAM supports SAP aggregation groups on 7705 SAR Apipe services.	See Apipe (ATM VLL) in chapter 70, Procedure 70-4, and Procedure 70-14 for more information.
	The 5620 SAM supports the ATM N:1-N>1 VC type, allowing for interoperability to create a single Apipe service using SAP aggregation groups on a 7705 SAR Apipe service and connection profiles on a 7750 SR Apipe service.	See Apipe (ATM VLL) in chapter 70, Procedure 70-4, and Procedure 70-14 for more information.
	The 5620 SAM supports ATM encapsulation on E3 channels configured on the 4 x Channelized DS3/E3 ASAP card on the 7705 SAR-8/18, Release 5.0 R1 or later.	See MDA modes for the 7705 SAR in chapter 19 and Procedure 70-4 for more information.
Cpipe enhancements	The 5620 SAM supports Cpipe services on DS3, E3, and OC3 channels configured for CEM encapsulation.	See MDA modes for the 7705 SAR in chapter 19 and Procedure 70-9 for more information.
Service retargeting	The 5620 SAM supports copy and move functions for 7705 SAR SAPs on Cpipe, Hpipe, Fpipe, and Ipipe services.	See Procedure 20-5 for more information.
VPRN enhancements	The 5620 SAM supports eBGP on VPRN instances on the 7705 SAR, Release 5.0 R1 or later.	See Procedure 74-5 for more information.
VPLS MC QoS	The 5620 SAM supports configuring access ingress and network ingress aggregate rates on the 7705 SAR-M.	See Procedure 17-13 for more information.
Auxiliary alarm enhancements	The 5620 SAM supports configuring auxiliary alarm digital inputs as normally open or normally closed.	See Procedure 19-9 for more information.
LAGs	The 5620 SAM supports link aggregation groups on the 7705 SAR-8/18, Release 5.0 R1 or later. LAGs on the 7705 SAR can contain no more than two links and can be configured only on access ports.	See Procedure 18-13 for more information.
IEEE 1588 PTP transparent clock	The 5620 SAM supports end-to-end transparent clocks for IEEE 1588 PTP on the 7705 SAR-M/ME.	See IEEE 1588 PTP clock in chapter 19 and Procedure 19-6 for more information.
Differential clock recovery	The 5620 SAM supports differential clock recovery on the 7705 SAR-M/ME, Release 5.0 R2 or later.	See Procedures 20-40 and 20-41 for more information.
DS1 channels	The 5620 SAM supports DS1 channels on the 2 x Channelized OC3/STM1 ASAP SFP MDA.	See chapter 20 for more information.
SDI and 6 x EM for 7705 SAR-18	The 5620 SAM supports the SDI and 6 x EM cards on the 7705 SAR-18.	See 7705 SAR 12-port SDI card and 7705 SAR six-port E&M daughter cards in chapter 12, Procedure 20-13, and Procedure 20-42 for more information.
Sub-rate speeds for SDI	The 5620 SAM supports sub-rate speeds for RS232 and X.21 serial types.	See Procedure 20-42 and the Speed parameter description for more information.

(3 of 5)

Feature or function	Description	Reference for more information
Power Injector card	The 5620 SAM supports the Microwave Power Injector card on the 7705 SAR-8/18 at beta level.	See 7705 SAR Power Injector card in chapter 12 for more information.
8-port Ethernet SFP card	The 5620 SAM supports the 8-port 10/100/1000 Ethernet SFP card on the 7705 SAR-8/18 at beta level.	See chapter 12 for more information.
10-port 1GigE/1-port 10GigE X-Adapter card	The 5620 SAM supports the 10-port 1GigE/1-port 10GigE X-Adapter card. This card is supported on the 7705 SAR-18 and can be configured to operate with ten 1-gigabit ports or with one 10-gigabit port at beta level.	See 7705 SAR 10-port 1GigE/1-port 10GigE X-Adapter card in chapter 12 and MDA modes for the 7705 SAR in chapter 19.
1, 2, 4, and 8-colour Optical Add/Drop Mux card	The 5620 SAM supports the OADM card in 1, 2, 4, and 8-colour variants on the 7705 SAR-8/18.	See 7705 SAR Optical Add/Drop Mux cards in chapter 12 for more information.
7705 SAR-M/ME	The 5620 SAM supports the 7705 SAR-M/ME node with variant chassis, integrated cards, and a module card slot.	See 7705 SAR-M daughter cards chapter 12 for more information.
7705 SAR-M/ME expansion module MDAs	The 5620 SAM supports the following plug-in module MDAs on the 7705 SAR-M/ME: • GPON module • DSL module • DSL combo module (DCM) • 1 Colour Optical Add/Drop Mux module (OADM)	See 7705 SAR-M daughter cards in chapter 12 and Procedure 19-27 for more information.
7705 SAR-8 v2 chassis	The 5620 SAM supports the 7705 SAR-8 v2 chassis.	See chapter 12 for more information.
9500 MPR enhancements		
ERP (G.8032) support	Support for configuring Ethernet Ring Protection (G.8032) on the 9500 MPR, Release 3.1 or later devices. ERP provides rapid detection and recovery time if a link or node fails.	See chapters 12 and 33 for more information.
EVPL mode on 9500 MPR (dot1q) VLAN services	Support for configuring the EVPL mode on 9500 MPR (dot1q) VLAN services. This allows you to configure a Point to Point VLAN service between 9500 MPR NEs.	See Procedure 69-8 for more information.
NEtO support enhancement	Support for opening NEtO sessions using the 5620 SAM GUI for the 9500 MPR, Release 3.3, has been added and simplified.	See Procedure 13-15 for more information.
OmniSwitch enhancements		
—	—	—
Network management enhancements		
—	—	—
Protocol enhancements		
—	—	—
Policy enhancements		
Auto tunnel enhancement	Support for the Import Administrative Groups parameter on Auto Tunnel rules for SDP tunnels.	See chapter 52 for more information.
SLA profile enhancements	Support for new ingress and egress report-rate parameters on SLA profiles.	See Procedure 68-13 for more information.
Service management enhancements		

(4 of 5)

Feature or function	Description	Reference for more information
Enumerated forwarding class values for OAM tests	When you mouse over the drop-down list of Forwarding Class parameter options on the Test Parameters tab of an OAM test configuration form, a tool tip displays the numeric value of each forwarding class. Also, in test results sent to the OSSI, the 5620 SAM returns the numeric forwarding class value in addition to the alphanumeric identifier.	—
VLAN customer configurable	You can choose the customer associated with a VLAN service after service creation.	—
Option to populate device site name with service name	You can enable a global 5620 SAM option that populates the service site name property on an NE using the service name when an NE is added as a service site.	See chapter 67 for more information.
Additional features		
—	—	—
5620 SAM documentation enhancements		
—	—	—
Discontinued support		
—	—	—

(5 of 5)

2.2 5620 SAM Release 9.0 R6

5620 SAM Release 9.0 R6 is a maintenance release. No features have been added.

2.3 5620 SAM Release 9.0 R5

Table 2-2 lists the features and functions added in 5620 SAM Release 9.0 R5.

Table 2-2 5620 SAM Release 9.0 R5 features

Feature or function	Description	Reference for more information
GUI enhancements		
Search message	For lists that do not populate automatically, the message “Press "Search" to populate list.” displays in the result panel when you first open the list form.	See section 3.2 for more information.
Search filters	The search filter DOES NOT CONTAIN is added to allow more precise filtering of text strings, IP addresses, and MAC addresses.	See Using search filters in chapter 3 for more information.
Equipment group filters	You can filter when you search for new alarms, historical alarms, managed equipment objects, and managed service objects by equipment that is organized by topology group.	See Equipment group filters in chapter 3 for more information.

(1 of 9)

Feature or function	Description	Reference for more information
Apply changes to object-level tabs on configuration forms	The Apply Tab button is added to the NE and composite services configuration forms. On these forms, changes implemented by pressing the Apply Tab button apply only to the current object-level tab.	See Modified configuration forms in chapter 3 for more information.
Configuration form enhancements for composite services	The following 5620 SAM client GUI configuration form enhancements are extended to the composite services configuration form: • the navigation tree is now on the left side of composite service configuration forms, for improved object accessibility • the ability to undock configurable object forms from the main composite service configuration form window	—
Equipment Window form no longer supported	The Equipment Window form has been removed from the 5620 SAM client GUI. Information that was previously accessible through the Equipment Window continues to be accessible from object properties forms. The graphical representation of a device shelf is accessible from the Shelf object on the navigation tree. Detailed inventory information is accessible from the Inventory tab on the NE configuration form.	See section 19.2 for more information about accessing the graphical representation of a device. See chapter 22 for more information about accessing inventory information.
General configuration form enhancement	A More Actions button has been added to all configuration forms. Clicking the More Actions button displays a contextual menu of configuration form options.	—
Mandatory field or incorrect data indicator	The asterisk indicator is extended to script and template configuration forms.	—
Scripts shortcut	The introduction of this shortcut allows users with the appropriate scope of command roles to associate scripts and templates to object types directly from the navigation tree, map objects, or the configuration form without having to navigate through the Script Manager.	See Table 4-2 in chapter 4 for more information about the Scripts shortcut option.
New default topology group	Newly added unmanaged network elements appear in a topology group called Unmanaged NEs. You can drag and drop unmanaged network elements from this topology group to any other group on the topology map or in the navigation tree.	See chapter 16 for more information.
Map enhancements		
Alarmed links/All links button enhancement	The ability to display specific links with associated alarms is added to the All links shown button.	See Table 5-1 in chapter 5 for more information.
5620 SAM System management enhancements		
—	—	—
Device management enhancements		
Vendor-specific ICMP extensions	The ability to configure vendor-specific ICMP extensions is extended to the 7450 ESS, 7710 SR, and 7750 SR device types.	See Procedure 17-12 for more information.
New alarm for 7450 ESS, 7710 SR, and 7750 SR nodes	The Configuration Roll Back Status alarm has been introduced for the 7450 ESS, 7710 SR, and 7750 SR nodes Release 9.0 R4 and later.	See the *5620 SAM Alarm Reference* for more information.
7210 SAS-D enhancements		
Y.1731 Ethernet OAM	The 7210 SAS-D Release 3.0 R5 and later supports EthTest, One Way Delay, and Two Way Delay.	See Procedure 18-13 for more information.

(2 of 9)

Feature or function	Description	Reference for more information
Synchronous Ethernet	The 7210 SAS-D 6F 4T ETR Release 3.0 R5 and later supports the configuration of timing synchronization.	See Procedure 19-5 for more information.
Port Clock Mode	The 7210 SAS-D Release 3.0 R5 and later supports the configuration of a new Port Clock Mode parameter on Ethernet ports.	See Procedure 20-1 for more information.
Ethernet Ring Protection	The 7210 SAS-D Release 3.0 R5 and later supports the configuration of Ethernet Ring Protection.	See Procedures 33-7 and 33-10 for more information.
IGMP Snooping	The 7210 SAS-D Release 3.0 R5 and later supports IGMP Snooping.	See Procedure 71-2 for more information.
7210 SAS-D and 7210 SAS-E enhancements		
Port Threshold in LAG	The 7210 SAS-D Release 3.0 R5 and later, and the 7210 SAS-E Release 3.0 R5 and later support the configuration of Port Threshold parameters when creating a LAG.	See Procedure 18-13 for more information.
MSTP	The 7210 SAS-D Release 3.0 R5 and later, and the 7210 SAS-E Release 3.0 R5 and later support the creation of MSTP sites for an MVPLS.	See Procedure 71-10 for more information.
7210 SAS-D, 7210 SAS-E, and 7210 SAS-M enhancements		
IP MTU	The 7210 SAS-D Release 3.0 R5 and later, the 7210 SAS-E Release 3.0 R5 and later, and the The 7210 SAS-M Uplink Release 3.0 R5 and later support the configuration of IP MTU on L3 access interfaces.	See Procedures 20-1 and 73-1 for more information.
7210 SAS-D, 7210 SAS-E, 7210 SAS-M, and 7210 SAS-X enhancements		
Accounting policy statistics collection	The 7210 SAS-D, the 7210 SAS-E, the 7210 SAS-M, and the 7210 SAS-X support the collection of accounting policy statistics.	See the *5620 SAM Statistics Management Guide* for more information.
7210 SAS-D and 7210 SAS-M enhancements		
Transit SAPs	The 7210 SAS-D Release 4.0 R1 and later, and the 7210 SAS-M Uplink Release 4.0 R1 and later support the configuration of transit SAPs for VPLS and Epipe services.	See Procedures 70-2 and 71-2 for more information.
IP Interface for VPLS service	The 7210 SAS-D Release 3.0 R5 and later, and the 7210 SAS-M Uplink Release 3.0 R5 and later support IP Interfaces for VPLS service.	See Procedure 71-2 for more information.
7210 SAS-M and 7210 SAS-X enhancements		
MC LAG	The 7210 SAS-M Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of MC Peer, MC LAG, and MC Sync.	See chapters 41, 43, and 44 for more information.
7210 Port Access Egress policies enhancements	The 7210 SAS-M Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support additional options for the configuration of 7210 Port Access Egress policies.	See Procedure 47-4 for more information.
7210 MPLS LSP-Exp Map policy configuration	The 7210 SAS-M Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of 7210 MPLS LSP-Exp Map policies.	See Procedure 47-26 for more information.
PBB	The 7210 SAS-M Network Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of PBB on B-VPLS, I-VPLS, and Epipe services.	See Procedures 70-2, 71-11, and 71-12 for more information.
PW Redundancy	The 7210 SAS-M Network Release 4.0 R1 and later, and the 7210 SAS-X Release 4.0 R1 and later support the configuration of PW Redundancy on a VPLS service.	See Procedures 71-1 and 71-5 for more information.

(3 of 9)

Feature or function	Description	Reference for more information
7450 ESS and 7750 SR enhancements		
New daughter card support	The 5620 SAM supports the following new daughter cards: • 4 x ATM OC12/OC3 SFP B on the 7750 SR, Release 9.0 R6 or later and on the 7450 ESS, Release 9.0 R6 or later • 16 x ATM OC3 SFP B on the 7750 SR, Release 9.0 R6 or later and on the 7450 ESS, Release 9.0 R6 or later • 16 x OC12/OC3 SFP B on the 7750 SR, Release 9.0 R4 or later and on the 7450 ESS, Release 9.0 R4 or later • 4 x OC48 SFP B on the 7750 SR, Release 9.0 R4 or later and on the 7450 ESS, Release 9.0 R4 or later In addition to supporting the functions on the existing non-B version of the daughter card, these new daughter cards support the configuration of loop-timing on a per-port basis.	See chapter 19 for more information.
Extended WAN-PHY support	Configuration of an Ethernet interface as a WAN-PHY interface is extended to the 12-port 10-Gbyte Magma IMM. WAN-PHY is configured using the XGig Mode parameter.	See chapter 20 for more information.
Stateless APS switchover	Support for the Stateless Aps Switchover parameter, which is configurable for MLPPP APS bundles.	See the *5620 SAM Parameter Guide* for more information.
7705 SAR enhancements		
7705 SAR-M 5.0 support at 7705 SAR 4.0 feature parity	Support for the 7705 SAR-M 5.0, with feature support at parity with the 7705 SAR 4.0. Includes the 7-port Ethernet card and 16-port ASAP card.	See chapter 12 for more information.
9500 MPR enhancements		
Multiple radio links support	Support for multiple radio links between two 9500 MPR devices.	See chapter 13 for more information.
VLAN path creation and management enhancements	The 5620 SAM extends the existing manual VLAN path management to automate the process of creating VLAN paths for redundant and non-redundant configurations. Three VLAN creation options are now available: manual, automatic, and point 2 point.	See chapter 70 for more information.
Configuration of TDM ports on 9500 MPR cards	You can only configure the administrative state of TDM ports on the following 9500 MPR cards when the Signal mode parameter associated with the port is set to an option other than disabled. • 32 x E1 (ETSI) • 32 x DS1(ANSI) • 16 x E1 ASAP Access (ETSI) • 2 x DS3 (ANSI) This functional change was made so the default administrative state of the TDM ports is IETF compliant.	See chapter 12 for more information.

(4 of 9)

Feature or function	Description	Reference for more information
LAG object support	LAG object support for the following ports in 9500 MPR Release 3.1.0: • MPT-HC • MPT-MC • MPT-HL LAG object support for the following ports in 9500 MPR Release 3.2.0: • MPT-HC • MPT-MC • MPT-HL • MD300 • Ethernet	See section 12.19 for more information.
Port segregations for LAGs	You can segregate ports from one LAG to another and from one LAG to another port.	See Procedure 20-27 for more information.
Core-enhanced card enhancements	The 5620 SAM supports the direct connection of MPT radio ports on core-enhanced cards on the ETSI and ANSI 3.1.0 or later of 9500 MPR devices. MPT-HC, MPT-HCv2, MPT-MC, and SFP are supported.	See chapter 12 for more information.
MPT-HCv2 support	The 5620 SAM supports MPT-HCv2 for 2+2 x Ethernet (EAS) cards and core-enhanced cards.	See chapter 12 for more information.
4+4 x Ethernet (EAS) card enhancements	The 4+4 x Ethernet (EAS) card with MPT-HL support can be configured on any card slot on the 9500 MPR ANSI 3.1 or later.	See chapter 12 for more information.
2+2 x Ethernet (EAS) card enhancements	The 5620 SAM supports the 2+2 x Ethernet (EAS) card with MPT-HC and MPT-MC support for ANSI 3.1 or later.	See chapter 12 for more information.
Service-in-service automatic discovery	The 5620 SAM now automatically associate a transport service with a newly discovered service tunnel when a physical link is created between a 9500 MPR and a non-MPR NE.	See chapter 70 for more information.
Power level performance management enhancements	Additional statistics have been added for power level performance management and plotter functions for: • Hop Current Data Stats • Link Current Data Stats • RSL Hop Current Data Stats • HSL Hop Current Data Stats	See Procedure 20-28 for more information. See the *5620 SAM Statistics Management Guide* for more information on plotter functions.
SDH 1+1 protection and card support for ETSI 3.1 and later	Support for 2xSTM card with SFP-O and SFP-E for ETSI 3.1 and later.	See Procedure 20-22 for more information.
SDH channelized and protection support for ETSI 3.1 and later	Support for 1xSTM channelized card with SFP-O and SFP-E for ETSI 3.1 and later.	See Procedure 20-23 for more information.
Radio and Ethernet LAG support	Support for Radio and Ethernet LAG Aggregation type.	See Procedure 18-17 for more information.
XPIC (1+1 redundancy)	XPIC is an ODU which draws power and data from a 2+2 EAS card when the port is configured as MPT-HC.	See chapter 12 for more information.
QoS configuration	The 5620 SAM provides QoS configuration support on the 9500 MPR. The 9500 NE QoS policy supports mapping and global queue settings and the 9500 Radio Interface Queue Map policy supports queue size settings of the radio interface.	See Procedures 47-33 and 47-34 for more information.

(5 of 9)

Feature or function	Description	Reference for more information
NE date and time configuration	The 5620 SAM provides NE date and time configuration on the 9500 MPR.	See Procedure 17-2 for more information.
OmniSwitch enhancements		
OmniSwitch 10K support	The 5620 SAM supports the OS 10K Modular Ethernet LAN switch. The switch has a 12-slot chassis configuration with Ethernet, Gigabit Ethernet, and 10 Gigabit Ethernet capabilities.	See chapter 12 for more information.
OmniSwitch 6900 support	The 5620 SAM supports the OS 6900 family of standalone aggregation switches that consists of two models: the OS 6900-X40 (1.28 Tb/s) and the OS 6900-X20 (640 Gb/s).	See chapter 12 for more information.
LLDP support	Support for LLDP on the OS 10K and OS 6900.	See Procedures 17-9 and 20-34 for more information.
LAG support	Support for the creation of LAGs on the OS 10K and OS 6900.	See Procedure 18-16 for more information.
Ethernet port configuration support	Support for the configuration of Ethernet ports on the OS 10K and OS 6900.	See Procedure 20-34 for more information.
OAM VLAN service support	Support for performing OAM diagnostic tests from the service topology view has been added for all OmniSwitch devices which support VLAN services except for enterprise (SME) OS 6250 devices. Tests supported include: continuity checking, loopbacks, one-way delay, two-way delay, and CFM link trace.	See chapters 38 and 80 and for more information.
Network management enhancements		
Advanced JMS message filters	You can create advanced filters to reduce the number of JMS event messages sent to OSS clients. An advanced JMS message filter is a 5620 SAM-O XML filter that specifies the following: • the types of event notifications that are to be sent to the client • a set of object properties to use as match criteria for messages sent to the client	See the *5620 SAM XML OSS Interface Developer Guide* for more information.
registerLogToFile supports performance statistics export	You can use the 5620 SAM-O registerLogToFile method to export performance statistics, in addition to accounting statistics.	See the *5620 SAM XML OSS Interface Developer Guide* and *5620 SAM Statistics Management Guide* for more information.
registerSasLogToFile supports retrieval of OAM logs	You can use the 5620 SAM-O registerSasLogToFile method to retrieve OAM logs that are based on specific class types.	See chapter 38 for more information.
Script cascading	You can use the 5620 SAM Script Manager to organize scripts in logical groups, or bundles, which permit interoperation between scripts in the bundle, or cascading. Scripts in a bundle can pass parameters to, and call, other scripts in the same bundle.	See the *5620 SAM Scripts and Templates Developer Guide* for more information.
Script scheduling	You can use the 5620 SAM to schedule script execution.	See the *5620 SAM Scripts and Templates Developer Guide* for more information.
TCA enhancements	The TCA function improvements include the following: • profile configuration for ease of management • custom threshold creation • delta threshold configuration	See chapter 26 for more information.

(6 of 9)

Feature or function	Description	Reference for more information
1+1 optimized APS groups	You can configure an SC APS group as 1+1 optimized. This architecture is optimized for networks which use predominantly bidirectional switching.	See chapter 40 for more information.
Create All Channel Support for APS Groups	Create All Channel is extended to APS and MC-APS port.	See chapter 20 and 40 for more information.
Querying network resources	Support added to view current network resources such as IP addresses, RDs and RTs, and MAC addresses.	See Procedure 30-1 for more information.
Protocol enhancements		
BGP Add-Path	You can configure a BGP site, group, or peer to send and receive BGP Add-Path route advertisements. Routers configured for BGP Add-Path will retain multiple paths to a single destination in its routing table.	See chapter 31 for more information.
PPPoA and PPPoEoA support	The 5620 SAM supports the configuration of PPPoA and PPPoEoA network protocols.	See Procedures 19-24, 66-2, 68-5, 68-20, 68-4, 68-35, 73-8, and 74-14, for more information.
Policy enhancements		
NE Management Access Filters enhancements	The 5620 SAM supports the configuration of new Log and Router parameters when creating IPv4 and IPv6 entries for NE Management Access Filters.	See Procedure 21-1 for more information.
Service management enhancements		
Service path search enhancements	Support for multi-segment tunnel selection and redundant path selection functionality.	See chapter 64 for more information.
Link LDP hello adjacency tracking	Support for Enable Fast Re-route parameter on LDP sites, and Enable BFD Tracking parameter on LDP interfaces. Support for Enable Loop-free Alternate parameter on ISIS sites.	See chapter 31 for more information.
Validation function for composite services	A test suite can now be used to validate a composite service.	See Procedure 76-3 for more information.
MS PW routing	Support for Multi-segment pseudo-wire routing to provide solutions for inter-domain services by using dynamic MS PW routing and signaling.	See chapter 75 for more information.
Tunnels for services	The concept of a service tunnel has been broadened to include services acting as tunnels as well.	See chapter 33 for more information.
Ethernet CFM Up MEP SAP generation for Epipe and VPLS	End-to-end test suite generation is now available for VPLS and VLL Epipe services.	See chapter 80 for more information.
GARP configuration on SRRP instances	New FIB Population Mode parameter for SRRP instances on IES and VPRN group interfaces.	See chapters 73 and 74 for more information
Usage-based billing	Usage-based billing groups can be enabled at the application profile level and associated with application groups and applications for application reporting to the 5670 RAM.	See chapter 77 for more information.
Application performance reporting	Support for DCP summarization to add route configuration to AA reporting data.	See chapter 77 for more information.
Transit prefix policies	Transit prefix policies can be configured to specify network or subscriber IP addresses for the creation of transit subscribers.	See chapter 77 for more information.

(7 of 9)

Feature or function	Description	Reference for more information
AA enhancements	The following enhancements are added for AA support: • ISA-AA support for HTTP expression matching • ISA-AA support for X-Online-Host • AA is supported on the 7750 SR-c12 • AA is supported for mixed mode on the 7450 ESS • IPv6 is supported for AA • You can set the administrative state for AA protocol stats in order to enable or disable AA protocol stats collection for specific partitions • You can view application filter hit stats	See chapter 77 for more information.
HTTP error redirect policies	Support for HTTP error redirect templates and error codes.	See chapter 77 for more information.
Spoke SDP FEC support	Support for spoke SDP FEC configuration on VLL Epipe service.	See chapter 70 for more information.
QPPB support	Support for Forwarding Class Name and Forwarding Class Priority configuration on routing policy statements and static routes. QoS Route Lookup (IPv4 and IPv6) configuration on subscriber group interfaces on IES and VPRN, L3 access interfaces on IES and VPRN, and base router network interfaces.	See chapters 30, 73, and 74 for more information
Port down on CRC support	Detects internal hardware errors on Ethernet ports, disables the associated port, and raises an alarm. New Down on Internal MAC Tx Error parameter, as well as CRC SD threshold and CRC SF threshold parameters.	See chapter 20 for more information.
Packetization buffer size calculation on CEM SAPs	Addition of the Packetization Buffer (ms) parameter, which is configurable for a CEM SAP on a Cpipe service. The new parameter removes the need for customers to manually calculate the packetization buffer size.	See chapter 70 for more information.
MEG sub-groups	MEPs can be divided into logical groupings called MEG sub-groups which allow you to direct Ethernet CFM to specific areas of the system.	See chapter 80 for more information.
GNE service sites	GNEs can be configured as service site objects and service interface objects on the service configuration forms. Supported on all VLLs, all 9500 MPR VLLs, VPLS, MVPLS, VPRN, and IES.	See chapters 70, 71, 73, and 74 for more information
Shared Domain ID	The Maintenance Domain ID parameter specifies a unique Maintenance Domain ID that can be forced to an NE.	See chapter 70 for more information
Customized STM test settings locked	Test Suite test settings can be locked to prevent loss of customized configurations	See chapter 78 for more information
Over-subscription thresholds	Operator can configure new thresholds associated to the access and network pools (including named pools)	See chapter 19 for more information
LSP manual switchover commands	Operator can perform manual switchover of LSPs	See Procedure 32-17 for more information
VPRN indirection for edge resilience	A backup path capability was added to all levels of BGP and to VPRN	See chapters 31 and 74 for more information
SRRP enhancements for PPPoE redundancy and PPPoE dual chassis Redundancy with MCS	Allows redundant shelves to establish PPPoE sessions for subscriber management	See chapters 41, 73 and 74 for more information
Alarms for composite services	Allows user to enable alarm aggregation for composite services	See chapters 67 and 76 for more information

(8 of 9)

Feature or function	Description	Reference for more information
Additional features		
CLI command to display active card alarms	Addition of Alarm Management and Maximum Cleared Alarms parameters to NE properties form for the 7450 ESS, 7710 SR, and 7750 SR. The new parameters allow customers to view NE alarms through the CLI	See chapter 19 for more information.
Script Editor and GUI Builder enhancements	The collapsible panel functionality is extended to include the GUI builder and associated templates, and CLI and XML API configuration scripts.	See the *5620 SAM Scripts and Templates Developer Guide* for more information.
5620 SAM documentation enhancements		
New on-product help system	A new on-product help system consolidates all 5620 SAM user documentation, delivering customer documentation and resources in both HTML and PDF.	See Help→User Documentation on the 5620 SAM GUI
5620 SAM Alarm Reference	The *5620 SAM Alarm Reference* is a new document that consolidates the 5620 SAM alarms from the *5620 SAM Troubleshooting Guide* and other 5620 SAM documents. The alarms are organized in chapters, by device type.	See the *5620 SAM Alarm Reference*.
Discontinued support		
—	—	—

(9 of 9)

2.4 5620 SAM Release 9.0 R4

5620 SAM Release 9.0 R4 is a maintenance release. No features have been added.

2.5 5620 SAM Release 9.0 R3

Table 2-3 lists the features and functions added in 5620 SAM Release 9.0 R3.

Table 2-3 5620 SAM Release 9.0 R3 features

Feature or function	Description	Reference for more information
GUI enhancements		
Text messaging enhancements	The 5620 SAM GUI client text messaging has been enhanced to include: • Messages are now uniquely identified with the Client ID number of the message sender. • A reply function has been added taking the Client ID into account, so that an operator receiving a text message can send a response immediately.	See Procedure 3-23 for more information.
Objects added to navigation tree	The Fans and Power Supplies objects are added to the navigation tree NE objects. Fan and power supply object display is not supported for 1830 PSS NEs.	—

(1 of 5)

Feature or function	Description	Reference for more information
User switching	You can switch to a different 5620 SAM GUI user by choosing a main menu option.	See chapter 3 for more information.
Main menu changes for Layer 2 policies	The Policies→Layer2 menu has changed to Policies→Ethernet.	—
5620 SAM system management enhancements		
Automatic database backup file set compression	You can configure the 5620 SAM Database Manager to automatically gzip and tar a database backup file set, which eases file management and conserves disk space.	See chapter 8 for more information.
Increased database security	The 5620 SAM database user and Oracle SYS user password algorithms are enhanced to meet U.S. Department of Defense requirements.	See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for information about setting these passwords during a 5620 SAM system installation or upgrade. See the *5620 SAM Maintenance Guide* for information about changing the passwords after an installation or upgrade.
Remove empty services	System Preferences option to remove from the 5620 SAM any service objects that have no sites configured.	See chapter 67 for more information.
New CPM/Switch Fabric 4	The 500 Gb/s CPM/ Switch Fabric 4 is supported on the 7750 SR-7, and 7450 ESS-7. The 1 Tb/s CPM/Switch Fabric 4 is supported on the 7750 SR-7, 7750 SR-12, 7450 ESS-7, and 7450 ESS-12.	See chapter 17 for more information.
Device management enhancements		
DS0 group level channelization	Supports the automatic configuration of sub-channels and assignment of timeslots on port in DS0 groups.	See chapter 20 for more information
Consolidated view of DS0 group timeslot assignments	Supports a consolidated view of channels that are assigned in DS0 groups. You can disable, enable, or reassign the assignment of timeslots within a DS0 group using the associate properties form.	See chapter 20 for more information
Script locking	A 5620 SAM GUI operator can prevent other 5620 SAM users from executing, modifying, and deleting CLI script targets and XMLAPI instances created by the current user.	See the *5620 SAM Scripts and Templates Developer Guide* for more information.
New alarms for 1-Port 100GE CFM IMM	The following alarms have been introduced for the 1-Port 100GE CFM IMM— No AM Lock, No Block Lock, and Duplicate Lane.	See the *5620 SAM Troubleshooting Guide* for more information.
7210 SAS-M and 7210 SAS-X enhancements		
Timing enhancements	Quality level and SSM (Synchronous Status Messages) parameters can be configured on 7210 SAS-M and 7210 SAS-X shelves or ports, respectively.	See Procedures 19-5 and 20-1 for more information.
BFD on static routes	BFD can be enabled for static routes on a 7210 SAS-M or a 7210 SAS-X.	See Procedure 30-20 for more information.
PW standby signalling	PW standby signalling can be enabled for a VLL Epipe service on a 7210 SAS-M or a 7210 SAS-X.	See Procedure 70-1 for more information.
7210 SAS-X enhancements		
Egress Scheduler Mode	The Egress Scheduler Mode and Aggregate Rate Limit parameters can be configured on the access ports of a 7210 SAS-X, or a SAP, respectively.	See the *5620 SAM Parameter Guide* for more information.

(2 of 5)

Feature or function	Description	Reference for more information
7450 ESS and 7750 SR enhancements		
IEEE 1588 PTP clock	IEEE 1588 PTP clock support in 7450 ESS and 7750 SR Release 9.0 R4.	See Procedure 19-10 for more information.
IEEE 1588 PTP peer	IEEE 1588 PTP peer support in 7450 ESS and 7750 SR Release 9.0 R4.	See Procedure 19-11 for more information.
7705 SAR enhancements		
BITS clock on 7705 SAR 18	The 7705 SAR 18 supports the BITS timing reference. Supported in 7705 SAR Release 4.0 R2.	See chapter 19 for more information.
Standby Signaling Slave	Support for the Enable PW Standby Signaling Slave parameter on VLL Epipe, Cpipe, Ipipe, and Apipe endpoints. Supported in 7705 SAR Release 4.0 R2.	See chapter 70 for more information.
SAA Accounting Files	Support for the configuration of SAA accounting files for the collection of results from the CFM Loopback, CFM Link Trace, and CFM Two Way Delay tests. Supported in 7705 SAR Release 4.0 R2.	See chapter 78 for more information.
BFD for T-LDP	BFD Enabled parameter support on LDP peers in 7705 SAR Release 4.0 R3.	See chapter 31 for more information.
IEEE 1588 PTP clock	IEEE 1588 PTP clock support in 7705 SAR Release 4.0 R3.	See chapter 19 for more information.
OSPFv3	OSPFv3 protocol support in 7705 SAR Release 4.0 R4.	See chapter 31 for more information.
IPv6 BFD support	IPv6 BFD on network interfaces and IES L3 access interfaces. Supported in 7705 SAR Release 4.0 R3.	See chapters 30 and 73 for more information.
Device discovery and management over IPv6	Support for discovery and management of 7705 SAR NEs over IPv6. Supported in 7705 SAR Release 4.0 R1.	See chapters 13 and 14 for more information about device discovery and management using IPv6.
STP with VPLS	Support for STP on VPLS services. Supported in 7705 SAR Release 4.0 R4, consistent with the 7750 SR, 7450 ESS, and 7710 SR Release 7.0.	See chapter 71 for more information.
Multiple E1 multi-frames in single PW	The Payload Size parameter is configurable for a CEM SAP on a Cpipe service for VC type CESoPSN-CAS. Supported in 7705 SAR Release 4.0 R4 on the following hardware: • 16-port T1/E1 ASAP V1 and V2 adapter card • 32-port T1/E1 ASAP V2 adapter card • 7705 SAR-F	See chapter 70 for more information.
OmniSwitch enhancements		
Secure FTP client support for OS devices	The 5620 SAM supports secure and non-secure file transfers for backups, restores, software upgrades, and statistics collection. Secure file transfers using SSH2 is supported by all OS devices. The device mediation policy determines whether FTP or SCP is used during file transfers.	See chapter 14 for more information about configuring SSH2 on OS devices.
OS 6250M (Metro) device SLA testing	The 5620 SAM CPE SLA Test Head function allows you to perform a CPE SLA test using a CPE test-head profile or a group of profile on OS 6250M (Metro) devices. You can also run several tests on a CPE test-head profile or a group of profiles.	See chapter 78 for more information.
OS9-GNI-P24E Network Interface card support	The 5620 SAM supports the OS9-GNI-P24E Network Interface card on the OS 9700E and OS 9800E NEs.	See chapter 12 for more information.

(3 of 5)

Feature or function	Description	Reference for more information
Network management enhancements		
Dual Stack Lite address	A DS Lite address can be added when configuring NAT on a routing instance.	See Procedure 30-22 for more information.
IPCP subnet negotiation	A subnet can be assigned to a PPP host through the local user database by configuring the IPCP Subnet Negotiation or IP Address Prefix Length parameters when appropriate.	See Procedures 31-30, 68-3, and 68-32 for more information.
LI NAT sources configuration	LI NAT sources can be configured from the properties form of a mirror service.	See Procedure 34-9 for more information.
Protocol enhancements		
Multiple OSPF area IP interfaces	Support for multiple OSPF area IP interfaces extended to OSPFv3 areas on the 7750 SR, 7450 ESS, and 7710 SR.	See chapter 31 for more information.
IGMP source and statistics viewing	The source of an IGMP group interface SAP group, as well as the statistics for an IGMP group interface SAP, can be viewed from the properties form of an applicable service.	See Procedure 31-42 for more information.
Policy enhancements		
Override policy aggregation	For policy types that allow multiple overrides to be configured, the Override Policy Items tab on the 5620 SAM GUI allows you to aggregate all subordinate override policies.	See chapter 46 for more information.
Connection profile policy	A connection profile is a list of VPI and VCI pairs that is supported on the 7750 SR-7, 7750 SR-12, 7750 SR-c12, 7750 SR-c4, 7450 ESS-7, and 7450 ESS-12. A connection profile SAP can be used to associate the ATM channel with a connection profile policy.	See chapter 57 for more information.
Policer mapping to local queue	Traffic flowing through a policer can now be directed to subsequently flow through an access egress queue.	See Procedure 47-3 for more information.
Percentage-based bandwidth in QoS policies	PIR and CIR shaping rates can now be specified as a percentage of available bandwidth for QoS ingress and egress queues, policers, and SAP overrides.	See Procedures 47-1, 47-3, and 47-44 for more information.
MSS for Hpol	The Aggregation Scheduler now supports the ability to add an ingress and egress policer control policy to further enhance rate limiting. This can only applied to an IOM3 port.	See Procedure 47-29 for more information.
ACL filter re-ordering confirmation	When defining the order in which an ACL IP filter policy tries to match filter ID entries with packets, a confirmation pop-up is invoked before the change is applied.	See Procedure 48-1 for more information.
HSMDA configurable Burst Thresholds	The 5620 SAM now supports specifying an explicit shaping burst size for an HSMDAv2.	See Procedures 19-24, 20-1, 47-3, and 47-12 for more information.
QoS and ACL MAC filtering based on VLAN ID	The 5620 SAM now allows SAPs to perform QoS and MAC filtering based on the VLAN ID field. This feature is applicable to VPLS, I-VPLS, MVPLS, and Epipe SAPs configured on IMM and IOM3 hardware.	See Procedures 48-3 and 47-1 for more information.
Routing policy enhancements	When configuring a local routing policy statement, the interface index of the interface to which IGMP multicast traffic is to be redirected can be specified.	See Procedure 30-11 for more information.
Ingress multicast reporting destination policy creation and statistics viewing	An ingress multicast reporting destination policy can be created, and the related statistics for a particular NE can be viewed.	See Procedures 49-5 and 49-5 for more information.

(4 of 5)

Feature or function	Description	Reference for more information
Subscriber multicast CAC policy creation	A subscriber multicast CAC policy can be created.	See chapter 68 for more information.
Subscriber profile policy bindings	Both an IGMP policy and a subscriber multicast CAC policy can be bound to a subscriber profile.	See chapter 68 for more information.
PPP Idle Timeout	When creating or modifying an SLA profile, PPP Idle Timeout can be configured for a category.	See chapter 68 for more information.
IGMP policy enhancements	Additional parameters can be configured in the multicast reporting panel on the properties form of an IGMP policy. A redirection policy for filtering IGMP packets can be specified.	See chapter 68 for more information.
Service management enhancements		
Ethernet-CFM redundancy	You can configure Ethernet-CFM redundancy to link MEPs to the state of the resiliency mechanism that is supported in MC-LAGs.	See chapter 80 for more information.
Virtual port statistics	Virtual port statistics can now be displayed for all queues forwarding to a virtual port configured on the egress of an Ethernet port.	See chapter 66 for more information.
5620 SAM documentation enhancements		
Scope of command roles and permissions appendix	An appendix featuring tabular lists of the following information: • All assignable scope of command role permissions and descriptions of their functions. • All predefined scope of command roles and a list of permissions for each role.	See Appendix A for more information.
5620 SAM User Guide content reorganization	The Introduction volume of the *5620 SAM User Guide* has been reorganized and now includes a detailed description of the 5620 SAM GUI and its components, such as configuration forms, the navigation tree, contextual menus, maps, and the equipment window.	See chapters 3, 4, 5, and * for more information. Note: The equipment window chapter was removed in 90R5.
5620 SAM Troubleshooting Guide reorganization	The 5620 SAM alarm description tables are now in an appendix of this guide.	See the *5620 SAM Troubleshooting Guide*.

(5 of 5)

2.6 5620 SAM Release 9.0 R2

5620 SAM Release 9.0 R2 is a maintenance release. No features have been added.

2.7 5620 SAM Release 9.0 R1

Table 2-4 lists the features and functions added in 5620 SAM Release 9.0 R1.

Table 2-4 5620 SAM Release 9.0 R1 features

Feature or function	Description	Reference for more information
GUI enhancements		
Configuration form enhancements	The 5620 SAM client GUI configuration form enhancements include: • collapsible panels to improve navigability of configuration forms • asterisks on configuration form tab button and panel labels to indicate that information is missing or incorrect • a search capability that allows you to locate specific attributes on a configuration form • the navigation tree is now on the left side of service and network element configuration forms, for improved object accessibility • the ability to lock tabs on a configuration form, which allows you to open multiple tabs on a configuration form at the same time • the ability to undock configurable object forms from the main configuration form window • a tool tip displays a descriptive label for service and network element configuration forms • an icon that denotes a change on a configuration form tab and helps the user navigate to the location of the change • specification of the columns to display in a list • improved the ability to customize the sequence in which columns in a list appear	See sections 3.1 and 3.2 for more information. See Procedure 3-33 for more information about viewing and managing listed information.
Map enhancements		
Hidden upper-layer adjacency links	The 5620 SAM Physical Topology Map view highlights physical links carrying hidden links. The Highlight Upper Layer Adjacency Links contextual menu command displays the hidden adjacencies.	See chapter 5 for more information.
Map endpoint enhancement	The Service Topology Map view adds a new Endpoint Layout option to the Auto-Layout tool for VPLS, VLL, mirror, and composite services.	See chapter 5 for more information.
5620 SAM System management enhancements		
Changes to Microsoft Windows support	The installation or upgrade of a 5620 SAM database or main server is no longer supported on a Microsoft Windows platform. 5620 SAM support for Windows is limited to single-user client installation and upgrade only.	See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for information about 5620 SAM system migration from Microsoft Windows to Solaris.
Security management	Security enhancements to the 5620 SAM allow system administrators to manage client GUI user security more effectively. System administrators can use security management to request a password change for 5620 SAM users	See chapter 9 for more information.
Automatic database reinstantiation	The 5620 SAM supports automatic reinstantiation of the primary database in the event of a database failover.	See chapter 7 for more information.
New Oracle version	The 5620 SAM, Release 9.0, uses Oracle version 11r2 as the RDBMS.	See the *5620 SAM Planning Guide* and *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for more information.

(1 of 12)

Feature or function	Description	Reference for more information
System component configuration	If an IP address change is required for one or more of the 5620 SAM workstations in the following scenarios, please contact your Alcatel-Lucent technical support representative: • when the station in a collocated standalone 5620 SAM system requires a different IP address • when a new IP address is required by the primary or standby station, or both stations, in a collocated redundant 5620 SAM system • when a new IP address is required by any or all of the primary or standby stations, in a distributed redundant 5620 SAM system	See chapter 6 for more information.
Device management enhancements		
Automated SSL configuration	You can configure SSL on 5620 SAM components using the 5620 SAM installation and configuration utility; no manual configuration is required. After you configure SSL on a Release 9.0 5620 SAM system, the 5620 SAM preserves the SSL configuration through subsequent upgrades.	See chapter 10 and the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for more information.
EMS configuration	The 5620 SAM supports the discovery and monitoring of Element Manager Systems.	See chapter 14 for more information.
Object life cycle state configuration extended	The ability to configure the object life cycle state has been extended to include SAPs (L2 access interfaces and L3 access interfaces) on VLL, VPLS, VPRN, MVPLS, and IES services.	See chapter 28 for information about setting the OLC state.
ISA-NAT member usage stats	The 5620 SAM supports the collection of ISA-NAT member usage statistics.	See chapter 18 for more information.
Signal capability	The 5620 SAM supports enabling a Signal Capability parameter to specify whether or not a Local PE should signal its Hash label capability to a remote PE.	See chapter 14 in the *5620 SAM Parameter Guide* for more information.
HSMDAv2 daughter card	Version 2 of the HSMDA daughter is introduced in this release. Numerous portions of the *5620 SAM User Guide* have been added or modified to address the capabilities of the new card, including: • QoS - Egress HSMDA scheduling • QoS - Egress HSMDA scheduling overrides • HSMDA WRR Policy • HSMDA QoS Pool modifications • HSMDA Egress secondary shapers • HSMDA LAGs and LAG Groups • Network queue policies • QoS policy overrides on L2/L3 access interfaces • Subscriber profiles • 7750 SR and 7450 ESS support • Ethernet ports • VPLS/MVPLS services • VLL Epipe services • IES services • VPRN services	See the following *5620 SAM User Guide* chapters and related *5620 SAM Parameter Guide* chapters for more information: • chapter 47 • chapters 20 and 47 • chapter 47 • chapter 20 • chapter 20 • chapter 18 • chapter 47 • chapter 47 • chapter 68 • chapter 19 • chapter 20 • chapter 71 • chapter 70 • chapter 73 • chapter 74
TWAMP server support	The 5620 SAM supports configuration of TWAMP servers.	See chapter 17 for more information.

(2 of 12)

Feature or function	Description	Reference for more information
Soft reset support	Soft reset support is extended to include the following: • 1-port 100GE CFP IMM • 12-port 10GE SF IMM • 10Gig-base Extended Performance MDAs that are in XGig WAN mode	See Procedure 23-12 for more information.
1830 PSS enhancements		
—	See the *5620 SAM Optical User Guide* for information about features and functions that are specific to optical device support.	—
7210 SAS-D enhancements		
Silo and discovery, and equipment support	The following functions are extended to include the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR: • Silo and discovery • Card support • Port support • LAG • In-band management • Backup and Restore There is no fan tray support for the 7210 SAS-D.	See chapters 12, 13, 16, and 23 for more information.
Dying Gasp alarm	The Dying Gasp alarm supported is extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR. The Dying Gasp alarm is triggered by a trap from the 7210 SAS when a 7450 ESS goes out of service.	See the *5620 SAM Troubleshooting Guide* for more information.
IES Q1.Q2 parameter configuration	Configuration of the Q1.Q2Q parameter is extended to the 7210 SAS-D. The Q1.Q2 parameter is configurable when the port Encap Type parameter is set to Q1.Q2. The range of values are configurable only on the Outer Encapsulation parameter.	See the *5620 SAM Parameter Guide* for more information on the IES Outer encapsulation parameter.
VPLS and MVPLS	VPLS and MVPLS support is extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See chapter 71 for more information.
VLL Epipe and LLF support	VLL Epipe configuration and LLF in VLL Epipe services capabilities are extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See chapter 70 for more information.
Mirror services	Mirror services support is extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See chapter 72 for more information.
Static routes	The configuration of static routes is extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See chapter 30 for more information.
H-Metering	The configuration of H-Metering is extended to the 7210 SAS-D 6F 4T.	See Procedures 70-13 and 71-3 for more information.
Q in Q Ethertype	The configuration of Q in Q Ethertype is extended to include the 7210 SAS-D. The Q in Q Ethertype parameter is configurable when the port Encap Type parameter is set to Q in Q.	See Procedure 20-1 for more information.
ACL IP and ACL MAC filter policies	The configuration of ACL IP Filter policies and ACL MAC Filter policies are extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See chapters 48 and 50 for more information on Filter policies.
Accounting and Performance statistics	Support for Accounting and Performance statistics is extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See the *5620 SAM Statistics Management Guide* for more information.

(3 of 12)

Feature or function	Description	Reference for more information
QoS policies	The following QoS policy capabilities have been extended to the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR: • 7210 Port Access Egress • 7210 Access Ingress • 7210 Network: Supports only Port types for the Network policy. Forwarding classes: only Dot1p In Profile and Dot1p Out Profile for Egress and Ingress Dot1p. Multi-Point: true only. 12 Meters are supported. Mode: srTCM and trTCM. Not supported: DSCP and LSP. • 7210 Network Queue: Not supported: Queue Management Policy and Port Parent in the NQueueEntry, 7210 Network Queue, Global Policy [Create] form. • 7210 Slope • 7210 Port Scheduler	See chapters 12 and 47 for more information.
Licensing	You can manage or unmanage SAS-D NEs on the 5620 SAM server based on the licenses. You can view license details and remaining licenses on the 5620 SAM GUI.	See chapter 6 for more information.
Ethernet OAM	802.1ag supports only CFM loopback and CFM link trace on the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR.	See chapters 38 and 80 and for more information.
7210 SAS-E enhancements		
dot1q NULL SAP	The 5620 SAM supports dot1q NULL SAP on the 7210 SAS-E.	See the *5620 SAM Parameter Guide* for more information.
Y.1731 Ethernet OAM	The 5620 SAM supports EthTest, One Way Delay, Two Way Delay on the 7210 SAS-E, Release 2.0 or later.	See chapter 38 for more information.
7210 SAS-M enhancements		
Dynamic reservation for non-customer traffic ports	Dynamic reservation for non-customer traffic ports is supported on 7210 SAS-M 24F 2XFP, and 7210 SAS-M 24F 2XFP [ETR], Release 3.0 R1.	See chapter 20 for more information.
H-Metering	H-Metering is supported on the 7210 SAS-M, Release 3.0 R1 and later.	See Procedures 70-13 and 71-3 for more information.
Q in Q Ethertype configuration	The Q in Q Ethertype parameter is configurable when the port Encap Type parameter is set to Q in Q for the 7210 SAS-M, Release 3.0 R1 and later.	See Procedure 20-1 for more information.
VCCV trace test for Cpipe and Epipe	VCCV trace test for Cpipe and Epipe is supported on the 7210 SAS-M, Release 2.0R5, and Release 3.0 R1 and later.	See chapters 38 and 70 for more information.
BFD support	BFD is supported on the RSVP interface for 7210 SAS-M, Release 3.01 R1 and later.	See chapters 30, 31, and 74 for more information.
MSTP	You can run individual STPs for every VLAN for the 7210 SAS-M, Release 3.01 R1 and later.	See chapter 33 for more information.
L2 Access Uplink support	The 5620 SAM supports: • 2x10GigE XFP MDA for L2 Access uplink and access port modes. Access encapsulation types supported are Null, dot1q and Q in Q. • Access Mode supports Null, Q in Q and dot1q. Q in Q Ethertype attribute in 7210 SAS-M Uplink is applicable to the Ports which support uplink mode or Access Q in Q Encap.This attribute is not applicable when the Mode is Access and the encap type is either Null or dot1q.	See chapter 20 for more information.
Mirror Service	Mirror Service has been extended to include local mirroring, destination sites, and one L2 Access interface.	See chapter 72 for more information.

(4 of 12)

Feature or function	Description	Reference for more information
Backup and restore	The backup and restore functionality has been extended to include the 7210 SAS-M.	See chapter 23 to create a device backup and restore policy.
Software upgrade	The software upgrade functionality has been extended to include the 7210 SAS-M.	See Procedure 23-11 to create a Software upgrade policy.
Statistics management	Statistics management for the 7210 SAS-M has been extended to include: • Accounting and Performance statistics • ICMP Ping and ICMP Trace for management ports	See the *5620 SAM Statistics Management Guide* for more information about how to configure performance and accounting statistics collection and how to view counters using the 5620 SAM.
Y.1731 Ethernet OAM tests and the 802.1ag support.	Ethernet OAM functionality (CFM continuity check, CFM loopback, EthTest, CFM link trace, CFM one way delay, and CFM two way delay tests) on Y.1731 platform and on 802.1ag only CFM loopback and CFM link trace is supported on 7210 SAS-M uplink NEs.	See chapters 38 and 80 for more information.
IES support	IES support is extended to 7210 SAS-M uplink NEs in access mode.	See Procedure 73-1 for more information.
Static routes	Static route support is extended to 7210 SAS-M.	See chapter 30 for more information.
VPLS and VLL	VPLS and VLL services are extended to VLAN uplink.	See chapter 71 for more information.
Link Loss Forwarding	The 5620 SAM supports link loss forwarding (LLF) functions for the 7210 SAS-M and 7210 SAS-M24F2X NEs in VLL Epipe services.	See Procedure 70-13 for more information.
QoS Policies	The 7210 SAS-M now supports the following QoS Policies: • 7210 Access Ingress • 7210 Port Access Egress • 7210 Network • 7210 Network Queue • 7210 Slope • 7210 Port Scheduler	See chapter 47 for more information.
7210 SAS -X enhancements		
Out-of-band management	Out-of-band management support is extended to the 7210 SAS-X 24F 2XFP	See chapter 13 for more information.
Ethernet Ring Protection (G.8032)	The 5620 SAM supports Ethernet Ring Protection (G.8032) on the 7210 SAS 3.0, Release 1 and later devices with one exception. Ethernet Ring Protection is not supported on the 7210 SAS-X 24F 2XFP, Release 3.0 R1. It is supported on 7210 SAS-X 24F 2XFP, Release 3.0 R2 Ethernet ring protection is provided by RPLs employed to protect the ring and help achieve high reliability and network stability.	See chapter 12 and Procedures 33-7 and 33-10 for more information.
Aggregate Rate Limit	The Aggregate Rate Limit parameter support is extended to the port level and the SAP level for access ports on the 7210 SAS-X Release 2.0 R7 port Ethernet daughter card.	See Procedures 17-18, 70-13, 71-3 for more information.
IGMP snooping	IGMP snooping support is extended to the 7210 SAS-X 24F 2XFP Release 3.0 R2 or later.	See chapter 71 and Procedure 71-3 for more information.
VCCV trace test support for Epipe	The VCCV trace test for Epipe functionality is extended to Release 2.0 R5, and Release 3.0 R1 and later.	See chapters 38 and 70 for more information.

(5 of 12)

Feature or function	Description	Reference for more information
BFD support on the RSVP interface.	BFD support on the RSVP interface is extended to include the 7210 SAS-X 24F 2XFP.	See chapters 30, 31, and 74.
MSTP	You can run individual STPs for every VLAN for the 7210 SAS-X 24F 2XFP.	See chapter 33 for more information.
7450 ESS, 7750 SR, and 7710 SR enhancements		
Support for new hardware	The 5620 SAM supports the use of VSM-CCA-XP daughter cards on the 7750 SR and 7450 ESS.	See chapter 19 for more information.
CES MDA support on 7450 ESS in mixed mode	The 5620 SAM supports the CES MDA cards on the 7450 ESS when this unit is configured for mixed mode operation, irrespective of chassis mode.	See chapter 19 for more information about daughter card support. See Procedures 19-1 and 19-4 for more information on chassis modes and enabling mixed mode operation.
LAG active/standby operation without LACP	The 5620 SAM supports configuration of the Standby Signalling parameter in the LACP configuration on LAG member links on the 7750 SR and 7450 ESS.	See chapter 18 for more information.
Scale to 100G IPsec	The 5620 SAM supports a range of 1 to 16 for the Group Number parameter on ISA-IPsec groups on the 7750 SR and 7450 ESS, Release 9.0 R1 and later.	See chapter 18 for more information.
Hash label support for chassis mode B	The 5620 SAM supports Hash labels on SDP bindings for 7750 SR NEs in chassis mode B.	See chapter 14 in the *5620 SAM Parameter Guide* for more information.
Multiple OSPF area IP interfaces	The 5620 SAM supports the configuration of IP interfaces that can belong to multiple OSPFv2 areas on the 7750 SR, 7450 ESS, and 7710 SR.	See chapter 31 for more information.
IPsec IKE	The 5620 SAM supports a range of 0 to 64 characters for the Pre Shared Key parameter on an IPsec tunnel or IPsec gateway on the 7750 SR and 7450 ESS Release 9.0 R1 and later.	See chapter 35 for more information.
GRE termination in VPRN	The 5620 SAM supports the configuration of a GRE tunnel termination on a VPRN site IPsec interface on the 7750 SR, Release 8.0 R5 and later.	See chapter 35 for more information.
Support for Local DHCPv6 Servers	The 5620 SAM supports the configuration of Local DHCPv6 Servers on the 7750 SR and on the 7450 ESS in mixed mode.	See Procedures 30-2 and 74-1 for more information.
IGMP reporting of join, leave, and expiry events	The 5620 SAM supports the ability to generate reports and view statistics related to IGMP multicast traffic. This feature is supported on the 7750 SR and 7450 ESS (mixed mode), Release 9.0 R3 or later.	See Procedures 30-2, 31-41, 49-5, and 68-9 for more information.

(6 of 12)

Feature or function	Description	Reference for more information

IPv6 support on 7750 SR-7 and 7750 SR-12 in chassis modes A and B	The configuration of IPv6 addressing on network ports of 7750 SR-7 and 7750 SR-12 devices operating in chassis mode A or B is introduced in this release. Mixed mode must be enabled and this functionality is only applicable to units running an IOM3-XP or IMM. IPv6 can be configured on:
	• Network interfaces
	• OSPFv3 instances
	• IS-IS instances
	• Route aggregations
	• Source IP addresses
	• IGMP instances
	• MLD instances
	• RIP instances
	• BGP instances
	• routing policies
	• static routes
	• ACL IPv6 Filter policies
	• access ingress policies
	• VRRP policies
	• MAF and CPM filters
	• ISA-IPSEC groups
	• VLL SAPs
	• IES interfaces as follows:
	  • access interfaces
	  • subscriber interfaces
	  • IPSec interfaces
	• VPRN service interfaces as follows:
	  • access interfaces
	  • IPSec interfaces
		See chapter 18 for more information on card provisioning and ISA-IPSEC groups.
		See chapter 18 and Procedures 19-1 and 19-4 for more information on chassis modes and enabling mixed mode operation and ISA-IPSEC groups.
		See chapter 21 for more information on MAF and CPM filters.
		See chapter 30 for more information on routing policies.
		See chapter 31 for more information on protocol configuration.
		See chapter 47 for more information on access ingress policies.
		See chapter 48 for more information on ACL IPv6 filter policies.
		See chapter 51 for more information on VRRP policies.
		See chapter 70 for more information on VLL service configuration.
		See chapter 73 for more information on IES configuration.
		See chapter 74 for more information on VPRN service configuration.

IPVPN service label per next-hop operation	The 5620 SAM supports the Label Mode parameter on VPRN sites on the 7750 SR and 7450 ESS.	See chapter 74 for more information.
FIB prioritization per VPRN operation	The 5620 SAM supports the FIB Priority parameter on VPRN sites on the 7750 SR, 7450 ESS, and 7710 SR.	See chapter 74 for more information.
BGP flowspec support on 7750 SR and 7450 ESS	The 5620 SAM supports configuration of the Flowspec Validate parameter on global, peer group, and peer level BGP sites, network interfaces, IES L3 access interfaces, and IES spoke SDP bindings.	See chapters 30, 31, and 73 for more information.
VLL Cpipe support extended to 7450 ESS and 7750 SR-1	The 5620 SAM supports the creation of a VLL Cpipe on the 7450 ESS-12 and 7450 ESS-7 in mixed mode or non-mixed mode, Release 8.0 R5 or later, and on the 7450 ESS-1, 7450 ESS-6 and 7750 SR-1, Release 8.0 R6 or later.	See Procedure 70-9 for more information.
Carrier serving carrier VPRN	The 5620 SAM supports network interface configuration on a VPRN service on the 7750 SR and 7450 ESS, Release 9.0 R1 and later.	See chapter 74 for more information.
7450 ESS support	• The Dying Gasp alarm is triggered by a trap from the 7450 ESS node when a 7210 SAS go down.	See the *5620 SAM Troubleshooting Guide* for more information on Dying Gasp alarm.
7705 SAR enhancements		

(7 of 12)

Feature or function	Description	Reference for more information
7705 SAR-18 support	The 5620 SAM supports the 7705 SAR-18 hardware platform. The 7705 SAR-18 chassis is functionally identical to the 7705 SAR-8, with the following differences: • 16 daughter card slots. (For, Release 9.0 R1, 12 of these card slots are configurable from the 5620 SAM. The remaining 4 slots are reserved.) • BITS timing interface. • No external timing interface.	See chapter 19 for more information.
802.1 PAE support on 7705 SAR	The 5620 SAM supports IEEE 802.1 PAE on the 7705 SAR, Release 4.0 R1 and later. This support is consistent with the 7750 SR, Release 7.0	See chapter 19 for more information.
CFM Loopback on 7705 SAR	The 5620 SAM supports CFM LoopBack Mode configuration on Ethernet ports on the 7705 SAR, Release 4.0 R1.	See chapter 20 for more information.
Swap MAC Address on 7705 SAR	The 5620 SAM supports Swap MAC Address configuration on Ethernet ports on the 7705 SAR, Release 4.0 R1.	See chapter 20 for more information.
16 port T1/E1 ASAP MDA on 7705 SAR	The 5620 SAM supports the 16 port T1/E1 ASAP daughter card on the 7705 SAR, Release 4.0 R3.	See chapter 19 for more information.
32 port T1/E1 adapter card on 7705 SAR	The 5620 SAM supports the 32 port T1/E1 ASAP adapter card on the 7705 SAR, Release 4.0 R3.	See chapter 19 for more information.
Graceful shutdown support on 7705 SAR 4.0 R1	The 5620 SAM supports the Graceful Shutdown parameters for RSVP sites and interfaces on the 7705 SAR, Release 4.0 R1 or later.	See chapter 31 for more information.
Ethernet OAM thresholds on 7705 SAR 4.0 R1	The 5620 SAM supports the ETH test and One Way Delay test thresholds on the 7705 SAR 4.0 R1, consistent with Release 7.0 of the 7750 SR, 7450 ESS, and 7710 SR.	See chapter 38 for more information.
OAM ping and trace results on 7705 SAR 4.0 R1	The 5620 SAM supports the reporting of test result status on the 7705 SAR 4.0 R1, consistent with Release 7.0 R3 of the 7750 SR, 7450 ESS, and 7710 SR.	See chapter 38 for more information.
Routing policy enhancements	The 5620 SAM supports the No Route Tag parameter on routing policy statements on the 7705 SAR 4.0 R1.	See chapter 30 for more information.
BGP enhancements on 7705 SAR 4.0 R1	The 5620 SAM supports the Local AS, Peer AS, Hold Time, and Remove Private AS parameters on the 7705 SAR, Release 4.0 R1 or later.	See chapters 31 and 68 for more information.
Filter policy support on 7705 SAR 4.0 R1	The 5620 SAM supports ACL IPv6 Filter policies, ACL MAC Filter policies, and CPM IPv6 Filter policies on the 7705 SAR, Release 4.0 R1 or later. Partial distribution of ACL IPv6, ACL MAC, or CPM IPv6 filters is not supported. Each entry, property, and value within a given filter policy must be supported by the target 7705 SAR NE.	See chapter 48 for more information.
Fabric Profile policy enhancement on 7705 SAR 4.0 R1	The 5620 SAM supports the Multipoint Rate parameter in 7705 SAR Fabric Profile policies on the 7705 SAR, Release 4.0 R1 or later.	See chapter 47 for more information.
Access ingress policy enhancements on 7705 SAR 4.0 R1	The 5620 SAM supports the Multipoint Queue ID, Broadcast Queue ID, and Unknown Queue ID forwarding class parameters on the 7705 SAR 4.0 R1.	See chapter 47 for more information.
Network queue policy enhancements on 7705 SAR 4.0 R1	The 5620 SAM supports multicast network queues 9 through 16 and the Multicast Queue ID forwarding class parameter on the 7705 SAR 4.0 R1.	See chapter 47 for more information.

(8 of 12)

Feature or function	Description	Reference for more information
Spoke SDP termination for IES and VPRN services on 7705 SAR 4.0 R2	The 5620 SAM supports spoke SDP terminations for IES and VPRN services on the 7705 SAR, Release 4.0 R2 or later.	See chapters 73 and 74 for more information.
9500 MPR enhancements		
9500 MPR port segregation	The 5620 SAM supports the configuration of port segregation on the 9500 MPR using a wizard.	See chapter 20 for more information.
9500 MPR timing synchronization	The 5620 SAM supports timing synchronization on 9500 MPR NEs.	See chapter 19 for more information.
9500 MPR release support	The 5620 SAM provides silo and discovery support for the following ETSI and ANSI releases: • 9500 MPR ETSI: Release 2.1 • 9500 MPR ANSI: Release 2.2.0 • 9500 MPR ETSI and ANSI: Release 3.0.0 GNE support: • 9400 AWY, MPR-SA, MPR-E, MSS-1C The 5620 SAM does not provide support for the following ETSI and ANSI releases: • 9500 MPR ETSI: Release 1.2 and Release 1.3 • 9500 MPR ANSI: Release 2.1	—
9500 MPR dot1q VLAN services support	The 5620 SAM supports the creation of dot1q VLAN services on both the MSS-4 and MSS-8 variants of the 9500 MPR (ANSI), release 3.0 or later.	See Procedure 69-8 for more information.
9500 MPR Path Management support	The 5620 SAM supports redundant protection paths provided by the radio system for the MPR family. Path Management for protected link 1 x (1+1).	See chapters 5 and 70 for more information.
9500 MPR Extended Backhaul service	The 5620 SAM supports: • SAP/XC (Physical Link) completion • Termination points (TP) related to transport service SAP and book ending equipment ports.	See Procedure 70-3 for more information.
9500 MPR card support	The 5620 SAM supports: • The MPT-ACC card is supported on 9500 MPR for ANSI Release 3.0.0. • The 2 x STM card is supported on 9500 MPR for ETSI Release 3.0.0. • Services over SDH ports (SDH to SDH) on 9500 MPR Cpipe for ETSI Release 3.0.0	See chapters 12, 19, and 70 for more information.
5620 SAM LTE ePC enhancements		
—	See the *5620 SAM LTE ePC User Guide* for information about LTE ePC features and functions.	—
5620 SAM LTE RAN enhancements		
—	See the *5620 SAM LTE RAN User Guide* for information about LTE RAN features and functions.	—
OmniSwitch enhancements		

(9 of 12)

Feature or function	Description	Reference for more information

OmniSwitch support	The 5620 SAM supports:
	• AOS Release 6.4.4 support on OS 6400, OS 6850, OS 6850E, OS 6855, OS 9700E, and OS 9800E NEs.
	• PIM and RIP routing protocol, and OSPF for the default routing instance on OS 6850, OS 6850E, and OS 6855, Release 6.4.4 or later.
	• RIP routing protocol on OS 6400, Release 6.4.4 or later.
	• OSPF, PIM, and RIP on VRF instances supported on OS 6855 U24X, Release 6.4.4 or later.
	• G8032 Ethernet ring protection for OS 6400, OS 6850, OS 6850E, OS 6855, OS 9700E, and OS 9800E, Release 6.4.4 or later, and OS 6250 (Metro) NEs, Release 6.6.2 or later. Note: For OmniSwitch NEs, only Ethernet ring element (and not Ethernet ring) is supported.
	  • EPS path configuration
	  • EPS service configuration (Standard and Stacked VLAN)
	  • protected service configuration
	  • statistics collection
	  • alarm support (automatic alarm clearing is not supported)
	  • EPS OAM
	• OS 6850E support for Release 6.4.4 or later:
	  • software upgrade and backup/restore
	  • licensing support
	• LAG OAM support for OS Releases 6.4.4 or later, and 6.6.2 or later
		See chapter 12 for more information.
		See chapters 16, 126, 167, 182, and 184 for more information.
		See Procedure 33-8 for more information.
		See chapters 37 and 78 for more information.
		See chapter 38 (Ethernet CFM) for more information.
		See Procedures 23-8, 23-9, and 23-16 for more information.
		See chapter 6 for more information.
		See Procedure 19-22 for more information.
		See chapters 69, 31, 38, 47, 56 for more information.
		See chapter 38 for more information.

Network management enhancements		
Synchronization of static port forwards	The 5620 SAM supports the synchronization of static port forwards.	See chapters 30, 68, and 74 for more information.
NAT enhancements	The 5620 SAM supports the configuration of many new parameters on the NAT configuration and NAT pool forms.	See chapters 30, 68, and 74 for more information.
IPv6 BFD support	The 5620 SAM supports IPv6 BFD on network interfaces, IES and VPRN L3 access interfaces, OSPFv3 interfaces, network and IES PIM interfaces, IS-IS interfaces, and on VRRP instances.	See chapters 30, 31, 39, 73, and 74 for more information.
MC APS enhancements	Bidirectional MC APS support is extended to include all non-channelized SONET/SDH MDAs and CMAs.	See chapter 40 for more information.
G.8032 multi-ring support	The 5620 SAM supports service tunnel Ethernet sub-ring functionality.	See chapter 33 for more information.
BGP best external	The 5620 SAM supports the advertisement of best external routes by a BGP site to its internal BGP peers.	See chapter 31 for more information.
Path MTU discovery in BGP	The 5620 SAM supports path MTU discovery for global BGP, BGP group, BGP peers, and LDP peers on virtual routers and VPRN routing instances.	See chapter 31 for more information.
PIM ECMP Hash label support	The 5620 SAM supports ECMP Hash labels on PIM sites.	See chapter 31 for more information.
mLDP in mVPN	The 5620 SAM supports mLDP inclusive tunnels in mVPN.	See chapter 31 for more information.
Exponential backoff timer	The 5620 SAM supports an Exponential backoff timer for MPLS LSPs.	See chapter 32 for more information.

(10 of 12)

Feature or function	Description	Reference for more information
CFM SLM test	The 5620 SAM supports a two-way CFM Synthetic Loss Measurement OAM diagnostic test.	See chapter 38 for more information.
Protocol enhancements		
—	—	—
Policy enhancements		
ISID level shaping on B-SAP	The 5620 SAM supports the Packet Byte Offset parameter on egress queues on IOM3-XP cards.	See chapter 47 for more information.
RADIUS-based accounting enhancements	You can use a 5620 SAM RADIUS-based accounting policy to collect per-host accounting statistics on Release 9.0 and later NEs.	See chapter 53 for more information.
Additional origin types for BGP routes	The 5620 SAM allows the selection of additional origin types for BGP routes to be considered as match criteria for routing policy statements.	See the *5620 SAM Parameter Guide* for more information on the Origin parameter.
Service management enhancements		
System preferences support for Services	The 5620 SAM supports the configuration of the system preferences of services that are associated with customers.	See chapter 67 for more information.
ESM enhancements	The 5620 SAM supports URPF check on subscriber interfaces for managed-route hosts. This feature supports Group Interfaces having the same functionality as IES and VPRN L3 Access Interfaces. Unicast RFP stats are collected for Group Interfaces.	See chapters 30, 73, and 74 for more information.
AA Customer level Apdex/MOS thresholds	The 5620 SAM supports a series of Apdex score thresholds on a per customer basis.	See Procedure 67-5 for more information.
AA transit IP policy	The 5620 SAM supports the configuration of AA transit IP policies.	See chapter 77 for more information.
Support for static port forwarding on residential subscriber instances	The 5620 SAM supports configuration of L2-Aware SPFs on residential subscriber instances.	See chapter 68 for more information.
LCP Keep Alive Interval	The 5620 SAM allows configuration of a new minimum value for the LCP Keep Alive Interval parameter.	See the *5620 SAM Parameter Guide* for more information.
PBB restrictions relaxed	Chassis mode restrictions for PBB Dual Homing and SAP-type restrictions for PBB Epipe local switching have been relaxed.	See chapter 71 for more information on VPLS and chapter 70 for more information on VLL Epipe.
MDT-SAFI supported on BGP and PIM sites	MDT-SAFI was added to the permitted Family and Address Family values on BGP sites and PIM sites.	See chapter 71 for more information on VPLS and chapter 74 for more information on VPRN.
Service size reduction	The 5620 SAM supports moving sites from one service to another of the same type in order to reduce the overall size of a particular service.	See chapter 67 for more information.
PW status signalling support	The 5620 SAM supports PW status signalling on spoke SDP bindings for VPLS and VLL Epipe services.	See chapter 71 for more information on VPLS and chapter 70 for more information on VLL.
Unnumbered subscriber interfaces	The 5620 SAM supports the configuration of unnumbered IES and VPRN subscriber interfaces.	See Procedures 73-7 and 74-12 for more information.

(11 of 12)

Feature or function	Description	Reference for more information
Operational groups	The 5620 SAM supports the creation of operational groups and the assignment of members and monitors to those groups.	See Procedures 17-3, 71-3, 71-5, and 71-6 for more information.
Block spoke SDP transmission on VLL Epipe	The 5620 SAM supports the Enable PW Standby Signaling Slave parameter on VLL Epipe endpoints and spoke SDP bindings.	See chapter 70 for more information.
Extended MEP support	The 5620 SAM supports the creation of facility MEPs on network interfaces, ports, and LAGs. The creation of virtual facility tunnel MEPs on LAG ports is also supported.	See chapter 80 for more information.
Router alert check configuration for IGMP	The 5620 SAM supports the Disable Router Alert Check parameter on certain IGMP interface objects.	See chapters 31, 71, 73, and 74 for more information.
Add or create services in composite service flat map view.	You can create a new service or add existing services or sites in the Composite Service Flat Topology Map view.	See chapter 76 for more information.
Additional features		
LogViewer enhancements	The 5620 SAM LogViewer utility includes the following: • Task Tracker, Web SSO, rsynch, and scheduler log support • improved performance • greater customization • user preference preservation across upgrades • multiple UI improvements	See the *5620 SAM Troubleshooting Guide* for more information.
Supervision Module	The 5620 SAM supports the launch of the 5620 SAM Supervision Module from a client GUI. This web-based application provides summarized views of objects monitored by the client GUI from which it is launched.	See the *5620 SAM Supervision Module User Guide* for more information.
Additional application filter expression types	The 5620 SAM allows the selection of TLS Certificate Subject Organization and TLS Certificate Subject Common as application filter expression types.	See the *5620 SAM Parameter Guide* for more information on the Application Filter Expression Type parameter.
5620 SAM documentation enhancements

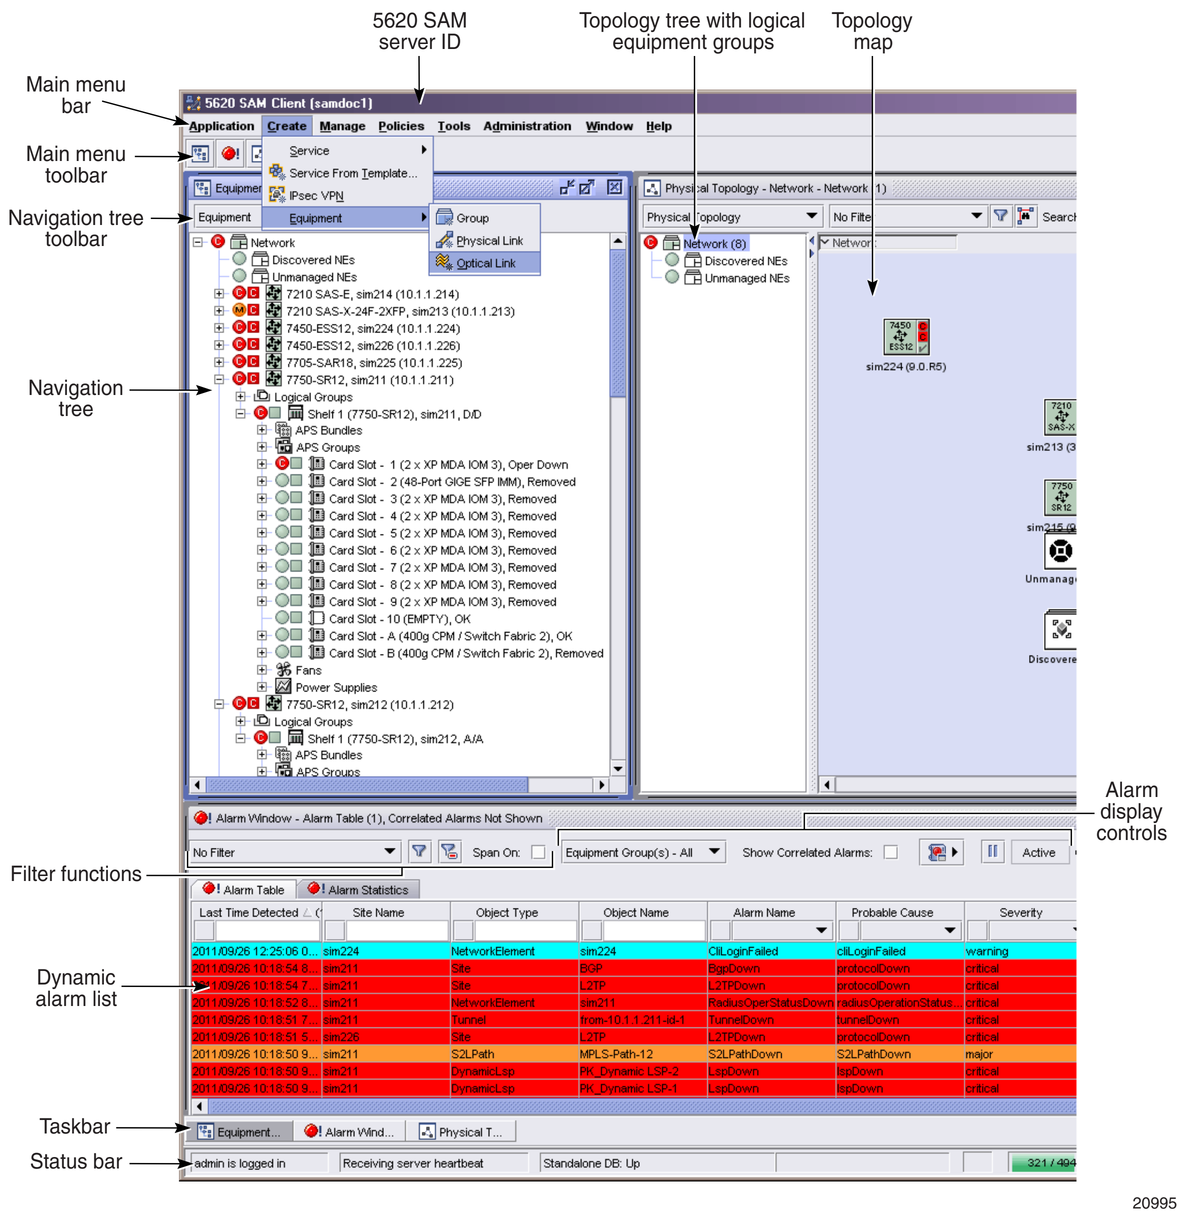
3 — 5620 SAM GUI overview

3.1 5620 SAM GUI overview

The 5620 SAM GUI is a graphical interface on a 5620 SAM client station that allows a NOC operator to perform network management functions. Multiple 5620 SAM GUI clients can connect to a 5620 SAM server.

The main GUI elements, as shown in Figure 3-1, are the navigation tree, alarm window, and map panel. This chapter describes general GUI operations such as opening and closing the GUI, managing windows and forms, and performing searches. See chapter 5 for information about map management.

Figure 3-1 Main 5620 SAM GUI elements



The 5620 SAM GUI enables an operator to do things such as the following:

- Display equipment and alarm status information.
- Configure and manage network management applications.
- Simplify the administration and configuration of equipment, customers, services, and subscribers using management forms instead of a CLI.
- Configure, manage, and monitor SLAs and equipment using statistics.
- Create and manage security policies for secure device and 5620 SAM access.

Floating windows

The 5620 SAM GUI uses floating windows that you can move, size, close, and bring to the foreground to provide the optimal working space for performing a task. By default, the navigation tree window appears at the left side of the GUI, the alarm window at the bottom, and the physical topology map is at the right side. If a window is closed or hidden, you can bring it to the foreground by selecting a toolbar icon or Window menu item, or by using shortcut keys. Each toolbar icon is identified by a tool tip that is displayed when the mouse pointer moves over the icon.

Main menu toolbar

The 5620 SAM GUI uses a main menu toolbar that you can use to create a shortcut to any main menu function. You can select which shortcut icons appear on the toolbar by right-clicking on the toolbar and selecting which icons to display.

User preferences

User preferences allow you to configure 5620 SAM GUI parameters to suit your specific requirements. Table 3-1 lists the location of user preference information in the 5620 SAM customer documentation suite. You can access the User Preferences form from the Application menu.

Table 3-1 Location of user preference information

Task	See
To set user preferences for configuration forms, show toolbar, default time zones, span of control, and topology windows	Section 3.5
To set user preferences for the alarm window	Procedures 37-5, 37-6, and 37-7
To access test objects that are available in the Service Test Manager (STM)	Procedure 78-3
To specify whether the 5620 SAM displays a confirmation message when an operator initiates a bulk change operation	Procedure 27-4
To specify the maximum number of objects to display per page on a list form	Procedure 3-35
To configure a browser path for a 5620 SAM client application to access the supervision portal from the 5620 SAM main menu	*5620 SAM Supervision Module User Guide*
To configure and view topology map icon labels to something other than the default value	Procedure 5-14

(1 of 2)

Task	See
To specify the global 5620 SAM parameters for graphing statistics	*5620 SAM Statistics Management Guide*
To set user preferences for script management	*5620 SAM Scripts and Templates Developer Guide*

(2 of 2)

System preferences

System preferences allow you to configure 5620 SAM system parameters to suit your specific requirements. Table 3-2 lists the location of system preference information in the 5620 SAM customer documentation suite. You can access the System Preferences form from the Administration menu.

Caution — Changing the parameter value of a System Preference may affect the behavior of an existing 5620 SAM service. Do not change the parameter value from the default without contacting Alcatel-Lucent technical support.

Note — The System Preferences parameters can only be modified by a user with administration privileges.

Table 3-2 Location of system preference information

Task	See
To configure the system preferences of the services that are associated with a customer	Procedure 67-2
To configure TCA system preferences	Procedure 26-5
To configure accounting and performance (Test Manager) statistics preferences	Section 38.4 and Procedure 78-2
To specify the storage parameters for exported statistics files on a 5620 SAM server	*5620 SAM XML OSS Interface Developer Guide*

Save workspace

You can save changes made to the navigation tree, the topology window, the alarm window, and the main menu toolbar with the save workspace function. Changes made to the position, size, and state preference of default windows can be saved. Shortcut icons added to the main menu toolbar can be saved. Each time you start the 5620 SAM GUI, the saved preferences are used instead of the defaults.

Note 1 — On a single-user client station, the GUI workspace preferences are saved in the following file:

- *user_home_dir*/5620SAM/guiPreference/*SAM_account_name*.guiPreferences on Solaris
- *user_home_dir*\5620SAM\guiPreference*SAM_account_name*.guiPreferences on Windows

where

user_home_dir is the home directory of the current user

SAM_account_name is the login name of the current 5620 SAM user

Note 2 — On a client delegate server station, the GUI workspace preferences are saved in the following file:

- *user_home_dir*/5620SAM/guiPreference/*SAM_account_name*.guiPreferences

where

user_home_dir is the home directory of the current user

SAM_account_name is the login name of the current 5620 SAM user

External windows

A window in the GUI can be used outside the GUI if you select the window and choose Move To External Window from the Window menu or from the menu that is displayed when you right-click on the window title bar.

External windows are managed by the operating system rather than the 5620 SAM. They maintain the window icon that is used within the GUI and are placed into a group of open 5620 SAM windows on the operating system task bar. Any windows launched from an external window appear as separate external windows. The 5620 SAM GUI task bar does not display external windows, but they can be viewed and brought to the front using the Window menu. The Window menu also contains options to Close All Internal Windows or Close All External SAM Windows.

Note — An external window cannot be moved back into the 5620 SAM GUI. You must close the external window and re-open it in the GUI.

Navigation tree

The navigation tree lists the managed equipment, services, and protocols that are configured on the NE. The navigation tree includes a view selector located on the navigation tree toolbar. The view selector is a drop-down menu that lists the physical and logical network views that are available.

The navigation tree is accessible from the main window, configuration forms, and maps.

See chapter 4 for more information about the navigation tree.

Contextual menus

Contextual menus allow you to create, configure, and manage specific parameters for the object and child objects from the navigation tree or from maps. You access the contextual menus by right-clicking on the navigation tree object or on the map object.

See chapter 4 for more information about contextual menus.

Task manager

The Task Manager allows SAM administrators and support personnel to monitor progress of operational tasks and SAM administrators to configure task monitoring parameters.

The Task Manager monitors the following:

- all write operations that are performed from the 5620 SAM GUI; for example, when you click on the Apply or OK buttons
- all write operations that are performed using the OSSI
- some read operations; for example, when you click on the Resync or Collect All buttons

See Procedures 3-15 and 3-22.

Text message

Administrative users can send broadcast messages to some or all active GUI users logged into the 5620 SAM. This is useful for sending maintenance and similar notifications to active users.

See Procedures 3-23 and 9-31.

Maps

Each map displays network objects and information, and provides contextual menus to open forms that display additional information. In the context of a 5620 SAM map, a link object, such as a physical link or service tunnel, is called an edge. An object other than a link between objects, such as an NE or a topology group, is called a vertex.

See chapter 5 for more information on maps.

Alarm window

The alarm window allows you to view and manage incoming alarms from network components which are displayed in the dynamic alarm list and are associated with objects that represent the affected network components.

See chapter 37 for more information on the alarm window.

Forms

5620 SAM forms are used to do the following:

- configure device and 5620 SAM parameters
- display the status of an object
- perform FCAPS operations

A form can be displayed anywhere in the GUI. A newly opened form is displayed in the foreground. You can do the following:

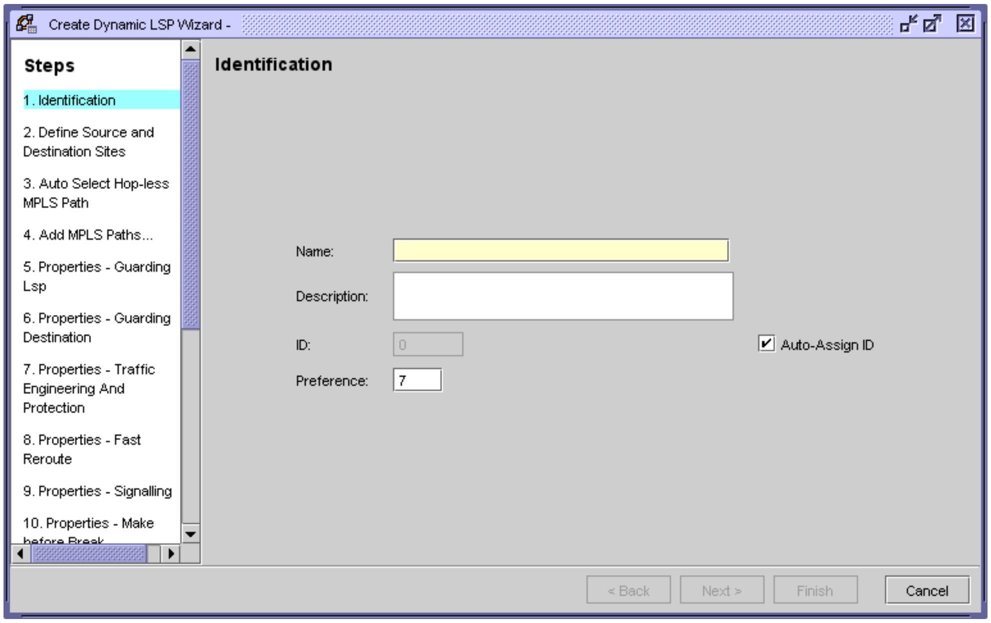
- organize forms according to operator preference
- compare information on multiple open forms
- navigate quickly to another open form by choosing the form from a list

A form has a title bar that displays object information. The displayed object name is the name specified during object creation. If the object is not named, a default name is used. When a form is minimized, a tool tip displays the title bar information. The Window menu lists the open forms.

Some configuration activities lead the operator through a series of forms, each of which represents a step in the configuration process. Such a form is called a step form. You must click on the Next button to proceed to the next step. Figure 3-2 shows the first step in a step form sequence. When the configuration sequence is complete, you must click on the Finish button to commit the changes. Each step must be performed to complete the configuration activity.

Note — Some steps open a new step form. You must complete the steps in the new form before you can return to the previous form. After you click on the Finish button, the previous form reappears.

Figure 3-2 Step form



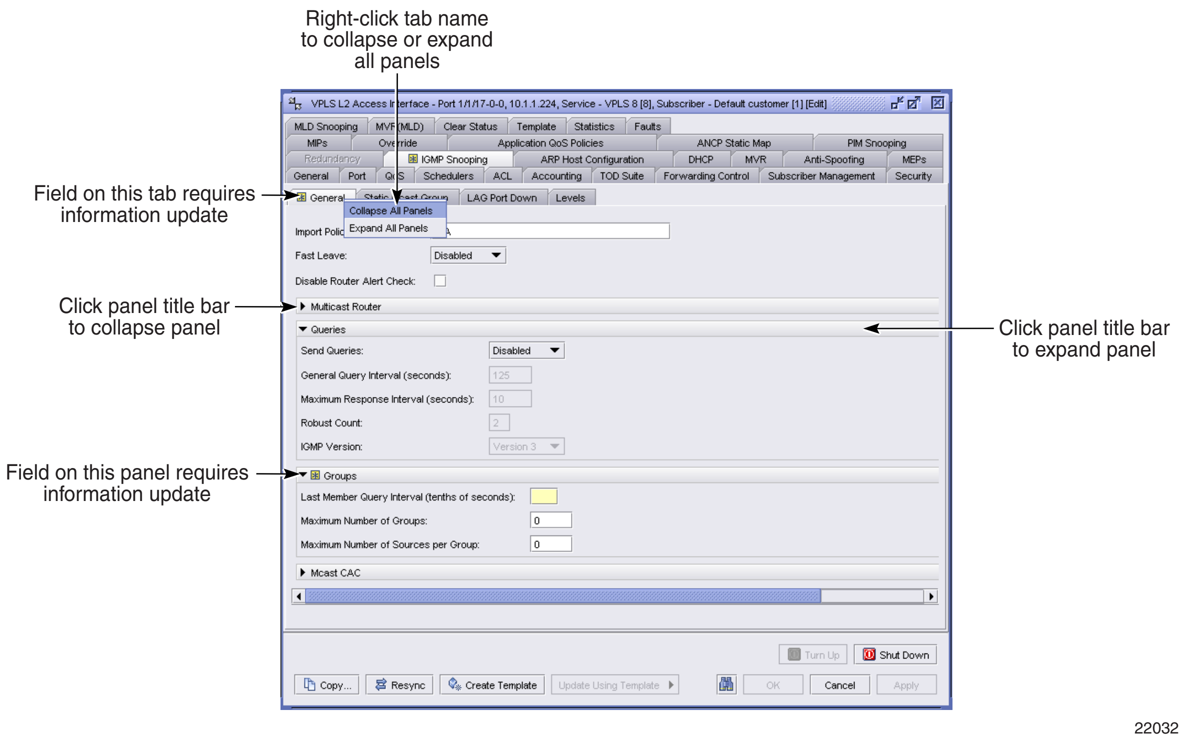
Collapsible panels

The 5620 SAM forms are used to configure devices. The 5620 SAM form panels can be collapsed to hide areas that are not of interest to the specific user or expanded to display all areas in a form.

To collapse a panel, click on the title bar of the expanded panel. To expand a collapsed panel click on the title bar of the collapsed panel, as shown in Figure 3-3. You can collapse or expand all of the panels on the form by right-clicking on the tab button title and then choosing the Collapse All Panels or Expand All Panels option.

An asterisk on a tab button or panel title bar indicates that a field contains incorrect data, or that a mandatory field requires data.

Figure 3-3 Collapsible panels in forms



Navigating service configuration forms

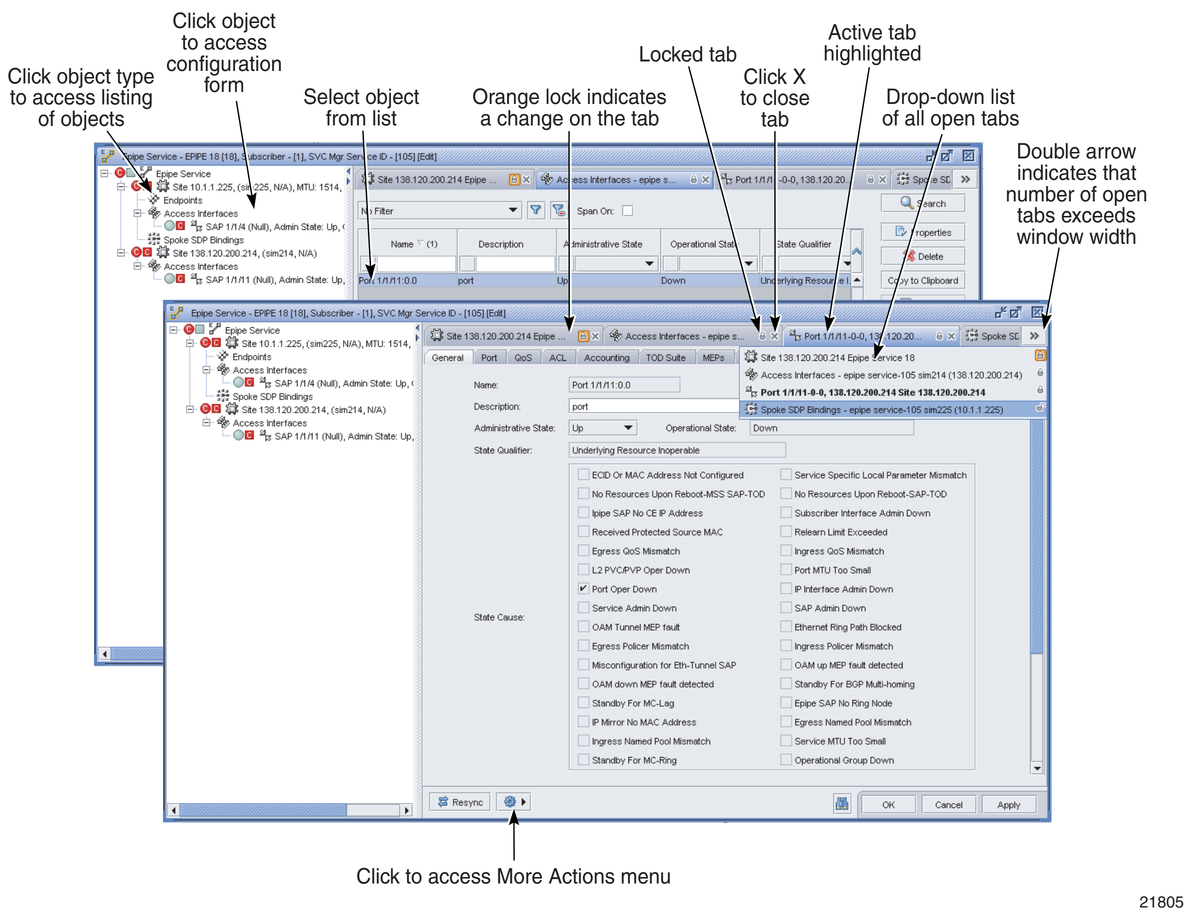
Service configuration forms allow you to create and manage services in the 5620 SAM. You can access service configuration forms from the Create menu or the Manage menu.

When you first access a service configuration form, the form displays a navigation tree on the left and the General tab on the right. The navigation tree lists the objects that are configured for the service. To access the configuration forms for the individual objects from the navigation tree, use one of the following methods:

- Click on the object type to access a filterable list form and choose the object.
- Click on the object in the navigation tree.

Figure 3-4 shows both methods of accessing object configuration forms from the navigation tree.

Figure 3-4 Service configuration form navigation



Navigating network element configuration forms

NE configuration forms allow you to create and manage network devices in the 5620 SAM. You can access NE configuration forms from the following locations:

- 5620 SAM GUI navigation tree
- Manage menu
- Physical topology map
- Service tunnel topology map

When you first access an NE configuration form, the form displays a navigation tree on the left and the General tab on the right. The navigation tree lists the devices that are configured on the NE. To access the configuration forms for the individual devices from the navigation tree, click on the object in the navigation tree.

See Chapter 4 for information about navigation tree capabilities.

Displaying multiple configuration forms

When you first access a configuration form, the form is unlocked. If you choose another object from the navigation tree, the unlocked form is replaced by the newly selected object configuration form. To lock the configuration form, click on the open lock icon on the configuration form tab, or right-click on the tab button and choose lock from the drop-down menu. When the configuration form is locked, the form remains open until the user closes the form. You can add configuration forms to the window by choosing objects from the navigation tree and then locking each form.

Note — Locked forms can only be closed (and not unlocked).

Each form is represented by a tab. If the tabs of the open forms exceed the width of the window, double arrows are displayed. Click on the double arrows to display a drop-down menu of the open configuration forms. You can access the open configuration forms from the drop-down menu or from the tab buttons. Figure 3-4 shows multiple open service configuration forms and the navigation options.

Object configuration forms can be undocked from the main configuration form window by right-clicking on the component tab title and selecting Undock. The undocked form opens in a new window and the configuration form tab is removed from the main configuration form window. Any changes that are made on the undocked object configuration form are immediately sent to the server.

Note 1 — The root object of the configuration form cannot be undocked, for example the IES service configuration form.

Note 2 — List forms cannot be undocked, for example a listing of access interfaces on a site.

Note 3 — Undocking is not supported on (Create) forms.

When the mouse point moves over the object form label, a tool tip displays a descriptive label for the form.

Modified configuration forms

If a configuration form is modified, the form changes to locked and the lock icon appears in orange to indicate that a modification occurred.

For service configuration forms, if an object is added to the service configuration, the new object appears in the navigation tree and the configuration form is displayed with the orange lock icon. The icon remains orange until the modifications are saved or discarded.

For equipment configuration forms, if an object is added from the navigation tree, the change will be made immediately. However, if a change, such as adding or removing an object, is made to an equipment configuration form, the change will be reflected on the form immediately, but it will not be reflected on the navigation tree until the Apply Tab, OK, or Apply button has been pressed.

Note — For the NE and composite service configuration forms, changes implemented by pressing the Apply Tab button apply only to the current object-level tab. Changes implemented by pressing the OK, Apply, or Cancel buttons apply to the entire form.

If you attempt to close a modified configuration form that contains unsaved changes, a message prompts you to specify whether to discard the changes or return to the display. If you attempt to close a modified configuration form that has related forms with unsaved modifications, the message lists the forms that have unsaved changes.

Localized language support

The 5620 SAM GUI supports localized language display. Localized language display, also known as internationalization, displays 5620 SAM GUI text in a specified language. The localized language setting applies to most 5620 SAM GUI objects except system components and database objects. Contact Alcatel-Lucent support for more information about localized language support.

Note 1 — The 5620 SAM supports localized language settings using predefined strings, and does not translate data to different languages.

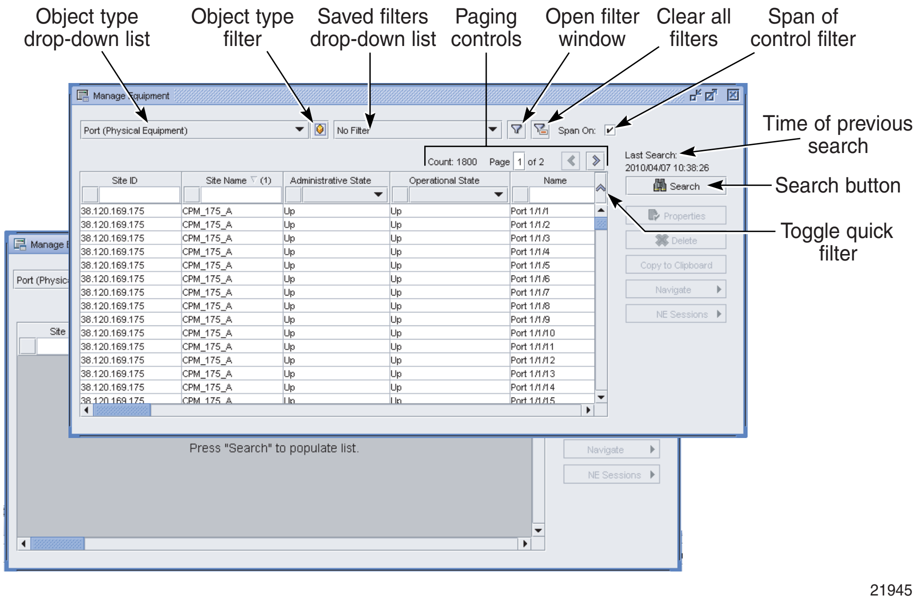
Note 2 — The 5620 SAM-O does not support language localization.

3.2 Using search functions

You can search for many types of objects using list forms, maps, and the navigation tree. For lists that do not populate automatically, the message "Press "Search" to populate list." displays in the result panel when you first access the list form. After you perform a search, a list form or map enables you to manage the results, for example, view or edit object information, or delete objects. Figure 3-5 shows a filterable list form that displays the following above the listed items:

- number of returned search items
- time of the most recent search
- filter controls for refining the list of returned search items
- paging controls for browsing through multiple pages of returned search items

Figure 3-5 Filterable list form



When the number of search results exceeds the allowed limit, the 5620 SAM displays a dialog box that indicates the number of results returned. You can use filter options to refine the search criteria and limit the search results.

A search returns one page of results at a time. You can configure the number of items per page on the User Preferences form. The paging controls on a list form become active when the number of items returned exceeds the page limit. You can use these controls to move sequentially through the pages of listed information or jump directly to a specific page.

You can save and reuse multiple search filters in list forms and maps. Only the saved filters of the current object type and ancestor types are available. You can use an advanced filter form to refine the search criteria using literal values, and different kinds of operators, such as arithmetic and Boolean.

Note — A tab that lists timestamped information, such as the Statistics tab of a 5620 SAM properties form, contains a default saved filter for statistics collected in the most recent time period, for example, the last hour. The time period depends on the type of object specified in the object type drop-down list. See chapter 6 for more information on how to change the time period, from its default value.

See chapter 5 for information about creating map filters.

Using search filters

When you perform a search from a list form, you can configure filters. A filter is based on a combination of attributes, functions, and values. When searching for objects with an ID value, you can search based on LESS THAN, EQUAL TO, or GREATER THAN. For text-type parameters, you can use advanced search functions, such as EQUALS or CONTAINS. Consider the following.

- You can set filters based on letters, numbers, and special characters.
- The search filters are typically case-insensitive; a search on 'ABC' and 'abc' returns the same list. WILDCARD searches, however, are case-sensitive.

Table 3-3 describes the operation of available 5620 SAM search functions.

Table 3-3 Search functions

Operator	Description
APPROXIMATELY EQUAL	When set to APPROXIMATELY EQUAL, which applies to timestamp fields, such as the Last Time Detected field in the Alarm Window, the search returns only items that match the specified time criterion, which you can specify using 1m resolution.
CONTAINS	When set to CONTAINS, the search returns only items that match the entered value. For example, a Description CONTAINS search of 'AB' returns 'ABC Industries' and 'Calgary, AB'. Any empty CONTAINS search returns all items. This search parameter is not case sensitive.
DOES NOT CONTAIN	When set to DOES NOT CONTAIN, the search returns only items that do not match the entered value. For example, a Service Name DOES NOT CONTAIN search of 'epipe' returns only services such as 'IES' services that do not contain 'epipe' as part of the service name. This search parameter is not case sensitive.
EQUALS	When set to EQUALS, the search returns only items that equal the value; for example, Administrative State set to 'Down".
GREATER OR EQUAL	When set to GREATER OR EQUAL, the search returns only items that have a value greater than or equal to the specified criteria.
GREATER THAN	When set to GREATER THAN, the search returns only items that have a value greater than the specified criteria.
IN THE PAST	When set to IN THE PAST, which applies to timestamp fields, such as the Last Time Detected field in the Alarm Window, the search returns only items that have a timestamp that is between the specified time and the present. Click on the clock icon beside the column heading filter field to specify a time criterion.
LESS OR EQUAL	When set to LESS OR EQUAL, the search returns only items that have a value less than or equal to the specified criteria.
LESS THAN	When set to LESS THAN, the search returns only items that have a value less than the specified criteria.
MATCHES ALL	When set to MATCHES ALL, the search returns only items that equal the property values selected; for example, if Monitored Access(es) Down and Site(s) Down are selected, the search returns only items that match all of the selected property values.
MATCHES ANY	When set to MATCHES ANY, the search returns only items that equal at least one of the property values selected; for example, if Monitored Access(es) Down and Site(s) Down are selected, the search returns only items that match one or more of each of the selected property values.

(1 of 2)

Operator	Description
NOT EQUAL	When set to NOT EQUAL, the search returns only items that do not match the selected criteria.
WILDCARD	When set to WILDCARD, you can use the ? character as a single-character wildcard, and * as a multi-character wildcard. For example, a Description WILDCARD search of 'VPRN ?' returns 'VPRN 4' and 'VPRN 8', but not 'VPRN Texas'.

(2 of 2)

Searches using Boolean operators

You can perform advanced searches that use multiple criteria to obtain more precise results. Boolean operators are used to limit and expand searches to the criteria that are specified in the search expressions. Boolean operators can be nested to combine several search expressions into one search expression.

Table 3-4 lists and describes the Boolean search operators.

Table 3-4 Boolean search operators

Boolean operator	Description
AND	When set to AND, the search returns only items that meet all of the specified search criteria.
OR	When set to OR, the search returns only items that meet at least one of the specified search criteria.
NOT	When set to NOT, the search returns only items that do not meet the specified search criteria.

Invalid attributes or values

When a saved search filter contains attributes or values that are not available for the object being searched, the invalid attributes or values are displayed in red text in the filter window. As long as invalid attributes or values exist, the Save button of the filter window are disabled. When a filter with invalid attributes or values is applied, the invalid attributes are not evaluated. For information about using the filter window, see Procedure 3-27.

When a saved search filter contains an invalid attribute, the attribute, function, and value are all displayed in red text in the filter window. The attribute are is surrounded by "**". Both the attribute and value are displayed as a best effort string and may not be internationalized.

When an invalid attribute is selected, the Attribute drop-down is displayed a best effort string that may not be internationalized. If the attribute is not recognized, the Functions drop-down and the Value field display only the corresponding values that are displayed in the filter window. These values cannot be changed until a different attribute is chosen from the Attribute drop-down, at which point they are updated accordingly.

When a saved search filter contains only an invalid value, only the value itself is displayed in red text. The value is surrounded by “**” and may not be internationalized. The Value drop-down does not display a value, but is populated with valid values that can be used to update the filter.

When a saved search filter contains invalid attributes, the filter name is displayed in red text in the saved filters drop-down of a list form. When a filter with invalid attributes is applied from the saved filters drop-down, the invalid attributes are not evaluated. For information about using the saved filters drop-down list, see Procedure 3-39.

Preset filters

When a preset filter is ready to be applied, the saved filters drop-down menu displays an italicized No Filter. Opening the filter window displays the preset filter. Clicking on the Search button applies the filter, and clicking on the Clear All Filters button clears the filter.

Span of control filters

A 5620 SAM GUI user can filter the objects that a map or list form displays, based on the user span of control. By default, the GUI displays only the objects that are in the View Access and Edit Access spans of the user.

Most 5620 SAM list forms contain a configurable Span On parameter. When the parameter is enabled, the displayed objects are limited to the Edit Access span objects. The parameter setting overrides, on the current form only, the global span of control filter setting on the User Preferences form. When the Span On parameter is displayed on a list form that allows filter creation, the associated filter form contains a drop-down menu that has the following options:

- Span: On—Only Edit Access span objects are displayed.
- Span: Off—View Access and Edit Access span objects are displayed.
- Span: User Preference—The User Preferences span filter setting determines which objects are displayed.

The Span On parameter setting in a list form defaults to the User Preferences span filter setting. 5620 SAM topology maps, however, do not contain the Span On parameter; instead, they automatically filter the NEs according to the User Preferences span filter setting.

See chapter 9 for information about spans of control. See Procedure 3-13 for information about configuring the global span of control filter on the User Preferences form.

Equipment group filters

The equipment group filters allow you to search globally for new alarms, historical alarms, managed equipment objects, and managed service objects by equipment that is organized by topology group. See Procedure 5-29 for information about how to create a topology group.

The equipment group filter is created by choosing existing topology groups. The filters can be saved, modified, or deleted. See Procedures 3-41 and 3-42 for information about how to use the equipment group filters .

Equipment group filters can return up to 12 000 elements. If the limit is exceeded, the user is prompted to modify the filter to reduce the number of elements within the limit. Additionally, if you choose an equipment group filter that includes a topology group that has been modified since the filter was applied, an icon appears beside the equipment group filter drop-down list prompting you to press the Search button to update the filter.

Locating attributes on configuration forms

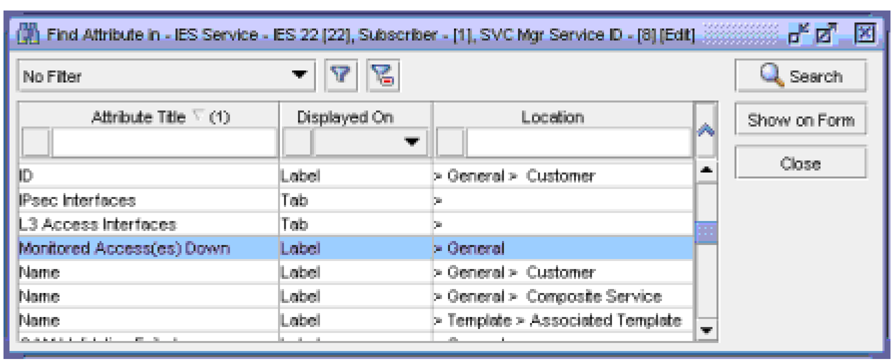
The find attribute function allows you to locate specific attributes on a configuration form.

Note — In this context, attribute refers to the names of tabs, panels, or fields.

Using the Find button located in the bottom right of a configuration form, you can list the attributes in that form. The Find Attribute in list form includes the name, type, and location for all attributes on the configuration form. After you choose the attribute using one of the selection methods described in Procedure 3-30, the tab where the attribute resides appears and the attribute name is highlighted. After you close the list form, the attribute name returns to the default display color. Figure 3-6 shows the Find Attribute in list form.

Note — For configuration forms that can display multiple objects simultaneously, such as the service configuration forms, the search is performed only on the selected object.

Figure 3-6 Find Attribute in list form



3.3 Workflow to use 5620 SAM GUI

1. Start the 5620 SAM GUI. See section 3.4 for more information.
2. Configure the way that the GUI operates for one or more users. See section 3.5 for more information.

3 Manage objects using 5620 SAM main menu options, the alarm and map windows, and the navigation tree. See section 3.6 for more information.

4 Use list forms to perform filtered searches that return information, and optionally save the filters and listed information to files. See section 3.7 for more information.

3.4 5620 SAM GUI start up procedures

The following procedures describe how to start up the 5620 SAM GUI.

Procedure 3-1 To start the 5620 SAM client GUI on a Windows single-user client station

Perform this procedure to start the 5620 SAM single-user client software on a Windows station and begin using the client GUI.

Note 1 — You can have more than one client installed on a station, but you can run only one client instance at a time. For example, you can have a Release 8.0 R1 client and a Release 9.0 R1 client running on the same station, but you cannot have two Release 9.0 R1 clients running on the same station.

Note 2 — The user that starts a 5620 SAM Windows client must be one of the following:

- the user that installed the client software
- a user with sufficient permissions on the client files and directories, such as a local administrator

1 To start the client GUI using a web browser, perform the following steps.

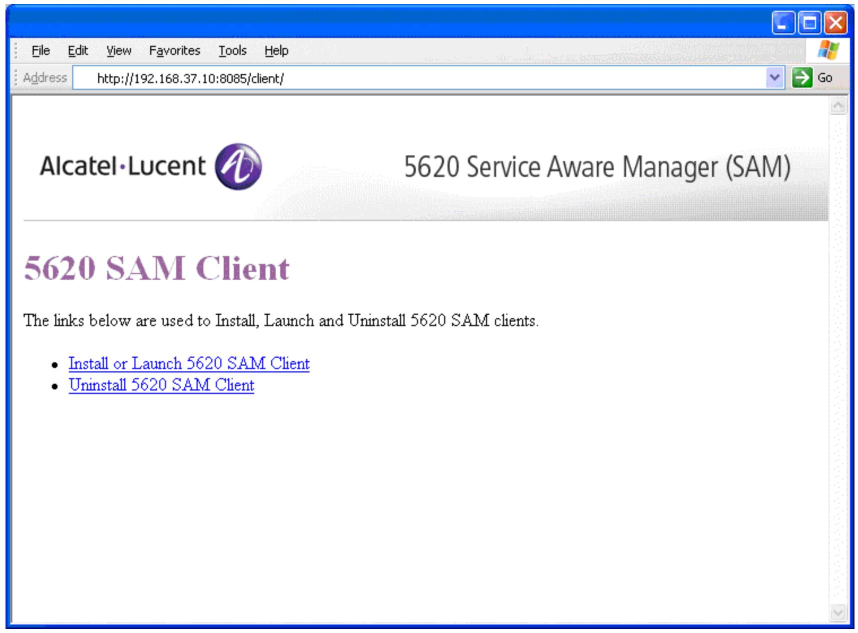
i Navigate to the following URL on the 5620 SAM main server:

http://*server*:8085/client

where *server* is the IP address or hostname of the 5620 SAM main server

The page shown in Figure 3-7 is displayed.

Figure 3-7 5620 SAM client page



ii Click on the “Install or Launch 5620 SAM Client” link.

iii If you did not use a web browser to install the client, a form opens and prompts you for the client installation directory. Use the form to specify the client installation directory, for example, C:\5620sam\client.

iv The 5620 SAM login form opens. Go to step 5.

2 To start the client GUI using a desktop shortcut, perform the following steps.

i Double-click on the 5620 SAM Client App icon on the Windows desktop. The 5620 SAM client login form opens.

ii Go to step 4.

3 To start the client GUI using a CLI, perform the following steps.

Note — Using a CLI to start the client GUI allows you to specify one or more client startup options.

i Open a command window.

ii Navigate to the 5620 SAM client installation directory. Enter the following commands at the CLI prompt in the order shown:

drive_ID ↵

cd *install_dir*\nms\bin ↵

where
drive_ID is the drive on which the 5620 SAM client is installed, for example, C:
install_dir is the 5620 SAM client installation location, typically \5620sam\client

iii Enter the following at the CLI prompt to start the 5620 SAM client using one or more startup options:

nmsclient.bat *option* ↵

where *option* is one or more of the startup options listed in Table 3-5

For example, to force a client update, enter the following:

nmsclient.bat update ↵

Table 3-5 5620 SAM client startup options for Windows

Option	Description
nms_version	Displays the client software version
baseLocale	Starts the client using the base OS locale for string resources such as language, number, date, and time formats
secure	Starts the client using HTTPS to connect to the server
server <*server*:*port*;*server*:*port*...>	Starts the client and specifies the 5620 SAM servers that the client is to check for an update where *server* is an IP address or a DNS name *port* is an HTTP or HTTPS port on the server
update	Starts the client and forces the download and installation of the updated client files. This overrides the local client configuration to ensure that the client and server configurations match. This option is useful for restoring a corrupted client installation. You can restore local configuration variances after the update.
retryCount	Starts the client and specifies the number of times to attempt to download a client update
noupdate	Starts the client without performing an update. This option is useful for preserving a specific client configuration that differs from the server configuration.

(1 of 2)

Option	Description
keepConfig	Starts the client and performs an update, but does not permit the overwriting of the nms-*.xml configuration files in the *install_dir*\nms\config directory where *install_dir* is the 5620 SAM client installation directory, typically C:\5620sam\client After this option is specified, it remains in effect until the client is started using the "update" option, which then remains in effect.
keepSpecified	Specifies that the files listed in *install_dir*\nms\config\keepFile.txt are not to be overwritten during a client update where *install_dir* is the 5620 SAM client installation location, typically C:\5620sam\client The keepFile.txt file must contain only one file entry per line, and each entry must be an absolute file path.
connectTimeout [*timeout*]	Specifies a timeout value, in ms, that the client uses for a download-server connection attempt. If the client cannot connect to a server within the timeout period, the operation is aborted. The default is 3000, which specifies 3s. The maximum connection timeout in Windows is 20s.
readTimeout [*timeout*]	Specifies a timeout value, in seconds, that the client uses for a download-server file read attempt. If the client cannot obtain a server response to a file request within the timeout period, the file request is aborted. The default is 3000, which specifies 3s. The maximum read timeout in Windows is 20s.
help	Displays the nmsclient.bat usage information and options

(2 of 2)

The 5620 SAM client login form opens.

4 Choose the 5620 SAM server that you want to log in to from the Server drop-down list.

Note — Before the login form can display multiple servers in the Server drop-down list, you must configure the client to support multiple server options. See chapter 6 for more information.

5 Enter the Login name and Password information required for the server.

Note 1 — If this is the first time that a client connects to the server, you must use admin as the Login Name. Contact your Alcatel-Lucent technical support representative for the default 5620 SAM user account information.

Note 2 — The login name and password used depend on whether client GUI users are authenticated locally or remotely, as determined by the system administrator. Use the login name and password provided by your system administrator. See chapter 9 for more information.

6 Click on the Login button. The 5620 SAM GUI opens.

7 If the 5620 SAM server is at a higher major release level than the client, the auto-update function may display a dialog box that asks whether you want to remove an older version of JRE. If this occurs, perform one of the following.

a If there is no longer a need for the client to connect to a main server at the older 5620 SAM release level, click on the Yes button. The older JRE version is removed.

b If the client is required for connecting to a a main server at the older 5620 SAM release level, click on the No button. The older JRE version is retained.

If you have trouble opening the GUI, see the *5620 SAM Troubleshooting Guide*.

Procedure 3-2 To start the 5620 SAM client GUI on a Solaris single-user client station

Perform this procedure to start the 5620 SAM single-user client software on a Solaris station and begin using the client GUI.

Note 1 — You can have more than one client installed on a station, but you can run only one client instance at a time. For example, you can have a Release 8.0 R1 client and a Release 9.0 R1 client running on the same station, but you cannot have two Release 9.0 R1 clients running on the same station.

Note 2 — The user that starts a 5620 SAM Solaris client must be one of the following:

- the user that installed the client software
- another user that has read, write, and execute permissions on the client files and directories

1 To start the client GUI using a web browser, perform the following steps.

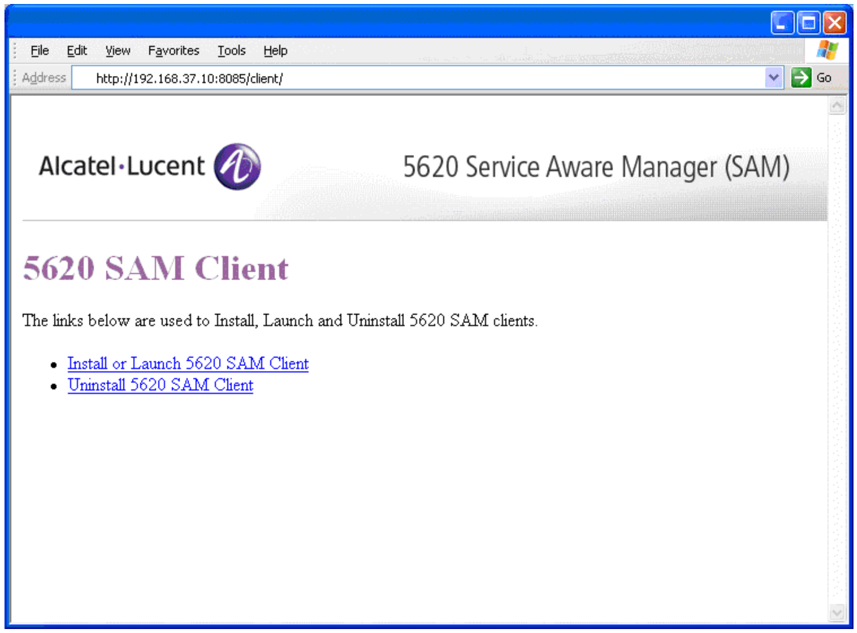
i Navigate to the following URL on the 5620 SAM main server:

http://*server*:8085/client

where *server* is the IP address or hostname of the 5620 SAM main server

The page shown in Figure 3-8 is displayed.

Figure 3-8 5620 SAM client page



ii Click on the “Install or Launch 5620 SAM Client” link.

iii If you did not use a web browser to install the client, a form opens and prompts you for the client installation location. Use the form to specify the current client installation directory, for example, /opt/5620sam/client.

iv The 5620 SAM login form opens. Go to step 5.

2 To start the client GUI using a desktop shortcut, perform the following steps.

i Double-click on the 5620 SAM Client App icon on the desktop. The 5620 SAM client login form opens.

ii Go to step 4.

3 To start the client GUI using a CLI, perform the following steps.

Note — Using a CLI to start the client GUI allows you to specify one or more client startup options.

i Open a bash console window on the client station.

ii Enter the following at the CLI prompt to navigate to the 5620 SAM client installation directory:

cd *install_dir*/nms/bin ↵

where *install_dir* is the 5620 SAM client installation location, typically /opt/5620sam/client

iii To specify one or more client startup options, enter the following at the CLI prompt:

./nmsclient.bash *option* ↵

where *option* is one or more of the startup options listed in Table 3-6

For example, to force a client update, enter the following:

./nmsclient.bash update ↵

Table 3-6 5620 SAM client startup options for Solaris

Option	Description
nms_version	Displays the client software version
baseLocale	Starts the client using the base OS locale for string resources such as language, number, date, and time formats
secure	Starts the client using HTTPS to connect to the server
server <*server*:*port*;*server*:*port*...>	Starts the client and specifies the 5620 SAM servers that the client is to check for an update where *server* is an IP address or a DNS name *port* is an HTTP or HTTPS port on the server
update	Starts the client and forces the download and installation of the updated client files. This overrides the local client configuration to ensure that the client and server configurations match. This option is useful for restoring a corrupted client installation. You can restore local configuration variances after the update.
retryCount	Starts the client and specifies the number of times to attempt to download a client update
noupdate	Starts the client without performing an update. This option is useful for preserving a specific client configuration that differs from the server configuration.

(1 of 2)

Option	Description
keepConfig	Starts the client and performs an update, but does not permit the overwriting of the nms-*.xml configuration files in the *install_dir*/nms/config directory where *install_dir* is the 5620 SAM client installation directory, typically /opt/5620sam/client After this option is specified, it remains in effect until the client is started using the “update” option, which then remains in effect.
keepSpecified	Specifies that the files listed in *install_dir*/nms/config/keepFile.txt are not to be overwritten during a client update where *install_dir* is the 5620 SAM client installation location, typically /opt/5620sam/client The keepFile.txt file must contain only one file entry per line, and each entry must be an absolute file path.
connectTimeout [*timeout*]	Specifies a timeout value, in ms, that the client uses for a download-server connection attempt. If the client cannot connect to a server within the timeout period, the operation is aborted. The default is 3000, which specifies 3s.
readTimeout [*timeout*]	Specifies a timeout value, in seconds, that the client uses for a download-server file read attempt. If the client cannot obtain a server response to a file request within the timeout period, the file request is aborted. The default is 3000, which specifies 3s.
help	Displays the nmsclient.bash usage information and options

(2 of 2)

The 5620 SAM client login form opens.

4 Choose the 5620 SAM server that you want to log in to from the Server drop-down list.

Note — Before the login form can display multiple servers in the Server drop-down list, you must configure the client to support multiple server options. See chapter 6 for more information.

5 Enter the Login name and Password information required for the server.

Note 1 — If this is the first time that a client connects to the server, you must use admin as the Login Name. Contact your Alcatel-Lucent technical support representative for the default 5620 SAM user account information.

Note 2 — The login credentials that are required depend on whether local or remote user authentication is used for the GUI client. Use the login name and password provided by your system administrator. See chapter 9 for more information.

6 Click on the Login button. The 5620 SAM GUI opens.

7 If the 5620 SAM server is at a higher major release level than the client, the auto-update function may display a dialog box that asks whether you want to remove an older version of JRE. If this occurs, perform one of the following.

- **a** If there is no longer a need for the client to connect to a main server at the older 5620 SAM release level, click on the Yes button. The older JRE version is removed.
- **b** If the client is required for connecting to a a main server at the older 5620 SAM release level, click on the No button. The older JRE version is retained.

If you have trouble opening the GUI, see the *5620 SAM Troubleshooting Guide*.

Procedure 3-3 To start the 5620 SAM client GUI through a client delegate server

Perform this procedure to open a 5620 SAM client GUI using the 5620 SAM client delegate software on another station.

1 If you are not in the same physical facility as the client delegate server, log in to the facility using the appropriate third-party access tool, for example, Citrix software.

2 Log in to the client delegate server using an account with local user privileges.

3 Open a bash console window on the client delegate server station.

4 Use the appropriate UNIX commands to redirect the display to the station that you are using.

5 Enter the following at the CLI prompt to navigate to the 5620 SAM client installation directory on the client delegate server:

cd *install_dir*/nms/bin ↵

where *install_dir* is the 5620 SAM client installation location, typically /opt/5620sam/client

6 Perform step 3 of Procedure 3-2.

Note — You must be logged in as the samadmin user on a client delegate server to use a client startup option that updates the client software or configuration. If you attempt such an operation as a user other than samadmin, the operation fails.

7 Enter the Login name and Password information on the 5620 SAM client login form.

Note 1 — If this is the first time that a client connects to the server, you must use admin as the Login Name. Contact your Alcatel-Lucent technical support representative for the default 5620 SAM user account information.

Note 2 — The login credentials that are required depend on whether local or remote user authentication is used for the GUI client. Use the login name and password provided by your system administrator. See chapter 9 for more information.

8 Click on the Login button. The 5620 SAM client GUI opens.

If you have trouble opening the GUI, see the Troubleshooting 5620 SAM Clients chapter of the *5620 SAM Troubleshooting Guide*.

Procedure 3-4 To change to a different 5620 SAM client GUI user

Perform this procedure to change which 5620 SAM user is currently logged in to the client GUI.

1 Choose Application→Switch User from the 5620 SAM main menu. A dialog box appears.

2 Click on the Yes button. The GUI restarts and displays the login form.

3 Log in using the required credentials. The client GUI opens.

Procedure 3-5 To close the 5620 SAM GUI

1 Choose Application→Exit from the 5620 SAM main menu. A dialog box appears.

2 Click on the Yes button. The GUI application closes.

3.5 5620 SAM GUI configuration procedures

The following procedures describe how to configure 5620 SAM GUI operation.

Procedure 3-6 To configure the default client time zone

Perform this procedure to specify which time zone the 5620 SAM client will use by default.

1 Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.

2 Configure the Default Client Time Zone parameter.

3 Click on the OK button. The User Preferences form closes and a dialog box appears.

4 Click on the OK button.

Procedure 3-7 To configure the current client time zone

Perform this procedure to specify which time zone the 5620 SAM client will use currently.

1 Click on the Current Client Time Zone button in the bottom right hand corner of the GUI. The Current Client Time Zone form opens.

2 Perform one of the following:

a Select Use Default Client Time Zone.

b Select Use Specific Client Time Zone and choose a time zone from the list.

3 Click on the OK button. The Current Client Time Zone form closes and a dialog box appears.

4 Click on the OK button.

Procedure 3-8 To configure the GUI inactivity timeout

A 5620 SAM user with an admin scope of command role can configure a GUI inactivity check that applies to all client GUIs, or to sets of users based on the associated user groups.

1 Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 To change the GUI inactivity check for all 5620 SAM GUI users, perform the following steps.

i Configure the Client Timeout (minutes) parameter.

ii Click on the Apply button.

3 To change the GUI inactivity check for all users in a user group, perform the following steps.

i Click on the User Groups tab. A list of user groups is displayed.

ii Choose a user group from the list and click on the Properties button. The User Group *name* (Edit) form opens.

iii Enable the Override Global Timeout parameter.

iv Configure the Client Timeout (minutes) parameter.

v Click on the OK button. A dialog box appears.

vi Click on the Yes button. The User Group (Edit) form closes.

4 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 3-9 To show, hide, or modify the toolbar

Icons that represent a subset of the main menu functions are available in the toolbar.

1 Start the 5620 SAM GUI. By default, toolbar icons are displayed under the 5620 SAM main menu.

2 To show the toolbar when it is hidden, perform the following steps.

i Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.

ii Select the Show Toolbar parameter and click on the OK button.

3 To modify the toolbar, right-click on an empty section of the toolbar. The toolbar contextual menu is displayed.

4 Perform one of the following:

a To add icons to the toolbar, select the icons in the contextual menu. The icons are added to the toolbar.

b To remove icons from the toolbar, deselect the icons in the contextual menu. The icons are removed from the toolbar.

c To hide the toolbar, choose Hide Toolbar from the contextual menu. The toolbar is removed from the display.

5 Click on an empty section of the GUI to close the toolbar contextual menu.

Procedure 3-10 To enable or disable containing window warnings

1. Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.
2. Configure the Suppress Containing Window Warning parameter.
3. Click on the OK button. The User Preferences form closes.

Procedure 3-11 To enable or disable template generation messages

1. Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.
2. Configure the Suppress Template Generation Message parameter.
3. Click on the OK button. The User Preferences form closes.

Procedure 3-12 To enable or disable Service and Composite Service Topology Map Load Warnings

1. Choose Application→User Preferences. The User Preferences form opens with the General tab displayed.
2. Configure the Suppress Service and Composite Service Map Load Warning parameter.
3. Click on the OK button. The User Preferences form closes.

Procedure 3-13 To enable or disable a global span of control filter

Perform this procedure to configure which objects the 5620 SAM client GUI displays in frames that include list forms, maps, and the Alarm Window. By default, the GUI displays all objects that are in your View Access and Edit Access spans.

You can temporarily override the global filter setting in a list form or window using the Span On check box, and can include your span of control in an advanced filter window. See section 3.2 for information about performing searches using list forms and span of control filters.

Note — This procedure affects the GUI display of only the user that performs the procedure, and not other users.

1 Choose Application→User Preferences. The User Preferences form opens with the General tab displayed.

2 Configure the Apply User Span of Control parameter.

3 Click on the OK button. The User Preferences form closes.

Procedure 3-14 To save the GUI workspace preferences

Perform this procedure to save the current GUI workspace preferences. The next time you log in to the client on the same user account and workstation, your GUI workspace preferences are restored.

1 Configure the following GUI workspace elements, as required:

- position, size, and state of the navigation tree, alarm window, and physical topology
- toolbar settings

2 Choose Application→Save Workspace from the 5620 SAM main menu. The current GUI workspace preferences are saved.

Procedure 3-15 To configure the 5620 SAM Task Manager

The Task Manager allows 5620 SAM operators to monitor progress of operational tasks. Only the 5620 SAM administrators can configure task monitoring parameters. The Task Manager monitors the following:

- all write operations that are performed from the 5620 SAM GUI; for example, when you click on the Apply or OK buttons
- all write operations that are performed using the OSSI
- some read operations; for example, when you click on the Resync or Collect All buttons

Note — The Task Manager is operational with the default values.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Open the nms-server.xml file using a text editor.

4 Find and configure the parameters to fit your operational requirements.

- maxNumRetainedTasks
- numTasksToPurgeWhenFull
- successfulTasksPurgeInterval
- failedTasksPurgeInterval

Note — If one or more of the parameters are changed from their default values, you must restart the 5620 SAM server for the changes to take effect.

5 Navigate to the client configuration directory, typically /opt/5620sam/client/nms/config.

6 Open the nms-client.xml file using a text editor.

7 If required, configure the autoRefreshInterval parameter. The parameter does not take effect until the 5620 SAM client is restarted.

8 If required, export a report to a file, as described in Procedure 3-34.

9 If required, save the table preferences, as described in section 3.2.

10 Close the form. See Procedure 3-22 to view the Task Manager.

3.6 Basic 5620 SAM GUI operation procedures

The following procedures describe how to operate and navigate the 5620 SAM GUI.

Procedure 3-16 To open the navigation tree or alarm window

The navigation tree and alarm window position and state preferences are stored in the local file system so that each time the GUI is opened using the same user account, the saved preferences are used.

1 Start the 5620 SAM client GUI.

2 Open a hidden window or bring these windows to the foreground using one of the following methods:

- **a** Choose the Navigation Tree or Alarm Window icon from the toolbar.
- **b** Choose *View*-Network or Alarm Window from the Window menu.
- **c** Use the Navigation Tree or Alarm Window shortcut key.
- **d** Choose the icon that represents the window from the task bar. The task bar is located just above the status bar.

Procedure 3-17 To go to a window

1 Perform one of the following:

- **a** Copy a window identifier link to the clipboard. See Procedure 3-24 for more information.
- **b** Save a window identifier link to the clipboard. See Procedure 3-25 for more information.

2 Choose Application→Go To Window from the 5620 SAM main menu. The Go To Window window opens.

3 Click on the Paste button or press CTRL+V. The window link identifier appears in the Label area.

4 Perform one of the following:

- **a** Click on the OK button. The Go To Window window closes and the window specified in step 1 opens.
- **b** Click on the Apply button. The window specified in step 1 opens.

Procedure 3-18 To use menus, the toolbar, or shortcuts

1 Start the 5620 SAM GUI.

2 Perform one of the following to open an object.

a Choose an option from the main menu. A shortcut icon for the menu option is shown beside the option text.

b Click on the menu equivalent in the toolbar. Scroll over the toolbar icons to view a tool tip that describes the icon function. See Procedure 3-9 for information about modifying or hiding the toolbar.

c By typing the appropriate ALT+*Key* shortcut; the underlined letter in a main menu item is the shortcut key. For example, ALT+P opens the Policies menu.

Note — Using the CTRL+F4 key to close a form or window may cause problems if the parent form is open. Alcatel-Lucent recommends that to close a form or window, you use the Close button and respond to the subsequent prompt, or click on the X button in the top right corner of the form or window.

Procedure 3-19 To use menus, windows, and forms to configure or view parameters

1 Start the 5620 SAM client GUI.

2 Open a configuration form using one of the following methods.

a Double-click on the lowest-level navigation tree object to open the object properties form. When you double-click on an object that has child objects, the child object is revealed; when you double-click on an object that has no child objects, the object properties form opens.

b Choose the appropriate 5620 SAM main menu or submenu option.

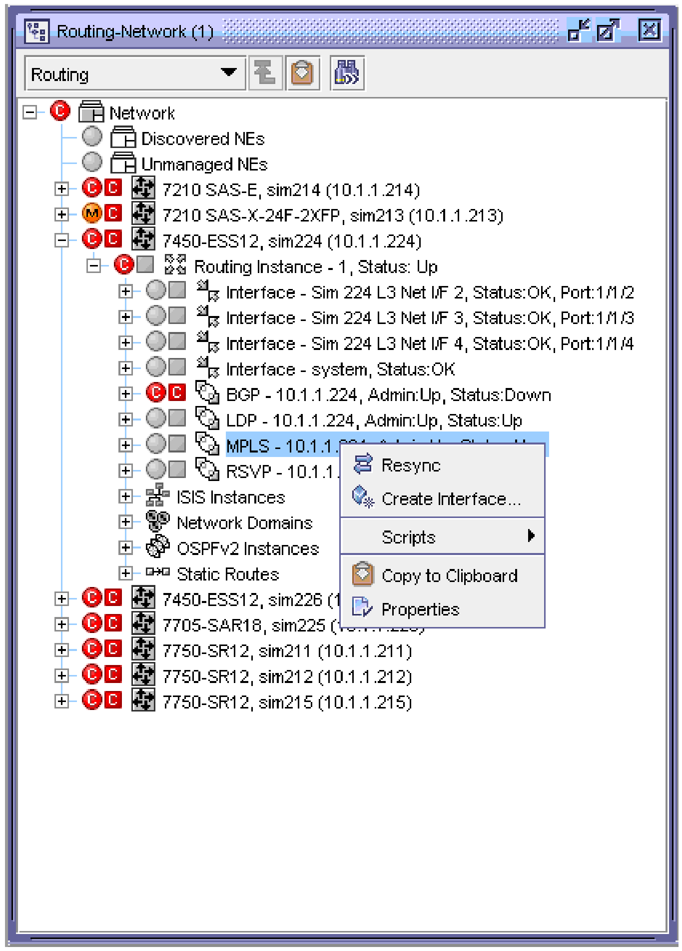
c Double-click on an object, for example, a customer in a list of customers.

d Click on the task bar icon that represents the form.

e Right-click on an object in the navigation tree or Alarm Window and choose the appropriate option from the contextual menu.

Figure 3-9 shows an example of a right-click contextual menu in the navigation tree.

Figure 3-9 Right-click contextual menu example



The appropriate form opens.

3 Configure or view the parameters on the form, as required, using the following methods.

Note — A parameter that has a yellow background is mandatory and must be configured before you can go to the next form or apply the changes on the current form.

a Enter information beside the parameter, as appropriate. For example, type in text to configure the Description parameter.

b Use the drop-down menu to choose an option from a list. For example, choose Access as the port mode on a port configuration form.

c If the configuration form is a step form, follow the form prompts.

d Double-click an object in a row to open a new view or set of configurations. For example, from a list of ports double-click on a row to open the configuration form for that port.

e Right-click on an object in the navigation tree to display additional contextual menu choices, as shown in Figure 3-9.

See the *5620 SAM Parameter Guide* for a list of the configurable parameters.

4 Click on the Apply button to save the configuration changes without closing the form.

5 Click on the appropriate button to complete the configuration.

a Click on the OK button to save the changes and close the form, if the form is other than a step form.

b Click on the Finish button to save the changes in a step form.

c Click on the More Actions button and choose Turn Up to activate the object.

d Click on the More Actions button and choose Shut Down to deactivate the object.

e Click on the Cancel button to close the form without saving the changes.

f Click on the Close button to close the form without saving the changes.

Note — Using the CTRL+F4 key to close a form or window may cause problems if the parent form is open. Alcatel-Lucent recommends that to close a form or window, you use the Close button and respond to the subsequent prompt, or click on the X button in the top right corner of the form or window.

g The Resync button to ensure that the 5620 SAM and managed devices are synchronized. Resynchronization does not affect the contents of the historical statistics database.

Procedure 3-20 To arrange multiple open forms

1 To arrange multiple open forms so that they overlap, choose Window→Cascade from the 5620 SAM main menu. The forms are displayed in the top left area of the GUI with the form that is farthest to the right in the foreground.

2 To arrange multiple open forms so that they do not overlap, perform one of the following.

a Choose Window→Tile Vertical from the 5620 SAM main menu. The forms are displayed beside each other.

b Choose Window→Tile Horizontal from the 5620 SAM main menu. The forms are displayed above each other.

c Choose Window→Tile Square from the 5620 SAM main menu. The forms are displayed beside and above each other to fill the GUI workspace.

3 To move an open form to the foreground, perform one of the following.

a Click on the task bar icon that represents the open form.

b Choose Window→*form_name* from the 5620 SAM main menu

where *form_name* is the name of the form that you want in the foreground

Procedure 3-21 To close one or all open forms

Note — When there is unsaved information on a form, you are prompted to save the changes before you close the form.

1 To close one form, perform one of the following.

a Click on the X in the top-right corner of the form.

b Click on the Close button.

c Right-click on a form in the task bar and choose Close from the contextual menu.

2 To close all open forms, choose Window→Close All from the 5620 SAM main menu.

Procedure 3-22 To view the 5620 SAM Task Manager

See Procedure 3-15 to configure the Task Manager.

Note — You can send the tasks that the Task Manager displays to a file using the OSSI findToFile method. See the *5620 SAM XML OSS Interface Developer Guide* for more information.

1 Choose Application→Task Manager from the 5620 SAM main menu. The Task Manager form opens.

The All Users check box appears for only the 5620 SAM administrators. If you are a 5620 SAM administrator or a user with an assigned administrator scope of command role, go to step 2 to monitor tasks for all users. Otherwise, go to step 3.

2 Enable the All Users check box to monitor operations that are performed in the 5620 SAM server by all 5620 SAM users. The default is Disabled.

3 If required, configure the filter and click on the Search button. The following appear in the Task Manager:

- all write operations that are performed from the 5620 SAM GUI; for example, when you click on the Apply or OK buttons
- all write operations that are performed using the OSSI
- some read operations; for example, when you click on the Resync or Collect All buttons

Note — The Task Manager automatically refreshes when the value of the autoRefreshInterval parameter is reached. The default is 20 s. You can also click on the Search button to refresh the list of tasks.

4 Double-click on a task to view more information about the task. The Task - Top Level window opens.

5 Click on the Tree tab button to view a hierarchical display of the tasks.

6 Click on the Sub-Tasks tab button to view the sub-tasks that are associated with the task.

7 Click on the More Actions button and choose Activity Log to open the User Read Log or User Request Log form and view additional information relating to the task.

The Activity Log option is available only for Top Level task forms. It is not available for sub-task forms.

8 Close the form.

Procedure 3-23 To send a text message to another 5620 SAM user

You can send text messages to another 5620 SAM user or to all active users logged into the 5620 SAM.

1 Choose Application→Text Message from the 5620 SAM main menu. The Text Message window opens.

2 Type the text message in the text area.

Note — You can also press CTRL+V to paste information from the clipboard into the text area. For example, pasting a window link identifier creates a link which the recipient can click to launch the window. For more information about copying to the clipboard, see Procedures 3-24 and 3-25.

3 Click on the Send To... button. The Select Session window opens.

4 If required, configure the filter criteria to create a filtered list of GUI client sessions.

5 Click on the Search button. A list of active GUI client sessions is displayed.

6 Perform one of the following:

- **a** To select a single user, click on a GUI client session.
- **b** To select all GUI client sessions, press CTRL +A
- **c** To select non-consecutive GUI client sessions, click on a session and press CTRL +ALT and select another session.

7 Click on the OK button. The text message is sent to the selected client(s). Messages are uniquely identified with the Client ID number of the sender. You can reply back to the sender by clicking on the Reply button.

Procedure 3-24 To use the clipboard

1 Select one or more objects to copy from one of the following locations.

- **a** To copy objects from the equipment view of the navigation tree, go to step 2.
- **b** To copy objects from a generated or displayed list, go to step 2.
- **c** To copy objects from a read-only field on a configuration form, go to step 6.

2 Click on the Copy to Clipboard button. The object properties are copied to the clipboard.

3 Choose Application→Clipboard from the 5620 SAM main menu. The Clipboard window opens displaying the copied object properties in a text string format.

4 Perform one of the following:

a Copy and paste the properties text string to an external application.

i Select the properties text string that you want to copy and press CTRL+C.

Only one text string can be selected and copied at a time.

ii Paste the properties text string into an external application.

b View the property form for a copied object.

i Select the properties text string for the object that you want to view.

ii Click on the View Object button. The properties form for the object opens.

5 Repeat steps 1 to 4 to copy additional objects, or close the Clipboard window.

For information about using the clipboard function to create physical links, see Procedure 5-34.

6 Highlight a read-only field to copy and press CTRL+C.

7 Paste the copied read-only field into another form or application by pressing CTRL+V.

Note — You cannot copy a password field.

Procedure 3-25 To save a window to the clipboard

1 Open a configuration form.

2 Choose Application→Save Window To Clipboard from the 5620 SAM main menu. The window identifier link is saved to the clipboard.

3.7 5620 SAM GUI search procedures

The following procedures describe how to use the 5620 SAM to search for and display information.

Procedure 3-26 To perform a simple search using column headings

1 Open a list form.

2 If available, choose an entry from the object drop-down list.

> **Note —** If you click on the Search button without selecting a specific object type from the list, a default entry may be used.

3 If the filter has not been pre-populated, configure the filter criteria using the filter area of any column heading.

> **Note 1 —** Entering a value into a filter area of a column heading without specifying an operation from an operation drop-down menu causes a default operation to be automatically selected.
>
> **Note 2 —** The following operators are available for filtering a list by object timestamp. Each operator allows you to specify the time criteria using the clock icon beside the column heading filter:
>
> - APPROXIMATELY EQUAL, which allows you to specify a time with 1m resolution rather than the default 1ms timestamp resolution
> - IN THE PAST, which allows you to specify an amount of time before the present as the filter range, for example, the past 3 hours
>
> **Note 3 —** Selecting NONE in an operation drop-down menu clears the filter area of the associated column heading.
>
> **Note 4 —** Clicking on the Toggle Quick Filter button toggles the visibility of the filter areas on or off.
>
> **Note 5 —** The filter areas of the column headings are disabled if a filter was applied using the filter window, if the filter window is open, or if a saved filter was loaded using the saved filter drop-down list. See Procedure 3-27 for more information about performing an advanced search.

4 Click on the Search button. The results list is displayed based on the filter.

5 To refresh the search results using the currently defined filter, click on the Search button. If applied, the current filter is used even when the filter areas are hidden or closed.

6 Close the List Form.

Procedure 3-27 To perform an advanced search

1 Open a List Form.

2 Click on the Filter button at the top of the form. The filter window opens.

Note — The filter areas of the column headings in a List Form are disabled if a filter is applied using the filter window, if the filter window is open, or if a saved filter was loaded using the saved filters drop-down list. See Procedure 3-26 for more information about performing a simple search using column headings.

3 Configure the filter properties.

- **i** Choose an item from the Attribute drop-down menu.
- **ii** Choose an item from the Function drop-down menu.
- **iii** Choose an item from the Value drop-down menu.
- **iv** Choose a Boolean Operator from the Operators drop-down menu.
- **v** Click on the Add button.

4 Do one of the following.

- **a** To filter additional properties, repeat step 3.
- **b** To modify the search filter, go to step 5.
- **c** If you are finished filtering properties, go to step 6.

5 Modify the search filter, if required.

- **a** Replace a Boolean operator.
  - **i** Select a Boolean operator in the summary area.
  - **ii** Choose an item from the Operators drop-down menu to replace the selected Boolean operator.

Note 1 — If an entire bracket is selected, all Boolean operators within are replaced at once.

Note 2 — If multiple filtered properties exist, replacing a Boolean operator wraps the properties associated with that operator in brackets.

b Exclude filtered properties.

i Select a filtered property in the summary area.

ii Click on the NOT button to exclude any matching entries from the search results.

Note 1 — If an entire bracket is selected, all filtered properties within are excluded at once.

Note 2 — Selecting an excluded property or a bracket and clicking on the NOT button includes the property or bracket again.

c Replace filtered properties.

i Select a filtered property in the summary area.

ii Configure the filter properties, as described in step 3.

iii Click on the Replace button.

d Delete filtered properties.

i Select a filtered property or a bracket in the summary area.

ii Click on the Delete button to remove the selected filtered properties from the search filter.

Note — Multiple filtered properties can be selected and deleted at once.

e Wrap filtered properties in brackets.

i Click the left mouse button and drag over multiple filtered properties in the summary area to select them.

ii Click on the brackets button to wrap the selected filtered properties in brackets.

Note 1 — Selecting properties that are already wrapped in brackets and clicking on the brackets button unwraps the selected properties.

Note 2 — Properties can only be wrapped or unwrapped if all Boolean operators contained within are matching.

6 Click on the Apply button or the OK button. The results list is displayed based on the filter.

7 If the filter window is open, click on the Close button. The filter window closes.

8 Close the List Form.

Procedure 3-28 To perform a search using the navigation tree

You can use the navigation tree to find specific objects. These objects include nodes, shelves, ports, and more.

1 Click on the Find... button on the navigation tree or press CTRL+F. The Find panel opens.

2 Configure the parameters as necessary. The parameters that are available for configuration vary depending on the view that has been selected.

3 Click on the Find button or press Enter. The first matching object is selected and expanded in the navigation tree.

4 To find additional matching objects, click on the Next button or press F3. The next matching object is selected and expanded in the navigation tree.

5 To return to the previous matching object in the navigation tree, click on the Previous button or press Shift+F3.

6 If required, click on the Clear button to clear all parameters configured in step 2.

7 Click on the Find... button or press CTRL+F to close the Find panel.

Procedure 3-29 To perform a search by specifying endpoints

Use the following procedure to find objects such as service tunnels, MPLS paths, VLAN paths and LSP paths by specifying endpoints.

1 Choose one of the following menu options from the 5620 SAM main menu:

- Manage→MPLS→Dynamic LSPs
- Manage→MPLS→Manual Bypass LSPs
- Manage→MPLS→Static LSPs
- Manage→MPLS→MPLS Paths
- Manage→MPLS→Static LSPs
- Manage→Service Tunnels
- Manage→VLAN→Paths

The Manage filter form opens.

2 Click on the Filter button. The filter window opens.

3 Choose Endpoints from the Select Filter Type drop-down menu. Endpoints is the default option.

Note — If a saved filter is selected or the filter areas of the column headings are populated, Advanced Filter is the default option.

4 Deselect the Any Source check box to pick a source IP address as a search filter. Otherwise, leave the Any Source check box selected to search by any source IP address.

5 Deselect the Any Destination check box to pick a destination IP address as a search filter. Otherwise, leave the Any Destination check box selected to search by any destination IP address.

6 Click on the Apply button. The results list is displayed based on the filter.

7 Click on the Close button to close the filter window.

8 Close the List Form.

Procedure 3-30 To locate an attribute on a configuration form

1 Open a configuration form.

2 Click on the Find button or press CTRL+F. The Find Attribute in list form opens and displays the attributes on the configuration form.

3 Configure the filter criteria and click on the Search button. A list of attributes is displayed.

4 Choose an attribute from the list and perform one of the following:

- a Click on the Show on Form button.
- b Double-click on the attribute row.
- c Press Enter.

On the configuration form, the selected name of the tab, panel, or field is highlighted and the associated tab is displayed.

Note — For configuration forms that can display multiple objects simultaneously, such as the service configuration forms, the search is performed only on the selected object.

Procedure 3-31 To filter object types

When an object drop-down list contains more than 10 items, you may click on the Filter for Object Type button to refine your search.

1 Open a List Form.

2 Click on the Filter for Object Type button. The Select Object Type form opens.

3 Configure the filter criteria using the filter area of any column headings.

Note — You can click on the Filter button on the Select Object Type form to open the filter window. See Procedure 3-27 for more information about performing an advanced search.

4 Click on the Search button. The results list is displayed based on the filter.

5 Select an object from the list and click on the OK button. The Select Object Type form closes and the List Form reappears with the new Object Type selected in the Object Type drop-down.

Procedure 3-32 To filter using span of control

On some List Forms, you can create and save a span filter to display objects for your specific span of control. For example, if you only want to see objects within the span of control that has been assigned to you, create a span filter. You can also configure user preferences to automatically filter out objects that are not in your span of control.

1 Open a List Form.

2 If available, choose an entry from the object drop-down list.

3 Do one of the following.

 a To search using Span of Control from a List Form, go to step 4.

 b To search using Span of Control from the filter window, go to step 5.

4 Click on the Span On check box. The results list is displayed based on the filter. Go to step 9.

5 Click on the Filter button. The filter window opens.

6 Choose an entry from the Span drop-down list.

Note — An entry from the Span drop-down list is selected based on the Span On check box on the List Form.

7 Click on the Apply button. The results list is displayed based on the filter and the Span On check box is updated.

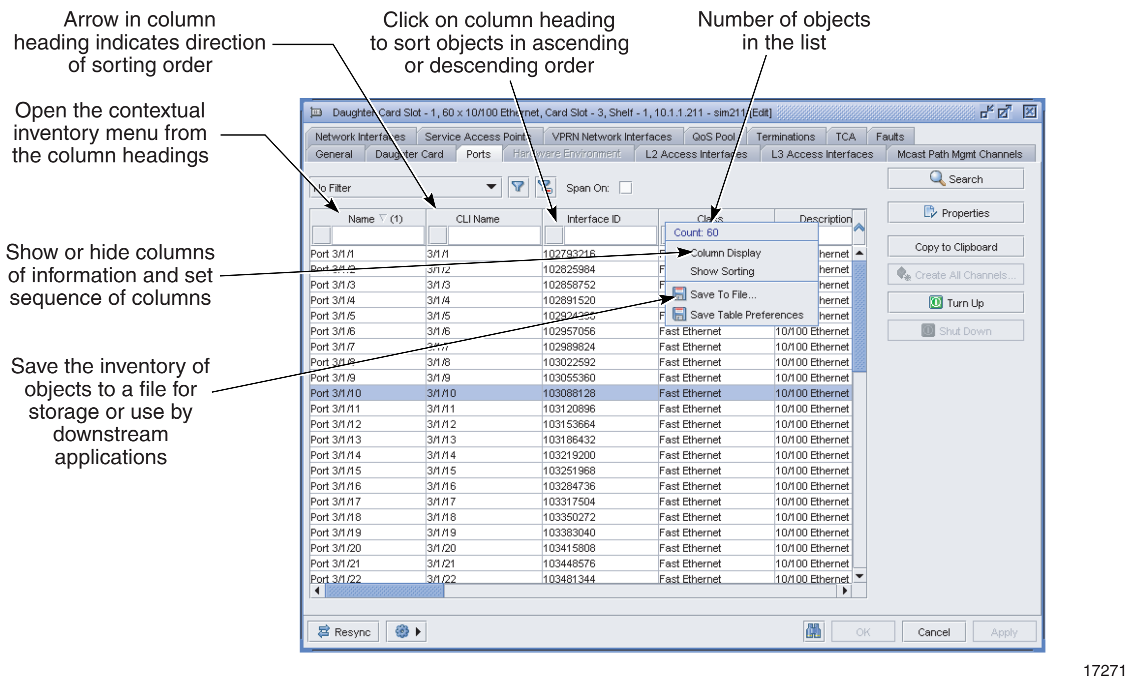
8 Click on the Close button. The filter window closes.

9 Close the List Form.

Procedure 3-33 To view and manage listed information

Many of the windows and forms are lists of network objects, for example, lists of ports displaying all the ports on a specific card. Figure 3-10 shows the major elements of a list.

Figure 3-10 List elements



On most lists, you can:

- generate inventories of the listed data
- reorganize the information from most important to least important

- remove columns of data that are not of interest
- sort listed information in ascending or descending order

1 Generate a list.

2 Perform an action on the list.

a To generate an inventory of data, right-click on the list heading. The Count indicates the number of objects in the list.

b To remove columns from the table:

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Displayed on Table list box, choose the columns that you need to remove from the table and click the left arrow. The specified columns are moved to the Available for Table list box.

Note 1 — Columns that cannot be removed from the table are dimmed in the Displayed on Table list box.

Note 2 — There must be at least one column in a table.

iii To resequence the columns, go to step dii.

iv Perform one of the following.

- Click on the Apply button to apply the configuration changes without closing the form. The specified columns are removed from the table.
- Click on the OK button to apply the changes and close the Column Display window. The specified columns are removed from the table.
- Click on the Cancel button to close the Column Display window.

c To add columns to the table:

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Available for Table list box, choose the columns that you need to add to the table and click the right arrow. The specified columns are moved to the Displayed on Table list box.

iii To resequence the columns, perform step dii.

iv Perform one of the following:

- Click on the Apply button to apply the configuration changes without closing the form. The added columns appear in the table.
- Click on the OK button to apply the changes and close the Column Display window. The added columns appear in the table.
- Click on the Cancel button to close the Column Display window.

d To reorganize the information:

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Displayed on Table list box, choose the name of the column that you need to move.

iii Click on the up and down arrows to move the column to the appropriate location in the table.

Note — You can move multiple columns simultaneously by choosing more than one column name before you click on the arrows.

iv Perform one of the following.

- Click on the Apply button to apply the configuration changes without closing the form. The columns appear on the table in the new sequence.
- Click on the OK button to apply the changes and close the Column Display window. The columns appear on the table in the new sequence.
- Click on the Cancel button to close the Column Display window.

Note — You can also resequence information by clicking on a column, dragging the column to the right or left, and dropping the column in the appropriate location.

e To sort data based on a column in ascending or descending order, click on the column heading. The down or up arrow changes and indicates the sequence in which the data is sorted.

f To sort data based on multiple columns, perform one of the following:

i Right-click on a column heading and choose Show Sorting from the contextual menu. The Show Sorting form opens. Choose the one or more properties from the Available for Sorting panel and click on the right arrow button. The properties appear in the Used for Sorting panel. Click on the Sort Ascending or Sort Descending, as required.

ii Click on the column heading of the first column by which you need to sort. Press and hold CTRL and click on one or more additional columns in the sequence in which you need to sort the data. The sort sequence appears in brackets after the column name. To change the direction of the sort, click on the heading of any of the selected columns while pressing CTRL.

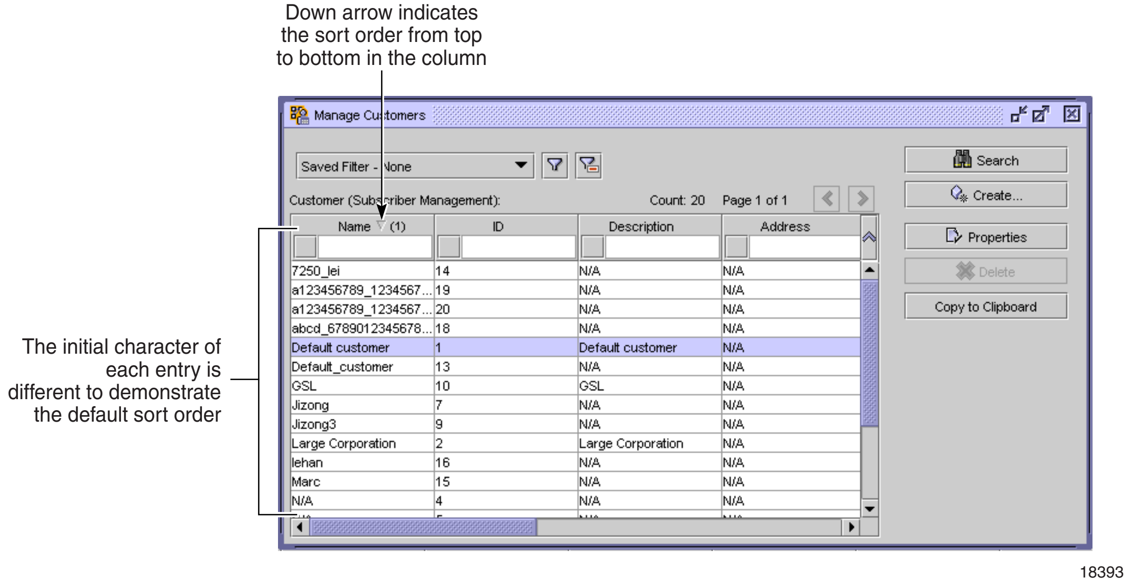
Note — To navigate quickly through a long sorted list, type a letter to move directly to the first item in the list that starts with that letter.

Table 3-7 describes the order in which different types of data are sorted from the top of the column to the bottom, based on the direction of the arrow in the column header. Figure 3-11 shows an example of information sorted in a column according to the down arrow in the column header.

Table 3-7 Sorting listed information

Entry type	Down arrow	Up arrow
Numbers only	Sorted from the lowest number to the highest number	Sorted from the highest number to the lowest number
Letters	Sorted left to right, character by character, in alphabetical order.	Sorted left to right, character by character, in reverse alphabetical order.
Alphanumeric	Sorted left to right, character by character, in the following order: from 0 to 9, then in alphabetical order	Sorted left to right, character by character, in the following order: in reverse alphabetical order, then from 9 to 0
Special characters	Sorted left to right, character by character. The following characters are sorted in the following order before numbers, and uppercase and lowercase letters in a list: (space) ! # $ % & ‘ ( ) * + , . / The following characters are sorted in the following order after numbers in a list, but before uppercase and lowercase letters: : ; < = > ? @ The following characters are sorted in the following order after numbers, and uppercase and lowercase letters in a list: { | } ~	Sorted left to right, character by character. The following characters are sorted in the following order before numbers, and uppercase and lowercase letters in a list: ~ } | { The following characters are sorted in the following order before numbers in a list, but after uppercase and lowercase letters: @ ? > = < ; : The following characters are sorted in the following order after numbers, and uppercase and lowercase letters in a list: / . , + *) (‘ & % $ # ! (space)
Blanks	Blank entries are placed first at the top of the list.	Blank entries are placed last at the bottom of the list.

Figure 3-11 List sort order example



Procedure 3-34 To save listed information to a file

After you list information, as described in Procedure 3-33, you can save a copy of the list for purposes such as the following:

- record keeping
- inventory management
- processing by another application

1 Generate a filtered list, as required.

2 Right-click on a list column heading and choose Save To File from the contextual menu. The Save As form opens.

Note — The 5620 SAM uses the user home directory as the default location for saved files.

3 Use the form to specify the name and location of the file that is to contain the listed information. You can save the information in the following formats:

- plain text
- HTML
- CSV

4 Click on the Save button. The information is saved as specified and the Save as form closes.

Procedure 3-35 To configure the maximum number of objects on a list form

Perform this procedure to specify the maximum number of objects to display per page on a list form.

1 Choose Application→User Preferences. The User Preferences form opens with the General tab displayed.

2 Configure the Specify # of Items Per Page parameter.

3 Click on the OK button. The User Preferences form closes.

Procedure 3-36 To save results list preferences

You can save results list preferences, so when similar searches on similar objects are performed, the output of the list is organized according to your preferences.

1 Open a List Form.

2 Organize the results list according to preference, for example, whether to sort columns of data in ascending or descending order.

3 Right-click on a results list column heading and choose Save Table Preferences from the contextual menu. A dialog box appears to confirm that you want to save the current filter preferences.

Note — Choosing Save Table Preferences from a contextual menu does not save any filter configurations.

4 Click on the Yes button. The results list format is saved.

Each time a similar list is generated for similar objects, for example, if you configured a table preference for generating lists of ports, then each time you list ports, results are displayed according to preconfigured table formats.

5 Close the List Form.

Procedure 3-37 To save search filters

List Forms allow you to save filters for object types. The filters created only apply to the specific object type against which the filter is created and saved, and that object type's descendant objects.

1 Open a List Form

2 Define filter properties, as described in Procedure 3-26 and click on the Filter button, or define filter properties, as described in Procedure 3-27. The filter form opens.

3 Click on the Save... button. The Save Filter form opens.

4 Configure the parameters:

- Filter Name
- Description
- Public

Note — These parameters have pre-populated values when a saved search filter is loaded or selected from the saved filters drop-down list, or if the filter was previously saved.

5 Click on the Save button. The Save Filter form closes. The defined filter is saved for a future search on a similar object type and the configured parameters are populated in the filter window.

6 Click on the Apply button of the OK button to use the filter. The results list is displayed based on the filter.

7 If the filter window is open, click on the Close button. The filter window closes.

8 Close the List Form.

Procedure 3-38 To clear a search filter

Use the following procedure to clear search filters from a List Form or the filter window.

1 Open a List Form.

2 Define filter properties as described in Procedure 3-26 or 3-27.

3 Do one of the following.

a To clear all search filters from a List form, go to step 4.

b To clear the search filter of the filter window, go to step 7.

4 Do one of the following.

a Click on the Clear all Filters button. Any filtered properties are cleared.

Note — Clicking on the Clear all Filters button does not clear or refresh search results.

b Choose No Filter from the saved filters drop-down list. Any filtered properties are cleared and the results list is displayed based on the empty filter. Go to step 11.

5 Click on the Search button. The results list is displayed based on the empty filter.

6 Go to step 11.

7 Click on the Filter button. The filter window opens.

8 Click on the Clear button. Any filtered properties are cleared from the filter window.

9 Click on the Apply button or the OK button. The results list is displayed based on the empty filter.

10 If the filter window is open, click on the Close button. The filter window closes.

11 Close the List Form.

Procedure 3-39 To load a saved search filter

Use the following procedure to load search filters from a List Form or the filter window. See Procedure 5-22 for information about loading a saved filter on a topology map.

1 Open a List Form.

2 Do one of the following.

a To load search filters from a List Form, go to step 3.

b To load search filters from the filter window, go to step 4.

3 Choose an entry from the saved filters drop-down list. The results list is displayed based on the filter. Go to step 11.

Note 1 — Choosing an entry from the saved filters drop-down list disables the filter areas of the column headings.

Note 2 — Only saved filters that are applicable to the current object type and its ancestor types appear in the saved filters drop-down list.

Note 3 — Selecting None from the saved filters drop-down list clears any filtered properties on the current form and immediately refresh the results list.

Note 4 — The contents of the filter window are updated based on the entry selected from the saved filters drop-down list.

4 Click on the Filter button. The filter window opens.

5 Click on the Saved Filters button. The Saved Filters window opens and displays filters that have been saved for the current object type and its ancestor type(s).

6 Select a saved filter in the list.

7 Click on the Load button. All the properties of the filter window are replaced with the contents of the saved filter.

8 If desired, modify the filter and click on the Save button to save it.

Note — The filter is saved using the current object type, regardless of the object type of the saved filter that was loaded.

9 Click on the Apply button or the OK button to use the filter. The results list is displayed based on the filter.

10 If the filter window is open, click on the Close button to close the filter window.

11 Close the List Form.

Procedure 3-40 To delete a saved search filter

Use the following procedure to delete saved search filters from the filter window.

1 Open a List Form.

2 Click on the Filter button. The filter window opens.

3 Click on the Saved Filters button. The Saved Filters window opens.

4 Select a saved filter in the list.

5 Click on the Delete button. The filter is deleted.

6 Close the form.

7 Close the filter window.

8 Close the List Form.

Procedure 3-41 To create equipment group search filters

On some list forms you can create and save search filters based on pre-existing topology groups.

1 Open a list form, if available, choose an entry from the object drop-down list. The equipment group filter drop-down list displays with Equipment Group(s) - All selected.

2 Choose Select Equipment Groups from the equipment group drop-down list. The Select Equipment Groups window appears with the topology groups listed in the Available column. See Procedure 5-29 for information about how to create a topology group.

3 Perform one of the following:

a To create an equipment group filter.

i In the Available list box, choose the topology groups that you need to include in the filter and click on the right arrow. The specified topology groups are moved to the Filtered by list box.

ii To include data from nodes that are in equipment subgroups in the equipment group filter, select the Include contained Equipment Groups check box.

iii Go to step c.

b To modify an equipment group filter.

i Click on the Saved Filters button. The Save Filter form displays the equipment group filters.

ii Select a filter and click on the Load button. The Save Filter form closes and the selected filter is displayed in the Select Equipment Groups window.

iii Update the selected equipment group filter as required.

iv Go to step c.

c To save an equipment group filter.

i Click on the Save button. The Save Equipment Group Filter displays.

ii Configure the parameters:

- Filter Name
- Description
- Public

Note — The parameters have pre-populated values when a saved equipment group filter is loaded or is selected from the saved filters drop-down list, or if the filter was previously saved.

iii Click the Save button. The Save Equipment Group Filter form closes, the filter is saved, and the Select Equipment Groups window displays the saved equipment group filter.

d Click on the Clear button to clear the current filter from the Select Equipment Groups window.

4 Click on the OK button to apply the filter without saving it. The results list is displayed based on the equipment group filter and any additional filters that are applied to the list. The Last Search value is updated, and the equipment group filter name is displayed in the equipment group filter drop-down list.

5 Close the list form.

Procedure 3-42 To perform a search using equipment group filters

On some list forms, you can create and save a filter based on pre-existing topology groups.

1 Open a list form, if available, choose an entry from the object drop-down list. The equipment group filter drop-down list displays with Equipment Group(s) - All selected.

2 Choose a filter from the equipment group drop-down list. The results list is displayed based on the selected equipment group filter and any additional filters that are applied to the list. The Last Search value is updated.

3 Close the list form.

4 — 5620 SAM navigation tree overview

4.1 Navigation tree overview

The navigation tree lists the managed equipment, services, and protocols that are configured on the NE. The navigation tree includes a view selector located on the navigation tree toolbar. The view selector is a drop-down menu that lists the physical and logical network views that are available.

The navigation tree is accessible from the main window, configuration forms, and maps.

You can choose the following views:

- Equipment—displays the physical objects that the 5620 SAM manages
- OSPF—displays the OSPF objects in the network
- IS-IS—displays the OSPF objects in the network
- Routing—displays the device routing instances and child objects such as the network interfaces and the configured protocols
- Ring Group—displays the ring group objects that the 5620 SAM manages

Table 4-1 describes the objects in the equipment view of the navigation tree that the 5620 SAM allows you to create and manage.

Note — The device properties forms include a navigation tree that is displayed on the left of the form. The root of the device properties form navigation tree is the device.

Table 4-1 5620 SAM navigation tree object descriptions — Equipment view

Object	Description
Routing	The network — contains the routers, devices, and topology groups, including the default Discovered NEs and Unmanaged NEs topology groups
Router, device, topology group	The second level in the hierarchy
CCAG, ISA-AA groups, ISA-Tunnel groups, ISA-LNS groups, ISA-NAT groups, ISA-Video groups, LAG, IGH, shelf	The third level in the hierarchy
APS groups	Located under the shelf object; contain the APS groups for a device
Card	Located under the shelf object
Daughter card	A child object of the card object
Bundles	A child object of the daughter-card object; a group of DS0 channels on a SONET- or TDM-capable daughter card
Port	A child object of the daughter-card object
Channel, sub-channel, timeslot	Child objects of the port object
Fans	Located under the shelf object[1]
Power Supplies	Located under the shelf object[1]

Note
(1) This object is not supported on 1830 PSS nodes.

You can use the following methods to view and manage objects in the 5620 SAM navigation tree:

- Double-click on an object or press the + key when the object is selected to open the object and to display the child objects.
- Double-click on an object or press the - key when the object is selected to close the object and to hide the child objects. A + key to the left of the map object indicates that the object contains child objects. For example, a topology group that contains one or more child topology groups has a + key to the left of the topology group in the navigation tree.
- Click on an object and use the cursor keys to navigate the object hierarchy. In the Equipment view, for example, you can navigate from the device to the ports and channels.
- Right-click on an object to open the contextual menu and choose a function. The menu options are specific to the object type. See "Contextual menus" in this section for more information.

Note — Keyboard-based navigation-tree operations may not function as expected when you open the client GUI using a third-party access tool, for example, a Citrix server.

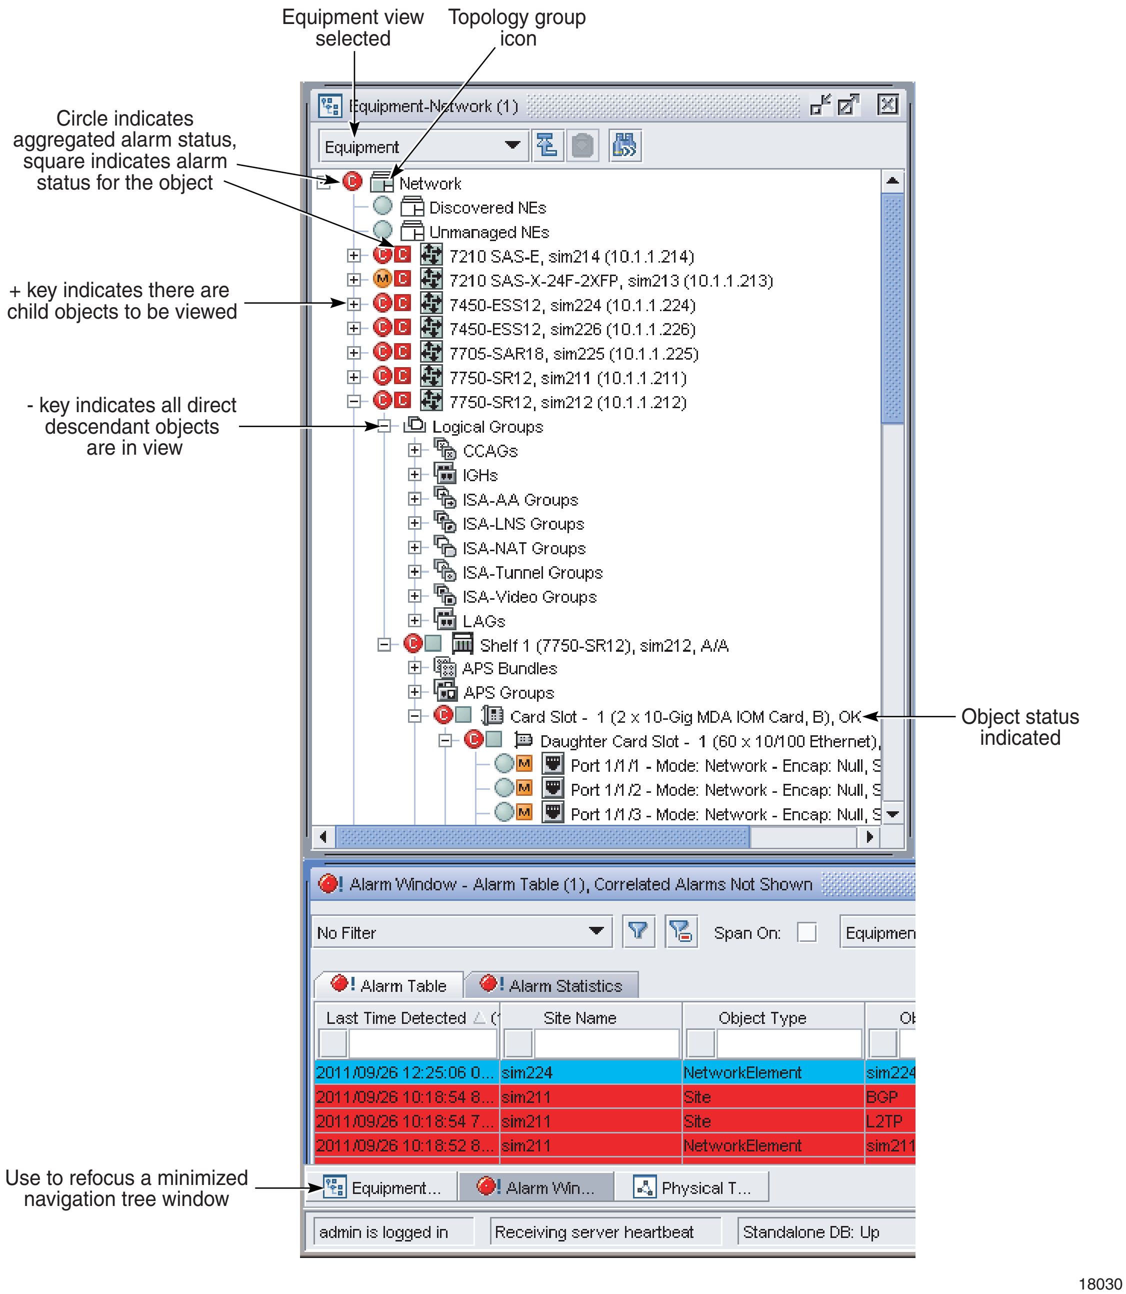
The navigation tree uses color highlights to display object status information such as the current alarm level and the aggregated alarm status. The operational and administrative states of an object are displayed in text form beside the object icon, as are the object type and description.

The circle icon to the left of the topology group icon represents the aggregated alarm status for the group. It represents the most serious alarm against descendant device.

The topology group icon is divided into three sections. The top right square represents the most severe state of all descendant devices. The bottom right square represents the most severe state of all descendant links. The bottom section of the topology group icon represents the most severe state of the devices and edges that are immediately descendant of the group. See chapter 37 for more information about viewing alarm status information in a map navigation tree. To troubleshoot alarms using topology maps, see *5620 SAM Troubleshooting Guide*.

Figure 4-1 shows some of the navigation tree objects that you can manage using the Equipment view.

Figure 4-1 5620 SAM navigation tree objects - Equipment view



Using the navigation tree toolbar

The navigation tree toolbar consists of the view selector, the Make Root At Top Level button, and the Copy to Clipboard button. Figure 3-1 shows the navigation tree toolbar. See Procedure 3-24 for information about using the Copy to Clipboard button.

Make Root At Top Level button

The Make Root At Top Level button restores the navigation tree to the default root. For example, in the equipment view, if you redefine the root of the tree as a card and click on the Make Root At Top Level button, the navigation tree refreshes with the default root, which is the network. The Make Root At Top Level button is enabled only when the root is not the network. The Make Root At Top Level button is available only for the equipment view.

Make Root and Make Root In New Tree menu options

The navigation tree contextual menus provide Make Root and Make Root In New Tree menu options that allow you to redefine the root of the tree. These menu options, along with the Make Root At Top Level button, help orient users in densely populated navigation trees. The menu options are available only for the equipment view. See “Contextual menus” in this section for more information about using these functions.

Copy to Clipboard button and Clipboard window

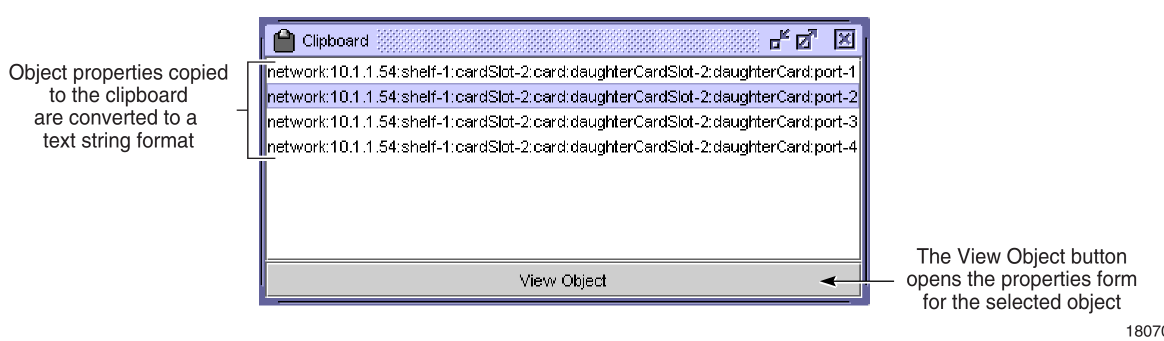
Using the Copy to Clipboard button on the navigation tree toolbar, you can copy the identifier of one or more 5620 SAM objects to the Clipboard window. You can then open the Clipboard window from the Application menu to retrieve the identifier and paste it into another application. You can also choose an object identifier in the Clipboard window and click on the View Object button to open the object properties form. The elements in an object identifier are delimited using colons (:).

The Copy to Clipboard button is on list forms and on the list tabs of properties forms. You can use the button to copy configurable and read-only text fields. The button is enabled when at least one object is selected.

Note — The Clipboard window keeps the object identifier from only the most recent copy action. After you copy an object identifier to the clipboard, if you click on the Copy to Clipboard button again to copy another object identifier, the second copy action overwrites the previously copied identifier in the Clipboard window.

Figure 4-2 shows the Clipboard window. See Procedure 3-24 for more information about using the clipboard function.

Figure 4-2 Clipboard window



Paste from Clipboard button

After using the Copy to Clipboard button to copy object identifiers to the Clipboard window, you can use the Paste from Clipboard button on the physical link properties form to set multiple parameters at one time using the copied object identifiers. See Procedure 5-34 for information about using the Paste from Clipboard button.

Contextual menus

Each object in the 5620 SAM navigation tree has a contextual menu that opens when you right-click on the object. Contextual menus are also accessible when you right-click on map objects.

You can use the contextual menus to do the following:

- create objects
- configure object properties
- perform maintenance functions
- change the state of objects
- open a different management interface, for example, a CLI
- designate an object as the root object in the navigation tree

The contextual menu options are specific to the object type. Table 4-2 lists the contextual menu options in alphabetical order.

Warning — In a composite service, deleting a service is not the same as removing a service from a composite service. Deleting a service removes the service from the 5620 SAM database. To avoid a service outage, be certain of the action that you are taking.

See Procedure 76-4 for more information about removing a service from a composite service.

Table 4-2 Contextual menu options

Option name	Description
Add to Ring Group	The Add to Ring Group menu option specifies whether to add the device to a group.
Configure Card	The Configure Card option opens the Create Card properties form that allows you to create a card configuration for the slot. You assign a supported card type to the slot. The options available are displayed with check marks beside them in the Supported Card Types parameter. The Equipped Card Type displays the card type that is physically in the slot. When the configured card types are correct, you can change the Administrative State as required.

(1 of 6)

Option name	Description
Configure Daughter Card	The Configure Daughter Card option opens the Daughter Card (Create) form that allows you to create a daughter card configuration for the slot. You assign a supported daughter card type to the daughter card slot. The options are displayed with check marks beside them in the Supported Daughter Card Types area of the form. The Equipped Daughter Card Type displays the daughter card type that is physically in the slot. When the configured card types are correct, you can change the Administrative State as required.
Copy to Clipboard	The Copy to Clipboard option copies the MDA information to the clipboard.
Create All Channels	The Create All Channels option allows you to automatically create all of the channels on ports with available channels. This option is available for OC12, OC3, and DS3 and E3 ASAP, APS and MC-APS ports.
Create APS Group	The Create APS Group menu option opens the APS Group (Create) form that allows you to create and manage APS groups on the shelf.
Create APS Protection Bundle	The Create APS Protection Bundle menu option opens the Create Multilink Bundle form, which allows you to create and manage APS protection bundles. You must create an APS working bundle before you can create an APS protection bundle or add members to the APS bundle.
Create APS Protection Channel	The Create APS Protection Channel menu option opens the APS Channel, Protection (Create) form that allows you to create and manage APS protection channels.
Create APS SONET Channel	The Create APS SONET Channel menu option opens the SONET Channel (Create) form that allows you to create the APS common configuration.
Create APS Working Bundle	The Create APS Working Bundle menu option opens the Create Multilink Bundle form, which allows you to create and manage APS working bundles. You must create an APS working bundle before you can create an APS protection bundle or add members to the APS bundle.
Create APS Working Channel	The Create APS Working Channel menu option opens the APS Channel, Working (Create) form that allows you to create and manage APS working channels.
Create Bundle Members	The Create Bundle Members option opens the Add Bundle Member form, which allows you to add members to an APS bundle or a multilink bundle.
Create Bundle	The Create Bundle option opens the APS Bundle Display configuration form or the the Create Multilink Bundle configuration form, which allows you to create a group of DS0 channel groups on a channelization-capable MDA. You configure bundle parameters and add bundle members. When the Create Bundle option is used to open the APS Bundle Display configuration form, the DS0 channel groups that you create provide bi-directional APS protection on IMA bundles. When the Create Bundle option is used to open the Create Multilink Bundle configuration form, the DS0 channel groups that you create provide a mechanism to distribute data across multiple links to achieve higher bandwidth on a SAP. You can create IMA group bundles on channelized ASAP MDAs.
Create CCAG	The Create CCAG option opens the CCAG (Create) form, which allows you to create a cross-connect aggregation group. You define CCAG properties, configure CCAG parameters, and configure CCAG members.

(2 of 6)

Option name	Description
Create Channel	The Create Channel option allows you to create channels on ports with available channels.
Create Group	The Create Group contextual menu option opens the Group (Create) form to create a topology group in the equipment view of the navigation tree and on the appropriate topology maps.
Create IGH Members	The Create IGH Members option opens the Create IGH Member configuration form which allows you to configure IGH member ports.
Create IGH	The Create IGH option opens the IGH (Create) form, which allows you to create an IGH. You define IGH properties, and configure IGH subgroups and members.
Create Interface	The Create Interface option is available for CES ports on the 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA. This option allows you to create an interface for a TDM line, such as E1 or T1, for backhauling the TDM signal through the IP/MPLS network.
Create ISA-AA Group	The Create ISA-AA Group option opens the ISA-AA Group (Create) form, which allows you to create an ISA-AA group and ISA-AA partitions. You define ISA-AA group and ISA-AA partition properties, configure ISA-AA group and ISA-AA partition parameters, and specify ISA-AA members.
Create ISA-Tunnel Group	The Create ISA-Tunnel Group option opens the ISA-Tunnel Group (Create) form, which allows you to create an ISA-Tunnel group. You define ISA-IPsec properties, configure ISA-IPsec parameters, and specify ISA-IPsec members.
Create ISA-LNS Group	The Create ISA-LNS Group option opens the ISA-LNS Group (Create) form, which allows you to create an ISA-LNS group. You define ISA-LNS properties, configure ISA-LNS parameters, and specify ISA-LNS group members.
Create ISA-NAT Group	The Create ISA-NAT Group option opens the ISA-NAT Group (Create) form, which allows you to create an ISA-NAT group. You define ISA-NAT properties, configure ISA-NAT parameters, and specify ISA-NAT group members.
Create ISA-Video Group	The Create ISA-Video Group option opens the ISA Video Group (Create) form, which allows you to create an ISA-Video group. You define ISA-Video properties, configure ISA-Video parameters, and specify ISA-Video group members.
Create LAG Members	The Create LAG Members option opens the Create LAG Member configuration form where you define LAG member ports.
Create LAG	The Create LAG option opens the Create LAG configuration form. You define LAG properties, configure LAG parameters, configure LAG subgroups and members, and configure LACP.
Create Ring Group	The contextual menu option for a network is Create Ring Group, which is used to group devices to be able to create VLAN or VPLS ring groups.

(3 of 6)

Option name	Description
Delete	For daughter cards, bundles, ports, and channels, the Delete option deletes the selected object when the object and everything contained in the object is set to administratively down. For topology groups, and IGH groups, the Delete option deletes the selected group object once all objects in the group have been removed from the group. For SC APS Bundle objects, the Delete option deletes the APS common configuration from the APS group. For all other objects where the Delete option is available, the Delete option deletes the object and all contained objects from the network. This option is not available for the network (root) topology group.
Discovery Manager	The Discovery Manager option opens the Discovery Manager (Edit) form. You can create NE discovery rules and discover NEs. See chapter 14 for information about discovering NEs and creating discovery rules.
Duplicate Links	On the physical topology map, the Duplicate Links option displays a fly-out menu. You can choose either the Highlight Duplicate Links or Delete Duplicate Links option. It is possible for both a manual link and a discovered physical link to exist on the same two endpoints. When this happens, a duplicate link alarm is raised. This alarm only occurs on point-to-point links and when both endpoints are ports or LAGS. You can identify such duplicate links by choosing the Highlight Duplicate Links option. You can remove these duplicate links by choosing the Delete Duplicate Links option. This action prompts you with a warning and then delete all of the manually created physical links. This alarm is not raised on existing manual links (for example, those in place after a database upgrade).
Equipment	The Equipment option opens a Group (Create) form to create a descendant topology group for the selected group in the navigation tree. For physical topology maps, you can also choose the Create Physical Link option to create links between map objects.
Force Mode	The Force Mode menu option forces an upgrade of the hardware.
Highlight MTU Mismatch	The Highlight MTU Mismatch option is used to highlight MTU mismatches between physical ports. When the configured MTU on two or more endpoints do not match, an alarm is raised to notify the operator of a possible configuration error. This is supported on both point-to-point and broadcast physical links. MTU mismatches can also be discovered by conducting an RCA audit. See Procedure 81-6 for more information.
Highlight Nearest Customer Links	The Highlight Nearest Customer Links option is used to highlight the nearest customer links between nodes. See “LLDP” in chapter 30 for more information.
Highlight Nearest Non-TPMR Links	The Highlight Nearest Non-TPMR Links option is used to highlight the nearest Non-Two Port MAC Relay links between nodes. See “LLDP” in chapter 30 for more information.
Highlight Upper Layer Adjacency Links	The Highlight Upper Layer Adjacency Links option is used to display hidden links between nodes.
List	The List option opens the Discovered NEs form with a list of newly discovered NEs or the Unmanaged NEs form with a list of newly added Unmanaged NEs.

(4 of 6)

Option name	Description
Make Flat Map for Group	The Make Flat Map for Group option opens a flat map of the topology group.
Make Root	The Make Root option makes the selected object the root of the navigation tree. The default root is the network.
Make Root In New Tree	The Make Root In New Tree option opens another navigation tree window with the selected object as the root of the tree.
NE Sessions	The NE Sessions option opens a Telnet session, an SSH session, an FTP file browser session, or an SSH file browser session with the selected device in the equipment view of the navigation tree.
Open URL	The Open URL option opens the Web browser to manage the GNE.
Properties	The Properties option opens the property form for the selected object. This form allows you to view read-only information and to configure parameters associated with the selected object. If the Copy button is available, you can use the Copy button to create topology groups in the network using the same parameter information.
Reboot	The Reboot option specifies that all cards in the chassis are re-initialized.
Reference	The Reference option displays a fly-out menu. You can choose from the Set All, Clear All, or the Cleanup All options. • The Reference option essentially takes a snapshot of the physically topology at a specific time. Any deviation from this checkpoint can then be subsequently shown. • The Set All option checkpoints all currently discovered links that exist. Any object that was previously checkpointed and is operationally down is left untouched. Any object that goes operationally down in the future is not removed, but is simply marked as operationally down. • The Clear All option clears all object checkpoints. Any object that is operationally down (shown as a red link) is removed from the database. Any non-checkpointed object that becomes operationally down in the future is removed from the system. • The Cleanup All option keep the current checkpoint set for objects that are operationally up, but removes checkpoints from objects that are operationally down objects. This is basically the same as the Clear All option, but only affects operationally down objects.
Remove	The Remove option deletes the service from the network in a composite service tier. See Warning note above.
Remove Card	The Remove Card option deletes the card from the slot when the slot and everything contained in the slot is changed to administratively down.
Remove From Ring Group	The Remove From Ring Group option removes the specified device from the ring group. The devices are not deleted; they remain in the equipment view of the navigation tree.
Remove Ring Group	The Remove Ring Group option removes the specified ring group. The devices contained in the ring group are not deleted; they remain in the equipment view of the navigation tree.
Resync	The Resync menu option specifies that SNMP MIB and CLI information bases are reread to resynchronize them with the 5620 SAM, which also resynchronizes the network management settings with the device. Resynchronization does not impact the contents of the historical statistics database.

(5 of 6)

Option name	Description
Scripts	The Scripts option is available to users with the appropriate scope of command roles. This option allows you to associate scripts and templates to object types directly from the navigation tree or from map objects without having to navigate through the Script Manager. The Scripts option displays a fly-out menu. You can choose from the Add Script and Manage Scripts option. Associated scripts and templates are also displayed on the fly-out menu. The type of script or template is identified by the icon located to the left of the script or template name. • The Add Script option opens the Select Script(s) window. From this window you can associate existing scripts and templates to the selected object type. You can also edit and create scripts and templates from the Select Script(s) window. • The Manage Scripts option allows you to add and remove script and template associations with the selected object type. You can also access the Scripts option from the configuration form.[(1)] See the *5620 SAM Scripts and Templates Developer Guide* for more information about the Script Manager.
Shut Down	The Shut Down option specifies that the selected object is changed to administratively down.
Shut Down MC LAG	The Shut Down MC LAG option specifies that the MC LAG is changed to administratively down.
Shut Down Peer	The Shut Down Peer option specifies that the MC peer is changed to administratively down.
Soft Reset	The Soft Reset option resets the card. A soft reset is preferable to a reboot, as it results in minimal downtime. A soft reset causes the card to stop all processes it is running and restart.
Turn Up MC LAG	The Turn Up MC LAG option specifies that the MC LAG is changed to administratively up.
Turn Up Peer	The Turn Up Peer option specifies that the MC peer is changed to administratively up.
Turn Up	The Turn Up option specifies that the selected object is changed to administratively up.

(6 of 6)

Note

(1) The Scripts option may be located under the More Actions button if more than one option exists for the configuration form.

4.2 Basic navigation tree procedures

Use the following procedures to manage equipment using the navigation tree.

Procedure 4-1 To make a selected object the root of the navigation tree

Use the Make Root option of the contextual menu to make a selected object the root of the navigation tree. The Make Root option is only available in the Equipment view. See section 4.1 for information about the navigation tree objects that support the menu option.

The Make Root option of the contextual menu is not available for an object that is positioned one object level below the root of the tree. For example, in a navigation tree where the device is the root of the tree, the LAG object and the shelf object do not support the Make Root option.

Right-click on the navigation tree object that you want to make the root of the tree and choose Make Root from the contextual menu. The navigation tree is refreshed with the selected object as the root of the tree. The Make Root At Top Level button is enabled.

See Procedure 4-3 for information about restoring the default root of the navigation tree.

Procedure 4-2 To make a selected object the root of another navigation tree

Use the Make Root In New Tree option of the contextual menu to make a selected object the root of another navigation tree.

Note — Up to seven navigation tree windows can be open at the same time and each tree must have a different root when it is first created.

The Make Root In New Tree menu option is only available in the equipment view. The Make Root In New Tree option is not available in the contextual menu for the root object of a tree. See section 4.1 for information about the navigation tree objects that support the menu option.

Right-click on the navigation tree object that you want to make the root of another navigation tree and choose Make Root In New Tree from the contextual menu. Another navigation tree window appears with the selected object as the root of the tree.

Procedure 4-3 To restore the default navigation tree root

The default root of the navigation tree is the network object. When the root is not the network object, the Make Root At Top Level button is enabled.

Click on the Make Root At Top Level button in the navigation tree toolbar to restore the default root of the tree. See section 3.1 for more information about the Make Root At Top Level button.

5 — 5620 SAM map management

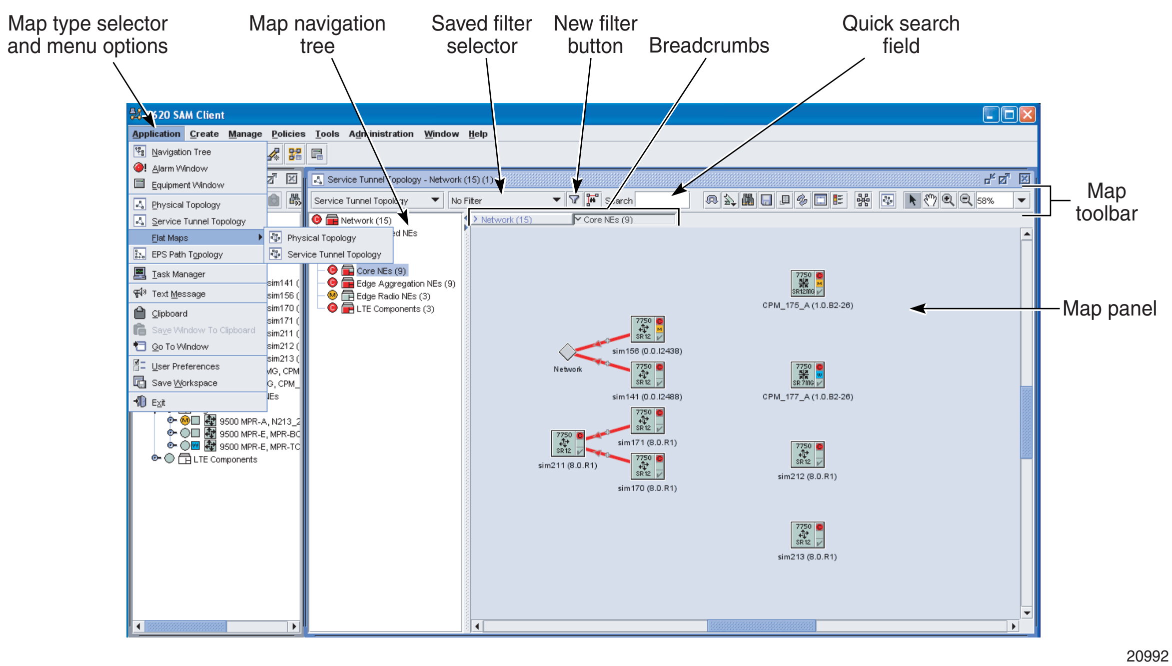
5.1 5620 SAM map management overview

The following 5620 SAM network topology maps are available:

- physical
- service tunnel
- service
- composite service
- LSP path
- LSP cross-connect

Each map displays network objects and information, and provides contextual menus to open forms that display additional information. In the context of a 5620 SAM map, a link object, such as a physical link or service tunnel, is called an edge. An object other than a link between objects, such as an NE or a topology group, is called a vertex. Figure 5-1 shows the main map elements.

Figure 5-1 Map elements



Map window

The map window includes the following:

- a title bar
- a map panel that displays the network objects
- a navigation tree that lists the topology groups
- a toolbar, which consists of a view selector, saved filter selector, quick-search field, and buttons that perform various functions

The title bar of the map window displays the following information:

- map type, for example, Physical Topology
- path from the network root to the currently displayed topology group; each step in the path is called a breadcrumb
- map number, for example, the first or the tenth map opened

Map panel

The map panel is associated logically with the map navigation tree. As the user navigates through the topology groups in the map navigation tree, the contents displayed on the map panel change. The topology group that is selected in the map navigation tree is the group that is displayed on the map panel.

When you double-click on a topology group object, the contents of the group on the map panel are displayed and the group is selected and opened in the map navigation tree. When you double-click on other map objects, such as routers or links, their property form opens. Right-click on any map object to display a contextual menu.

When map objects are linked between different topology groups, the line representing the connection terminates on a map object called a connector. The connector indicates that the endpoint of the link resides in another topology group. The label of the connector icon is the name of the topology group to which the link points. Connector objects do not have contextual menus.

When a physical link is created between a port or LAG managed by the 5620 SAM and an unmanaged object, the unmanaged object is called a remote endpoint. The remote endpoint label is configured by the user when the physical link is created.

You can configure a background image to display in the map panel for a topology group, for example, a map image of North America. You can position device icons and topology group icons in the map of the network to reflect their relative geographic locations.

Selecting map objects

Click on the Select Tool button to select an object on the map. You can select multiple objects by pressing the Shift key and clicking on each object you want to select, or by drawing a selection rectangle around all of the objects you want to select on the topology map. You can also press CTRL-A to select all items on a map.

You can select one or more objects and view them exclusively in a map by right-clicking on the selection and choosing Show Only Selected. The map is then filtered to display only the selected objects and the links between them. Links to other objects are not shown. You can revert to the previous view by right-clicking in the map and choosing Cancel Show Only.

When multiple objects are selected, you can shift the map focus to the next object using the F3 key, and shift the map focus to the previous object by pressing CTRL-F3.

You can also select all of the NEs that are attached to an NE by selecting one or more NE and right-clicking and choosing Select Attached.

You can deselect a selected NE by pressing the CTRL key and clicking on the NE.

Moving map objects

The 5620 SAM allows you to move map objects in the following ways:

- in the map panel; for example, to add a router to a topology group by dragging and dropping the router object to the topology group object in the map panel
- from the map panel to the map navigation tree; for example, to add a router to a topology group by dragging and dropping the router object from the map panel to the topology group object on the map navigation tree
- after discovery by using either the or by moving the tiled icons to a new map panel location
- between two maps
- in the map navigation tree; for example, to make a topology group the immediate descendant of another topology group by dragging and dropping one topology group object to another topology group object in the map navigation tree

When a topology group is created, users with Topology Mgmt privileges can populate the group from the topology map by dragging and dropping map objects into the group in the map panel or in the map navigation tree, or from the map panel to the map navigation tree.

Note — You cannot move map objects to or from groups that are not within your span of control.

By default, users can move map objects and change the layout of the objects on the map, however the changes are not saved to the database when the map is closed. The ability to save changes to the layout of topology maps is controlled by scope of command roles and access permissions. Permissions are set by using 5620 SAM security configuration forms. See chapter 9 for more information about setting access privileges.

The Reload button icon indicates when you move a map object and change the layout of the objects. The Reload button icon changes to indicate whether moving a map object and changing the layout of the objects is saved to the database. See “Map toolbar” in this section for more information about the Reload button.

Note — When you move a map object in the map panel, the X,Y coordinates for the map object change. If you have update and execute scope of command access permission, this change affects all users that display the map view and the topology group.

Connectors can only be moved in the map panel. Connectors cannot be moved to another topology group.

Finding map objects quickly

The Search field beside the toolbar buttons is used to quickly locate a map object. When you enter a text string in the Search field and press ↵, the 5620 SAM searches each object name in the map for the string. If a match is found, the map focus shifts to the object. If multiple matches are found, you can shift the map focus to the next object using the F3 key, and shift the map focus to the previous object by pressing CTRL-F3.

Links and link groups

The topology maps display single links and multiple links that connect two map objects. Links are used to represent the physical connectivity between two NEs or logical connectivity, such as service tunnels. The map uses an arrow to display the direction of a unidirectional link. Multiple links between 2 objects are grouped, by default, as one link with no defined direction. Bidirectional links are displayed with no defined direction. A link group is displayed with a plus sign located on the link object.

When you double-click on a single link, the properties form for the link opens. When you double-click on the link group object for multiple links, a list form opens displaying all of the links that belong to the link group. For the physical, service tunnel, and LSP maps, a list form opens regardless of whether there is one link or multiple links in the link group.

A bidirectional link group is displayed with a plus sign icon located in the middle of the link object. A unidirectional link or link group is displayed using an arrow icon on the object pointing in the direction of the path.

The color of a single link object is determined by the status of each link endpoint. The color of a link group object is determined by the most serious alarm that is raised for a link in the link group.

Breadcrumbs

Breadcrumbs are buttons that are displayed along the top of the map panel. Breadcrumbs indicate, from left to right, the hierarchy of the topology groups to the group currently displayed in the map panel. The default top of the hierarchy, the breadcrumb at far left, is the entire network. Click on a breadcrumb to open the map for the corresponding group.

Map navigation tree

The following network topology maps display a map navigation tree:

- physical map
- service tunnel map

You can use the map navigation tree:

- for non-linear navigation to any topology group on the map
- to display the topology group hierarchy starting from the entire network

The map navigation tree displays:

- topology groups, including group names
- status of the topology groups

When you click on a map object in the map navigation tree, the contents of the object are displayed in the map panel, and the map object is selected. See section 4.1 for more information about the navigation tree.

Contextual menus for objects in the map navigation tree

To open a contextual menu for an object, right-click on a map object in the map navigation tree. See Table 4-2 for more information about contextual menu options.

Map toolbar

The map toolbar allows you to manage a 5620 SAM map view. The toolbar is above the map panel in the map window. Figure 5-2 shows the map toolbar elements.

Figure 5-2 Map toolbar elements

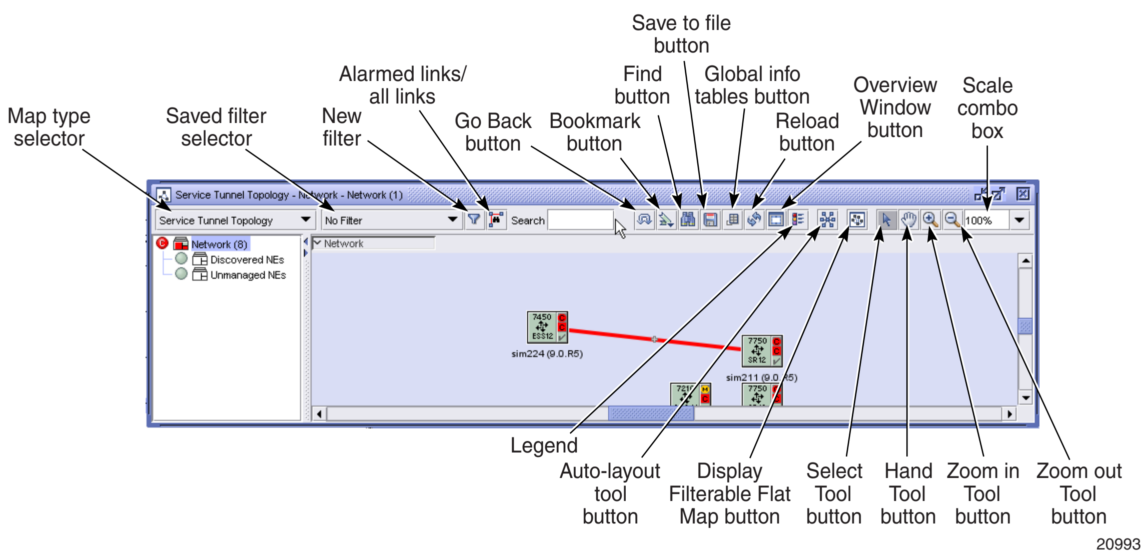


Table 5-1 describes the map toolbar elements.

Caution 1 — Applying an information table configuration to many objects on the map may take a long time.

Caution 2 — When you reload a map from the database, the database is unavailable during the loading period.

Caution 3 — The current composite service map is redrawn when you click on the Rearrange by Service Tiers button, and the prior layout of the composite service map cannot be recalled.

Caution 4 — After you click on the Auto-Layout Tool button and confirm the action, any existing map layout is overwritten and cannot be recovered. If you are satisfied with the layout of the icons on the map, do not use the Auto-Layout Tool button.

Table 5-1 Map toolbar elements descriptions

Toolbar element name	Description
Map type selector	The map type selector is a drop-down menu that lists the map view options that you can choose to specify the view. The map type selector offers the following views: • Physical Topology • Service Tunnel Topology
New Filter button 	A filter allows you to apply one or more object filters to a map view, to narrow the range of objects that are displayed. Filters can be saved for future searches on similar objects. When a filter is applied, the name of the filter is displayed on the saved filter selector. When a filter is applied, only the objects that the filter returns are displayed, with the following exceptions: • if one link endpoint is displayed, the other endpoint is also displayed, even if the filter excludes it • if a filter does not include a link filter, only the links between the returned NEs are displayed. Filters can be saved as private or public. You can apply a span of control to public filters to filter out objects that are not in the current user span of control. Public filters can only be changed by the user who created them. Private filters appear only for the user who creates them. Click on the Filter button to create and save filters that specify the objects displayed in a map. You can create a filter based on a combination of search criteria. Figure 5-4 shows the navigation buttons that you can use to create, apply, and save a map filter. See Procedure 5-21 for more information about creating a topology map filter. See chapter 3 for more information about configuring filters.
Alarmed links/All links shown button 	Click on the Alarmed links/All links shown button to specify any of the following on the topology map: • all links • only link groups with associated alarms • only specific links with associated alarms • link groups and the specific links within the link groups with associated alarms The Alarmed links/All links shown button options are: • All links shown (default)—the icon is displayed in white and all links are displayed on the map. • Show Only Alarmed—the icon is displayed in yellow and only link groups with associated alarms are displayed on the map. • Enable Alarm Link Pullout—the icon is displayed in yellow and links with associated alarms are displayed on the map. The link groups containing the pulled out alarm links with unknown physical characteristics are displayed in grey.
Go Back button 	Click on the Go Back button to navigate between previously viewed topology groups. For example, if you are viewing Router Group 1 then view Router Group 2, click on the Go Back button to return to Router Group 1. The Go Back button only functions in one map type; both previously viewed topology groups must be the same map type.
Bookmark button 	Bookmarks are used to create shortcuts to frequently visited locations on a map. Click on the Bookmark button and choose to add a bookmark or manage existing bookmarks.
Find button 	Click on the Find button to search for network objects on a map. You can choose to search for specific vertices or edges. A list form opens that allows you to configure specific criteria to filter the results of your search. See chapter 3 for information about performing searches. When the network object is found, the map navigation tree displays the topology group that contains the object. If necessary, the 5620 SAM scrolls to the part of the map where the object is located.

(1 of 3)

Toolbar element name	Description
Save To File button 	Click on the Save To File button to save the map view or the full map. You can choose the location to save the map image and the file type. See Procedure 5-8 for more information about using the Save To File button.
Global Info Tables button 	Click on the Global Info Tables button to create information table configurations, apply information table configurations globally, or turn the global information table option off. See Procedures 5-15 and 5-16 for more information about using the Global Info Tables button. See Caution 1 above.
Reload Button indicating no database changes  Reload Button indicating database changes 	Click on the Reload button to load the topology map from the 5620 SAM database. The topology map is updated to display the latest configurations. The Reload button icon changes to indicate whether moving a map object and changing the layout of the object is saved to the database. See Caution 2 above.
Overview Window button 	Click on the Overview Window button to open the Overview window. Use the Overview window to pan the entire map, or a specific group or service, and the area that you want to view. Figure 5-3 shows the Overview window.
Legend button 	Clicking on the Legend button opens a contextual menu that displays a list of map legend types, if multiple legends are available, or opens the Legend form. Choosing a legend type from the contextual menu opens the Legend form with the appropriate legend tab displayed. The following legend types are available, depending on the map type: • icons—always shown; displays the icons used to identify objects • colors—displays the color scheme used for identifying map objects • highlight sessions—displays the highlight sessions for the current map, and allows clearing of one or more sessions • other legend types that are specific to a type of map
Rearrange by Service Tiers button 	The Rearrange by Service Tiers button is available only for composite service topology maps. Figure 5-13 shows the composite service map. Click on the Rearrange by Service Tiers button to organize the composite service tier icons in the map panel by service tier. The service tier icons are displayed in the following order from the top of the panel: • tier 1 icons (typically IES and VPRN services) • tier 2 icons (typically VPLS and MVPLS) • tier 3 icons (typically satellite HVPLS and VLL services) • tier 4 icons (typically VLAN services) . . . • tier n icons (user-assigned) See Caution 3 above.

(2 of 3)

Toolbar element name	Description
Auto-Layout button[1] 	Click on the Auto-layout button to lay out the map icons. The layout options are: • Circular — emphasizes ring and star topologies in networks. Objects are grouped according to the network structure and arranged in circles or radial tree structures. • Smart Organic—emphasizes inherent data groupings and symmetries. This information helps with understanding the interconnections of complex structures. • Endpoint Layout (VPLS, VLL, mirror, and composite service sites only) - all endpoints are snapped close to the associated parent site. The Auto-Layout tool is useful when: • many newly discovered NEs are tiled together on the map and difficult to view • a large number of network device icons are spread out across the map and cannot be easily viewed without zooming out After you click on the Auto-Layout button, icons with links between them are placed closer together in the center of the map. Icons without links are placed on the periphery of the linked icons. See Caution 4 above.
Display Filterable Flat Map button 	Click on the Display Filterable Flat Map button to quickly display a flat map of the current topology map view. You can also view a flat map on the 5620 SAM by choosing Application→Flat Maps from the 5620 SAM main menu.
Select Tool button 	Click on the Select Tool button to select and move an object on the map or to view object information. You can select and move multiple objects by pressing the Shift key and clicking on each object you want to select, or by drawing a selection rectangle around all the objects you want to select on the topology map.
Hand Tool button[2] 	Click on the Hand Tool button to switch to a pan mode. Click on the background to move the contents of the map in any direction. When you are in the pan mode and you scroll over an object, you can select and move an object on the map or view object information. You can select and move multiple objects by pressing the Shift key and clicking on the object you need to select.
Zooming in  and zooming out  using a mouse or toolbar buttons[3]	The ability to zoom in and out on a map allows you to view hundreds of map objects at once to see the scope of the network, or view the information for one NE. Click on the Zoom in Tool and Zoom out Tool buttons and click on the map to resize the objects in a map or use the mouse wheel to zoom in and zoom out of topology maps. Click on the map and roll the mouse wheel forward to zoom in or roll the mouse wheel backward to zoom out. Each roll of the mouse wheel brings the map objects closer or further. When a map is at a low zoom level, the icons are displayed at a reduced size, link lines are thinner and labels are hidden. Labels are displayed when you click on the reduced icon. When a map is viewed at a high zoom level, the icons are displayed at normal size, link lines are thicker and labels are displayed.
Scale combo box	Use the scale combo box to increase or decrease the map zoom. You can choose a zoom percentage value from 25% to 300%, or fit all objects in the window from the drop-down menu. The scale combo box displays the current scale of the map.

(3 of 3)

Notes

(1) You can also apply the auto-layout option to a contiguous group by right-clicking on one of the selected objects. See Procedure 5-23 for information about using the auto-layout function.

(2) You can temporarily activate the panning function by pressing and holding the space bar, and then clicking in the map panel.

(3) Object icons are displayed at a reduced size in a flat map.

Figure 5-3 shows the Overview window.

Figure 5-3 Overview window

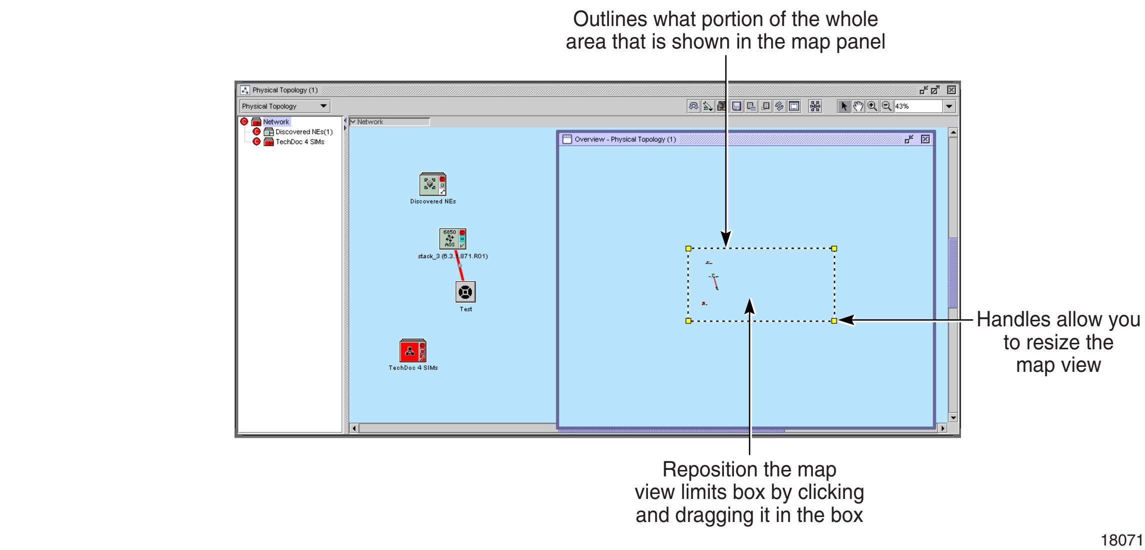

Figure 5-4 shows the navigation buttons that you can use to create, apply, and save a map filter.

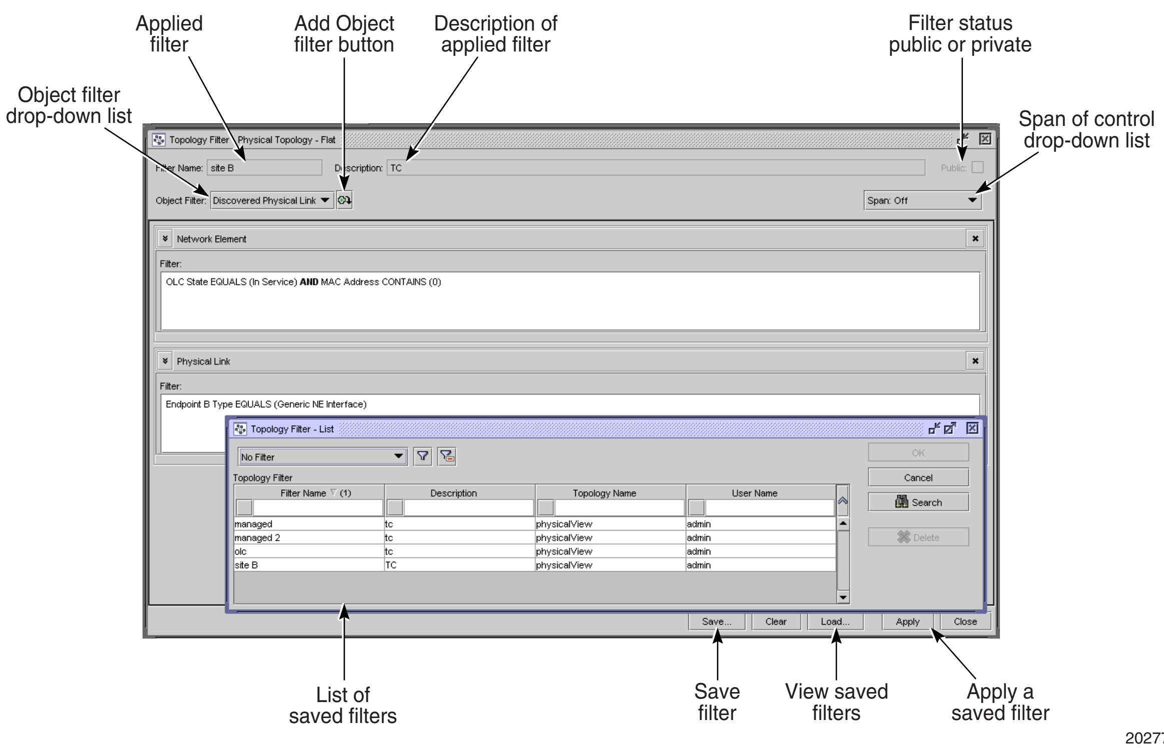
Figure 5-4 Filtered map form



Zooming in and out

The ability to zoom in and out on a map allows you to view hundreds of map objects at once to see the scope of the network, or view the information for one NE. See Procedure 5-11 for information about zooming functions.

When a map is viewed at a low zoom level, the icons are displayed at a reduced size, link lines are thinner and labels are hidden. Labels are displayed when you click on the reduced icon. When a map is viewed a a high zoom level, icons are displayed at normal size, link lines are thicker and labels are displayed.

Bookmarks

You can bookmark frequently visited areas of the map for easier navigation when you return to those locations. Bookmarks are associated with a map view. To use the bookmark, you must be in the same view where you created the bookmark or a view that shares the same group, for example, a topology group that belongs to both the physical topology map and the service tunnel map. Otherwise, the bookmark menu option is disabled.

You can access the bookmark drop-down menu using the Bookmark button on the map toolbar. Figure 5-2 shows the Bookmark button. The bookmark menu is divided into two sections and separated by a horizontal line. The top section of the drop-down menu contains the bookmark management functions, and the bottom section contains the user-created dynamic list of bookmarks.

The list of bookmarks is updated when you add, remove, group, or rearrange the bookmarks. The menu items can be bookmarks or folders, which can expand to display more bookmarks or folders.

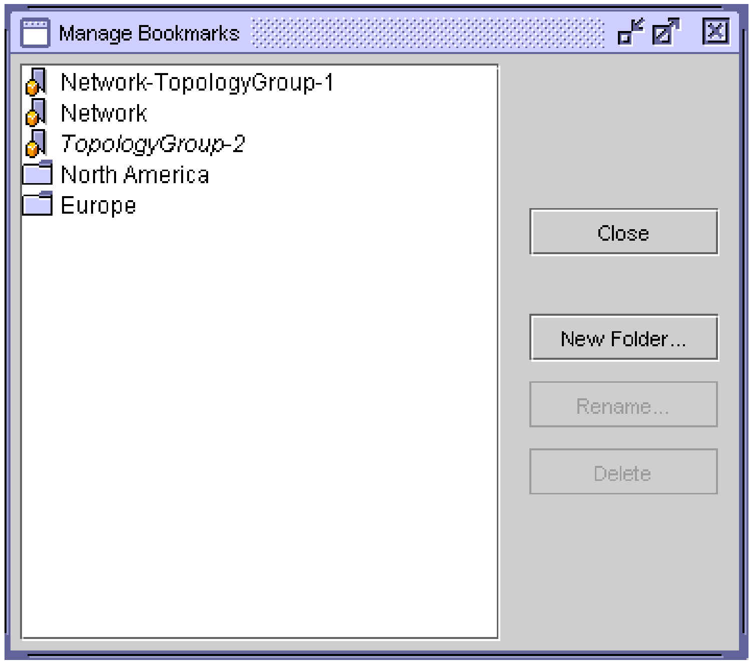
Note — A large number of bookmarks is difficult to manage. Bookmarks should be organized in folders for better usability and easier management. Alcatel-Lucent recommends that you create a maximum of 1000 bookmarks.

When a bookmark is selected, the map panel displays the bookmarked topology group. The map navigation tree expands to display the topology group.

When a valid bookmarked topology group is moved to another group, the bookmark for the group is updated to correspond to the new location of the group. If the bookmark location is not valid, for example, a topology group was deleted since the bookmark was created, an invalid bookmark message is displayed. The map panel remains unchanged.

Click on the Add Bookmark menu option to add the topology group currently viewed in the map panel as a bookmark. Click on the Manage Bookmarks menu option to open the Manage Bookmarks form. Figure 5-5 shows the Manage Bookmarks form.

Figure 5-5 Manage Bookmarks form



The Manage Bookmarks form has a list panel on the left in which the bookmarks and folders are listed in a tree structure. You can drag and drop bookmarks and folders in and out of other folders in the list panel. Select a bookmark or folder for editing. Click on an empty area to deselect the tree object. Double-click on a top-level folder to open the folder and display its contents. A turner to the left of the descendant folder object in the list panel indicates that the folder contains descendant objects, such as bookmarks or other folders.

The names of invalid bookmarks, and bookmarks and folders that are not from the current view, are displayed in italics.

The following buttons with which you can perform different actions are displayed to the right of the list panel:

- Close—used to close the Manage Bookmarks form. All changes in the form are saved when you click on the Close button.
- New Folder—used to create a folder in the list panel. The Folder Properties dialog box appears.
    - If a folder is selected in the list panel, the new folder that is an immediate descendant object of the selected folder.
    - If no folder is selected in the list panel, the new folder is created as a top-level folder.
- Rename—used to rename a folder or bookmark. The Rename dialog box appears. The Name field contains the name of the selected folder or bookmark. This button is enabled only when a folder or bookmark is selected in the list panel.
- Delete—used to delete a selected folder or bookmark from the list panel. This button is enabled only when a folder or bookmark is selected.

Information tables

You can configure information tables that are displayed beside map objects. An information table contains specific values, such as an NE chassis type, software descriptor, and system address. Information tables are displayed beside each map object to which the configuration applies. You can drag and drop information tables on topology maps, but the new table location is not saved with the map.

Note — You cannot apply an information table configuration to link groups or topology groups.

Multiple information tables can be applied to map objects, but only one is displayed at a time. Tab indicators appear on the information table to indicate that multiple information tables apply to the map object. You can cycle through the applied information tables by clicking on the information table and pressing the Tab key.

You can specify that information tables are to be displayed only during a mouse-over operation, which is when the mouse pointer passes over an object. You can also specify whether an information table contains a header. Header display is enabled by default, and cannot be disabled for mouse-over tables. See Procedure 5-15 for more information. Mouse-over supports cycling between tables using the Tab key.

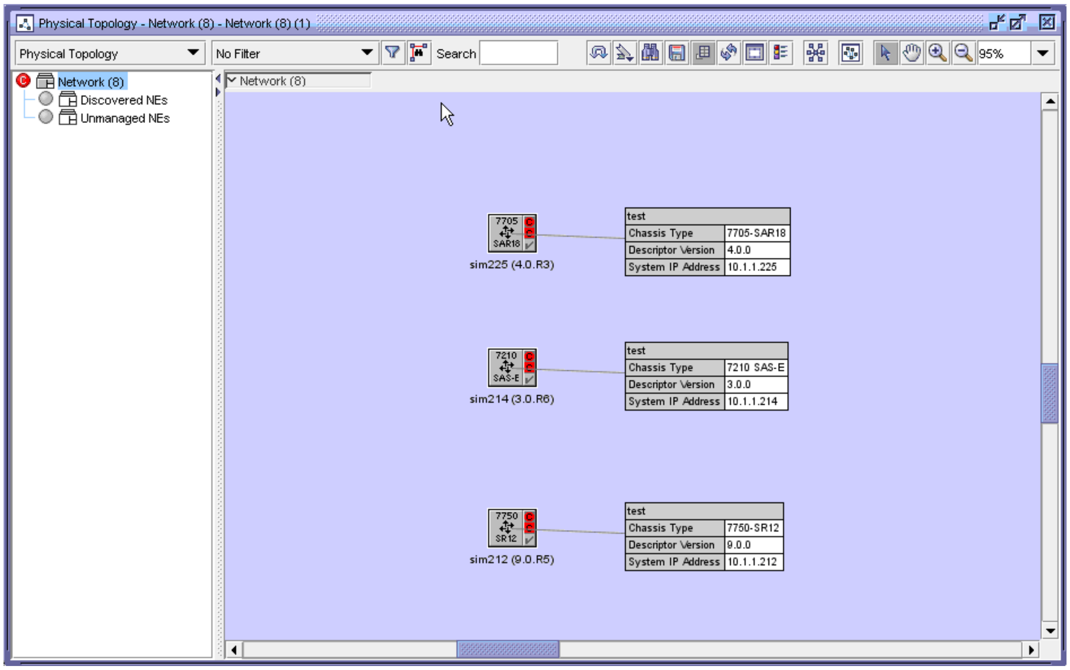
The following types of information tables can be applied to map objects:

- global—available for all map types
- selected—available for all map types
- highlight—available for maps that support the highlight function
- others that are specific to a map type

Global Info Tables

When one or more information table configurations are available for a map type, you can apply an information table configuration to all map objects using the Global Info Tables button. You can also use this button to turn the global information table configuration off. See Procedure 5-16 for more information about how to use the Global Info Tables feature. Figure 5-6 shows a map view with an information table configuration applied to all map objects.

Figure 5-6 Applied global information table configuration



Selected Info Tables

You can apply an information table configuration to one map object or a selected group of map objects by right-clicking on the object or selected group. You can also use this contextual menu to turn the selected information table configuration off. See Procedure 5-17 for information about how to use the Selected Info Tables feature.

Map Highlight Info Tables

On a map that supports the highlight function, you can apply an information table configuration to a map highlight by right-clicking on an existing highlight session from the Highlight Sessions tab of the Legend-*topology* form. You can also use this contextual menu to turn the highlight information table configuration off. See Procedure 5-18 for more information about how to use the Map Highlight Info Tables feature.

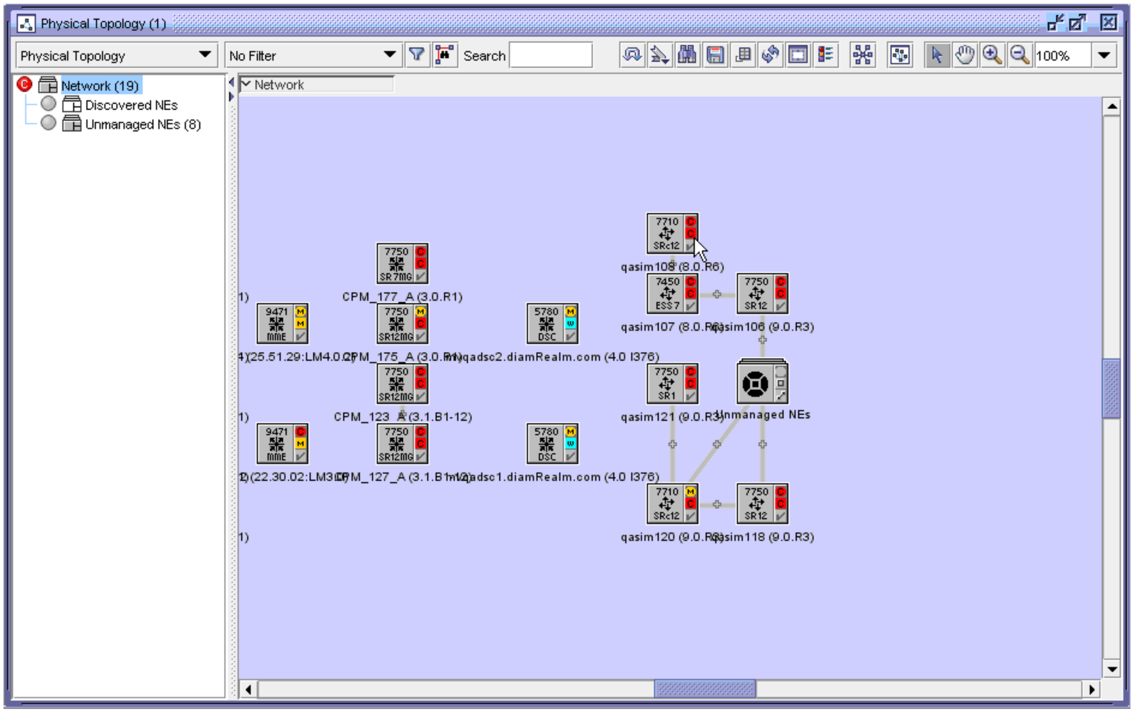
5.2 5620 SAM map types

This section details the types of maps available to the 5620 SAM.

Physical topology map

The physical topology map is available by choosing Application→Physical Topology from the 5620 SAM main menu. The physical topology map is used to view and manage Layer 1 objects, including the logical grouping of devices. Figure 5-7 shows the physical topology map.

Figure 5-7 Physical topology map



The physical topology map is open in the working panel by default when the 5620 SAM client GUI starts.

The following apply to link objects in the physical topology map:

- The following colors indicate link status:
  - Red—the link has failed
  - Light Gray—the link is in service
  - Green—the link is new
  - Blue—the link is in standby or backup mode
  - Dark gray—the link is unknown
  - Purple—the link is being diagnosed
  - Magenta—the link carries hidden links
  - Yellow—the LAG link is degraded (one or more links in the LAG have failed)
- If endpoint B of a physical link is on an unmanaged device, the status of the physical link is the same as the status of endpoint A, which is on a 5620 SAM-managed device.
- A LAG link is represented as a single physical link. However, if you right-click on a LAG link, the form that opens provides information and configuration options for the entire LAG link. For example, the Endpoint Info tab on the Discovered Physical Link form shows the link endpoints as LAG endpoints rather than physical ports, and allows the operator to open the LAG properties form.

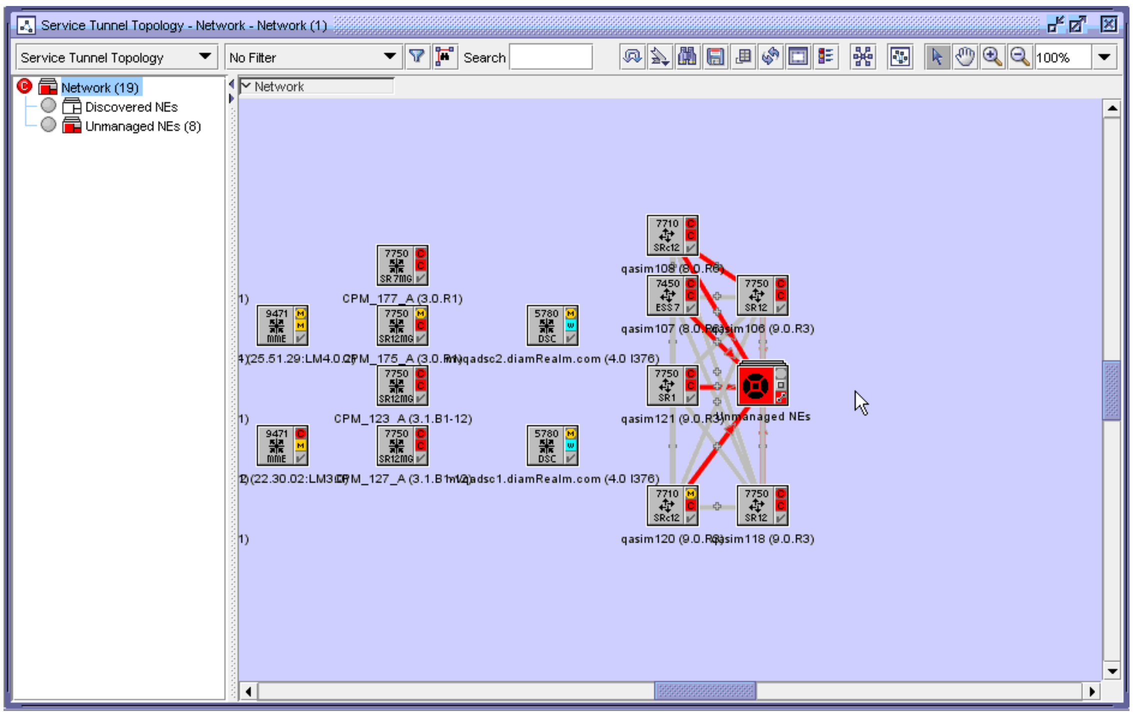
Menu options for physical topology map background

To open a contextual menu for the map background, right-click on the map background. See Table 4-2 for contextual menu option information.

Service tunnel topology map

A service tunnel topology map is available on the 5620 SAM by choosing Application→Service Tunnel Topology from the 5620 SAM main menu. The Service Tunnel Topology map is displayed, as shown in Figure 5-8.

Figure 5-8 Service tunnel topology map



Icons in the service path topology map represent devices. The color of the device icon represents the status of the device. Red indicates that the device is down. Green indicates that the device is up. Yellow indicates that the device is being synchronized.

Link groups between devices represent service tunnels. When a link group is red, at least one tunnel in the link group is down. For link groups between managed devices, right click on the link group icon to list and edit tunnels in the link group. For link groups between managed and unmanaged devices, right-click on the link group icon to open contextual menus and submenus which allow you to open additional information forms for the service tunnel, including the properties form.

EPS path topology maps

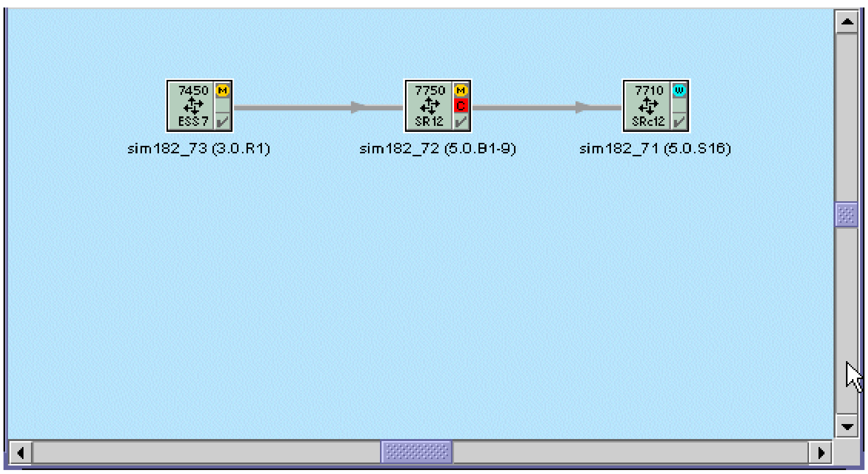
An EPS path topology map is available on the 5620 SAM by choosing Application→EPS Path Topology from the 5620 SAM main menu. See the *5620 SAM LTE ePC User Guide* and the *5620 SAM LTE RAN User Guide* for information about EPS paths in LTE networks.

LSP path topology map

An LSP path topology map is available from the MPLS Path form and the LSP Path form. See Procedure 5-3 to view the map from the MPLS Path form. See Procedure 5-4 to view the map from the LSP Path form.

The LSP path topology map is used to view a specific provisioned, actual, or CSPF LSP path in the context of its source, and transient and destination hops. Figure 5-9 shows an LSP path topology map.

Figure 5-9 LSP path topology map



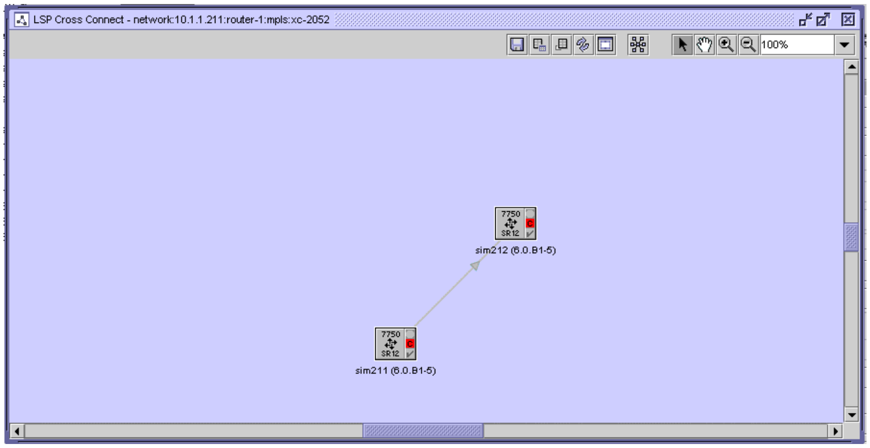
When you view the LSP path topology map, hops are linked by straight lines, where each line represents a sub-path between two hops of the LSP path. The direction of each path is indicated by an arrow. Green lines indicate provisioned paths, and gray lines indicate actual paths.

LSP cross-connect topology map

An LSP cross-connect topology map is available from the LSP Path form. To view the map from the LSP Path form, see Procedure 5-6.

The LSP cross-connect topology map is used to view a specific LSP cross-connect in the context of its source, and transient and destination hops. Figure 5-10 shows the LSP cross-connect topology map.

Figure 5-10 LSP cross-connect map



Flat maps

Flat maps provide a complete network view without topology groups. A flat topology map can display up to 1000 objects. You can narrow the range of objects that are displayed by creating and saving filters and filter definition trees.

A flat map is available on the 5620 SAM by choosing Application→Flat Maps from the 5620 SAM main menu. The following flat map types are available:

- Physical Topology
- Service Tunnel Topology

A flat map is used to view a large number of network objects and link groups. You can double-click on a NE in the flat map to display the object properties. For example, when you double-click on an NE, a property form opens, from which you can view or configure the NE parameters.

Object icons in a flat map are displayed at a reduced size, link lines are thinner, and object information is not displayed. Flat maps support the following, as do other 5620 SAM topology maps:

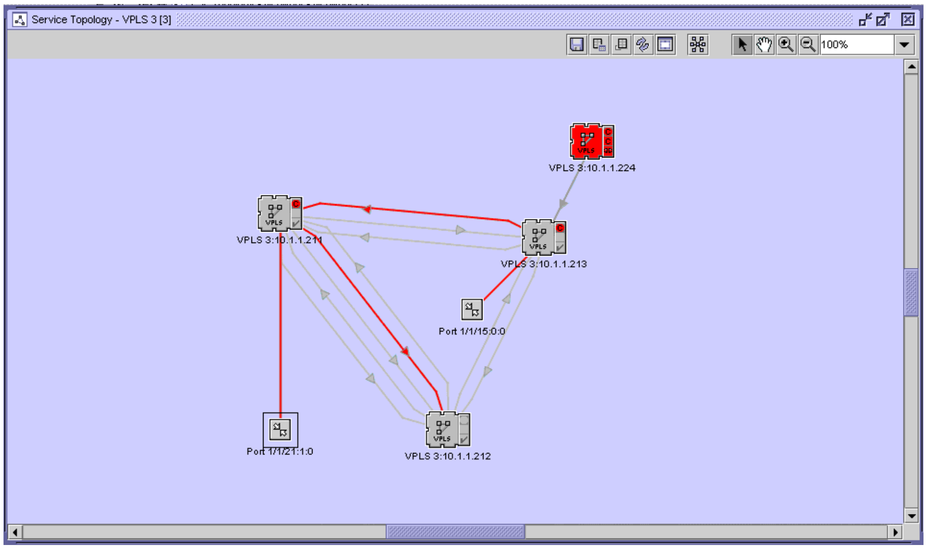
- mouse-based navigation
- zooming
- NE and link status colors
- searching
- filtering

Service topology maps

A service topology map is available from the Manage Services form. To view the map from the Manage Services form, choose Manage→Service→Services from the 5620 SAM main menu and list services by clicking on the Search button. Select one or more services in the list and click on the Topology View button.

Figure 5-11 shows the service topology map.

Figure 5-11 Service topology map



The large icons represent managed devices. The small icons represent unmanaged devices. The label of the managed device icon indicates the service name and the IP address of the device.

The symbol and color in the top-right corner of the managed device icon represents the aggregated alarm status, the most severe alarm on any of the services on the device. The symbol immediately below the aggregated alarm status symbol on the icon and the color of the icon together indicate the alarm status for the service site. A red icon indicates that the service on the device is down. A green icon indicates that the service on the device is up.

The port icons represent managed access interfaces. A service site can support up to 20 SAPs. When the number of SAPs on a service site exceeds 20, all of the SAPs on that site are grouped into a SAP group, represented by a SAP group icon on the map. When the number of SAPs drops below 20, the SAP group icon is replaced with the icons for all the individual SAPs on the map. To view the list of SAPs in a SAP group, right-click on the SAP group icon and choose List L2 Access Interface or List L3 Access Interface, depending on the service type, from the contextual menu. The corresponding Site form for the service opens with the L2 Access Interface or L3 Access Interface tab is displayed.

A line between two map objects represents a link or group of links. Links between device icons represent service circuits. Links between device icons and port icons represent the binding of an access port or interface to a service. The symbol and color in the bottom right corner of the managed device icon represents the connectivity alarm status. During a resynchronization of the managed device, the icon represents the resynchronization status, and is shown in yellow. The status is inherited from the link endpoints. A plus sign icon located in the centre of the link indicates a bidirectional group link. An arrow icon located on the link indicates a unidirectional link and identifies the direction of the path.

Right-clicking on a managed NE, port, or link opens a contextual menu. Contextual menus allow you to open additional information forms, such as the properties form for an object.

You can view multiple services on a map at the same time if the services are selected from the Manage Services form during map creation.

Service segmentation

A service segmentation view is also available to aid in conceptualizing complex services. Segments are logical grouping of interconnected sites, services, and bindings. The segmentation view is available for VPLS and VLL services.

A service segment is considered to be a portion of a single service that extends to multiple sites connected within that segment. It is based on the service type through one of the possible connection topologies (for example, mesh, PBB tunnels, a switching VLL, rings, and so on), without having to pass through any connectors such as spokes, CCAGs, or SCPs (SAP-to-SAP).

General examples of segments in Layer 2 service topologies include:

- A simple pair or single spoke/mesh SDP binding comprises one segment
- A mesh of a multi-node VPLS service comprises one segment
- A multi-node mesh with a spoke SDP to a single node comprises two segments
- Each mesh of VSIs forms a segment (applicable to H-VPLS)

Just a few examples of the many possible service-specific segmentation configurations include scenarios such as the following:

- H-VPLS (Inter-Metro with redundant spoke SDPs):
    - One application of H-VPLS is the connection of two or more geographically-dispersed VPLS domains belonging to the same customer. Two spoke SDP connections are used to connect each VPLS between the two metros, either in a redundant PW spokes topology or under STP protocol. The redundant spokes comprise one segment, while each VPLS will also comprise one or more segments, depending on their specific configurations.
- VLL Switching:
    - For a VLL service at a switching router, a terminating PE device has at least one VLL SAP, while a switching PE device has a VLL instance which cross-connects two spoke bindings. All VLL instances of such a service must have the same service ID, and if the VLL has one or more switching sites, it must have at least two terminating sites. In this scenario, the primary and redundant spoke SDPs on the same network endpoint are considered to be in the same segment.
- PBB:
    - In a PBB configuration, the B-VPLS is considered a service tunnel, from the I-VPLS or I-Epipe perspective. Therefore, the sites connected via a B-VPLS (that is, having the same ISID) are considered to be in one segment.
    - I-Sites bound to the same PBB tunnel (B-VPLS) and having the same ISID exist in the same segment.
    - Epipe sites bound to same PBB tunnel (B-VPLS) exist in the same segment

Whenever you modify a service, note that the following actions can trigger segment creation, modification, or deletion in a segmented service view:

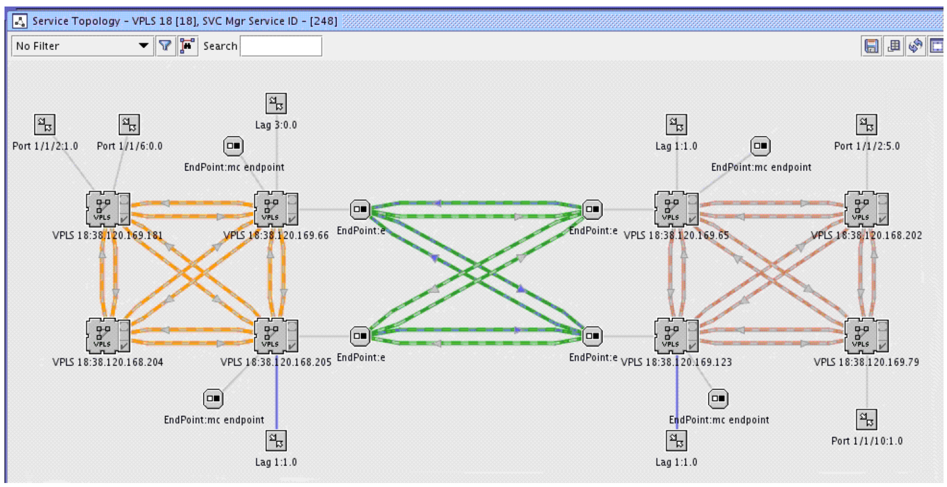
- Adding or removing service sites
- Creating or deleting spoke and/or mesh bindings (either through the 5620 SAM GUI or CLI)
- Creation or deletion of VLAN Uplinks by 5620 SAM

You can access the segmented view of a service by right-clicking on an empty portion of the background in the service's topology view. A contextual menu allows you to activate or de-activate the segmented view for the service.

In a segmented view, the outlined links of all spoke bindings, mesh bindings, or VLAN Uplinks are colored in the same distinct way for the segment they belong to. However, there are currently only 19 different colors available for use in showing service segments. If all the colors for a specific service are used, a warning message is logged to indicate this.

Figure 5-12 shows an example of how the 5620 SAM displays the segmented view of an H-VPLS Metro-to-Metro service.

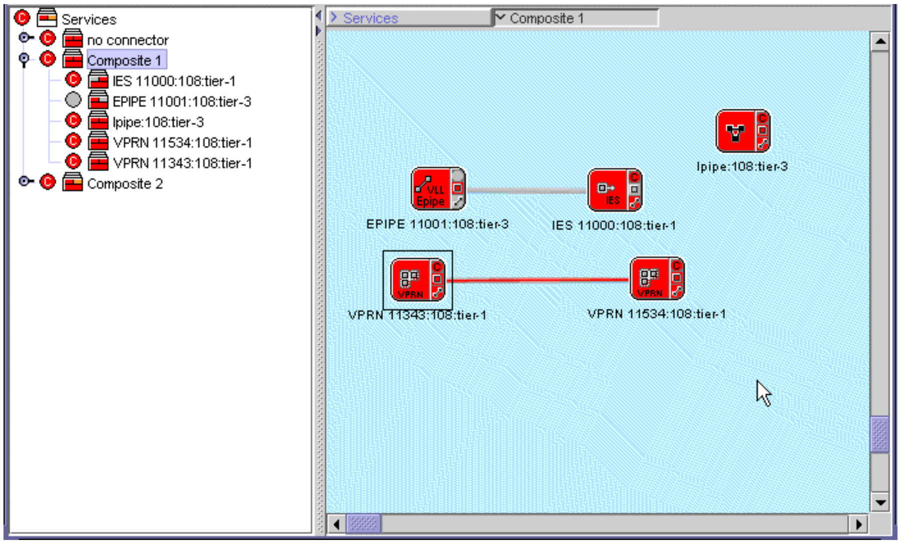
Figure 5-12 Service segmentation example



Composite service topology maps

You can use the 5620 SAM to view composite service topology and flat topology maps. Figure 5-13 shows a sample composite service topology map. When you open a flat topology view map, the navigation tree is not part of the map.

Figure 5-13 Composite service topology map



In a composite service topology map, you can use the navigation tree at the left side to display the composite service and service tier hierarchy starting from the services object. The map navigation tree displays the following:

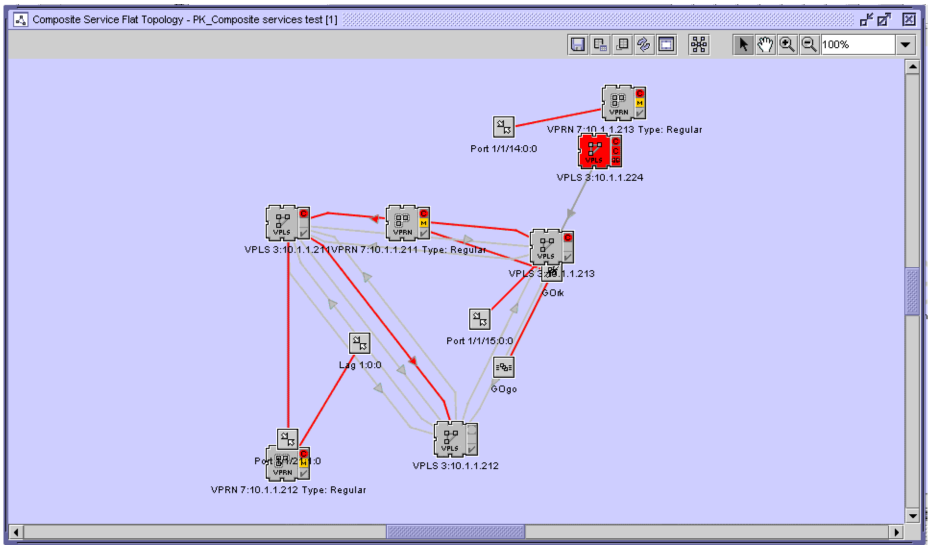
- composite services and service tiers, including service name and tier number
- status of the composite services and their tiers

The map toolbar for the composite service topology map includes the Rearrange by Service Tiers button. See Table 5-1 in this section for more information.

Double-click on a composite service object in the map panel to display the service objects that belong to the composite service. Double-click on the service objects to display the service sites and access interfaces. The links or groups of links between the service sites and access interfaces are also displayed.

In the composite service topology map, all service objects in the composite service are displayed simultaneously. The service sites, access interfaces, and the links or groups of links between them are also displayed. The navigation tree is thus not required in this view. Figure 5-14 shows a sample composite service flat topology map.

Figure 5-14 Composite service flat topology map



You can right-click on an object icon or link group icon to turn up, shut down, or display the properties form for the item.

5.3 Working with maps

This section details different methods of managing 5620 SAM capabilities from the topology view.

Modifying a service from the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view in the service configuration forms.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

Services that can be modified from their topology views include VPLS, VPRN, VLL, IES, and composite services. See the appropriate service management chapter for procedures that describe how to modify services from the topology view.

Managing OAM diagnostics from the topology view

A 5620 SAM operator can configure and execute OAM diagnostic tests from the service topology view. A right-click contextual menu of test types and test operations allows a GUI user to perform many test-management tasks. The OAM diagnostic functions on the map are enabled and disabled using a selector in the map window.

5620 SAM OAM diagnostic test management using the topology map is supported for the following service types:

- VLAN, excluding 9500 MPR VLAN
- VLL Epipe
- VPLS
- VPRN

You can use a contextual menu option to open a test-creation form for selected map objects such as NEs, SAPs, SDPs, MEPs, and MIPs. The form is automatically populated with the information for the selected objects. After you apply the test configuration, you can use the map to execute the test and view the results. A test result summary is viewable using statically displayed or mouse-over global info tables that are shown beside the object that initiates the test. By default, the info table for a tested object displays the five most recent test results; you can enable or disable the display of individual or all results.

The general OAM contextual menu options that are available include the following:

- Create OAM Tests—lists the tests that are appropriate for the service type and selected objects; choosing a test type opens the pre-populated test-creation form
- Select OAM Tests—opens a filterable list form from which you can choose previously created tests associated with one or two objects

Note — The tests that are listed using the Select OAM Tests option do not include generated tests, or manually added first-run or last-run tests in a test suite.

See Procedure 5-28 for information about enabling basic OAM-related map functions.

Working with Ethernet CFM objects

You can configure and manage Ethernet CFM objects such as MEGs, MEPs, and MIPs using the Ethernet CFM contextual menu option. MEPs and MIPs are represented iconically. For example, a SAP or SDP binding object can have a graphical connector to MEPs and MIPs, and a site object can be connected to a B-VPLS MEP.

A service topology map displays only one MEG at a time. The MEG is selectable using a drop-down list in the map window when the OAM function on the map is enabled. The CFM objects associated with the currently selected MEG are displayed.

For a MEP, the following attributes are displayed:

- the MEP level, as a number inside the icon
- the MEP direction, as the up or down direction in which the icon points
- the MEP administrative state, as the icon color

For a MIP, only the level is displayed.

The displayed Ethernet CFM contextual menu options for MEPs and MIPs depend on the Ethernet CFM configuration, for example, the MD level and whether MEPs and MIPs are already present in the MEG.

When an operator right-clicks on the map background, the available Ethernet CFM option is global MEG creation, which opens a configuration form populated with the selected sites or all service sites, if none are selected.

When the selected object is a SAP, you can create, view, and delete MEPs, however MEP creation in this context is limited to B-VPLS sites. You can enable, disable, and view MIPs. Enabling a MIP creates a MIP only when the configuration supports this function.

When the selected object is an SDP binding, you can enable, disable, and view the associated MEPs.

Note — When you enable a MIP on a SAP or SDP binding, the 5620 SAM creates a MEG site if one does not exist, and uses explicit MHF creation.

5.4 Workflow to use 5620 SAM maps

1. Familiarize yourself with the components and basic operations of 5620 SAM maps. See sections 5.1 and 5.5 for more information.

2. Determine the map type you want to use. See section 5.2 for more information.

   - Select service maps to show which NEs are used by the services.
   - Select topology maps to show the relationship between NEs in a routing domain.

3. Configure map layout and object information tables. See section 5.6 for more information.

4. As required, create map filters to narrow the range of objects displayed. See section 5.6 for more information.

5. As required, create topology groups and populate the groups with devices to organize the network. See section 5.7 for more information.

6. As required, create physical links between managed and unmanaged devices to configure Layer 1 management. See section 5.7 for more information.

5.5 Basic 5620 SAM map procedures

Use the following procedures to perform basic map management tasks.

Procedure 5-1 To open a map from the 5620 SAM main menu

1 Choose Application from the 5620 SAM main menu.

2 Choose a type of map to view from the menu options:

- Physical Topology to view Layer 1 network connectivity
- Service Tunnel Topology to view service tunnels
- Flat Maps→Physical Topology
- Flat Maps→Service Tunnel Topology

The appropriate map opens and displays the network objects.

See Procedure 5-7 for information about using the map elements. See Procedure 5-9 to list or view object information from a map. See section 5.1 for information about the map views.

Procedure 5-2 To open a service topology map

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Create an appropriate filter and click on the Search button. A list of services is displayed.

3 Select one or more services in the list and click on the Topology View button. A dialog box appears.

4 Click on the Yes button to continue. The Service Topology map opens.

See Procedure 5-7 for information about the map elements. See Procedure 5-9 to list or view object information from a map. See section 5.1 for information about the map views.

Procedure 5-3 To open an MPLS provisioned path map from the MPLS Path form

1 Choose Manage→MPLS→MPLS Paths from the 5620 SAM main menu. The Manage MPLS Paths form opens.

2 Create an appropriate filter and click on the Search button. A list of MPLS paths is displayed.

3 Select an MPLS path in the list and click on the Properties button. The MPLS Path configuration form for the MPLS path opens.

4 Click on the Provisioned Path tab button. The hops of the MPLS path appear in a list.

5 Select a hop in the list and click on the Topology View button. The MPLS provisioned path map opens showing the hops between the devices.

See Procedure 5-7 for information about the map elements. See Procedure 5-9 to list or view object information from a map. See section 5.1 for information about the map views.

Procedure 5-4 To open a dynamic LSP path map from the LSP Path form

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Create an appropriate filter and click on the Search button. A list of dynamic LSPs is displayed.

3 Select a dynamic LSP in the list and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 Click on the LSP-Path Bindings tab button. The LSP paths appear in a list.

5 Select an LSP path in the list and click on the Properties button. The LSP-Path Binding (Edit) form opens.

6 Perform one of the following:

a View the topology for provisioned paths:

i Click on the Provisioned Path tab button. The hops of the LSP path appear in a list.

ii Select a hop in the list and click on the Topology View button. The LSP path map opens showing the hops between the devices.

b View the topology for actual paths:

i Click on the Actual Path tab button. The hops of the actual path appear in a list.

ii Select a hop in the list and click on the Topology View button. The LSP path map opens showing the actual path hops between the devices.

c View the topology for CSPF paths:

i Click on the CSPF Path tab button. The hops of the CSPF path appear in a list.

ii Select a hop in the list and click on the Topology View button. The LSP path map opens showing the CSPF path hops between the devices.

See Procedure 5-7 for information about the map elements. See Procedure 5-9 to list or view object information from a map. See section 5.1 for information about the map views.

Procedure 5-5 To open a flat map

1 Perform one of the following.

  a Open a flat physical topology map.

    i Choose Application→Flat Maps→Physical Topology from the 5620 SAM main menu. The Topology Filter - Physical Topology - Flat filter form opens.

    ii Go to step 2.

  b Open a service tunnel topology map.

    i Choose Application→Flat Maps→Service Tunnel Topology from the 5620 SAM main menu. The Topology Filter - Service Tunnel Topology - Flat filter form opens.

    ii Go to step 2.

  See Procedure 5-7 for information about the map elements. See Procedure 5-9 to list or view object information from a map. See section 5.1 for information about the map views.

2 Perform one of the following:

  a Perform Procedure 5-21 to create a filter definition.

  b Perform Procedure 5-22 to load and apply a saved filter.

3 View the map.

4 Close the map.

Procedure 5-6 To open a dynamic LSP cross-connect topology map

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Create an appropriate filter and click on the Search button. A list of dynamic LSPs is displayed.

3 Choose an LSP in the list and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 Click on the Cross Connects tab. The cross-connects of the LSP path appear in a list.

5 Choose a cross-connect in the list and click on the Topology View button. The LSP path map opens and displays the cross-connects between the devices.

See Procedure 5-7 for information about the map elements. See Procedure 5-9 to list or view object information from a map. See section 5.1 for information about the map views.

Procedure 5-7 To view and understand map elements

1 Open a map, as described in Procedures 5-1 to 5-6.

2 View the map elements, which can include the following:

- device icons, which each display one of the following background colors to represent connectivity status and SNMP reachability
  - red—down or unreachable
  - yellow—resynchronizing or discovering
  - green—normal

  The icon in the top-right corner of a device icon represents the most serious alarm raised against the device.

  The icon in the middle right hand side of a device icon represents the alarm status for the device.

The icon in the bottom right corner of a device icon represents the connectivity to the device. During resynchronization, the icon represents the resynchronization status; for example, yellow.

- topology group icons, which have the following characteristics:
  - The background color white indicates that the topology group does not contain any descendant objects.
  - The color and icon in the upper left corner of the topology group icon indicate the most severe alarm on any of the devices in the group.
  - The color of the upper middle section of a topology group icon indicates the aggregated connectivity status of the devices in the group.
  - The color of the upper right corner of the topology group icon indicates the aggregated link status of the links in the group.
- composite service icons, which have the following characteristics:
  - The color and icon in the upper left corner of the composite service icon indicate the most severe alarm on any of the devices in the composite service.
  - The color of the upper middle section of the composite service icon indicates the aggregated connectivity status of the devices in the composite service.
  - The color of the upper right corner of the composite service icon indicates the aggregated link status of the links in the composite service.
- service tier icons in composite service maps, which have the following characteristics:
  - The color and icon in the upper left corner of the composite service icon indicate the most severe alarm on any of the devices in the service.
  - The color of the upper middle section of the composite service icon indicates the aggregated connectivity status of the devices in the service.
  - The color of the upper right corner of the composite service icon indicates the aggregated link status of the links in the service.

Procedure 5-8 To save a map to a file

You can use the Save to File button to save a portion of a map or the entire map to a file. You can save the file in JPEG, BMP or PNG format.

1 Open a map.

2 Click on the Save To File button. The save options are displayed in the drop-down menu.

3 Choose a type of view from the drop-down menu:

- Choose Save Map View to save the current view.
- Choose Save Full Map to save the entire map view.

The Save form opens.

4 Save the results.

i To choose a directory for the file, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose BMP, JPEG, or PNG from the File of Type drop-down menu.

iv Click on the Save button. The map view is saved to the specified file.

Procedure 5-9 To view object information from a map

1 Open a map.

2 Right-click on one of the following objects:

- device icon
- plus sign icon in the centre of a link or link group
- port of a generic or unmanaged NE that indicates the endpoint of a link, path, tunnel, or service
- topology group icon

The appropriate contextual menu appears.

3 Choose a contextual menu option. The following are examples of the options available, depending on the type of object selected.

- Choose Properties to open the properties form for the object.
- Choose Scripts to open the properties form for an NE with the Scripts tab displayed.

Procedure 5-10 To manage the topology map window

The topology map panel and navigation tree panel are separated by a vertical split bar that you can use to control the panels. You can change the size, and hide, or show the map panel or the navigation tree panel.

1 To change the size of the map panel and the navigation tree panel, drag the vertical split bar to the left or right to control the amount of space used for the map panel and the navigation tree.

2 To hide the navigation tree panel, click on the vertical split bar left-facing arrow icon. The tree panel is hidden.

3 To show the map navigation tree panel, click on the vertical split bar right-facing arrow icon. The tree panel opens.

4 To hide the map panel, click on the vertical split bar right-facing arrow icon. The map panel is hidden.

5 To show the map panel, click on the vertical split bar left-facing arrow icon. The map panel opens.

Procedure 5-11 To zoom in and zoom out on a map

1 Open a map.

2 Perform one of the following:

- **a** Use the mouse wheel to zoom in and zoom out. Perform the following steps.
  - **i** Click on the map.
  - **ii** To zoom in, roll the mouse wheel forward.
  - **iii** To zoom out, roll the mouse wheel backward.
- **b** Use the Zoom In Tool and Zoom Out Tool. Perform the following steps.
  - **i** Click on the Zoom in Tool or Zoom out Tool button.
  - **ii** Move the mouse pointer into the map panel. The pointer changes to a magnifying glass containing a + or - sign.
  - **iii** Click on the area of the map you want to expand or contract. The map expands or contracts. Continue clicking until the desired zoom level is reached.
  - **iv** Use the opposite button and an equal number of clicks to return the map to its default setting.
  - **v** To return to the pointer icon, click on the Select Tool button in the toolbar.

3 Use the Scale combo box to specify a zoom level, and press ↵.

Procedure 5-12 To display only selected map objects

1 Open a map.

2 Select the objects.

3 Right-click on the selected objects and choose Show only Selected from the contextual menu. The map refreshes to display only the selected objects, and the word Hidden is displayed in the map panel to indicate that some objects are currently hidden.

4 To restore the original map view, right-click in the map panel and choose Cancel Show Only from the contextual menu.

Procedure 5-13 To display only highlighted map objects

1 Open a map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Select one or more highlight sessions in the list.

4 Right-click on the selected highlight sessions and choose Show Only Highlighted from the contextual menu. The map refreshes to display only the highlighted objects, and the word Hidden is displayed in the map panel to indicate that the non-highlighted objects are currently hidden.

5 To restore the original map view, right-click in the map panel and choose Cancel Show Only from the contextual menu. The map refreshes to display the original view.

Note — You can also restore the original map view by right-clicking on the selected highlight sessions in the Legend form and choosing Cancel Show Only from the contextual menu.

5.6 5620 SAM map configuration procedures

Use the following procedures to perform map configuration tasks.

Procedure 5-14 To configure and view topology map icon labels

By default, topology map icons include a descriptive label. For example, the label on a managed device icon on the Service Topology map includes the service name and the IP address of the device.

1 Choose Application→User Preferences. The User Preferences form opens with the General tab displayed.

2 Click on the Topology tab. A list of topology map icons is displayed.

3 Select a topology map icon.

4 Configure Text Field #1 and Text Field #2 to identify the information to display in each map icon label.

5 Click on the OK button. The User Preferences form closes.

Procedure 5-15 To create an information table configuration

You can create an information table configuration for all map objects, selected map objects, or map highlights. See Procedure 5-16 to apply a configuration to all map objects. See Procedure 5-17 to apply a configuration to selected map objects. See Procedure 5-18 to apply a configuration to highlighted map objects.

1 Open a map.

2 Click on the Global Info Tables button. A drop-down menu opens with the information table configurations displayed.

3 Select the Configure menu item. The *topology_view* Info Table Configurations form opens.

4 Click on the Create button. The *topology_view* - Info Table Configuration form opens.

5 Configure the Configuration Name parameter.

6 For each map object type, click on the associated check box to select the attribute for display in the information table.

Note — If an applicable attribute is not selected for a specific object type, an information table is not displayed when you apply an information table configuration to objects of that type.

7 Click on the OK button. The *topology_view* - Info Table Configuration form closes, and the new configuration is listed on the *topology_view* - Info Table Configurations form.

8 Close the *topology_view* - Info Table Configurations form.

Procedure 5-16 To enable or disable a global information table

The Global Info Tables button allows you to view an information table for all map objects. An information table configuration must be created before it can be applied. See Procedure 5-15 for information about creating an information table configuration.

1 Open a map.

2 Click on the Global Info Tables button. A drop-down menu opens with the information table configurations displayed.

3 Perform one of the following:

a Select a radio button to apply an existing global information table configuration. The map is refreshed with the corresponding information table displayed beside the map objects.

b Click on the Off button. The global information table feature is disabled.

Procedure 5-17 To enable or disable a selected information table

The Selected Info Tables menu option allows you to view an information table for a map object, or a group of map objects. An information table configuration must be created before it can be applied to a map object or a group of map objects. See Procedure 5-15 for information about creating an information table configuration.

1 Open a map.

2 Right-click on a map object or a selection of map objects. A drop down menu opens.

3 Choose Selected Info Tables. A drop down menu opens with a list of information table configurations and an Off option.

4 Perform one of the following:

a Choose an information table configuration. The map view is refreshed with the configured information table displayed beside the map objects.

b Choose the Off option. The selected information tables for the selected map objects are no longer displayed.

Procedure 5-18 To re-enable or disable map highlights

1 Open the required map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Perform one of the following:

a Re-enable a disabled highlight. Perform the following steps.

i Select the check box in the Active column for the highlight.

ii Click on the Apply button. The map view is refreshed with the highlight displayed.

b Disable the highlight. Perform the following steps.

i Deselect the check box in the Active column for the highlight.

ii Click on the Apply button. The map view is refreshed. The highlight and the associated information tables are no longer displayed.

4 Click on the Close button. The Legend - *topology* form closes.

Procedure 5-19 To enable or disable a highlight information table

You must create an information table configuration before you can apply it to a map highlight. See Procedure 5-15 for information about creating information table configurations.

1 Open the required map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Select one or more highlight sessions in the list.

4 Right-click on the selected highlight sessions and choose Highlighted Info Sessions from the contextual menu. A drop-down menu opens with a list of information table configurations and an Off option.

5 Perform one of the following.

a Choose an info table configuration. The map view is refreshed with the chosen information table displayed beside the highlighted map objects.

b Choose the Off option. The map view is refreshed and no longer displays information tables for the highlighted map objects.

Note — When a highlight is disabled or deleted, the map no longer displays the information tables for the highlight.

6 Click on the Close button. The Legend - *topology* form closes.

Procedure 5-20 To delete a map highlight

1 Open a map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Click on a map highlight to select it.

4 Right-click on the selected highlight and choose Delete. A dialog box appears.

5 Click on the Yes button. The highlight is deleted.

6 Click on the Close button. The Legend - *topology* form closes.

Procedure 5-21 To create a map filter

Perform this procedure to configure a filter to restrict the objects in a map view. You can save the filter for searches on similar objects.

1 Open a map.

2 Click on the New Filter button. The Topology Filter - *topology_view* form opens.

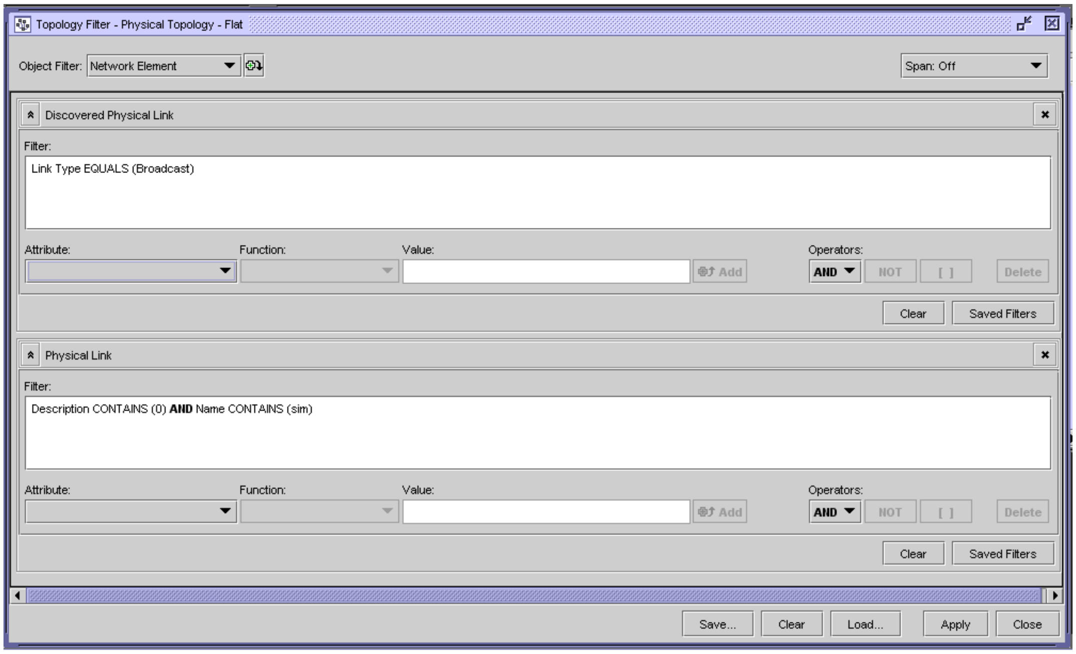
3 Choose an object filter from the Object Filter drop-down menu. Table 5-2 lists the filter options for each map type.

Table 5-2 Map filter options

Type of map	Filter options
Physical topology	Discovered Physical Link Network Element Optical Link Physical Link
Service tunnel topology	Network Element Tunnel

4 Click on the Add Object Filter button. The selected object filter is displayed in the filter panel as shown in Figure 5-15.

Figure 5-15 Map filter



5 Choose one or more of the object filters to create the filter. See chapter 3 for information about creating filters.

6 Configure the Span parameter.

7 Perform one of the following:

a Click on the Apply button to apply the filter and not save the filter. The map view is refreshed to display only the map objects defined in the filter. The filter selector displays Filter Applied.

b Perform the following steps to save the filter.

i Click on the Save button. The Save Filter form opens.

ii Configure the parameters:

- Filter Name
- Description
- Public

8 Click on the Save button. The Save Filter form closes.

9 Close the Topology Filter - *topology_view* form.

Procedure 5-22 To load and apply a saved filter to a topology map

See Procedure 5-21 for information about creating a filter definition tree.

1 Open a map.

2 Click on the saved filter selector and choose a filter from the drop-down list.

The 5620 SAM applies the filter and the map view is refreshed to display only the map objects specified in the filter. The filter name is displayed in the saved filter selector.

Procedure 5-23 To auto-layout icons on a map

Caution — After you click on the Auto-Layout button and confirm the action, the existing map layout is overwritten and cannot be recovered.

1 Open a map.

2 Perform one of the following:

a Auto-layout all of the icons on the map.

i Click on the Auto-Layout Tool button and choose one of the following options:

- Circular - emphasizes ring and star topologies in networks. Objects are grouped according to the network structure and arranged in circles or radial tree structures.
- Smart Organic - emphasizes inherent data groupings and symmetries. This information helps with understanding the interconnections of complex structures.
- Endpoint Layout (VPLS, VLL, mirror, and composite service sites only) - all endpoints are snapped close to the associated parent site.

A dialog box appears.

ii Click on the Yes button.

b Auto-layout a group of icons on the map.

i Select multiple objects.

ii Right-click on an object in the group, choose Layout Selected, and choose one of the following options from the contextual menu:

- Circular
- Smart Organic
- Endpoint Layout (VPLS, VLL, mirror, and composite service sites only)

A dialog box appears.

iii Click on the Yes button.

The map layout changes so that icons with links between them are closer together, and icons without links between them are moved to the periphery.

Procedure 5-24 To search for a specific network object

1 Open a map.

2 Perform one of the following:

a To search for a network object by typing the name, or part of the name of the network object:

i Click on the Find button in the map toolbar.

ii Choose Find Vertex or Find Link. The Find *object* form opens.

iii Configure the filter criteria and click on the Search button. A list of objects is displayed.

Note — The search function is case sensitive.

iv Select an object in the list.

b To search for a network object by pasting the name of the network object from the clipboard:

i Click on the network object that you want to locate from the equipment view of the navigation tree or from a generated or displayed list.

ii Click on the Copy to Clipboard icon to copy the network object name to the clipboard.

iii Click on the Find button.

iv Choose Find Vertex or Find Link. The Find Object form opens.

v Click on the Paste button. The network object that you copied to the clipboard is displayed in the Find object with label containing text field.

Note — Only the first item listed on the clipboard is pasted in the Find object with label containing text field of the Find Object form.

c Use the Quick-search field on the map window. Perform the following steps.

i Type part or all of the object name in the Quick-search field beside the toolbar icons.

ii Press ↵. The map shifts to display the first object that matches the search criterion.

iii Press F3 to shift the map focus to the next matching object, if the search finds multiple matches.

iv Press CTRL-F3 to shift the map focus to the previous matching object, if the search finds multiple matches.

v Go to step 5.

3 Click on the OK button.

a If a match is found, the map panel displays the topology group that contains the object and the map navigation tree expands to display the group. If necessary, the map panel scrolls to the portion of the map where the object is displayed.

b If multiple matches are found, the Find Object form opens with a drop-down list of all of the search results. Go to step 4.

4 Select a network object and click on the OK button. The map panel displays the topology group that contains the object and the map navigation tree expands to display the group. If necessary, the map panel scrolls to the portion of the map where the object is displayed.

5 Manage the object, as required.

Procedure 5-25 To create a bookmark

See section 5.1 for more information about the bookmark function.

1 Open a map.

2 Locate the topology group that you want to bookmark.

> **Note —** Bookmarks are associated with a map view. To use the bookmark after it is created, you must be in the same view where you created the bookmark or a view that shares the same group, for example, a topology group that belongs to both the physical topology map and the service tunnel map.

3 Click on the Bookmarks button and choose Add Bookmark. A bookmark for the currently displayed topology group is created.

Procedure 5-26 To manage bookmarks

See section 5.1 for more information about the bookmark function.

1 Open a map, as described in Procedures 5-1 to 5-6.

> **Note —** Bookmarks are associated with a map view. To use the bookmark after it is created, you must be in the same view where you created the bookmark or a view that shares the same group, for example, a topology group that belongs to both the physical topology map and the service tunnel map.
>
> Bookmarks that were not created in the map view currently displayed, or that are invalid, are disabled and cannot be selected. In the Manage Bookmarks form, these bookmarks appear in italics.

2 Click on the Bookmarks button and choose Manage Bookmarks. The Manage Bookmarks form opens.

3 Perform one of the following:

- **a** Create a top-level folder to manage the bookmarks.
  - **i** Click on the New Folder button. The Folder Properties form opens.
  - **ii** Enter the name of the new folder in the Name field and click on the OK button. A new top-level folder is added to the list panel.
- **b** Create a folder in an existing folder.
  - **i** Select an existing folder in the list panel and click on the New Folder button. The Folder Properties form opens.
  - **ii** Enter the name of the new folder in the Name field and click on the OK button. A new folder is added to the list panel inside the existing folder.

c Organize your bookmarks and folders. Drag and drop bookmarks and folders in and out of other folders in the list panel.

d Rename a bookmark or folder.

i Select an existing bookmark or folder in the list panel and click on the Rename button. The Rename form opens with the existing name in the Name field.

ii Change the text in the Name field and click on the OK button. The name of the bookmark or folder is modified.

e Delete a bookmark or folder.

i Select a bookmark or folder that you want to delete in the list panel.

ii Click on the Delete button. The selected bookmark or folder is removed from the list panel and the bookmark drop-down menu on the map toolbar.

4 Click on the Close button to close the Manage Bookmarks form and save the changes.

Procedure 5-27 To change the map background image

To view the map background image examples provided by the 5620 SAM, navigate to the background directory in the 5620 SAM client Installation directory, for example, /nms/images/map/background.

When adding your own map image to the directory, ensure that the file type is GIF and that the size is a maximum of 2000 × 2000 pixels.

The default background image is defaultBackgroundImage.gif.

1 Open a map, as described in Procedures 5-1 to 5-6.

2 In the map navigation tree, right-click on the topology group for which you want to change the map background image and choose Properties from the contextual menu. The Group - Network (Edit) form opens.

3 Modify the Background Image parameter to specify a new map image file, for example, n_america.gif.

4 Click on the OK button. A dialog box appears.

5 Click on the Yes button to proceed. The background image for the topology group changes to the selected image.

5.7 5620 SAM map management procedures

Use the following procedures to perform map management tasks.

Procedure 5-28 To use OAM diagnostic functions on a service topology map

Perform this procedure to enable the OAM diagnostic functions on a service topology map and use the basic OAM controls in the map window. See the other procedures in this chapter for information about using specific elements such as the toolbar buttons and info tables.

1 Create a service topology map by selecting the service in the Manage Services form and clicking on the Topology View button.

2 Select the OAM check box at the bottom left of the map window.

3 To manage one or more objects, select the objects and right-click on the set of objects to choose an option from the contextual menu.

4 To select a MEG to display, choose the MEG using the drop-down list of available MEGs at the bottom of the map window.

5 To view the properties of the selected MEG, click on the MEG Properties button at the bottom of the window. The Global Maintenance Entity Group (Edit) form opens with the General tab displayed. The service displayed on the map is listed on the Service tab.

6 To resynchronize the MIPs in the selected MEG, click on the Resync MIPs button at the bottom of the window.

7 Use the other procedures in this chapter to refine the map contents or display object properties, as required.

8 Use the right-click contextual menu options to configure and manage OAM objects, as required. See “Managing OAM diagnostics from the topology view” in section 5.1 for a functional description of the available contextual menu options for OAM diagnostics.

Procedure 5-29 To create a topology group

Note — A topology group can contain a maximum of 500 NEs.

1 Open the Group (Create) form using one of the following methods.

a Choose Create→Equipment→Group from the 5620 SAM main menu.

b Right-click on the Network icon in the equipment view of the navigation tree and choose Equipment→Create Group from the contextual menu.

2 Configure the parameters:

- Name
- Description
- Background Image

3 Click on the Apply button.

4 Click on the Spans tab button.

5 Click on the Add button. The Select Span(s) - Equipment Group form opens with a list of available spans.

6 Select one or more spans to apply to the topology group.

7 Click on the OK button. The Select Span(s) - Equipment Group form closes and a dialog box appears.

8 Click on the OK button to confirm the action.

After the topology group is created, an object for the topology group is displayed in the equipment navigation tree, and on the appropriate topology maps.

Procedure 5-30 To populate a topology group

Note — A topology group can contain a maximum of 500 NEs.

1 Choose Application→Physical Topology, or Service Tunnel Topology from the 5620 SAM main menu. The appropriate map window opens.

2 Populate topology groups, as required,

a Click on a map object in the map panel, for example, a router or router group, and drag the object onto the topology group object to which you want the map object to belong in the:

- map panel
- map navigation tree

The map object becomes a descendant object of the topology group.

b Click on a topology group object in the map navigation tree and drag the object onto another group object in the map navigation tree to which you want the group object to belong. The topology group object becomes a descendant object of another group object.

Procedure 5-31 To modify a topology group and create topology groups with the same parameter settings

1. Right-click on the topology group object on the map for which you want to modify the parameters and choose Properties from the contextual menu. The Group (Edit) form opens.
2. Modify the parameters as required.
3. Click on the Apply button. A dialog box appears.
4. Click on the Yes button to save the changes.
5. If required, click on the Copy button to create more topology groups based on the same parameter information. A Group (Create) form opens with the existing parameter information.
6. Edit the parameter information as required.
7. Click on the OK button. The Group (Create) form closes.
8. Close the Group (Edit) form.

   Any changes to the properties of a topology group appear immediately on the equipment navigation tree and the appropriate topology maps.

Procedure 5-32 To delete a topology group

When you delete a topology group object, the topology group cannot contain any devices or descendant topology groups.

1. Choose Application→Physical Topology, or Service Tunnel Topology from the 5620 SAM main menu. The appropriate map window opens.
2. Drag and drop all devices and descendant topology groups from the topology group that you want to delete to another topology group or the root group, for example, the network.
3. Right-click on the topology group object that you want to delete on the map and choose Delete from the contextual menu. A dialog box appears.
4. Click on the Yes button to proceed. The topology group is deleted.

Procedure 5-33 To modify a service or composite service using the topology view

You can use the service or composite service topology view to add, modify, or navigate to service components. The service configuration form can also be accessed directly at any time from this view by right-clicking any component. This allows quick access to conduct more detailed component configuration.

1 Perform one of the following.

  a Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

  b Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure a search filter, if required, and click on the Search button. A list of services or composite services is displayed.

3 Perform one of the following.

  a Select a service and click on the Topology View button. The Service Topology map opens.

  b Select a composite service and click on the Flat Topology View button. The Composite Service Flat Topology View map opens.

4 Right-click on the map background, or on one or more selected service sites, to display a contextual menu of configuration options. When you choose an option, a configuration form opens.

5 See the appropriate service management chapter for information about modifying a specific service type.

Procedure 5-34 To create a physical link

The MDA type for both physical link endpoints must be the same. Only one physical link can be configured on a port.

Users with Device Mgmt privileges can create, modify, and delete physical links.

1 Open the Physical Link (Create) form using one of the following methods.

  a Choose Create→Equipment→Physical Link from the 5620 SAM main menu.

  b Right-click on the topology map background in the equipment view of the navigation tree and choose Equipment→Physical Link from the contextual menu.

2 Configure the parameters:

- Name
- Description
- Endpoint A Type
- Endpoint B Type
- Notes

3 Configure the parameters in the Endpoint A panel by performing one of the following.

a If you set the Endpoint A Type parameter in step 2 to Port, go to step 4.

b If you set the Endpoint A Type parameter in step 2 to Network Element, go to step 5.

c If you set the Endpoint A Type parameter in step 2 to LAG, go to step 6.

4 Configure the parameters in the Endpoint A - Port panel by performing one of the following steps.

a Use the Select Endpoint A - Port - Physical Link form to search for a port.

i Click on the Select button in the Endpoint A – Port panel to choose a managed endpoint for the physical link. The Select Endpoint A - Port - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of ports.

iii Select a port and click on the OK button. The Select Endpoint A - Port - Physical Link form closes and the port parameter information is displayed in the Endpoint A - Port panel of the Physical Link (Create) form.

b Choose a port from the equipment navigation tree.

i Select a port object and click on the Copy to Clipboard button. The port information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint A - Port panel of the Physical Link (Create) form. The port parameter information is displayed in the Endpoint A - Port panel.

5 Configure the parameters in the Endpoint A - Network Element panel by performing one of the following steps.

- **a** Use the Select Endpoint A - Network Element - Physical Link form to search for a port.
  - **i** Click on the Select button in the Endpoint A panel to choose a managed endpoint for the physical link. The Select Endpoint A - Network Element - Physical Link form opens.
  - **ii** Use the configurable filter and click on the Search button to generate a list of NEs.
  - **iii** Select an NE and click on the OK button. The Select Endpoint A - Network Element - Physical Link form closes and the NE parameter information is displayed in the Endpoint A - Network Element panel of the Physical Link (Create) form.
- **b** Choose an NE from the equipment navigation tree:
  - **i** Select an NE and click on the Copy to Clipboard button. The NE information is copied to the clipboard.
  - **ii** Click on the Paste from Clipboard button in the Endpoint A - Network Element panel of the Physical Link (Create) form. The NE parameter information is displayed in the Endpoint A - Network Element panel.

6 Configure the parameters in the Endpoint A - LAG panel by performing one of the following steps.

- **a** Use the Select Endpoint A - LAG - Physical Link form to search for a port.
  - **i** Click on the Select button in the Endpoint A panel to choose a managed endpoint for the physical link. The Select Endpoint A - LAG - Physical Link form opens.
  - **ii** Use the configurable filter and click on the Search button to generate a list of NEs.
  - **iii** Select an NE and click on the OK button. The Select Endpoint A - LAG - Physical Link form closes and the NE parameter information is displayed in the Endpoint A - LAG panel of the Physical Link (Create) form.
- **b** Choose an NE from the equipment navigation tree:
  - **i** Select an NE and click on the Copy to Clipboard button. The NE information is copied to the clipboard.
  - **ii** Click on the Paste from Clipboard button in the Endpoint A - LAG panel of the Physical Link (Create) form. The NE parameter information is displayed in the Endpoint A - LAG panel.

7 Configure the parameters in the Endpoint B panel by performing one of the following.

a If you set the Endpoint B Type parameter in step 2 to Port, go to step 8.

b If you set the Endpoint B Type parameter in step 2 to Network Element, go to step 9.

c If you set the Endpoint B Type parameter in step 2 to Unmanaged NE, go to step 11.

d If you set the Endpoint B Type parameter in step 2 to LAG, go to step 12.

8 Configure the parameters in the Endpoint B - Port panel by performing one of the following.

a Use the Select Endpoint B - Port - Physical Link form to search for a port.

i Click on the Select button in the Endpoint B panel to choose a managed endpoint for the physical link. The Select Endpoint B - Port - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of ports.

iii Select a port and click on the OK button. The Select Endpoint B - Port - Physical Link form closes and the port parameter information is displayed in the Endpoint B - Port panel of the Physical Link (Create) form.

b Choose a port from the equipment navigation tree.

i Select a port object and click on the Copy to Clipboard button. The port information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint B - Port panel of the Physical Link (Create) form. The port parameter information is displayed in the Endpoint B - Port panel.

9 Configure the parameters in the Endpoint B - Network Element panel by performing one of the following.

a Use the Select Endpoint B - Network Element - Physical Link form to search for a port.

i Click on the Select button to choose a managed endpoint for the physical link. The Select Endpoint B - Network Element - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of NEs.

iii Select an NE and click on the OK button. The Select Endpoint B - Network Element - Physical Link form closes and the NE parameter information is displayed in the Endpoint B - Network Element panel of the Physical Link (Create) form.

b Choose an NE from the equipment navigation tree:

i Select an NE and click on the Copy to Clipboard button. The NE information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint B - Network Element panel of the Physical Link (Create) form. The NE parameter information is displayed in the Endpoint B - Network Element panel.

10 If the Endpoint B is an unmanaged NE that the 5620 SAM recognizes as an unmanaged mobile NE such as an eNodeB, go to step 14.

11 Configure the parameters in the Endpoint B - Unmanaged NE panel:

- Unmanaged - Name
- Unmanaged - Management Address
- Unmanaged - Description

Note — If the 5620 SAM is to manage endpoint B, configure the Unmanaged - Name parameter with the management IP address of the unmanaged NE.

When the 5620 SAM discovers the NE, the unmanaged endpoint of the physical link is updated with the newly managed NE on the topology map.

12 Configure the parameters in the Endpoint B - LAG panel by performing one of the following.

a Use the Select Endpoint B - LAG - Physical Link form to search for a port.

i Click on the Select button in the Endpoint B panel to choose a managed endpoint for the physical link. The Select Endpoint B - LAG - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of ports.

iii Select a port and click on the OK button. The Select Endpoint B - LAG - Physical Link form closes and the port parameter information is displayed in the Endpoint B - LAG panel of the Physical Link (Create) form.

b Choose a port from the equipment navigation tree.

i Select a port object and click on the Copy to Clipboard button. The port information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint B - LAG panel of the Physical Link (Create) form. The port parameter information is displayed in the Endpoint B - Port panel.

13 Go to step 17.

14 Click on the Select button in the Endpoint B - Unmanaged NE (LTE) panel to choose an unmanaged mobile NE such as an eNodeB. The Select Unmanaged NE - Physical Link form opens.

15 Use the configurable filter and click on the Search button to generate a list of unmanaged mobile NEs for example, eNodeBs.

16 Select an unmanaged mobile NE and click on the OK button. The Select Unmanaged NE - Physical Link form closes and the NE information is displayed in the Endpoint B - Unmanaged NE (LTE) panel of the Physical Link (Create) form.

17 Click on the OK button to close the form. The physical link is created between the two endpoints and can be viewed from the physical topology map.

Procedure 5-35 To modify a physical link and create physical links with the same parameter settings

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Physical Link from the object drop-down list.

3 Configure the filter criteria and click on the Search button.

4 Select a physical link in the list and click on the Properties button. The Physical Link (Edit) form opens.

5 Modify the parameters as required.

6 Click on the Apply button to save the changes.

7 If required, click on the More Actions button and choose Copy to create more physical links based on the same parameter information. A Physical Link (Create) form opens with the existing parameter information.

8 Edit the parameter information as required.

9 Click on the OK button. The Physical Link (Create) form closes.

10 Close the Physical Link (Edit) form.

After a physical link is created, you can view the link on the physical topology map.

Procedure 5-36 To delete a physical link

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Physical Link from the object drop-down list.

3 Configure the filter criteria and click on the Search button.

4 Select a physical link in the list and click on the Delete button. A dialog box appears.

5 Click on the Yes button to proceed. The physical link is deleted.

Note — When a NE is unmanaged or removed, all the physical links that terminate on the ports or on the NE itself are deleted.

Procedure 5-37 To configure bandwidth availability on physical links

Use this procedure to configure bandwidth parameters on links being used by service CAC.

Note — This capability is only available if service CAC has been configured. See chapter 6 for information about enabling and disabling service CAC.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Perform one of the following.

  a Choose Discovered Physical Link from the object drop-down menu.

  b Choose Physical Link from the object drop-down menu.

3 Configure the filter criteria and click on the Search button.

4 Select a physical link in the list and click on the Properties button. The Physical Link (Edit) form opens.

5 Click on the Bandwidth tab button.

6 Select the Endpoint A or the Endpoint B tab.

7 Configure the following endpoint bandwidth parameters:

- Bandwidth (%)
- Used Bandwidth (Mbps)
- Utilization Threshold (%)

8 Configure the following effective bandwidth parameters:

- Name
- Bandwidth (Mbps)
- Booking Factor (%)
- Utilization Threshold (%)
- Used Bandwidth (Mbps)

9 To view a summary of bandwidth usage for all tunnels and services currently using the physical link, click on the Bandwidth Usage tab button.

10 Click on the OK button. The Physical Link (Edit) form closes.

11 Close the Manage Equipment form.

Procedure 5-38 To view and modify discovered physical link properties

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Discovered Physical Link from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button.

4 Select a discovered physical link in the list and click on the Properties button. The Discovered Physical Link (Edit) form opens with the General tab displayed.

5 Configure the following parameters, if required:

- Name
- Description

6 Perform one of the following to configure the link reference information, if required.

a Click on the More Actions button and choose Reference Discovered Links. The parameters in the Reference panel are populated with reference information.

b Click on the More Actions button and choose Clear Reference. The parameters in the Reference panel are reset.

7 Select the appropriate tab to view other information, as required..

8 Click on the OK button. The Discovered Physical Link (Edit) form closes.

9 Close the Manage Equipment form.

Procedure 5-39 To switch between a backup/standby link to an inservice link

1 In the Physical topology map, click on the Protected link between two nodes which is indicated in blue.

2 Right-click on the blue link and select Expand Group, the links are expanded into the Backup/Standby link which is represented in blue and the In Service link which is represented in green.

3 To switch between the links and make the Standby/Backup node In Service and vice versa, click on the relevant Port/Card and right-click and select Properties, the Physical Port (Edit) form opens.

4 Click on the Protection tab button and from the Equipment Protection Scheme Parameter and the Receiver Protection Scheme Parameter, select the Commands option. See Procedures 19-19 and 20-31 for more information on how to set the forced and lockout parameter from the commands option.

5 Click on the Apply button, a dialog box is displayed, confirm the change by selecting Yes.

6 Click on the Cancel button. The Physical Port (Edit) form closes.

5620 SAM system management

6 — 5620 SAM component configuration

6.1 5620 SAM component configuration overview

A 5620 SAM system may occasionally require a configuration change. The procedures in this chapter describe how to perform operations such as the following on the components in a 5620 SAM system:

- changing a component IP address or hostname
- adding a 5620 SAM database, server, or client
- updating a license key to accommodate new software modules or equipment
- changing the configuration of all 5620 SAM GUI clients
- implementing secure communication in a 5620 SAM cluster

Note 1 — You can also change the configuration of a 5620 SAM component such as a database, server, or client using the 5620 SAM installation software, as described in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*.

Note 2 — This chapter does not describe how to configure SSL on a 5620 SAM component. See chapter 10 for information about configuring 5620 SAM SSL.

You can use the 5620 SAM auto-client update function to reconfigure multiple 5620 SAM clients. See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for information about using auto-client update to perform a client update. See Procedure 6-9 for information about performing global auto-client updates.

6.2 Software configuration procedures

The following procedures describe how to view and change the general 5620 SAM software configuration.

Procedure 6-1 To view the 5620 SAM software release and license key information

Perform this procedure to display information about the installed 5620 SAM software release and license capacity.

1 Perform one of the following.

a View the software release information; perform the following steps.

i Choose Help→About 5620 SAM from the 5620 SAM main menu. The About the 5620 SAM Client Application form opens.

ii Review the software release information. The build information specifies the release of the 5620 SAM software installed, for example, Release 8.0 R1, where 8.0 is the major release identifier, and R1 is the minor release identifier.

b View the 5620 SAM license information; perform the following steps.

i Choose Help→5620 SAM License Information from the 5620 SAM main menu. The 5620 SAM License (Edit) form opens with the General tab displayed.

ii Review the software license information, which includes the following:

- active license key value
- hostname and IP address of the main server
- number of supported operator positions
- status of the primary and standby servers
- supported 5620 SAM modules and packages
- redundancy configuration information for redundant deployments

iii Click on the Devices and Quantities Licensed tab button.

iv Review the software license information, which includes the following:

- device information that includes the following:
  - quantity licensed
  - quantity consumed
  - quantity remaining
- card and daughter card information that includes the following:
  - quantity licensed
  - quantity consumed
  - quantity remaining

Note — A highlighted entry is alarmed. You can double-click on an alarmed entry to view the alarm details.

2 Close the open forms.

Procedure 6-2 To export license information to a file

You can export the license information as text to a file storage location. This text file can be sent to Alcatel-Lucent to provide information about your system.

1 Choose Help→5620 SAM License Information from the 5620 SAM main menu. The 5620 SAM License (Edit) form opens.

2 Click on the Export License information to file button. A Save as form opens.

3 Use the form to specify a name, location, and format for the file that contains the exported license information.

Note — License key files can be saved in HTML or text format.

4 Click on the Save button. The license key file is saved to the specified location.

5 Close the 5620 SAM License (Edit) form.

Procedure 6-3 To verify that the required 5620 SAM software modules are installed

The 5620 SAM functions are provided by the following modules that are enabled or disabled using the 5620 SAM license key:

- 5620 SAM-A—for OAM tools, service assurance functions, fault correlation using alarms, topology views, and statistics management
- 5620 SAM-E—for device mediation, equipment navigation and management, security, CLI access, backup and restore, alarm management, real-time equipment statistics, and inventory and reporting
- 5620 SAM-O—for the 3GPP and XML open interfaces
- 5620 SAM-P—for service provisioning, templates, and management of network customers, subscribers, tunnels, paths, and policies
- Mobile Services Package—for LTE functions

Note — The 5620 SAM-E module is enabled By default. You cannot install and run other modules without installing the 5620 SAM-E.

If a module or package is not installed, you cannot use the client GUI to perform the functions associated with the module or package.

1 Choose Help→5620 SAM License Information from the 5620 SAM main menu. The 5620 SAM License (Edit) form opens with the General tab displayed.

2 View the options in the 5620 SAM Modules and Packages Licensed panel. If a module or package is not selected, it is not enabled in the license key.

3 Verify that the required software modules are installed.

If you cannot perform a function using the client GUI and you have sufficient user privileges on a managed device, you can use a CLI on the device to perform the function.

4 View the other license key information, as required.

5 Close the 5620 SAM License (Edit) form.

Procedure 6-4 To change the license key in a standalone 5620 SAM system

Perform this procedure to update the 5620 SAM license information for a standalone 5620 SAM system.

A 5620 SAM license key is generated based on multiple parameters such as the platform type, the software release, and the required number of GUI clients and managed MDAs. When a license key parameter changes, a new license key is required.

Note — CLI scripts that are configured to run on OmniSwitch devices fail if the CLI prompt contains the following characters: ~ ! @ $ % &

1 Log in to the main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag:

```
<license
```

This section of the file contains the 5620 SAM license information that is configured in the following steps.

6 Replace the existing license key value between the quotation marks in the following line with the updated license key value in the following format:

```
key="XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXX
```

XX-XXXXX-XXXXX-XXXXX"

7 Save and close the nms-server.xml file.

8 Open a console window.

9 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

10 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and the functions defined in the updated license key are enabled.

11 Enter the following at the prompt:

```
bash$ ./nmsserver.bash nms_status ↵
```

The main server displays status information.

12 Review the information in the 5620 SAM License Information section of the command output to ensure that it is correct.

13 If one or more license parameters are incorrect, contact Alcatel-Lucent technical support for assistance.

Procedure 6-5 To change the license key in a redundant 5620 SAM system

Perform this procedure to update the 5620 SAM license information for a redundant 5620 SAM system.

A 5620 SAM license key is generated based on multiple parameters such as the platform type, the software release, and the required number of GUI clients and managed MDAs. When a license key parameter changes, a new license key is required.

In a redundant 5620 SAM system, the primary and standby main server license key parameters must be identical, except for the primary and standby main server station host IDs.

Caution — The primary and standby main server license keys must be synchronized to ensure proper 5620 SAM operation in the event of a main server activity switch. The main servers compare license key values when they establish communication or when one main server is performing a read_config operation using the nmsserver.bash script. If a difference in the keys is detected, the 5620 SAM raises an alarm that clears when the license keys are again synchronized.

Note — CLI scripts that are configured to run on OmniSwitch devices fail if the CLI prompt contains the following characters: ~ ! @ $ % &

Change license key on primary main server

1 Log in to the primary main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag:

```
<license
```

This section of the file contains the 5620 SAM license information that is configured in the following steps.

6 Replace the existing license key value between the quotation marks in the following line with the updated license key value in the following format:

```
key="XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXX
XX-XXXXX-XXXXX-XXXXX"
```

7 Save and close the nms-server.xml file.

8 Open a console window.

9 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

10 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file, the license information is updated, and the additional functionality defined in the updated license key is enabled.

11 Enter the following at the prompt to verify the updated license information:

```
bash$ ./nmsserver.bash nms_status ↵
```

The main server displays status information.

12 Review the 5620 SAM License Information section of the command output to ensure that the license parameters are correct.

Note — The license information that is displayed is associated with the local main server.

13 Keep the console window open. It is used later in the procedure.

Change license key on standby main server

14 Log in to the standby main server station as the samadmin user.

15 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

16 Create a backup copy of the nms-server.xml file.

17 Open the nms-server.xml file using a plain-text editor.

18 Locate the following XML tag:

```
<license
```

This section of the file contains the 5620 SAM license information that is configured in the following steps.

19 Replace the existing license key value between the quotation marks in the following line with the updated license key value in the following format:

```
key="XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXX
XX-XXXXX-XXXXX-XXXXX"
```

20 Save and close the nms-server.xml file.

21 Open a console window.

22 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

23 Enter the following at the prompt:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts using the updated license information, and the additional functionality defined in the updated license key is enabled.

24 Enter the following at the prompt to verify the updated license information:

```
bash$ ./nmsserver.bash nms_status ↵
```

The main server displays status information.

25 Review the 5620 SAM License Information section of the command output to ensure that the license parameters are correct.

Note — The license information that is displayed is associated with the local main server.

26 Compare the standby main server license information to the active main server information displayed in step 12 to ensure that it is the same.

27 If the active and standby license parameters do not match, contact Alcatel-Lucent technical support for assistance.

Procedure 6-6 To change the timed license expiry notice period

The 5620 SAM raises a daily warning alarm as the expiry date of the 5620 SAM license key approaches. By default, the first daily warning alarm will be raised seven days prior to the key expiry date. This value is configurable. Perform this procedure to change the number of days.

1 Log in to the main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag:

```
<license
```

```
timedLicenseExpiryCount="value"
```

where *value* is the number of days prior to timed license key expiry.

6 Save and close the nms-server.xml file.

7 Open a console window.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and the time period defined is updated.

Procedure 6-7 To configure the maximum number of 5620 SAM admin user sessions

Perform this procedure to configure the maximum number of 5620 SAM admin user sessions that can be active concurrenly.

1 Log in to the main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag:

```
<samsession
```

This section of the file contains the maximum number of admin sessions that can be configured.

max5620SAMAdminSessions="value"

where *value* is the max number of allowed admin user sessions.

6 Save and close the nms-server.xml file.

7 Open a console window.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and the number of sessions defined.

10 Log out of the main server.

11 Close the open console windows, as required.

Procedure 6-8 To enable 5670 RAM support

Perform this procedure to enable the 5670 RAM functions on a 5620 SAM system. You require samadmin user privileges to perform this procedure.

1 If the 5620 SAM is deployed in a standalone configuration, go to step 5.

2 Perform steps 5 to 15 on the primary main server.

3 Perform steps 5 to 15 on the standby main server.

4 Go to step 16.

5 Log in to the main server station as the samadmin user.

6 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

7 Create a backup copy of the nms-server.xml file.

8 Open the nms-server.xml file using a plain-text editor.

9 Locate the following section:

```
<ram5670
        ramEnabled="false" />
```

10 Change “false” to “true”.

11 Save and close the nms-server.xml file.

12 Open a console window.

13 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

14 Perform one of the following:

a If you are configuring a standalone main server, or the primary main server in a redundant deployment, enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and puts the configuration change into effect.

b If you are configuring the standby main server in a redundant deployment, enter the following at the prompt:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts and puts the configuration change into effect.

15 Log out of the main server.

16 Close the open console windows, as required.

6.3 System configuration procedures

The following procedures describe how to configure system parameters that define the connections between 5620 SAM components.

Procedure 6-9 To change the global 5620 SAM client configuration using the auto-client update utility

Perform this procedure to modify the base configuration of each 5620 SAM GUI client that connects to a specific 5620 SAM main server.

Note 1 — You can exclude a specific 5620 SAM client from a global configuration change by using a command-line option when you open the client GUI, as described in chapter 3.

Note 2 — Do not use this procedure to configure SSL for 5620 SAM clients. Use the appropriate SSL configuration procedures in chapter 10 to configure SSL.

Note 3 — CLI scripts that are configured to run on OmniSwitch devices fail if the CLI prompt contains the following characters: ~ ! @ $ % &

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Modify the appropriate client configuration file in the *install_dir*/nms/config/clientDeploy directory with the configuration change. For example, update the nms-client.xml file with a new client log location.

where *install_dir* is the server installation location, typically /opt/5620sam/server

3 Open a console window.

4 Enter the following at the prompt to enable an update notification for clients that connect to the server and to prepare the client configuration files for download.

bash$ ***install_dir*/bin/nmsdeploytool.bash deploy** ↵

where *install_dir* is the server installation location, typically /opt/5620sam/server

5 Perform one of the following on each 5620 SAM single-user GUI client station and client delegate server station.

Note — When you perform this step on a client delegate server, you affect each GUI client that connects through the client delegate server.

a Update the client configuration by restarting the client GUI. The client automatically backs up the current configuration and applies the configuration change.

Note — On a client delegate server station, you must start the client software as the root user or the configuration update fails.

A Solaris client stores the backup of the current configuration in the *install_dir*/nms/configBackup directory

where *install_dir* is the client installation location, typically /opt/5620sam/client

A Windows client stores the backup of the current configuration in the *install_dir*\nms\configBackup directory

where *install_dir* is the client installation location, typically C:\5620sam\client

b Preserve the current client configuration when the client GUI starts by specifying a startup option that disables the auto-client update function. See chapter 3 for information about 5620 SAM client startup options.

Note — Specifying a client startup option affects only the current GUI session. To ensure that the client configuration is not updated automatically during a subsequent session, you must open the session using the startup option that disables the auto-client update.

Procedure 6-10 To configure a client GUI login form to display multiple server options

Perform this procedure to enable the users of a specific 5620 SAM client GUI to choose the 5620 SAM main server to which they connect.

Note 1 — You cannot configure a client delegate server to display multiple server options on the client login form. If you require client connections to multiple 5620 SAM servers through a client delegate server, you must install one 5620 SAM client delegate software instance for each 5620 SAM server.

Note 2 — The 5620 SAM auto-client update function overrides the nms-client.xml configuration changes that are specified in this procedure. If the nms-client.xml file on a main server changes, it overwrites the local client copy the next time the client connects to the server, unless a client startup option is used to prevent it. For information about using client startup options, see chapter 3.

Alcatel-Lucent recommends that you use the 5620 SAM auto-client update function described in chapter 6 to modify the 5620 SAM client configuration.

1 Click on Application→Exit to close the 5620 SAM client GUI, if it is open. The client GUI closes.

2 Navigate to the client configuration directory, typically /opt/5620sam/client/nms/config on Solaris and C:\5620sam\client\nms\config on Windows.

3 Open the nms-client.xml file using a text editor.

4 Find the lines starting with <j2ee> and <systemMode>. By default, the IP address and port information of the standalone or redundant servers, as configured during installation, are displayed.

5 For each standalone main server or redundant main server pair you want displayed on the client GUI login form, perform the following:

i Copy the entire <j2ee> and <systemMode> sections of the file.

ii Paste the <j2ee> and <systemMode> sections after the previous section.

iii Modify the ejbServer IP address to the IP address or hostname of the server you want displayed during client GUI login.

iv Modify the nameOne (for standalone) or nameOne and nameTwo (for redundant) parameters to indicate the domain name and hostname of the server, for easier identification by operators. This name does not have to be the hostname of the server domain. In some cases, the name may be the same for the active and standby server in a redundant server domain. The name is not automatically derived from a host lookup.

Note — Common hostname restrictions apply to the nameOne and nameTwo fields. You cannot use the following special characters:

- !
- #
- $
- %
- &
- (
-)
- +

v Save the changes and close the file.

6 Log in to the client GUI. The new server options are displayed in the Server drop-down menu.

Procedure 6-11 To change the default GUI preference and table layout, script result, or log file location on a client delegate server

Perform this procedure to customize the default file location for one or more of the following on a 5620 SAM client delegate server:

- user-defined GUI preferences:
  - saved table layouts
  - preferences saved using Application→Save Workspace
- script result files
- client log files

1 Close each 5620 SAM client that connects to the main server through the client delegate server by choosing Application→Exit from the 5620 SAM main menu.

2 Log in to the client delegate server station as the samadmin user.

3 Open a console window.

4 Navigate to the client configuration directory, typically /opt/5620sam/client/nms/config.

5 To change the default saved GUI preferences and table layout file location:

i Open the nms-client.xml file using a plain-text editor.

ii Insert the following section directly above the </configuration> line at the end of the file:

```
<guiPreferences
        path="new_file_location"
    />
```

where *new_file_location* is the new default saved GUI table layout and GUI preferences file location

Note — The specified location can be an absolute file path or a file path relative to *install_dir*/nms, where *install_dir* is the client installation location, typically /opt/5620sam/client.

iii Save and close the nms-client.xml file. Subsequent 5620 SAM client sessions on the client delegate server save the GUI preferences and table layouts to files in the new location.

6 To change the default script result file location:

i Open the nms-client.xml file using a plain-text editor.

ii Insert the following section directly above the </configuration> line at the end of the file:

```
<cache
        directoryName="new_file_location"
    />
```

where *new_file_location* is the new default script result file location

Note — The specified location can be an absolute file path or a file path relative to *install_dir*/nms, where *install_dir* is the client installation location, typically /opt/5620sam/client.

iii Save and close the nms-client.xml file. Subsequent 5620 SAM client sessions on the client delegate server save the script results to files in the new location.

Procedure 6-12 To change the IP address or hostname of a 5620 SAM server or database

Perform this procedure to change the IP address or hostname of one or more main server, auxiliary server, or database components in a standalone or redundant 5620 SAM system. This may be required, for example, when the management network topology changes.

Caution — Changing an IP address or hostname in a 5620 SAM system is a complex operation that requires careful planning and organization, and depending on the type of change required, may involve a brief network management outage. Do not attempt to modify the network configuration of a 5620 SAM component without assistance from Alcatel-Lucent technical support.

1 Collect the following information:

- the current IP address or hostname of each main server, auxiliary server, and database in the 5620 SAM system
- the new IP addresses or hostnames that are to be assigned

2 Contact Alcatel-Lucent technical support to schedule a maintenance period for the network configuration change.

Procedure 6-13 To change the IP address of a 5620 SAM client delegate server

Perform this procedure when a client delegate server is assigned a new IP address.

1 Collect the following information:

- the current IP address or hostname of the client delegate server
- the new IP address or hostname of the client delegate server

2 Contact Alcatel-Lucent technical support to schedule a maintenance period for the network configuration change.

Procedure 6-14 To enable 5620 SAM database backup file synchronization

Perform this procedure to enable the main servers in a redundant 5620 SAM deployment to synchronize the database backup file sets. After a database backup, if database backup file synchronization is enabled, the 5620 SAM automatically copies the new database backup file set to the other database station.

Note 1 — This procedure applies only to redundant 5620 SAM deployments.

Note 2 — You must perform this procedure first on the standby main server station, and then on the primary main server station.

Note 3 — Before you perform this procedure, you must ensure that there is sufficient network bandwidth between the database stations for a database copy operation. See the *5620 SAM Planning Guide* for information about the bandwidth requirements of database backup file synchronization.

1 Log in to the main server station as the root user.

2 Place the 5620 SAM software DVD-ROM in a DVD-ROM drive.

3 Open a console window.

4 Perform one of the following to open the 5620 SAM server installer.

a On a SPARC station:

i Enter the following:

\# **cd Solaris** ↵

ii Enter the following:

\# **./ServerInstall_SAM_9_0_*revision*.bin** ↵

where
revision is the revision identifier, such as R1, R3, or another descriptor

b On an x86-based station:

i Enter the following:

\# **cd Solarisx86** ↵

ii Enter the following:

\# **./ServerInstall_x86_SAM_9_0_*revision*.bin** ↵

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

5 Click on the Next button.

6 Accept the terms of the license agreement in the “Software License Agreement” panel.

7 Click on the Next button.

8 Choose Main Server Configuration in the “Choose Installation Type” panel.

9 Click on the Next button.

10 Click on the Next button in each subsequent panel until the “Standby Database Configuration” panel is displayed.

11 Select the “Enable Database Backup File Synchronization” parameter.

12 Click on the Next button.

13 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

14 Click on the Done button to close the server configuration utility.

15 Enter the following to switch to the samadmin user:

```
# su - samadmin ↵
```

16 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

17 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The 5620 SAM main server reads the nms-server.xml file and puts the configuration changes into effect. The 5620 SAM automatically copies subsequent database backup file sets from the primary database station to the standby database station.

Procedure 6-15 To change the Statistics Browser default Past number of hours filter

Due to the large number of statistics that can be stored in the 5620 SAM database, filters should be used when performing statistic searches to limit the search results to the time period. By default, the Statistics Browser form applies a filter to limit the search results to the past one hour. The number of hours is configurable. Perform this procedure to configure the Past <number_of_hours> filter, found on the Browse Statistics form, to limit the number of statistics listed.

1 Choose Application→Exit to close the 5620 SAM client GUI, if it is open. The 5620 SAM client GUI closes.

2 Navigate to the client configuration directory, typically /opt/5620sam/client/nms/config on Solaris and C:\5620sam\client\nms\config on Windows.

3 Open the nms-client.xml file using a text editor.

4 Locate the XML tag:

```
<statistics
```

5 Edit the following line to read:

```
browserDefaultHour="value"
```

where *value* is the default number of hours for the Past <number_of_hours> filter.

6 Save the changes and close the file.

7 Launch a new 5620 SAM client and login. The new value is displayed on the Browse Statistics form.

Procedure 6-16 To change the Statistics tab default Past number of hours filter

Perform this procedure to configure the Past <number_of_hours> filter, found on the Statistics tab of the object form.

1 Choose Application→Exit to close the 5620 SAM client GUI, if it is open. The 5620 SAM client GUI closes.

2 Navigate to the client configuration directory, typically /opt/5620sam/client/nms/config on Solaris and C:\5620sam\client\nms\config on Windows.

3 Open the nms-client.xml file using a text editor.

4 Locate the XML tag:

```
<statistics
```

5 Edit the following line to read:

```
tabDefaultHour="value"
```

where *value* is the default number of hours for the Past <number_of_hours> filter.

6 Save the changes and close the file.

7 Launch a new 5620 SAM client and login. The new value is displayed on the Statistics tab of the object properties form.

6.4 Network management configuration procedures

The following procedures describe how to configure system-wide 5620 SAM functions related to the managed network.

Procedure 6-17 To change the system name of a managed device

Perform this procedure to change the system name of one of the following device types using a 5620 SAM utility:

- 7210 SAS-D 6F 4T
- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR

Caution — This procedure requires a restart of a 5620 SAM main server, which is service-affecting. To avoid service interruption in a redundant deployment, schedule the system name change to coincide with a maintenance window and perform this procedure on the 5620 SAM main server. System name changes are automatically propagated to the standby server.

Note 1 — The 5620 SAM main server utility lists other NE types, but does not support changing the system name for devices that are not listed above.

Note 2 — The change can be implemented using SNMPv2c or SNMPv3.

1 Stop the main server software. After this step, the 5620 SAM main server is not managing the network.

i Open a console window.

ii Log in as the samadmin user.

iii Navigate to the server binary directory. Enter the following at the prompt:

```
bash$ cd install_dir/nms/bin ↵
```

where *install_dir* is the server installation location, typically /opt/5620sam/server

iv Enter the following at the prompt:

```
bash$ ./nmsserver.bash stop ↵
```

v Enter the following at the prompt:

```
bash ./nmsserver.bash appserver_status ↵
```

vi The server application is stopped when the command in step 1 v returns the following text string:

```
Application Server is stopped
```

If the command returns anything other than the above text string, wait five minutes and repeat step 1 v. Do not proceed unless the console displays the above text.

2 Use a text editor to open the updateSysName.properties file in the current directory.

3 Follow the instructions in the file to update the SNMPv2c or SNMPv3 settings in the file, depending on the SNMP version that the device uses.

4 Save and close the updateSysName.properties file.

5 Enter the following at the prompt to initiate a system name change for the device.

bash$ **./updateSysName.bash** ↵

6 Enter the ID of the device that you want to update.

7 Enter the new system name.

8 Enter the following at the prompt to start the 5620 SAM main server:

bash$ **./nmsserver.bash start** ↵

The main server starts.

Procedure 6-18 To configure the 5620 SAM to save device configuration backups on a file system

Perform this procedure to configure the 5620 SAM to save device configuration backups as files in addition to saving them in the database. By default, the 5620 SAM saves device configuration backups only in the 5620 SAM database.

Note — The samadmin user requires read and write permissions to each directory specified in this procedure.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag, which marks the beginning of the section that you want to configure:

<*device_type*backup

where *device_type* is one of the following:
Ran—for RAN devices such as the eNodeB
AosSr—for OmniSwitch devices
MPRSr—for 9500 MPR devices
sr—for all other devices, such as the 7450 ESS, 7710 SR, and 7750 SR

The same *device_type* identifier is used in the following steps.

6 To enable the storage of device backups on the main server file system, configure the following parameter by inserting the storage location between the quotation marks:

device_type`BackupDirectory="`*location*`"`

where *location* is an absolute or relative file path

Note — A relative file path that you specify in this step is relative to the *installation_directory*/nms/bin directory on the 5620 SAM main server.

7 If required, configure the following parameters by changing the value between the quotation marks:

Note — The default value for each parameter is shown in this step.

`diskUsageThreshold="80"`

`maxNumberOfFiles="5000"`

`purgeDiskUsageThreshold="95"`

`saveLatestOnly="true"`

device_type`BackupSyncEnabled="false"`

device_type`BackupSyncInterval="30"`

The following are the parameter descriptions:

- diskUsageThreshold—The percentage of disk usage above which the 5620 SAM raises a major alarm. When the disk usage falls below this value, the alarm clears. The range is 0 to 95; the default is 80. A value of 0 means that the disk usage is not monitored.
- maxNumberOfFiles—The maximum number of backup files for this device type that are saved on the file system. When this value is exceeded, the 5620 SAM deletes the oldest backup files. The range is 0 to 100 000; the default is 5000. A value of 0 means that no limit is enforced.
- purgeDiskUsageThreshold—The percentage of disk usage above which the 5620 SAM deletes the oldest backup files and raises a major alarm. The files are deleted until the disk usage falls below the percentage specified by diskUsageThreshold. A value of 0 means that no file deletion occurs and, accordingly, no alarm is raised. The range is 0 to 95; the default is 95.
- saveLatestOnly—If set to true, specifies that only the latest device backup is saved. If set to false, specifies that device backups are saved according to the constraints specified by the diskUsageThreshold, maxNumberOfFiles, and purgeDiskUsageThreshold parameters.
- *device_type*BackupSyncEnabled—If set to true, specifies that the 5620 SAM synchronizes the backup files between the primary and standby main servers.
- *device_type*BackupSyncInterval—If *device_type*BackupSyncEnabled is set to true, specifies how often, in m, the 5620 SAM synchronizes the files.

8 To disable the storage of device backups on the main server file system, configure the following parameter by removing the storage location between the quotation marks, as shown in the following example:

```
device_typeBackupDirectory=""
```

9 Perform steps 5 to 8 to configure the storage of device backups for another device type, if required.

10 Save and close the nms-server.xml file.

11 Open a console window.

12 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

13 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The 5620 SAM main server reads the nms-server.xml file and puts the configuration changes into effect. Subsequent device configuration backups are saved to the path specified in the nms-server.xml file.

The 5620 SAM saves the device backup files in the following directory under the location specified in step 5:

`samNodeBackup/`*`device_ID`*`/`*`timestamp`*

where
device_ID is the unique identifier of a device
timestamp is the time when the backup is saved

Procedure 6-19 To configure automatic device configuration backup file removal

Perform this procedure to configure the 5620 SAM to automatically remove the configuration backup files for a device when the device is unmanaged.

Caution — This procedure requires a restart of the 5620 SAM server, which is service-affecting.

Note — This procedure configures the removal of backup files only; device configuration backups in the database are retained.

1 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

2 Create a backup copy of the nms-server.xml file.

3 Open the nms-server.xml file using a plain-text editor.

4 Search for the following XML tag:

```
</configuration>
```

5 Enter the following line above the </configuration> tag:

```
<nodeBackups removeBackupOnDelete="true"/>
```

6 Save and close the nms-server.xml file.

7 Open a console window.

8 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the console prompt to restart the 5620 SAM server:

```
bash$ ./nmsserver.bash force_restart ↵
```

Caution — Restarting a 5620 SAM server is service-affecting. Ensure that you perform this step only during a scheduled maintenance window.

10 The 5620 SAM main server restarts. The 5620 SAM deletes the configuration backup files of NEs that are subsequently unmanaged.

Procedure 6-20 To configure service CAC

Perform this procedure to configure the service CAC functionality to enable 5620 SAM to automatically bind PBB tunnels to services based on available bandwidth.

Note 1 — This feature has limited availability. Contact your Alcatel-Lucent technical support representative for more information about the availability of this feature.

Note 2 — You must perform this procedure on each main server in a 5620 SAM system.

1 Close each 5620 SAM client that connects to the main server through the client delegate server, by choosing Application→Exit from the 5620 SAM main menu.

2 Use an OS utility to change the IP address of the client delegate server station to the new value.

3 Log in to the main server station as the samadmin user.

4 Open a console window.

5 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

6 Open the nms-server.xml file using a plain-text editor.

7 Locate the following XML tag:

```
<require-CAC
```

The service CAC section should read as follows:

```
<require-CAC

        enabled="false"

        defaultBWThreshold="90"

        linkTunnelCacheMaxSize="1000"

        tunnelServiceCacheMaxSize="10000"
```

```
        serviceBWCacheMaxSize="50000"
    />
```

8 Change enabled="false" to enabled="true".

9 Save and close the nms-server.xml file.

10 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

11 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and enables the server CAC features on the client delegate server.

Procedure 6-21 To enable alarm reporting for duplicate NE system IP addresses

Perform this procedure to enable the 5620 SAM to verify the uniqueness of NE system IP addresses. When verification is enabled, the 5620 SAM raises an alarm when an NE reports a system IP address that is in use by another NE.

1 Log in to the main server station as the samadmin user.

2 Open a console window.

3 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following tag that marks the beginning of the SNMP section:

```
<snmp
```

6 Add the following before the end of the SNMP section, ensuring that there is a space between the last character and the section end, which is marked by a /> tag:

```
verifyNodeIdentity=”1"
```

7 Save and close the nms-server.xml file.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and alarm reporting for duplicate NE system IP addresses is enabled.

Procedure 6-22 To enable LSP on-demand resynchronization

Perform this procedure to modify the nms-server.xml file to enable LSP on-demand resynchronization. The 5620 SAM scheduled resynchronization is then disabled for some LSP objects. See chapter 32 for more information.

Caution — Modify only the parameters specified in this procedure. Unauthorized modification of the nms-server.xml file can seriously affect network management and 5620 SAM performance.

1 Log in to the main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following line:

```
<lspOnDemand overrideEnabled="false" />
```

6 Change "false" to "true".

7 Save and close the nms-server.xml file.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and LSP on-demand resynchronization is enabled.

Procedure 6-23 To enable debug configuration file reloading for mirror services

Perform this procedure to ensure that the managed NEs reload the debug configuration file after an NE restarts. This ensures that the mirror services in the managed network resume operation after a reboot or CPM activity switch on the NE that hosts the mirror service. By default, debug configuration file reloading is disabled.

Caution — This procedure requires a 5620 SAM main server restart, which is service-affecting.

1 Log in to the main server station as the samadmin user.

2 Open a console window.

3 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag:

```
<serviceMirror
```

6 Specify the NE location of the debug configuration file. For example:

```
<serviceMirror
debugFilename=""
reloadDelay="10"
/>
```

where
reloadDelay specifies the time, in seconds, to wait before a reload request is sent
debugFilename specifies the location of the file on an NE, for example, cf3:/ServiceMirror.dbg

Note — The debugFilename value must be the debug configuration filename that is configured on the NEs that host mirror services.

7 Save and close the nms-server.xml file.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt to restart the main server:

```
bash$ ./nmsserver.bash force_restart ↵
```

Caution — Restarting a 5620 SAM main server is service-affecting. Ensure that you perform this step only during a scheduled maintenance window.

The main server restarts.

10 If required, create a device backup policy to ensure that device configurations are not lost in the event of an NE failure. See chapter 23 for information about device backup policies.

Procedure 6-24 To create a default SNMPv2 OmniSwitch user on a 5620 SAM system

Perform this procedure to create a default SNMPv2 OmniSwitch user on a 5620 SAM system.

Caution — Modify only the parameters specified in this procedure. Unauthorized modification of the nms-server.xml file can seriously affect network management and 5620 SAM performance.

1 Log in to the main server station as the samadmin user.

2 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Locate the following XML tag:

```
<snmp
```

This section of the file contains the 5620 SAM SNMP information that is configured in the following steps.

6 Add the following before the end of the SNMP section, ensuring that there is a space between the last character and the section end, which is marked by a /> tag:

snmpV2UserName=”user_name”

where *user_name* is a user name that is configured on the switch

The SNMP section should read as follows:

```
<snmp
            ip="server_IP_address"
            port="port_number"
            trapLogId="log_ID"
            snmpV2UserName="user_name" />
```

7 Save and close the nms-server.xml file.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt:

bash$ **./nmsserver.bash read_config** ↵

The main server reads the nms-server.xml file and the new SNMPv2 user name is enabled.

7 — 5620 SAM system redundancy

7.1 5620 SAM system redundancy overview

You can deploy a 5620 SAM system in a redundant configuration to provide greater fault tolerance by ensuring that there is no single point of software failure in the 5620 SAM management network. A redundant 5620 SAM deployment consists of the following components:

- primary and standby 5620 SAM main servers
- primary and standby 5620 SAM databases

Note 1 — For conciseness, a primary 5620 SAM main server is sometimes called a primary server in this chapter.

Note 2 — For conciseness, a standby 5620 SAM main server is sometimes called a standby server in this chapter.

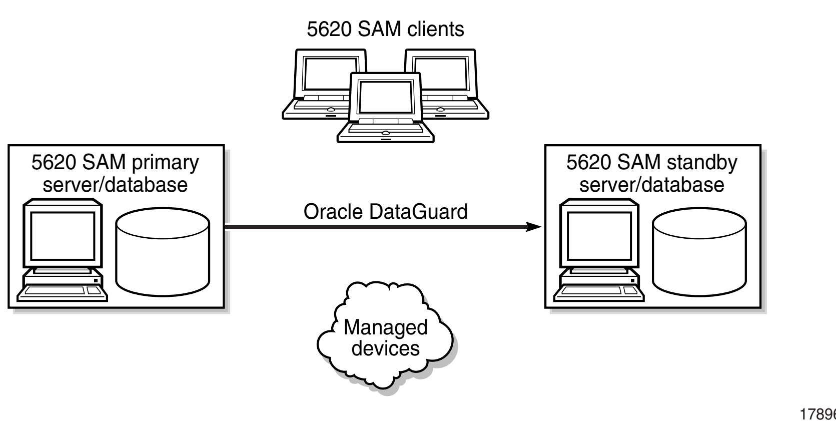
The current state of a component defines the primary or standby role of the component. The primary main server actively manages the network and the primary database is open in read/write mode. When a standby component detects a primary component failure, it automatically changes roles from standby to primary. You can also change the role of a component using the 5620 SAM client GUI or a CLI script.

The 5620 SAM supports collocated and distributed system redundancy. A collocated system requires two stations that each host a main server and database. A distributed system requires four stations that each host a main server or database. Each main server and database is logically independent, regardless of the deployment type.

Caution — For increased 5620 SAM system performance and fault tolerance, Alcatel-Lucent recommends that you deploy the primary server and database in the same geographical location and LAN.

Figure 7-1 shows a collocated redundant 5620 SAM system.

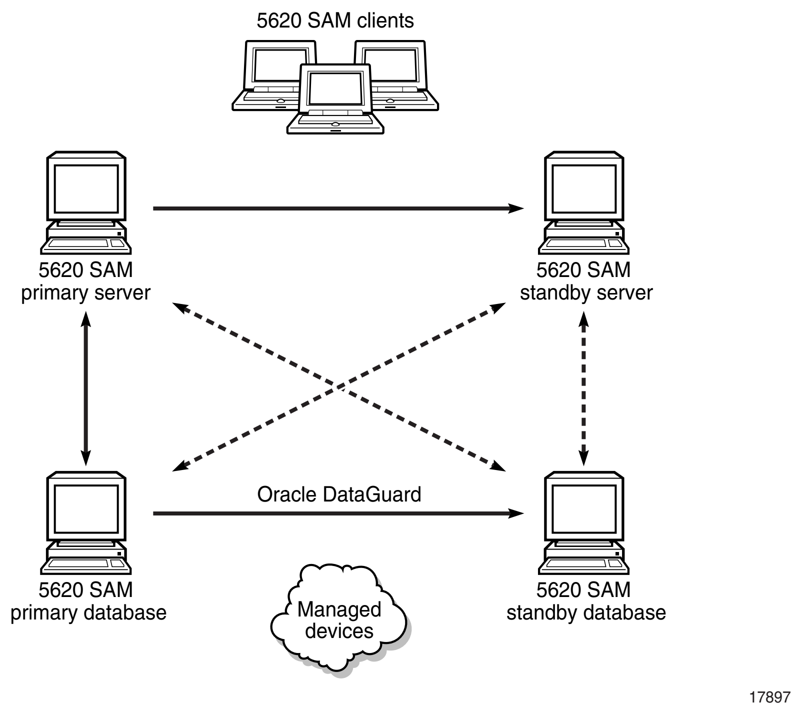
Figure 7-1 Collocated redundant 5620 SAM system



The primary and standby main servers can communicate with the redundant databases, and periodically verify server redundancy. If the standby server fails to reach the primary server within 60s, the standby server becomes the primary server. A 5620 SAM database uses the Oracle DataGuard function to maintain redundancy.

Figure 7-2 shows a distributed redundant 5620 SAM system.

Figure 7-2 Distributed redundant 5620 SAM system



In 5620 SAM redundancy server installation, the Oracle DataGuard synchronization level is set to real-time apply by default to keep the primary and secondary databases synchronized.

A main server role change is called a server activity switch. An automatic database role change is called a failover. A manual database role change is called a switchover.

A typical redundant 5620 SAM deployment has a primary server and database in a facility that is geographically separate from the standby server and database facility. To ensure that the primary components are in the same LAN after an activity switch or failover, you can configure automatic database realignment during 5620 SAM server installation. See “Automatic database realignment” for more information.

The 5620 SAM GUI clients always communicate with the current primary server. After a server activity switch, the GUI clients automatically connect to the new primary server, which is the former standby server. The 5620 SAM OSS clients also communicate with the current primary server, but after a server activity switch, the OSS clients do not automatically connect to the new primary server.

You can use the 5620 SAM GUI, or scripts on a 5620 SAM main server, to do the following:

- Check the redundant server and database status.
- Perform an activity switch from the primary to standby server.
- Reinstantiate the former primary database as the standby database.

5620 SAM system redundancy is configured during 5620 SAM component installation. See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for information about configuring 5620 SAM redundancy.

The following general conditions apply to 5620 SAM system redundancy:

- The main servers and databases must each be redundant. For example, you cannot have redundant servers and a standalone database.
- The network that contains a redundant 5620 SAM system must meet the latency and bandwidth requirements described in the *5620 SAM Planning Guide*.

  Note — To provide hardware fault tolerance in addition to software redundancy, Alcatel-Lucent recommends using redundant physical links between the primary and standby servers and databases to ensure there is no single point of network or hardware failure.

- The server and database stations require the same OS version and patch level.
- The primary and standby server stations must have identical disk layouts and partitioning.
- The primary and standby database stations must have identical disk layouts and partitioning.
- The following users can perform manual server activity switches or database switchovers:
  - the samadmin user on a main server station
  - a client GUI user that has update or execute access permissions on the db.DatabaseManager.switchover and db.DatabaseManager.reinstantiateStandby classes
  - a client GUI user that has the admin scope of command role

Auxiliary servers

5620 SAM auxiliary servers are optional servers that extend the network management processing engine by distributing server functionality, for example, statistics collection, among multiple stations in a 5620 SAM domain. Each auxiliary server is installed on a separate station in a 5620 SAM server cluster. An auxiliary server communicates only with the primary main server and database. Main and auxiliary servers can open sessions only on the primary database.

A 5620 SAM main server controls task scheduling and sends task requests to auxiliary servers. When a Preferred auxiliary server is unresponsive, the main server directs the requests to a Reserved auxiliary server. The Preferred or Reserved role of an auxiliary server is specified during 5620 SAM main server installation.

When an auxiliary server cannot connect to the primary main server or database, it re-initializes and continues trying to connect until it succeeds or, in the case of a database failover, until the main server directs it to the new database.

An auxiliary server does not cause, perform, or initiate redundancy activities such as failovers. However, an unused, or Reserved, auxiliary server may be called into service by the main server when another auxiliary server fails.

When an auxiliary server fails to respond to the primary main server, the main server tries repeatedly to establish communication before it raises an alarm. The alarm clears when the main server receives a response. 5620 SAM system performance may degrade when a main server loses contact with a number of auxiliary servers that exceeds the number of Preferred auxiliary servers in the 5620 SAM server cluster.

After startup, an auxiliary server waits for initialization information from a main server. An auxiliary server restarts if it does not receive all required initialization information within five minutes.

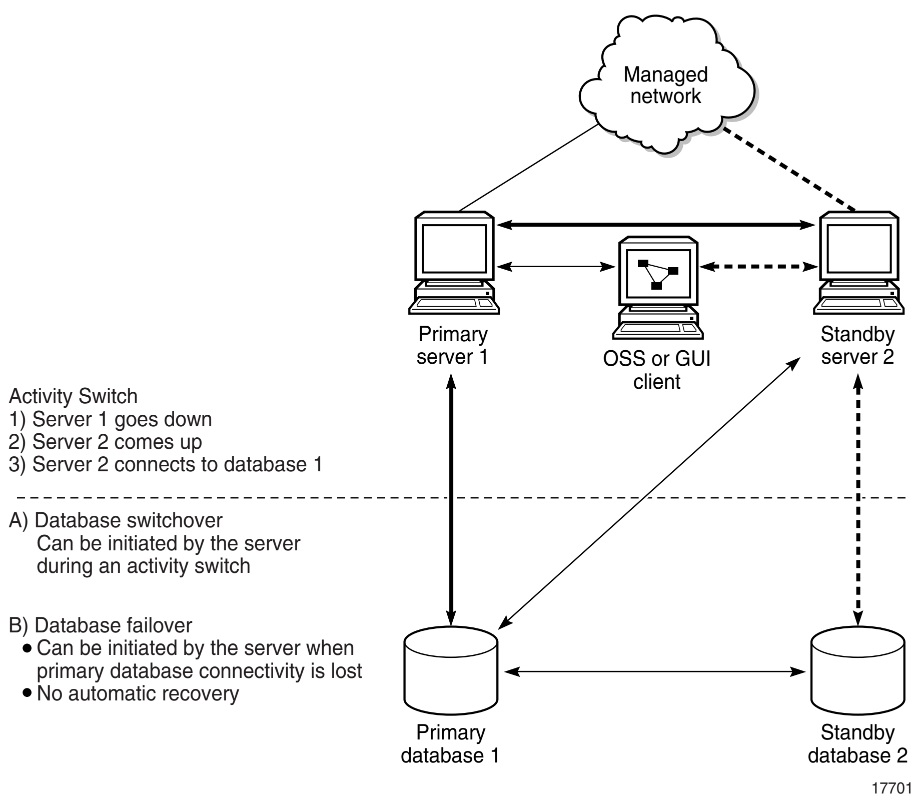
Note — Because an auxiliary server does not play an active role in 5620 SAM redundancy, the unqualified term "server" in this chapter refers to a 5620 SAM main server.

See the *5620 SAM System Architecture Guide* for more information about the interaction of 5620 SAM main and auxiliary servers.

Redundancy functions

Figure 7-3 shows the 5620 SAM system redundancy role-change events.

Figure 7-3 5620 SAM redundancy role-change events

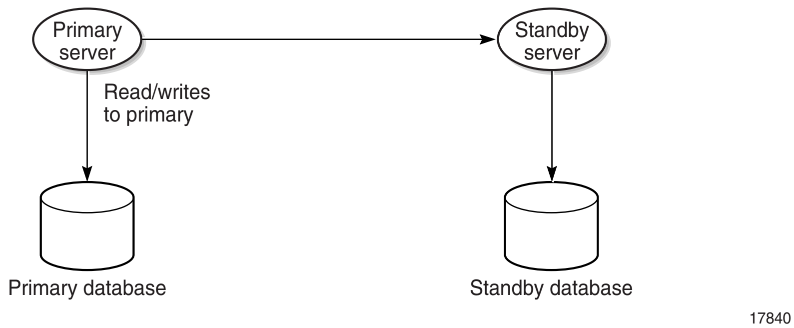


Server activity switches

The standby server initiates an automatic server activity switch when it cannot communicate with the primary server. A 5620 SAM administrator performs a manual server activity switch.

Figure 7-4 shows the server and database roles before an activity switch.

Figure 7-4 Server and database roles before server activity switch



A manual server activity switch is typically a planned server maintenance or testing operation. For security reasons, you cannot use a 5620 SAM GUI or OSS client to perform a server activity switch.

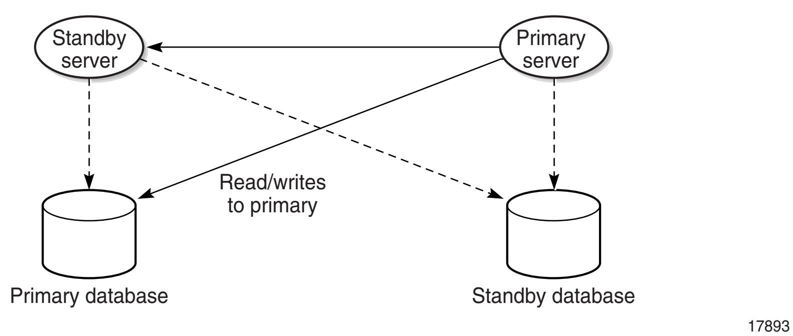
During a server activity switch, a main server does not process SNMP traps, attempt to synchronize NEs, or collect statistics. Auxiliary servers process outstanding requests during an activity switch, but do not communicate with a main server.

The following occurs during a server activity switch:

- The primary server raises alarms about the event.
- Each GUI client receives notification of the activity switch and displays a message about the server unavailability during the activity switch.

Figure 7-5 shows the server and database roles after a successful activity switch.

Figure 7-5 Server and database roles after server activity switch



The following occurs after a server activity switch:

- If automatic database realignment is enabled, the new primary server performs a database switchover.
- The GUI clients communicate with the new primary server and display the current redundancy status.
- The OSS clients must connect to the new primary server, as described in the *5620 SAM XML OSS Interface Developer Guide*.
- The new primary server establishes communication and synchronizes information with the 5620 SAM auxiliary servers.
- The auxiliary servers exchange information with the new primary server; no auxiliary servers exchange information with the former primary server.
- The Preferred or Reserved state of each auxiliary server changes, depending on the configuration of the new primary server.
- The new primary server attempts to redeploy the client requests that the former primary server did not complete before the activity switch.

The connected 5620 SAM GUI clients do not need to re-login if there is a failover or switchover of the server of database. During the failover or switchover, there may be inactivity for the connected clients, but when the new primary server and database are established, all connected user sessions will be seamlessly transferred to the new servers.

Database switchovers

A 5620 SAM administrator directs a main server to initiate a database switchover. Figure 7-6 shows the main server and database roles before a database switchover.

Figure 7-6 Server and database roles before database switchover

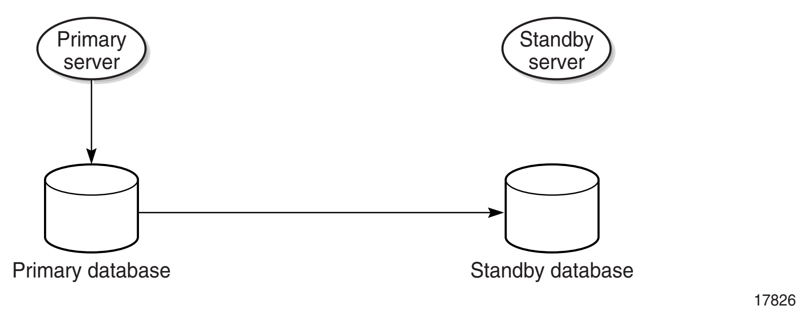


Figure 7-7 shows the server and database roles after a database switchover.

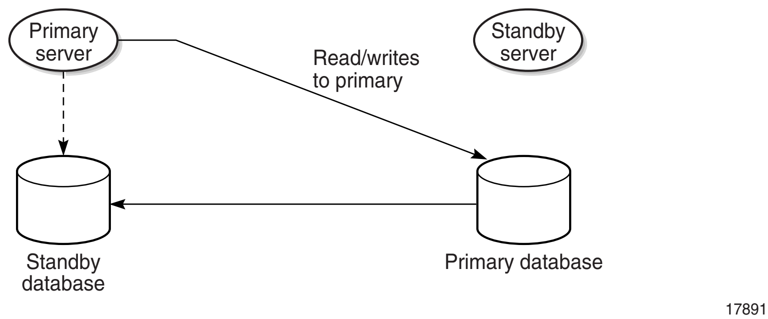
Figure 7-7 Server and database roles after database switchover



The following occurs after a successful database switchover:

- The primary server connects to the new primary database.
- Archive logging begins on the new primary database.
- The primary server directs each auxiliary server to use the new primary database.

When a database switchover fails, the primary and standby database roles do not change. No automatic database realignment occurs as a result of a switchover.

Database failovers

5620 SAM database failover functionality is enabled by default. A failover occurs when a main server cannot communicate with the primary database, but can communicate with the standby database and the managed NEs. When this happens, the main server directs the standby database to become the primary database.

A database failover occurs only under the following conditions.

- The standby database is configured, operational, and reachable.
- The main server can communicate with the managed NEs.

Figure 7-8 shows the server and database roles before a failover.

Figure 7-8 Server and database roles before database failover

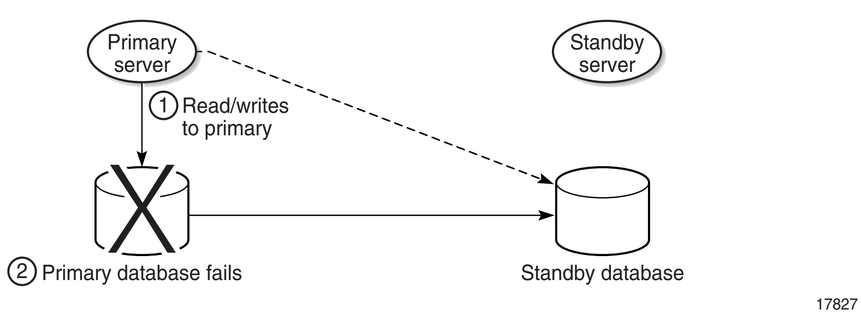


Figure 7-9 shows the server and database roles after a successful failover.

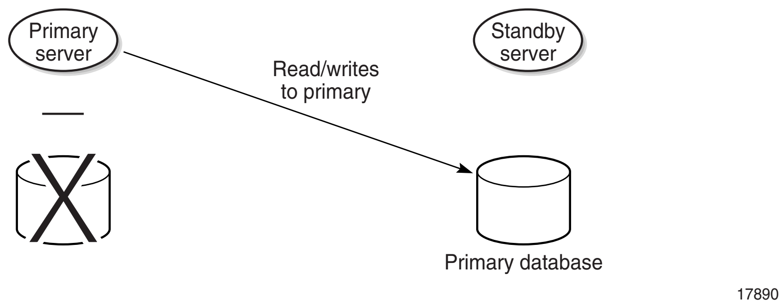
Figure 7-9 Server and database roles after database failover



Note — After a successful failover, database redundancy is not available. See "Re-establishing database redundancy" in this section for information about re-establishing database redundancy after a failover.

When a database failover fails, the primary server tries again to communicate with the primary database. If the primary database remains unavailable, the primary server tries again to initiate a failover.

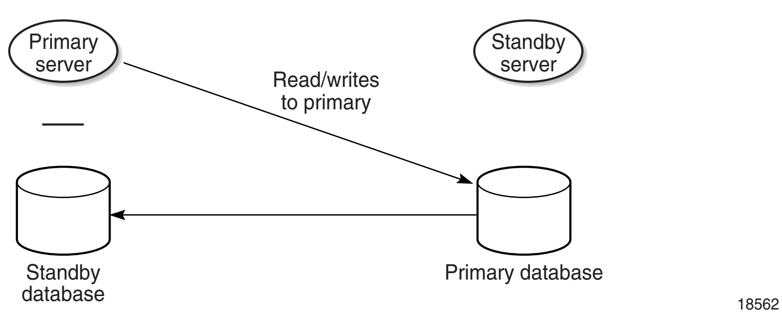
Re-establishing database redundancy

After a failover, the former primary database is no longer part of the redundant configuration. To re-establish database redundancy, you must reinstantiate the former primary database as the new standby database. You can do this only when the failed database station is restored to full operation and has a configured proxy port that is in service. See Procedures 7-6 and 7-7 for more information about manually reinstantiating a redundant database.

You can configure the 5620 SAM to automatically reinstantiate the former primary database as the new standby database. Automatic database reinstantiation occurs only in the event of a database failover. When the function is enabled, the 5620 SAM attempts an automatic reinstantiation every 60 minutes by default. You can enable automatic database reinstantiation during the 5620 SAM main server installation. See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for information about enabling and configuring automatic database reinstantiation.

Figure 7-10 shows a former primary database serving as the new standby database.

Figure 7-10 Server and database roles after database reinstantiation



Automatic database realignment

In a redundant 5620 SAM system that is geographically dispersed, the primary server and database may be in separate LANs or WANs after an activity switch or failover. The network latency that this introduces can affect 5620 SAM system performance. Automatic database realignment is an optional mechanism that attempts to ensure that each main server uses the local database.

The database with which a main server tries to align itself is called the preferred database of the main server. An operator enables automatic database realignment and specifies the preferred database during 5620 SAM server installation, or during server configuration after installation.

Note — For automatic database alignment to work, you must enable it and specify a preferred database on each main server in a redundant 5620 SAM system.

When a primary server starts, it verifies that the primary database is the preferred database. If the primary database is not the preferred database, the server performs a database switchover to reverse the primary and standby database roles. If the switchover is successful, the main servers and databases in the 5620 SAM system are aligned. If the switchover fails, each database reverts to the former role, and the main server raises an alarm about the failed switchover.

When you perform a database switchover and automatic database realignment is enabled, the primary server does not attempt database realignment. A switchover is a manual operation that is considered to be a purposeful act.

Performing a server activity switch when automatic database realignment is enabled triggers a database switchover.

Summary of redundancy operations

Table 7-1 summarizes the operations related to 5620 SAM main server redundancy.

Table 7-1 5620 SAM server redundancy operations

<table>
<tr><th>Type</th><th>Description</th><th>Notes</th></tr>
<tr><td>Server activity switch (automatic)</td><td>An automatic activity switch occurs when the primary server cannot communicate with the standby server.
An automatic server activity switch involves the following sequence of high-level events.
• The standby server cannot communicate with the primary server within 60 s, and the primary database cannot communicate with the primary server.
• The standby server performs an activity switch to become the new primary server. [(1)]
• If automatic database realignment is enabled, the new primary server attempts a database switchover.
• The new primary server establishes a connection to the primary database and begins to manage the network.
• The new primary server and the auxiliary servers synchronize the outstanding request information.</td><td rowspan="2">When the primary server detects a standby server communication failure, each GUI client receives notification of the failure.
During an activity switch, each client GUI displays a main server status message.
During an activity switch, a main server does not process SNMP traps from the network, and no NE resynchronizations occur. The auxiliary servers continue to process outstanding requests, and synchronize the request information with the new primary server after the activity switch.
When the communication failure is resolved, each GUI client receives notification that redundancy is restored.</td></tr>
<tr><td>Server activity switch (manual)</td><td>A manual activity switch is typically performed for maintenance or testing purposes during a scheduled maintenance period.
A manual server activity switch involves the following sequence of high-level events.
• The new primary server establishes a connection to the primary database and begins to manage the network.
• The new primary server and the auxiliary servers synchronize the outstanding request information.
• If automatic database realignment is enabled, the new primary server attempts a database switchover.
See Procedure 7-3 for information about performing a manual activity switch.</td></tr>
</table>

Note

(1) This activity switch is allowed only if the primary server does not retain control of the primary database.

Table 7-2 summarizes the operations related to 5620 SAM database redundancy.

Table 7-2 5620 SAM database redundancy operations

Type	Description	Notes
Database switchover	A database switchover is a manual operation that reverses the primary and standby database roles, for example, for primary database maintenance, or to realign database roles with database stations after a server activity switch. A switchover can occur only when the primary and standby databases are functioning correctly and can communicate with each other. A database switchover involves the following sequence of high-level events. • A 5620 SAM administrator initiates the switchover on a primary or standby server. • The main server asks each auxiliary server to release all database connections. The switchover fails if all database connections are not released within 15 minutes. • The main server directs the standby database to become the primary database. • The main server restarts to fully synchronize information with the new primary database. See Procedure 7-4 for information about performing a database switchover.	No automatic database realignment occurs after a database switchover.
Database failover	A database failover is an automatic reversal of the primary and standby database roles, for example, after a primary database failure. A database failover involves the following sequence of high-level events. • No main server can communicate with the primary database within a period that is 2 min by default. • The currently active main server directs the standby database to become the primary database. • If automatic database realignment is enabled and the primary server and database are not aligned, the primary server performs an activity switch. • The primary server directs each auxiliary server to connect to the new primary database.	When the primary server detects a communication failure with the primary or standby database, the GUI clients are informed that the database is not reachable. After the cause of the communication failure is resolved, the GUI clients are notified that the database is reachable. After a failover, you must reinstantiate the former primary database as the new standby database. Database redundancy is not restored until reinstantiation is complete. The 5620 SAM attempts to automatically reinstantiate the former primary database when automatic database reinstantiation is enabled.
Re-establishing database redundancy	Re-establishing database redundancy is a user action that uses database reinstantiation to restore the former primary database as the new standby database. After a failover, the former primary database is not available for redundancy until an operator or the 5620 SAM reinstantiates it as the new standby database. See Procedures 7-6 and 7-7 for information about re-establishing database redundancy after a failover.	The following conditions must be true before you can re-establish database redundancy. • The failover completes successfully. • The station that contains the primary database is operational. • The former primary database proxy port is configured and in service.

Redundancy scenarios

The following are redundancy failure scenarios and the 5620 SAM response to each:

- primary server cannot communicate with primary database—If the standby server can communicate with the primary database and the managed NEs, the primary server performs a server activity switch. No database failover occurs. If both the primary and standby servers cannot communicate to the primary database, the primary server initiates a database failover. If automatic database realignment is enabled and the primary server and new primary database are not aligned, the primary server performs a server activity switch.
- primary server cannot communicate with managed NEs—If the standby server can communicate with the primary database and the managed NEs, the primary server performs a server activity switch. No database failover occurs. If automatic database realignment is enabled and the new primary server and the primary database are not aligned, the new primary server performs a database activity switch.
- primary server cannot communicate with primary database or managed NEs—If the standby server can communicate with the primary database and the managed NEs, the primary server performs a server activity switch. No database failover occurs. If automatic database realignment is enabled and the primary server and new primary database are not aligned, the primary server performs a database activity switch.
- primary server cannot communicate with primary database, managed NEs, or standby server—The standby server activates to become the new primary server. If automatic database realignment is enabled, the new primary server initiates a database activity switch.
- primary and standby servers cannot communicate with primary database—The primary server initiates a database failover. If automatic database realignment is enabled and the primary server and new primary database are not aligned, the primary server performs a server activity switch.
- primary and standby servers cannot communicate with each other - primary server can communicate to primary database—The primary server continues to perform as a primary server and the primary database continues to perform as a primary database. An alarm will be raised to indicate the communication failure between primary server and standby server.
- primary and standby servers cannot communicate with each other - primary and standby servers can communicate to their respective preferred databases—The primary server continues to perform as a primary server and the primary database continues to perform as a primary database. The standby server will become the primary server and the standby database will become a primary database. There will be two separate primary servers and primary databases running in the network. An alarm will be raised to indicate the activity switch. The connected users will not get impacted as they continue their session with the original primary server. New users will continue to establish sessions with the original primary server. If a user explicitly tries to connect to a new primary server, the sessions will be established.

- primary and standby servers cannot communicate with each other—The primary server cannot communicate to its preferred database and the standby server cannot communicate with its preferred database.
- primary and standby server cannot communicate with the managed NEs—If both the primary server and standby server cannot communicate with the managed NEs but can communicate to the respective preferred databases, no server activity switch or database failover occurs. The NE status will be marked as not reachable and the appropriate reachability alarm will be raised.

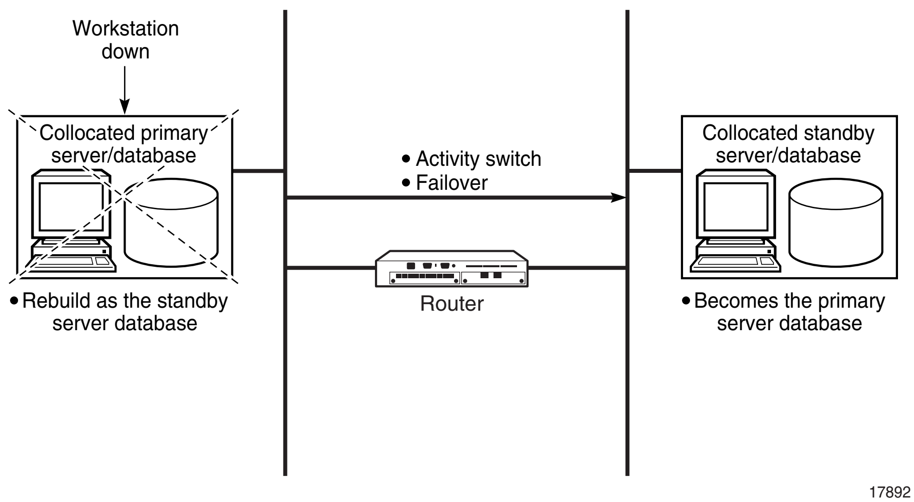
You can configure the following redundancy parameters to specify how a 5620 SAM system manages a loss of connection to the managed NEs:

- the number of elapsed seconds that constitute a loss of connectivity
- how often a main server refreshes the list of managed NEs
- the minimum number of NEs that must respond to a connectivity check

Contact your Alcatel-Lucent technical-support representative for more information.

Figure 7-11 shows the redundancy effect on a collocated configuration in which the station that hosts the primary server and database becomes unresponsive.

Figure 7-11 Primary database and server station down, collocated system

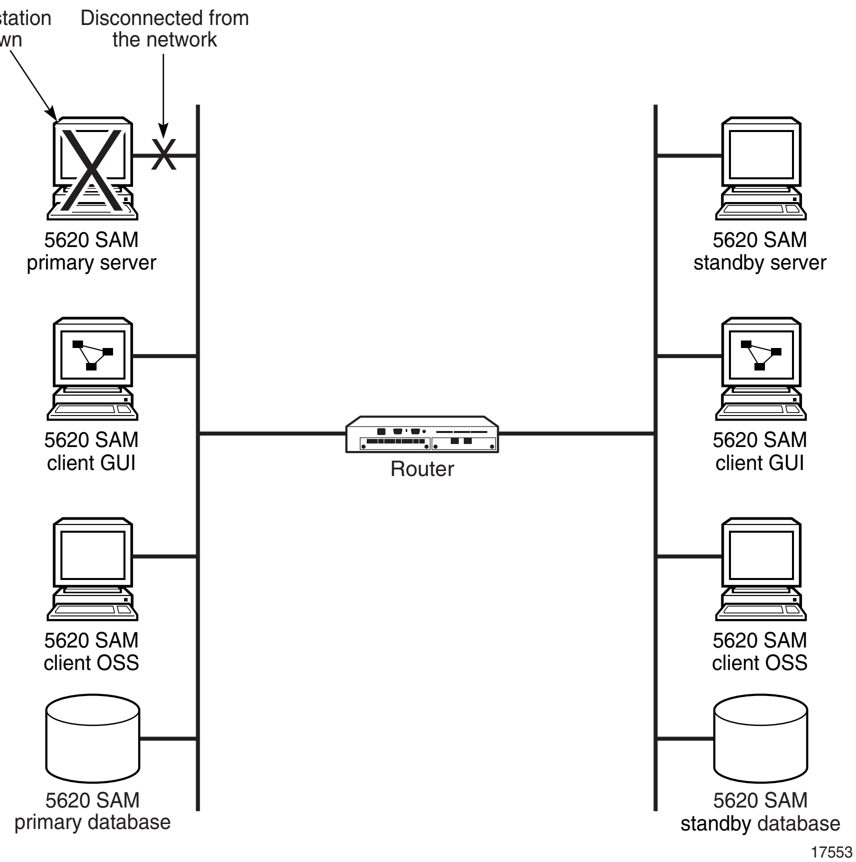


The following occurs when the primary station becomes unresponsive:

- The standby server and database become the primary server and database.
- Redundancy is not restored until the former primary station is rebuilt as the new standby station.

Figure 7-12 shows a primary server disconnection from the network in a distributed 5620 SAM system.

Figure 7-12 Primary server disconnected from network, distributed system

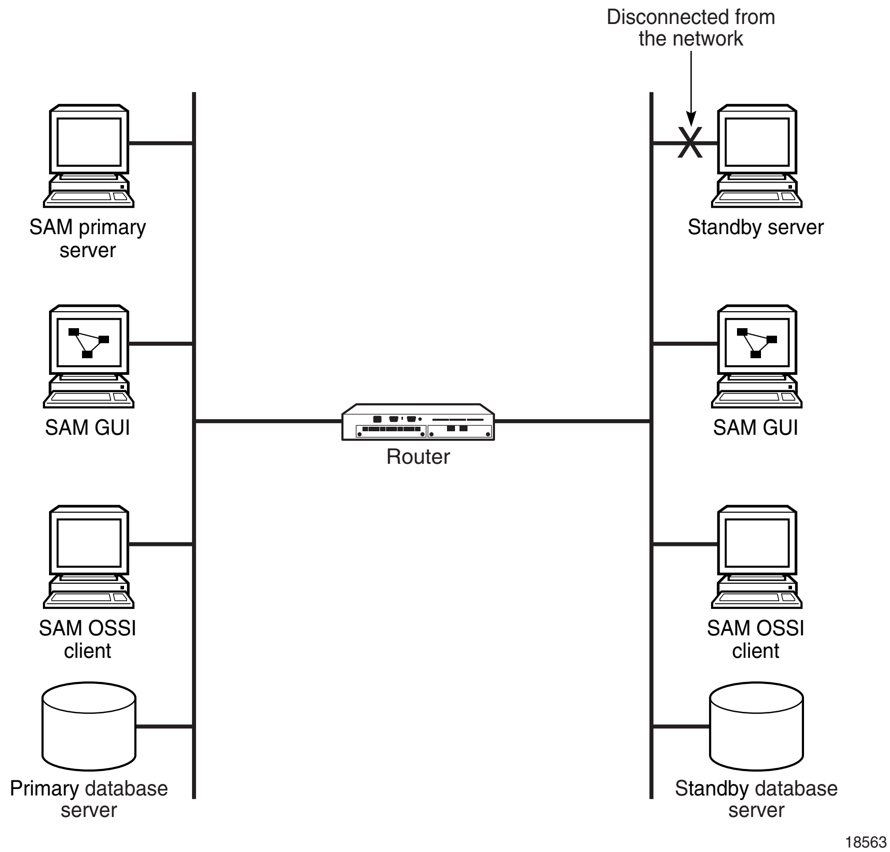


The following occurs when the primary server is disconnected from the management network:

- The standby server detects the loss of connectivity with the primary server and becomes the new primary server.
- The new primary server raises alarms about the unavailability of the former standby server and the activity switch.
- If automatic database realignment is enabled, the new primary server performs a database switchover.
- When connectivity is restored, the former primary server reconnects to the network as the new standby server.

Figure 7-13 shows a standby server disconnection from the network in a distributed 5620 SAM system.

Figure 7-13 Standby server disconnected from network, distributed system



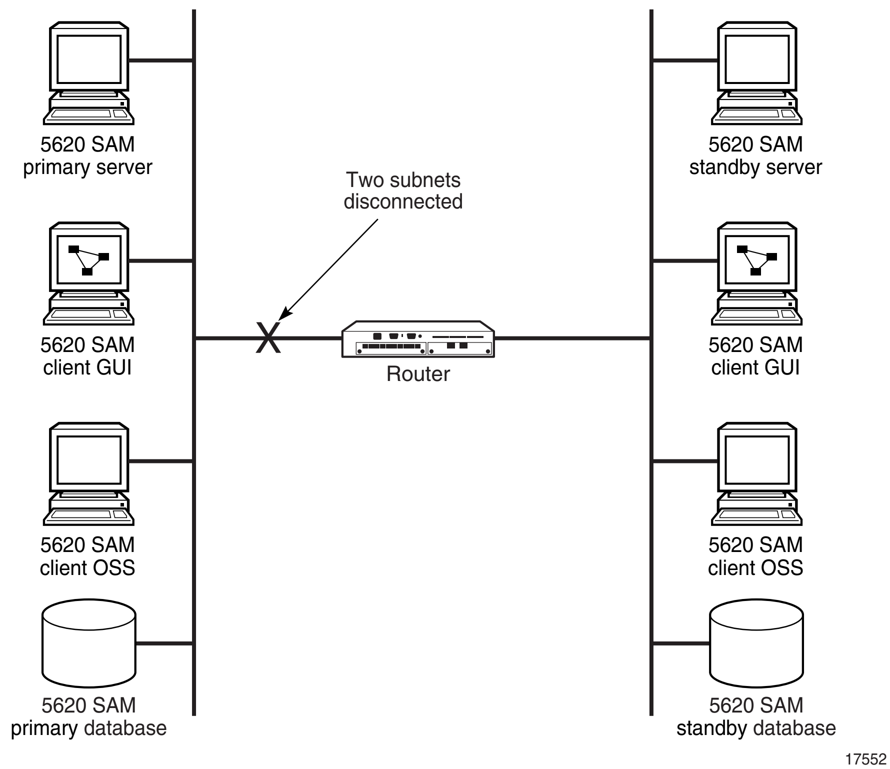
The following occurs when the standby server is disconnected from the network:

- The standby server tries to become the primary server because it cannot contact the primary server, so assumes that it is down.
- The primary server raises an alarm to indicate that the standby server is down.

After the standby server reconnects to the network, it resumes the role of standby server and the standby down alarm is cleared.

Figure 7-14 shows a network failure in a distributed 5620 SAM system.

Figure 7-14 Network failure, distributed system



The following occurs when the primary and standby servers are in separate subnets and cannot communicate:

- The original primary server raises an alarm about the standby server unavailability, and each GUI client displays the standby server status as Down.
- The standby server becomes a primary server. The original primary server continues to operate as a primary server.

Note — You can eliminate a single point of hardware or network failure by using redundant interfaces and redundant physical network paths. See the *5620 SAM Planning Guide* for more information.

7.2 Workflow for configuring 5620 SAM system redundancy

1 Configure redundancy during 5620 SAM component installation. See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for more information.

2 As required, perform manual activity switches and switchovers.

a For 5620 SAM main servers:

i Verify the redundancy status of the 5620 SAM software. See Procedure 7-1 for more information.

ii Perform a manual activity switch on the primary server. See Procedure 7-3 for more information.

iii Validate the updated redundancy status. See Procedure 7-1 for more information.

b For 5620 SAM databases:

i Verify the redundancy status of the 5620 SAM software. See Procedure 7-1 for more information.

ii As required, perform a switchover. See Procedures 7-4 and 7-5 for more information.

iii As required, configure automatic database realignment. See Procedure 7-8 for more information.

iv Validate the updated redundancy status. See Procedure 7-1 for more information.

3 After a failover, re-establish redundancy between the standby and primary databases. See Procedures 7-6 and 7-7 for more information.

7.3 5620 SAM system redundancy procedures

Use the following procedures to perform redundancy tasks.

Procedure 7-1 To view the 5620 SAM main server and database status

1 View the Standby Server and Standby DB status indicators in the 5620 SAM client GUI task bar. Each indicator should display Up.

2 Choose Administration→System Information. The System Information form opens with the General tab displayed.

3 View the general redundancy information:

- Domain Name—the 5620 SAM domain name specified at installation
- Redundancy Enabled—selected if redundancy is enabled
- Alignment Enabled—selected if automatic database realignment is enabled; displayed only if the 5620 SAM system is redundant
- Realignment Status—Aligned or Not Aligned

4 View the following information in the Primary Server panel:

- Host Name—the host name of the primary or standalone main server
- Status—Unknown, Down, or Up

5 View the following information in the Primary Database Server panel:

- Instance Name—the name of the primary database instance, also called a SID
- IP Address—the IP address that each main or auxiliary server uses to reach the primary database
- Host Name—the host name of the primary database, or of the database in a standalone 5620 SAM system

6 If the 5620 SAM system is redundant, view the following information in the Standby Server panel:

- Host Name—the host name of the standby main server
- Status—Unknown, Down, or Up

7 If the 5620 SAM system is redundant, view the following information in the Standby Database Server panel:

- Instance Name—the name of the standby database instance, also called a SID
- IP Address—the IP address that each main or auxiliary server uses to reach the standby database
- Host Name—the host name of the standby database

8 Click on the Properties button to display additional information about the primary or standalone 5620 SAM main server. The Main Server properties form opens.

9 View the following general main-server information:

- Host Name—the host name of the primary main server
- Server Type—Main
- Resource Managed—selected if the main server is included in 5620 SAM resource management

10 View the following information in the Client Communication panel:

- Private IP Address—the IP address that the main server uses as the source address for communication with the 5620 SAM GUI and OSS clients through a NAT router
- Public IP Address—the IP address that the 5620 SAM GUI and OSS clients use to reach the main server through a NAT router

Note 1 — The Private IP Address and Public IP Address display 0.0.0.0 when the 5620 SAM clients and the main server use host names, rather than IP addresses, for communication.

Note 2 — The Private IP Address and Public IP Address display the same IP address when NAT is not used between the main server and clients.

11 View the following information in the Redundant Server Communication panel:

- Private IP Address—the IP address that the main server uses as the source address for communication with the standby main server through a NAT router
- Public IP Address—the IP address that the standby main server uses to reach the primary main server through a NAT router
- Peer Public IP Address—the IP address that the standby main server uses to reach the main server

Note — The Private IP Address and Public IP Address display the same IP address when NAT is not used between the primary and standby main servers.

12 View the following information in the Auxiliary Server Communication panel:

- Private IP Address—the IP address that the main server uses as the source address for communication with the auxiliary servers through a NAT router
- Public IP Address—the IP address that the auxiliary servers use to reach the primary main server

Note — The Private IP Address and Public IP Address display the same IP address when NAT is not used between the main server and the auxiliary servers.

13 Close the Main Server properties form. The System Information form reappears.

14 Click on the Database button to view more detailed database information, if required. See chapter 8 for information about the 5620 SAM database.

15 Click on the Faults tab to view alarm information, if required.

16 Close the System Information form.

Procedure 7-2 To view the 5620 SAM auxiliary server status

1 Choose Administration→System Information. The System Information form opens.

2 Click on the Auxiliary Servers tab button.

3 Review the list of auxiliary servers.

4 Select an auxiliary server in the list and click on the Properties button. The properties form for the auxiliary server opens.

5 Review the auxiliary server information, which includes the following:

- Host Name—the host name of the auxiliary server
- Port Number—identifies the port that the auxiliary server uses to communicate with each main server and database
- Auxiliary Server Type—Reserved or Preferred
- Server Status—Unknown, Down, Up or Unused
- Resource Managed—selected if the auxiliary server is included in 5620 SAM resource management
- Public IP address—the IP address that the main servers use to reach the auxiliary server

6 Perform one of the following:

a View the following main server information for a redundant 5620 SAM system:

- Server 1 Public IP address—the IP address that the auxiliary server uses to communicate with the primary or standby main server
- Server 2 Public IP address—the IP address that the auxiliary server uses to communicate with the primary or standby main server

b View the following main server information for a standalone 5620 SAM system:

- Server Public IP address—the IP address that the auxiliary server uses to communicate with the main server

7 Click on the Auxiliary Services tab button.

8 Review the list of auxiliary services.

9 Review the information for each auxiliary service, which includes the following:

- Service Name—the type of service, for example, statistics collection
- Selected—indicates whether this auxiliary server is currently used by a main server to process requests
- IP Address—the IP address that each main server uses to reach the auxiliary server
- Host Name—the host name of this auxiliary server
- Auxiliary Server Type—Reserved or Preferred

10 Close the Auxiliary Services form.

11 Click on the Faults tab to view alarm information, if required.

12 Close the System Information form.

Procedure 7-3 To perform a server activity switch

Perform this procedure to reverse the primary and standby roles of the main servers in a redundant 5620 SAM system. Consider the following before you perform a server activity switch.

- Each client GUI receives notification of a server activity switch.
- During a server activity switch, a main server does not process SNMP traps, attempt to synchronize NEs, or collect statistics.
- During a server activity switch, auxiliary servers process outstanding requests, but do not communicate with a main server.
- After a server activity switch, the new primary main server deploys outstanding configuration changes to NEs, establishes communication with the auxiliary servers, and synchronizes information with the auxiliary servers.
- A manual activity switch stops and starts the former primary main server. Server redundancy is unavailable until the former primary main server is fully initialized as the new standby main server.

1 Log in to the primary main server station as the samadmin user.

2 Open a console window.

3 Enter the following at the CLI prompt:

bash$ ***install_dir*/nms/bin/nmsserver.bash force_restart** ↵

where *install_dir* is the 5620 SAM server installation location, typically /opt/5620sam/server

The server activity switch begins. The primary main server restarts as the standby main server, and the former standby main server becomes the new primary main server.

4 Close the console window.

5 Clear alarms, as required. The activity switch alarms must be cleared manually.

6 Verify that the GUI and OSS clients can connect to the new primary main server.

Procedure 7-4 To perform a 5620 SAM database switchover using the 5620 SAM client GUI

Perform this procedure to use the 5620 SAM client GUI to switch the primary and standby database roles. Before you perform the procedure, ensure that you understand the following implications of a switchover.

- The primary and standby database roles are reversed.
- The primary main server connects to the new primary database.
- Archive logging begins on the new primary database.
- The primary main server directs each auxiliary server to connect to the new primary database.

1 Log in to the client GUI as a 5620 SAM user with the admin scope of command role.

2 Choose Administration→System Information from the 5620 SAM main menu. The System Information form opens with the General tab displayed.

3 Click on the More Actions button and choose Switchover. A dialog box appears.

Note — The Switchover option is disabled when the proper switchover conditions are not in place, for example, when a switchover or failover is in progress.

4 Respond to the dialog-box prompt.

5 Click on the Yes button. The 5620 SAM server performs the database switchover.

6 Close the System Information form.

Procedure 7-5 To perform a 5620 SAM database switchover using a CLI script

Perform this procedure to use a CLI script to switch the primary and standby database roles. Before you perform the procedure, ensure that you understand the following implications of a switchover.

- The primary and standby database roles are reversed.
- The primary main server connects to the new primary database.
- Archive logging begins on the new primary database.
- The primary main server directs each auxiliary server to connect to the new primary database.

1 Log in to the primary main server station as the samadmin user.

2 Open a console window.

3 Enter the following at the CLI prompt:

```
bash$ install_dir/switchoverdb.bash username password ↵
```

where

install_dir is the 5620 SAM server installation location, typically /opt/5620sam/server

username and *password* are the login credentials for a 5620 SAM client account that has the required privilege level and scope of command

The script displays the following confirmation message:

```
The standby database will become the new primary database,

and the old primary will become the new standby.

Do you want to proceed? (YES/no) :
```

4 Enter the following case-sensitive text at the prompt to start the switchover:

YES ↵

The 5620 SAM server initiates a database switchover. Progress is indicated by a rolling display of dots in the console window. The database switchover is complete when the CLI prompt reappears.

5 Close the console window when the database switchover is complete.

Procedure 7-6 To reinstantiate a redundant database using the 5620 SAM client GUI

Perform this procedure to re-establish redundancy after a database failover or similar maintenance activity. This procedure reinstantiates the former primary database as the new standby database.

When automatic database reinstantiation is enabled, a failed manual reinstantiation attempt does not affect the reinstantiation timer. In the case of a successful manual reinstantiation, further reinstantiations are not attempted by the 5620 SAM.

Before you start, the following conditions must be true:

- The primary database proxy and the standby database proxy are in contact with the 5620 SAM server.
- The database listener is operating.

1 Log in to the client GUI as a user with the 5620 SAM admin scope of command role.

2 Choose Administration→System Information from the 5620 SAM main menu. The System Information form opens with the General tab displayed.

3 Verify the database redundancy status matches the following:

- Failover State: Successful
- Switchover State: Not Attempted

4 Click on the More Actions button and choose Re-Instantiate Standby. A dialog box appears.

5 Click on the Yes button to confirm. The database reinstantiation begins.

The client GUI status bar and the System Information form display the reinstantiation status. The Standby Re-instantiation State changes from In Progress to Success when reinstantiation is complete. The Last Attempted Standby Re-instantiation Time displays the start time of the current reinstantiation.

6 Close the System Information form when the reinstantiation is complete.

Procedure 7-7 To reinstantiate a redundant database using a CLI script

Perform this procedure to re-establish redundancy after a database failover or similar maintenance activity. This procedure reinstantiates the former primary database as the new standby database. Before you start, the following conditions must be true:

- The primary database proxy and the standby database proxy are in contact with the 5620 SAM server.
- The database listener is operating.

1 Log in to the primary main server station as the samadmin user.

2 Open a console window.

3 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

4 Enter the following at the CLI prompt:

bash$ **./reinstantiatedb.bash -u *username* -p *password*** ↵

where

username is the user name of a 5620 SAM client account that has the required privilege level and scope of command

password is the password for the user account

The script displays the following confirmation message:

```
This action will rebuild the standby database.

Do you want to proceed? (YES/no) :
```

5 Enter the following case-sensitive text at the prompt to begin reinstantiation:

YES ↵

The 5620 SAM server begins to reinstantiate the former primary database as the standby database. Progress is indicated by a rolling display of dots in the console window. Database reinstantiation is complete when the CLI prompt reappears.

6 Close the console window when the reinstantiation is complete.

Procedure 7-8 To configure automatic database realignment

Perform this procedure to enable or disable automatic database realignment on the main servers.

Caution — This procedure requires a restart of a 5620 SAM main server, which is service-affecting. To avoid service interruption, schedule the reconfiguration to coincide with a maintenance window.

Note 1 — This procedure applies only to redundant 5620 SAM deployments.

Note 2 — You must perform this procedure first on the standby main server station, and then on the primary main server station.

1 Log in to the standby main server as the samadmin user.

2 Stop the main server software.

i Navigate to the server binary directory. Enter the following at the prompt:

bash$ **cd *install_dir*/nms/bin** ↵

where *install_dir* is the server installation location, typically /opt/5620sam/server

ii Enter the following at the prompt:

bash$ **./nmsserver.bash stop** ↵

iii Enter the following at the prompt:

bash **./nmsserver.bash appserver_status** ↵

iv The server application is stopped when the command in step 2 iii returns the following text string:

```
Application Server is stopped
```

If the command returns anything other than the above text string, wait five minutes and repeat step 2 iii. Do not proceed unless the console displays the above text.

3 Enter the following to switch to the root user:

bash$ **su -** ↵

4 Place the 5620 SAM software DVD-ROM in a DVD-ROM drive.

5 Navigate to the DVD_ROM drive.

6 Perform one of the following to open the 5620 SAM server installer.

a On a SPARC station:

i Enter the following:

cd Solaris ↵

ii Enter the following:

./ServerInstall_SAM_9_0_*revision*.bin ↵

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

b On an x86-based station:

i Enter the following:

cd Solarisx86 ↵

ii Enter the following:

./ServerInstall_x86_SAM_9_0_*revision*.bin ↵

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

7 Click on the Next button.

8 Accept the terms of the license agreement in the “Software License Agreement” panel.

9 Click on the Next button.

10 Choose Main Server Configuration in the “Choose Installation Type” panel.

11 Click on the Next button.

12 Click on the Next button in each subsequent panel until the “Database Alignment” panel is displayed.

13 Configure the “Enable Database Alignment” parameter.

Note — You must configure this parameter the same way on the standby and primary main servers.

14 If you selected the “Enable Database Alignment” parameter in step 13, select a server to act as the preferred server.

15 Click on the Next button.

16 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

17 Select the “Start the 5620 SAM Main Server” parameter.

18 Click on the Done button to close the server configuration utility.

19 Enter the following to switch back to the samadmin user:

```
# exit ↵
```

20 Verify the standby main server has started.

21 Log out of the standby main server.

22 Perform steps 1 to 21 on the primary main server.

Note — When you stop the primary main server, a switchover to the standby main server will occur.

23 If required, perform Procedure 7-3 to perform a server activity switch and revert the main servers to their original roles.

8 — 5620 SAM database management

8.1 5620 SAM database management overview

You can use the 5620 SAM database manager to do the following:

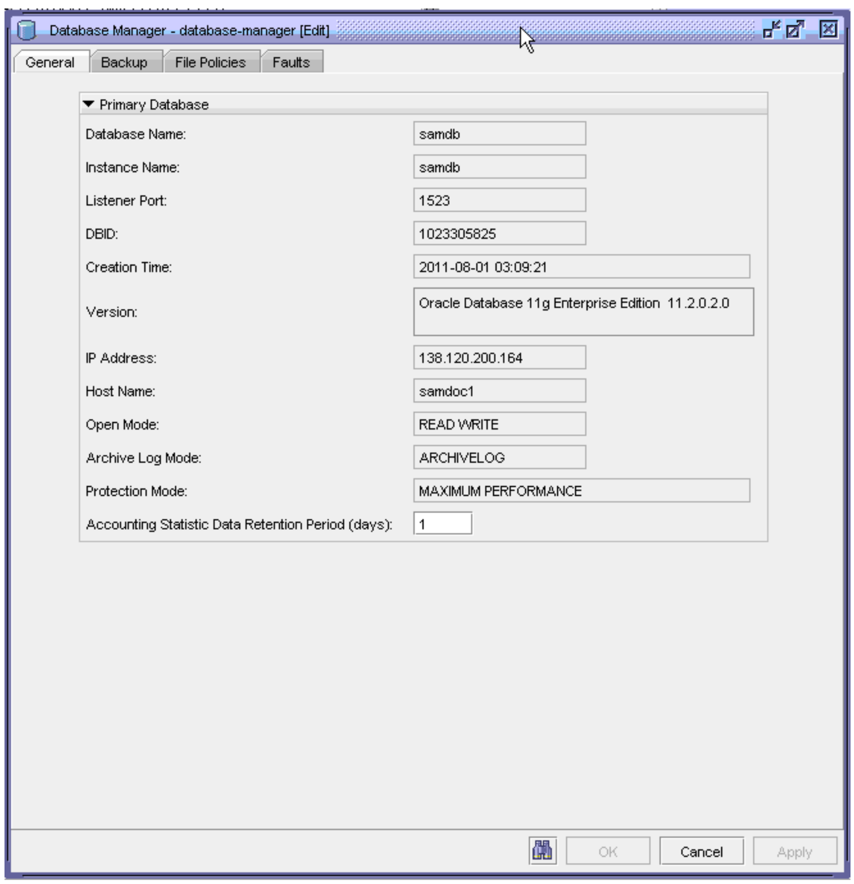
- view database parameters
- configure database parameters
- manage database log storage
- back up a database
- restore a database
- troubleshoot a database

Note 1 — The station to which you restore a 5620 SAM database must have the same OS as the station from which the backup is obtained, for example, Solaris SPARC, or the restore fails.

Note 2 — The 5620 SAM backs up the Oracle encryption wallet during a database backup, and restores the wallet during a database restore. In a redundant deployment, the 5620 SAM automatically replicates the encryption wallet from the primary to the standby database after the standby database reinstantiation.

Figure 8-1 shows the General tab of the Database Manager form.

Figure 8-1 Database Manager form — General tab



See the *5620 SAM Maintenance Guide* for information about restoring a 5620 SAM database.

8.2 Workflow to manage the 5620 SAM database

1. Discover the network devices. The database of the managed devices is stored in the 5620 SAM database. See chapter 14 for more information.
2. Configure data retention parameters according to company policy. See Procedure 8-1 for more information.
3. Perform regular database management according to company policy.
   - i Monitor the database as required. See Procedure 8-2 for more information.
   - ii Back up the database as required. Alcatel-Lucent recommends that you back up the database daily. See Procedures 8-3 and 8-4 for more information.
   - iii Manage disk space by configuring policies to limit the maximum size of database log files, such as the alert, trace, listener, and audit logs. See Procedure 8-5 for more information.

8.3 5620 SAM database procedures

Use the following procedures to perform database management tasks.

Procedure 8-1 To configure statistics data retention for the 5620 SAM database

1. Choose Administration→Database from the 5620 SAM main menu. The Database Manager (Edit) form opens.
2. Configure the Accounting Statistic Data Retention Period (Days) parameter.

   Caution — Configuring the Accounting Statistic Data Retention Period (Days) parameter can affect 5620 SAM system performance. Consult an Alcatel-Lucent support representative before you configure the parameter.

3. Click on the OK button. A dialog box appears.
4. Click on the Yes button.
5. Close the Database Manager (Edit) form.

Procedure 8-2 To view the database properties

Perform this procedure to view general information about the Oracle database that the 5620 SAM uses.

1 Choose Administration→Database from the 5620 SAM main menu. The Database Manager (Edit) form opens and displays information that includes the following:

- Database Name—created during 5620 SAM installation; the default is samdb
- Instance Name—created during 5620 SAM installation; the default is samdb
- Listener Port—the port on the server used for database communication
- DBID—the Oracle database ID, sometimes referred to as the SID
- Creation Time—the database creation time
- Version—the Oracle version identifier, for example, Oracle Database 11g Enterprise Edition 11.2.0.2.0
- IP Address—the IP address that the server uses as the destination address for communicating with the database
- Host Name—the host name of the database station
- Open Mode—specifies the type of database access, either READ or READ WRITE
- Archive Log Mode—specifies whether to archive the database log files; this is configured during database installation
- Protection Mode—the database protection mode, which is set by default during installation to MAXIMUM PERFORMANCE

2 View the information.

3 Close the Database Manager (Edit) form.

Procedure 8-3 To back up the 5620 SAM database using the client GUI

Caution — Ensure that there is sufficient hard disk space to store the database backup. Alcatel-Lucent recommends that a separate database backup directory is created to store backup files. This backup directory should be at least five times larger than the expected database backup size. Contact your Alcatel-Lucent support representative or see the *5620 SAM Planning Guide* for more information.

Alcatel-Lucent recommends that you regularly back up the 5620 SAM database. A database backup provides a snapshot of the database that you can use to restore the network data. The reasons for performing a database backup include the following:

- To move a database from one station to another
- To recover from hardware or software errors

- To set aside a clean copy of the database before performing a system upgrade
- As a preventive measure before making major changes to the network

Note — During a database backup, the performance of database-related operations on the GUI or the OSS interface may be affected. Alcatel-Lucent recommends performing a database backup only during a period of low 5620 SAM activity.

1 The database must be in ARCHIVELOG mode to perform a backup. Perform Procedure 8-2 and ensure that Archive Log Mode is set to ARCHIVELOG.

2 Click on the Backup tab button.

3 Perform one of the following.

a Configure a scheduled full or partial database backup. A full backup backs up the entire 5620 SAM database whereas a partial backup contains no accounting statistics data.

i Configure the parameters.

Note — Ensure that the Scheduled Backup Directory location is not tampered with and has more than enough space to contain the number of database backups specified by the Number to Keep parameter.

ii Select the Schedule Enabled parameter.

b Perform an unscheduled full database backup. A full backup backs up the entire 5620 SAM database.

i Configure the Manual Backup Directory parameter.

Note — Ensure that the Manual Backup Directory location is not tampered with and has more than enough space to contain the database backup

ii Click on the Full Backup button. A dialog box appears.

iii Click on the Yes button. The full backup starts. The Backup State shown on the form changes to In Progress.

c Perform an unscheduled partial database backup. A partial backup contains no accounting statistics data.

i Configure the Manual Backup Directory parameter.

Note — Ensure that the Manual Backup Directory location is not tampered with and has more than enough space to contain the database backup ii Click on the Partial Backup button. A dialog box appears.

iii Click on the Yes button. The partial backup starts. The Backup State shown on the form changes to In Progress.

4 Configure the Enable Backup File Compression parameter.

5 View the information in the Backup Status panel, if required. This information includes the following:

- Scheduled Backup—whether a backup schedule is configured
- Backup State—the state of the current or previous backup operation; the Backup State is dynamically updated during a backup operation
- Next Scheduled Backup Time—the next scheduled backup time
- Last Successful Backup Time—when the previous successful backup completed
- Last Successful Backup Type—the type of previous successful backup completed
- Last Attempted Backup Time—when the previous attempted backup took place
- Last Attempted Backup Type—the type of backup that was last attempted
- Directory of the Last Successful Backup—the storage location of the previous successful backup

6 Close the Database Manager (Edit) form.

Note — After backing up and restoring a database, you must perform a full resynchronization of the network to discover the recent managed device information changes.

Procedure 8-4 To back up the database using a CLI script

Caution — Ensure that there is sufficient hard disk space to store the database backup. Alcatel-Lucent recommends that a separate database backup directory is created to store backup files. This backup directory should be at least five times larger than the expected database backup size. Contact your Alcatel-Lucent support representative or see the *5620 SAM Planning Guide* for more information.

Alcatel-Lucent recommends that you regularly back up the 5620 SAM database. A database backup provides a snapshot of the database that you can use to restore the network data. The reasons for performing a database backup include the following:

- To move a database from one station to another
- To recover from hardware or software errors

- To set aside a clean copy of the database before performing a system upgrade
- As a preventive measure before making major changes to the network

Note — During a database backup, the performance of database-related operations on the GUI or the OSS interface may be affected. Alcatel-Lucent recommends performing a database backup only during a period of low 5620 SAM activity.

1 Log in as the Oracle management user on the database station. In a redundant 5620 SAM system, this is the station that holds the primary database.

2 Open a console window.

3 Enter the following at the console prompt to begin the database backup:

path*/install/config/samdb/SAMbackup.sh *backup_directory ↵

where
path is the 5620 SAM database installation location, typically /opt/5620sam/samdb
backup_directory is the directory that is to contain the database backup

Caution — When you back up a 5620 SAM database, you must specify a backup directory path that does not include the 5620 SAM database installation directory, or data loss may occur. The typical 5620 SAM database installation location is /opt/5620sam/samdb.

The database backup begins. A database backup can take several hours to complete.

4 Close the console window when the database backup is complete.

Procedure 8-5 To manage alert, listener, trace, and audit database log files

You can use policies to manage the file size of stored alert, trace, listener, and audit log files. When the size and number of files are left unbounded, exceeding database disk space limits may become a problem. The default settings of the file policies reduce the number of log files that are kept.

Database log files are compressed and stored in the alert log directory (for trace, alert, and audit log files) or the listener directory for listener log files.

For historical or troubleshooting purposes, Alcatel-Lucent recommends that you archive the database log files.

1 Choose Administration→Database from the 5620 SAM main menu. The Database Manager (Edit) form opens.

2 Click on the File Policies tab button.

3 Perform one of the following.

a Create a new database file policy.

i Click on the Database File Policies button. The Database File Policies form opens.

ii Click on the Create button. The File Policy (Create) form opens.

iii Configure the parameters:

- ID
- Description
- Auto-Assign ID
- Purge Mode
- Max (Collective) Log Size
- Number of Archives

iv Click on the OK button. The File Policy (Create) form closes.

v Close the Database File Policies form.

b Modify an existing policy.

i Click on the Database File Policies button. The Database File Policies form opens.

ii If required, specify a filter and click on the Search button.

iii Select a policy from the list and click on the Properties button. The File Policy (Edit) form opens.

iv Configure the parameters:

- Description
- Purge Mode
- Max (Collective) Log Size
- Number of Archives

v Click on the OK button. The File Policy (Edit) form closes.

vi Close the Database File Policies form.

4 Associate the file policy with a database log type, if required.

i Click on the Select button beside one of the following:

- Alert Log File Policy
- Listener Logs File Policy
- Trace and Audit Logs File Policy

The Database File Policies - Database Manager (Edit) form opens.

ii Choose a policy from the list.

iii Click on the OK button. The Database File Policies - Database Manager (Edit) form closes and the policy identifier is displayed on the Database Manager (Edit) form.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Database Manager (Edit) form closes.

9 — 5620 SAM user security

9.1 5620 SAM user security overview

A 5620 SAM client GUI operator can use security management forms to configure and manage the following:

- 5620 SAM users and user groups, which are assigned the following configurable profiles:
    - scope of command profiles, which define the level of user control over objects in scope of command roles
    - span of control profiles, which define the 5620 SAM objects that users can view and manage
- 5620 SAM user-account and password expiry periods
- GUI inactivity timeout periods
- password history counts
- the number of active and allowed client sessions
- the GUI login form, which can display a customized login message
- user activity logs, which record the actions performed by each user

User accounts and user groups

You can use 5620 SAM user accounts and user groups to do the following:

- Provide GUI or OSS access to the 5620 SAM functional areas that match specific operator requirements.
- Restrict access to functions or objects based on operator expertise or authority.

Users have view access, read-write access, or no access to 5620 SAM objects and functions based on the following:

- the user group to which they belong
- the scope of command profile assigned to the user group.

The 5620 SAM user account called admin is created during 5620 SAM installation. The admin account is assigned the administrator scope of command role and a span of control profile that has Edit Access assigned to each default span. See “Scope of command” in this section for more information.

Caution — Because the 5620 SAM is unable to obtain an authentication secret value from an NE, Alcatel-Lucent recommends that you use only the 5620 SAM to configure a shared authentication secret on an NE. If you configure a shared authentication secret on a managed NE using another interface, for example, a CLI, the 5620 SAM cannot synchronize the security policy with the NE.

Note — To restrict user access to top-level 5620 SAM functions such as 5620 SAM and NE security management, Alcatel-Lucent recommends the following:

- Assign the administrator scope of command role to a minimal number of 5620 SAM user accounts.
- Assign each 5620 SAM user to a user group that has the minimum privileges for performing the required tasks.

Only the admin user, or a user whose scope of command includes write access to the security package, can perform the tasks listed in Table 9-1.

Table 9-1 5620 SAM security-related tasks

Task:	See:
Create a proprietary user login statement	Procedure 9-1
Specify expiry periods for user accounts, passwords, and GUI inactivity checks	Procedure 9-3
Specify responses to authentication failures	Procedure 9-5
Create or modify scope of command roles	Procedure 9-8
Create or modify scope of command profiles	Procedure 9-9
Create or modify span of control profiles	Procedure 9-13
Assign 5620 SAM objects to a span	Procedure 9-12
Create or modify user groups	Procedure 9-17
Create users and assign users to user groups	Procedure 9-18
Specify a default external user group	Procedure 9-23
Search for inactive user accounts	Procedure 9-24
Suspend and reinstate users	Procedure 9-25
Modify user passwords	Procedure 9-26
Send text messages and notifications to some or all GUI clients	Procedure 9-31
Shut down GUI or 5620 SAM-O JMS client sessions on a per-client basis	Procedure 9-32
View user logs	Procedure 9-33
Enable LI management	Chapter 34

The following general rules apply to 5620 SAM users and user groups:

- Only database space limits the number of users and user groups that can be created.
- A user cannot belong to more than one user group.
- Only one session per user account can be open at the same time on a client station.
- A scope of command profile allows user-group access to one or more 5620 SAM functional areas.
- A span of control profile allows user-group access to one or more 5620 SAM managed objects.

- A user group is associated with only one scope of command profile that can contain multiple scope of command roles.
- A user group is associated with only one span of control profile that can contain multiple spans.
- The assigned user privileges determine the following for a GUI user:
    - the available 5620 SAM menu options
    - the parameters on object property forms that are configurable
- By default, each user group is assigned access to all 5620 SAM objects.
- A user inherits span of control access rights from their assigned user group.
- When you modify a user group, and a user in the group has an open client session, client operations may fail for the user. To put the new user group permissions into effect, the user must close the current client session and open a new session.
- You can modify, but not delete, a span of control profile that is assigned to a user group.

Password management

A 5620 SAM user password must observe the following constraints:

- be 8 to 100 characters long
- contain at least three of the following character types:
    - lowercase
    - uppercase
    - special
    - numeric
- not be the user account name in forward or reverse order
- not contain more than three consecutive instances of the same character
- be changed according to a configurable schedule to prevent account lockout
- not be reused as a new password for the same user account

Scope of command

The scope of command for a user defines what the user is allowed to do; it is a collection of one or more configurable roles, or sets of permissions. A scope of command profile that contains one or more roles, and the profile is subsequently applied to a user group. Each user in the group inherits the access rights specified in the scope of command profile.

Roles

A scope of command role specifies the read, create, update, and delete access permissions for a 5620 SAM object type or package. You can create custom roles by assigning specific access permissions to different 5620 SAM functional areas. These functional areas are organized in packages, methods, and classes. See Appendix A for a listing of all access permissions that can be assigned to a scope of command role.

Note 1 — When you enable the Create permission on a 5620 SAM package, method, or class, the Update permission is automatically enabled.

Note 2 — When you enable the Update permission on a 5620 SAM package, method, or class, the Create permission is not automatically enabled.

You can create an original scope of command role, or copy an existing role and modify the role permissions to create a new role. The 5620 SAM has several predefined scope of command roles. See Appendix A for a listing of the permissions, access levels, and descriptions of all predefined scope of command roles and profiles.

Note — When you create a scope of command role, you must enable create, update/execute, and delete access to allow the modification of a class or package.

Profiles

A scope of command profile contains one or more scope of command roles, and is assigned to a user group. Each user in the group inherits the permissions from the scope of command roles in the profile.

Span of control

The span of control for a user is a list of the objects over which the user has control, for example, a grouping of NEs or services. You can create an original span, or copy an existing span and modify the list of associated objects to create a new span. The objects that are in a span, or that can be added to a span, are called span objects.

The 5620 SAM has several predefined spans. Each new 5620 SAM object, for example, a discovered NE, is added to the corresponding predefined span. Table 9-2 lists the predefined 5620 SAM spans and the type of span objects in each.

Note — You cannot modify or delete a predefined span.

Table 9-2 Predefined 5620 SAM spans

Span	Included objects
Default Topology Group Span	Topology groups
Default Router Span	Managed NEs
Default Script Span	CLI and XML API scripts, service templates, tunnel templates, and auto-provision profiles
Default Test Suite Span	Test suites
Default Group Span	Ring groups and VLAN groups
Default Bulk Operation Span	Bulk operations
Default Service Span	Services
Default Customer Span	Customers
Default Transport Span	Optical wavelength services

Spans are specified in span of control profiles that are associated with user groups. A user can create a new 5620 SAM object only when the predefined span for the object type is in the span of control profile. For example, if you do not have the Default Group Span in your span of control profile, you cannot create a ring group.

NEs are added implicitly to a span when the parent topology group, ring group, or VLAN group is in a span. An object that is implicitly added to a span cannot be removed from the span, but an explicitly added object can be removed.

Note 1 — A user can view or configure a point-to-point connection only when each endpoint of the connection is in the user span of control. For example, if the endpoints of an LSP path are in different spans, you must have view or configuration privileges in each span in order to view or configure the LSP path.

Note 2 — During span modification, you can drag and drop NEs and topology groups into the span contents list.

Each user can control which objects the 5620 SAM displays in maps, lists, and navigation trees, based on the user span of control. The User Preferences form contains a parameter that globally specifies whether the Edit Access span objects of the user are shown by default. Objects that are not in a View Access span of the user are never displayed, regardless of the user preference. See chapter 3 for information about configuring the user span of control display preference.

In a list form, a user can override the global display preference using the Span On parameter. When the form is a filtered list form, such as a topology map, the Manage Services form or the Alarm Window, the associated advanced filter form contains a selector for filtering the search results based on the span of control. See chapter 3 for information about configuring span of control filters.

Profiles

A span of control profile is a collection of one or more spans that is assigned to a user group. Each span in a profile is assigned one of the following access designations during profile creation:

- View Access—The user can view the span objects, unless the scope of command permissions deny read access.
- Edit Access—The user can view and modify the span objects, unless the scope of command permissions deny access.
- Blocked Edit—The user can view but not modify the span objects, regardless of the scope of command permissions.
- Blocked View—The user cannot view or modify the span objects, regardless of the scope of command permissions.

Blocked Edit and Blocked View spans restrict access to a subset of the objects in another span in the same profile. For example, if multiple span of control profiles each contain the Default Service Span, you can add a customer-specific Blocked View or Blocked Edit span to each profile so that the user group associated with a profile can view or configure only the services of specific customers.

A Blocked Edit or Blocked View span takes precedence over other spans. For example, if a user has an Edit Access span that contains all services and a Blocked View span that contains Customer A and Customer B, the user cannot view or configure the services that belong to Customer A and Customer B.

Caution — Alcatel-Lucent recommends that you carefully plan and consider the effects of combining customer, service, and NE spans in a span of control profile. For example, a user can modify a service only when the service, customer, and participating NEs are in one or more Edit Access spans of the user, and none of these objects is in a Blocked Edit or Blocked View span.

To ensure that span conflicts do not interfere with network troubleshooting, the 5620 SAM allows a user to execute tests on NEs and service sites that are not in an Edit Access span of the user. However, activities such as policy distribution, software upgrades, and statistics collection can be performed only by a user with Edit Access spans that contain the target objects.

When you upgrade the 5620 SAM from a release earlier than 8.0 to Release 8.0 or later, the 5620 SAM automatically assigns all of the predefined spans to each existing span of control profile. The Default Customer and Default Service spans are assigned as Edit Access spans to preserve the existing user privileges; each of the other spans is assigned as a View Access span.

Span rules

By default, the 5620 SAM automatically adds a new service to the Default Service span. Using an OSS or GUI client, you can create policies called span rules that direct the 5620 SAM to add new services to other spans in addition to the Default Service span.

A span rule is associated with a format or range policy, and applies to the users and user groups named in the format or range policy. You can associate multiple range policies with one user and service type. This enables the automatic addition of a new service to a specific span based on the Service ID chosen during service creation.

During span rule creation, you must specify one of the following to indicate which spans receive the services that the user creates:

- the Edit Access spans of each user associated with the format or range policy
- each span that is explicitly named in the rule

The span rules associated with a format or range policy take effect for new services only if the format or range policy is administratively enabled and has a valid configuration that includes at least one user or user group.

See “Sample span rule configuration” in this chapter for a sample span rule configuration and implementation.

Remote authentication and authorization for users with no 5620 SAM user account

The 5620 SAM uses a JAAS security framework to provide authentication and authorization services. When a user logs in to the 5620 SAM, the authentication method used depends on the 5620 SAM login module configuration. The 5620 SAM supports the following remote authentication login modules:

- RadiusJaasLoginModule
- TacacsPlusJaasLoginModule

The JAAS security framework integrates the login modules with the 5620 SAM. During startup, the 5620 SAM reads a file that contains the JAAS login module configuration. Depending on the VSA configuration in the file, one of the following authentication and authorization methods is available for remote users that do not have a 5620 SAM user account:

- The remote server authenticates the user and the 5620 SAM assigns a user group.
- The remote server authenticates the user and assigns a user group.

When the 5620 SAM assigns a user group to a remote user, a default external user group must be present in the 5620 SAM. User authentication succeeds when the remote authentication server validates the user password. User authorization succeeds and the user is provided with access rights when the default external user group is associated with the user. The 5620 SAM then creates a remote user account for the login session. In this scenario, when the default external user group is not specified, authorization fails and the user is denied access.

When the remote authentication server assigns a user group to a remote user, VSA support must be enabled in the JAAS login module configuration. In this scenario, a user group must be defined on the remote authentication server, and the remote server administrator must load the 5620 SAM RADIUS dictionary on the RADIUS server. The Sam-security-group-name VSA in the dictionary is used to configure a RADIUS remote user on the RADIUS server. The user group that is defined in the VSA must exist in the 5620 SAM. The remote authentication server administrator must specify the user group in the user configuration on the authentication server.

When the remote user logs in to the 5620 SAM, authentication succeeds when the remote authentication server validates the user password. Authorization succeeds and the user is provided with access rights when the user group defined on the remote server is sent to the 5620 SAM and validated. If the user group name matches a user group name in the 5620 SAM, the 5620 SAM creates a remote user account for the login session. Otherwise, authorization fails and user access is not granted.

See Procedure 9-23 for information about how to configure remote authentication and authorization for remote-only users.

In RADIUS, the authentication success message that is sent to the 5620 SAM contains the user group name. In TACACS+, authentication must succeed before an authorization message containing the user group name is sent to the 5620 SAM.

Successful remote authentication for an OSS user requires that the remote server and the 5620 SAM use the same password format. The OSS users can log in using a clear text password or an MD5 hashed password if the remote authentication server supports MD5 password hashing. See the *5620 SAM XML OSS Interface Developer Guide* for more information.

When a remote 5620 SAM GUI or OSS session terminates, the user account for the session does not get deleted. This allows remote authenticated users to keep details such as filters defined between sessions.

Combined local and remote authentication

Many organizations already have existing TACACS+ or RADIUS authentication of users, based on long standing TACACS+ and RADIUS user accounts and passwords. You can incorporate new 5620 SAM user accounts for local 5620 SAM authentication with existing TACACS+ or RADIUS user accounts.

Consider the following:

- A system administrator can integrate the existing TACACS+ or RADIUS user accounts with 5620 SAM user accounts.
- You can create a 5620 SAM user name that exactly matches a TACACS+ or RADIUS user name.
- A 5620 SAM user name can be 1 to 80 characters in length, which is sufficient to match most remote authentication user names.

- 5620 SAM users who currently authenticate remotely can log in to the 5620 SAM using their RADIUS or TACACS+ passwords.
- 5620 SAM user authentication requires an account password that observes the 5620 SAM password constraints described in this chapter.

Note — When the samvsa parameter in the 5620 SAM JAAS configuration file is set to true, the 5620 SAM requires a user group from the remote server for authorization and the following conditions apply:

- If a 5620 SAM user account is associated with a local user group and configured to use remote authentication, the local user group is replaced by the remote user group.
- The user group sent by the remote server must exist in the 5620 SAM, otherwise, authentication fails.

The samvsa flag is set to false by default. See "Remote authentication and authorization for users with no 5620 SAM user account" in this chapter and Procedure 9-23 for more information about configuring the 5620 SAM VSA.

For example, a user named jane has the following accounts:

- a remote RADIUS account called jane and the password accessforjane
- a local 5620 SAM account called jane and the password LetJane1In!

When jane is authenticated by RADIUS, she gains access to the 5620 SAM by typing in jane and accessforjane. If the RADIUS server is down, jane is authenticated locally by the 5620 SAM after typing jane and LetJane1In!.

Client session control

Each 5620 SAM GUI client, 5620 SAM-O JMS client, or XML API request creates a 5620 SAM client session. You can view a list of the active 5620 SAM client sessions on the Sessions tab of the 5620 SAM User Security - Security Management form. Using this form, an admin user, or a user with an assigned security span of control, can also terminate one or more 5620 SAM GUI client sessions. When a 5620 SAM GUI client session is terminated in this manner, each client application receives a warning message and the connection is closed by the 5620 SAM server after a short delay.

Messaging connections

A list of active 5620 SAM GUI connections and 5620 SAM-O JMS connections can be viewed on the Messaging Connections tab of the 5620 SAM User Security - Security Management form. Using this form, an admin user, or a user with an assigned security span of control, can terminate one or more connections. When a 5620 SAM-O client connection is terminated, a notification is sent to the 5620 SAM-O client, but the admin user must also remove the 5620 SAM-O JMS client connection so that the server stops storing JMS messages for the session.

Client delegate sessions

The threshold for the number of 5620 SAM client sessions allowed on a client delegate server is configurable using the 5620 SAM GUI. When a user tries to open a client session that exceeds the threshold, the client delegate server opens the session, displays a warning message to the user, and raises an alarm. The threshold-crossing function can help to balance the session load across multiple client delegate servers. You require the Update user permission on the Server package to configure this threshold. See Procedure 9-29 for more information.

9.2 Sample 5620 SAM user authentication configuration

Figure 9-1 shows an example of how 5620 SAM user and user group authentication is performed.

Note 1 — RADIUS and TACACS+ authentication servers support multiple users. If the 5620 SAM cannot reach the first authentication server, the 5620 SAM sequentially attempts the user authentication using the remaining authentication servers.

Note 2 — If user authentication fails against the first authentication server in a sequence (for example, because of wrong password), there is no attempt to authenticate the user against the next authentication server in the sequence.

Note 3 — The EMS server log and 5620 SAM session log record unsuccessful user authentication attempts for known and unknown users. A user that is not defined in the 5620 SAM but belongs to an external AAA server is an example of an unknown user.

Figure 9-1 Sample 5620 SAM user and user group authentication

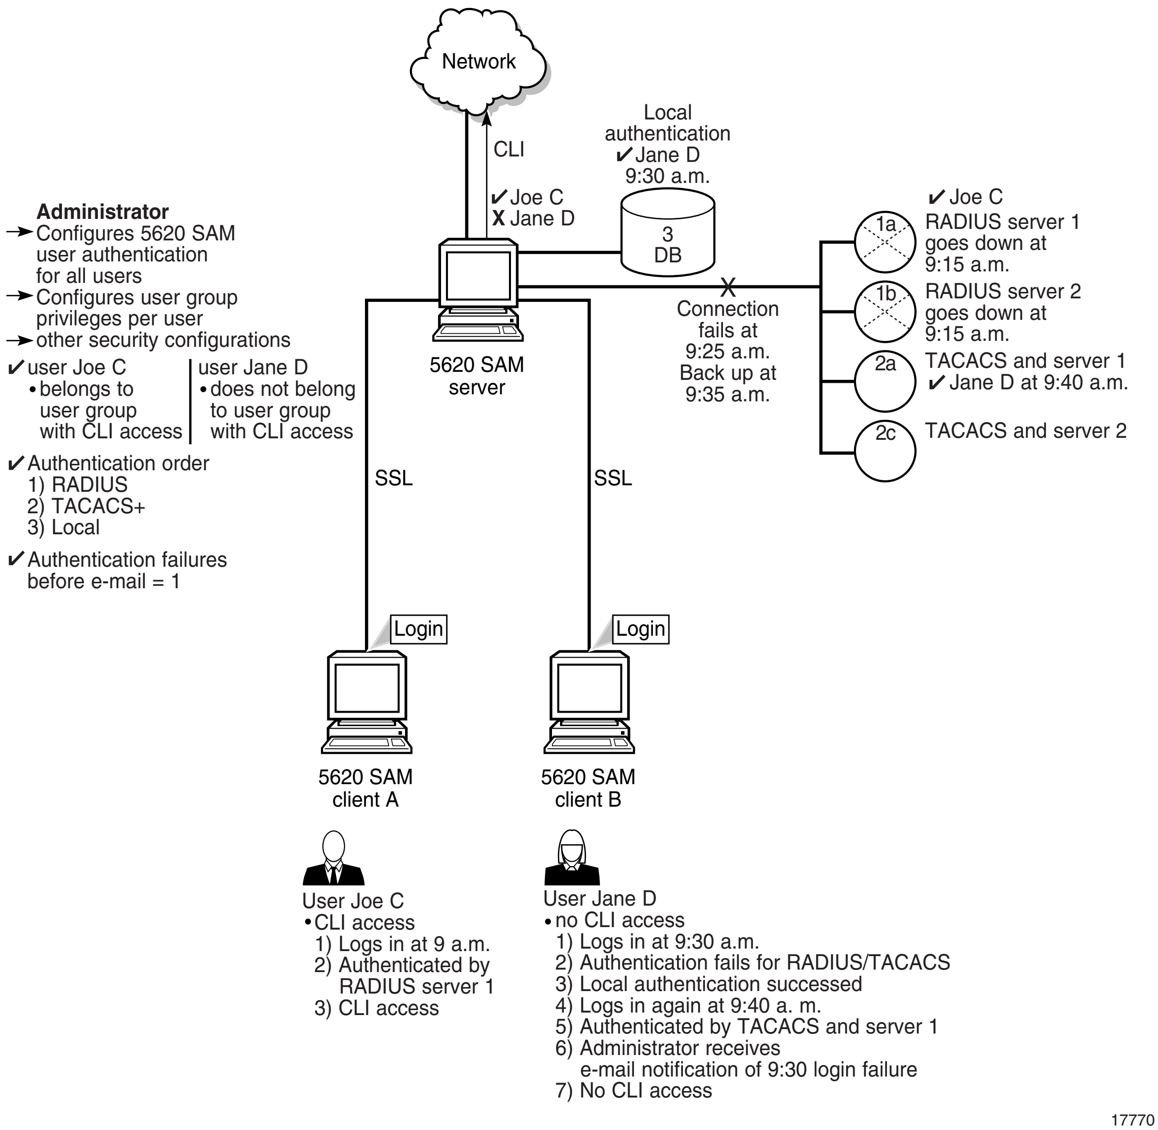


Table 9-3 lists the high-level tasks required to configure this sample.

Table 9-3 Sample 5620 SAM user authentication configuration

Task	Description
Pre-configurations	Ensure proper RADIUS or TACACS+ server configuration, according to your company requirements. PAP authentication is supported for RADIUS and TACACS+. The 5620 SAM server must be able to communicate with the authentication servers to validate users. All configuration tasks should be done with admin access. The 5620 SAM server IP address must be configured as the client of the RADIUS or TACACS+ server. The secret keys must match on the 5620 SAM server and the RADIUS or TACACS+ server.

(1 of 2)

Task	Description
1. Configure the remote authentication order for all users	Choose Administration→Security→5620 SAM RADIUS/TACACS+ User Authentication from the 5620 SAM main menu. Set the authentication order parameters to: • radius • tacplus • local Also specify the RADIUS and TACACS+ servers using the corresponding tabs on the same form.
2. Create scope of command profiles	Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. Create a CLI scope of command profile and assign the default CLI management role to the profile. Create at least one scope of command profile that does not allow CLI access by assigning the *default* scope of command role, which has no access permissions to CLI management.
3. Create and configure user groups	Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. Create a CLI user group and at least one user group that does not allow CLI access. Assign the scope of command profile with CLI management access to the CLI user group. Assign the scope of command profile with no CLI management access to the user group without CLI access. Authorization is done using user groups, so each user must belong to a user group with a local account on the 5620 SAM server.
4. Create and configure user accounts	You can create local users on the 5620 SAM by performing the following steps, or define remote users using RADIUS and TACACS+. The local users are available when RADIUS or TACACS+ authentication is not available. Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. Create users. Assign the appropriate user group to each user: one with CLI access and one without CLI access.
5.Configure notification	Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. Configure the authentication failure action parameters, including the parameters that allow the e-mail account of the administrator to be notified after login failure.

(2 of 2)

Consider the following:

- The 5620 SAM server acts as a network access server. A network access server is considered a client of a RADIUS or TACACS+ server.
- The sequence of activity between the 5620 SAM server, which is the authentication client, and the RADIUS or TACACS+ server, which is the authentication server, is the following:
    - client requests authentication
    - server replies to authentication request
    - client requests logout and authentication stops
- When the remote authentication servers are down and local authentication is used, the user must log in using 5620 SAM credentials, as described in "Combined local and remote authentication".

9.3 Sample span rule configuration

This section describes the configuration of a policy that directs the 5620 SAM to automatically add each service created for Customer X to an Edit Access span associated with the service creator. A user named Bob is designated the service administrator for Customer X; only Bob can create or edit Customer X services. A regular service user, by contrast, can only view the Customer X services.

Table 9-4 Sample span rule configuration

Task	Description
1. Create a span that contains the existing Customer X services.	• Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. • Choose Create→Span on the Span of Control tab. • Specify Customer X Services as the span name. • Use the Contents tab to specify the Customer X services.
2. Create a span of control profile for Bob.	• Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. • Choose Create→Profile on the Span of Control tab. • Add the Default Service Span as a View Access span to the span of control profile; the user cannot create a new service unless this is done. • Add the Customer X Services span as an Edit Access span to the span of control profile.
3. Create a range policy for each service type that the Customer X service administrator can create; in this sample, the services are IES and VPRN services.	• Choose Administration→Format and Range from the 5620 SAM main menu. • Choose Create→Range Policy. • Specify IES Service as the Object Type. • Specify Service ID as the Property Name. • Configure a range. • Use the Add button on the Users tab to assign the policy to Bob. • Choose Create→Range Policy. • Specify VPRN Service as the Object Type. • Specify Service ID as the Property Name. • Configure a range. • Use the Add button on the Users tab to assign the policy to Bob.
4. Create a span rule that contains the Customer X span.	• Choose Administration→Span Rules from the 5620 SAM main menu. • Specify Customer X Management as the name. • Set the Created In parameter to All listed spans. • Add the Customer X Services span using the Spans tab.

After the span rule is created, Bob creates a new VPRN service for Customer X. The 5620 SAM uses the VPRN range policy to automatically configure the service ID, and applies the associated Customer X Management span rule when Bob saves the service. As a result, the service is added to the Customer X Services span as well as to the Default Service Span. Because Bob has Edit Access to the Customer X Services span, he can reconfigure the service later, as required.

9.4 Workflow to manage 5620 SAM user and group security

1 Assess the requirements for user access to the different 5620 SAM functional areas and develop a strategy for implementing user security. See section 9.1 for more information.

2 Create a proprietary client GUI login screen. See Procedure 9-1 for more information.

3 Reserve a client GUI session for the admin user to ensure that the admin user can always log in. See Procedure 9-2 for more information.

4 Configure user account parameters, as required:

- expiry periods for user account, passwords, and GUI inactivity timeouts; see Procedure 9-3 for more information
- minimum length for user names; see Procedure 9-4 for more information
- user authentication attempts; see Procedure 9-5 for more information
- automated email delivery; see Procedure 9-7 for more information

5 If required, create scope of command roles in addition to the default roles. See Procedure 9-8 for more information.

6 Create scope of command profiles according to types of tasks performed and assign scope of command roles accordingly. See Procedure 9-9 for more information.

7 If required, create spans in addition to the default spans. Add 5620 SAM managed objects to the spans. See Procedure 9-12 for more information.

8 Create span of control profiles and assign spans. See Procedure 9-13 for more information.

9 Create span rules, as required, for automatically assigning new services to spans other than the Default Service Span. See Procedure 9-14 for more information.

10 Create user groups and assign scope of command and span of control profiles to each group, as required. See Procedure 9-17 for more information.

11 Create user accounts for performing the tasks that are assigned to each user group, as defined by the scope of command and span of control profiles associated with each user group. See Procedures 9-18 and 9-19 for more information.

12 Specify 5620 SAM RADIUS and TACACS+ authentication for 5620 SAM user accounts, as required. See Procedure 9-22. See chapter 21 for more information about managing security using RADIUS and TACACS+ authentication.

13 If required, configure authentication and authorization for remote users in which either the 5620 SAM provides the user group to which the user belongs or the remote authentication server provides the user group. See Procedure 9-23 for more information.

14 As required, manage user and group security by performing the following tasks:

- search for inactive user accounts; see Procedure 9-24 for more information
- create, modify and delete user groups; see Procedures 9-17 and 9-20 for more information
- create, modify and delete users; see Procedures 9-18 and 9-21 for more information
- suspend or reinstate users; see Procedures 9-6 and 9-25 for more information
- configure GUI inactivity timeout values; see Procedure 9-3 for more information
- configure password expiry; see Procedure 9-3 for more information

15 Monitor and manage the active client sessions, as required. See Procedures 9-26, 9-27, and 9-28 for more information.

16 As required, manage the user and system logs. See Procedures 9-33, 9-34, and 9-35 for more information.

9.5 5620 SAM user and group security management procedures

This section provides procedures to create and manage users and user groups.

Procedure 9-1 To create a proprietary 5620 SAM login statement

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Configure the security statement parameters:

- Enabled
- Statement

3 Click on the OK button. A dialog box appears.

4 Click on the Yes button. The 5620 SAM User Security - Security Management (Edit) form closes.

The Statement parameter text is displayed on the login form during each subsequent client GUI login attempt.

Procedure 9-2 To reserve an admin account login

You can reserve one client GUI session, from the maximum number of sessions allowed by the license key, for admin users only. This allows an administrator to manage the existing client GUI sessions.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Configure the Reserve Administrator Login parameter.

3 Click on the OK button to save the changes and close the form. A dialog box appears.

4 Confirm the action by clicking on the Yes button.

5 Log in as required.

Procedure 9-3 To configure expiry periods and a GUI inactivity timeout

You can configure global expiry periods for user accounts, passwords, and client GUI inactivity checks. You can configure per user group expiry periods for client GUI inactivity checks. You can enable a password history count.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Configure the Password History Duration (days) and Password Reuse Cycle parameters.

3 Configure the global expiry period parameters:

- Account Expiry (days)
- Password Expiry (days)
- Client Timeout (minutes)
- Advance Password Expiry Notification (days)

If you set any of the parameters to 0, the corresponding expiry period check is disabled. To change the client inactivity check timeout for individual user groups, see Procedure 9-17.

4 Click on the OK button to save the changes and close the form. A dialog box appears.

5 Confirm the action by clicking on the Yes button.

When a user attempts to log in with an expired password, the user account is suspended. When a user updates her or his password, the password expiry period is reset, and the new password again expires when the Password Expiry (days) parameter value is reached.

Procedure 9-4 To configure the minimum allowable user name length

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 In the User Name panel, check the Enable box.

3 Configure the Minimum User Name Length Allowed parameter. Select a range between 5 to 40 characters, the minimum is 5 characters.

4 Click on the OK button to save the changes and close the form. A dialog box appears.

5 Confirm the action by clicking on the Yes button.

Procedure 9-5 To configure authentication failure actions

You can specify an authentication message or a lockout for a user account that exceeds the configured number of login authentication attempts. Only non-admin accounts can be locked out, as admin accounts always have access.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the E-mail tab button.

3 Configure the authentication failure action parameters:

- Attempts before lockout
- Attempts before e-mail
- E-mail Subject
- E-mail text

If you set the Attempts before lockout parameter to 0, the lockout function is disabled.

4 Click on the OK button to save the changes and close the form. A dialog box appears.

5 Confirm the action by clicking on the Yes button.

Procedure 9-6 To configure suspended account actions

You can specify a suspended account message for a user account when you suspend the user account using the User State parameter.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the E-mail tab button.

3 Configure the suspended account parameters:

- E-mail Subject
- E-mail text

4 Click on the OK button to save the changes and close the form. A dialog box appears.

5 Confirm the action by clicking on the Yes button.

Procedure 9-7 To configure automated e-mail delivery

Perform this procedure to specify the e-mail parameters for automated 5620 SAM messages to users and administrators; for example, when locking out a user account that exceeds the allowed number of authentication attempts.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the E-mail tab button.

3 Configure the outgoing e-mail server SMTP parameters:

- Server
- E-mail User Name
- E-mail User Password
- E-mail Address

4 Configure the Test Message parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The 5620 SAM User Security - Security Management (Edit) form closes.

Procedure 9-8 To create a scope of command role

Perform this procedure to create a set of user permissions that define an operator role. You can apply one or more scope of command roles to a user group using a scope of command profile.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Scope of Command tab button.

3 Click on the Create button and choose Role. The Role (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Role ID
- Role Name
- Description

5 Perform the following steps to configure the permissions for the scope of command role.

i Click on the Permissions tab button. A list of the 5620 SAM packages, methods, and classes is displayed.

Note — When you enable the Create permission for a 5620 SAM package, method, or class, the Update/Execute permission is automatically enabled.

When you enable the Update/Execute permission for a 5620 SAM package, method, or class, the Create permission is not automatically enabled.

ii Select the required access permissions, which are displayed in the list column headings, for each package, class, or method that you want to assign to the scope of command role.

6 Click on the OK button. The Role (Create) form closes.

7 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-9 To create a scope of command profile

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Scope of Command tab button.

3 Click on the Create button and choose Profile. The Scope of Command Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Profile ID
- Profile Name
- Description

5 Perform the following steps to assign one or more scope of command roles to the profile.

i Click on the Roles tab button.

ii Click on the Add button. The Select Role - Role form opens.

iii Select one or more roles and click on the OK button. The Select Role - Role form closes and a dialog box appears.

iv Click on the OK button.

v Click on the OK button. The Scope of Command Profile (Create) form closes.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-10 To delete a scope of command role

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Scope of Command tab button.

3 Choose Role (Security) from the object drop-down list and click on the Search button. A list of scope of command roles is displayed.

4 Select a role in the list and click on the Delete button. A dialog box appears.

Note 1 — You cannot delete a predefined scope of command role.

Note 2 — You cannot delete a scope of command role that is assigned to a scope of command profile when the scope of command profile is assigned to a user group that contains users.

5 Click on the Yes button. The 5620 SAM deletes the scope of command role.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-11 To delete a scope of command profile

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Scope of Command tab button.

3 Choose Profile (Security) from the object drop-down list and click on the Search button. A list of scope of command profiles is displayed.

4 Select a profile in the list and click on the Delete button. A dialog box appears.

Note — You cannot delete a scope of command profile that is assigned to a user group that contains users.

5 Click on the Yes button. The 5620 SAM deletes the scope of command profile.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-12 To create a span of control

Perform this procedure to specify a set of 5620 SAM objects in a span of control and the type of user access available for the objects. You can apply one or more spans to a user group using a span of control profile.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Span of Control tab button.

3 Click on the Create button and choose Span. The Span (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Span ID
- Span Name
- Description

5 Click on the Contents tab button.

6 Click on the Add button and choose an object type from the menu. The Select *(object_type)* list form opens.

7 Select one or more objects and click on the OK button. The Select *(objects)* list form closes and the objects are listed on the Span (Create) form. A dialog box appears.

8 Click on the OK button. The Span (Create) form closes.

9 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-13 To create a span of control profile

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Span of Control tab button.

3 Click on the Create button and choose Profile. The Span of Control Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Profile ID
- Profile Name
- Description

5 Perform the following steps to assign one or more spans to the profile.

i Click on the Spans tab button. The predefined spans are listed.

ii Click on the Add button and choose an access type. The Select *access_type* Spans form opens.

iii Select one or more spans in the list and click on the OK button. The Select *access_type* Spans form closes, and a dialog box appears.

iv Click on the OK button. The spans are listed on the Span of Control Profile (Create) form with the type of access displayed in the Access Type column.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-14 To create a span rule

Perform this procedure to create a span rule. A span rule is a policy that specifies to which span of control profiles, in addition to the Default Service Span, a newly created 5620 SAM service is automatically assigned.

1 Using an account with an assigned security scope of command role, choose Administration→Span Rules from the 5620 SAM main menu. The Span Rules form opens.

2 Click on the Create button. The Service Creation Span Rule (Create) form appears.

3 Configure the parameters:

- Auto-Assign ID
- Span Rule ID
- Name
- Created In

4 Perform the following steps to associate one or more spans with the rule.

i Click on the Spans tab button.

ii Click on the Add button. The Select Span(s) form opens.

iii Select one or more spans in the list.

iv Click on the OK button. The Select Span(s) form closes and the selected spans are listed on the Service Creation Span Rule (Create) form.

5 Perform the following steps to associate one or more format or range policies with the rule.

i Click on the Format and Range Policies tab button.

ii Click on the Add button. The Select Format or Range Policies form opens.

iii Select one or more policies in the list.

iv Click on the OK button. The Select Span(s) form closes and the selected policies are listed on the Service Creation Span Rule (Create) form.

6 Click on the OK button. The Service Creation Span Rule (Create) form closes.

Procedure 9-15 To delete a span of control

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Span of Control tab button.

3 Choose Span (Security) from the object drop-down list and click on the Search button. A list of spans is displayed.

4 Select a span in the list and click on the Delete button. A dialog box appears.

Note — You cannot delete a default span, or a span in a span of control profile that is assigned to a user group that contains users.

5 Click on the Yes button. The 5620 SAM deletes the span of control.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-16 To delete a span of control profile

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Span of Control tab button.

3 Choose Profile (Security) from the object drop-down list and click on the Search button. A list of span of control profiles is displayed.

4 Select a profile in the list and click on the Delete button. A dialog box appears.

Note — You cannot delete a span of control profile that is assigned to a user group that contains users.

5 Click on the Yes button. The 5620 SAM deletes the span of control profile.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-17 To create a 5620 SAM user group

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the User Groups tab button.

3 Perform one of the following:

a Create a new group by clicking on the Create button. The User Group (Create) form opens with the General tab displayed.

b Modify an existing group by performing the following steps.

i Set the filter criteria.

ii Click on the Search button. A list of groups is displayed.

iii Select a group in the list and click on the Properties button. The User Group (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- User Group
- Description
- User Group State
- Apply Local Authentication Only
- Maximum User Sessions Allowed
- Account Expiry
- Password Expiry
- Override Global Timeout
- Client Timeout (minutes)

5 If the user group is intended for use by remote users, configure the parameters:

- Maximum GUI Sessions Allowed
- Maximum OSS Sessions Allowed
- Priority

6 Perform the following steps to assign a scope of command profile to the user group.

i Click on the Select button in the Scope of Command panel. The Select Scope of Command Profile form opens.

ii Select a profile in the list and click on the OK button. The Select Scope of Command Profile form closes, and the User Group (Create) form displays the scope of command profile name.

7 Perform the following steps to assign a span of control profile to the user group.

i Click on the Select button in the Span of Control panel. The Select Span of Control Profile form opens.

ii Select a profile in the list and click on the OK button. The Select Span of Control Profile form closes, and the User Group (Create) form displays the span of control profile name.

8 If you are creating a new user account, perform the following steps.

i Click on the OK button. The User Group (Create) form closes.

ii Go to step 15.

9 Click on the Format and Range Policies tab button.

10 Click on the Add button. The Select Format or Range Policies form opens.

11 Select one or more policies in the list and click on the OK button.

12 Click on the OK button. A dialog box appears.

Note — When you change the scope of command or span of control profiles of a group, the permissions of each user in the group are altered immediately when you click on the OK button.

13 Click on the Yes button. The User Group (Create) form closes.

14 If an active client GUI session is affected by the user group modification, restart the GUI client.

15 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-18 To create a 5620 SAM user account

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Users tab button.

3 Perform one of the following:

a Create a new user account by clicking on the Create button. The User (Create) form opens with the General tab displayed.

b Modify an existing user account by performing the following steps.

i Set the filter criteria.

ii Click on the Search button. A list of user accounts is displayed.

iii Select an account in the list and click on the Properties button. The User (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- User Name
- Description
- User State
- E-mail Address
- Priority
- Password Change Required
- User Password
- Confirm Password
- Maximum Sessions Allowed
- Maximum OSS Sessions Allowed
- Valid Client IP address
- Enable IP Address validation

Note — If the user account is for a remote user, you cannot configure the Maximum Sessions Allowed, Maximum OSS Sessions Allowed, or Priority parameters. For remote users, these parameters are derived from the user group configured on the user account.

5 You can test the validity of the user e-mail address by clicking on the Test E-mail button beside the E-mail Address parameter.

Note — Before you test the validity of the user e-mail address, ensure that the outgoing SMTP e-mail server and e-mail test message are configured. See Procedure 9-7 for information about configuring the outgoing e-mail server and test message.

6 Perform the following steps to choose a user group for the user account.

i Click on the Select button. The groupName form opens.

ii Select a user group in the list and click on the OK button. The groupName form closes, and the User (Create) form displays the user group name.

7 If you are creating a new user account, perform the following steps.

   i Click on the OK button. The User Group (Create) form closes.

   ii Go to step 13.

8 Click on the Format and Range Policies tab button.

9 Click on the Add button. The Select Format or Range Policies form opens.

10 Select one or more policies in the list and click on the OK button.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The User (Edit) form closes.

13 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-19 To copy a 5620 SAM user account

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Users tab button.

3 Set the filter criteria and click on the Search button. A list of configured users opens.

4 Choose a user from the list and click on the Properties button. The User *type_of_user*, Group *user_group* (Edit) form opens.

5 Click on the Copy button. A User (Create) form opens for the second user.

6 Configure the parameters, as required. You must change the User Name parameter and configure the User Password and Confirm Password parameters.

7 Click on the OK button to save the changes and close the form.

8 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-20 To delete a 5620 SAM user group

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the User Groups tab button.

3 Configure the filter criteria and click on the Search button. A list of user groups is displayed.

4 Select a group in the list and click on the Delete button. A dialog box appears.

Note — You cannot delete a user group that contains users.

5 Click on the Yes button. The 5620 SAM deletes the user group.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-21 To delete a 5620 SAM user account

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Users tab button.

3 Configure the filter criteria and click on the Search button. A list of user accounts is displayed.

4 Select an account in the list and click on the Delete button. A dialog box appears.

Note — When a user account is associated with a scheduled task, you must decide whether to remove the schedules. If you do not want to remove the schedules, no schedules are removed. If you do want to remove schedules, the schedules associated with the user account are removed if the schedule is not associated with a scheduled task. Schedules that are associated with a scheduled task are not removed.

5 Click on the Yes button. The 5620 SAM deletes the user account.

6 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 9-22 To create RADIUS and TACACS+ authentication policies for 5620 SAM user accounts

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM RADIUS/TACACS+ User Authentication from the 5620 SAM main menu. The RemoteAuthenticationManager (Edit) form opens with the General tab displayed.

2 Configure the parameters:

- Authentication Order 1
- Authentication Order 2
- Authentication Order 3

3 Click on the RADIUS tab button to configure RADIUS authentication server parameters.

4 Click on the Create button. The SAM RADIUS Authentication Server (Create) form opens.

5 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Address
- Port
- Retry Attempts
- Timeout (seconds)
- Secret Name

6 Click on the OK button to save the changes.

7 Verify the action.

8 Click on the TACACS tab button to configure TACACS+ authentication server parameters.

9 Click on the Create button. The SAM TACACS+ Authentication Server (Create) form opens.

10 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Address
- Timeout (seconds)
- Secret Name

11 Click on the OK button to save the changes.

12 Verify the action.

13 Click on the Faults tab to view alarms, as required.

14 Click on the OK button to save the changes and close the form.

Procedure 9-23 To configure remote authentication and authorization for remote-only users

Note 1 — Ensure that remote authentication is enabled. See Procedure 9-22 for information about creating RADIUS and TACACS+ authentication policies.

Note 2 — See "Remote authentication and authorization for users with no 5620 SAM user account" in section 9.1 for information about remote authentication and authorization for remote-only users.

1 Perform one of the following:

a To configure remote authentication and authorization for remote-only users where the 5620 SAM provides the user group to which the user belongs, go to step 2.

Note — The samvsa flag must be set to false in the SamJaasLogin.config file. The default value is false. The SamJaasLogin.config file is located in the server installation configuration directory, typically C:\5620sam\client\nms\config or /opt/5620sam/server/nms/config.

b To configure remote authentication and authorization for remote-only users where the remote authentication server provides the user group to which the user belongs, go to step 3.

2 Specify the default external user group.

i Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

ii Configure the default external user group parameter: User Group.

iii Click on the Select button. The Select Group - TSecurityManager form opens.

iv Select a user group and click on the OK button. The Select Group - TSecurityManager form closes and the 5620 SAM User Security - Security Management (Edit) form refreshes with the selected user group.

Note — Do not select a user group that has the Apply Local Authentication Only parameter enabled. Doing so may cause subsequent login attempts to fail once the user is created locally in 5620 SAM.

v Click on the OK button. A dialog box appears.

vi Click on the Yes button. The 5620 SAM User Security - Security Management (Edit) form closes.

3 Modify the SamJaasLogin.config file.

Note — Ensure that you create a backup of the SamJaasLogin.config file before you make any modifications to it.

i Log in to the 5620 SAM main server station as the samadmin user.

ii Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

iii Open the SamJaasLogin.config file using a text editor.

iv If RADIUS authentication is enabled, find the RADIUSLogin section of the file and change the samvsa flag to true. The following is an example of the file text:

```
RADIUSLogin
{
  com.timetra.nms.jaas.provider.radius.auth.RadiusJaasLoginM
odule REQUIRED
debug=false
  samvsa=true
;
};
```

If TACACS+ authentication is enabled, find the TACACSLogin section of the file and change the samvsa flag to true. The following is an example of the file text:

```
TACACSLogin
{
  com.timetra.nms.jaas.provider.tacacs.auth.TacacsPlusJaasLo
ginModule REQUIRED
debug=false
  samvsa=true
;
};
```

v Save the file.

vi Close the file.

vii Enter the following at the CLI prompt:

```
bash$ path/nms/bin/nmsserver.bash read_config ↵
```

where
path is the 5620 SAM server installation location, typically opt/5620sam/server

The 5620 SAM server puts the configuration changes into effect.

4 Define the user group VSA on the remote authentication server.

Note — Step 4 must be performed by the remote authentication server administrator.

Perform one of the following:

a If RADIUS authentication is enabled:

i Copy the example of the RADIUS dictionary below to the RADIUS dictionary file. Enter changes to the file based on your RADIUS configuration.

ii Configure the RADIUS user profile and add a previously defined 5620 SAM user group name to the Sam-security-group-name VSA. The following is an example of the RADIUS user group VSA:

```
Sam-security-group-name="user_group_name_locally_defined
_in_5620SAM"
```

The VSA configuration file contains information such as usernames, passwords, and the 5620 SAM user group name. The user authentication process returns the user group name in the Sam-security-group-name VSA of the access-accept message.

The following is an example of the RADIUS dictionary text:

```
##########################################################
###
#           Alcatel-Lucent 5620 SAM Server
dictionary.    #
#  $Id: dictionary.alcatel.sam,v
1.1 2006/08/18 10:00:22$ #
##########################################################
####

VENDOR          Alcatel-Lucent                      123

BEGIN-VENDOR                             Alcatel-Lucent

ATTRIBUTE       Sam-security-group-name      3       stri
ng

END-VENDOR                               Alcatel-Lucent
```

Note 1 — The user group must be a valid user group in the 5620 SAM.

Note 2 — The vendor ID must be 123.

b If TACACS+ authentication is enabled, define the 5620 SAM user group VSA in the user profile on the TACACS+ server. The following is an example of the TACACS+ user group VSA:

```
service=sam-app{
  sam-security-group="user_group_name_locally_defined_in_562
0SAM"
}
```

Note — The user group must be a valid 5620 SAM user group.

Procedure 9-24 To search for inactive user accounts

1 Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens with the General tab displayed.

2 Click on the Users tab button.

3 Click on the Inactive User Search button and perform one of the following.

- **a** Choose 90 Days.
- **b** Choose 180 Days.
- **c** Choose Custom. The User Inactivity Period form opens.
    - **i** Configure the User inactive greater than or equal to parameter.
    - **ii** Click on the OK button to close the form and return to the Inactive User Search form.

4 User accounts that have been inactive for a number of days that is greater than or equal to the value entered in step 3 are displayed.

5 Perform actions for inactive user accounts, as required.

Procedure 9-25 To suspend or reinstate a 5620 SAM user account

1 Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Users tab.

3 Specify a filter to create a filtered list of users and click on the Search button.

4 Choose a user from the user list.

5 Click on the Properties button. The User *type_of_user* (Edit) form opens.

6 Suspend or reinstate the user.

   a To suspend the user, set the User State parameter to suspended.

   b To reinstate the user, set the User State parameter to active.

7 Click on the Apply button to save the changes.

8 Verify the action.

9 Close the form.

Procedure 9-26 To administratively change the password of a 5620 SAM user

The system administrator uses the Security Management form to maintain user accounts. The user can change their password in a separate form. If a user forgets their password, the system administrator can change the password and inform the user of the new password.

1 Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Users tab button.

3 Specify a filter to create a filtered list of users and click on the Search button.

4 Choose a user from the user list.

5 Click on the Properties button. The User *type_of_user* (Edit) form opens.

6 Configure the User Password parameter and the Confirm Password parameter.

7 Click on the Apply button to save the changes.

8 Verify the action.

9 Close the form.

When a user attempts to log in with an expired password, the user account is suspended. When a user updates her or his password, the password expiry period is reset, and the new password again expires when the Password Expiry (days) parameter value is reached.

Procedure 9-27 To request a password change for a 5620 SAM user

The system administrator uses the Security Management form to maintain user accounts. The system administrator can request a password change for a specific 5620 SAM user. The user can change their password in a separate form.

Note — This change does not affect the current user session.

1 Choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Users tab button.

3 Specify a filter to create a filtered list of users and click on the Search button.

4 Choose a user from the user list.

5 Click on the Properties button. The User *type_of_user* (Edit) form opens.

6 Enable the Password Change Required check box to request a password change for the user.

7 Click on the Apply button to save the changes.

8 Verify the action.

9 Close the form.

The next time the user logs in to 5620 SAM, the user will be prompted to change his or her password. Once the user changes his or her password, the Password Change Required check box returns to the default of unchecked.

Procedure 9-28 To change the password of the current 5620 SAM user

Users change their password in the Change Password form.

1 Start the 5620 SAM and log in using your user name and password.

2 Choose Administration→Security→Change Password from the 5620 SAM main menu. The Password Change form opens.

3 Verify that the Login Name matches your user account name.

4 Configure the parameters:

- Old Password
- New Password
- Confirm Password

5 Click on the OK button to save the changes.

6 Confirm the action, as required.

7 Close the form.

When a user attempts to log in with an expired password, the user account is suspended. When a user updates her or his password, the password expiry period is reset, and the new password again expires when the Password Expiry (days) parameter value is reached.

Procedure 9-29 To configure the number of allowed client sessions for a client delegate server

Note — The 5620 SAM continues to accept new client sessions from a client delegate server after the allowed number of sessions is reached. The maximum number of sessions is to be used as a guide for balancing the client session load among multiple client delegate servers.

1 Using an account with Update permission on the Server package, choose Administration→System Information from the 5620 SAM main menu. The System Information form opens with the General tab displayed.

2 Click on the Client Delegate Servers tab button.

3 Specify a filter and click on the Search button. A list of client delegate servers is displayed.

4 Select an entry in the list and click on the Properties button. The Client Delegate Server (Edit) form opens.

5 Configure the Maximum UI Sessions parameter.

6 Click on the OK button. The Client Delegate Server (Edit) form closes and the System Information form reappears.

7 Closes the System Information form.

Procedure 9-30 To view and manage the active 5620 SAM client sessions

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Sessions tab button.

3 Specify a filter to create a filtered list of GUI or 5620 SAM-O JMS client sessions and click on the Search button. The list of currently active client sessions opens.

4 Review the following session information:

- user name logged in for the client GUI session
- ID of the session
- time and date that the session started
- user group privileges for the session
- type of client, either a GUI (5620 SAM) or 5620 SAM-O JMS (SAMOSS) client
- IP address of the client

5 Perform one of the following:

a Close the form.

b Choose a session from the list and click on the Close Session button to shut down the client session.

Note — There are additional dependencies for closing a 5620 SAM-O session. See Procedure 9-32 for more information.

6 Validate the action.

7 Close the form.

Procedure 9-31 To send a text message to 5620 SAM GUI users

Administrative users can send broadcast messages to some or all active GUI users logged into the 5620 SAM. This is useful for sending maintenance and similar notifications to active users.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Sessions tab button.

3 Specify a filter to create a filtered list of GUI client sessions and click on the Search button. A list of active client sessions is displayed.

4 Select the required client sessions in the list.

5 Click on the Text Message button. The Text Message form opens.

6 Enter your text message in the Text Message form and click on OK. The text message is sent to the selected clients.

7 Close the Security Management (Edit) form.

Procedure 9-32 To disconnect a 5620 SAM-O JMS client connection or remove a durable subscription

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Security - Security Management (Edit) form opens.

2 Click on the Messaging Connections tab button.

3 Specify a filter to create a filtered list 5620 SAM-O JMS client connections and click on the Search button. The list of currently active client connections opens.

4 Perform one of the following:

a Choose a JMS connection from the list and click on the Close Connection button to shut down the client connection. The connection to the server is terminated when you close a durable JMS connection, however, the subscription continues to store JMS messages.

b Choose a JMS connection from the list and click on the Remove Connection button to shut down the client connection and remove the durable subscription. The server stops storing the JMS messages for the session.

Note — When you remove a durable subscription, the OSS client can still attempt to connect to the 5620 SAM-O server. You can prevent an OSS client from attempting to connect by suspending the OSS user account. See Procedure 9-25 for more information.

5 Validate the action.

6 Close the form.

Procedure 9-33 To view client usage and activity logs

Perform this procedure to view client activity log entries to identify the 5620 SAM user and action associated with a network problem. Activity log collection is enabled by default. See the *5620 SAM Troubleshooting Guide* for more information about troubleshooting using the 5620 SAM client activity log.

Note — A user with LI privileges can see and access LI-related activity and usage records. A 5620 SAM user with appropriate access can see all non-LI related activity and usage records.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM Usage and Activity Records from the 5620 SAM main menu. The 5620 SAM Usage and Activity Records form opens.

2 Choose a type of user log from the object drop-down list:

- Database Log to view information about changes to the database due to actions performed by the client
- Deployment Log to view information about deployment requests sent from the client
- Session Log to view information about the current client session, including operations performed and permissions for the logged in user account
- User Read Log to view information about data viewed by users of the client
- User Request Log to view information about user requests sent from the client

3 Specify a filter to create a filtered list of logs, and click on the Search button. The list of logs opens.

4 To edit the log, choose a log from the list and click on the Properties button. The log opens. Review the log information. See the *5620 SAM Troubleshooting Guide* for more information about reading and interpreting logs.

The information displayed depends on the type of log. For example, user read logs display:

- username logged in for the client session
- timestamp information
- type of operation performed; for example, configuration
- user account name that performed the operation
- target class against which the operation was performed
- information about the actions performed, based on the log type

When you are finished editing the log, click on the Close button to close the log.

5 Click on the Close button to close the 5620 SAM Usage and Activity Records form.

Procedure 9-34 To save activity or usage logs to a file

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM Usage and Activity Records from the 5620 SAM main menu. The 5620 SAM Usage and Activity Records form opens.

2 Choose a type of user log from the object drop-down list:

- Database Log to view information about changes to the database due to actions performed by the client
- Deployment Log to view information about deployment requests sent from the client
- Session Log to view information about the current client session, including operations performed and permissions for the logged-in user account
- User Read Log to view information about data viewed by users of the client
- User Request Log to view information about user requests sent from the client

3 Specify a filter to create a filtered list of logs, and click on the Search button. The list of logs opens.

4 Highlight the log records that appear in the search list.

5 Right-click on a column heading and choose Save to File from the contextual menu. The Save As form appears.

6 Save the results.

i To choose a directory in which to save the listed information, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose HTML or CSV from the File of Type drop-down menu.

iv Click on the Save button. The results of the inventory search are saved to the specified HTML or CSV file.

7 Close the 5620 SAM Usage and Activity Records form.

Procedure 9-35 To configure client usage and activity logging

Perform this procedure to configure how the 5620 SAM logs client activity. Activity log entries can identify the 5620 SAM user and action associated with a network problem. Activity log collection is enabled by default. See the *5620 SAM Troubleshooting Guide* for more information about troubleshooting using the 5620 SAM client activity log.

Note — A user with LI privileges can see and access LI-related activity and usage records. A 5620 SAM user with appropriate access can see all non-LI related activity and usage records.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM Usage and Activity Records from the 5620 SAM main menu. The 5620 SAM Usage and Activity Records form opens.

2 Choose a type of user log from the object drop-down list:

- Database Log to view information about changes to the database due to actions performed by the client
- Deployment Log to view information about deployment requests sent from the client
- Session Log to view information about the current client session, including operations performed and permissions for the logged-in user account
- User Read Log to view information about data viewed by users of the client
- User Request Log to view information about user requests sent from the client

3 Click on the Log Policy button to specify how much data to collect and store in the log or whether to turn logging off. The appropriate logger configuration form opens.

i Configure the parameters:

- Retention Time (hours)
- Administrative State

Click on the Apply button to save the changes.

ii Click on the Purge Log Records button to delete log records. Log records that meet storage specifications are stored and can be viewed. See the *5620 SAM Statistics Management Guide* for more information.

iii Click on the OK or Cancel button to close the Edit Policy form.

4 Click on the Close button to close the 5620 SAM Usage and Activity Records form.

10 — 5620 SAM SSL security

10.1 5620 SAM SSL security overview

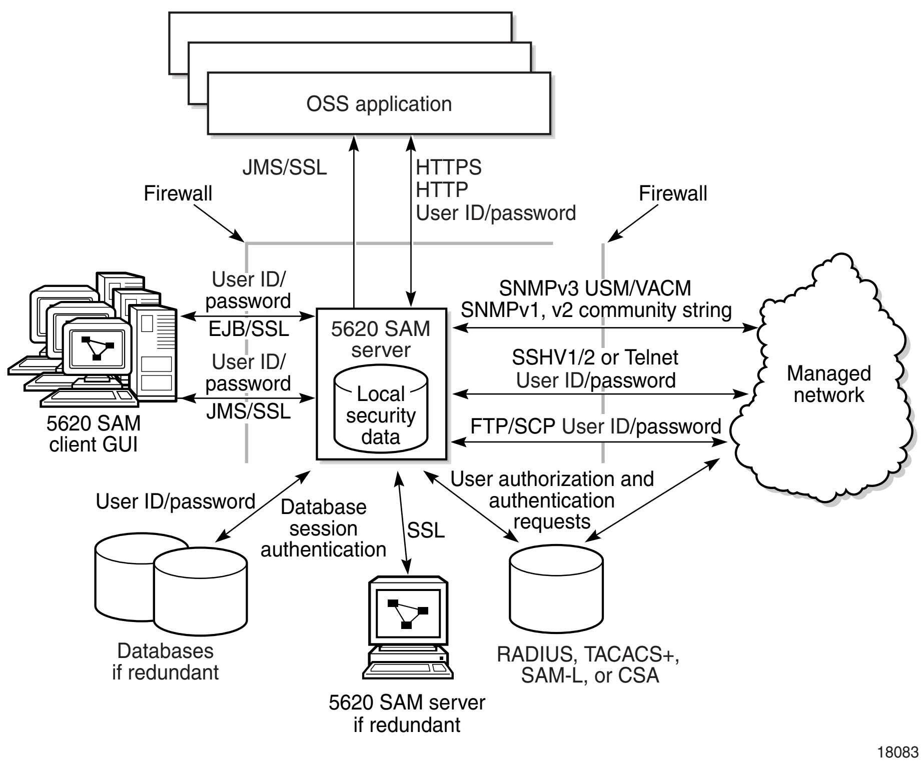
Secure Sockets Layer, or SSL, is a security mechanism for data encryption, client authentication, and message integrity. You can configure SSL for secure communication between 5620 SAM main servers and other 5620 SAM components such as GUI and OSS clients, client delegate servers, and auxiliary servers.

Note — You cannot selectively enable SSL on the components in a 5620 SAM system. If you enable SSL on a main server, you must enable SSL in all other 5620 SAM server and client configurations.

SSL secures the EJB, JMS, and HTTP interfaces of 5620 SAM single-user GUI clients and client delegate servers, and the JMS and HTTP interfaces of OSS clients. When SSL is enabled on a 5620 SAM GUI or OSS client, the client uses HTTPS instead of HTTP.

Figure 10-1 shows the communication channels between 5620 SAM components.

Figure 10-1 5620 SAM communication channels and security



SSL requires a security certificate that is shared among members of a network domain. The certificate can be generated locally, or obtained from a certification authority, or CA. A locally generated certificate, which is called a self-signed certificate, is for use only in a private network.

SSL security certificates are stored in a keystore file on a 5620 SAM main server. A truststore file, which is also stored on a main server, contains SSL security certificates from trusted entities.

You can enable 5620 SAM SSL by specifying the keystore and truststore files during a 5620 SAM installation or upgrade, or by using the 5620 SAM configuration utility on an installed system. If SSL is configured and enabled on a 5620 SAM Release 9.0 or later system, the SSL configuration is maintained through subsequent upgrades.

A 5620 SAM server can act as an SSL client to another server. For example, in a redundant 5620 SAM deployment, the standby main server is an SSL client of the primary main server. Also, when SSO is configured, a 5620 SAM main server keystore must contain the SSL certificate of the remote server.

A main server automatically distributes the truststore file to each 5620 SAM GUI client. However, you must manually copy the truststore file to the other main server in a redundant deployment, and to each auxiliary server and OSS client in the 5620 SAM system.

Note 1 — To enable or disable SSL on a single-user GUI client or delegate client, you must uninstall the single-user client or client delegate server software, and then select the appropriate SSL option during the client or client delegate server re-installation. A GUI client cannot connect to a main server that has a different SSL configuration, so the main server cannot update the client SSL configuration.

Note 2 — Alcatel-Lucent recommends using the Java Key Store, or JKS, keystore format in a 5620 SAM system. If you have a keystore in a different format, for example, PKCS12, you can use the Java keytool utility to convert the keystore to JKS format, as described at the following location:

http://download.oracle.com/javase/6/docs/technotes/tools/solaris/keytool.html

10.2 Workflow to configure SSL for a 5620 SAM system

Caution 1 — Configuring SSL in a standalone 5620 SAM system requires a shutdown of the main server, which causes a network management outage. Configure SSL in a 5620 SAM system only during a scheduled maintenance period.

Caution 2 — Configuring SSL in a redundant 5620 SAM system requires a server activity switch, which causes a network management outage. Configure SSL in a 5620 SAM system only during a scheduled maintenance period.

1 Prepare the required keystore and truststore files. See Procedure 10-1 for more information.

i If you do not want to use a self-signed security certificate, request a security certificate from a CA.

ii If you use a self-signed security certificate, generate an SSL keystore file.

iii If the security certificate in the keystore file is self-signed, export the certificate to a certificate file.

iv Import the self-signed or CA certificate from the certificate file to the default truststore file on the main server.

v Copy the truststore file from the main server station to the following stations in the 5620 SAM system:

- the other main server station in a redundant deployment
- each auxiliary server station
- each OSS client station

2 If the 5620 SAM system is deployed in a redundant configuration, enable SSL on the standby main server. See Procedure 10-2 for more information.

3 Enable SSL on each reserved auxiliary server. See Procedure 10-3 for more information.

4 If the 5620 SAM system includes multiple GUI clients, enable SSL on one GUI client or client delegate server to minimize the loss of network visibility during the required server activity switch. See Procedures 10-4 and 10-5 for more information.

5 If the 5620 SAM system is deployed in a redundant configuration, enable SSL on the primary main server. See Procedure 10-2 for more information.

6 If the 5620 SAM system is deployed in a standalone configuration, enable SSL on the standalone main server. See Procedure 10-2 for more information.

7 Enable SSL on each preferred auxiliary server. See Procedure 10-3 for more information.

8 Enable SSL on the remaining GUI clients and client delegate servers. See Procedures 10-4 and 10-5 for more information.

9 Enable HTTPS on each OSS client. See Procedure 10-6 for more information.

10.3 SSL configuration procedures

The following procedures describe how to configure and enable SSL in a 5620 SAM system.

Procedure 10-1 To prepare a 5620 SAM system for SSL configuration

Perform this procedure to create the keystore and truststore files required for SSL security in a 5620 SAM system.

Caution — Alcatel-Lucent strongly recommends that you obtain an SSL security certificate from a CA.

Note — The Solaris keytool command-line options specified in this procedure are the basic options required to generate a CSR, generate a keystore file, and import and export certificates. Visit the following URL for information about the available command-line options:

http://download.oracle.com/javase/6/docs/technotes/tools/solaris/keytool.html

1 Log on to a 5620 SAM main server station as the samadmin user.

2 Open a console window.

3 Navigate to the *path*/jre/bin directory.

where *path* is the 5620 SAM server installation location, typically /opt/5620sam/server

4 Perform one of the following to generate a keystore file using the keytool utility.

a Generate a keystore file that contains a security certificate from a CA.

i Enter the following to generate a certificate signing request, or CSR:

```
bash$ ./keytool -certreq -alias alias -sigalg sigalg
-file certreq_file -keypass keypass -storetype JKS
```

where
alias is a case-insensitive alias that is required for subsequent keytool operations
sigalg is the encryption algorithm for signing the CSR, such as SHA or RSA
certreq_file is the output file that is to contain the CSR
keypass is the password to assign to the keystore

ii Send the generated CSR file to a CA. The CA authenticates the certificate requestor and returns a certificate or certificate chain, which is used to replace the existing certificate chain in a keystore.

b Generate a keystore file that contains a self-signed security certificate.

i Enter the following to generate a keystore file:

```
bash$ ./keytool -genkey -alias alias -keyalg RSA -keypass
password -storepass password -keystore destination_file
-validity days -dname "CN=common_name, OU=org_unit,
O=org_name, L=locality, S=state, C=country" ↵
```

where
alias is a case-insensitive alias that is required for subsequent keytool operations
password is a password used to secure the key and keystore
destination_file is the path and name of the keystore file
days is the number of days before the SSL key expires; the default is 90 if the -validity option is not specified
and where the following comprise the X.500 distinguished name:
common_name is the name of a person
org_unit is a department or division name
org_name is a company name
locality is a city name
state is a state or region name
country is a country code, for example, US

The following is an example keystore generation command:

```
./keytool -genkey -alias bob -keyalg RSA -keypass
BobsPassword -storepass
BobsPassword -keystore /opt/samserver.keystore -validity
365 -dname "CN=Bob Smith, OU=Accounting, O=ABC Inc.,
L=Pittsburgh, S=Pennsylvania, C=US"
```

In this example, the utility creates the /opt/samserver.keystore file, which contains the SSL key. The key is valid for 365d, or one year.

ii Record the keystore password.

iii Enter the following to export the certificate from the keystore file to a certificate file:

bash$ **./keytool -export -alias *alias* -keystore *keystore_file* -storepass *password* -file *certificate_file*** ↵

where
alias is the keystore alias specified during keystore generation
keystore_file is the generated keystore file, for example, /opt/samserver.keystore
password is the keystore password
certificate_file is the path and name of the certificate file to create

5 Enter the following to import the certificate from the certificate file to a truststore file on the main server:

Note — You can import the certificate to the default 5620 SAM truststore file, or to an existing truststore file. The default 5620 SAM truststore file is *path*/nms/config/ssl/trustStore/cacerts.trustStore, where *path* is the 5620 SAM server installation directory, typically /opt/5620sam/server.

bash$ **./keytool -importcert -trustcacerts -alias *alias* -file *certificate_file* -keystore *truststore_file* -storepass *password***

where
alias is the keystore alias
certificate_file is the self-signed or CA certificate file
truststore_file is the truststore file to which you want to import the certificate
password is the truststore password

6 Copy the truststore file from the main server station to the following stations in the 5620 SAM system:

Note — You must copy the truststore file to the same location on each station in the system, for example, /opt.

- the other main server station in a redundant deployment
- each auxiliary server station
- each OSS client station

Procedure 10-2 To enable SSL on a main server

Perform this procedure to enable SSL encryption on a 5620 SAM main server for communication with other 5620 SAM components.

Caution — Configuring SSL on a 5620 SAM main server requires a shutdown of the server software and causes a network-management outage. Ensure that you perform this procedure only during a scheduled maintenance period.

Note — You must perform this procedure on each main server In a redundant 5620 SAM deployment. See section 10.2 for information about the order in which the main servers must be configured.

1 Stop the 5620 SAM main server application.

i Log in to the main server station as the samadmin user.

ii Open a console window.

iii Enter the following to change to the server binary directory:

```
bash$ cd path/nms/bin ↵
```

where *path* is the 5620 SAM server installation location, typically /opt/5620sam/server

iv Enter the following to stop the 5620 SAM main server software:

```
bash$ ./nmsserver.bash stop ↵
```

v Enter the following to display the 5620 SAM main server status:

```
bash$ ./nmsserver.bash appserver_status ↵
```

The command displays a status message.

vi The 5620 SAM main server is stopped when the command displays the following status message:

```
Application Server is stopped
```

If the command displays a different message, wait 5m and repeat step 1 v. Do not proceed to the next step until the server is stopped.

2 Enter the following to switch to the root user:

```
bash$ su - ↵
```

3 Place the 5620 SAM software DVD-ROM in a DVD-ROM drive.

4 Navigate to the DVD-ROM drive.

5 Perform one of the following to open the 5620 SAM server installer.

a On a SPARC station:

i Enter the following:

```
# cd Solaris ↵
```

ii Enter the following:

```
# ./ServerInstall_SAM_9_0_revision.bin ↵
```

where
revision is the revision identifier, such as R1, R3, or another descriptor

b On an x86-based station:

i Enter the following:

```
# cd Solarisx86 ↵
```

ii Enter the following:

```
# ./ServerInstall_x86_SAM_9_0_revision.bin ↵
```

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

6 Click on the Next button.

7 Accept the terms of the license agreement in the “Software License Agreement” panel.

8 Click on the Next button.

9 Choose Main Server Configuration in the “Choose Installation Type” panel.

10 Click on the Next button.

11 Click on the Next button in each subsequent panel until the “SSL Configuration” panel is displayed.

12 Select the “Enable Secure Communication” parameter.

13 Configure the remaining parameters:

- Keystore File
- Keystore Password
- Truststore File
- Truststore Password

14 Click on the Next button.

15 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

16 Select the “Start the 5620 SAM Main Server” parameter.

17 Click on the Done button to close the server configuration utility.

18 Enter the following to switch back to the samadmin user:

exit ↵

19 Close the console window.

Procedure 10-3 To enable SSL on an auxiliary server

Perform this procedure to enable SSL encryption on a 5620 SAM auxiliary server for communication with other 5620 SAM components.

1 Stop the 5620 SAM auxiliary server application.

i Log in to the auxiliary server station as the samadmin user.

ii Open a console window.

iii Enter the following to change to the server binary directory:

bash$ **cd *path*/nms/bin** ↵

where *path* is the 5620 SAM server installation location, typically /opt/5620sam/auxserver

iv Enter the following to stop the 5620 SAM auxiliary server software:

bash$ **./auxnmsserver.bash auxstop** ↵

v Enter the following to display the 5620 SAM auxiliary server status:

bash$ **./auxnmsserver.bash auxappserver_status** ↵

The command displays a status message.

vi The auxiliary server is stopped when the command displays the following status message:

```
Application Server is stopped
```

If the command displays a different message, wait 5m and repeat step 1 v. Do not proceed to the next step until the server is stopped.

2 Enter the following to switch to the root user:

bash$ **su -** ↵

3 Place the 5620 SAM software DVD-ROM in a DVD-ROM drive.

4 Navigate to the DVD-ROM drive.

5 Perform one of the following to open the 5620 SAM server installer.

a On a SPARC station:

i Enter the following:

\# **cd Solaris** ↵

ii Enter the following:

\# **./ServerInstall_SAM_9_0_*revision*.bin** ↵

where
revision is the revision identifier, such as R1, R3, or another descriptor

b On an x86-based station:

i Enter the following:

\# **cd Solarisx86** ↵

ii Enter the following:

\# **./ServerInstall_x86_SAM_9_0_*revision*.bin** ↵

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

6 Click on the Next button.

7 Accept the terms of the license agreement in the “Software License Agreement” panel.

8 Click on the Next button.

9 Choose Auxiliary Server Configuration in the “Choose Installation Type” panel.

10 Click on the Next button.

11 Click on the Next button in each subsequent panel until the “SSL Configuration” panel is displayed.

12 Select the “Enable Secure Communication” parameter.

13 Configure the remaining parameters:

- Truststore File
- Truststore Password

14 Click on the Next button.

15 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

16 Select the “Start the 5620 SAM Auxiliary Server” parameter.

17 Click on the Done button to close the server configuration utility.

18 Enter the following to switch back to the samadmin user:

```
# exit ↵
```

19 Close the console window.

Procedure 10-4 To enable SSL on a Solaris GUI client or client delegate server

Perform this procedure to enable SSL on a 5620 SAM single-user GUI client that runs on Solaris, or on a client delegate server.

Note — To enable or disable SSL on a single-user GUI client or delegate client, you must uninstall the single-user client or client delegate server software, and then select the appropriate SSL option during the client or client delegate server re-installation. A GUI client cannot connect to a main server that has a different SSL configuration, so the main server cannot update the client SSL configuration.

1 Close the client GUI, if it is open, by choosing Application→Exit from the 5620 SAM main menu. A dialog box appears.

2 Click on the Yes button. The client GUI closes.

3 Uninstall the client or client delegate server by performing the appropriate procedure in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*.

4 Place the 5620 SAM software DVD-ROM in a DVD-ROM drive.

5 Open a console window.

6 Navigate to the DVD-ROM drive.

7 Perform one of the following to open the 5620 SAM client installer.

a On a SPARC station:

i Enter the following:

```
# cd Solaris ↵
```

ii Enter the following:

```
# ./ClientInstall_SAM_9_0_revision.bin ↵
```

where
revision is the revision identifier, such as R1, R3, or another descriptor

b On an x86-based station:

i Enter the following:

```
# cd Solarisx86 ↵
```

ii Enter the following:

```
# ./ClientInstall_x86_SAM_9_0_revision.bin ↵
```

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM client configuration utility opens, and displays the Introduction panel.

8 Click on the Next button.

9 Accept the terms of the license agreement in the “Software License Agreement” panel.

10 Click on the Next button.

11 Choose Client Configuration in the “Choose Installation Type” panel.

12 Click on the Next button.

13 Click on the Next button in each subsequent panel until the “Main Server Configuration” panel is displayed.

14 Select the “Enable Secure Communication” parameter.

15 Click on the Next button.

16 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

17 Select the “Start the 5620 SAM Client” parameter.

18 Click on the Done button to close the client configuration utility.

19 The 5620 SAM client GUI opens and connects to the main server, which updates the client configuration. Subsequent client-server communication uses SSL.

Procedure 10-5 To enable SSL on a Windows GUI client

Perform this procedure to enable SSL on a 5620 SAM GUI client that runs on Windows.

Note — To enable or disable SSL on a single-user GUI client or delegate client, you must uninstall the single-user client or client delegate server software, and then select the appropriate SSL option during the client or client delegate server re-installation. A GUI client cannot connect to a main server that has a different SSL configuration, so the main server cannot update the client SSL configuration.

1 Close the client GUI, if it is open, by choosing Application→Exit from the 5620 SAM main menu. A dialog box appears.

2 Click on the Yes button. The client GUI closes.

3 Uninstall the client or client delegate server by performing the appropriate procedure in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*.

4 Navigate to the Windows directory on the 5620 SAM software DVD-ROM.

5 Double-click on the ClientInstall_SAM_9_0_*revision*.exe file

where *revision* is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM client configuration utility opens, and displays the Introduction panel.

6 Click on the Next button.

7 Accept the terms of the license agreement in the “Software License Agreement” panel.

8 Click on the Next button.

9 Choose Client Configuration in the “Choose Installation Type” panel.

10 Click on the Next button.

11 Click on the Next button in each subsequent panel until the “Main Server Configuration” panel is displayed.

12 Select the “Enable Secure Communication” parameter.

13 Click on the Next button.

14 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

15 Select the “Start the 5620 SAM Client” parameter.

16 Click on the Done button to close the 5620 SAM client configuration utility.

17 The 5620 SAM client GUI opens and connects to the main server, which updates the client configuration. Subsequent client-server communication uses SSL.

Procedure 10-6 To enable HTTPS on an OSS client

Perform this procedure to enable an OSS client application to use secure HTTP, or HTTPS, for communicating with a 5620 SAM main server.

1 Ensure that SSL is enabled in the 5620 SAM system, as described in this chapter.

2 Perform the following steps to modify the URL that the OSS application uses to reach the main server.

- **i** Change http: to https:.
- **ii** Change the port value in the URL from 8085 to 8444.

11 — 5620 SAM integration with other Alcatel-Lucent systems

11.1 5620 SAM integration overview

You can configure the 5620 SAM to operate interactively with other Alcatel-Lucent systems. Depending on the nature of the integration, you can use an interface on one system to perform functions on, or retrieve information from, the other system.

For information about 5620 SAM interworking with non-Alcatel-Lucent systems, see the *5620 SAM Integration Guide*.

11.2 5620 SAM and 5650 CPAM integration

When the 5650 CPAM software is enabled on a 5620 SAM system, the 5650 CPAM functions are available from the 5620 SAM main menu. The 5650 CPAM provides real-time control IGP topology capture, inspection, visualization, and troubleshooting. The integration with the 5620 SAM allows the 5650 CPAM to cohesively associate routing information to infrastructure such as network routes, service tunnels, LSPs, edge-to-edge service traffic paths, and OAM tests. See the *5650 CPAM User Guide* for more information.

5650 CPAM and 5620 SAM integration supports the following operational activities:

- **network planning**
  Planning activities are optimized with real-time topology and strong linkages between services and infrastructure layers in the 5620 SAM GUI and 5620 SAM-O OSS interfaces.
- **network operations**
  Real-time topology and multi-layer highlighting allows you to rapidly assess the state of services, tunnels, and routing on the IGP and IP/MPLS maps.
- **network troubleshooting**
  Historical OAM trace, SPF and RSVP path, and checkpoints allow you to rapidly detect and resolve service level issues whose root cause is in the IP or MPLS layers.
- **network restoration**
  Checkpoints and real-time views of IP/MPLS and service and tunnel infrastructure allow you to restore and plan networks.
- **proactive assurance**
  5650 CPAM alarms, network route and tunnel inspection lists, validation functions, checkpoints, and multi-layer views allow you to detect routing faults.

The 5650 CPAM provides a tight eastbound and westbound integration with the 5620 SAM. This integration allows for a real-time view of the network including routing topology and associated configurations whether performed on the GUI, OSS interface, or by CLI. The 5650 CPAM can leverage 5620 SAM redundancy and offer tight navigation between protocol maps and 5620 SAM-managed objects, such as protocol links. In addition, the 5620 SAM GUI supports the management of the 7701 CPAA platform.

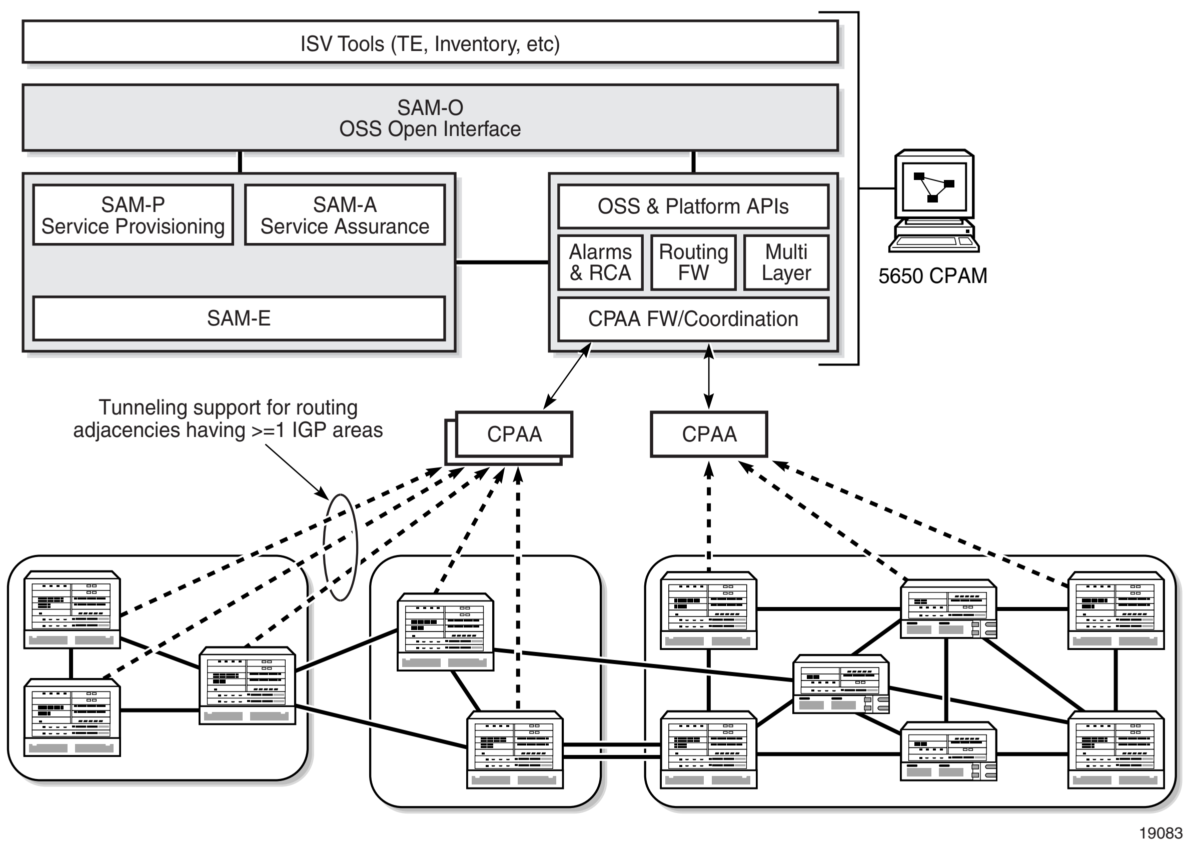
The 5620 SAM-O OSS interface module includes 5650 CPAM packages and methods that provide a smooth integration path for the export of real-time protocol or IP-level topology to advanced OSS applications, such as TE tools.

When the 5650 CPAM and the 5620 SAM share the same database, the 5650 CPAM can access objects managed by 5620 SAM and display them on the 5650 CPAM topology views. Without integration with the 5620 SAM, the following functions are not available:

- service, LSP, multicast, and OAM highlights
- historical LSP active paths
- LDP and RSVP interface display on the MPLS view

Figure 11-1 shows the 5650 CPAM architecture. See the 5650 CPAM documentation suite for information about how to configure application interoperation.

Figure 11-1 5650 CPAM and 5620 SAM integration



There are two main components to the control plane assurance management solution:

- a server component, the 5650 CPAM route controller
- a route analyzer component, the 7701 CPAA

The 5650 CPAM server component contains 7701 CPAA control frameworks, applications, and coordination functions for the distributed 7701 CPAAs and provides the applications that are required to leverage the data provided by the 7701 CPAA platform.

The 5650 CPAM route controller, or server, communicates with several GUI and OSSI clients using the same API as the 5620 SAM. When the 5650 CPAM route controller is integrated with a 5620 SAM, the 5620 SAM and 5650 CPAM versions must be compatible. In addition, the 5650 CPAM route controller can run independently with one or multiple 5620 SAM servers.

The 7701 CPAA is a mountable rack that provides an analysis and distributed computing platform. This platform uses a passive version of the industry-tested and -proven 7750 SR routing code base to guarantee a high degree of interoperability with customer networks. The 7701 CPAA acts as a special-purpose routing element whose role is to passively peer with the network.

The 7701 CPAA is supported by the 5620 SAM as a special-purpose NE.

5650 CPAM deployment

The 5650 CPAM is supported on Solaris platforms only. For system configuration requirements, contact the appropriate Alcatel-Lucent NSM representatives or see the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for more information. System configurations depend on the size of the managed network.

The 5650 CPAM requires a license key to operate. The license key specifies the number of appliances, routers, and GUI clients that the system can support, and the expiry date of the license key.

The 5650 CPAM can be installed by entering the 5650 CPAM license key during the 5620 SAM installation.

If the 5620 SAM is already installed and running, you must enable the 5650 CPAM by adding the appropriate 5650 CPAM license key to the nms-server.xml file. You do not have to re-start the server. You must run the nmsserver.bat or .bash file with the read_config option to activate the 5650 CPAM. If the 5650 CPAM is installed and running without the 5620 SAM, you can enable the 5620 SAM by adding the appropriate 5620 SAM license key to the nms-server.xml file.

The 5650 CPAM works with the 5620 SAM to manage the same network using the same database instance. The 5650 CPAM network may include devices that are not managed by the 5620 SAM.

For example, network A is managed by the 5620 SAM, Release 8.0 and network B is managed by the 5620 SAM, Release 9.0. The 5650 CPAM is connected to both networks. In the integration scenario, the Release 9.0 5620 SAM system and the 5650 CPAM system manage the same network using the same database instance. The network managed by the 5650 CPAM is normally larger than the network managed by the 5620 SAM because it may include several devices that the 5620 SAM does not support.

Database upgrade

The 5620 SAM and the 5650 CPAM share the same database in an integrated deployment.

5650 CPAM uninstallation

You can uninstall the 5650 CPAM from a 5620 SAM/5650 CPAM integration by removing the 5650 CPAM license key from the nms-server.xml file. You must run the nmsserver.bat or .bash file with the read_config option to deactivate the 5650 CPAM.

5650 CPAM menus

Table 11-1 describes the 5650 CPAM menus.

Table 11-1 5650 CPAM menus

Menu item	Description	Dependencies
Tools→Route Analysis	Access all 5650 CPAM management menus	Disabled if the 5650 CPAM license key is not enabled
Application→Flat Maps	View the following flat topology maps: • IGP Topology • OSPF Topology • ISIS Topology • MPLS Topology • Multicast Topology	These flat map options do not appear if the 5650 CPAM license key is not enabled

11.3 5620 SAM and 5620 NM integration

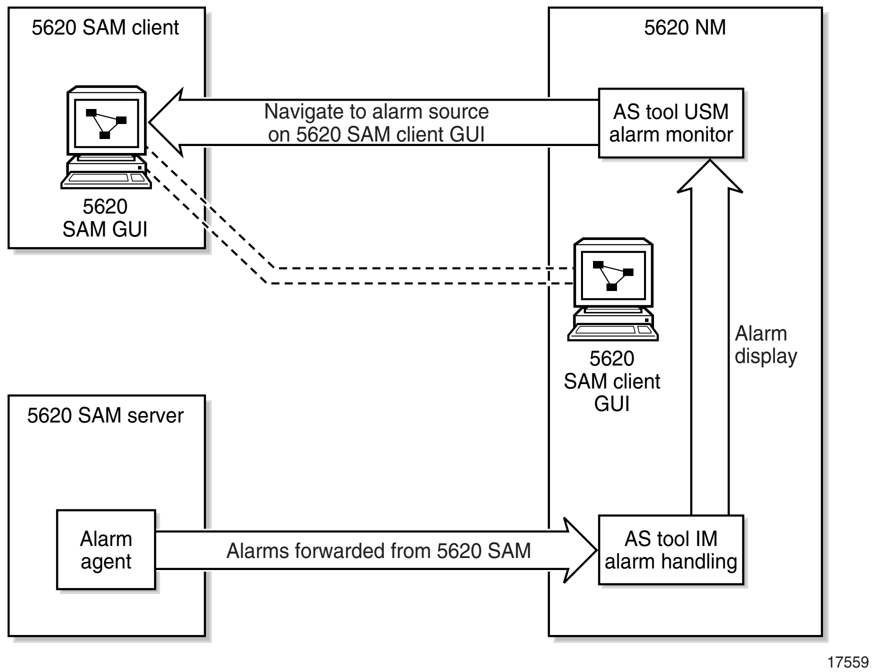
You can integrate the 5620 SAM and 5620 NM, which enables an operator to do the following.

- Navigate the 5620 SAM GUI using a 5620 NM client.
- Forward alarms from the 5620 SAM to the 5620 NM AS tool IM.
- Display 5620 SAM alarms graphically on the 5620 NM AS tool USM.
- Monitor services end-to-end using supported NM integration functions.

Note — Before you can integrate the 5620 SAM and 5620 NM, you must enable navigation from external systems during a 5620 SAM main server installation or upgrade, or enable it after an installation or upgrade using the 5620 SAM server configuration utility. See the *5620 SAM | 5650 CPAM Installation and Upgrade Guide* for information about enabling navigation from external systems.

Figure 11-2 shows how navigation to the 5620 NM and 5620 NM AS tool for alarm management occurs.

Figure 11-2 Alarm navigation



Before you start

Consider the following before you attempt to integrate the 5620 SAM and 5620 NM:

- The *5620 NM Release Notice* lists the 5620 SAM releases that are compatible with various 5620 NM releases.
- The 5620 NM and 5620 SAM integration software is on the 5620 SAM software DVD-ROM.
- For 5620 SAM GUI navigation using a 5620 NM client, the 5620 SAM client must be installed on the same station that runs the 5620 NM client X-window access application.
- For alarm forwarding, the 5620 SAM and 5620 NM client software can be installed on the same or different stations.
- The platform for the 5620 NM software must meet the minimum requirements in the *5620 Network Manager Installation and Upgrade Guide*.
- You must configure the 5620 SAM to interwork with the 5620 NM software; for example, configure the 5620 SAM server to forward alarms and configure the 5620 SAM client to allow navigation from external systems.

5620 SAM client GUI startup and navigation restrictions

The following restrictions apply to 5620 SAM client GUI navigation using a 5620 NM client.

- When the client GUI is starting, 5620 NM navigation requests are blocked.
- A 5620 SAM client accepts navigation requests after the client GUI user logs in.

- Each navigation request is submitted only after a login timeout expires. This timeout helps to decrease the number of requests that are sent when a user submits and then immediately cancels a request.
- A 5620 SAM client delegate server acts as a single 5620 SAM client instance; you cannot configure a client delegate server to integrate with more than one 5620 NM client.
- The following navigation rules apply when multiple client GUIs are running.
  - A navigation request is cancelled when the client GUI is shut down.
  - All navigation requests are handled by the first registered client GUI.
  - If no client GUI is registered, a 5620 SAM server starts a new client GUI when it receives a navigation request.
  - If the currently registered 5620 SAM client GUI shuts down, another registered client GUI handles the navigation requests.

11.4 Workflow for 5620 SAM and 5620 NM integration

1. Ensure that the appropriate 5620 SAM integration software is installed and appropriately configured on the 5620 NM. See Procedure 11-1 for more information.
2. Configure the 5620 SAM client and server to support GUI navigation. See Procedure 11-2 for more information.
3. Start the 5620 SAM GUI. See section 3.4 for more information.
4. Start the 5620 NM client GUI. See Procedure 11-3 for more information.
5. Perform the required network management function using the appropriate GUI, as described in section 11.3.

11.5 5620 SAM and 5620 NM integration procedures

The following procedures describe how to configure 5620 SAM and 5620 NM integration.

Procedure 11-1 To configure 5620 SAM and 5620 NM GUI integration

Perform this procedure to enable the use of a 5620 SAM client GUI through a 5620 NM client GUI.

1. Include the required 5620 SAM integration package in the 5620 NM installation. Consult the 5620 NM documentation for integration software installation and configuration information.
2. If required, configure the 5620 SAM server to forward alarms to the 5620 NM, as described in section 11.3.
3. If navigation from external systems is not currently enabled on each 5620 SAM main server, perform Procedure 11-2.

4 Install a 5620 SAM GUI client on a station that displays the 5620 NM client GUI. This is typically a station that runs an X-Window terminal emulator, but it can also be the 5620 NM database networkstation or the 5620 NM operator server networkstation, if a client GUI is locally displayed.

5 Perform one of the following on the station where the 5620 SAM client is installed.

a On a Solaris station, open the *path*/nms-client.xml file with a plain-text editor

where *path* is the 5620 SAM client configuration directory, typically /opt/5620sam/client/nms/config

b On a Windows station, open the *path*/nms-client.xml file with a plain-text editor

where *path* is the 5620 SAM client configuration directory, typically C:\5620sam\client\nms\config

6 Perform the following steps to ensure that anti-aliasing is disabled.

i Search for the following XML tag that marks the beginning of the topologyMaps section:

```
<topologyMaps
```

ii Edit the antiAliasActive entry in the topologyMaps section to read “false” as shown below.

```
<topologyMaps
     iconReductionThreshold="40"
     labelHideThreshold="35"
        snapToGridInterval="25"
        antiAliasActive="false"
     />
```

7 Open a console window on the station.

8 Perform one of the following to run the navigator proxy script and start the client software.

a On a Solaris station, perform the following steps.

i Enter the following at the CLI prompt:

\# **cd *path***

where *path* is the 5620 SAM client binary directory, typically /opt/5620sam/client/nms/bin

ii Enter the following:

```
# ./install_navigation_daemon.bash
```

iii Enter the following:

```
# ./nmsclient.bash
```

b On a Windows station, perform the following steps.

i Enter the following at the CLI prompt:

cd *path*

where *path* is the 5620 SAM client binary directory, typically C:\5620sam\client\nms\bin

ii Enter the following:

```
install_navigation_service.bat
```

iii Enter the following:

```
nmsclient.bat
```

The GUI client starts.

9 Use the 5620 SAM client GUI to create a 5620 NM user account that has a non-administrative privilege level with the appropriate scope of command role applied. See chapter 9 for more information about configuring user accounts and how to apply a scope of command role.

10 Copy /opt/5620sam/server/nms/lib/common/generated/nms_common_core.jar from a 5620 SAM main server to the opt/netmgt/jnm/samjms/lib directory on the 5620 NM database networkstation.

11 Copy the following files from the /integration/5620NM/client/samadaptor directory on the 5620 SAM integration DVD-ROM to the /opt/netmgt/samadaptor/lib directory on the 5620 NM database networkstation:

- jbasiccomp.jar
- jnavapi.jar
- navrmi.jar
- samAdaptor.jar

12 Open the X-Window terminal emulator on the station that has the newly installed 5620 SAM client.

13 Log in to the 5620 NM operator server networkstation as a user with administrative privileges.

14 Open a console window on the 5620 NM operator server networkstation.

15 Start the 5620 NM client. The 5620 NM client GUI is displayed on the local station, and the 5620 SAM client GUI is available as a 5620 NM main menu item.

16 Use the 5620 SAM client account created in step 9 to perform the required interworking functions, as described in described in section 11.3, and the *5620 Network Manager User Guide*.

Procedure 11-2 To enable navigation from external systems on a 5620 SAM main server

1 Log in to the main server station as the root user.

2 Place the 5620 SAM software DVD-ROM in a DVD-ROM drive.

3 Open a console window.

4 Navigate to the DVD-ROM drive.

5 If the main server is installed on a SPARC station, enter the following to open the configuration utility:

```
# Solaris/ServerInstall_SAM_9_0_revision.bin ↵
```

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

6 If the main server is installed on an x86-based station, enter the following to open the configuration utility:

```
# Solarisx86/ServerInstall_SAM_9_0_revision.bin ↵
```

where
revision is the revision identifier, such as R1, R3, or another descriptor

The 5620 SAM server configuration utility opens, and displays the Introduction panel.

7 Click on the Next button.

8 Accept the terms of the license agreement in the “Software License Agreement” panel.

9 Click on the Next button.

10 Choose Main Server Configuration in the “Choose Installation Type” panel.

11 Click on the Next button.

12 Click on the Next button in each subsequent panel until the “Navigation from External Systems” panel is displayed.

13 Select the “Enable Navigation from External Systems” parameter.

14 Configure the “TCP port for accepting GUI navigation requests” parameter.

15 Click on the Next button.

16 Click on the Next button in each subsequent panel until the “Installation Complete” panel is displayed.

17 Click on the Done button to close the server configuration utility.

18 Enter the following to switch to the samadmin user:

```
# su - samadmin ↵
```

19 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

20 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The 5620 SAM main server reads the nms-server.xml file and puts the configuration changes into effect.

Procedure 11-3 To start the 5620 NM GUI

1 Log in to the 5620 SAM single-user client or client delegate station

2 Start the X-terminal software.

3 Use the X-terminal software to start the 5620 NM GUI on the Solaris station that has the 5620 NM Operator Position installed.

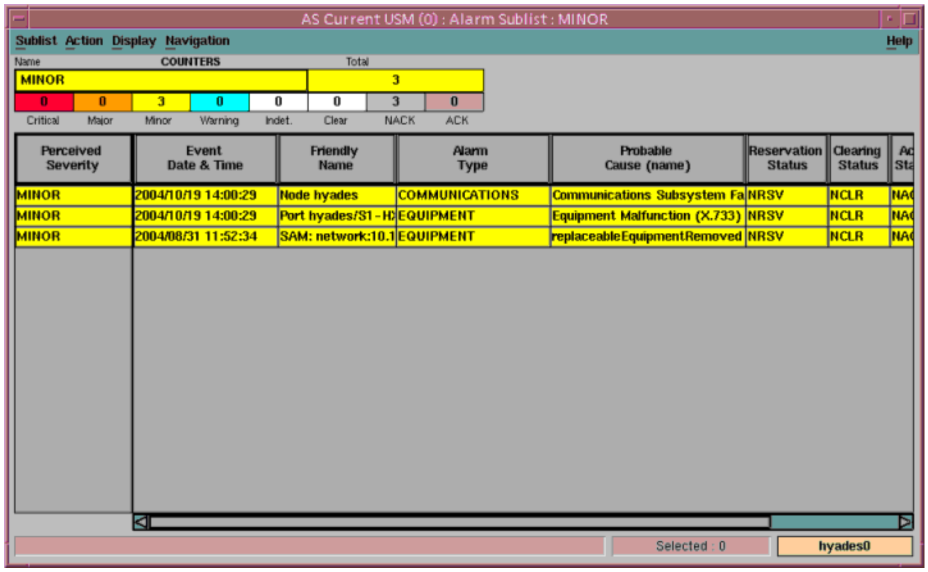
Procedure 11-4 To navigate from the 5620 NM AS tool USM to the 5620 SAM client GUI

See the *5620 SAM Troubleshooting Guide* for more information about troubleshooting using alarms.

1 Choose a counter summary window or alarm sublist from the AS tool USM.

2 Choose a sublist or an alarm in a sublist. 5620 SAM alarms are preceded by SAM in the Friendly Name field of the alarm sublist, as shown in Figure 11-3.

Figure 11-3 5620 SAM alarm in the AS tool USM



3 From the 5620 NM AS tool USM menu, choose Navigation→External Equipment→Show Equipment to navigate to the property form that lists the alarm on the 5620 SAM client GUI. The appropriate form is displayed. If the 5620 SAM client GUI is running, a new object properties form is displayed.

4 If the client GUI is not running, perform the following steps.

  i Open the 5620 SAM client GUI.

  ii View the object property form that is displayed on the 5620 NM client GUI.

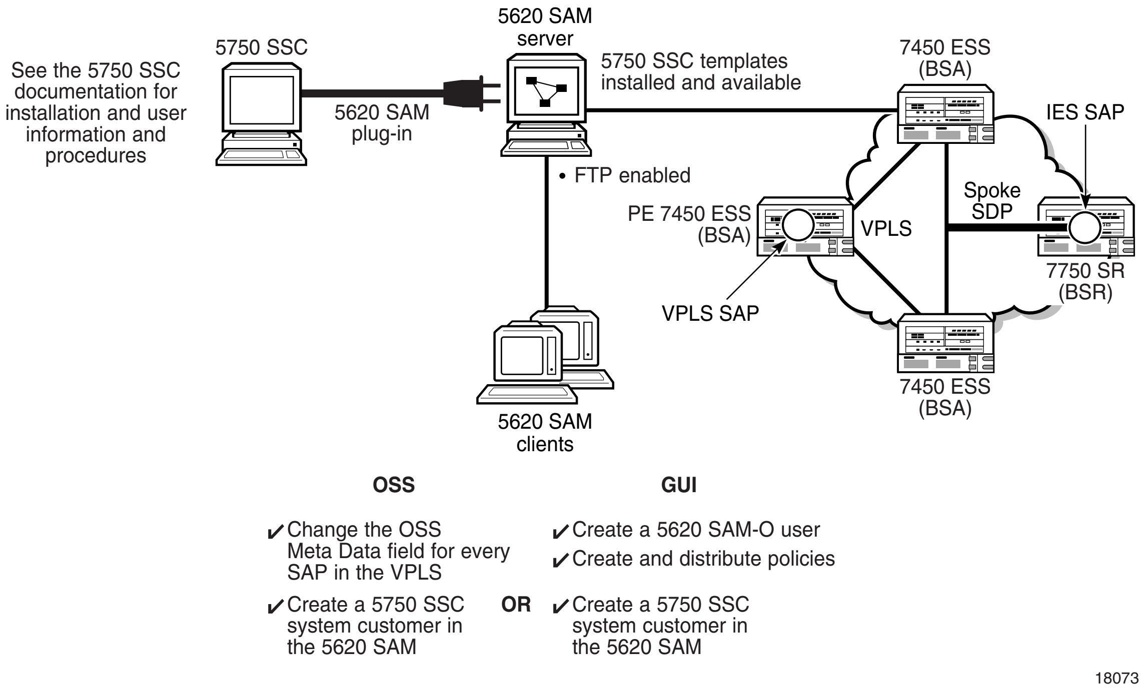
5 After the alarm issue is resolved, clear the alarm using the 5620 SAM client GUI. Alarm status changes are shown in the 5620 NM AS tool USM.

11.6 5620 SAM and 5750 SSC integration

The 5620 SAM can be configured to interoperate with the 5750 Subscriber Services Controller. The 5750 SSC provides centralized control of subscriber access services for triple play service delivery; for example, DHCP to identify subscribers and trigger service configuration.

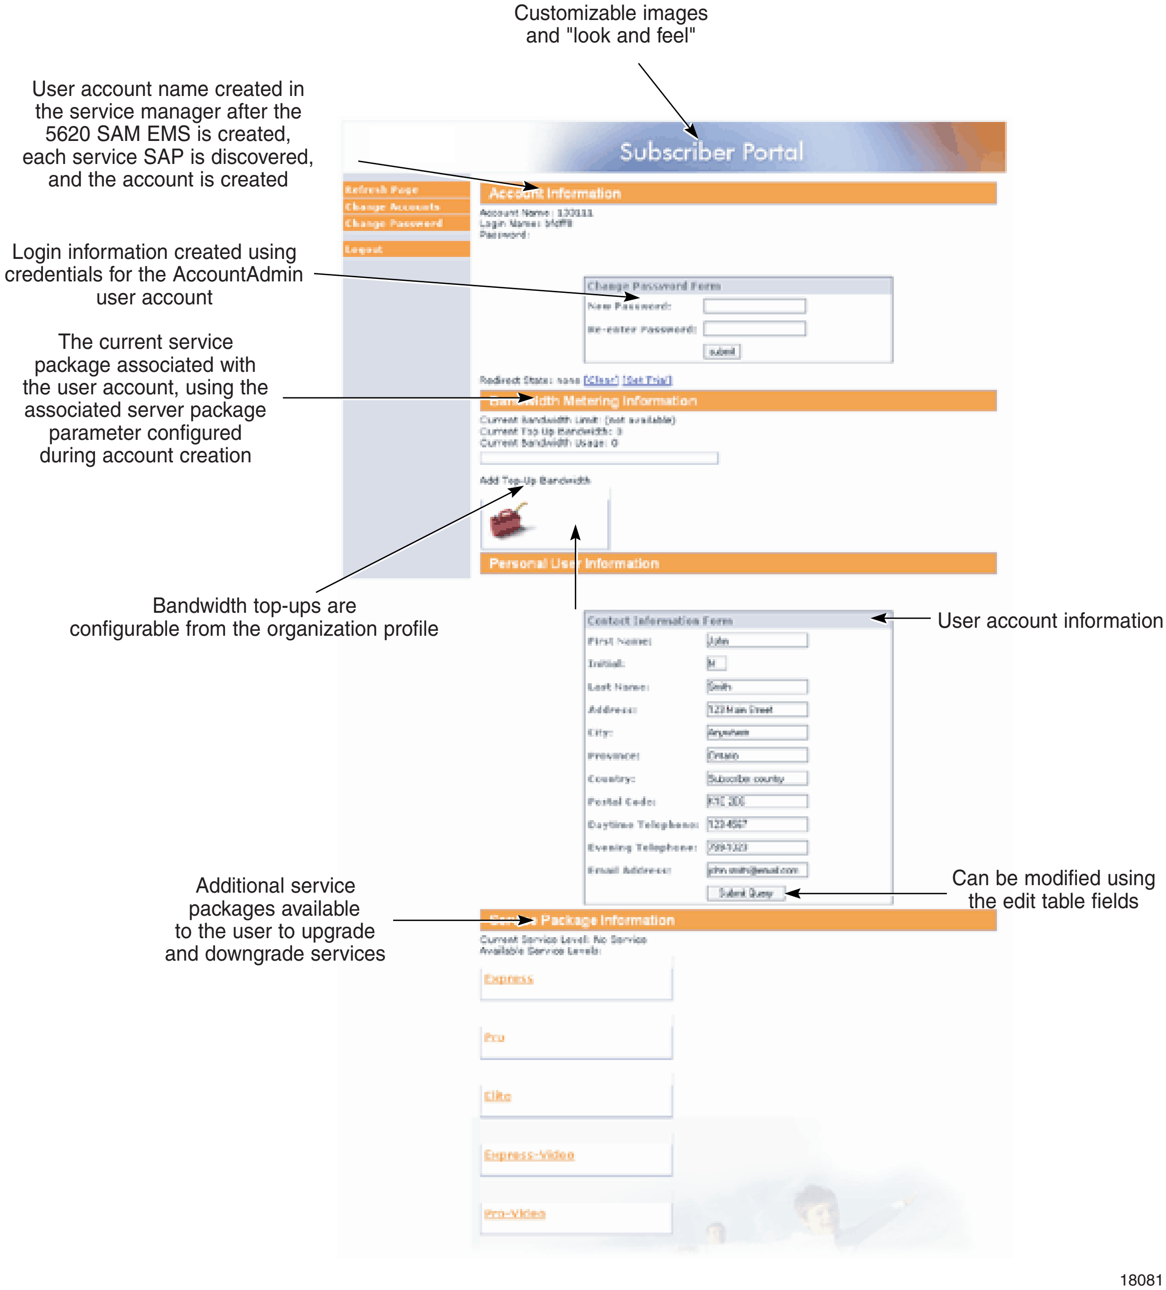
Figure 11-1 shows the integration requirements for the 5620 SAM and the 5750 SSC. See the 5750 SSC documentation suite for information about how to configure application interoperation.

Figure 11-4 5750 SSC and 5620 SAM integration



You use the 5750 SSC Service Manager to create and manage subscriber services, including user account information and QoS levels. The 5750 SSC user accounts represent the residential subscribers of triple play services. The information configured in the 5750 SSC Service Manager is used to build the subscriber web portal for user self-management. Figure 11-5 shows a subscriber web portal and how the component pieces are assembled from 5750 SSC subscriber management configurations.

Figure 11-5 Subscriber web portal



11.7 5620 SAM and 5780 DSC integration

The 5780 DSC is treated as a device that is managed by the 5620 SAM, rather than an external system that requires integration with the 5620 SAM. The 5620 SAM allows you to view the properties for the equipment, instance, Diameter proxy agent, and policy charging rules for the 5780 DSC. The 5780 DSC is represented in the 5620 SAM equipment navigation tree. The instance, Diameter proxy agent, and policy charging rule properties are viewable using the Manage→Mobile Core→DSC Instances 5620 SAM main menu option.

The *5620 SAM User Guide* and other non-LTE documents in the 5620 SAM documentation suite do not describe 5780 DSC management. The following documents describe 5620 SAM management and configuration of the 5780 DSC:

- *5620 SAM LTE ePC User Guide*—Describes 5780 DSC discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes the 5780 DSC parameters that are represented in the 5620 SAM schema, and parameters on LTE and LTE service forms in the 5620 SAM GUI

Note — The *5620 SAM Alarm Reference* lists and describes all 5620 SAM alarms, including LTE and optical alarms.

11.8 5620 SAM and the 5620 SAM Supervision Module

The 5620 SAM Supervision Module is a web-based application that provides a summarized, at-a-glance view of NEs and objects in the 5620 SAM network. You can use the supervision module to group and monitor network resources that are natively managed by the 5620 SAM or by a subtending network management system that is interfaced with the 5620 SAM for supervision purposes.

You can access the 5620 SAM Supervision Module by choosing Application→Supervision Portal from the 5620 SAM main menu. The supervision module launches if you have specified a web browser in the user preferences. See the *5620 SAM Supervision Module User Guide* for more information.

Table 11-2 describes the menu objects.

Table 11-2 5620 SAM Supervision Module menu objects

Menu object	Description
Application→Supervision Portal	Launches the 5620 SAM Supervision Module web portal
Administration→Supervision Settings	Allows you to configure KPI timers and create the following supervision module objects: • supervision groups • summary views

Device management

28 — Object life cycle

29 — Auto-provision

12 — Device support

12.1 Device support overview

The 5620 SAM can manage the following Alcatel-Lucent devices:

- 1830 PSS-1
- 1830 PSS-16
- 1830 PSS-32
- 1830 PSS-4
- 5780 DSC
- 7210 SAS-D 6F 4T
- 7210 SAS-D 6F 4T ETR
- 7210 SAS-E
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7250 SAS
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 MG
- 7750 SR
- 7750 SR-c4
- 7750 SR-c12
- 9471 MME
- 9500 MPR
- eNodeB
- OS 6250M
- OS 6250SME
- OS 6400
- OS 6850
- OS 6900
- OS 6855
- OS 9600
- OS 9700
- OS 9700E
- OS 9800
- OS 9800E
- OS 10K

The 5620 SAM can also manage Telco devices, and provides limited management support for other third-party devices, which are called generic NEs.

For core-network devices such as the 7450 ESS, 7710 SR, and 7750 SR, the 5620 SAM supports the current software release and the three immediately previous major releases. For example, a Release 9.0 5620 SAM system can manage a 7750 SR at Release 9.0, 8.0, 7.0, 6.1, or 6.0. Older device releases are not supported.

For devices other than core-network devices, the 5620 SAM release support varies. See the *5620 SAM Network Element Compatibility Guide* for specific device support information.

Caution — When a device introduces a maintenance release, you must ensure that your 5620 SAM software supports the new device release before you upgrade the device to the new release. You may need to upgrade the 5620 SAM to support the new device release. See the current *5620 SAM Network Element Compatibility Guide* for more information.

The 5620 SAM GUI displays a device feature or function only if the device supports the feature or function. The 5620 SAM user documentation describes the major variations in support, including device-specific procedures for specific implementations, but does not describe the following minor GUI variations for different devices:

- partial support for the parameter list on a form
- partial support for the buttons and tabs on a form

The following documents describe 5620 SAM support for specific device releases:

- *5620 SAM Network Element Compatibility Guide*—lists the device releases and functions that the 5620 SAM supports
- *5620 SAM Parameter Guide*—lists and describes the supported parameters; includes device-specific variations in parameter defaults and ranges

See the device user documentation for information about device functions, parameters, and CLI commands that are outside the scope of the 5620 SAM documentation. Contact Alcatel-Lucent technical support for specific network or facility considerations.

Workflows

The *5620 SAM User Guide* describes the management of many devices, however 5620 SAM management of some devices, for example, optical and LTE devices, is described in other guides. Each device-specific section in this chapter contains one of the following:

- a workflow for device discovery and management, if within the scope of the *5620 SAM User Guide*
- a reference to the guide that describes 5620 SAM management of the device

A device-specific workflow in this chapter lists the high-level steps required to do the following:

- commission, configure, and manage the device
- create and manage customer services on the device

You can use a device workflow to determine which device functions you require, and then systematically enable and configure the functions.

12.2 Workflow for general device management

The following workflow lists the initial high-level 5620 SAM management steps that are common to all devices. See the other workflows in this chapter as required for device-specific workflow steps.

1. View information about specific 5620 SAM device support. See this chapter for more information.

2. View the 5620 SAM license for information about the consumed and remaining device quantities and update if required. See chapter 6 for more information.

3. Change the license key in a standalone or redundant 5620 SAM system. See chapter 6 for more information.

4. Commission the device for 5620 SAM management. See chapter 13 for more information.

5. Configure in-band and out-of-band management, as required. See chapter 13 for more information.

6 Configure a polling policy. See chapter 13 for more information.

7 As required, change the system name of the device. This may be required, for example, because of network reconfiguration, or the management of a new device that has the same name as a currently managed device. See chapter 6 for more information.

12.3 1830 PSS support

The 1830 Photonic Service Switch product family provides advanced CWDM, DWDM, and OTN capabilities. It provides increased network flexibility and operational automation using zero-touch, transparent photonic networking. The 5620 SAM supports the following 1830 PSS devices:

- 1830 PSS-1 - edge aggregation device; the supported variants are the following:
  - 1830 PSS-1 AHP amplifier
  - 1830 PSS-1 GBE edge device
  - 1830 PSS-1 MD4H edge device
- 1830 PSS-16 - end office device
- 1830 PSS-32 - central office device
- 1830 PSS-4 - edge device

The *5620 SAM User Guide* and other non-optical documents in the 5620 SAM documentation suite do not describe 1830 PSS management. The following documents describe 5620 SAM management and configuration of the 1830 PSS:

- *5620 SAM Optical User Guide*—Describes 1830 PSS discovery, configuration, and management using the 5620 SAM
- *5620 SAM Optical Parameter Reference*—Provides a list of all optical device parameters that the 5620 SAM supports

Note — The *5620 SAM Alarm Reference* lists and describes all 5620 SAM alarms, including LTE and optical alarms.

12.4 5780 DSC support

The 5620 SAM allows you to view the properties for the equipment, instance, Diameter proxy agent, and policy charging rules for the 5780 DSC. The 5780 DSC is represented in the 5620 SAM equipment navigation tree. The instance, Diameter proxy agent, and policy charging rule properties are viewable using the Manage→Mobile Core→DSC Instances 5620 SAM main menu option.

The *5620 SAM User Guide* and other non-LTE documents in the 5620 SAM documentation suite do not describe 5780 DSC management. The following documents describe 5620 SAM management and configuration of the 5780 DSC:

- *5620 SAM LTE ePC User Guide*—Describes 5780 DSC discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes the 5780 DSC parameters that are represented in the 5620 SAM schema, and parameters on LTE and LTE service forms in the 5620 SAM GUI

Note — The *5620 SAM Alarm Reference* lists and describes all 5620 SAM alarms, including LTE and optical alarms.

12.5 7210 SAS support

This section describes the 5620 SAM support for Alcatel-Lucent 7210 SAS devices.

7210 SAS-D support

The 7210 SAS-D is an intelligent Ethernet edge-demarcation device that extends enhanced Carrier Ethernet VPN service delivery to the CE. The license for a 7210 SAS-D is based on the chassis type. The 5620 SAM supports the following chassis types:

- 7210 SAS-D 6F 4T
- 7210 SAS-D 6F 4T ETR

5620 SAM support for the 7210 SAS-D includes the following:

- access and uplink modes for Ethernet ports
- alarm management
- configuration backups and restores
- egress port rate limiting
- frame-based accounting
- hardware:
    - 4 x 10/100/100BaseT MDA
    - 6 x 100/1000 SFP MDA
- H-Metering
- LAGs
- LLF
- OAM diagnostic tests:
    - CFM and EFM
    - DNS ping
    - ICMP ping
    - ICMP trace

- QoS policies:
    - 7210 Access Egress
    - 7210 Network
    - 7210 Network Queue
    - 7210 Port Access Ingress
    - 7210 Port Scheduler
    - 7210 Slope
- services:
    - IES, using in-ban d management only
    - VLL Epipe
    - VPLS
- software upgrades
- statistics collection

Note — The 5620 SAM supports only access mode for 7210 SAS-D 6F 4T ETR ports.

7210 SAS-E support

The 7210 SAS-E is a Carrier Ethernet CE device that is typically owned and managed by a customer. Using software based on the 7750 SR OS and managed by the 5620 SAM, the 7210 SAS-E extends Carrier Ethernet VPN services to the CE. The 7210 SAS-E can also be deployed as an aggregation device for smaller sites.

5620 SAM support for the 7210 SAS-E includes the following:

- access and uplink modes for Ethernet ports
- alarm management
- configuration backups and restores
- egress port rate limiting
- frame-based accounting
- hardware:
    - integrated IOM and Ethernet ports
    - 12 x 100/1000 SFP Ethernet ports; and copper SFPs
    - 12 x 10/100/1000 TX Ethernet ports
- in-band and out-of-band management; out-of-band management is supported only on Release 2.0 R2 or later
- G.8032 Ethernet Ring Protection
- LAGs
- LLDP
- OAM diagnostic tests:
    - CFM and EFM
    - DNS ping
    - ICMP ping
    - ICMP trace

- QoS policies:
    - 7210 Access Egress
    - 7210 Access Ingress
    - 7210 Network
    - 7210 Network Queue
    - 7210 Port Access Egress
    - 7210 Port Scheduler
    - 7210 Queue Management
    - 7210 Remarking
    - 7210 Slope
- services:
    - IES, using in-ban d management only
    - VLL Epipe
    - VPLS
- software upgrades
- static routes for in-band management
- statistics collection

7210 SAS-E daughter cards

The 7210 SAS-E supports an integrated 2 x 12-Gig IOM card on a single chassis. The equipment navigation tree displays a card slot with one daughter card that contains 12 x 100/1000 Ethernet SFP ports and 12 x 10/100/1000 Ethernet ports.

7210 SAS-M and 7210 SAS-X support

The 7210 SAS-M is a CE device that provides MPLS-enabled metropolitan and WAN Carrier Ethernet service delivery, Ethernet-based mobile backhaul, and residential service access.

The 7210 SAS-X is an MPLS-enabled Ethernet aggregation device for small and medium-sized networks that provides business, mobile backhaul, and residential services. It is similar to the 7210 SAS-M, but has 10Gb/s uplink ports, enhanced traffic management, greater scalability, and hierarchical QoS functions.

The 5620 SAM supports the following 7210 SAS-M and 7210 SAS-X chassis types:

- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP

Note — If you use the CLI or BOF to change the mode of a 7210 SAS-M from Access Uplink to Network, or from Network to Access Uplink, you must unmanage and remanage the device. The mode is shown on the Uplink Mode tab of the shelf properties form.

5620 SAM support for the 7210 SAS-M and 7210 SAS-X includes the following:

- alarm management
- configuration backups and restores
- egress port rate limiting
- frame-based accounting
- G.8032 Ethernet Ring Protection, 7210 SAS-X 24F 2XFP 3.0R2 and later only
- hardware:
    - 2-Port Gig Ethernet MDA with SyncE, 7210 SAS-M only
    - 2x10GigE XFP MDA, 7210 SAS-M in L2 access uplink mode only
    - 24 x 10/100/1000 Ethernet SFP ports
    - 4 x Channelized DS1/T1 CES MDA; does not support uplink mode
    - two 10 GigE ports, only on 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, and 7210 SAS-X 24F 2XFP
- H-metering
- in-band and out-of-band management; out-of-band management is supported only on the 7210 SAS-M, Release 2.0 R2 or later
- IP/MPLS:
    - RSVP
    - T-LDP
- LLDP
- OAM diagnostic tests:
    - CFM and EFM
CPE Ping
DNS Trace
ICMP Ping
ICMP Trace
LSP Ping
LSP Trace
MAC Ping
MAC Populate
MAC Purge
MAC Trace
MTU Ping
SVC Ping
Tunnel Ping
VCCV Ping
- policy audits
- QoS policies:
    - 7210 Access Ingress
    - 7210 Access Egress
    - 7210 Network
    - 7210 Network Queue
    - 7210 Port Access Egress
    - 7210 Port Scheduler
    - 7210 Queue Management
    - 7210 Remarking
    - 7210 Slope

- routing:
  - ISIS
  - OSPF
  - static routes
- security management
- services:
  - CESoP Cpipe for CES MDA, 7210 SAS-M only
  - IES, using in-ban d management only
  - VLL Epipe
  - VLL Cpipe, 7210 SAS-M only
  - VPLS (ELAN)
  - spoke SDP bindings
- software upgrades
- statistics collection

12.6 Workflow to manage 7210 SAS devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 7210 SAS NEs and services. This workflow assumes that the physical devices have been installed.The management functions are supplemental to the general management functions described in section 12.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 13 for more information. Configure polling policies as described in Procedure 13-12.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 14 for more information.

4 As required, manage and configure equipment; see chapter 16 for more information about equipment management and configuration. Additionally, configure the following, as required:

a split horizon groups as described in Procedure 20-16

b LAGs as described in Procedures 18-13 and 18-14

c frame-based accounting as described in Procedure 17-11

d dry contact sensors as described in Procedure 19-2

e channelized TDM ports as described in Procedure 20-14

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication; see chapter 21 for more information.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices; see chapter 23 for more information.

7 Create equipment inventories of managed devices; see chapter 22 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs; see chapter 24 for more information
- **b** threshold-crossing alarms; see chapter 26 for more information
- **c** bulk configuration changes; see chapter 27 for more information
- **d** object life cycle management; see chapter 28 for more information
- **e** automatic provisioning; see chapter 29 for more information

9 Configure NE routing and forwarding; see chapter 30 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 31 for more information.
- **b** MPLS and LSPs; see chapter 32 for more information.
- **c** service tunnels to carry service traffic; see chapter 33 for more information.
- **d** Lawful Intercept; see chapter 34 for more information
- **e** IPsec; see chapter 35 for more information
- **f** 5620 SAM alarm policies; see chapter 37 for more information
- **g** OAM diagnostic tests; see chapter 38 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 39 for more information
- **b** APS; see chapter 40 for more information
- **c** MC peer groups; see chapter 41 for more information
- **d** MC endpoint groups; see chapter 42 for more information
- **e** MC LAG groups; see chapter 43 for more information
- **f** MC synchronization groups; see chapter 44 for more information
- **g** MC ring groups; see chapter 45 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies; see chapter 47 and Procedures 47-2, 47-4, 47-5, 47-7, 47-9, 47-11, 47-13, 47-19, and 47-25 for more information
- **b** multicast policies; see chapter 49 for more information

- **c** time of day policies; see chapter 50 for more information
- **d** VRRP policies; see chapter 51 for more information
- **e** auto tunnels policies; see chapter 52 for more information
- **f** 802.1x policies; see chapter 54 for more information
- **g** PBB MRP policies; see chapter 55 for more information
- **h** connection profile policies; see chapter 57 for more information
- **i** service PW template policies; see chapter 58 for more information
- **j** residential subscriber policies; see chapter 59 for more information
- **k** remote network monitoring policies; see chapter 60 for more information
- **l** size constraint policies; see chapter 61 for more information
- **m** NAT policies; see chapter 62 for more information
- **n** format and range policies; see chapter 63 for more information

12 Configure services and related functions; see chapters 64 and 65 for general service information. As required, configure specific services and related functions such as the following:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLL Epipe services as described in Procedure 70-2
- **e** VLL Apipe, Cpipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **f** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain as described in Procedure 71-2. See chapter 71 for more information.
- **g** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information
- **h** IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information
- **i** composite services to connect various types of services; see chapter 76 for more information
- **j** 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information

k OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information

l Ethernet Connectivity Fault Management; see chapter 80 for more information

m RCA audit; see chapter 81 for more information

12.7 7250 SAS and Telco device support

The Alcatel-Lucent 7250 SAS devices and Telco devices support Ethernet and service-aware Ethernet aggregation across IP/MPLS networks. Typically, these devices are connected in rings or trees to 7450 ESS devices to distribute L2 VPN or BTV services in VLANs.

The 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA can backhaul TDM lines through the core network using two 4-port CES modules. A 5620 SAM operator configures a CES module to receive E1 or T1 transmission, and then creates an interface on a logical port in the CES module to enable circuit emulation with dot1q encapsulation.

The 7250 SAS-ES and 7250 SAS-ESA support all 7250 SAS functions, and have two additional GigE uplink ports that support the following:

- hierarchical QoS
- RSVP-TE and FRR
- MPLS LSR
- VPLS

The 7250 SAS-ESA also supports dry contact sensors. Four dry contact sensor inputs are available in a connector on the back panel of the 7250 SAS-ESA. The sensor inputs can be used to monitor the status of external equipment such as doors, power modules, fans, and batteries. When a sensor input detects a change in the state of a dry contact, the 7250 SAS-ESA sends an SNMP trap to the 5620 SAM. Depending on how the sensor inputs are configured, a change in the state of a dry contact can raise or clear an alarm condition.

The 5620 SAM provides element and network management functions for 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices using the CLI and SNMP. When a function is not supported by the device, the function cannot be selected from the GUI or does not appear on the GUI.

12.8 Workflow to manage 7250 SAS and Telco devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 12.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM NE Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 13 for more information. Additionally, configure the following:

- **a** commissioning as described in Procedure 13-3
- **b** polling policies as described in Procedure 13-11

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 14 for more information.

4 As required, manage and configure equipment; see chapter 16 for more information about equipment management and configuration. Additionally, configure the following, as required:

- **a** uplink ports as network ports as described in Procedure 20-18
- **b** dry contact sensors as described in Procedure 19-2
- **c** circuit emulation as described in Procedures 17-21, 17-22, 17-23, 17-24, and 17-25

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication; see chapter 21.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices; see chapter 23 for more information.

7 Create equipment inventories of managed devices; see chapter 22 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs; see chapter 24 for more information
- **b** threshold-crossing alarms; see chapter 26 for more information
- **c** bulk configuration changes; see chapter 27 for more information
- **d** object life cycle management; see chapter 28 for more information
- **e** automatic provisioning; see chapter 29 for more information

9 As required, configure NE routing and forwarding; see chapter 30 for general routing and forwarding information. Configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 31 for more information. Additionally, configure bridging as described in Procedure 31-53.
- **b** MPLS and LSPs; see chapter 32 for more information. Additionally, configure LSPs as described in Procedures 32-10, 32-11, and 32-12.
- **c** service tunnels to carry service traffic; see chapter 33 for more information
- **d** Lawful Intercept; see chapter 34 for more information
- **e** IPsec; see chapter 35 for more information
- **f** 5620 SAM alarm policies; see chapter 37 for more information
- **g** OAM diagnostic tests; see chapter 38 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 39 for more information
- **b** APS; see chapter 40 for more information
- **c** MC peer groups; see chapter 41 for more information
- **d** MC endpoint groups; see chapter 42 for more information
- **e** MC LAG groups; see chapter 43 for more information
- **f** MC synchronization groups; see chapter 44 for more information
- **g** MC ring groups; see chapter 45 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies as described in Procedure 47-35. See chapter 47 for more information.
- **b** filter policies as described in Procedures 48-4, 48-5, 48-6, and 48-7. See chapter 48 for more information.
- **c** multicast policies; see chapter 49 for more information
- **d** VRRP policies; see chapter 51 for more information
- **e** auto tunnels policies; see chapter 52 for more information
- **f** 802.1x policies; see chapter 54 for more information
- **g** PBB MRP policies; see chapter 55 for more information
- **h** AOS Ethernet service policies; see chapter 56 for more information
- **i** connection profile policies; see chapter 57 for more information

- **j** service PW template policies; see chapter 58 for more information
- **k** residential subscriber policies; see chapter 59 for more information
- **l** remote network monitoring policies; see chapter 60 for more information
- **m** size constraint policies; see chapter 61 for more information
- **n** NAT policies; see chapter 62 for more information
- **o** format and range policies; see chapter 63 for more information

12 Configure services and related functions; see chapters 64 and 65 for general service information. As required, configure specific services and related functions such as the following:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLAN services for subscribers; see chapter 69 for more information
- **e** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **f** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information
- **g** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information
- **h** IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information
- **i** composite services to connect various types of services; see chapter 76 for more information
- **j** 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information
- **k** OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information
- **l** Ethernet Connectivity Fault Management; see chapter 80 for more information
- **m** RCA audit; see chapter 81 for more information

12.9 7450 ESS support

The Alcatel-Lucent 7450 ESS sets a new market standard for enabling the delivery of profitable Ethernet business services in metro, national and international network environments. It also provides high density service-aware Ethernet aggregation for consumer triple-play services over IP/MPLS-based networks. The Alcatel-Lucent 7450 ESS is purpose-built for the service provider market, with an architecture that supports a wide range of interfaces and offers unmatched density and performance. The 7450 ESS allows service providers to offer new, revenue-generating services for both the consumer and business markets.

In order to determine which network ports are eligible to transport traffic of individual SDPs, the Network Domain feature has been introduced. This information is used for the SAP-ingress queue allocation algorithm applied to VPLS SAPs. See chapter 30 for more information.

12.10 Workflow to manage 7450 ESS devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 7450 ESS NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 12.2.

1. Determine configuration requirements for the installed device; see this chapter, the *5620 SAM NE Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2. Commission the device for 5620 SAM management; see chapter 13 for more information. Configure polling policies as described in Procedure 13-10.

3. Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 14 for more information.

4. As required, manage and configure equipment; see chapter 16 for more information about equipment management and configuration. Additionally, configure the following:

    a. mixed mode as described in Procedure 19-4

    b. IEEE 1588 PTP clock as described in Procedures 19-10 and 19-11

5. Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication; see chapter 21.

6. If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices; see chapter 23 for more information.

7. Create equipment inventories of managed devices; see chapter 22 for more information.

8 As required, perform additional device management functions such as the following:

  a TCP enhanced authentication between NEs; see chapter 24 for more information

  b card migration; see chapter 25 for more information

  c threshold-crossing alarms; see chapter 26 for more information

  d bulk configuration changes; see chapter 27 for more information

  e object life cycle management; see chapter 28 for more information

  f automatic provisioning; see chapter 29 for more information

9 Configure NE routing and forwarding; see chapter 30 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

  a NE protocols; see chapter 31 for more information.

  b MPLS and LSPs; see chapter 32 for more information.

  c service tunnels to carry service traffic; see chapter 33 for more information.

  d Lawful Intercept; see chapter 34 for more information

  e IPsec; see chapter 35 for more information

  f ISA-Video; see chapter 36 for more information

  g 5620 SAM alarm policies; see chapter 37 for more information.

  h OAM diagnostic tests; see chapter 38 for more information.

10 As required, configure redundancy in the managed network using functions such as the following:

  a VRRP; see chapter 39 for more information

  b APS; see chapter 40 for more information

  c MC peer groups; see chapter 41 for more information

  d MC endpoint groups; see chapter 42 for more information

  e MC LAG groups; see chapter 43 for more information

  f MC synchronization groups; see chapter 44 for more information

  g MC ring groups; see chapter 45 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

  a QoS policies; see chapter 47 for more information

  b filter policies; see chapter 48 for more information

- **c** multicast policies; see chapter 49 for more information
- **d** time of day policies; see chapter 50 for more information
- **e** VRRP policies; see chapter 51 for more information
- **f** auto tunnels policies; see chapter 52 for more information
- **g** RADIUS-based accounting policies; see chapter 53 for more information
- **h** 802.1x policies; see chapter 54 for more information
- **i** PBB MRP policies; see chapter 55 for more information
- **j** connection profile policies; see chapter 57 for more information
- **k** service PW template policies; see chapter 58 for more information
- **l** residential subscriber policies; see chapter 59 for more information
- **m** remote network monitoring policies; see chapter 60 for more information
- **n** size constraint policies; see chapter 61 for more information
- **o** NAT policies; see chapter 62 for more information
- **p** format and range policies; see chapter 63 for more information

12 Configure services and related functions; see chapters 64 and 65 for general service information. As required, configure specific services and related functions such as the following:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **e** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information
- **f** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information
- **g** IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information
- **h** VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 74 for more information
- **i** composite services to connect various types of services; see chapter 76 for more information

j Application Assurance to provide deep-packet inspection and application-based subscriber traffic management; see chapter 77 for more information

k 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information

l OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information

m Ethernet Connectivity Fault Management; see chapter 80 for more information

n RCA audit; see chapter 81 for more information

12.11 7705 SAR support

The Alcatel-Lucent 7705 SAR is an IP/MPLS aggregation and mobile backhaul router for the mobile RAN. Located at cell sites, the 7705 SAR uses PW over MPLS to aggregate mobile 2G and 3G traffic that it backhauls to the core network. The 7705 SAR supports ATM, TDM, and Ethernet.

7705 SAR auxiliary alarm daughter cards

The 7705 SAR supports an auxiliary alarm daughter card. This is a unique card that interfaces with real-time systems. The following inputs and outputs are available:

- 24 digital inputs that can connect to dry contacts of security sensors, HVAC systems, and telecom systems
- Two analog inputs for monitoring battery voltage; each supports a range of 0 to 75V and has configurable thresholds for alarms and events on each port
- Eight dry-contact relay outputs that interface to external audible, visual, or telecom equipment using NO or NC contact pins

The inputs and outputs are listed on the Ports tab of the daughter card slot properties form, in the same manner as ports on a data-plane daughter card. Each input or output has configurable parameters. The name specified for each input or output must be unique within the device.

7705 SAR six-port E&M daughter cards

The 7705 SAR supports a six-port E&M daughter card. The configuration of ports and channels on this daughter card is similar to the 16-port DS1/E1 ASAP daughter card. You create a channel under each port, and a channel group under each channel.

The following configuration restrictions and limitations apply to ports and channels on the six port E&M daughter card:

- A port can have only one channel.
- A channel can have only one channel group.

- A channel group must be in Access mode and use CEM encapsulation.
- A channel group MTU is not configurable.

Only CESoPSN Cpipe SAPs can be created on the daughter card.

7705 SAR 12-port SDI card

The 7705 SAR-8/18 supports a 12-port Serial Data Interface card. The SDI card includes four connectors, each of which supports three ports. Each port in a three-port connector must be configured to work on the same interface type. V.35 and X.21 interfaces support FR, CEM, and IPCP encapsulation. The ports operate in access mode and can be configured to work with the following interfaces:

- RS232
- V.35
- X.21

7705 SAR Power Injector card

The 7705 SAR-8/18 supports a Power Injector card to deliver power and data to an MPT radio. Up to four Power Injector cards can be installed on the 7705 SAR-8, and up to eight Power Injector cards can be installed on the 7705 SAR-18.

7705 SAR Optical Add/Drop Mux cards

The 7705 SAR-8/18 supports an Optical Add/Drop Mux (OADM) card in 1, 2, 4, and 8-colour variants. These cards increase bandwidth in a fiber network.

7705 SAR 10-port 1GigE/1-port 10GigE X-Adapter card

The 7705 SAR-18 supports a 10-gigabit Ethernet XMDA which can be configured for ten 1-gigabit ports or one 10-gigabit port.

7705 SAR-F daughter cards

The 7705 SAR-F integrates eight-port Ethernet v3 and 16-port DS1/E1 v2 ASAP MDA functions in one chassis. When the 5620 SAM discovers a 7705 SAR-F, the integrated MDAs are automatically configured and displayed in the equipment tree.

7705 SAR-M daughter cards

The 7705 SAR-M variants are equipped with an integrated 7-port Ethernet card. Depending on the variant, a 7705 SAR-M may have an integrated 16-port channelized DS1/E1 ASAP card or a module slot. The 7705 SAR-M variants are:

- fan-cooled chassis with integrated 7-port Ethernet card, integrated 16-port channelized DS1/E1 ASAP card, and module slot
- fan-cooled chassis with integrated 7-port Ethernet card and module slot
- passively cooled chassis with integrated 7-port Ethernet card and integrated 16-port channelized DS1/E1 ASAP card
- passively cooled chassis with integrated 7-port Ethernet card

The following module cards can be inserted in the module slot:

- GPON module
- DSL module
- DCM
- 1 Colour Optical Add/Drop Mux module (OADM)

The DSL module includes a port with eight XDSL lines. The DCM includes one port with four SHDSL lines and one port with two XDSL lines. Except for 802.1x, 802.1ab LLDP, line loopbacks, and LAGs, all services and limitations which apply to Ethernet ports also apply to DCM and DSL modules.

12.12 Workflow to manage 7705 SAR devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 7705 SAR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 12.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 13 for more information. Configure polling policies as described in Procedure 13-10.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 14 for more information.

4 As required, manage and configure equipment; see chapter 16 for more information about equipment management and configuration. Additionally, configure the following:

- **a** ICMP extensions as described in Procedure 17-12
- **b** QoS ingress aggregate rates on the 7705 SAR-M as described in Procedure 17-13
- **c** Timing synchronization as described in Procedure 19-5
- **d** IEEE 1588 PTP clock as described in Procedures 19-6, 19-7, and 19-8
- **e** auxiliary alarm definitions as described in Procedure 19-9
- **f** channelized TDM ports as described in Procedure 20-19

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication; see chapter 21.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices; see chapter 23 for more information.

7 Create equipment inventories of managed devices; see chapter 22 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs; see chapter 24 for more information
- **b** threshold-crossing alarms; see chapter 26 for more information
- **c** bulk configuration changes; see chapter 27 for more information
- **d** object life cycle management; see chapter 28 for more information
- **e** automatic provisioning; see chapter 29 for more information

9 Configure NE routing and forwarding; see chapter 30 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 31 for more information.
- **b** MPLS and LSPs; see chapter 32 for more information.
- **c** service tunnels to carry service traffic; see chapter 33 for more information.
- **d** Lawful Intercept; see chapter 34 for more information
- **e** IPsec; see chapter 35 for more information
- **f** 5620 SAM alarm policies; see chapter 37 for more information.
- **g** OAM diagnostic tests; see chapter 38 for more information.

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 39 for more information
- **b** APS; see chapter 40 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies; see chapter 47 for more information. Additionally, configure fabric profile as described in Procedure 47-24.
- **b** filter policies; see chapter 48
- **c** multicast policies; see chapter 49 for more information
- **d** VRRP policies; see chapter 51 for more information
- **e** auto tunnels policies; see chapter 52 for more information
- **f** 802.1x policies; see chapter 54 for more information
- **g** PBB MRP policies; see chapter 55 for more information

- **h** connection profile policies; see chapter 57 for more information
- **i** service PW template policies; see chapter 58 for more information
- **j** residential subscriber policies; see chapter 59 for more information
- **k** size constraint policies; see chapter 61 for more information
- **l** NAT policies; see chapter 62 for more information
- **m** format and range policies; see chapter 63 for more information

12 Configure services and related functions; see chapters 64 and 65 for general service information. As required, configure specific services and related functions such as the following:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLL Apipe, Cpipe, Epipe, Fpipe, Ipipe, and Hpipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **e** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information
- **f** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information
- **g** IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information
- **h** composite services to connect various types of services; see chapter 76 for more information
- **i** 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information
- **j** OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information
- **k** Ethernet Connectivity Fault Management; see chapter 80 for more information
- **l** RCA audit; see chapter 81 for more information

12.13 7710 SR support

The Alcatel-Lucent 7710 SR is a modular, multi-service edge router that aggregates subscriber traffic over a variety of interfaces. It is based on the Alcatel-Lucent 7750 SR, and is typically deployed in distributed hub sites and enterprise customer offices to extend IP services to the network edge.

The 7710 SR chassis is optimized for the delivery of data, voice and video services, and supports up to 4 or up to 12 interfaces of various types and speeds.

12.14 Workflow to manage 7710 SR devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 7710 SR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 12.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM NE Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 13 for more information. Configure polling policies as described in Procedure 13-10.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 14 for more information.

4 As required, manage and configure equipment; see chapter 16 for more information about equipment management and configuration. Additionally, configure channelized TDM ports as described in Procedure 20-20.

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication; see chapter 21.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices; see chapter 23 for more information.

7 Create equipment inventories of managed devices; see chapter 22 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs; see chapter 24 for more information
- **b** threshold-crossing alarms; see chapter 26 for more information
- **c** bulk configuration changes; see chapter 27 for more information
- **d** object life cycle management; see chapter 28 for more information
- **e** automatic provisioning; see chapter 29 for more information

9 Configure NE routing and forwarding; see chapter 30 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 31 for more information
- **b** MPLS and LSPs; see chapter 32 for more information

- **c** service tunnels to carry service traffic; see chapter 33 for more information
- **d** Lawful Intercept; see chapter 34 for more information
- **e** IPsec; see chapter 35 for more information
- **f** 5620 SAM alarm policies; see chapter 37 for more information
- **g** OAM diagnostic tests; see chapter 38 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 39 for more information
- **b** APS; see chapter 40 for more information
- **c** MC peer groups; see chapter 41 for more information
- **d** MC endpoint groups; see chapter 42 for more information
- **e** MC LAG groups; see chapter 43 for more information
- **f** MC synchronization groups; see chapter 44 for more information
- **g** MC ring groups; see chapter 45 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies; see chapter 47 for more information
- **b** filter policies; see chapter 48 for more information
- **c** multicast policies; see chapter 49 for more information
- **d** time of day policies; see chapter 50 for more information
- **e** VRRP policies; see chapter 51 for more information
- **f** auto tunnels policies; see chapter 52 for more information
- **g** RADIUS-based accounting policies; see chapter 53 for more information
- **h** 802.1x policies; see chapter 54 for more information
- **i** PBB MRP policies; see chapter 55 for more information
- **j** connection profile policies; see chapter 57 for more information
- **k** service PW template policies; see chapter 58 for more information
- **l** residential subscriber policies; see chapter 59 for more information
- **m** remote network monitoring policies; see chapter 60 for more information
- **n** size constraint policies; see chapter 61 for more information

- **o** NAT policies; see chapter 62 for more information
- **p** format and range policies; see chapter 63 for more information

12 Configure services and related functions; see chapters 64 and 65 for general service information. As required, configure specific services and related functions such as the following:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **e** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information
- **f** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information
- **g** IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information
- **h** VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 74 for more information
- **i** composite services to connect various types of services; see chapter 76 for more information
- **j** 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information
- **k** OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information
- **l** Ethernet Connectivity Fault Management; see chapter 80 for more information
- **m** RCA audit; see chapter 81 for more information

12.15 7750 MG support

The 5620 SAM supports the discovery and management of the 7- or 12-slot Alcatel-Lucent 7750 MG. The 7750 MG can be configured as an SGW or a PGW in an LTE network.

The *5620 SAM User Guide* and other non-LTE documents in the 5620 SAM documentation suite do not describe 7750 MG management. The following documents describe 5620 SAM management and configuration of the 7750 MG:

- *5620 SAM LTE ePC User Guide*—Describes 7750 MG discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes 7750 MG device parameters as represented in the 5620 SAM schema, in addition to parameters on LTE and LTE service forms in the 5620 SAM GUI

Note — The *5620 SAM Alarm Reference* lists and describes all 5620 SAM alarms, including LTE and optical alarms.

12.16 7750 SR support

The Alcatel-Lucent 7750 SR is a multi-service edge router designed for service providers, cable MSO, and enterprise customers that deliver residential, business and mobile services through an IP/MPLS network. The 7750 SR is optimized for the high-performance delivery of data, voice and video services.

The 5620 SAM supports the following 7750 SR chassis types:

- 7750 SR-1
- 7750 SR-7
- 7750 SR-12
- 7750 SR-c4
- 7750 SR-c12

7750 SR-c4

The 7750 SR-c4, which supports up to 4 CMAs or 2 MDAs, has a forwarding capacity of 40 Gb/s, native uplink support, and a faster control plane processor than the 7750 SR. The ICM-2 is a preconfigured MDA that you cannot add or delete using the 5620 SAM.

The 7750 SR-c4 supports the following CMAs and MDAs:

- 7750 SR-c4 CFM-C4-XP
- 7750 SR-c4 IOM-C4-XP
- 5-port GIGE XP SFP CMA
- 1-port GIGE XP SFP CMA
- DC PEM

7750 SR-c12

The 7750 SR-c12, which supports up to 12 CMAs or 6 MDAs, has a forwarding capacity of 40 Gb/s, native uplink support, and a faster control plane processor than the 7750 SR.

12.17 Workflow to manage 7750 SR devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 7750 SR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 12.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM NE Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 13 for more information. Configure polling policies as described in Procedure 13-10.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions. See chapter 14 for more information.

4 As required, manage and configure equipment. See chapter 16 for more information. Additionally, configure the following:

- **a** mixed mode; see Procedure 19-4 for more information
- **b** IEEE 1588 PTP clock; see Procedures 19-6 and 19-7 for more information

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See chapter 21 for more information.

6 If required, perform NE maintenance functions, such as the following:

- **a** backing up and restoring device configurations
- **b** upgrading device software
- **c** monitoring deployment of configuration changes to devices

See chapter 23 for more information.

7 Create equipment inventories of managed devices. See chapter 22 for more information.

8 As required, perform additional device management functions, such as:

- **a** TCP enhanced authentication between NEs; see chapter 24 for more information
- **b** card migration; see chapter 25 for more information
- **c** threshold-crossing alarms; see chapter 26 for more information
- **d** bulk configuration changes; see chapter 27 for more information
- **e** object life cycle management; see chapter 28 for more information
- **f** automatic provisioning; see chapter 29 for more information

9 Configure NE routing and forwarding. See chapter 30 for general routing and forwarding information. As required, configure specific routing and forwarding functions, such as:

- **a** NE protocols; see chapter 31 for more information
- **b** MPLS and LSPs; see chapter 32 for more information
- **c** service tunnels to carry service traffic; see chapter 33 for more information
- **d** Lawful Intercept; see chapter 34 for more information
- **e** IPsec; see chapter 35 for more information
- **f** ISA-Video; see chapter 36 for more information
- **g** 5620 SAM alarm policies; see chapter 37 for more information
- **h** OAM diagnostic tests; see chapter 38 for more information

10 As required, configure redundancy in the managed network using functions such as:

- **a** VRRP; see chapter 39 for more information
- **b** APS; see chapter 40 for more information
- **c** MC peer groups; see chapter 41 for more information
- **d** MC endpoint groups; see chapter 42 for more information
- **e** MC LAG groups; see chapter 43 for more information
- **f** MC synchronization groups; see chapter 44 for more information
- **g** MC ring groups; see chapter 45 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions. See chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types, such as:

- **a** QoS policies; see chapter 47 for more information
- **b** filter policies; see chapter 48 for more information
- **c** multicast policies; see chapter 49 for more information
- **d** time of day policies; see chapter 50 for more information
- **e** VRRP policies; see chapter 51 for more information
- **f** auto tunnels policies; see chapter 52 for more information
- **g** RADIUS-based accounting policies; see chapter 53 for more information
- **h** 802.1x policies; see chapter 54 for more information
- **i** PBB MRP policies; see chapter 55 for more information
- **j** connection profile policies; see chapter 57 for more information

- **k** service PW template policies; see chapter 58 for more information
- **l** residential subscriber policies; see chapter 59 for more information
- **m** remote network monitoring policies; see chapter 60 for more information
- **n** size constraint policies; see chapter 61 for more information
- **o** NAT policies; see chapter 62 for more information
- **p** format and range policies; see chapter 63 for more information

12 Configure services and related functions. See chapters 64 and 65 for general service information. As required, configure specific services and related functions, such as:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **e** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information
- **f** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information
- **g** IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information
- **h** VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 74 for more information
- **i** composite services to connect various types of services; see chapter 76 for more information
- **j** Application Assurance to provide deep-packet inspection and application-based subscriber traffic management; see chapter 77 for more information
- **k** 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions, such as running OAM diagnostics; see chapter 79 for more information
- **l** OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information
- **m** Ethernet Connectivity Fault Management; see chapter 80 for more information
- **n** RCA audit; see chapter 81 for more information

12.18 9471 MME support

The 5620 SAM allows you to view the properties of the 9471 MME equipment, instance, interface function, application function, and packet handler. The 9471 MME equipment is represented in the 5620 SAM equipment navigation tree.

The *5620 SAM User Guide* and other non-LTE documents in the 5620 SAM documentation suite do not describe 9471 MME management. The following documents describe 5620 SAM management and configuration of the 9471 MME:

- *5620 SAM LTE ePC User Guide*—Describes 9471 MME discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes 9471 MME device parameters as represented in the 5620 SAM schema, in addition to parameters on LTE and LTE service forms in the 5620 SAM GUI

Note — The *5620 SAM Alarm Reference* lists and describes all 5620 SAM alarms, including LTE and optical alarms.

12.19 9500 MPR support

The Alcatel-Lucent 9500 MPR is a microwave digital radio that supports PDH and Ethernet to migrate from TDM to IP. The 9500 MPR provides a generic, modular IP platform for multiple network applications, such as 2G, 3G, HSDPA, and WiMAX to accommodate broadband services.

5620 SAM support for the 9500 MPR includes the following:

- 4 and 8-slot MSS shelves
- removable core-enhanced radio modem, 32 x DS1 and 32 x E1, 16 x E1 ASAP Access (ETSI) card, 2 x DS3 (ANSI) card, 4+4 x Ethernet (EAS) (ANSI) card, and cooling fan cards
- ODUs
- LAG objects

MSS-4 and MSS-8 shelves

Slots 1 and 2 are reserved for core-enhanced cards. Each shelf requires a core-enhanced card in slot 1 and can have an optional spare card installed in slot 2 to protect the main card.

The MSS-4 shelf supports cards in slots 3 and 4. The card slots can be used for unprotected radio modem or 32 x DS1 / 32 x E1 cards. A card in slot 3 can be protected by an identical card in slot 4.

The MSS-8 shelf supports six additional card slots. The slots support any combination of unprotected radio modem and 32 x DS1 / 32 xE1 cards, or a combination of protected and unprotected cards. Protected cards must be installed in slots 3, 5, or 7 and are protected by optional identical cards in slots 4, 6, and 8, respectively.

9500 MPR supported cards

The 9500 MPR supports the following card types:

Core-enhanced card

The core-enhanced card in slot 1 provides the following:

- device management and control functions
- DC power
- a plug-in flash memory card to store device configuration and license data
- an Ethernet switch that implements the cross-connections between the radio modem or 32 x DS1 / 32 x E1 cards, between the Ethernet user ports, and between the Ethernet ports and the radio modem or 32 x DS1 / 32 xE1 cards
- four electrical Ethernet ports; port 4 can be used as an additional management port, if required
- two SFP Ethernet ports; the ports are supported by the 5620 SAM when an SFP MDA is installed
- up to six MPT radio ports; ports 1 to 4 support MPT-HC, MPT-HCv2 and MPT-MC; ports 5 and 6 support MPT-HC, MPT-HCv2, and SFP

An optional identical core-enhanced card can be installed in card slot 2. The card provides protection if the card in slot 1 fails.

Core-B card

The Core-B card in slot 1 provides the following:

- device management and control functions
- DC power
- a plug-in flash memory card to store device configuration and license data
- an Ethernet switch that implements the cross-connections between the radio modem or 32 x DS1 / 32 x E1 cards, between the Ethernet user ports, and between the Ethernet ports and the radio modem or 32 x DS1 / 32 xE1 cards
- four Gigabit Ethernet electrical interfaces and one Gigabit Ethernet SFP optical interface

An optional identical core-enhanced card can be installed in card slot 2. The card provides protection if the card in slot 1 fails.

Note — The Core-B card is supported on 9500 MPR for ANSI 1.2.0 only.

Radio modem card

The radio modem card contains EPS and RPS logic, and performs the following:

- sends and receives standard Ethernet packets to and from the core-enhanced cards
- manages the radio frame generation and termination, the interface to and from the alternate radio transport card, and the cable interface functions to the ODU
- generates internal DC power for the card

32xE1(ETSI) card and 32xDS1(ANSI) card

Two 32 port cards versions are available: the 32 x E1 ETSI standard based and the 32 x DS1 ANSI standard based cards.

- provides external interfaces for up to 32 E1or DS1 ports
- manages the encapsulation and reconstruction of PDH data for standard Ethernet packets
- sends and receives standard Ethernet packets to and from core-enhanced cards
- contains the switch for EPS core protection
- generates internal dc power

2 x DS3 (ANSI) card

Two DS3 ports are available.

- supports up to six units per shelf
- 1+1 EPS protection

4+4 x Ethernet (EAS) card

The 4+4 x EAS module can be configured in any card slot on the 9500 MPR. This ANSI- based card supports 4 x Ethernet 10/100/1000-baseT (traffic) and 4+4 x Ethernet (Access/MPT) connection interfaces. Each chassis allows up to two EAS modules. ANSI 3.1 or later is supported. You can configure the 4+4 x EAS module with two types of MPT radio ports: MPT and SFP. This function is supported on ports 5 to 8.

2+2 x Ethernet (EAS) card

The 2+2 x EAS module can be configured with three types of MPT radio ports: MPT-HC, MPT-HCv2 and MPT-MC. MPP-MC can be configured only on ports 1 and 2, and cannot be involved in protection. MPT-HCs and MPT-HCv2 can be configured on any of the four ports if the corresponding port on the consecutive slot has the same card with the same MPT type. Card protection in this case is applicable. ANSI 3.1 or later is supported.

MPT-ACC ports are supported for 9500 MPR ANSI Release 3.0.0.

2 X STM card (ETSI 3.0.0 only)

The two port 2 x STM card is supported on card slots 3 and 4 only for ETSI Release 3.0.0.

16 x E1 ASAP Access (ETSI) card

The 16 x E1 ASAP Access (ETSI) card enables the management of ATM services on the 9500 MPR, through collecting IMA traffic, terminating the IMA groups and encapsulating and extracting the ATM cells into and from ATM PW packets towards the core board. ATM interfaces are established over PDH physical interfaces. ATM traffic is transported by the ATM PW service and encapsulated in Ethernet frames. The card is supported for ETSI Release 1.3.0.

2xSTM card

The 2xSTM card can be configured in all card slots on the 9500 MPR. Up to two ports can be configured. This ETSI- based card supports SFP-O and SFP-E port usage type.

1xSTM Channelized card

The 1xSTM channelized card can be configured in all card slots on the 9500 MPR. Up to one port can be configured. This ETSI- based card supports SFP-O and SFP-E port usage type. Up to 63E1 channels are supported. Services are deployed at the E1 channel level as TDM over Ethernet.

ODU

The ODU is a microprocessor-controlled transceiver that interfaces the MSS with the microwave antenna. Each radio modem card connects to one ODU. A 1 + 0 radio modem protection scheme requires one radio modem card and one ODU for each radio direction. Two radio modem cards and two associated ODUs must be provisioned in each radio direction for the 1+1 protection scheme.

XPIC

XPIC is an ODU which draws power and data from a 2+2 x Ethernet (EAS) card when the port is configured as MPT-HC. See Procedure 20-29 to configure power source type over Ethernet on a 2+2 x Ethernet (EAS) card. See Procedure 20-26 to configure MPT radio ports for SFP, MPT-HC. See the 9500 MPR user documentation for more information about how to install and use the NEtO software to configure XPIC.

9500 MPR LAG objects

The 5620 SAM can discover 9500 MPR LAG objects, but the LAG properties are not configurable using the GUI. All LAGs and their corresponding port terminations are created using CLI. The 5620 SAM does not allow creation, modification, or deletion of LAG properties or port terminations. See Procedure 18-17 to configure the Service creation and discovery associated with 9500 MPR Radio LAGs or Ethernet LAGs.

Port terminations are not discovered if the LAG type is Ethernet. If an Ethernet port is associated with a LAG, the port properties are read-only; modification using the 5620 SAM is not possible. An Ethernet LAG is in network mode and cannot be used in the 9500 MPR Release 3.1.0. Service creation is not possible using an Ethernet LAG as a network port.

You can associate only an MPT port as a LAG member. The following MPT ports can be configured using CLI:

- MPT MC
- MPT HC
- MPT HL

LAG objects support the following port types in 9500 MPR Release 3.2.0:

- MPT-HC
- MPT-MC
- MPT-HL
- MD300
- Ethernet

Using the 9500 MPR external element manager

You can start the 9500 MPR external element manager, NEtO, from the 5620 SAM GUI. See the 9500 MPR user documentation for information about installing and using the NEtO NE manager. See chapter 17 for information about starting the external element manager from the 5620 SAM GUI.

9500 MPR backups and restores

After 5620 SAM discovery, 9500 MPR NEs are automatically assigned to the default MPR Backup Policy and the MPR Read/Write Policy.

The MPR Read/Write Policy is a mediation policy that is automatically created. It contains the default FTP authentication details which have to be configured using the FTP login credentials required for backup and restore access. BOF save and CLI are not supported on 9500 MPR NEs. See chapter 23 for information about creating a 9500 MPR backup policy.

12.20 Workflow to manage 9500 MPR devices

The following workflow describes the sequence of high-level tasks required to configure and manage end-user 9500 MPR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions. See section 12.2 for more information.

1. Determine the configuration requirements for the installed device. See this chapter, the *5620 SAM NE Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2. Enable 5620 SAM management of a 9500 MPR; see Procedure 13-15 for more information.

3. Configure the required polling policies for a 9500 MPR; see Procedure 13-13 for more information.

4. Start the 9500 MPR external element manager (NEtO) from the 5620 SAM GUI; see Procedure 17-14 for more information.

5 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions. See chapter 14 for more information.

6 As required, manage and configure equipment. See chapter 16 for more information about equipment management and configuration. Additionally, configure the following, as required:

  a manage the software in the 9500 MPR committed and standby banks; see Procedure 19-12 for more information

  b card and port protection; see Procedures 19-19, 19-20, 20-31, and 20-32 for more information

  c ports; see Procedures 20-21, 20-22, 20-23, 20-24, 20-25, 20-26, 20-27, 20-28, 20-30, and 20-33 for more information

  d power source type on EAS card slots; see Procedure 20-29 for more information

  e radio LAGs or Ethernet LAGs; see Procedures 18-17 and 18-18 for more information

7 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See chapter 21 for more information.

8 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices. See Workflow for a 9500 MPR software upgrade in chapter 23 for more information.

9 Create equipment inventories of managed devices. See chapter 22 for more information.

10 As required, perform additional device management functions, such as:

  a TCP enhanced authentication between NEs; see chapter 24 for more information

  b threshold-crossing alarms; see chapter 26 for more information

  c bulk configuration changes; see chapter 27 for more information

  d object life cycle management; see chapter 28 for more information

  e automatic provisioning; see chapter 29 for more information

11 Configure NE routing and forwarding; see chapter 30 for general routing and forwarding information. As required, configure specific routing and forwarding functions, such as:

  a NE protocols; see chapter 31 for more information

  b MPLS and LSPs; see chapter 32 for more information

  c service tunnels to carry service traffic; see chapter 33 for more information. Additionally, configure Ethernet radio ring elements; see Procedure 33-9 for more information

- **d** Lawful Intercept; see chapter 34 for more information
- **e** IPsec; see chapter 35 for more information
- **f** error recovery mechanisms; see Procedure 37-21 for more information. See chapter 37 for more information about configuring 5620 SAM alarm policies.
- **g** OAM diagnostic tests; see chapter 38 for more information

12 As required, configure redundancy in the managed network using functions such as:

- **a** VRRP; see chapter 39 for more information
- **b** APS; see chapter 40 for more information

13 Create 5620 SAM policies that define the conditions for 5620 SAM management functions. See chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types, such as:

- **a** ATM QoS policies; see Procedure 47-32 for more information. See chapter 47 for more information about QoS policies.
- **b** radio interface queue map policies; see Procedure 47-33 for more information.
- **c** NE QoS policies; see Procedure 47-34 for more information.
- **d** filter policies; see chapter 48 for more information
- **e** multicast policies; see chapter 49 for more information
- **f** VRRP policies; see chapter 51 for more information
- **g** auto tunnels policies; see chapter 52 for more information
- **h** 802.1x policies; see chapter 54 for more information
- **i** PBB MRP policies; see chapter 55 for more information
- **j** connection profile policies; see chapter 57 for more information
- **k** service PW template policies; see chapter 58 for more information
- **l** residential subscriber policies; see chapter 59 for more information
- **m** size constraint policies; see chapter 61 for more information
- **n** NAT policies; see chapter 62 for more information
- **o** format and range policies; see chapter 63 for more information

14 Configure services and related functions. See chapters 64 and 65 for general service information. As required, configure specific services and related functions, such as:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information

c residential subscribers of customer services; see chapter 68 for more information

d 9500 MPR (dot1q) VLAN services; see Procedure 69-8 for more information.

e VLAN groups and VLAN paths; see Procedures 69-10 and 69-12 for more information

f VLL Apipe, Cpipe, and Epipe services to provide point-to-point connectivity between customer access ports; see Procedures 70-3, 70-5, and 70-10 for more information.

g VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information.

h composite services to connect various types of services; see chapter 76 for more information

i 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information

j OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information

k Ethernet Connectivity Fault Management; see chapter 80 for more information

l RCA audit; see chapter 81 for more information

12.21 eNodeB support

The eNodeB is an enhanced BTS system for UE access to the LTE RAN network and LTE services in the 700 MHz spectrum. The eNodeB is available as a compact or distributed system that consists of a BBU and a compact TRDU or distributed RRH component.

The *5620 SAM User Guide* and other non-LTE documents in the 5620 SAM documentation suite do not describe eNodeB management. The following documents describe 5620 SAM management and configuration of the eNodeB:

- *5620 SAM LTE RAN User Guide*—Describes eNodeB discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes eNodeB device MIM parameters as represented in the 5620 SAM schema, in addition to parameters on LTE and LTE service forms in the 5620 SAM GUI

Note — The *5620 SAM Alarm Reference* lists and describes all 5620 SAM alarms, including LTE and optical alarms.

12.22 OmniSwitch support

The Alcatel-Lucent OmniSwitch family of devices is a group of enterprise LAN switches. The 5620 SAM supports the OmniSwitch chassis types listed in Table 12-1.

Table 12-1 5620 SAM OmniSwitch support

Family	Characteristics	AOS Version Supported	Chassis and cards support
OS 6250	Layer 2+ Fast Ethernet Stackable LAN family of switches for both the enterprise (SME) and Ethernet (Metro) access segments.	Release 6.6.1 or later	Non-PoE chassis • OS 6250-24 • OS 6250-8M • OS 6250-24M • OS 6250-24MD PoE chassis • OS 6250-P24
OS 6400	Stackable layer 2+ gigabit Ethernet LAN switch available in 24 or 48-port variants. Up to eight switches can be linked to form a stack.	Release 6.3.3 or later	Non-PoE chassis • OS6400-24 • OS6400-48 PoE chassis • OS6400-P24 • OS6400-P48 Fiber chassis • OS6400-U24 • OS6400-U24D
OS 6850	Stackable layer 2/3 gigabit Ethernet fixed configuration switch available in 24 or 48-port variants. Up to eight switches can be linked to form a stack.	Release 6.3.1 or later	Non-PoE chassis • OS6850-24 • OS6850-24X • OS6850-48 • OS6850-48X • OS6850-U24X • OS6850-24L • OS6850-48L PoE chassis • OS6850-P24 • OS6850-P24X • OS6850-P48 • OS6850-P48X • OS6850-P24L • OS6850-P48L

(1 of 3)

Family	Characteristics	AOS Version Supported	Chassis and cards support
OS 6850E	The OS 6850E is the next evolution of the OS 6850. In addition to supporting the features of the OS 6850, the areas of enhancements for OS 6850E include form factor, new transceiver support, and new stacking mode.	Release 6.4.4 or later	Non-PoE chassis • OS 6850E-24 • OS 6850E-24X • OS 6850E-48 • OS 6850E-48X • OS 6850E-U24X PoE chassis • OS 6850-P24 • OS 6850E-P24X • OS 6850E-P48 • OS 6850E-P48X
OS 6855	Stackable layer 2/3 gigabit Ethernet switch specifically built for IP network deployments where environmental operating conditions are unusually demanding. The OS 6855 is available with up to 24 gigabit ports and four combo ports.	Release 6.3.2 or later Stackability only among OS6855-U24X chassis, Release 6.4.2	Fiber chassis • OS6855-U10 • OS6855-U24 • OS6855-U24X (stackable) Copper with Po E chassis • OS6855-14 • OS6855-24
OS 6900	The OS 6900 is a family of standalone aggregation switches that consists of two models: the OS 6900-X20 (640 Gb/s) and the OS 6900-X40 (1.28 Tb/s). The OS 6900-X40 has 40 fixed SFP+ ports, and two expansion slots. The OS 6900-X20 has 20 fixed SFP+ ports, and one expansion slot. Both models provide 1+1 redundant hot-swappable power supplies and a field-replaceable fan tray. Each expansion slot is capable of supporting 120 Gb/s of bandwidth.	Release 7.2.1 or later	XNI cards (supported on both model types) • OS-XNI-U12: Supports 12 SFP+ ports • OS-XNI-U4: Supports 4 SFP+ ports
OS 9600	A five-slot chassis supporting one CMM and four network interface modules. It offers a wide range of GigE and 10GigE interfaces and power-over-Ethernet to support IP telephones, WLAN access points and video cameras. The OS 9600 supports a maximum of two load sharing power supplies.	Release 6.3.1 R2 or later	CMM cards • OS9600-CMM • OS9700-CMM • OS9800-CMM Network interface cards • 2-port 10GigE XFP • 6-port 10GigE XFP • 20-port Fast Ethernet (10/100 – SW upgradable to 10/100/1000) RJ45 and 2-port GigE (100/1000) SFP • 24-port GigE SFP • 24-port GigE (10/100/1000) RJ45 • 24-port GigE (10/100/1000) RJ45 w/PoE • OS9-GNI-P24: 24-port (10/100/1000) TX (RJ-45) PoE support • 48-port GigE (10/100/1000) MRJ21
OS 9700	A high-density ten-slot chassis with two slots for control and eight slots for network interfaces supporting an aggregation of up to 192 GigE ports or 48 10GigE ports. Designed for smart continuous switching operation, the two center slots are dedicated to CMMs allowing redundant configurations. The OS 9700 supports a maximum of three power supplies.	Release 6.3.1 R2 or later	
OS 9800	A high performance 18-slot switch supporting 16 slots for Gigabit Ethernet and/or 10-Gigabit Ethernet network interface modules. An additional two slots are reserved for primary and redundant CMMs. The OS 9800 supports a maximum of four power supplies.	Release 6.3.1 R2 or later	

(2 of 3)

Family	Characteristics	AOS Version Supported	Chassis and cards support
OS 9700E	The OS 9700E is a high performance switch offering eight slots for Gigabit Ethernet and/or 10-gigabit Ethernet Network Interface (NI) modules. Additional two slots are reserved for primary and redundant Chassis Management Modules (CMMs).	Release 6.4.4 R1 or later	Network interface cards • OS9-GNI-C24E: 24-port 10/100/1000 with RJ-45 support • OS9-GNI-U24E: 24-port 1000base-X with SFP/MiniGBIC support • OS9-GNI-P24E: 24-port (10/100/1000) T/TX (RJ-45) PoE+ support • OS9-XNI-U2E: 2-port unpopulated 10-Gigabit Ethernet with XFP support
OS 9800E	The OS 9800E is a high performance switch offering 16 slots for Gigabit Ethernet and/or 10-Gigabit Ethernet Network Interface (NI) modules. An additional two slots are reserved for primary and redundant Chassis Management Modules (CMMs).		
OS 10K(1)	The OS 10K is a high-capacity, high-performance modular Ethernet LAN switch that provides 5.12 Tb/s of switching performance. The OS 10K has a 12 slot chassis configuration: 4 slots for CMM/fabric cards; and 8 slots for XNI or GNI cards that provide Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet capabilities.	Release 7.1.1 or later	CMM and CFM cards • OS10K-CMM • OS10K-CFM XNI cards • OS10K-XNI-U32S: 32 unpopulated 10G SFP+ transceiver connectors GNI cards • OS10K-GNI-U48E: 48 SFP transceiver connectors • OS10K-GNI-C48E: 48 auto-sensing ports, each port is configurable as 10BaseT, 100BaseTX, or 1000BaseT

(3 of 3)

Note

(1) The behavior of the power supplies is controlled by power management. You will see a power failure alarm even though power supplies are connected to the OS 10K chassis and is not being used by the 10K node. The 10K power management puts power supply into an inactive (down) state, if it is not required.

Caution 1 — OmniSwitch devices do not support automatic synchronization with the 5620 SAM database when you use the CLI to make configuration changes. To ensure that you are viewing accurate OmniSwitch information in the 5620 SAM, you must resynchronize the NE by clicking on the appropriate Resync button.

Caution 2 — OmniSwitch NEs do not send trap notifications for all MIB changes on the NE. To ensure that you are viewing the current configuration information in the 5620 SAM, you must resynchronize of the NE by clicking on the appropriate Resync button.

OmniSwitch LAG objects

OmniSwitch devices support static and dynamic LAGs. When you create a static LAG, you can manually add ports as LAG members. The ports that you select as members of a dynamic LAG are first placed into an Unassigned Dynamic LAG Members group. The OmniSwitch uses LACP to dynamically assign ports from an Unassigned Dynamic LAG Members group to the appropriate LAG. When a port is assigned to a dynamic LAG, it is removed from the Unassigned Dynamic LAG Members group.

You can create VLANs, use 802.1Q framing, configure QoS conditions, and enable other networking functions on a LAG, which is treated like a physical link.

OmniSwitch LAG support includes the following:

- up to 32 LAGs on an OS 6250, OS 6400, OS 6850, OS 6850E, or OS 6855 or stack of OmniSwitch devices
- up to 128 LAGs on an:
    - OS 9600, OS 9700, OS 9800, Release 6.3.4 or later
    - OS 9700E or OS 9800E, Release 6.4.2 or later
    - OS 6900, Release 7.2.1 or later
    - OS 10K, Release 7.1.1 or later
- two, four, or eight Ethernet links in a LAG
- access or network LAGs

Using WebView to manage an OmniSwitch

You can configure and manage an OmniSwitch using the WebView application, an Alcatel-Lucent web-based element management tool that runs on an OmniSwitch. WebView supports the following web browsers:

- Internet Explorer 6.0 or later for Windows
- Netscape 7.1 for Windows
- Netscape 7.0 for Solaris

Note — The web browser must have cookies and Java enabled.

See the appropriate OmniSwitch *Switch Management Guide* for information about configuring and using WebView. See chapter 17 for information about opening WebView using the 5620 SAM GUI.

12.23 Workflow to manage OmniSwitch devices

The following workflow describes the sequence of high-level tasks that are required to configure and manage end-user OmniSwitch NEs and services. The workflow assumes that the physical devices are installed. The management functions are supplemental to the general management functions described in section 12.2.

1 Determine the configuration requirements for installed devices. See this chapter, the *5620 SAM NE Compatibility Guide*, and the *5620 SAM Parameter Guide* for specific device information.

2 Commission the device for 5620 SAM management. See Procedure 13-4 and chapter 13 for more information.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions. See chapter 14 for more information.

4 As required, manage and configure equipment. See chapter 16 for more information about equipment management and configuration. Additionally, configure:

- **a** LAGs; see Procedures 18-15 and 18-16 for more information.
- **b** PoE ports; see Procedure 19-21 for more information.
- **c** Ethernet ports; see Procedure 20-34 for more information.
- **d** stacks; see Procedure 19-22 for more information.
- **e** CPU temperature threshold; see Procedure 19-23 for more information.
- **f** LLDP; see Procedures 17-9 and 20-34 for more information.
- **g** running configuration; see Procedure 19-13 for more information.
- **h** health monitoring; see Procedure 19-14 for more information.
- **i** Ethernet diagnostics; see Procedures 17-16, 17-17, and 17-18 for more information.

5 Create RADIUS or TACACS+ security policies. See Procedure 21-11 and chapter 21 for more information.

6 If required, perform NE maintenance functions, such as:

- **a** backing up and restoring device configurations; see chapter 23 for more information
- **b** upgrading device software; see chapter 23 for more information
- **c** monitoring deployment of configuration changes to devices; see chapter 23 for more information
- **d** immediate software upgrade; see Procedure 23-16 for more information

7 Create equipment inventories of managed devices. See chapter 22 for more information.

8 As required, perform additional device management functions, such as:

   a TCP enhanced authentication between NEs; see chapter 24 for more information

   b threshold-crossing alarms; see chapter 26 for more information

   c bulk configuration changes; see chapter 27 for more information

   d object life cycle management; see chapter 28 for more information

   e automatic provisioning; see chapter 29 for more information

9 Configure NE routing and forwarding. See chapter 30 for general routing and forwarding information. Additionally, configure the following, as required:

   a OmniSwitch routing instances; see Procedure 30-3 for more information

   b UDP relay and DHCP Snooping on OmniSwitch routing instances; see Procedure 30-6 for more information

   c OmniSwitch L3 interfaces; see Procedures 30-8 and 30-10 for more information.

   d OmniSwitch static routes; see Procedure 30-21 for more information

10 As required, configure additional specific routing and forwarding functions, such as:

   a NE protocols; see chapter 31 for more information. Additionally, configure:

      - IGMP; see Procedure 31-38 for more information
      - bridging; see Procedures 31-54 and 31-55 for more information

   b MPLS and LSPs; see chapter 32 for more information

   c service tunnels to carry service traffic; see chapter 33 for more information. Additionally, configure Ethernet ring elements; see Procedure 33-8 for more information.

   d Lawful Intercept; see chapter 34 for more information

   e IPsec; see chapter 35 for more information

   f 5620 SAM alarm policies; see chapter 37 for more information

   g OAM diagnostic tests; see chapter 38 for more information. Additionally, configure ping and traceroutes; see Procedures 38-38, 38-40, and 38-41 for more information

11 As required, configure redundancy in the managed network using functions such as:

   a VRRP; see chapter 39 for more information

   b APS; see chapter 40 for more information

12 Create 5620 SAM policies that define the conditions for 5620 SAM management functions. See chapter 46 for general information about 5620 SAM policy management. As required, configure specific policy types such as:

- **a** QoS policies; see Procedures 47-36, 47-37, and 47-38, and chapter 47, for more information.
- **b** filter policies; see chapter 48 for more information
- **c** multicast policies; see chapter 49 for more information
- **d** VRRP policies; see chapter 51 for more information
- **e** auto tunnels policies; see chapter 52 for more information
- **f** 802.1x policies; see chapter 54 for more information
- **g** PBB MRP policies; see chapter 55 for more information
- **h** AOS Ethernet service policies; see chapter 56 for more information
- **i** connection profile policies; see chapter 57 for more information
- **j** service PW template policies; see chapter 58 for more information
- **k** residential subscriber policies; see chapter 59 for more information
- **l** size constraint policies; see chapter 61 for more information
- **m** NAT policies; see chapter 62 for more information
- **n** format and range policies; see chapter 63 for more information

13 Configure services and related functions. See chapters 64 and 65 for general service information. As required, configure specific services and related functions such as:

- **a** virtual ports; see chapter 66 for more information
- **b** customers; see chapter 67 for more information
- **c** residential subscribers of customer services; see chapter 68 for more information
- **d** VLAN services; see Procedures 69-4, 69-6, 69-14, and 69-15, and chapter 69, for more information
- **e** VLAN groups and paths; see chapter 70 for more information
- **f** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 70 for more information
- **g** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 71 for more information
- **h** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 72 for more information

i IES to provide an IP interface between customer traffic and the Internet; see chapter 73 for more information

j composite services to connect various types of services; see chapter 76 for more information

k 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 79 for more information

l OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 78 for more information

m Ethernet Connectivity Fault Management; see Procedure 80-4 and chapter 80 for more information

n RCA audit; see chapter 81 for more information

12.24 Generic NE support

The 5620 SAM provides limited management support of generic NEs, which are non-Alcatel-Lucent devices, using generic NE profiles, alarm catalogues, and CLI scripts. A generic NE profile includes the following elements:

- the device MIB system object ID
- regular-expression strings that specify the format of prompts and commands
- the SNMP trap management configuration
- interfaces that can be specified as the endpoints of 5620 SAM physical links
- an optional alarm catalogue, which defines the alarms that the 5620 SAM raises in response to SNMP traps from the generic NE

Note 1 — By default, only the 5620 SAM admin user, or an operator with an assigned admin scope of command role, can manage generic NE profiles and alarm catalogues. A non-admin user requires the genericne scope of command role to manage generic NE profiles.

Note 2 — To create, modify, or delete a generic NE alarm catalogue or mapping, you require a trapmapper scope of command role with write, update, and execute permissions.

See chapter 13 for information about configuring a generic NE profile.

Generic NE device discovery and polling in the 5620 SAM are configured using the same methods that are used for an Alcatel-Lucent NE, but the 5620 SAM uses preconfigured scripts to manage and unmanage a generic NE. See chapter 11 for information about device discovery. See chapter 27 for information about creating CLI scripts using the 5620 SAM script manager.

The 5620 SAM displays generic NEs, but not generic NE interfaces, on the topology map and in the navigation tree.

Statistics support

The 5620 SAM supports the collection of a limited set of statistics counters from standard system, interface, and routing MIBs on generic NEs. These statistics are processed and presented in the same manner as statistics from other devices. You can view generic NE statistics on the Statistics tab of a generic NE interface properties form, retrieve them using the OSSI, and display them graphically using the 5620 SAM Statistics Plotter.

Note 1 — To collect or view generic NE statistics from routing MIBs, you require a valid 5650 CPAM license that has a third-party router quantity greater than zero.

Note 2 — If persistent SNMP indexes are not enabled on a generic NE, one or more generic NE interface indexes may change after a generic NE reboots. This can cause a mismatch between the statistics records collected before the reboot and the current interface indexes. The 5620 SAM takes no action to identify or correct such a mismatch.

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

Alarm support

By default, the 5620 SAM supports a limited number of standard system and interface SNMP traps for generic NEs. The 5620 SAM monitors SNMP reachability and interface status, and raises a standard alarm for each the following events:

- coldStart—The generic NE restarts.
- linkDown—An interface goes out of service.
- linkUp—An interface returns to service.

Note — When the 5620 SAM drops or fails to receive an SNMP trap from a generic NE, the trap is lost. The 5620 SAM is unable to request that a generic NE resend an SNMP trap.

You can configure the 5620 SAM to raise user-defined alarms in response to specific generic NE traps using alarm catalogues. An alarm catalogue is a set of trap-to-alarm mappings that can be associated with a generic NE profile. A generic NE profile can have at most one alarm catalogue, but each catalogue can contain up to 150 alarm mappings. When a mapping is administratively disabled, the 5620 SAM raises no alarm in response to an associated trap from a generic NE.

An alarm mapping can be static, which means that it maps to a specific alarm, or the mapping can use one or more transform functions that extend the mapping customization. A transform function defines conditions that enable the dynamic mapping of a trap to an alarm that is created using varbind values in an SNMP trap PDU. For example, you can use a transform function to assign a specific alarm name, severity, or probable cause to an alarm based on varbind values.

You can use a 5620 SAM GUI or OSS client to configure generic NE alarm catalogues and alarm mappings. The GUI supports the following methods:

- configuration forms—for object creation, modification, viewing, and deletion

  See chapter 13 for information about managing generic NE alarm catalogues using configuration forms.
- XML API script—for object creation and modification only

  A script template for alarm catalogue configuration is available at the following location:

  install_dir/nms/sample/xmlapi/AlarmCatalogue-Template.txt

  where *install_dir* is the 5620 SAM main server installation directory, typically /opt/5620sam/server

See the *5620 SAM Scripts and Templates Developer Guide* for information about using the Script Manager.

An OSS client can also retrieve a catalogue or a subset of the alarm mappings in a catalogue using the standard methods.

When the 5620 SAM receives a generic NE trap that is not one of the supported standard traps or a mapped trap in an alarm catalogue, the 5620 SAM drops the trap. When the 5620 SAM receives a high trap volume and must discard traps that it cannot process, it does not distinguish between standard and user-defined traps. To conserve system resources, Alcatel-Lucent recommends that you configure a generic NE to send only the required traps to the 5620 SAM.

Traps that map to user-defined alarms require extra processing by the 5620 SAM and are managed in a separate, resource-limited queue. When this queue fills, the 5620 SAM discards some of the traps and raises an alarm. You can monitor the queue length using the 5620 SAM Resource Manager.

Generic NE trap sequencing and throttling support are configurable in a generic NE profile. After the 5620 SAM finishes throttling traps from a generic NE or encounters a trap sequence error, it resynchronizes the discovered device MIBs.

13 — Device commissioning and management

13.1 Device commissioning overview

An Alcatel-Lucent device, Telco device, or generic NE requires commissioning preconfiguration before the 5620 SAM can manage it. When this preconfiguration is complete, the 5620 SAM can discover the device, as described in chapter 14.

Some devices, such as the 7210 SAS-E and 9500 MPR, require configuration in addition to device commissioning before the 5620 SAM can discover or manage them. See section 13.2 for information about device-specific management requirements.

Commissioning generic NEs for 5620 SAM management

The 5620 SAM uses configurable profiles and CLI configuration scripts to discover and manage generic NEs. You can use the same generic NE profile for multiple devices of the same type. Before the 5620 SAM can discover a generic NE using a discovery rule, the following conditions must be true:

- The device preconfiguration is complete.
- A 5620 SAM generic NE profile for the device exists.
- A 5620 SAM mediation policy is configured with a community string that matches the community string specified during the device preconfiguration.
- A discovery rule is configured to represent the device.

See chapter 14 for information about mediation policies and device discovery. See section 13.2 for information about configuring user-defined alarms for generic NE management.

Note 1 — By default, only the 5620 SAM admin user or an operator with an assigned admin scope of command role can manage generic NE profiles and alarm catalogs. A non-admin user requires an assigned generic NE scope of command role to manage generic NEs.

Note 2 — When multiple generic NE profiles contain possible matches for a system object ID, the profile that contains the system object ID with the longest or most specific match is chosen.

Note 3 — To create, modify, or delete a generic NE alarm catalog or mapping, you require a trapmapper scope of command role with write, update, and execute permissions.

13.2 Device management overview

The 5620 SAM supports in-band and out-of-band management of devices.

When you configure in-band management only, management traffic between the 5620 SAM and a device is transmitted through any port that is configured for network access, but not the management port. Using in-band management, the 5620 SAM sends management traffic to the system IP address of the device, or to an optional L3 management interface.

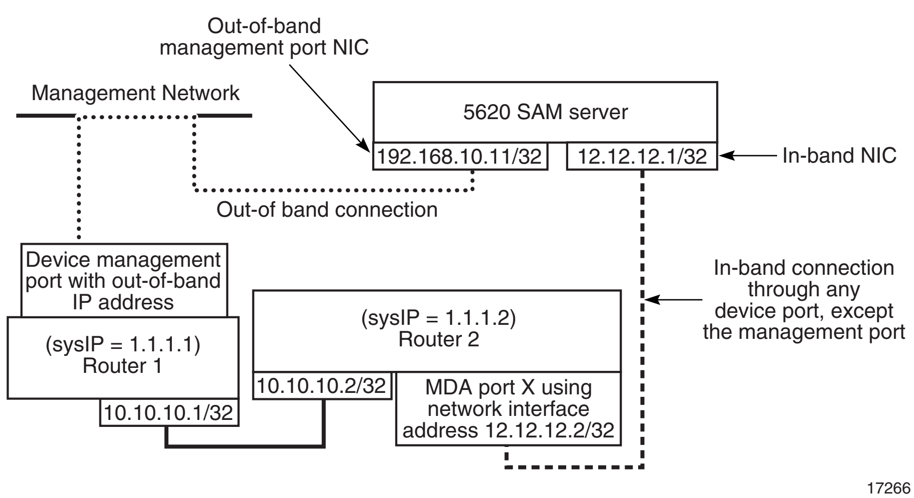
When you configure out-of-band management only, management traffic between the 5620 SAM and a device is transmitted through the management port of the device. Using out-of-band management, the 5620 SAM sends management traffic to the management IP address of the device.

When you configure a device for in-band and out-of-band management, one method provides redundancy for the other. If the IP addresses are the same, redundancy is not supported. Redundancy is not supported on the OmniSwitch.

Figure 13-1 shows an example of in-band and out-of-band management.

Note — To enable in-band management of a device, you must manually configure a second trap destination and trap log on the device.

Figure 13-1 Example of in-band and out-of-band management



The type of management is determined during device discovery. When the device is discovered using its management IP address, management is out of band. When the device is discovered using its system IP address or an L3 interface IP address, management is in band. In each case, a valid route to the device must exist. See chapter 14 for more information about the discovery process.

In Figure 13-1, there is an out-of-band management route that allows a ping from the 5620 SAM to the management IP address of router 1 (192.168.10.1/32). The in-band connection sends management packets to the system IP address on router 2 (12.12.12.2/32) on MDA port X.

Caution — Do not use the 5620 SAM to alter the configuration of the in-band port. If the port is shut down, network visibility is lost.

Some device types require configuration in addition to the SNMP configuration before they can be managed by the 5620 SAM. See the appropriate part of this section for device-specific management information.

Firewalls and management bandwidth

The ports between 5620 SAM components, and between the 5620 SAM system and the managed devices, must be open through firewalls to allow proper operation of the software. See the *5620 SAM Planning Guide* for more information about requirements for the following:

- firewalls and open ports
- communication bandwidth between 5620 SAM components
- communication bandwidth between the 5620 SAM and managed network

IPv6 management

The 5620 SAM supports device management using IPv6 for devices with IPv6 capabilities. The management protocol is established when the device is discovered. When a device is configured with an IPv6 address on its management port and/or system interface and the discovery rule is configured to discover IPv6 addresses, the 5620 SAM discovers and manages the device using IPv6. To change a device management protocol between IPv4 and IPv6, you must unmanage the device, create a new discovery rule specifying the new management protocol, and then rediscover the device.

Note — To manage 7750 SR, 7710 SR, or 7450 ESS devices using IPv6, the device must also be configured with an IPv4 address on the management port for out-of-band management, or an IPv4 address on the system interface for in-band management.

The 5620 SAM supports the configuration of IPv4 and IPv6 in-band and out-of-band management addresses on the same device.

Secure file transfers

The 5620 SAM supports secure and non-secure file transfers for backups, restores, software upgrades, and statistics collection. The device mediation policy determines whether FTP or SCP is used to perform file transfers to and from the managed devices. See chapter 14 for more information about configuring SSH2.

The following devices support the use of SSH2 for secure file transfers:

- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR
- OS 6250M
- OS 6250SME
- OS 6400
- OS 6850
- OS 6850E
- OS 6855
- OS 9600
- OS 9700
- OS 9700E
- OS 9800
- OS 9800E

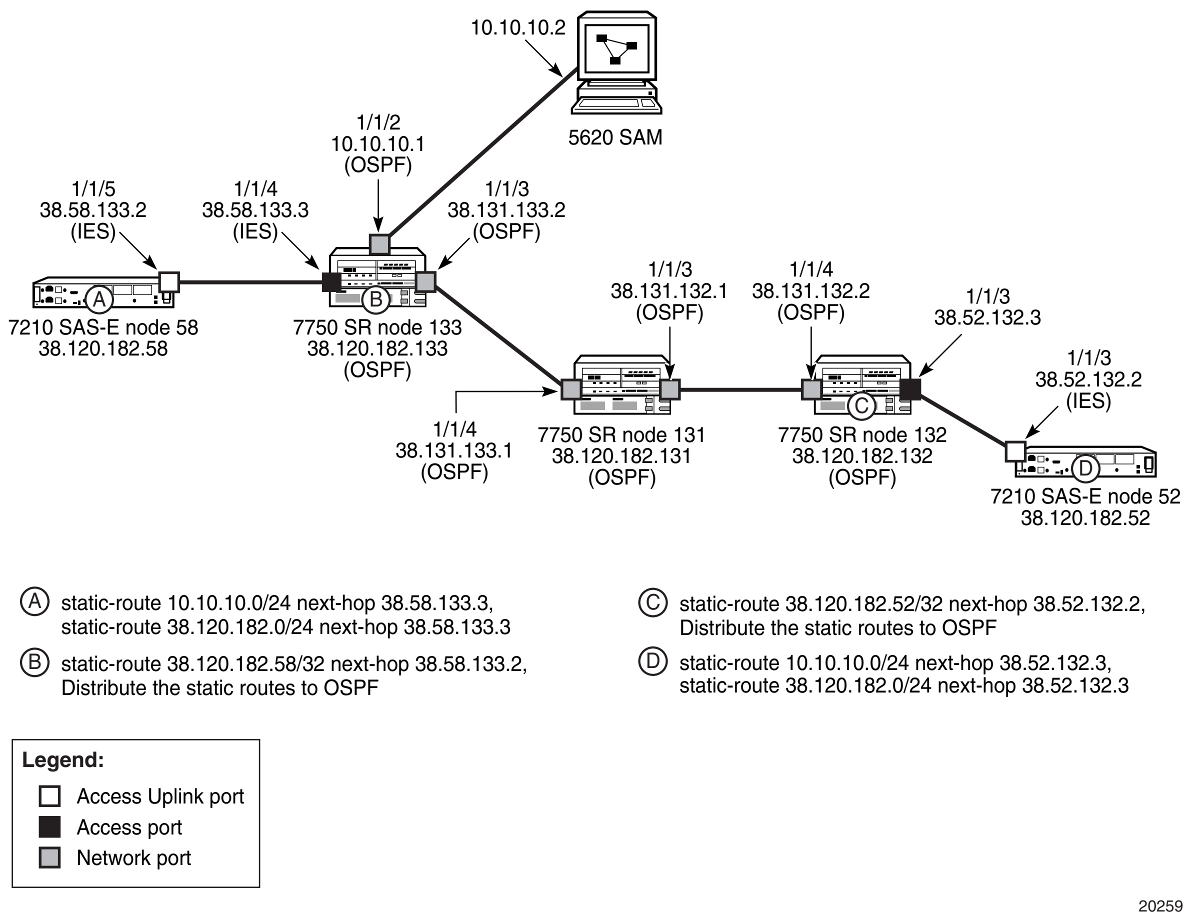
7210 SAS in-band and out-of-band management

The 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, and 7210 SAS-X 24F 2XFP support in-band and out-of-band management. The 7210 SAS-D 6F 4T, 7210 SAS-D 6F 4T ETR, and 7210 SAS-E support static routes, but do not support an IGP or SDPs. The example network shown in Figure 13-2 and the associated configuration steps describe the configuration required to enable 7210 SAS-E in-band management using static routes that are distributed to an IGP, which, in the example, is OSPF.

Note 1 — The 7210 SAS-E Release 2.0 R2 or later supports out-of-band management.

Note 2 — The 7210 SAS-M Release 2.0 R2 or later supports out-of-band management.

Figure 13-2 Example 7210 SAS-E in-band management network



The following configuration steps are required to set up the example network:

1 Using the CLI, configure the SNMP security parameters on the devices that you need to discover. See Procedure 13-1 for more information.

2 Perform the following steps on node 133:
- Configure an interface on port 1/1/2 that connects to the 5620 SAM server interface.
- Configure an interface on port 1/1/3, which is connected to node 131.
- Create an L3 interface on port 1/1/4 by creating an IES.
- Create a static route to node 58.
- Create an ASBR OSPF (area 0.0.0.0) instance on the system and enable OSPF on the interfaces to node 131 and the 5620 SAM server.
- Create a routing policy to distribute the static route to OSPF.

3 Perform the following steps on node 131:
- Configure an L3 interface on port 1/1/4, which is connected to node 133.
- Configure an L3 interface on port 1/1/3, which is connected to node 132.
- Enable OSPF (area 0.0.0.0) on the system and the interfaces connected to nodes 133 and 132.

4 Perform the following steps on node 132:
- Create an L3 interface on port 1/1/4, which is connected to node 131.
- Create an L3 interface on port 1/1/3, which is connected to node 52.
- Create a static route to node 52.
- Create an ASBR OSPF (area 0.0.0.0) instance on the system and enable OSPF on the interface to node 131.
- Create a routing policy to distribute the static route to OSPF.

5 Perform the following steps on node 52:
- Create an IES L3 interface on port 1/1/3, which is an uplink port.
- Create static routes that direct traffic to the IES L3 interface.

6 Perform the following steps on node 58:
- Create a IES L3 interface on port 1/1/5, which is configured as an uplink port.
- Create static routes to direct traffic to the IES L3 interface.

7 Ensure that each 7210 SAS-E can ping the network interface IP address which is configured on the 5620 SAM main server.

8 Ensure that the 5620 SAM main server can ping the system IP address of each 7210 SAS-E.

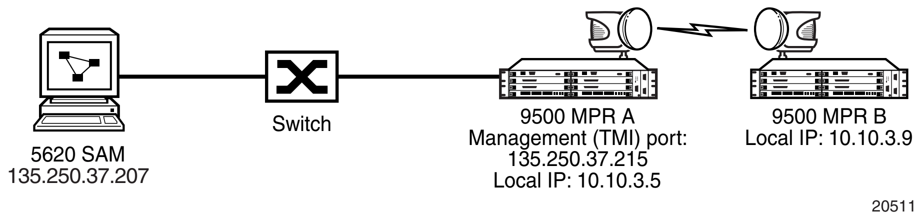
9 Configure an in-band polling policy using the 5620 SAM. See Procedure 13-12 for more information.

9500 MPR in-band management

The 9500 MPR nodes support in-band and out-of-band management.

To enable 9500 MPR in-band management, the 5620 SAM requires connectivity to the 9500 MPR NE, as shown in Figure 13-3 and described in the associated example configuration steps.

Figure 13-3 Example of 9500 MPR In-band management



Perform the following initial configuration on the 9500 MPR:

1 Connect the first 9500 MPR Node 1 to the switch using the TMN port or port 4 of the 9500 MPR A.

When the 5620 SAM is connected to the 9500 MPR network via non 9500 MPR devices like the 7705 SAR or 7750 SR, it is expected that the TMN in-band feature will be enabled on Node 1 of the 9500 MPR that is connected to non 9500 MPR devices. For example, SAM-----7705SAR_1/1/1-----port1/4_MPR1 -------(radio)------MPR2.......

In the above example, the 9500 MPR Node 1 and port 1/4 has been enabled with VLAN ID and IP addresses and the 7705 SAR is configured with the same VLAN and IP address from the same subnet.

2 Ensure that the radio links between the 9500 MPRs is working by pinging the local IP addresses. A connection between two 9500 MPR nodes could be over an Ethernet or optical link. If the core Ethernet or core optical port is used between two 9500 MPRs, the ports should be enabled with TMN in-band on the 9500 MPR.

Note — The management port IP, TMN in-band IP and local IP can be in a different subnet.

Perform the following network configuration:

1 Verify that you can ping the local IP address of all the nodes from the 5620 SAM server.

2 Verify that you can ping the 5620 SAM server IP from each of the 9500 MPR nodes.

Note — You can manage the 9500 MPR through the local IP address even though the management interface via the 5620 SAM server is not reachable.

3 The 5620 SAM should be able to discover and manage the local IP addresses of the 9500 MPRs after connectivity has been established between the 5620 SAM and the 9500 MPR nodes. See “9500 MPR support” for more information about 9500 MPR node discovery and management.

9500 MPR radio link discovery and management

The 5620 SAM supports N x (1+x) radio [x = 0, 1] link discovery. To enable 9500 MPR radio link discovery and management, the 5620 SAM requires connectivity between the 9500 MPR NE radio ports, as shown in Figure 13-4 and described in Table 13-1.

Figure 13-4 Connectivity example for 9500 MPR radio link discovery and management

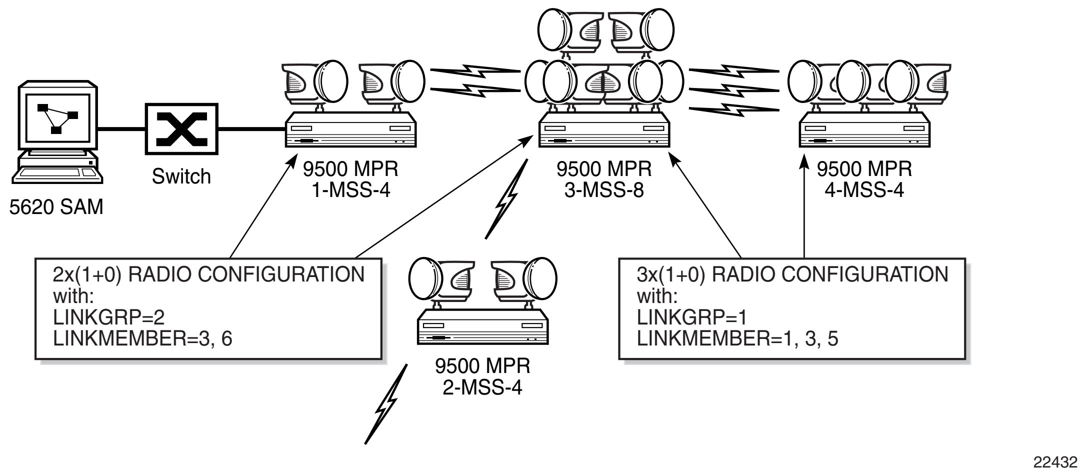


Table 13-1 Connectivity parameter details

	1-MMS-4	2-MSS-4	3-MSS-8	4-MSS-4
2-MSS-4	PPPRF Enabled LinkID (as assigned)	—	PPPRF Enabled LinkID (as assigned)	—
3-MSS-8	PPPRF Enabled LinkID (23, 23) PPPRF Disabled LinkID (26, 26)	PPPRF Enabled LinkID (as assigned)	—	PPPRF Enabled LinkID (11, 11) PPPRF Disabled LinkID (13, 13) PPPRF Disabled LinkID (15, 15)

To discover multiple radio links, you must provision the radio ports on the 9500 MPR based on the following criteria.

1 Only one radio port can have PPPRF enabled. The far endpoint on the same link must have the same configuration as the first endpoint. PPPRF should be disabled on both endpoints for the second and any subsequent radio links.

2 LinkID requirements include:

   - The LinkID must be enabled for all of the port members of the configuration that have the same LINKGRP, and a different LINKMEMBER that matches the far endpoint.
   - Expected and Sent values must be equal (for example, 11, 11 or 13, 13).
   - For a multiple Nx(1+x) radio configurations on the same node, the LINKGRP must be unique without overlapping (for example, 1 and 2).
   - LinkID should be formatted as LINKGRP:LINKMEMBER in a hexidecimal format where LINKGRP is the first character and LINKMEMBER are the members.
   - Any mismatch between the LinkID at the link level (for example, Send is not equal to Expected) mutes the radio connection (MPT case).

3 As a requirement for the first radio link to be discovered, the remote address must be configured at both endpoints. For subsequent links, alarms cannot be present on the radio port.

4 When Radio Link Aggregation is enabled for any of the radio links between two 9500 MPRs, all radio links must belong to the same LAG.

Configuring user-defined alarms for generic NEs

As part of a generic NE profile, you can map SNMP traps from generic NEs to user-defined 5620 SAM alarms in an alarm catalogue. A generic NE profile can be associated with only one alarm catalogue, but an alarm catalogue can contain up to 150 trap-to-alarm mappings.

A mapping is one of the following types:

- static—A specific SNMP trap is associated with a specific alarm.
- dynamic—The mapping includes one or more transform functions that define alarm properties based on values in SNMP trap PDUs.

Each mapping in a catalogue defines an alarm that the 5620 SAM raises or clears when it receives a specific SNMP trap. A mapping includes standard elements such as the trap OID, alarm type, probable cause, and severity, but can include the following optional elements:

- trap name
- self-clearing designation—specifies that the alarm clears when a specific clearing trap is received, and has the following requirements:
    - If the severity of the raising alarm is a static value, the clearing trap must have a static mapping in the same catalogue as the raising trap, and can be linked to only one raising trap.
    - If the severity of the raising alarm is defined using a transform function, the transform function must include a raising value pair and a clearing value pair.
- FDN extension, which is an alarm-name extension that can include the following:
    - static text
    - scripting functions—expressions that specify the trap PDU values to include; these allow the same alarm type to be raised in response to different traps while uniquely identifying the trap origin in the alarm name.

- additional text—used to provide information of value related to the trap event, for example, troubleshooting actions; the additional text consists of the trap OID by default, but can include the following:
  - static text
  - scripting functions—expressions that specify the trap PDU values to include; these are used to generate a more precise description of the alarm condition
- System Address and/or Interface Index varbind positions for a GNE on which to raise an alarm.

Note — The FDN extension of a generic NE alarm is not appended to the Alarm Name field in the 5620 SAM GUI, but is included in the Additional Text field. To create a filter for generic NE alarms that have FDN extensions, you must filter on the Additional Text field.

A change to an alarm catalogue or to a mapping in a catalogue takes effect when you commit the change.

Transform functions

A transform function is an optional catalogue component that associates one or more values in an SNMP trap PDU with an alarm property such as the alarm name, probable cause, or severity. For example, you can create a transform function that assigns an alarm severity of Critical when the value in a specific varbind is 1, Major when the value is 2, and Minor when the value is 3.

When an alarm mapping includes one or more transform functions, the 5620 SAM can raise multiple alarms in response to the same SNMP trap. A trap value and the associated alarm property value are specified as a value pair in a transform function. You can also specify a default alarm property value that the 5620 SAM assigns to an alarm when a received value is not defined in a value pair.

A transform function defines the input value type, such as integer, and the output alarm property type, such as severity. You can modify these parameters only when the transform function does not contain a value pair and is not used by a mapping.

A transform function returns an empty string when a received value is not defined in a value pair and no default alarm property value is assigned. When the transform function defines the alarm name, probable cause, or severity, the 5620 SAM logs an error in response and does not raise an alarm.

13.3 Workflow to commission and manage devices

The following workflow describes the sequence of high-level tasks required to commission and preconfigure an Alcatel-Lucent device, Telco device, or generic NE for discovery by the 5620 SAM.

1 Using a CLI, enable and configure SNMP on the device.

a See Procedure 13-1 for 7210 SAS, 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR configuration information.

b See Procedure 13-3 for 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco configuration information.

c See Procedure 13-4 for OmniSwitch configuration information.

d See Procedures 13-5, 13-8, and 13-9 for generic NE configuration information.

e See Procedure 13-6 for lightweight generic NE configuration information.

2 If required, enable 5620 SAM management of a 9500 MPR. See Procedure 13-15 for more information.

3 If required, configure the source for 5620 SAM SNMP traps. See Procedure 13-2 for more information.

4 If required, enable the cross launch of a 9400 AWY, MPT-sa, or MSS-1c J-USM manager. See Procedure 13-7 for more information.

5 If required, use a CLI to enable 5620 SAM in-band management of the device by to configure a second trap destination and trap log on the device. See section 13.2 for more information.

Note — Before you configure a discovery rule, as described in chapter 14, you must ensure that a device has routing enabled for the in-band and out-of-band address, as required.

6 If required, establish a route for in-band traffic. For example, to configure a static route or use OSPF. See chapter 30 for more information on static routes. See chapter 31 for more information about OSPF.

7 Configure the 5620 SAM to use in-band, out-of-band, or in-band and out-of-band polling for the device. A 5620 SAM mediation policy specifies the polling interval. See chapter 14 for information about mediation policies.

a See Procedure 13-10 for 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR configuration information.

b See Procedure 13-11 for 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA configuration information.

c See Procedure 13-12 for 7210 SAS configuration information.

d See Procedures 13-5, 13-8, and 13-9 for generic NE configuration information.

e See Procedure 13-13 for 9500 MPR configuration information.

f See Procedure 13-14 for information about editing polling settings for multiple managed devices.

8 If required, configure or modify a generic NE alarm catalogue for use with a generic NE profile. See Procedures 13-16, 13-17, 13-18, 13-19, and 13-20 for more information.

13.4 Alcatel-Lucent and Telco device commissioning procedures

The following procedures describe how to configure Alcatel-Lucent and Telco devices for 5620 SAM management.

Procedure 13-1 To commission a device for 5620 SAM management

This procedure applies to 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR devices. See Procedure 13-3 for information about how to commission a 7250 SAS or Telco device. See Procedure 13-4 for information about how to commission an OmniSwitch device. See the appropriate device documentation for information about using a device CLI.

Caution — Do not apply an SNMP log filter to the 5620 SAM SNMP log. The 5620 SAM cannot manage an NE that has an SNMP log filter applied to the log used by the 5620 SAM, which is typically log ID 98.

1 Open a console window on the device.

2 Enter the following command at the prompt to configure the system address of the device:

configure router interface "system" address *xxx.xxx.xxx.xxx/mask* ↵

where <*xxx.xxx.xxx.xxx*> is the system IP address
mask is the bit mask

3 Enter the following command at the prompt to enable Telnet:

configure system security telnet-server ↵

4 Enter the following command at the prompt to enable FTP:

configure system security ftp-server ↵

5 If required, enter the following command at the prompt to enable SSH2:

configure system security ssh version 2 ↵

6 Enter the following command at the prompt to enable console, FTP, and SNMP access for the appropriate user account on the device:

configure system security user *user_account* access console ftp snmp ↵

where *user_account* is the appropriate user account for Telnet, FTP, and SNMP access, for example, admin

7 If required, enter the following command at the prompt to enable hash encryption for passwords and authentication keys during device configuration save or list operations:

configure system security hash-control read-version *read-version* write-version *write-version* ↵

where

read-version is the version of encryption accepted during read operations, for example, 1, 2, or all to indicate that both are accepted

write-version is the version of encryption used during write operations, for example, 1 or 2

Version 1 encryption uses a simple key algorithm that generates the same character string each time it hashes a specific password or authentication key.

Version 2 encryption uses a more complex key algorithm that generates a different character string each time it hashes a specific password or authentication key.

8 Enter the following commands in sequence at the prompt to set the time zone and time:

configure system time zone *time_zone -offset_from_UCT* ↵

admin set-time *YYYY/MM/DD hh:mm:ss* ↵

where

time_zone is the appropriate time zone, for example, EST

offset_from_UCT is the offset, in hours, from Universal Co-ordinated Time, also known as Greenwich Mean Time, for example, if you specify EST, *offset_from_UCT* is -5, as EST lags UCT by five hours

YYYY/MM/DD hh:mm:ss is the current local time

9 If required, perform one of the following to enable a time protocol.

a Enter the following command at the prompt to enable NTP:

configure system time ntp server-address *server_IP_address* ↵

where
server_IP_address is the IP address of the SNTP server

b Enter the following command at the prompt to enable SNTP:

configure system time sntp server-address *server_IP_address* ↵

where
server_IP_address is the IP address of the SNTP server

10 Enter the following commands in sequence at the prompt to enable the SNMPv2 engine and to configure an SNMP community:

configure system snmp no shutdown ↵

configure system snmp packet-size 9216 ↵

configure system security snmp community *community_name* rwa version both ↵

where *community_name* is the SNMPv2 community name

Note 1 — The command is used for the 5620 SAM write mediation policy. If you are using SNMPv2, you must use this mediation policy for read as well, or create another mediation policy that is also configured for rwa.

Note 2 — The SNMPv2 community string name rwa attributes must be enabled for the 5620 SAM to properly manage a node, even if the 5620 SAM is only used to monitor a network.

Note 3 — To configure SNMPv3 management on the device, see Procedure 14-1.

11 Enter the following commands in sequence at the prompt to ensure that the device uses persistent SNMP indexes:

bof persist on ↵

bof save ↵

12 Enter the following commands in sequence at the prompt to save the configuration changes and reboot the device:

admin save ↵

admin synchronize boot-env ↵

admin reboot now ↵

The device initializes with SNMP communication enabled.

13 Type the following to clear the log ID and trap group ID:

configure log ↵

log-id 98 ↵

shutdown ↵

exit ↵

no log-id 98 ↵

no snmp-trap-group 98 ↵

exit all ↵

14 Use a 5620 SAM client to discover the device and to verify that the device configuration allows management of the device, for example, by performing a device configuration backup. See chapter 14 for information about device discovery. See chapter 23 for information about performing device configuration backups.

15 Enter the following commands in sequence at the prompt to ensure that the SNMP trap configuration is correct:

configure log ↵

info ↵

The output should look similar to the following:

```
snmp-trap-group 98
description "5620sam"
trap-target "xxx.xxx.xxx.xxx:162" address
xxx.xxx.xxx.xxx snmpv2c notify-community "privatetrap98"
trap-target "yyy.yyy.yyy.yyy:162" address
yyy.yyy.yyy.yyy snmpv2c notify-community "privatetrap98"
exit
log-id 95
from security
to snmp 1024
exit
snmp-trap-group 95
description "5620sam"
trap-target "xxx.xxx.xxx.xxx:162" address xxx.xxx.xxx.xxx snmpv2c
notify-community "privatetrap98"
trap-target "yyy.yyy.yyy.yyy:162" address  yyy.yyy.yyy.yyy
snmpv2c notify-community "privatetrap98"
exit
```

where

xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server in a standalone 5620 SAM configuration, or one of the two main servers in a redundant configuration

yyy.yyy.yyy.yyy is the IP address of the other 5620 SAM main server in a redundant 5620 SAM configuration, if present

Procedure 13-2 To configure the source for 5620 SAM SNMP traps

If the 5620 SAM is unable to find an SNMP trap target log ID that matches the 5620 SAM configuration log ID, which is by default 98, it recreates the log ID and snmp-trap-group, which results in a single log file that receives traps from two sources.

You can configure the source of log ID 98 by configuring the nms-server.xml file to define the source for traps.

Caution — This procedure requires a restart of the 5620 SAM main and auxiliary servers, which is service-affecting. Ensure that you attempt to perform this procedure only during a scheduled maintenance window.

1 Log in to the main server station as the samadmin user.

2 Open a console window.

3 Navigate to the server configuration directory, typically /opt/5620sam/server/nms/config.

4 Open the nms-server.xml file using a text editor.

5 Locate the following text in the file:

```
<snmp

ip="samserverIP"

port="162"

trapLogId="98"
```

where
samserverIP is the IP address of the 5620 SAM main server

This default configuration applies to traps from admin and security.

6 To restrict the source for traps to admin only, add the following line:

```
logIdSourceBits="80"
```

7 Save and close the nms-server.xml file. You must restart the 5620 SAM server for your configuration changes to take effect.

8 Open a console window.

9 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

10 Enter the following at the prompt to restart the main server:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts.

Note — To prevent a server activity switch in a redundant 5620 SAM system, you must stop the standby 5620 SAM server before you restart the primary main server.

Procedure 13-3 To commission a 7250 SAS or Telco device for 5620 SAM management

This procedure applies to 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices. See Procedure 13-1 for information about how to commission 7210 SAS, 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR devices. See Procedure 13-4 for information about how to commission an OmniSwitch device. See the appropriate device documentation for more information about using the CLI.

Note — An uncommissioned Telco, 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA device is in Privileged, or enable, mode by default. After you configure an enable mode password for the device in step 6 of this procedure, enable mode is not the default. See the appropriate device documentation for more information about enable mode.

1 Open a console window on the device.

2 Enter the following command to enable further device configuration:

configure terminal ↵

3 Enter the following sequence of commands to set the host name and IP address for the managed device:

hostname *name* ↵

ip address *xxx.xxx.xxx.xxx*/*M* ↵

where
name is the host name
xxx.xxx.xxx.xxx is the IP address
M is the bit mask

Note — Ensure that each 7250 SAS-ES or 7250 SAS-ESA that is going to use in-band management can ping the network interface IP address configured on the 5620 SAM main server; also ensure that the 5620 SAM main server can ping the system IP address of each 7250 SAS-ES or 7250 SAS-ESA.

4 If you are configuring a 7250 SAS-ES or 7250 SAS-ESA, go to step 5. Otherwise, go to step 6.

5 For the 7250 SAS-ES and 7250 SAS-ESA, which support enhanced functionality such as OSPF and VPLS, you must configure a system interface, lo1, so that the 5620 SAM can discover or manage the devices. Enter the following sequence of commands to configure the lo1 system interface:

`interface lo1` ↵

`ip address` ***`xxx.xxx.xxx.xxx`*** **`/32`** ↵

where *xxx.xxx.xxx.xxx* is the IP address

6 Enter the following command to change the switch login password:

`password` ***`password password`*** ↵

where *password* is the new switch login password that is entered twice

7 Enter the following command to set the enable mode password:

`enable password` ***`password password`*** ↵

where *password* is the new enable mode password that is entered twice

8 By default, access ports on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices belong to a default VLAN. The port numbers may differ from those shown in the following examples, depending on which port is designated as the management port. Enter the appropriate sequence of commands to remove the device from the default VLAN.

a For a 7250 SAS, enter the following commands:

`vlan` ↵

`config default` ↵

`remove ports 1/1/2-1/5/4` ↵

`exit` ↵

`exit` ↵

b For a 7250 SAS-ES or 7250 SAS-ESA,enter the following commands:

vlan ↵

config default ↵

remove ports 1/1/2-1/6/2 ↵

exit ↵

exit ↵

c For a Telco device, enter the following commands:

vlan ↵

config default ↵

remove 1/1/1-1/1/# ↵

exit ↵

exit ↵

where # is the number of ports on the card; for example, 24

9 Enter the following command to configure static routes from the device to the 5620 SAM network management domain:

ip route *xxx.xxx.xxx.xxx*/*M* *yyy.yyy.yyy.yyy*

where
xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server
M is the 5620 SAM main server subnet mask
yyy.yyy.yyy.yyy is the IP address of the gateway device used to reach the 5620 SAM main server

10 Perform one of the following to configure the required version of SNMP on the device:

a For SNMP v2c:

i Enter the following sequence of commands to configure the SNMP group and users:

snmp-server enable ↵

snmp-server view viewALL 1.3 included ↵

snmp-server group *v2c_group* v2c read viewALL write viewALL notify viewALL ↵

snmp-server user *v2c_user* group *v2c_group* v2c ↵

snmp-server user *v2c_usertrapXX* group *v2c_group* v2c ↵

where

v2c_user is an SNMP user name; for example private. The name must match the SNMP Community String used by the 5620 SAM node discovery mediation policy.

v2c_group is an SNMP trap group name

v2c_usertrapXX is an SNMP trap user name. The name is comprised of the *v2c_user* name followed by trapXX, where XX is a number from 01 to 98. For example, if the *v2c_user* name is private, the *v2c_usertrapXX* name must be privatetrapXX. The name must match the SNMP trap user name used by the 5620 SAM node discovery mediation policy.

ii Enter the following sequence of commands to configure SNMP trap forwarding to the 5620 SAM:

snmp-server target-param *Target v2c_usertrapXX* v2c ↵

snmp-server target-addr *name xxx.xxx.xxx.xxx port# Target* TRAP ↵

snmp-server notify all TRAP ↵

where

Target is a name specified for the SNMP target, for example Target_1

v3_usertrapXX is the user name created in step i above

name is the target name, for example sam

xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server

port# is the SNMP trap receiving port on the 5620 SAM main server; for example, the default of 98 for a standalone or primary main server, or 97 for a standby main server

b For SNMPv3:

i Configure an SNMPv3 user and group.

snmp-server enable ↵

snmp-server view viewALL 1.3 included ↵

snmp-server group *v3_group* v3 priv read viewALL write viewALL notify viewALL ↵

snmp-server user *v3_user* group *v3_group* v3 priv *privpass* auth md5 *authpass*↵

snmp-server user *v3_usertrapXX* group *v3_group* v3 priv *snmppass* auth md5 ↵

where
v3_user is the SNMPv3 user name
v3_group is the name of the SNMPv3 trap group
privpass is the DES privacy encryption password
authpass is the MD5 authentication password
v3_usertrapXX is an SNMP trap user name. The name is comprised of the *v3_user* name followed by trapXX, where XX is a number from 01 to 98. For example, if the *v3_user* name is private, the *v3_usertrapXX* name must be privatetrapXX. The name must match the SNMP trap user name used by the 5620 SAM node discovery mediation policy.

ii Configure SNMPv3 trap forwarding to the 5620 SAM:

snmp-server target-param Target *v3_usertrapXX* v3 priv ↵

snmp-server target-addr *name xxx.xxx.xxx.xxx port# Target* TRAP ↵

snmp-server notify all TRAP

where
Target is the target parameter name, for example Target_1
v3_usertrapXX is the SNMPv3 user name created in i above
name is the target name, for example SAM
xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server
port# is the SNMP trap-receiving port on the 5620 SAM main server

11 Perform one of the following to configure the STP for a device in a VLAN ring topology:

a Enter the following sequence of commands to configure RSTP:

protocol ↵

rapid-spanning-tree enable ↵

rapid-spanning-tree priority 4096 ↵

b Enter the following sequence of commands to configure MSTP:

protocol ↵

mstp enable ↵

mstp 0 priority 4096 ↵

Note — When you set the MSTP priority, ensure that the devices closest to the 7450 ESS are set with the lowest priority and use instance 0. This enables the STP on all ports. When ports are used for access as SAPs, STP should be disabled.

12 The 5620 SAM supports enhanced functionality such as MPLS LSPs, FRR, and VPLS on the 7250 SAS-ES and 7250 SAS-ESA.

See Table 13-2 to determine what protocol and interface configuration is supported on the 5620 SAM.

Table 13-2 5620 SAM protocol and interface configuration support for the 7250 SAS-ES and 7250 SAS-ESA

Protocols and Interfaces	Description	7250 SAS-ES 2.0	7250 SAS-ES and 7250 SAS-ESA 3.0
Create and configure L3 interfaces	Create L3 interfaces and configure interface properties	CLI	CLI
Configure LDP	Configure LDP on the NE Enter the LDP targeted peers for the NE	CLI	CLI
Configure OSPF	Configure OSPF on the NE, system interface, L3 interfaces, and specified networks	CLI	CLI
Configure OSPF-TE	Configure OSPF-TE on the NE	Not supported	CLI
Configure RSVP	Configure RSVP on the NE, system interface, and L3 interfaces Enable RSVP-TE extensions	CLI	CLI
Configure MPLS	Configure MPLS on the NE, system interface, and L3 interfaces	CLI	CLI
Create and configure MPLS interfaces	Create and configure MPLS interfaces and administrative groups	CLI for MPLS interfaces Administrative groups are not supported	CLI and 5620 SAM

After the devices are configured, perform the following for SNMP v2c.

- Configure a mediation policy that contains a community string user name that matches the one created using CLI, as described in Procedure 14-4.
- Create a discovery rule that represents the devices, and reference the newly created mediation policy, as described in Procedure 14-6.

After the devices are configured, perform the following for SNMPv3.

- Create SNMPv3 users from the 5620 SAM GUI using the NE user configuration manager. See Procedure 21-6 for more information about NE user configuration. Ensure that the following are configured.
    - Give the user SNMP access by enabling the snmp check box.
    - Enter the same User Name as the user name that was created using CLI; for example, *v3_user*
    - On the SNMPv3 tab, select MD5 as the authentication protocol and DES as the privacy protocol.
    - Type the appropriate plain-text ASCII password used as the MD5 authentication key and DES privacy key; for example, *snmppass*.

- Create a new SNMPv3 mediation policy, as described in Procedure 14-4. Ensure that the following are configured:
  - Security Model is SNMP v3 USM
  - SNMP User Name is the same as the user name created using CLI, which is also the name of the NE user configuration created to use SNMPv3.
- Create a discovery rule that represents the devices, and reference the newly created mediation policy, as described in Procedure 14-6.

Procedure 13-4 To commission an OmniSwitch for 5620 SAM management

See the appropriate OmniSwitch documentation for more information about the CLI command syntax and SNMP.

Note 1 — The 5620 SAM cannot discover an OmniSwitch that is configured with the factory default settings.

Note 2 — You must use a direct console port connection to access an OmniSwitch for the first time. All other management methods such as SNMP, Telnet, FTP, and HTTP, are disabled until you enable them.

1 Open a console window using a direct console port connection to the OmniSwitch.

2 Create a Loopback0 interface and assign an IP address to the interface by entering the following at the prompt:

ip interface Loopback0 address *xxx.xxx.xxx.xxx* ↵

where

xxx.xxx.xxx.xxx is the IP address of the interface

Note 1 — Loopback0 is the name assigned to an IP interface to identify an address that is used for network management purposes. The Loopback0 interface is not bound to any VLAN, therefore it always remains operationally active.

Note 2 — The Loopback0 interface name is case-sensitive. Ensure that you enter the name exactly as shown.

3 Enable SNMP sessions on the switch by entering the following at the prompt:

aaa authentication snmp local ↵

4 Enable FTP, Telnet, HTTP, or SSH sessions, if required, by entering the following at the prompt:

aaa authentication ftp local ↵

aaa authentication telnet local ↵

aaa authentication http local ↵

aaa authentication ssh local ↵

5 Perform one of the following to configure the required version of SNMP on the switch and the 5620 SAM:

The OmniSwitch default user, admin, does not have SNMP access. Before the 5620 SAM can discover an OmniSwitch, you must create at least one user on the switch with SNMP access.

a For SNMP v2c:

i Configure an SNMP v2 user by entering the following at the prompt:

`user` ***`user_name`*** **`password`** ***`password`*** **`no auth`** ↵

where
user_name is a username that corresponds to an SNMP v2 user that the 5620 SAM can identify; Alcatel-Lucent recommends that you use the name sam, which is the 5620 SAM default name
password is a password associated with the username; the password is between 8 and 47 characters

Note — If you need to use a different SNMPv2 default user name, use Procedure 6-24 to create an SNMPv2 default user name on the 5620 SAM.

ii Configure SNMP v2 trap forwarding to the 5620 SAM by entering the following at the prompt:

`snmp station` ***`xxx.xxx.xxx.xxx v2 user_name`*** ↵

where
xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server
user_name is the username that you created in step i

Trap forwarding configuration occurs automatically when the 5620 SAM discovers a switch and uses the default SNMP v2 user name sam or the user name configured in Procedure 6-24.

iii Configure an SNMP security level that allows the switch to accept all SNMP queries by entering the following at the prompt:

`snmp security no security` ↵

iv Configure an SNMP v2 community string by entering the following at the prompt:

`snmp community map` ***`community_string`*** **`user`** ***`user_name`*** ↵

where
community_string is the name of an SNMP v2 community string that the 5620 SAM can identify
user_name is the SNMP v2 username created in step i

v Create a mediation security policy on the 5620 SAM that uses a community string that matches the string created in step iv. See Procedure 14-4 for information about creating a mediation security policy.

vi Create a discovery rule on the 5620 SAM to discover the switch and reference the policy created in step v. See Procedure 14-6 for information about creating a discovery rule.

b For SNMP v3:

If you need to discover an OmniSwitch using SNMP v3 you must create an SNMP v3 user on the switch that matches an SNMP v3 user defined on the 5620 SAM.

i Configure an SNMP v3 user on the switch by entering the following at the prompt:

user *user_name* password *password* *security_level* ↵

where
user_name is a username that matches an SNMP v3 USM username configured on the 5620 SAM
password is a password associated with the username; the password is between 8 and 47 characters. The password is the plain text ASCII MD5/SHA authentication key and DES privacy key.
security_level is MD5, MD5 + DES, SHA, or SHA + DES

ii Configure SNMP v3 trap forwarding to the 5620 SAM by entering the following at the prompt:

snmp station *xxx.xxx.xxx.xxx* v3 *user_name* ↵

where
xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server
user_name is the username created in step i

Trap forwarding occurs automatically when the 5620 SAM discovers a node with a username that matches the SNMP v3 USM username specified in the 5620 SAM mediation policy.

iii Configure the SNMP v3 switch security option that you need by entering the following at the prompt:

snmp security *security_option* ↵

where *security_option* is one of the security options described in Table 13-3

Table 13-3 SNMP security options

Option	Description
no security	All SNMP queries are accepted.
authentication set	Includes: • SNPM v1 and v2 Gets • Non-authenticated v3 Gets and Get-Nexts • Authenticated v3 Sets, Gets, and Get-Nexts • Encrypted v3 Sets, Gets, and Get-Nexts

(1 of 2)

Option	Description
authentication all	Includes: • Authenticated v3 Sets, Gets, and Get-Nexts • Encrypted v3 Sets, Gets, and Get-Nexts
privacy set	Includes: • Authenticated v3 Gets and Get-Nexts • Encrypted v3 Sets, Gets, and Get-Nexts
privacy all (default)	Includes: • Encrypted v3 Sets, Gets, and Get-Nexts
traps only	Includes: • All SNMP requests are rejected

(2 of 2)

iv Create an SNMP v3 user on the 5620 SAM using the NE User Configuration manager. See Procedure 21-6 for information about NE user configuration.

- Enable SNMP to give the SNMP v3 user SNMP access.
- Choose a username that matches the name created on the switch in step i.
- Choose the same SNMP v3 authentication protocol, privacy protocol, and password that is configured on the switch.

v Create an SNMP v3 mediation security policy. See Procedure 14-4 for information about configuring a mediation security policy.

- Choose the SNMP v3 (USM) security model option.
- Choose a username that matches the name created on the switch in step i.

vi Create a discovery rule that uses the mediation security policy created in step v. See Procedure 14-6 for information about creating discovery rules.

6 Use a 5620 SAM client to discover the switch and to verify that the switch configuration allows you to manage the switch.

13.5 Generic NE commissioning procedures

The following procedures describe how to configure the 5620 SAM to manage one or more generic NEs.

Procedure 13-5 To prepare a generic NE for 5620 SAM management using a generic NE profile

Perform this procedure to prepare a non-Alcatel-Lucent device for 5620 SAM discovery and management. See chapter 16 for more information about device management.

Note — For lightweight generic NE management (9400 AWY, MSS-1c, and MPT-sa), see Procedure 13-6.

1 Open a console window on the device. See the appropriate device documentation for information about using the device CLI.

2 Perform the following preconfigurations.

- **i** Enable FTP.
- **ii** Enable Telnet.
- **iii** Enable the SNMP engine.
- **iv** Configure at least one SNMPv1, SNMPv2c, or SNMPv3 community.
- **v** Set the SNMP PDU size to 9216.
- **vi** Enable persistent SNMP indexes.

3 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

4 Click on the Create button and choose Create Generic NE Profile. The Generic NE Profile (Create) form opens.

5 Configure the parameters:

- ID
- Auto-Assign ID
- Generic NE Type
- Generic NE Category
- Sys Object ID
- Description
- Default Element Manager URL
- Chassis MAC Object ID
- Default External EMS
- CLI Supported

Note — You cannot modify the Generic NE Type parameter after the generic NE profile is created; you must delete the generic NE profile and create a profile using the new Generic NE Type parameter value.

6 Click on the CLI Profile tab button and configure the parameters:

- Command Prompt
- Max Number Of Sessions
- Telnet Port
- Pre Login Prompt
- Write Login Prompt
- Write Password Prompt
- Read Login Prompt
- Read Password Prompt
- Error Indicator
- Disable Paging Command
- Reset Command
- Login Timeout (seconds)
- Execution Command Timeout (seconds)
- Login Prompt Optional
- Idle Session Warning Message

7 Configure the following parameters if a login confirmation prompt appears:

- Enable Confirm Prompt
- Prompt
- Answer

The Prompt and Answer parameters are configurable when the Enable Confirm Prompt parameter is selected.

8 Configure the following parameters for a second level of login security, if required:

- Enable Second Login
- Enable Login Command
- Enable Login Prompt

The Enable Login Command and Enable Login Prompt parameters are configurable when the Enable Second Login parameter is selected.

9 Click on the Interface Types tab button to configure an interface for the generic NE.

10 Click on the Add button. The Select Generic NE Interface Type form opens.

11 Configure the filter criteria and click on the Search button. The form displays a list of interface types.

12 Select one or more interface types in the list and click on the OK button. The Select Generic NE Interface Type form closes and the selected interface types are listed on the Generic NE Profile (Create) form.

13 Click on the Routing MIBs tab button. The Generic NE Profile form is displayed.

Note — The Routing MIBs tab button is dimmed if you do not have a valid 5650 CPAM license that has a third-party router quantity greater than zero. See the *5650 CPAM User Guide* for information about 5650 CPAM licenses.

14 Click on the Add button. The Select Generic NE Routing MIB window is displayed.

15 Click on the Search button. A list of the supported Routing MIBs is displayed.

16 Select one or more of the Routing MIBs in the list and click on the OK button. The Select Generic NE Routing MIB window closes. The Generic NE Profile form is displayed.

Note — You must not configure the Routing MIBS and apply the configuration to the Generic NE profile before you configure the interface types. See steps 9 to 12. If you configure the Routing MIBs in the wrong order, you must perform a full node resync and specify the 'ignore time stamp' instruction.

17 Click on the OK button. The Generic NE Profile form reappears with the new generic NE profile.

18 Click on the Apply button.

Note — After you have discovered the NE using the generic NE profile in 5620 SAM, you can use the Routing tree to navigate to and view the discovered routing objects.

19 Click on the Trap Configuration tab button.

Caution — The 5620 SAM assumes that the trap log name on a generic NE is the same as the trap log name on the 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, and 7750 SR. Some generic NEs may not support the use of a trap log name that matches the name used by these devices. If this is the case for a generic NE that you need to manage using the 5620 SAM, you may not be able to use the Trap Restoration Logs on the generic NE.

20 Configure the parameters:

- Supports Trap Sequence Number
- Supports Trap Restoration Logs
- Maximum Trap Gap
- Full Node Resync on Max Trap Gap
- Minimum Time Interval Between Full Node Resyncs (seconds)

Caution — The 5620 SAM supports trap sequencing only for devices that increment the trap ID value by 1. Do not enable the Supports Trap Sequence Number parameter if the generic NE increments the trap ID value by anything other than 1.

21 Click on the Select button beside the Script ID parameter in the Trap Configuration Script panel. The Select Script - Generic NE Profile form opens.

The script chosen in this step enables trap forwarding to the 5620 SAM. The 5620 SAM runs this script on the generic NE when it tries to manage the generic NE.

Note 1 — A 5620 SAM CLI script to configure the GNE trap destination must already exist before you can select it for use in the generic NE profile. See the *5620 SAM Scripts and Templates Developer Guide* for information on creating CLI scripts.

Note 2 — If the 5620 SAM system is a redundant deployment, ensure that both 5620 SAM main servers are specified in the trap configuration script as SNMP trap destinations to be added.

22 Select a script in the list and click on the OK button. The Select Script - Generic NE Profile form closes and the script identification is displayed on the Generic NE Profile (Edit) form.

23 Click on the Select button beside the Script ID parameter in the Trap De-Configuration Script panel. The Select Script - Generic NE Profile form opens.

The script chosen in this step disables trap forwarding to the 5620 SAM. The 5620 SAM runs this script on the generic NE when it tries to unmanage the generic NE.

Note — If the 5620 SAM system is a redundant deployment, ensure that both 5620 SAM main servers are specified in the trap de-configuration script as SNMP trap destinations to be removed.

24 Select a script in the list and click on the OK button. The Select Script - Generic NE Profile form closes and the script identification is displayed on the Generic NE Profile (Edit) form.

25 Click on the Select button beside the Catalogue Name parameter in the Alarm Catalogue panel. The Select Alarm Catalogue - Generic NE Profile form opens.

26 Select an alarm catalogue in the list and click on the OK button. The Select Alarm Catalogue - Generic NE Profile form closes and the catalogue name is displayed on the Generic NE Profile (Edit) form.

27 Click on the OK button. A dialog box appears.

28 Click on the Yes button. The Generic NE Profile (Edit) form closes.

29 Close the Generic NE Manager form.

Procedure 13-6 To prepare a lightweight generic NE for 5620 SAM management using a generic NE profile

Perform this procedure to prepare a lightweight (9400 AWY, MSS-1c, and MPT-sa) device for 5620 SAM discovery and management. See chapter 16 for more information about device management.

Note — An MPT-sa/MPRe is an MPT-MC/MPT-HC in standalone mode.

1 Before managing the MPT-sa/MSS1c/AWY, the 5620 SAM IP address must be registered with any NEs that are to be managed as lightweight generic NEs. To register the 5620 SAM IP address perform the following steps.

i Open MCT or Multi-version NEtO and open the required NE, MPRe/MSS1c/AWY.

ii Use the Trusted SNMP Manager option in the navigation tree to register the 5620 SAM IP address.

iii Enter 162 as the Traps UDP Port for the MPT-sa/MSS1c/AWY.

iv Enter Network Manager Layer as the Type.

v Once the 5620 SAM IP address is registered, close the MCT tool.

2 Perform the following steps to ensure that the SystemGneProfilesNames flag is set correctly in the nms-server.xml file for lightweight generic NE management of 9400 AWY, MSS-1c, or MPT-sa.

Note — To create a lightweight managed NEs profile, the user does not have to enter any parameters such as SysObject ID. After completion, the respective profile is the default profile in the 5620 SAM.

i Go to directory /opt/5620sam/server/nms/config.

ii Open the nms-server.xml file.

iii Go to the line systemGNEProfileNames=“ ”

iv Edit as systemGNEProfileNames=“MPTSA” or systemGNEProfileNames=“MSS1c” or systemGNEProfileNames=“9400AWY” or systemGNEProfileNames=“MPTSA, MSS1c, 9400AWY”

v Save and close the file.

vi Go to path /opt/5620sam/server/nms/bin

vii Execute the following command:

su samadmin nmsserver.bash read_config ↵

viii Using Discovery Manager, manage the MPT-sa/MSS1c/AWY with the default setting for snmpv2 as read-write access policy. Configure the community string as “SNMP-trap” for trap access mediation policy.

ix Observe that a new group has been created in the Equipment Network tree and that all related generic NEs are located in this group.

3 To auto-populate the alarms catalogue, follow the steps below:

Note 1 — To see the alarms from MPRe/MSS1c/AWY the user does not need to do any manual mapping from the Trap ID to the Alarm Name. Follow the steps below to display the automatic binding of known traps reported in 5620 SAM.

Note 2 — AFter the alarm catalogue is auto-populated, the alarms for which the 5620 SAM receives traps are processed. Existing alarms on the Generic NE are not processed.

i Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

ii Choose Generic NE Profile (Generic NE) in the object drop-down list and click on the Search button. A list of generic NE profiles is displayed.

iii Select the created generic NE profile in the list and click on the Properties button. The Generic NE Profile (Edit) form opens with the General tab displayed.

iv Click on the More Actions button and choose Populate Alarm Catalogue from the drop-down. The respective Alarm catalogue is created.

v Click on the Trap Configuration tab button. Attach the Alarm catalogue to the respective profile.

vi Click on the Interface tab button. Add each of the respective interfaces or all interfaces to get the traps. All alarms should now be visible in your 5620 SAM client.

vii Generate new alarms from MPRe/MSS1c/AWY, the alarms are displayed in the 5620 SAM alarm window.

Procedure 13-7 To cross launch the 9400 AWY, MPT-sa, or MSS-1c J-USM manager

Perform this procedure to enable the cross launch of a Java-based EMS/craft terminal.

1 Perform Procedure 13-5 to discover the 9400 AWY, MPT-sa, or MSS-1c GNE.

2 Perform one of the following steps to specify the NEtO directory path:

Note — Option B is the preferred method.

a To specify the NEtO directory path for every node:

i Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

ii Right-click on the 9400 AWY, MPT-sa, or MSS-1c GNE in the Equipment view and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

iii Specify the directory name in the External EMS field.

b To configure and use the same NEtO directory path for all nodes that are discovered using a discovery rule:

i Open the Discovery Manager window and choose the Discovery Rules tab button.

ii Select the existing Discovery Rule that was created for all the nodes and select the Properties button, the Topology Discovery Rule [Edit] form opens with the General tab button displayed.

iii Specify the NEtO directory name in the Default External EMS field

Note — To cross launch a 9400 AWY NE, retain the NEtO software directory in your 5620 SAM client and remove any space in the NEtO directory description, for example, C:\9500SAM\8.0\NEtOETSI\multiversion2.1\NEtO_MultiVersion\NEtO.

3 Click on the OK button. A dialog box appears.

4 Click on the Yes button. The Network Element (Edit) form closes.

5 Right-click on the GNE and choose External Element Manager from the contextual menu. The MCT/NEtO is launched.

Procedure 13-8 To modify a generic NE profile

Perform this procedure to change the parameters in an existing generic NE profile.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Profile (Generic NE) in the object drop-down list and click on the Search button. A list of generic NE profiles is displayed.

3 Select a generic NE profile in the list and click on the Properties button. The Generic NE Profile (Edit) form opens with the General tab displayed.

The following tabs contain configurable parameters:

- General—contains parameters that identify the generic NE type
- CLI Profile—contains parameters that define the console window prompts and commands
- Trap Configuration—contains parameters that define the SNMP trap management configuration
- Interface Types—allows the association of multiple types of interfaces with the generic NE profile. A generic NE interface is selectable as the endpoint of a 5620 SAM physical link.

4 Modify the parameters for the generic NE profile, as required.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Generic NE Profile (Edit) form closes.

7 Close the Generic NE Manager form.

8 If you modify the list of interfaces on the Interface Types tab, perform the following steps.

Caution — If you modify the list of interfaces on the Interface Types tab, you must resynchronize the entire generic NE without comparing timestamps to ensure that the 5620 SAM database is correctly updated with the new interface information.

i Right-click on the generic NE in the 5620 SAM topology map and choose Resync from the contextual menu. The Resync Site(s) form opens with the Resync Options panel displayed.

ii Click on the Next button. The Force Resync panel is displayed.

iii Select the Ignore Timestamps parameter.

iv Click on the Finish button. The 5620 SAM resynchronizes the generic NE.

v Close the Resync Site(s) form.

Procedure 13-9 To delete a generic NE profile

Note 1 — You cannot delete a generic NE profile that is associated with a managed generic NE. You must unmanage the generic NEs associated with a generic NE profile before you can delete the profile.

Note 2 — You cannot delete a generic NE profile when a generic NE associated with the profile is a target of a CLI script. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

1. Unmanage and delete the generic NEs that are managed using the generic NE profile. See chapter 14 for more information.
2. Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.
3. Choose Generic NE Profile (Generic NE) in the object drop-down list and click on the Search button. A list of generic NE profiles is displayed.
4. Select a profile in the list and click on the Delete button. A dialog box appears.
5. Click on the Yes button. The 5620 SAM deletes the generic NE profile.
6. Close the Generic NE Manager form.

13.6 Device management procedures

The following procedures describe how to configure device management.

Procedure 13-10 To configure polling for a 7450 ESS, 7705 SAR, 7710 SR, or 7750 SR

1. Choose Equipment or Routing from the drop-down menu on the navigation tree.
2. Open the Network icon. The managed devices are displayed.
3. Click on an icon that represents a 7750 SR, 7450 ESS, 7710 SR or 7705 SAR.
4. Right-click and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
5. Record the system IP address and the management IP address. Configure the Location and OLC State parameters, if required.
6. Click on the Polling tab button.
7. Click on the General tab button.
8. Specify whether scheduled polling is enabled or disabled using the Scheduled Polling parameter. Scheduled polling is configured using the Mediation configuration form. See Procedure 14-4 for more information.
9. Configure the Redundant Synchronization Mode parameter.

10 Verify that the Persistent SNMP Indices parameter is set to true to ensure persistent SNMP indices are used.

11 Configure the parameters:

- Primary DNS
- Secondary DNS
- Tertiary DNS
- DNS Domain
- Separate LI Administration
- LI Local Save Allowed

Note 1 — To configure LI parameters, you require LI user privileges.

Note 2 — To view LI configuration information, you need LI privileges. Right-click on a discovered device in the navigation tree and choose Properties from the contextual menu, and click on the LI Configuration Status tab button.

12 View the read-only parameters to determine the current polling status:

- Resync Status indicates whether the last polling interval was successfully completed.
- Last Resync Start Time and Last Resync End Time indicate the start and finish of the last polling interval.

13 Click on the Management tab button.

14 Configure the following parameters to specify an L3 management interface for in-band management, if required:

- L3 Management Interface
- Enable L3 Management Interface

15 Configure the following parameters:

- Active Management IP
- Auto Revert to Preferred
- Management IP Selection
- Primary Route Preference
- Secondary Route Preference

Note 1 — The Auto Revert to Preferred parameter is configurable when the Management IP Selection parameter is set to Out Of Band Preferred or In Band Preferred.

Note 2 — To avoid a communications outage between the 5620 SAM and managed NEs, the parameter settings in the Management Preference panel must match the parameter settings in the Notifications Preferred Management panel. See the Management IP Selection parameter description for more information.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-11 To configure polling for a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA

1 Choose Equipment or Routing from the drop-down menu on the navigation tree.

2 Open the Network icon. The managed devices are displayed.

3 Click on an icon that represents a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA.

4 Right-click and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

5 Record the system IP address and the management IP address. Configure the Location and OLC State parameters, if required.

6 Click on the Polling tab button.

7 Specify whether scheduled polling is enabled or disabled using the Scheduled Polling parameter. Scheduled polling is configured using the Mediation configuration form. See Procedure 14-4 for more information.

8 View the read-only parameters to determine the current polling status:

- Resync Status indicates whether the last polling interval was successfully completed.
- Last Resync Start Time and Last Resync End Time indicate the start and finish of the last polling interval.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button to confirm the action. The Network Element (Edit) form closes.

Procedure 13-12 To configure polling for a 7210 SAS

Perform this procedure to configure polling policies for a 7210 SAS-D 6F 4T, 7210 SAS-D 6F 4T ETR, 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP device.

1 Choose Equipment or Routing from the drop-down menu on the navigation tree.

2 Open the Network icon. The managed devices are displayed.

3 Click on the device icon.

4 Right-click on the icon and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

5 Record the system IP address and the management IP address. Configure the Location and OLC State parameters, if required.

6 Click on the Polling tab button.

7 Specify whether scheduled polling is enabled or disabled using the Scheduled Polling parameter. Scheduled polling is configured using the Mediation configuration form. See Procedure 14-4 for more information.

8 Verify that the Persistent SNMP Indices parameter is set to true to ensure that persistent SNMP indices are used.

9 Configure the parameters in the Bof Configuration panel, if required:

- Primary DNS
- Secondary DNS
- Tertiary DNS
- DNS Domain

10 View the read-only parameters to determine the current polling status:

- Resync Status indicates whether the last polling interval was successfully completed.
- Last Resync Start Time and Last Resync End Time indicate the start and finish of the last polling interval.

11 Click on the Management tab button.

12 On the In Band panel, configure the parameters:

- L3 Management Interface
- Enable L3 Management Interface

13 On the Management Preference panel, configure the parameters:

- Active Management IP
- Auto Revert to Preferred
- Management IP Selection

Note 1 — The Active Management IP, Auto Revert to Preferred, and Management IP Selection parameters are configurable only on the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR, Release 3.0 or later, the 7210 SAS-E, Release 2.0 R2 or later, and the 7210 SAS-M, Release 2.0 R2 or later. The 7210 SAS-X Release 3.0R2 or later supports a Management IP Selection value of Out of Band Preferred.

Note 2 — The Auto Revert to Preferred parameter is configurable when the Management IP Selection parameter is set to Out Of Band Preferred, In Band Preferred, or In Band Only.

14 On the Notifications Preferred panel, configure the following parameters:

- Primary Route Preference
- Secondary Route Preference

15 You can configure two uplinks in the BOF for port redundancy. If the image path and configuration file path are local, you do not need to configure the IP address and routing information for uplink A and uplink B. You can optionally obtain IP parameters using DHCP when you configure a value of 0 for the uplink port IP address. The DHCP server should be configured to provide the IP address and the default gateway information that is used to reach the server where the image and configuration files are stored.

16 Click on the 7210 BOF tab button and on the Select button in the Uplink A panel to choose an uplink port. The Select Port - Uplink Bof Configuration search form opens.

17 Choose a port from the list and click on the OK button. The Select Port - Uplink Bof Configuration search form closes and the port name appears in the Uplink A panel.

18 Configure the following parameters in the Uplink A panel:

- IP Address
- Mask
- VLAN ID

19 Click on the Select button in the Uplink B panel to choose an uplink port. The Select Port - Uplink Bof Configuration search form opens.

20 Choose a port from the list and click on the OK button. The Select Port - Uplink Bof Configuration search form closes and the port name appears in the Uplink B panel.

21 Configure the following parameters in the Uplink B panel:

- IP Address
- Mask
- VLAN ID

22 Click on the Uplink Routes tab button and on the Create button. The Uplink Route Configuration (Create) form opens.

23 Configure the following parameters:

- Uplink
- Route Destination
- Mask
- Next Hop

24 Click on the Apply button if you need to add more than one uplink route or the OK button if you only need to add one route. A dialog box appears.

25 Click on OK to save your configuration.

26 Repeat steps 23 to 25 to add another uplink route. You can add up to ten routes for each uplink.

27 Click on the OK button. A dialog box appears.

28 Click on the Yes button to confirm the action. The Network Element (Edit) form closes.

Procedure 13-13 To configure polling for a 9500 MPR

1 Choose Equipment or Routing from the drop-down menu on the navigation tree.

2 Open the Network icon. The managed devices are displayed.

3 Click on an icon that represents a 9500 MPR.

4 Right-click and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

5 Record the system IP address and the management IP address. Configure the Location and OLC State parameters, if required.

6 Click on the Polling tab button.

7 Configure the Scheduled Polling parameter if you are configuring a 9500 MPR. Scheduled polling is configured using the Mediation configuration form. See Procedure 14-4 for more information.

8 View the read-only parameters to determine the current polling status:

- Resync Status indicates whether the last polling interval was successfully completed.
- Last Resync Start Time and Last Resync End Time indicate the start and finish of the last polling interval.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button to confirm the action. The Network Element (Edit) form closes.

Procedure 13-14 To edit polling settings for multiple devices

You can use the list of managed devices from the Discovery Manager Resync Status tab to modify polling settings for a device or devices; for example, when you want to enable or disable polling on numerous managed devices.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form opens.

2 Click on the Resync Status tab button.

3 Select a device or devices from the list.

4 Click on the Properties button. When you choose multiple devices, the Network Element (Multiple Instances) (Edit) form opens.

You can only configure those parameters that are common to all devices selected from the list.

5 Click on the Polling tab button.

6 Enable or disable polling using the Scheduled Polling parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button to confirm the action. The Network Element (Edit) form closes.

Procedure 13-15 To enable 5620 SAM management of a 9500 MPR

Perform this procedure to enable the 5620 SAM to manage the 9500 MPR and to allow NEtO sessions to be opened using the 5620 SAM GUI.

You must first install the NEtO software on a 5620 SAM client station and modify the client configuration. See the 9500 MPR user documentation for more information about how to install and use the NEtO software. See Procedure 17-14 for information about how to start NEtO from the 5620 SAM GUI.

1 Log in to a 5620 SAM client station.

2 Perform Procedure 14-6 to create a discovery rule for the device.

3 Discover a 9500 MPR NE and verify that the 5620 SAM can manage the device.

Note — The 5620 SAM server and NEtO cannot be run on the same machine. The 5620 SAM client and NEtO (not the 5620 SAM Server) must be on the same machine.

4 On a Windows client, navigate to the 5620 SAM client path *\5620sam\client\nms\thirdparty\config* directory.

5 Open the one the following 9500 MPR property files using a plain-text editor:

- Alcatel-MPR-9500_3.3.0.properties is for A/E-3.3
- Alcatel-MPR-9500_3.2.0.properties is for A/E-3.2
- Alcatel-MPR-9500_3.1.0.properties is for A/E-3.1
- Alcatel-MPR-9500_3.0.0.properties is for 3.0
- Alcatel-MPR-9500_1.0.0.properties id for older releases (example, A-2.2.1, A-2.2.0, A-1.2, E-1.4, E-1.3, E-2.1)

6 Edit the NEtO directory path in the variable *install_dir =${path}*.

For example for a Windows client, the paths could be:

- *install_dir=D:\\NEtO*
- *install_dir=C://9500MPR//MPRE_CT_V01.22.01*, or
- *install_dir=D:\\NM\\SAM\\NEtO_Multiversion\\NEtO*

7 As required, edit the profile name. The format is, profile_name = <role> <community string> <user id> <password>. For example, profile_name = admin private initial adminadmin.

Note — If you do not edit the profile name, the community string is derived from the mediation policy of the discovery rule .

8 Save and close the file.

9 Select the equipment view of the navigation tree on the 5620 SAM GUI. Right-click on a 9500 MPR NE, and select External Element Manager from the menu.

10 Verify that the NEtO software launches.

Procedure 13-16 To create a generic NE alarm catalogue

Perform this procedure to create an alarm catalogue for use with a generic NE profile.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Click on the Create button and choose Create Generic NE Alarm Catalogue. The Generic NE Alarm Catalogue (Create) form opens.

3 Configure the parameters:

- Catalogue Name
- Description
- Version

4 Perform Procedure 13-17 to create a transform function for the catalogue, if required.

5 Click on the Mappings tab button.

6 Click on the Create button to create a raising alarm mapping. The Generic NE Alarm Mapping (Create) form opens.

7 Configure the following parameters:

- Trap OID
- Trap Name
- Administrative State
- FDN Extension
- Additional Text
- Use Default Additional Text

8 Perform one of the following using the parameters in the Alarm Name panel.

a Specify a static alarm name by configuring the Alarm Name parameter.

b Specify a dynamic alarm name. Perform the following steps.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

9 Perform one of the following using the parameters in the Probable Cause panel.

a Specify a static probable cause. Perform the following steps.

i Click on the Select button beside the Probable Cause parameter. The Select Property form opens with a list of probable causes displayed.

ii Select a probable cause in the list and click on the OK button. The probable cause is displayed on the Generic NE Alarm Mapping (Create) form.

b Specify a dynamic probable cause. Perform the following steps.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

10 Perform one of the following using the parameters in the Severity panel.

a Specify a static severity by configuring the Severity parameter.

b Specify a dynamic severity. Perform the following steps.

Note — When you specify the use of a transform function for the alarm severity, the Mapping Type changes to Raising/Clearing. You cannot create a clearing mapping for this type of mapping; you must use a transform function to clear an alarm when the alarm severity is defined using a transform function.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

11 Configure the varbind positions for specific objects on a GNE in the Alarmed Object panel:

- System Address Varbind Position
- Interface Index Varbind Position

Note — In order to configure the System Address Varbind Position and Interface Index Varbind Position parameters, you must set the Alarm Name parameter to GNE MTIE Alarm.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Generic NE Alarm Mapping (Create) form closes, and the new alarm mapping is listed on the Generic NE Alarm Catalogue (Create) form.

14 Repeat steps 6 to 13 to create an additional raising alarm mapping, if required.

15 If you do not need to create a clearing alarm mapping, go to step 25.

16 To create a clearing alarm mapping, select a raising alarm mapping in the list and click on the Create Clearing button. The Generic NE Alarm Mapping (Create) form opens.

Note 1 — A raising alarm mapping is indicated by the word Raising in the Mapping Type list column.

Note 2 — You can create a clearing alarm mapping only when the corresponding raising alarm is in the same alarm catalogue.

Note 3 — You can associate a clearing alarm mapping with only one raising alarm mapping.

Note 4 — You cannot create a clearing mapping for a mapping that uses a transform function to define the alarm severity; you must use a transform function to clear an alarm when the alarm severity is defined using a transform function.

17 Configure the parameters:

- Trap OID
- Trap Name
- Administrative State
- FDN Extension
- Additional Text
- Use Default Additional Text

Note 1 — A static clearing alarm mapping inherits the following values from the associated raising alarm:

- Alarm Name
  This value must match the raising alarm value.
- Probable Cause
  This value must match the raising alarm value.
- FDN Extension
  The resulting text string must match the text string generated by the raising mapping.
- Additional Text
  The resulting text string must match the text string generated by the raising mapping.

See Procedure 13-19 for information about modifying the Alarm Name or Probable Cause value.

Note 2 — The explicit FDN Extension and Additional Text values can differ from the values in the raising mapping, but the generated text strings must match. For example, if the object name is in varbind 2 of the raising trap and in varbind 3 of the clearing trap, the parameter values name different varbinds but the script output is identical.

Note 3 — The alarm severity in a clearing alarm mapping is set to Cleared and cannot be changed.

18 Perform the following steps to specify a dynamic alarm name, if required, using the parameters in the Alarm Name panel.

- **i** Select the Specify Transform Function parameter.
- **ii** Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.
- **iii** Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.
- **iv** Configure the Varbind Position parameter.

19 Perform the following steps to specify a dynamic probable cause, if required, using the parameters in the Probable Cause panel.

- **i** Select the Specify Transform Function parameter.
- **ii** Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.
- **iii** Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.
- **iv** Configure the Varbind Position parameter.

20 Click on the OK button. A dialog box appears.

21 Click on the OK button. The Generic NE Alarm Mapping (Create) form closes, and the new alarm mapping is listed on the Generic NE Alarm Catalogue (Create) form.

22 Repeat steps 16 to 21 to create and additional clearing alarm mapping, if required.

23 Click on the OK button. A dialog box appears.

24 Click on the OK button. The Generic NE Alarm Mapping (Edit) form closes.

25 Click on the OK button. A dialog box appears.

26 Click on the Yes button. The Generic NE Alarm Catalogue (Edit) form closes.

27 Close the Generic NE Manager form.

Procedure 13-17 To create a transform function for a generic NE alarm catalogue

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Click on the Create button and choose Create Generic NE Alarm Catalogue. The Generic NE Alarm Catalogue (Create) form opens.

3 Click on the Transform Functions tab button.

4 Click on the Create button. The Generic NE Alarm Transform Function (Create) form opens.

5 Configure the parameters:

- Transform Function Name
- Out Value Type
- Specify Default Out Value

6 If you enable the Specify Default Out Value parameter, click on the Select button beside the Default Out Value parameter. The Select Property form opens. Otherwise, go to step 8.

7 Select a value in the list and click on the OK button. The Select Property form closes, and the value is displayed on the Generic NE Alarm Transform Function (Create) form.

8 Click on the Pairs tab button.

9 Click on the Create button. The Pair (Create) form opens.

10 Configure the In Value parameter.

11 Click on the Select button beside the Out Value parameter. The Select Property form opens.

12 Select a value in the list and click on the OK button. The value is displayed on the Pair (Create) form.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The Pair (Create) form closes, and the value pair is listed on the Generic NE Alarm Transform Function (Create) form.

15 Repeat steps 9 to 14 to add another value pair, if required.

16 Click on the OK button. A dialog box appears.

17 Click on the OK button. The Generic NE Alarm Transform Function (Create) form closes, and the transform function is listed on the Generic NE Alarm Catalogue (Edit) form.

18 Repeat steps 4 to 17 to create another transform function, if required.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The Generic NE Alarm Catalogue (Edit) form closes.

21 Close the Generic NE Manager form.

Procedure 13-18 To add an alarm mapping to a generic NE alarm catalogue

Note — A modification to a generic NE alarm catalogue takes effect when you commit the change.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Alarm Catalogue (Trap to Alarm Mapper) in the object drop-down list and click on the Search button. A list of generic NE alarm catalogues is displayed.

3 Select an alarm catalogue in the list and click on the Properties button. The Generic NE Alarm Catalogue (Edit) form opens with the General tab displayed.

4 Configure the Description and Version parameters, if required.

5 Perform steps 4 to 27 in Procedure 13-16.

Procedure 13-19 To modify or delete a generic NE alarm mapping

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Alarm Catalogue (Trap to Alarm Mapper) in the object drop-down list and click on the Search button. A list of generic NE alarm catalogues is displayed.

3 Select an alarm catalogue in the list and click on the Properties button. The Generic NE Alarm Catalogue (Edit) form opens with the General tab displayed.

4 Click on the Mappings tab button.

5 Perform one of the following.

a Modify the mapping. Perform the following steps.

Note — A modification to a generic NE alarm mapping takes effect immediately after you commit the change.

i Select a mapping in the list and click on the Properties button.The Generic NE Alarm Mapping (Edit) form opens.

Note — To change the Alarm Name value in a raising alarm mapping and in the associated clearing alarm mapping, you must do one of the following:

- Configure the parameter in each mapping simultaneously by selecting both mappings before you click on the Properties button.
- Configure the parameter in one mapping at a time and commit the changes to the catalogue only after both mappings are modified.

ii Configure the following parameters:

- Trap Name
- Administrative State
- Alarm Name
- Severity
- FDN Extension
- Additional Text
- Use Default Additional Text

iii Click on the Select button beside the Probable Cause parameter. The Select Property - Generic NE Alarm Mapping form opens with a list of probable causes displayed.

iv Select a probable cause in the list and click on the OK button. The probable cause is displayed on the Generic NE Alarm Mapping form.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Generic NE Alarm Mapping (Create) form closes.

b Delete the mapping. Perform the following steps.

Note — When you delete a generic NE raising alarm mapping, the associated clearing mapping is also deleted.

i Select a mapping in the list and click on the Delete button. A dialog box appears.

ii Click on the OK button. The 5620 SAM deletes the generic NE alarm mapping.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Generic NE Alarm Catalogue (Edit) form closes, and the Generic NE Manager form reappears.

8 Close the Generic NE Manager form.

Procedure 13-20 To delete a generic NE alarm catalogue

Note 1 — You cannot delete an alarm catalogue that is associated with a generic NE profile. You must remove the alarm catalogue from each associated generic NE profile before you can delete the catalogue.

Note 2 — When you delete a generic NE alarm catalogue, you delete the alarm mappings that the catalogue contains.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Alarm Catalogue (Trap to Alarm Mapper) in the object drop-down list and click on the Search button. A list of generic NE alarm catalogues is displayed.

3 Select an alarm catalogue in the list and click on the Properties button. The Generic NE Alarm Catalogue (Edit) form opens with the General tab displayed.

4 Click on the Generic NE Profiles tab button. The tab lists the generic NE profiles to which the alarm catalogue is assigned.

5 If no profiles are listed, go to step 8.

6 Perform the following steps to remove a profile association.

- **i** Select a profile in the list and click on the Properties button. The Generic NE Profile (Edit) form opens with the General tab displayed.
- **ii** Click on the Trap Configuration tab button.
- **iii** Click on the Clear button in the Alarm Catalogue panel. The Catalogue Name value is removed from the form.
- **iv** Click on the OK button. A dialog box appears.
- **v** Click on the Yes button. The Generic NE Profile (Edit) form closes, and the Generic NE Alarm Catalogue (Edit) form reappears.

7 Repeat step 6 for each listed profile.

8 Close the Generic NE Alarm Catalogue (Edit) form. The Generic NE Manager form reappears.

9 Select the alarm catalogue in the list and click on the Delete button. A dialog box appears.

10 Click on the Yes button. The 5620 SAM deletes the generic NE alarm catalogue.

11 Close the Generic NE Manager form.

14 — Device discovery

14.1 Device discovery overview

The 5620 SAM simplifies network provisioning by discovering NEs and reconciling their properties with the contents of the 5620 SAM database.

The 5620 SAM discovers NEs using SNMP. During the discovery process, the 5620 SAM scans the network for devices according to user-specified IP addresses or IP address ranges. When the IP address used to discover a device is the system IP address, also called the system ID, management is considered in-band. When the IP address used to discover the device is the management IP address of the device management port, management is considered out-of-band. See chapter 13 for more information about in-band and out-of-band management.

After the 5620 SAM discovers a device, it sets the device state to Managed and adds the device properties to the 5620 SAM database. To discover one or more devices, you use the 5620 SAM Discovery Manager to create discovery rules and scan the network as specified by the rules.

Discovery rules contain rule elements that specify which devices or subnets are to be included in or excluded from the discovery process. A discovery rule can contain multiple rule elements. For example, you can configure one rule element to discover a subnet and another to exclude specific IP addresses from the subnet.

Note — The 5620 SAM does not attempt to discover tests or test suites that are configured locally on an NE, for example, using a CLI.

SNMP management

Simple Network Management Protocol, or SNMP, is an application-layer protocol that provides a message format to facilitate communication between SNMP managers and agents. SNMP provides a standard framework for NE monitoring and management from a central location.

An SNMP manager controls and monitors the activities of network hosts that use SNMP. An SNMP manager uses a get operation to obtain a value from an SNMP agent, and uses a set operation to store a value in the agent. The manager uses definitions from a management information base, or MIB, to perform operations on the managed device, for example, retrieving data values, replying to requests, and processing SNMP notifications called traps.

SNMPv1 and SNMPv2c provide no security, authentication, or encryption. Without authentication, an unauthorized user is able to perform SNMP network management functions and eavesdrop on management information as it passes from one system to another.

SNMPv3 requires that an authentication and encryption method such as SSH is assigned to each user for validation by the NE. SNMPv3 authentication and encryption enable an NE to validate the system that issues an SNMP message and to determine whether another system has tampered with the message.

For information about device-specific SNMP support, see the SNMP chapter of the appropriate *System Management Guide* for the device. For information about SSH security, see section 14.4.

IPv6 discovery

The 5620 SAM supports the discovery of devices that use IPv6 in-band or out-of-band management IP addresses. In order for the 5620 SAM to discover and manage a device that uses IPv6, the device must have an IPv6 address on the management port, system interface, or both. The 5620 SAM main server must also be given an IPv6 address during installation.

Note — To manage 7750 SR, 7710 SR, or 7450 ESS devices using IPv6, the device must also be configured with an IPv4 address on the management port for out-of-band management, or an IPv4 address on the system interface for in-band management.

The IP version that the 5620 SAM uses to discover a device is specified in each discovery rule. If the 5620 SAM discovers both IPv4 and IPv6 addresses on the system interface of a device, it discovers the device using the address that corresponds to the IP version specified in the discovery rule.

Discovery and SNMP packet size

Each 5620 SAM-managed device must be configured to send SNMP packets of up to 9216 bytes in size. You must ensure that each device between the managed devices and the 5620 SAM can handle an MTU size of 9216 bytes, or is configured to forward fragmented SNMP packets.

Consider the following:

- When an intermediate network device receives SNMP traffic, it must be able to process packets of up to 9216 bytes in size. If this exceeds the MTU size of the intermediate device, and the device cannot forward fragmented packets, the packets may be dropped and device discovery may fail.
- Verify that large packets can travel from the managed devices to the 5620 SAM by using CLI to ping the IP address of the 5620 SAM main server using a large packet. See the *5620 SAM Troubleshooting Guide* server troubleshooting chapter for more information about using traceroute and ping to verify packet transport.

Unmanaging or deleting devices

Using the 5620 SAM to unmanage a device excludes the device from the managed network, but a reference to the device remains in the 5620 SAM discovery system. The unmanage function may be used for unusual conditions such as when the 5620 SAM requires a complete refresh of NE data because of data corruption. Unmanaging a device results in a loss of management data for the selected device, which includes, but is not limited to, the following:

- object names and descriptions
- statistics
- alarms
- physical links
- policies
- script results
- scheduled activities
- NE backups

Deleting a device results in the complete loss of management data for the device and completely removes the device from the managed network.

Caution — If you use the 5670 RAM to process 5620 SAM statistics, unmanaging or deleting an NE results in the loss of all historical 5670 RAM AA statistics for the device.

14.2 Resynchronization of NEs

Full Resync status is independent from partial resync and reachability status, it only provides the status of the last full resync.

There are three resync status related attributes on the NE:

- Resync Status,
- Last Resync Start Time
- Last Resync End Time

These attributes are only updated if the resync operation is a full resync or a scheduled resync. These attributes will not be updated by a partial resync.

The Resync status is displayed in the Resync Status column in the Resync tab. See Procedure 14-6 for more information.

- Full Resync Done indicates that the 5620 SAM resynchronized with all or a subset of the MIB entry tables for an NE.
- Full Resync Failed indicates that the attempt of the 5620 SAM to resynchronize with all or a subset of the MIB entry tables for an NE failed.

  A failed status does not indicate that the SNMP agent on the managed device is not reachable. If the agent is unreachable, an SnmpReachabilityProblem alarm is raised against the managed device and the node icon is red. When the agent becomes reachable, the alarm is cleared.
- Requested indicates that the resynchronization request has entered the request queue.

14.3 Mediation and SNMP MIBs

A 5620 SAM mediation policy defines the interval at which the 5620 SAM polls NEs for SNMP MIB configuration changes. You can use the Mediation and MIB Entry Policy forms to view the information in an SNMP MIB. See Procedure 14-4 for more information.

You can use the 5620 SAM client GUI to list the contents of the device MIBs that the current 5620 SAM system supports. The list includes the following information:

- the MIB name
- the MIB version; the 5620 SAM software may support multiple MIB versions
- the OID of a MIB entry
- the MIB entry name
- the 5620 SAM polling interval for a MIB or MIB entry

See Procedure 14-21 for information about listing and saving SNMP MIB information.

14.4 SSH security

SSH is a protocol that provides secure file transfer and file system access between the 5620 SAM, and managed NEs. SSH version 2, or SSH2, is enabled by default on the following device types:

- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7250 SAS
- 7250 SAS-ES
- 7250 SAS-ESA
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR

SSH2 supports the use of public/private encryption-key pairs to perform authentication based on public key cryptography. A public/private key pair is generated on an NE. The private key is stored locally on the NE, and the public key is specific to SSH2 clients and persists in the 5620 SAM for future communication with the SSH2 server on the NE. The public key is used to verify that the client is connecting to the correct SSH2 server.

An SSH2 server identifies itself to a client by sending a message that is signed with the private key of the server. The 5620 SAM uses the public key of the SSH2 server to authenticate the identity of the server.

SSH2 host key management

An NE sends an SSH2 host key on the first attempt of the 5620 SAM to make an SSH2 connection. The 5620 SAM automatically accepts the public key fingerprint and stores it locally. After the first connection, the local copy of the fingerprint is used for server authentication during subsequent sessions.

If a different host key is sent by the same NE in a subsequent session, the connection is rejected and the 5620 SAM raises an alarm. If the user verifies that the host key of the SSH2 NE has been changed in a legitimate manner, for example, when the SSH server is rebooted and host key persistence is not configured, the user can manually accept the key by removing the mismatched host key entry from the SSH2 known host manager of the 5620 SAM. This removes the SSH2 fingerprint from the 5620 SAM database. Connections are then accepted from the NE until the SSH server is again rebooted.

Note — By default, SSH host keys do not persist in the 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X24F2XFP, 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR.

Host keys always persist in the 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA.

Alcatel-Lucent recommends that you configure the host key persistence on an SSH2 NE to retain the public key fingerprint across reboots. If public key persistence is not enabled, a 5620 SAM operator must manually accept a new key and remove an alarm each time a connection attempt is made after the NE reboots.

SSH2 and NE CLI sessions

When SSH2 for CLI sessions is enabled in the mediation policy of an SSH2-capable device, SSH2 instead of Telnet is used for each CLI session. The following devices support SSH2 CLI sessions:

- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7250 SAS
- 7250 SAS-ES
- 7250 SAS-ESA
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR
- generic NE

SSH1 is used only in SSH CLI sessions on NEs that do not support SSH2.

SSH2 and script management

When SSH2 for CLI sessions is enabled in the mediation policy of an SSH2-capable device, SSH2 is used instead of Telnet for each script execution session. The following devices support the use of SSH2 for management using the 5620 SAM Script Manager:

- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7250 SAS
- 7250 SAS-ES
- 7250 SAS-ESA
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR
- generic NE

SSH1 is used only in SSH CLI sessions on NEs that do not support SSH2.

SSH2 and secure file transfers

When secure file transfers are specified in the mediation policy of an SSH2-capable device, SCP is used instead of FTP for backups, restores, software upgrades, and statistics collection. The following devices support the use of SSH2 for secure file transfers:

- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR
- OS 6250M
- OS 6250SME
- OS 6400
- OS 6850
- OS 6850E
- OS 6855
- OS 9600
- OS 9700
- OS 9700E
- OS 9800
- OS 9800E

SSH and device management

The 5620 SAM supports the management of 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA devices using CLI. When the mediation policy for a device is configured to use SSH2, secure CLI communication is used to manage the device. Table 14-1 lists different SSH protocols and the compatibility of each with different device types.

Table 14-1 SSH2 and NE compatibility

Protocol	7210 SAS-M 24F 7210 SAS-M 24F 2XFP 7210 SAS-M 24F 2XFP ETR 7210 SAS-X 24F 2XFP 7450 ESS 7705 SAR 7710 SR 7750 SR	7250 SAS 7250 SAS-ES 7250 SAS-ESA	Generic NE
SSH2	✓	✓	✓
SCP	✓		
Device management using SSH2		✓	

Note — SSH2 communication with a device may be slower to establish than other types of communication because of the encryption and authentication computations that are required.

14.5 Server resource management

The 5620 SAM supports the grouping of NEs by network function for increased SNMP mediation efficiency.

Resource allocation is automatically configured during 5620 SAM installation and network discovery based on the available system resources, and the numbers and types of NEs that are to be managed. The resource group to which an NE belongs is initially determined by the device type. The following are the 5620 SAM NE resource groups and the default device assignments:

- global—for 5620 SAM tasks that are not associated with NEs
- default—for NEs that do not belong to a specific resource group
- core—for 7450 ESS and 7750 SR devices
- middle—for 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7710 SR, and 7705 SAR devices
- edge—for 7250 SAS, Telco, and similar devices
- GNE—for other network devices

The 5620 SAM logs the system load of each resource group at regular intervals. An Alcatel-Lucent support representative can monitor system resource usage, determine whether the current resource allocation is appropriate, and reconfigure resource management, if required.

Caution — Only a qualified Alcatel-Lucent support representative can assess or configure 5620 SAM server resource management. Contact Alcatel-Lucent technical support for more information.

14.6 SNMP event notification policies

To reduce the 5620 SAM processing load associated with SNMP events, you can configure a policy that specifies which SNMP traps the 5620 SAM processes. An event notification policy acts as a filter that enables or disables the processing of specific SNMP traps for a specific NE type and version.

A 5620 SAM operator with an admin or operations scope of command role and write access permission to the policy package can create an event notification policy using the Mediation form. The 5620 SAM assigns a default event notification policy to an NE during initial device discovery. A 5620 SAM operator can create and apply a policy that specifies which traps to process and which to ignore. 5620 SAM processing is enabled for all supported traps in the default policy. See Procedure 14-7 for more information about configuring an event notification policy.

The following conditions apply to event notification policies:

- After an NE upgrade, the 5620 SAM processes the new traps generated by the upgraded NE. A 5620 SAM administrator must ensure that the event notification policies that are in effect before an NE upgrade are correctly configured, and must modify them after the upgrade to silenced new traps, if required.
- 5620 SAM software upgrades do not affect existing event notification policies.

Caution — The 5620 SAM relies on certain SNMP notifications to verify network management activities. Before you configure an event notification policy, consult an Alcatel-Lucent support representative to ensure that you do not disable the processing of traps that are vital to 5620 SAM operation.

SNMP statistics that include the number of ignored traps for an NE are available from the Statistics tab of the NE properties form.

14.7 Workflow for device discovery

The following workflow describes the sequence of high-level tasks required to discover network devices. The following are required must be true before the 5620 SAM can discover a device:

- Each Alcatel-Lucent or Telco device is commissioned; see chapter 13 for commissioning information.
- Each non-Alcatel-Lucent and non-Telco device has a generic NE profile; see chapter 13 for more information.

1 Using a CLI, ensure that each device you want to discover and manage using SNMPv3 has a unique engine ID. See Procedure 14-1 for more information.

2 If required, perform the following steps to configure SSH2 security.

i Enable SSH2 on the device. See Procedure 14-2 for more information.

ii Configure and start an SSH server on the device. See the appropriate device documentation for SSH configuration information.

Note — A 7705 SAR may become temporarily unreachable after you enable SSH and start the SSH server on the device.

iii If the device supports SSH2 host key persistence, use Telnet to enable this function on the device. See Procedure 14-3 for more information.

3 Create a mediation policy. If you want to use SSH2 for mediation, ensure that you enable SSH2 for CLI sessions and secure file transfers. See Procedure 14-4 for more information.

Note — If you specify the use of SNMPv3 in the policy, you must enable SSH2 in the policy.

4 Discover the devices.

i Create one or more discovery rules, as required. See Procedures 14-5 and 14-6 for more information.

Note — If you want to use SSH2, specify the created SSH2 mediation policy for read and write access in the discovery rule.

ii Verify the discovery, management, and synchronization statuses of each device specified in the discovery rules.

5 As required, create event notification policies. See Procedure 14-7 for more information.

6 As required, assign event notification policies to NEs. See Procedure 14-8 for more information.

7 As required, manage device discovery by performing one or more of the following using the procedures in this chapter.

a Edit discovery rules and rule elements. See Procedure 14-9 for more information.

b Enable or disable discovery rules. See Procedure 14-10 for more information.

c Delete discovery rules. See Procedure 14-11 for more information.

d Rescan the network using a discovery rule. See Procedure 14-12 for more information.

e Manage, unmanage, or delete managed devices. See Procedures 14-13, 14-14, and 14-15 for more information.

f Synchronize NEs with the 5620 SAM database. See Procedure 14-16 for more information.

g Monitor the acceptance and rejection of SSH2 host keys using the 5620 SAM SSH2 Known Host Key Manager. See Procedure 14-17 and 14-18 for more information.

h Switch from non-secure to secure mediation for one or more devices. See Procedures 14-19 and 14-20 for more information.

i List and save SNMP MIB information. See Procedure 14-21 for more information.

14.8 Device discovery procedures

Use the following procedures to configure device discovery and mediation.

Procedure 14-1 To configure SNMPv3 on a device

Perform this procedure to enable SNMPv3 on a device. SNMPv3 provides user-based security. The access granted is restricted to the scope of the configured users and groups.

If you are configuring an NE for LI, you must create a second access group. See step 2 in Procedure 34-3 for more information about creating an LI user and access group.

1 Open a CLI session on the device.

2 Enter the following commands in the order shown to create a read-write-notify group for general SNMP mediation on the managed device:

configure system security snmp ↵

access group "*snmpv3_groupname*" security-model usm security-level privacy read "iso" write "iso" notify "iso" ↵

where
snmpv3_groupname is the name that is being assigned to the SNMP group

3 If mediation of VPRN objects is required, enter the following command to create a read-write-notify group for this purpose on the managed device:

access group "*snmpv3_groupname*" security-model usm security-level privacy context vprn prefix read "vprn-view" write "vprn-view" notify "iso" ↵

where
snmpv3_groupname is the name that is being assigned to the SNMP group

4 Enter the following command to exit SNMP group configuration.

exit ↵

5 Enter the following command to obtain the SNMP engine ID of the device.

show system info ↵

The SNMP engine ID is displayed as SNMP Engine ID.

6 Generate an MD5 or SHA authentication key, and DES privacy keys, using the password2key utility on a 5620 SAM client or server station.

- MD5 and SHA authentication keys are used to create an encrypted authentication password for users.
- DES privacy keys are used to encrypt the entire SNMP packet, for additional security.

Note — The length of a generated key is determined by the authentication method. MD5 keys are 32-character strings. SHA keys are 40-character strings.

i Log in to the 5620 SAM client or server station.

Note 1 — If you are using the password2key utility on a Solaris 5620 SAM server station, you must log in as the samadmin user.

Note 2 — If you are using the password2key utility on a 5620 SAM client station, you must log in as a local administrator, or as the user that installed the client.

ii Open a console window.

iii Navigate to the *install_directory*/nms/bin directory

where *install_directory* is the 5620 SAM installation location, typically /opt/5620sam/server or /opt/5620sam/client on Solaris, or C:\5620sam\client on Windows

iv Enter the following to create an MD5 or SHA authentication key.

nmsclient.bat password2key *method password engine_ID* ↵

where
method is the type of encryption algorithm used to generate the authentication key, either MD5 or SHA
password is the ASCII password string used to generate the authentication key for the SNMPv3 user, for example, yoga
engine_ID is the SNMP engine ID obtained in step 5

The SHA authentication key generated from this example is 60210e3d2bfa7e02682262df9c5de400b9c3322b.

v Enter the following to create an MD5 or SHA DES privacy key.

nmsclient.bat password2key *method password engine_ID* ↵

where
method is the type of encryption algorithm used to generate the DES privacy key, either MD5 or SHA
password is the ASCII password string used to generate the DES privacy key, for example, happy
engine_ID is the SNMP engine ID obtained in step 5

The DES privacy key generated from this example is 4088f4ef966b8d1ebe54b8d841a5f76806c374ec.

vi If your security model requires unique keys for each managed device, repeat steps 6iv and 6v for each set of keys to be generated.

vii Store the generated keys.

7 Using the keys generated in step 6, create an SNMPv3 user on the managed device.

i Enter the following sequence of commands at the prompt:

configure system security user *snmpv3_username* ↵

access snmp ↵

snmp ↵

authentication *method authentication_key* privacy des-key *DES_privacy_key* ↵

group *snmpv3_groupname* ↵

exit all ↵

where
snmpv3_username is the name being assigned to the SNMPv3 user
snmpv3_groupname is the name of the new SNMP user group
method is sha or md5, depending on the authentication method used
authentication_key is the SHA or MD5 authentication key generated in step 6
DES_privacy_key is the DES privacy key generated in step 6

Note — A DES privacy key is 32 characters long. If SHA encryption, which produces a 40-character key, is used to generate the DES privacy key in step 6, you must provide only the first 32 characters of the key, as shown in the following example that uses the key values from step 6:

authentication sha 60210e3d2bfa7e02682262df9c5de400b9c3322b privacy des 4088f4ef966b8d1ebe54b8d841a5f768 ↵

ii Enter the following command at the prompt to save the configuration changes.

admin save ↵

The device is now ready to be managed using SNMPv3. To enable device management by the 5620 SAM, you must do the following:

- Create an SNMPv3 user using the 5620 SAM NE user configuration manager. See chapter 21 for information about creating and configuring NE users. You must specify the following for each user:
  - Give the user SNMP access.
  - Enter the same User Name as the user name created earlier in this procedure.
  - On the SNMPv3 tab, select SHA as the authentication protocol and DES as the privacy protocol.
  - Type the appropriate ASCII password used to generate the MD5 or SHA authentication key, and DES privacy key, in step 6; for example, yoga and happy.
- Create a new SNMPv3 mediation security policy, as described in Procedure 14-4. Specify the following:
  - the SNMPv3 USM security model
  - the SNMP user name created earlier in this procedure
- Create one or more discovery rules that use the new SNMPv3 mediation policy.

8 Close the CLI session.

Procedure 14-2 To verify that SSH2 is enabled on a device

Perform this procedure to verify that SSH2 is enabled on a device, and to enable SSH2 on the device, if required. See section 14.4 for a list of devices that support SSH2.

Note — If the device is a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA, you cannot use this procedure to enable SSH2. You must see the device documentation for information about enabling SSH2.

1 Open a CLI session on the device.

2 Run the following CLI command to see whether SSH2 is enabled:

```
show system security ssh ↵
```

3 If required, enter the following command at the prompt to enable SSH2:

```
configure system security ssh version 2 ↵
```

4 Close the CLI session.

Procedure 14-3 To enable host key persistence on the SSH2 server of a device

Perform this procedure to enable the persistence of the server host key on a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7450 ESS, 7750 SR, 7705 SAR, or 7710 SR. Host key persistence is always enabled on the 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA. For other devices, see the user documentation for information about configuring SSH2 host key persistence.

1 Open a CLI session on the device.

2 Enter the following at the prompt to disable the SSH server:

configure system security ssh server-shutdown ↵

3 Enter the following at the prompt to enable host key persistence:

configure system security ssh preserve-key ↵

4 Enter the following at the prompt to enable the SSH server:

configure system security ssh no server-shutdown ↵

5 Enter the following at the prompt to verify that the preserve-key function is enabled on the server:

show system security ssh ↵

6 Close the CLI session.

Procedure 14-4 To configure NE mediation

Perform this procedure to configure the 5620 SAM to poll network elements at regular rates and intervals. To configure LI mediation, see Procedure 34-5.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Configure the parameters:

- Polling Synchronization Time
- Polling Admin State
- Discovery Rule Scan Interval

Note — Polling and scanning use system resources, and can increase the amount of management traffic. Consider your network needs and network management domain capabilities when setting these parameters.

3 Configure MIB polling intervals for different managed devices, as required.

i Click on the MIB Entry Policies tab button.

A list of MIBs appears, organized by the product name of the device that supports the MIB.

ii Configure the search filter and click on the Search button. The Mediation (Edit) form displays the MIB entry policies that match the search criteria.

iii Select one or more MIBs from the list.

iv Click on the Properties button.

The MIB Entry Policy (Edit) form opens.

v Configure the parameters:

- Polling Interval
- Administrative State
- Number of Varbind per PDU

Caution — Changing the Number of Varbind per PDU parameter value may affect the time required for subsequent NE resynchronizations and degrade 5620 SAM server performance. Do not configure the parameter without contacting Alcatel-Lucent technical support.

vi Click on the OK button.

vii Confirm the action.

The MIB Entry Policy (Edit) form closes and the Mediation (Edit) form reappears.

viii Click on the Apply button to save the changes, if required.

4 Use the Ping tab to define how the management IP addresses of devices are checked using a ping. Each managed device may provide one or more of the following three IP addresses, each of which can be scheduled to be pinged, as configured during discovery rule creation:

- the system IP address, called an in-band management interface
- the management IP address on the management port, called an out-of-band management interface
- the IP address of the standby Control card, also called a CPM

Note — When the device does not have one or two of the IP addresses, for example, there is no CPM IP address, ensure that you create a ping policy that does not have its schedule enabled. This allows the assignment of an inactive ping policy during discovery configuration. See Procedure 14-6 for more information.

i Click on the Ping tab button.

ii Click on the Create button to create a new ping policy, or click on the Properties button to change an existing ping policy.

The ManagementPingPolicy (Create) form opens.

iii Configure the parameters:

- Auto-Assign ID
- Policy ID
- Displayed Name
- Ping Command Timeout (seconds)
- Schedule Enabled
  You must enable scheduling for the default ping policy to be performed. When scheduling is not enabled, and a managed device is not reachable, management connection alarms may not be raised.
- Ping Interval (minutes)
- Ping Interval (seconds)

The destination interface of the ping is determined during the creation of discovery rules for devices. You can also perform an unscheduled ping from the Managed State tab of the Discovery Manager configuration form. See Procedure 14-6 for more information.

iv Click on the Apply button to save the changes.

You can view management connection alarms from the network element properties form of the managed device that was pinged. For example, from the Discovery Manager form, click on the Resync Status tab button. Choose a device from the list and click on the Properties button. From the network element properties form, click on the Faults tab button to view the alarms.

5 Create or modify a statistics MIB policy to determine how often the 5620 SAM polls the managed device MIBs for statistics. See the *5620 SAM Statistics Management Guide* for more information.

6 Click on the Mediation Security tab button.

i Click on the Create button to create a new SNMP mediation security policy, or select an existing policy and click on the Properties button to modify the policy. The MediationPolicy form opens.

Note 1 — Each 7250 SAS or Telco device requires a separate mediation policy unless the user names and passwords, which are often the SNMP community strings, match exactly.

Note 2 — To configure SNMPv3 security, you must preconfigure the 5620 SAM server and the managed devices. See Procedure 14-1 for more information.

ii Configure the general mediation parameters:

- Policy ID
- Auto-Assign ID
- Displayed Name
- Security Model
- Timeout (milliseconds)
- Retry
- Community String

Note — The Community String value must match the community string value on the managed device.

iii Configure the parameters in the CLI and File Transfer panels:

- Communication Protocol
- User Name
- User Password

  You must also enter the User Password parameter value in the Confirm Password parameter field.
- File Transfer Type

Note 1 — If you choose Secure as the File Transfer Type parameter value, you must set the Communication Protocol parameter to SSH2.

Note 2 — To configure SSH2 you must enable SSH2 and host key persistence on the SSH server of the device. See section 14.4 for more information about configuring SSH2.

Note 3 — If you choose SSH2 as the Communication Protocol, the User Name and User Password parameters must be the user name and password for the SSH server.

Note 4 — You must also enter the User Password value in the Confirm Password field.

7 If you choose SSH2 as the Communication Protocol value in step 6 iii, configure the SSH2 Server Port parameter.

8 Perform one of the following.

a If you choose FTP as the File Transfer Type value in step 6 iii, configure the parameters in the FTP panel:

- User Name
- User Password
  You must also enter the User Password parameter value in the Confirm Password parameter field.
- Read Timeout (sec)
- Read Timeout (sec)

b If you choose Secure as the File Transfer Type value in step 6 iii, configure the parameters in the Secure FTP panel:

- Read Timeout (sec)
- Read Timeout (sec)

See chapter 13 for information about enabling FTP access for a device user account.

9 If you set the Security Model parameter to SNMPv3 (USM), assign a user profile that is configured with the SNMPv3 authentication and privacy parameters, as described in Procedure 14-1.

i Click on the Select button to view a list of configured users. The Select Site User For SNMP Access form opens.

ii Select a user from the list and click on the OK button. The user name is displayed on the Mediation Security form.

iii Click on the Properties button to open the configuration form for the user and view or modify the SNMPv3 security settings, if required.

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The Mediation Policy form closes and the Mediation (Edit) form reappears.

12 Close the Mediation (Edit) form.

Procedure 14-5 To configure a discovery rule

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

2 Click on the Create button to create a new discovery rule. The Create Discovery Rule - Specify General Attributes form opens.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Description
- Administrative State

  When you set the administrative state to Up, the network is scanned according to the discovery rule when the discovery rule is saved. The network is also scanned according to the discovery rule as specified by the Discovery Rule Scan Interval parameter in the Mediation (Edit) form. When you set the administrative state to Down, the network is not scanned as specified by these conditions.
- OLC State
- Management Protocol
- Default External EMS

4 Click on the select button beside the Group Name parameter. The Select Discovery Group - TopologyDiscoveryRule window opens with a list of Topology Groups.

5 Choose a Topology Group from the list.

6 Click on the OK button. The Create Discovery Rule form refreshes with the Topology Group information displayed.

Note — If the selected Topology Group reaches the maximum element limit, any additional discovered NEs are automatically added to the Discovered Group.

7 Click the Next button. The Create Discovery Rule - Add Rule Elements form opens.

8 Click on the Create button to add a new rule element. The Topology Discovery Rule Element (Create) form opens.

9 Configure the parameters:

- IP Address
- Mask Bits
- Usage

Note — Ensure that you track the IP addresses used to discover devices. When the IP address used to discover the device is the system IP address (also known as the system ID) or the L3 management interface address, management is in band. When the IP address used to discover the device is the management IP address of the device management port, management is out of band.

10 Click on the OK button. The Topology Discovery Rule Element (Create) form closes and the Create Discovery Rule - Add Rule Elements form reappears.

The discovery rule is saved.

11 Confirm the action.

12 Add more rule elements, as required, by performing steps 8 to 10.

13 Click on the next button. The Add Auto Discovery Rule Elements ACL form opens.

14 Click on the Create button. The Auto Discovery Rule Element ACL (Create) form opens.

15 Configure the parameters:

- System ID
- Action

16 Click on the OK button. The Auto Discovery Rule Element ACL (Create) form closes and the Add Auto Discovery Rule Elements ACL form reappears.

17 Add more automatic discovery rule elements, as required, by performing steps 14 to 16.

18 Click on the Next button. The Create Discovery Rule - Configure Mediation Security form opens.

19 Specify the mediation policies for read access, write access, and SNMP trap access. Mediation policies are created or modified using the Mediation form, as described in Procedure 14-4.

Click on the Select button if you want to specify mediation security policies specific to the discovery rule. The Configure Mediation Security form opens.

You can:

- Select an existing mediation security policy from the list and click on the OK button.
- Select an existing mediation security policy and click on the Properties button. The MediationPolicy (Edit) form opens.
- Configure the parameters, as described in step 6 in Procedure 14-4 and click on the OK button to save the changes.

If you do not specify a policy, the default policy is applied.

20 Click on the Next button. The Create Discovery Rule - Configure Management Ping Policy form opens.

21 Specify the management ping policies for each of the following management IP addresses, if required:

- the management IP address on the management port, called an out-of-band management interface
- the system IP address, called an in-band management interface
- the IP address of the standby Control card, also called a CPM

Note — Management ping policies are created using the Mediation configuration form. These are the policies applied during discovery rule creation. You must apply a ping policy even to interfaces that do not exist.

For example, if there is no standby CPM or out-of-band management IP address, specify a ping policy that has the Schedule Enabled parameter set to disabled for the nonexistent management and standby CPM interfaces. In this example, a ping policy with the Schedule Enabled parameter enabled is required for the in-band interface that does exist. See Procedure 14-4 for more information about creating ping policies.

22 Click on the Select button for each ping policy ID parameter. The Configure Management Ping Policy list form opens.

23 Choose a ping policy from the list. When there is no interface, choose a ping policy that has its Schedule Enabled parameter set to disabled.

24 Click on the OK button. The ping policy ID appears in the Policy ID parameter.

You can view management connection alarms from the network element properties form of the managed device that was pinged. For example, from the Discovery Manager form, click on the Resync Status tab button. Choose a device from the list and click on the Properties button. From the network element properties form, click on the Faults tab button to view the alarms.

25 Click on the Next button. The Create Discovery Rule - Configure MIB Statistics Policy form opens with the default MIB statistics policy displayed.

26 Click on the Select button to choose a different MIB statistics policy, if required. The Configure MIB Statistics Policy form opens. Select a MIB statistics policy in the list and click on the OK button.

27 Click on the Next button. The Create Discovery Rule - Add Discovered Routers to Span(s) form opens.

28 Click on the Add button to specify a span of control for the new network element contained in the discovery rule. If you do not specify a span, the default span is applied.

Note — New routers added to a span from a discovery rule are added explicitly to the span.

When a discovered NE group is part of a user-defined span, new routers that are discovered from the discovery rule are automatically added to the span.

29 Click on the Next button. The Create Discovery Rule - Configure Backup Policy form opens.

30 Click on the Select button to choose a different backup policy, if required. The Select Backup Policy - Topology Discovery Rule form opens. Select a backup policy in the list and click on the OK button.

31 Click on the Next button. The Create Discovery Rule - Add EM Systems form opens.

32 Click on the Add... button. The EM System (Create) form opens with the General tab displayed.

33 Configure the parameters:

- Element Manager System Name
- Description
- Administrative State

34 Click on the Element Managers tab button.

35 Click on the Add... button. The Element Manager (Create) form opens.

36 Configure the parameters:

- Host Name
- Server Type
- Server IP Address
- Server Port Number
- User Name
- Password

37 Click on the OK button. The Element Manager (Create) form closes and the EM System (Create) form reappears.

38 Click on the OK button. The EM System (Create) form closes and the Create Discovery Rule - Add EM Systems form reappears.

39 Click on the Finish button. The Create Discovery Rule form closes and a dialog box appears.

Note 1 — If the EM System being discovered is an OMC-RAN, only space and underscore are supported characters for node names. Any other special characters will be replaced by an underscore.

Note 2 — After discovering an EM System, the system should be opened and its administrative state set to Up in order to enable the connection to the 5620 SAM. A maximum of four EM Systems may have their administrative state set to Up at any time within the 5620 SAM.

Note 3 — A manual resynch must be performed in order for alarms from an EM System to be displayed in the 5620 SAM client or Supervision web portal.

40 Click on the OK button to close the dialog box. The Discovery Manager form reappears.

41 Close the Discovery Manager form.

Procedure 14-6 To discover devices

Perform this procedure to complete the following tasks:

- Create discovery rules
- Ping the managed devices to test connectivity
- Locate managed devices on a topology map
- Discover devices by scanning the network according to discovery rules
- Set discovered devices in a managed state
- Resynchronize NEs and the 5620 SAM database
- Check the discovery, management, and synchronization status of a device

Note 1 — SNMP parameters must be correctly specified using CLI on the managed devices. Contact your Alcatel-Lucent support representative or see chapter 13 for more information about using CLI to commission devices before managing them.

Note 2 — Ensure that in-band and out-of-band management are correctly configured to discover devices, as described in chapter 13.

1 Configure a discovery rule as described in Procedure 14-5.

2 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

3 Click on the Apply button to discover devices by scanning the network as specified by a discovery rule.

New or modified discovery rules are saved. The 5620 SAM discovers devices by scanning the network as specified by the discovery rules. After a device is discovered, the 5620 SAM server sets the device in a managed state and adds the device elements to the 5620 SAM database.

Discovery rules that are disabled or shut down are not applied.

4 Verify that the device is discovered and is managed by the 5620 SAM by clicking on the Managed State tab button on the Discovery Manager form. A list of managed devices opens.

The management state of the device is displayed in the Site State column. Managed is the default state. If the device is unmanaged, select the device from the list and click on the Manage button.

5 From the Managed State tab, you can also perform management IP address pings to ensure connectivity to all managed devices. Do not ping devices without an interface.

6 From the Managed State tab, you can locate the device in a topology map.

i Click on one or multiple managed devices in the list.

ii Click on the Navigate button. A drop-down menu opens that lists the map view options.

iii Select an option. The *topology_view* (Navigate) window appears showing the selected network objects.

> **Note —** Only managed devices located outside the discovery group can be located. If the selected managed devices do not all belong to the same group on the map, then only the managed devices of one of the groups is located. Unmanaged devices cannot be located.

7 Verify that the device configuration has been reconciled with the 5620 SAM database contents, by clicking on the Resync Status tab button. The Resync Status tab displays the operation status of the last full resync to the user. See section 14.2 for more information.

To initiate manual device reconciliation, select one or more devices in the list and click on the Resync button.

If the reconciliation fails:

- View faults that are associated with a device by double-clicking on the device in the Discovery Manager form and clicking on the Faults tab button in the form that opens.
- Check your SNMP security parameters on a device using the CLI.
- Check your 5620 SAM mediation settings by choosing Administration→Mediation from the 5620 SAM main menu.

Devices that have been successfully discovered appear in the 5620 SAM navigation tree.

8 From the Resync Status tab, you can locate the device in a topology map.

i Click on one or multiple resynchronized devices in the list.

ii Click on the Navigate button. A drop-down menu opens that lists the map view options.

iii Select an option. The *topology_view* (Navigate) window appears showing the selected network objects.

> **Note —** Only devices located outside the discovery group can be located. If the selected devices do not all belong to the same group on the map, then only the devices of one of the groups is located.

9 Close the Discovery Manager form.

Procedure 14-7 To configure an event notification policy

Perform this procedure to configure how the 5620 SAM processes specific SNMP traps from specific NE types and releases.

Caution — The 5620 SAM relies on certain SNMP notifications to verify network management activities. Before you configure an event notification policy, consult an Alcatel-Lucent support representative to ensure that you do not disable the processing of traps that are vital to 5620 SAM operation.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens.

2 Click on the Event Notification Policies tab button.

3 Perform one of the following.

a Create a policy.

i Click on the Create button. The Event Notification Policy (Create) form opens.

ii Configure the parameters:

- Auto-Assign ID
- Policy ID
- Displayed Name
- Description
- Network Element Type

After the Network Element Type parameter is configured, the form expands to display the Product and Version panels.

iii Click on the Select button in the Version panel to choose the version of NE to which the policy is to apply. The Select Version - Event Notification Policy form opens with a list of available versions displayed.

iv Select a version and click on the OK button. The Select Version - Event Notification Policy form closes and the version information is displayed on the Event Notification Policy (Create) form.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Mediation (Edit) form reappears with the new policy in the list.

vii Click on the Apply button. A dialog box appears.

viii Click on the Yes button.

ix Select the new policy in the list and click on the Properties button. The Event Notification Policy (Edit) form opens.

b Modify a policy.

i Click on the Displayed Name column heading to sort the existing policies by device type and version.

ii Drag the Displayed Name column boundary to display the device type and release information.

iii Scroll through the list to locate the policy for the required device type and version using the information in the Displayed Name column.

iv Select the required policy and click on the Properties button. The Event Notification Policy (Edit) form opens.

v Configure the parameters:

- Displayed Name
- Description

4 Click on the Notification Policies tab button. A list of SNMP traps is displayed.

5 Click on a column header, for example, MIB Name or MIB Entry Name, to sort the list alphabetically.

6 Select an SNMP trap entry in the list and click on the Properties button. The MIB Entry Policy - trappolicy (Edit) form opens.

7 Configure the Administrative State parameter.

Note — You cannot configure the Administrative State parameter in a default event notification policy. A default policy is indicated by a check mark beside the Default Policy indicator on the General tab of the Event Notification Policy (Edit) form.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The MIB Entry Policy - trappolicy (Edit) form closes.

10 Repeat steps 6 to 9 to configure the processing of an additional SNMP trap by the 5620 SAM.

11 Close the Event Notification Policy (Edit) form.

12 Close the Mediation (Edit) form.

Procedure 14-8 To assign an event notification policy to an NE

Caution — The 5620 SAM relies on certain SNMP notifications to verify network management activities. Before you assign an event notification policy to an NE, consult an Alcatel-Lucent support representative to ensure that you do not disable the processing of traps that are vital to 5620 SAM operation.

1 Right-click on an NE icon in the navigation tree and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

2 Click on the Polling tab button.

3 Click on the Clear button in the Assigned Event Notification Policy panel. The Select button in the panel is enabled.

4 Click on the Select button in the Assigned Event Notification Policy panel to choose an event notification policy. The Select Event Notification Policy - Network Element form opens with a list of appropriate event notification policies for the device displayed.

5 Select a policy in the list and click on the OK button. The Select Event Notification Policy - Network Element form closes and the new policy identifier is displayed on the Network Element (Edit) form.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Network Element (Edit) form closes and the policy is applied.

Procedure 14-9 To edit a discovery rule

Edit discovery rules when new devices are added to the network.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Select a discovery rule from the list.

3 Click on the Properties button.

The appropriate TopologyDiscoveryRule (Edit) form opens.

4 Configure the parameters, as required. For example, to remove a rule element:

i Click on the Rule Elements tab button.

ii Select the rule from the list.

iii Click on the Delete button.

iv Confirm the action.

5 Click on the OK button to close the TopologyDiscoveryRule (Edit) form.

6 Perform steps 3 to 7 in Procedure 14-6.

7 Close the Discovery Manager form.

Procedure 14-10 To enable or disable a discovery rule

When a discovery rule is enabled, the network is scanned according to the discovery rule when the discovery rule is saved or rescanned. The network is also scanned according to the discovery rule as specified by the Discovery Rule Scan Interval parameter in the Mediation form. If your discovery rule is disabled, the network is not scanned as specified by these conditions.

1 Choose Administration→Discovery Manager from the main menu. The Discovery Manager form opens.

2 Select a discovery rule from the list.

3 Enable or disable the discovery rule.

  a Click on the Turn Up button to enable the discovery rule.

  b Click on the Shut Down button to disable the discovery rule.

Procedure 14-11 To delete a discovery rule

When you delete a discovery rule, only the rule is removed; the devices discovered using the rule are not removed from the 5620 SAM.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Select a discovery rule in the list.

3 Click on the Delete button. A dialog box appears.

4 Click on the OK button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Discovery Manager form closes.

Procedure 14-12 To rescan the network according to a discovery rule

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Select one or more discovery rules from the list.

3 Click on the Rescan button.

4 Click Yes to confirm the action.

The 5620 SAM scans the network as specified by the discovery rules and discovers devices. After a device is discovered, the 5620 SAM server sets the device in a managed state and adds the NE properties to the 5620 SAM database.

5 Perform steps 4 and 7 in Procedure 14-6 to verify that the device has been successfully discovered.

Procedure 14-13 To manage or unmanage a device

Warning — Unmanaging a device results in a loss of management data for the selected device. See section 14.1 for more information.

If you use the 5670 RAM to process 5620 SAM statistics, unmanaging an NE results in the loss of all historical 5670 RAM AA statistics for the device.

Manage/unmanage of HIP devices is not supported. To unmanage or delete a HIP network element, you must set the EMS administrative state to down, then delete the EMS.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Click on the Managed State tab button.

3 Select a device in the list.

4 Click on the Manage or Unmanage button, as required. A Confirm message appears.

5 View the information and click Yes to confirm the action.

The device becomes managed or unmanaged by the 5620 SAM.

Procedure 14-14 To specify which management address the 5620 SAM uses to remanage a device

Perform this procedure to specify which management IP address is saved for a device when the device is set to an unmanaged state. You can configure the 5620 SAM to save the original management IP address or the most recently used management IP address for a device.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Click on the Managed State tab button.

3 Choose a device from the list.

4 Click on the Properties button. The Node Discovery Control (Edit) form opens with the General tab displayed.

5 Configure the Use Original Management IP parameter.

6 Click on the OK button. A dialog box appears.

7 Click Yes to confirm the action.

Procedure 14-15 To delete a device

Warning — Deleting a device results in a loss of management data and completely removes the device from the managed network. See section 14.1 for more information.

If you use the 5670 RAM to process 5620 SAM statistics, deleting an NE results in the loss of all historical 5670 RAM AA statistics for the device.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Click on the Managed State tab button.

3 Select a device in the list.

4 If the device is managed, click on the Unmanage button and wait for the state to change to Unmanaged, otherwise, go to step 5.

5 Click on the Delete button. A Confirm message appears.

6 View the information and click Yes to confirm the action.

The device is deleted by the 5620 SAM.

Procedure 14-16 To partially or fully resynchronize NEs with the 5620 SAM database

1 Perform one of the following.

a Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

b Open a physical or service tunnel topology map displaying the required NE(s). Refer to Chapter 5 for more information on using topology maps.

2 Select the required NE(s). Multiple selection is allowed.

3 Choose a resynchonization option.

a Right-click on one of the selected devices you want to resynchronize with the 5620 SAM database and choose Resync→Resync All MIBs from the contextual menu.

Note — Choosing Resync All MIBs will fully resynchronize all MIBs for the devices, ignoring timestamps.

b Perform a partial resynchronization.

i Right-click on one of the selected devices you want to resynchronize with the 5620 SAM database and choose Resync→Customized Resync from the contextual menu. The Resync Site(s) form opens.

ii Select Choose MIB Entries.

iii Click on the Next button.

iv Select one or more MIB entries from the list.

v Click on the Next button.

vi Configure the Ignore Timestamps parameter.

vii Click on the Finish button and close the Resynce Site(s) form.

4 Choose Administration→Discovery Manager from the 5620 SAM main menu.

5 Perform step 7 in Procedure 14-6 to verify that a particular device's properties have been added to the 5620 SAM database.

6 Close the Discovery Manager form.

Procedure 14-17 To view the active and mismatched host keys

1 Open the SSH2 known host key manager by performing one of the following.

a Choose Administration→Security→SSH2 Known Host Key from the 5620 SAM main menu.

b Perform the following steps.

i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.

ii Click on the Managed State tab button. A list of managed devices appears.

iii Select a device in the list and click on the Properties button. The Node Discovery Control (Edit) form opens.

iv Click on the Mediation Security tab button.

v Click on the SSH2 Known Host Key button. The SSH2 Known Host Key Manager form opens.

2 Configure the filter criteria. A list of active and mismatched host keys appears.

3 Click on the Close button to close the SSH2 Known Host Key Manager form and the open parent forms, as required.

Procedure 14-18 To manually accept a mismatched host key

Perform this procedure to manually accept a host key that has been rejected by the 5620 SAM client so that a connection to the SSH server can be established. Before you accept a mismatched host key, verify the validity of the connection to the SSH server.

1 Open the SSH2 Known Host Key Manager by performing one of the following.

a Choose Administration→Security→SSH2 Known Host Key Manager from the 5620 SAM main menu.

b Perform the following steps.

i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.

ii Click on the Managed State tab button. A list of managed devices appears.

iii Select a device in the list and click on the Properties button. The Node Discovery Control (Edit) form opens.

iv Click on the Mediation Security tab button.

v Click on the SSH2 Known Host Key button.

The SSH2 Known Host Key Manager filter form opens.

2 Choose Mismatch SSH2 Host Key as a match criterion using the drop-down list in the SSH2 Server Status column header.

3 Click on the Search button. A list of mismatched host keys is displayed.

4 Select the required host key entry.

5 Verify with the device administrator that the key fingerprint is the host key of the required device.

6 Click on the Delete button to delete the mismatched host key. The mismatched host key is deleted and a connection to the SSH server can be established.

Note — You can only remove the mismatched host key entry using the SSH2 Known Host Key Manager form. Deleting a Host Key Mismatch alarm from the dynamic alarm list does not remove the host key from the SSH2 Host Key Manager and 5620 SAM database.

7 Close the SSH2 Known Host Key Manager form.

8 Close the Node Discovery Control (Edit) form, if it is open.

9 Close the Discovery Manager (Edit) form, if it is open.

Procedure 14-19 To change from SNMPv2c management of a device to SNMPv3 management

1 Unmanage and delete the device.

- i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.
- ii On the Discovery Manager (Edit) form, select the device from the list that you want to manage using SNMPv3 and then click on the Unmanage button.
- iii When the device shows a Site State of Not Managed, click on the Delete button.
- iv Click OK on the Discovery Manager (Edit) form.

2 Perform Procedure 14-1 to create SNMPv3 groups and users on the device, and to create a discovery rule with an SNMPv3 mediation security policy.

Note — You can modify the existing discovery rule with an SNMPv3 mediation security policy. However, you must create a new discovery rule for the deleted device if not all devices discovered by the same rule are changed to SNMPv3 management.

3 Rediscover the device.

- i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.
- ii Click on the Discovery Rules tab button.

- **iii** Select the discovery rule that was created in step 2 to discover the deleted device.
- **iv** Click on the Rescan button.
- **v** Click OK on the Discovery Manager (Edit) form.

Procedure 14-20 To switch from non-secure to secure mediation

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Click on the Mediation Security tab button. You can create a mediation policy as described in Procedure 14-4, or modify the default mediation policy to use SSH2. Perform one of the following.

- **a** Click on the Create button to create a new mediation policy. The Mediation Policy (Create) form opens with the General tab displayed.
- **b** Choose the default policy from the list, and click on Edit. The Mediation Policy (Edit) form opens with the General tab displayed.

3 Configure the following parameters using the prescribed values:

- SSH2 as the Communication Protocol
- The SSH2 server user name and password as the User Name and User Password
- Secure as the File Transfer Type

Note — When the File Transfer Type is set to Secure, the Communication Protocol, User Name, and User Password parameters must be configured with the SSH2 information.

- The port that the NE uses for SSH2 communication as the SSH2 Server Port

4 Configure the remaining parameters on the form.

5 Click on the OK button. A dialog box appears.

6 Click on the OK button. The Mediation Policy form closes.

7 Click on the OK button. The Mediation (Edit) form closes.

8 Perform steps 1 to 3 of Procedure 14-6 to create a new discovery rule that uses the new SSH2 mediation policy as the read-access mediation policy and the write-access mediation policy.

9 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form opens with the Discovery Rules tab displayed.

10 Click on the Managed State tab button. A list of managed devices appears.

11 Choose the device from the list that you want to use SSH2 for CLI sessions and secure file transfers.

12 Click on the Properties button.

13 Click on the Mediation Security tab button.

14 Choose the newly created SSH2 mediation policy as the read access mediation policy.

> **Note —** You can also change the mediation policy for a discovery rule by performing step 14 and choosing a discovery rule from the Discovery Rules tab.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The Discovery Manager (Edit) form closes.

Procedure 14-21 To list and save SNMP MIB information

Perform this procedure to list and save SNMP MIB information, which may be of use for purposes such as the following:

- to maintain a record of the SNMP MIBs that the 5620 SAM supports
- to compare SNMP MIB support between 5620 SAM releases
- to identify the polling interval for a MIB entry

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Click on the MIB Entry Policies tab button.

3 Configure the search filter and click on the OK button. The Mediation (Edit) form displays the MIB entry policies that match the search criteria.

4 To view the polling interval for a MIB entry, perform the following steps.

i select the MIB entry and click on the Properties button. The MIB Entry Policy (Edit) form opens with the General tab displayed.

ii View the polling interval setting in the Configuration panel.

iii Close the MIB Entry Policy (Edit) form.

5 If required, sort the list according to the contents of a column by clicking on the column header.

6 If required, perform the following steps to save the listed information to a file.

- **i** Right-click on a column header and choose Save to File. the Save As form opens.
- **ii** Use the form to specify the file that is to contain the saved information.
- **iii** Click on the Save button. The information is saved to the specified file.

7 Close the Mediation (Edit) form.

15 — Device CLI sessions

15.1 Device CLI sessions overview

You can perform most NE management functions using the 5620 SAM client GUI. Functions such as the following, however, require CLI access to a managed NE:

- validating GUI configuration actions
- configuring items that the GUI cannot, such as LI user access
- troubleshooting using device debug files

The 5620 SAM client GUI provides CLI access to the managed NEs from the main menu and from NE contextual menus in topology maps and navigation trees.

Note 1 — When you use a CLI to change security parameters on anNE, the changes may not be synchronized with the 5620 SAM and subsequently not displayed in the GUI. For security reasons, the 5620 SAM cannot retrieve parameters such as passwords from an NE. To ensure that the security parameters are synchronized, you must use the client GUI to change the values.

Note 2 — A CLI script that is configured for an OmniSwitch NE can fail if it contains one or more of the following characters:

- ~
- !
- @
- $
- %
- &

Scope of command roles and user permissions on the cli package control CLI command access on an NE. The user permissions are set when security is configured on the NE locally or by using 5620 SAM configuration forms. See chapter 21 for more information about setting NE access privileges.

vi editor support

On the 7750 SR, 7450 ESS, and 7710 SR, Release 8.0 or later, you can use the vi editor to modify local files. For example, after you use the 5620 SAM script manager to create a CLI script, you can use a 5620 SAM CLI session to monitor the script execution on an NE, then use vi to modify the script. The vi editor is available in 5620 SAM Telnet and SSH sessions. It supports the standard vi navigation keys as well as the cursor keys, sometimes called the arrow keys. See the appropriate device documentation for information about the supported vi commands and functions for a specific device.

See the appropriate device documentation for information about the device CLI command structure and usage. See the *5620 SAM Scripts and Templates Developer Guide* for more information about using the 5620 SAM script manager to create CLI scripts.

15.2 Workflow to use a 5620 SAM CLI

The following workflow describes the sequence of high-level tasks required to open and use a device CLI from the 5620 SAM client GUI. The following must be true before you can use the 5620 SAM to open a device CLI using the GUI.

- The 5620 SAM user account has console access privileges on the managed devices; see chapter 9 for more information.
- The Telnet server on the managed devices is started.
- If required, SSH2 is properly configured on the managed devices; see chapter 14 for more information.

1 Configure the 5620 SAM CLI preferences. See Procedure 15-1 for more information.

2 Open a CLI session and log in to a managed device. See Procedure 15-2 for more information.

3 Configure the device, view device information, and modify files, as required.

4 Close the CLI session. See Procedure 15-1 for more information.

15.3 CLI procedures

The following procedures describe how to open CLI sessions using the 5620 SAM and configure the CLI console preferences.

Procedure 15-1 To configure the 5620 SAM CLI console preferences

Perform this procedure to customize the 5620 SAM CLI window settings. You can specify the following:

- the console text style and appearance
- the size of the scrolling buffer
- whether to save the session output to a file

1 Open a CLI session, as described in Procedure 15-2.

2 Right-click in the CLI window and choose Configure from the contextual menu. The Terminal Configuration form opens.

3 Configure the parameters:

- Minimum number of scrolling lines
- Font Name
- Font Size
- Bold
- Italic
- Foreground color
- Background color
- Send Console To a File
- Append to file
- Log File Location

Note — When the Send Console To a File parameter is enabled and the Append to file parameter is disabled, the log file is overwritten each time a new CLI session starts.

4 Click on the OK button. The Terminal Configuration form closes. The current and subsequent CLI sessions use the new settings.

Procedure 15-2 To open and close a 5620 SAM device CLI session

Perform this procedure to open a Telnet or SSH session on a managed device using the 5620 SAM client GUI.

1 Perform one of the following.

a Use the 5620 SAM navigation tree; perform the following steps.

i Choose Equipment from the view selector.

ii Right-click on a device icon.

iii Choose NE Sessions→*option* from the contextual menu

where *option* is Telnet Session or SSH Session

The Telnet Session or SSH Session window opens.

Note 1 — The managed device must be configured for Telnet access. See the appropriate device documentation for information about configuring Telnet access to the device.

Note 2 — SSH2 is used in SSH sessions by default on the 7450 ESS, 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7750 SR, 7250 SAS, and generic NEs. Ensure that SSH2 is properly configured on such a device and that an SSH2 mediation policy is specified in the device discovery rule. See chapter 14 for more information about configuring SSH2 security.

b Use the 5620 SAM main menu; perform the following steps.

i Choose one of the following main menu options:

- Tools→NE Sessions→Telnet Session
- Tools→NE Sessions→SSH Session

The Telnet Session or SSH Session window opens.

ii Perform one of the following to specify an NE as the CLI session target.

- Type the management IP address of the NE beside the dimmed Connect button.
- Select an IP address from the drop-down menu.
- Click on the Select button to search for the NE.

The Connect button is enabled.

iii Click on the Connect button.

c Use the Manage Equipment form; perform the following steps.

i Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

ii Configure the filter criteria and click on the Search button.

iii Select an NE in the list.

iv Click on the NE Sessions button and choose Telnet Session or SSH Session. The Telnet Session or SSH Session window opens.

d Use a service topology map; perform the following steps.

i Choose one of the following from the 5620 SAM main menu:

- Manage→Service→Services
- Manage→Service→Composite Services
- Manage→Service→Mirror Services

The appropriate management list form opens.

ii Configure the filter criteria and click on the Search button.

iii Select a service in the list.

iv Click on the Topology View button. A dialog box appears.

v Click on the Yes button. A service topology map opens.

vi Right-click on an NE in the map and choose NE Sessions→Telnet Session or NE Sessions→SSH Session. The Telnet Session or SSH Session window opens.

e Use the Physical Topology map; perform the following steps.

i If the Physical Topology map is not open, choose Application→Physical Topology from the 5620 SAM main menu. The Physical Topology map opens.

ii Right-click on an NE in the map and choose NE Sessions→Telnet Session or NE Sessions→SSH Session. The Telnet Session or SSH Session window opens.

2 Enter the login credentials. You can use the CLI as specified by your user account permissions.

3 Perform NE management tasks, as required.

4 Click on the Disconnect button to close the CLI session.

Note — When you disconnect from a CLI session, the session window remains open to facilitate the opening of a subsequent CLI session.

5 Perform one of the following.

a Open a new CLI session; perform the following steps.

i Perform one of the following to specify an NE as the CLI session target.

- Type the management IP address of an NE beside the dimmed Connect button.
- Select an IP address from the drop-down menu.
- Click on the Select button to search for an NE.

The Connect button is enabled.

ii Click on the Connect button.

b Close the Telnet Session or SSH Session window.

16 — Working with network objects

16.1 Working with network objects overview

The 5620 SAM is used to create, configure, and manage a device with the various children objects required to be part of a network. Equipment such as the routers, which are at the top of the hierarchy, have properties that are configured using the CLI and discovered when the 5620 SAM discovery process is run. After the device is discovered, it is displayed as an object in the navigation tree. See chapter 4 for more information about the navigation tree.

Objects in the 5620 SAM are considered to have parent/child relationships that are contained within a hierarchy. For example, a card in a card slot is the parent object of a daughter card. The behavior of each object is defined using parameters that are specific to the function required. Those parameters can be managed to suit the needs of the service required. Objects are created and managed using the properties forms found in the contextual menus of the equipment view.

The network is the top object in the navigation tree. The network icon in the navigation tree is the parent object of all managed devices. When you expand the network icon, all managed devices are shown as children of the network parent.

The device object is the discovered device at the top of the hierarchy in the navigation tree, directly below the network icon. The following children objects of the router are created automatically in the navigation tree after the device is discovered.

- CCAG
- ISA-Tunnel Group
- ISA-AA Group
- ISA-LNS Group
- ISA-NAT Group
- ISA-Video Group
- LAG
- IGH
- Shelf
- Card Slot
- Card Slot A for the CPM and switch fabric
- Card Slot B for the redundant CPM and switch fabric
- Fans
- Power Supplies

The following objects must be created using property forms or create forms from the contextual menus of the equipment view or the ring group view.

- topology groups
- individual CCAGs with VSM-CCA members
- individual ISA-Tunnel Groups with ISA IPsec MDA members
- individual ISA-AA Groups with ISA-AA MDA members and ISA-AA partitions
- individual ISA-LNS Groups with ISA broadband applications MDA members
- individual ISA-NAT Groups with ISA broadband applications MDA members
- individual ISA-Video Groups with ISA-Video MDA members
- individual LAGs with subgroups of LAG member ports
- IGH members
- cards
- ring groups

- daughter cards
  Ports are automatically created when the daughter card is created.
- channels

Configuring an object is accomplished in two steps. First the object must exist or be created, second, the object parameters are modified. See Procedure 17-1 to create objects using the navigation tree.

16.2 Working with topology group objects

The topology group icons in the navigation tree represent logical topology groups. Initially, a topology group object is created by choosing Create→Equipment→Group from the 5620 SAM main menu. A Group (Create) form opens. Additional topology groups can be created using the Copy button on the topology group properties form.

The Discovered NEs and the Unmanaged NEs topology groups are created by default. The Discovered NEs topology group contains the discovered devices. The Unmanaged NEs topology group contains unmanaged NEs that have been added to the network. You can create new topology groups and move devices to them using the topology maps.

Note — For existing topologies, the unmanaged NE will not be automatically moved to the Unmanaged NEs topology group in the following situations:

- existing unmanaged NEs
- managed NEs that are unmanaged

Although there is no limit to the number of topology groups, Alcatel-Lucent recommends a maximum of 10 000 topology groups per system for optimal performance. Each topology group can contain a maximum of 500 objects. Network elements and immediate child groups are considered objects in a topology group. A bracketed number is displayed beside the name of each topology group in the navigation tree. This number indicates the current number of objects in the group.

See chapter 5 for information about configuring topology group objects and managing topology groups using maps.

16.3 Working with physical links

The 5620 SAM allows you to create and manage links at the Layer 1 level. The physical links represent the actual physical configuration of network connections between ports. You can view and manage physical links from the physical topology map and the Manage Equipment list form.

Although there is no limit to the number of physical links you can have in a system, Alcatel-Lucent recommends a maximum of 10 000 physical links for optimal system performance.

Radio links between 9500 MPRs are shown as physical links by the 5620 SAM, with ports as the endpoint type.

See chapter 5 for information about configuring physical links and managing physical links using maps.

16.4 Workflow to manage network objects

The following workflow describes the sequence of high-level tasks required to manage and configure network objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 13 for more information about device commissioning. See chapter 14 for more information about device discovery.

Note — Network objects can be accessed using the equipment navigation tree. See chapter 4 for more information.

1 As required, create network topology groups. See chapter 5 for more information.

2 As required, configure device objects. See chapter 17 for more information.

3 As required, configure logical group objects. See chapter 18 for more information.

4 As required, configure shelf, card, and daughter card objects. See chapter 19 for more information.

5 As required, configure port and channel objects. See chapter 20 for more information.

6 As required, create physical links. See chapter 5 for more information.

17 — Device object configuration

17.1 Device object configuration overview

The device object is the discovered device at the top of the hierarchy in the navigation tree, directly below the network icon.

This chapter contains the procedures to configure device objects using the navigation tree. Device object properties forms, which are used to configure specific parameters for discovered devices, are accessed using objects on the 5620 SAM navigation tree. See chapter 4 for more information about using the navigation tree.

17.2 Working with device objects

The device icons in the navigation tree represent device objects. Most of the configured properties for this object are inherited from the device. The Properties contextual menu option from the navigation tree allows you to configure or modify parameters for the object. These parameters are found on the respective tab buttons of the properties form and include the following:

- General
- Polling
- Protocols
- Load Balancing
- PAE Site
- Groups
- SAS Agent
- Faults

See chapter 13 for in-band and out-of-band management using parameters on the Polling tab. See chapter 12 for more information about the supported device types.

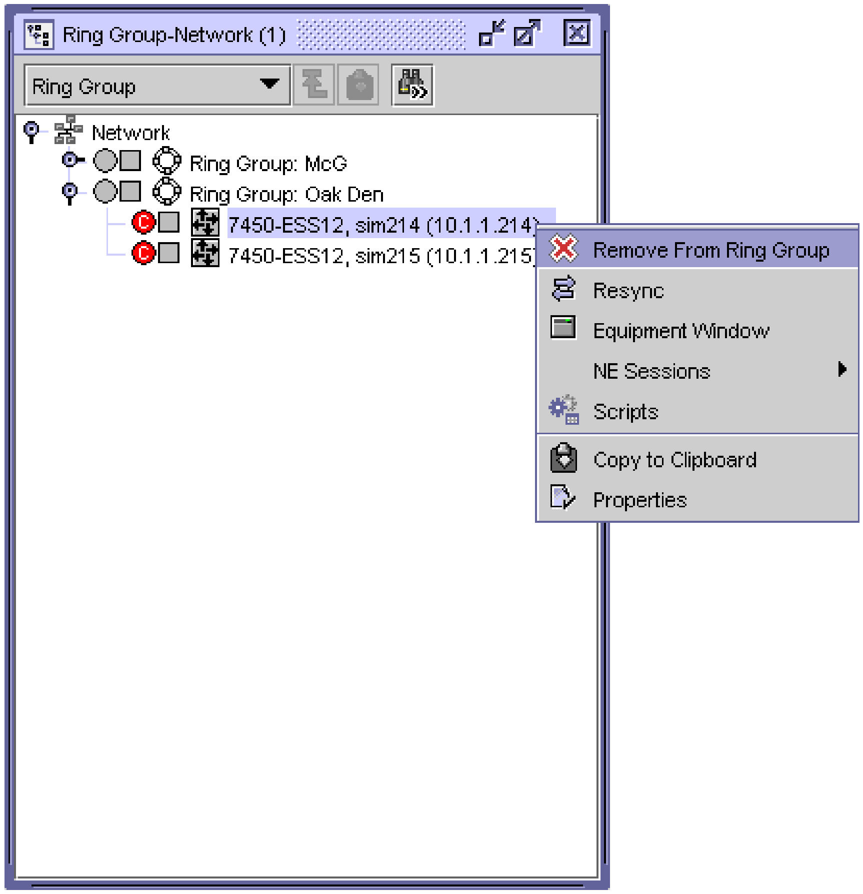
17.3 Working with ring group objects

The 5620 SAM allows you to create and manage ring groups in the ring group view of the navigation tree. Ring groups are used to group devices, such as Telco, 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESAs logically to represent a typical network topology.

Note — The 5620 SAM Release 7.0 R3 or later uses VLAN groups instead of ring groups to group OmniSwitch NEs. When you upgrade to 5620 SAM Release 7.0 R3 or later, a ring group that contains OmniSwitch NEs is automatically converted to a VLAN group. See chapter 70 for more information about VLAN groups.

In the ring group view of the navigation tree, the network icon provides the contextual menu option Create Ring Group to create ring group icons. Using the properties form of a ring group, you can group devices logically in the ring group. Figure 17-1 shows a sample navigation tree ring group view.

Figure 17-1 Sample navigation tree ring group view



17.4 Workflow to manage device objects

The following workflow describes the sequence of high-level tasks required to manage and configure device objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 13 for more information about device commissioning. See chapter 14 for more information about device discovery.

Note — Device objects can be accessed using the equipment navigation tree. See chapter 4 for more information about using the equipment navigation tree.

1 As required, configure the following general NE capabilities:

- **a** Create an object. See Procedure 17-1 for more information.
- **b** Modify an NE configuration. See Procedure 17-2 for more information.
- **c** Create an operational group. See Procedure 17-3 for more information.

- **d** Enable and configure global Cflowd parameters on an NE, and create Cflowd collectors. See Procedure 17-4 for more information.
- **e** Associate a span of control with an NE. See Procedure 17-5 for more information.
- **f** Configure 802.1x authentication on an NE. See Procedure 17-6 for more information.
- **g** Configure active card alarms on an NE. See Procedure 17-7 for more information.
- **h** Configure a TWAMP server. See Procedure 17-8 for more information.
- **i** Enable LLDP on a router. See Procedure 17-9 for more information.
- **j** Create a chassis-level PBB configuration. See Procedure 17-10 for more information.
- **k** Enable frame-based accounting on a 7210 SAS. See Procedure 17-11 for more information.
- **l** Configure the use of vendor-specific ICMP extensions on a 7705 SAR. See Procedure 17-12 for more information.
- **m** Configure the QoS ingress aggregate rates on a 7705 SAR-M. See Procedure 17-13 for more information.
- **n** Start the 9500 MPR external element manager from the 5620 SAM GUI. See Procedure 17-14 for more information.
- **o** Start and stop a Webview or Secure Webview session on an OmniSwitch. See Procedure 17-15 for more information.
- **p** Configure dying gasp on an OS 6250 (Metro) NE. See Procedure 17-16 for more information.
- **q** Configure port and queue statistics on an OS 6250 port. See Procedure 17-17 for more information.
- **r** Configure Ip statistics on an OmniSwitch routing instance. See Procedure 17-18 for more information.

2 As required, configure ring group objects. See Procedures 17-19 and 17-20 for more information.

3 As required, configure circuit emulation functions as follows:

- **a** Configure a CES module. See Procedure 17-21 for more information.
- **b** Configure a CES port. See Procedure 17-22 for more information.
- **c** Configure an unstructured CES interface. See Procedure 17-23 for more information.
- **d** Configure a structured CES interface. See Procedure 17-24 for more information.
- **e** Modify a CES interface. See Procedure 17-25 for more information.

17.5 General device configuration procedures

Use the following procedures to configure devices using the navigation tree.

Procedure 17-1 To create an object

1 Right-click on an empty object in the navigation tree to open the contextual menu.

2 Choose Properties or, when available, Create <*objectname*>.

The properties form or the create form, as applicable, opens.

3 Configure the parameters as required.

Certain object parameters are available for configuration. Configuring these parameters creates the object, however, after the object is created you may need to edit it using properties forms.

Procedure 17-2 To change device properties

1 Right-click on a discovered device in the navigation tree and choose Properties from the contextual menu. The properties form for the device opens.

2 Use the properties form to view or modify the device parameters, as required using the following tabs.

- The General tab displays:
  - the Location, Resource Group ID, Latitude (degrees), and Longitude (degrees) parameters
  - the VPLS Mode parameter if the device is a 7250 SAS-ES or 7250 SAS-ESA
  - an Auto-Provision button if the device is a 7705 SAR; see chapter 29 for information about configuring and deploying configuration profiles to a 7705 SAR
  - the Physical Impedance parameter if the device is a 9500 MPR
- The Polling tab displays polling parameters. See chapter 14 for more information about configuring in-band or out-of-band polling policies.
- The Protocols tab displays the routing protocols configured for the device. See chapter 31 for more information about configuring protocols.
- The Inventory tab contains a filterable list where inventory data for the selected NE can be generated.
- The Globals tab contains multiple tabs. Not all tabs apply to every NE type:
  - Load Balancing—displays the L4 Load Balancing parameter
  - Alarm Management—displays the Alarm Management and Maxiumum Cleared Alarms parameters
  - LACP—displays the LACP System Priority parameter
  - LLDP—displays several LLDP parameters. The parameters displayed vary according to the NE type.

    7210 SAS, 7450 ESS, 7710 SR, 7710 SR, and 7750 SR NEs display the Administrative Status, Transmission Interval (Seconds), Transmission Multiplier, Re-Init Delay (Seconds), Notification Interval (Seconds), Maximum Consecutive Transmissions, Fast Transmission Interval (Seconds), and PDUs in Fast Transmission parameters.

    OmniSwitch NEs display the Transmission Interval (Seconds), Transmission Multiplier, Re-Init Delay (Seconds), Notification Interval (Seconds), and Transmission Delay (Seconds) parameters.
  - Ethernet CFM—displays the MEP ID parameter, which is used for automatic MEP ID assignment during automatic MEP creation, the parameters required to enable SLM, and the MC-LAG Standby Inactive and MC-LAG Prop Hold Time parameters. The latter two parameters must be configured for Ethernet CFM redundancy to be operational. See chapter 80 for more information.
  - PAE—displays the Administrative State parameter
  - TWAMP—displays the parameters required to enable TWAMP on a server
- The ATM tab for a 7750 SR displays ATM OAM loopback parameters for interfaces that host IES and VPRN SAPs. See Procedure 38-34 for more information.
- The Scripts tab displays the script instances and versions that are applied to the device. In addition, you can execute scripts and open the script manager using this tab. See the *5620 SAM Scripts and Templates Developer Guide* for more information.
- The Redundancy tab displays two sub-tabs: BGP Multi-homing and MC Peer. The BGP Multi-homing tab allows you to configure NE-level parameters used in

BGP VPLS multi-homing. See Procedure 71-6 for more information. The MC Peer sub-tab allows you to add or remove MC peers. See chapter 41 for more information.

- The Ring Groups tab displays the ring groups associated with the device. See Procedure 17-19 for more information.
- The Rule-Based Groups tab displays the rule-based groups that support rule-based service-tunnel creation.
- The CFLOWD tab displays global NE Cflowd parameters, and allows the configuration of NE-based Cflowd collectors.
- The Frame Based Accounting tab displays the parameters that enable ingress and egress frame-based accounting for the 7210 SAS-E, Release 1.0 R5 or later, the 7210 SAS-M 24F, Release 1.1 R3 or later, and the 7210 SAS-M 24F 2XFP and 7210 SAS-M 24F 2XFP ETR, Release 1.0 R1 or later.
- The Split Horizon Groups tab lists the SHGs that include the device as a member.
- The LI Configuration Status tab which is viewable by an operator with LI privileges, displays the LI operational configuration. See chapter 34 for more information about configuring LI.
- The QoS tab displays the QoS Classification parameter for a 9500 MPR.
- The VLAN Groups tab displays VLAN group information for a 9500 MPR.
- The System Settings tab displays the Admission Control parameter for a 9500 MPR.
- The Physical Links tab displays physical link information. Only radio link information is displayed for the 9500 MPR. See chapter 5 for more information.
- The NE Time configuration tab displays the Network Element Time parameter for a 9500 MPR.
- The Spans tab displays the spans of control. See chapter 9 for more information about configuring a span of control on an NE.
- The Statistics tab displays statistics available for the device. See the *5620 SAM Statistics Management Guide* for more information.
- The Faults tab displays the network-level alarms for the device.

3 Close the device properties form.

Procedure 17-3 To create an operational group

Multiple objects can be bundled into operational groups. Altering the status of the operational group will alter the status of every object contained therein.

1 Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

2 Right-click on an NE in the Equipment view and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab button.

4 Click on the Service tab button.

5 Click on the Operational Group tab button.

6 Click on the Create... button. The Operational Group (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Group Name
- Hold Down Time
- Hold Up Time

8 Click on the OK button. A dialog box appears.

9 Click on the OK button. The Operational Group (Create) form closes and the Network Element form reappears with the new operational group in the list.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Network Element form closes.

Procedure 17-4 To enable and configure global Cflowd on an NE

Perform this procedure to enable Cflowd and configure global Cflowd parameters on an NE. You can also configure Cflowd sampling for AA flows. See chapter 77 for information about configuring Cflowd collectors for AA applications groups.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE where you want to configure Cflowd and select Properties from the contextual menu. The NE properties form opens.

3 Click on the CFLOWD tab button. The General tab is displayed.

4 Set the CFLOWD State parameter to Enabled. The form displays additional parameters.

5 Configure the remaining parameters:

- Active Time-out (minutes)
- In-Active Time-out (seconds)
- Cache Size
- Sample Rate
- Over Flow (percent)
- Administrative State
- Template Re-transmit (seconds)

6 Click on the Collector tab button.

7 Perform the following steps to add a collector.

i Click on the Create button. The Cflowd Collector Configuration (Create) form opens.

ii Configure the parameters:

- Host Address
- Port Number
- Description
- Version
- Aggregation Type
- Autonomous System
- Template Type

The Aggregation Type parameter is configurable when the Version parameter is set to version-8.

The Autonomous System parameter is configurable when the Version parameter is set to version-5 or version-8.

The Template Type parameter is configurable when the Version parameter is set to version-9.

iii Click on the OK button. The CFLOWD Collector Configuration (Create) form closes and a dialog box appears.

iv Click on the OK button. The collector is listed on the NE properties form.

8 Repeat step 7 to add another collector, if required.

Note — A global NE Cflowd configuration can contain a maximum of five collectors.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The NE properties form closes.

Procedure 17-5 To add a span of control to an NE

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on a discovered device in the navigation tree and choose Properties from the contextual menu. The properties form for the device opens.

3 Click on the Spans tab button.

4 Click on the Add button. The Select Span(s) - Network Element form opens with a list of available spans.

5 Choose one or more spans to apply to the NE.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Select Span(s) - Network Element form closes.

Procedure 17-6 To enable or disable 802.1X

You can view the status of 802.1X authentication on a device in a managed network.

Note — Before you can create an 802.1X policy, 802.1X must be enabled on the device. Before you can configure 802.1X on an Ethernet access port, 802.1X must be enabled on the device and an 802.1X policy must be created and distributed to the device.

1 Enable 802.1X on a managed device:

- i Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
- ii Right-click on the managed device where you want to enable or disable 802.1X and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
- iii Click on the Globals tab button. The Load Balancing tab opens.
- iv Click on the PAE tab button.
- v Set the Administrative State parameter to Up.
- vi Click on the OK button. The Network Element (Edit) form closes.
- vii Repeat step 1 for each device for which you want to enable 802.1X.

  To create and distribute 802.1X policies to the devices that use 802.1X, see chapter 54.

  To configure 802.1X on Ethernet access ports, see Procedure 20-1 in chapter 20.

2 To disable 802.1X on a managed device, repeat step 1 but set the Administrative State to Down.

Procedure 17-7 To configure active card alarms on an NE

Use this procedure to configure a 7450 ESS, 7710 SR, or 7750 SR to view NE alarms through the CLI.

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Right-click on the NE on which you want to configure active card alarms and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
3. Click on the Globals tab button. The Load Balancing tab is displayed.
4. Click on the Alarm Management tab button and configure the parameters:
   - Alarm Management
   - Maxiumum Cleared Alarms
5. Click on the OK button. The Network Element (Edit) form closes.

Procedure 17-8 To configure a TWAMP server

You can enable or disable Two-Way Active Measurement Protocol on a server and view session and connection statistics.

Note — You cannot configure a TWAMP server after an NE upgrade until the NE is fully resynchronized.

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Right-click on the managed device where you want to configure a TWAMP server and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
3. Click on the Globals tab button. The Load Balancing tab is displayed.
4. Click on the TWAMP tab button. The General tab is displayed.
5. Configure the Administrative Status parameter.

Note — To make changes to the following TWAMP server parameters, the Administrative Status parameter must be set to disabled.

6 Configure the parameters:

- Inactivity Timeout (Seconds)
- Maximum Connections
- Maximum Sessions

7 Click on the Prefix tab button.

Note — The objects listed in the table control the behavior of the TWAMP connections that match the defined IP prefix.

8 Perform one of the following:

a Click on the Create button to add a new prefix. The Prefix TWAMP Server (Create) form opens, with the General tab displayed.

b Click on the Search button to display a list of existing prefixes. Select the required item from the list and click the Properties button. The Prefix TWAMP Server (Edit) form opens, with the General tab displayed.

9 Configure the parameters:

- Prefix Address
- Prefix Length
- Description
- Maximum # Connections
- Maximum # Sessions

10 Click on the Statistics tab.

11 Select either SrvConnStats (Assurance) or PrefixSrvStats (Assurance), as required, from the Select Object Type drop-down menu.

12 Select either Past 4 Hour(s) or No Filter, as required, from the filter selector.

13 Click on the Statistics Policies button and select Statistics Policy from the menu. The Statistics Policy form opens, with the General tab displayed.

14 Configure the parameters:

- Retention Time (hours)
- Administrative State
- Threshold Reporting State

15 Click on the Thresholds tab.

16 Perform one of the following, depending on your selection in step 11.

a Configure the PrefixSrvStats (Assurance) threshold parameters:

- Srv Pfx Conn Count Periodic Threshold
- Srv Pfx Conns Rejected Periodic Threshold
- Srv Pfx Session Count Periodic Threshold
- Srv Pfx Test Packets Rx Periodic Threshold
- Srv Pfx Test Packets Tx Periodic Threshold
- Srv Pfx Test Sess Abort Periodic Threshold
- Srv Pfx Test Sess Completed Periodic Threshold
- Srv Pfx Test Sess Rejected Periodic Threshold

b Configure the SrvConnStats (Assurance) threshold parameters:

- Conn Idle Time Periodic Threshold (seconds)
- Conn Session Count Periodic Threshold
- Conn Test Packets Rx Periodic Threshold
- Conn Test Packets Tx Periodic Threshold
- Conn Test Sess Completed Periodic Threshold
- Conn Test Sess Rejected Periodic Threshold

17 Click on the OK button. A confirmation dialog is displayed.

18 Click Yes. The Statistics Policy form closes.

19 Click on the OK button. The Prefix TWAMP Server (Create) form closes.

20 To view TWAMP statistics on a server:

i Perform steps 1 to 4 above.

ii Click on the Prefix tab button.

iii Click on the Search button to display a list of existing prefixes. Select the required item from the list and click the Properties button. The Prefix TWAMP Server (Edit) form opens, with the General tab displayed.

iv Select either SrvConnStats (Assurance) or PrefixSrvStats (Assurance), as required, from the Select Object Type drop-down menu.

v Select either Past 4 Hour(s) or No Filter, as required, from the filter selector.

vi Click on the Collect or Collect All button. The system compiles the statistics and displays the available records in the table.

vii Select the required record from the table and click the Properties button. The Statistics Record is displayed.

viii Close the Statistics record form when your are finished.

ix Click on the OK button. The Prefix TWAMP Server (Create) form closes.

21 Close the Network Element (Edit) form.

LLDP

Link Layer Discovery Protocol, or LLDP, is a neighbor-discovery protocol that allows an NE to advertise its identity and capabilities to other NEs attached to the same physical IEEE 801 LAN. LLDP is a global NE function that you can configure from the 5620 SAM equipment navigation tree on NEs that use Ethernet connectivity.

The 5620 SAM supports LLDP configuration on the following devices:

- 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, and 7210 SAS-M 24F 2XFP ETR, Release 3.0 R1 or later
- 7450 ESS
- 7710 SR
- 7750 SR
- OmniSwitch, Release 6.3.1 or later
- OS 6900, Release 7.2.1 or later
- OS 10K, Release 7.1.1 or later

See “LLDP” in section 30.1 for more information about LLDP.

Procedure 17-9 To enable LLDP on a router

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Navigate to the router icon by choosing Routing→Router.

3 Right-click on the router icon and choose Properties. The Network Element (Edit) form opens.

4 Enable LLDP by performing the following steps.

i Click on the Globals tab button.

ii Configure the parameters:

- Administrative Status
- Transmission Interval (Seconds)
- Transmission Multiplier
- Re-Init Delay (Seconds)
- Maximum Consecutive Transmissions
- Fast Transmission Interval (Seconds)
- PDUs in Fast Transmission
- Notification Interval (Seconds)
- Transmission Delay (Seconds)
- Fast Start Repeat Count

The Administrative Status, Maximum Consecutive Transmissions, Fast Transmission Interval (Seconds), and PDUs in Fast Transmission parameters do not apply to the OmniSwitch.

The Transmission Delay (Seconds) and Fast Start Repeat Count parameter only applies to the OmniSwitch.

5 Click on the OK button. A dialog box appears.

6 Confirm the action. The Network Element (Edit) form closes.

7 Configure the applicable router ports to fully enable LLDP, as described in step 37 in Procedure 20-1 and step 13 in Procedure 20-34. See step 2 in Procedure 17-2 for information about how to set global node element attributes, including LLDP.

Procedure 17-10 To create a chassis-level PBB configuration

Perform this procedure to provide the PBB MAC name configuration at the NE level.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE in the Equipment view and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab button.

4 Click on the Service tab button and configure the parameters:

- PBB Source Backbone MAC Address
- MAC Notification Interval (seconds)
- MAC Notification Count

5 Click on the MAC Name tab button and click on the Create button. The PBB MAC Name (Create) form opens with the General tab displayed. Configure the parameters:

- MAC Name
- MAC Address

6 Click on the OK button.

Procedure 17-11 To enable frame-based accounting for QoS policies

Perform this procedure to enable frame-based accounting for QoS policies on a 7210 SAS-E, Release 1.0 R5 or later, the 7210 SAS-M 24F, Release 1.1 R3 or later, or a 7210 SAS-M 24F 2XFP or 7210 SAS-M 24F 2XFP ETR, Release 1.0 or later.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure frame-based accounting and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Frame Based Accounting tab button.

4 Configure the parameters:

- Egress
- Ingress

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 17-12 To enable or disable ICMP extensions on the 7705 SAR

Use this procedure to configure the use of vendor-specific ICMP extensions on the 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR device types.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR where you want to configure ICMP extensions and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the ICMP tab button.

4 Configure the Vendor-Specific ICMP Extensions parameter.

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 17-13 To configure QoS ingress aggregate rates on the 7705 SAR-M/ME

Perform the following procedure to configure QoS access ingress and network ingress aggregate rates on the 7705 SAR-M/ME.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR-M/ME on which you need to configure QoS ingress aggregate rates and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the QoS tab button.

4 Configure the Aggregate Rate parameter in the Access Ingress panel and in the Network Ingress panel.

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 17-14 To start the 9500 MPR external element manager from the 5620 SAM GUI

Perform the following procedure to start the 9500 MPR external element manager, NEtO, from the 5620 SAM GUI.

Warning — When you use the 5620 SAM to manage the 9500 MPR, use of the NEtO external element manager must be restricted to configuring only radio modem card parameters. If you use NEtO to configure any other parameters, services can be affected and can seriously impact network management and 5620 SAM performance.

Prerequisite:

- To be able to launch NEtO, you need to define the NEtO path. See Procedure 13-15 for more information on how to define the path.

1 Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

2 Right-click on a discovered 9500 MPR in the Equipment view and choose External Element Manager from the contextual menu. The NEtO main view screen appears.

See the appropriate 9500 MPR *User Guide* for information about configuring and using the NEtO external element manager.

Procedure 17-15 To start and stop a Webview or Secure Webview session on an OmniSwitch

Perform the following procedure to start and stop a Webview or Secure Webview session on an OmniSwitch.

1 To start a Webview or Secure Webview session:

i Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

ii Right-click on a discovered OmniSwitch in the Equipment view and choose Launch Webview or Launch Secure Webview from the contextual menu. A web browser starts and the Webview or Secure Webview login screen appears.

Note — An alternative method of launching a Webview or Secure Webview session is to right-click on a discovered OmniSwitch in the Equipment view. Select Equipment Window from the contextual menu. The Equipment Window form opens. Select the Launch Webview or Launch Secure Webview button on the form.

iii Enter your user name and password. After a successful login, the Chassis Management Home Page appears.

2 To stop a Webview or Secure Webview session:

i Click on the Log Out text at the top of the Webview or Secure Webview window. A Confirm Log Out dialog box appears.

ii Click on the Log Out button to end the Webview or Secure Webview session.

See the appropriate OmniSwitch *Switch Management Guide* for information about configuring and using Webview or Secure Webview.

Procedure 17-16 To configure Dying Gasp on an OS 6250 (Metro) NE

Note — In order to see the Dying Gasp alarm in the 5620 SAM, the NE must be managed using SNMP V2, with a "public" community string, since this alarm has a pre-defined community string of "public".

1 Use the 5620 SAM navigation tree; perform the following steps.

2 Choose Equipment from the view selector.

3 Right-click on an OS 6250 (Metro) icon.

4 Choose NE Sessions→*option* from the contextual menu

where *option* is Telnet Session or SSH Session

5 Choose Telnet Session.

6 The Telnet Session window opens.

7 See Step 5 of Procedure 13-4 to configure the NE to be managed with a "public" community string using SNMP v2.

Note 1 — If the Backup/Primary power supply fails, a major alarm will be raised. This alarm will be sent only to the first two SNMP stations configured on the NE. “Show snmp station” lists the management station address. SAM ip should be first or second.

Note 2 — The "Loopback 0" address should not be used for the source IP address field on the NE.

Procedure 17-17 To configure port/queue statistics on an OS 6250 port

This procedure provides port/queue statistics on an OS 6250 (Metro) or OS 6250 (SME) NE.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the OS 6250 device where you want to configure port and queue statistics and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Click on the Statistics tab button.

7 In the Select Object Type area, choose Qos Port/Queue Stats (Physical Equipment) from the contextual menu.

8 Click on the Collect button.

9 A statistics record appears on the Physical Port (Edit) form. Select the record.

10 Click on the Properties button. The Statistics Record - QoS Port/Queue Stats form opens.

11 View the read-only port/queue statistics parameter values for the OS 6250 port.

12 Click on the Close button. The Statistics Record - QoS Port/Queue Stats form closes.

13 Close the Physical Port (Edit) form.

Procedure 17-18 To configure Ip statistics on an OmniSwitch routing instance

This procedure provides Ip traffic statistics (received or transmitted) on a routing instance of an OmniSwitch.

1. Choose Routing from the view selector in the navigation tree. The navigation tree displays the Routing view.
2. Right-click on a Routing Instance in the Routing view and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with General tab displayed.
3. Click on the Statistics tab button.
4. In the Select Object Type area, choose Ip Traffic Stats (Received) (Routing Management General) or Ip Traffic Stats (Transmitted) (Routing Management General) from the contextual menu.
5. Click on the Collect button.
6. A statistics record appears on the Routing Instance (Edit) form. Select the record.
7. Click on the Properties button. The Statistics Record - IP Stats (Received) or Statistics Record - IP Stats (Transmitted) form opens, depending on which object is selected in Step 4.
8. View the read-only IP statistics parameter values for the OmniSwitch routing instance.
9. Click on the Close button. The Statistics Record - IP Stats (Received) or Statistics Record - IP Stats (Transmitted) form closes.
10. Close the Routing Instance (Edit) form.

17.6 Ring group configuration procedures

Use the following procedures to manage ring groups using the navigation tree.

Procedure 17-19 To create a ring group

You can use the ring group creation function to:

- indicate a VLAN ring topology, for example, by grouping 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices with 7450 ESSs that operate in the same spanning tree or Ethernet ring
- indicate a VPLS ring topology, for example by grouping 7250 SAS-ES and 7250 SAS-ESA devices with 7450 ESS, 7750 SR, and 7710 SR devices
- configure the properties of the ring group to provide VLAN Internet, BTV (MVR), and L2 VPN (TLS) services
- group devices by geographic region

Consider the following before you create a ring group.

- Ensure that the devices are commissioned, as described in chapter 13.
- Ensure that mediation policies are configured to allow CLI access to the managed devices, as described in chapter 14.
- The VLAN ID for 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco devices must be unique in a ring group.
- If you want specific access interfaces to be part of a VLAN service, ensure that the parent device of the interface is a member of the ring group.

1 Choose Ring Group from the view selector in the navigation tree. The navigation tree displays the Ring Group view.

2 Right-click on the Network object and choose Create Ring Group from the contextual menu. The Ring Group (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Group Name
- Description
- Ring Group Type

4 Click on the Apply button.

5 If you set the Ring Group Type parameter to VPLS in step 3, go to step 8.

6 Click on the TLS tab button to configure L2 VPN parameters.

7 Configure the TLS parameters:

- Enabled
- Ethertype
- Jumbo Frame

The Ethertype and Jumbo Frame parameters are configurable when the Enabled parameter is selected.

8 Perform one of the following to add a device to the ring group.

a Perform the following steps to use the current properties form.

i Click on the Group Members tab button.

ii Click on the Create button. The Select Network Elements form opens.

iii Choose one or more NEs and click on the OK button. A dialog box appears.

iv Click on the OK button. The Select Network Elements form closes and the selected devices are listed on the Ring Group (Create) form.

v Click on the OK button. A dialog box appears.

vi Click on the Yes button. The Ring Group (Edit) form closes and the device objects are listed in the navigation tree under the new ring group object.

b Perform the following steps to use the navigation tree.

i Right-click on the device object in the Equipment view of the navigation tree and choose Add To Ring Group from the contextual menu. The Select Group form opens to display a list of ring groups.

ii Choose the new ring group and click on the OK button. The Select Group form closes and the device object is listed under the ring group in the Ring Group view of the navigation tree.

Note — All device types can be added as members of a VLAN ring group. Only devices that support VPLS can be added to a VPLS ring group.

9 To apply a span of control to a ring group, click on the Spans tab button.

i Click on the Add button. The Select Span(s) - Ring Groups form opens with a list of available spans.

ii Choose one or more spans of control to apply to the ring group.

iii Click on the OK button. The Select Span(s)-Ring Group form closes and a dialog box appears.

iv Click on the OK button.

10 To view network-level alarms from a 7250 SAS or other device in a ring group, click on the Faults tab button.

11 Provision VLAN services, as described in chapter 69.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The Ring Group (Create) form closes.

Procedure 17-20 To remove a ring group or ring group device

1 Choose Ring Group from the view selector in the navigation tree. The navigation tree displays the Ring Group view.

2 Navigate to the required ring group object.

3 To remove a device from the ring group, right-click on the device object under the ring group and choose Remove From Ring Group from the contextual menu. The device is removed from the ring group.

4 To remove a ring group:

i Perform step 3 for each device in the ring group to remove all devices from the ring group.

ii Right-click on the Ring Group object and choose Remove Ring Group from the contextual menu. A dialog box appears.

iii Click on the Yes button. The ring group is removed.

Caution — Removing a ring group deletes the VLAN services that are associated with the ring group.

17.7 Circuit emulation configuration procedures

Use the following procedures to manage circuit emulation using the navigation tree.

Caution — Do not use the CLI to manage a CES on the 7250 SAS, Release 1.0 R3 or later. Doing so may result in database inconsistencies between the network element and the 5620 SAM.

Procedure 17-21 To configure a 7250 SAS CES module

Perform this procedure to configure CES on a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA device.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA CES module and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the daughter card slot level and click on a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA daughter card slot object that accommodates a CES module, such as slot 4 or 5. The Daughter Card Slot (Edit) form opens with the General tab displayed.

5 Click on the CES tab button.

6 Configure the parameters:

- Mode
- IP Address
- Gateway IP Address
- Clock Mode
- Mask

7 Click on the OK button. A dialog box appears.

8 Click on the OK button.

Procedure 17-22 To configure a 7250 SAS CES port

Perform this procedure to configure the framing scheme for the attached E1 or T1 line on a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA device.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA CES port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA CES port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Configure the Default VLAN parameter.

7 Click on the States tab button.

8 Configure the Administrative State parameter.

9 Click on the T1/E1 tab button.

10 Configure the parameters:

- Port Framing
- Line Code
- Loopback
- Line Buildout
- Line Length
- Db Loss
- Line Impedance

The Db Loss parameter is configurable when the Line Buildout parameter is set to Long.

11 Click on the OK button. A dialog box appears.

12 Click on the OK button.

Procedure 17-23 To create an unstructured CES interface on a 7250 SAS device

This procedure applies to 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA devices. Perform this procedure to create an unstructured CES interface on a TDM port to extend clear channel services across an Ethernet or MPLS network.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA unstructured CES interface and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level, right-click on a configured 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA CES port and choose Create Interface. The Unstructured Interface (Create) form appears.

5 Configure the Description parameter.

6 Click on the CES tab button.

7 Configure the Interface ID parameter.

8 Click on the OK button. A dialog box appears.

9 Click on the OK button. The unstructured CES interface appears in the navigation tree under the port of the daughter card.

Procedure 17-24 To create a structured CES interface on a 7250 SAS device

This procedure applies to 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA devices. Perform this procedure to configure a structured CES interface to channel multiple DS-0 channels to one or more multiple destinations across an Ethernet or MPLS network.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA structured CES interface and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the daughter card slot level and right-click on a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA daughter card slot object that accommodates a CES module, such as slot 4 or 5.

5 Choose Create CES Channel Group from the contextual menu. The CES Channel Group (Create) form appears with the General tab displayed.

6 Configure the Channel ID parameter.

Note — Channel groups with an ID that is greater than 30 must be created, modified, or deleted using a CLI session due to SNMP limitations on the device. See chapter 15 for more information about starting a CLI session.

7 Click on the Channel Group tab button.

8 Click on the Select button in the Port panel. The Select Port - CES Channel Group form appears.

9 Choose a port from the list and click on the OK button. The Select Port - CES Channel Group form closes and the selection appears in the Name field.

10 Configure the Time Slots panel. For a DS0 group from a T1, choose from 1 to 24. For a DS0 group from an E1, choose from 1 to 31.

11 Click on the OK button. A dialog box appears.

12 Click on the OK button. The structured CES interface appears in the navigation tree under the CES channel group of the daughter card.

Procedure 17-25 To modify a CES interface on a 7250 SAS device

This procedure applies to 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA devices.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7250 SAS, 7250 SAS-ES, or 7250 SAS-ESA CES interface and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the interface level and right-click on a configured CES Interface. The Unstructured Interface (Edit) form opens for a CES interface that is assigned to a TDM port, or the Structured Interface (Edit) form opens for a CES interface that is assigned to a channel group. The General tab is displayed.

5 Configure the Description parameter.

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Click on the CES tab button.

9 Configure the parameters:

- Protocol
- Max Jitter Expected (ms)
- Samples Aggregation
- Destination Port
- Destination IP Address
- Local Port
- Destination MAC Address
- Destination ECID
- Local ECID
- Priority

10 Click on the OK button. A dialog box appears.

11 Click on the OK button.

18 — Logical group object configuration

18.1 Logical group object configuration overview

Logical group objects are children of the device object. They appear below the device object in the navigation tree. The following logical group objects are created automatically in the navigation tree after the device is discovered.

- CCAG
- ISA-AA Group
- ISA-Tunnel Group
- ISA-LNS Group
- ISA-NAT Group
- ISA-Video Group
- LAG
- IGH

Properties forms for logical group objects are accessed using the 5620 SAM navigation tree.

This chapter contains the procedures to configure logical group objects using the navigation tree. See chapter 4 for more information about using the navigation tree.

18.2 Working with CCAG objects

CCAGs are navigation tree objects located below device icons. CCAGs are configured manually using the CCAG object navigation tree menu and subsequent forms. For proper CCAG configuration, a VSM-CCA card must be present in the NE. In the navigation tree, a VSM-CCA card can be opened to show its ports. The ports are indicated by VSM Port x/y/z, which shows port type and the ID of the port.

You must configure the following in the CCAG configuration forms:

- General properties such as CCAG ID, Description, CCA Rate Enabled, CCA Rate, Access Adapt QoS, and Administrative State
- CCAG MDA Members which are compatible ports that can belong to a CCAG.

When you create a CCAG, the 5620 SAM creates virtual paths to be used as interconnections to bind services together. Two unidirectional paths are created: Alpha and Beta. For each path, three virtual ports are created: one for SAP-SAP connections, one for SAP-NET connections, and one for NET-SAP connections. The last two virtual ports are used to bind a service and a network interface together.

A maximum of eight cards can be added to a CCAG, with a maximum of eight CCAGs per NE.

18.3 Working with ISA-AA groups and ISA-AA partitions

ISA-AA groups are created to provide redundancy for application assurance capabilities when multiple ISA-AA MDAs are installed on an NE. ISA-AA redundancy protects against card failure and minimizes service interruption during maintenance or protocol signature upgrades. When you create or delete an ISA-AA group, a default AA group policy is automatically created or deleted under the ISA-AA group.

You must configure the following on the ISA-AA groups configuration form:

- General properties, such as Group Number, Description, Operation Upon Failure, and Administrative State
- ISA-AA Group members
- ISA-AA Group diverted forwarding classes

An ISA-AA group can contain up to seven member ISA-AA MDAs, with up to seven ISA-AA groups per NE. Each group can contain up to seven primary members and one backup member.

ISA-AA groups are supported on the 7750 SR-7, 7750 SR-12, 7450 ESS-6, 7450 ESS-7, 7450 ESS-12, and 7750 MG.

The 5620 SAM supports ISA-AA partitions. Each partition is an object with its own AA policy. You can partition an AA group into AA policy partitions with one partition for each VPN-specific AA service. The partition support VPN-specific custom protocols, applications, application group definitions, policy definitions and reporting. Each partition policy can be divided into multiple application QoS policies using ASOs. Multiple ISA-AA groups are used to scale the number of VPN-specific AA policies.

See chapter 77 for information about ISA-AA partitions, AA groups, and AA policies. See Procedure 18-2 for information about how to create and configure ISA-AA partitions.

18.4 Working with ISA-Tunnel Groups

ISA-Tunnel Groups are created to provide redundancy for IP security tunneling and encryption functions when multiple ISA-IPSEC MDAs are installed on an NE. ISA-IPSEC redundancy protects against card failure and minimizes service interruption during maintenance or protocol signature upgrades.

You must configure the following in the ISA-Tunnel Groups configuration form:

- General properties, such as Group Number, Description, and Administrative State
- ISA-Tunnel group members

Up to two cards can be added to an ISA-Tunnel Group, with up to four ISA-Tunnel groups per NE. Each group can contain one primary and one backup member. One member is the active member.

18.5 Working with ISA-LNS groups

The 5620 SAM supports the creation and configuration of ISA-LNS groups. ISA-LNS groups provide LNS PPP session termination on 7750 SR NEs. You can assign an ISA-LNS group to a tunnel group profile or a tunnel profile. When an operational L2TP tunnel is established, peers that are associated with the ISA-LNS group are automatically created. Session traffic is automatically balanced across the available active ISA broadband application MDAs in the group. You can add ISA broadband application MDAs to an ISA-LNS group, and up to four ISA-LNS groups on each NE. See Procedure 18-7 for information about how to create and configure an ISA-LNS group.

You must configure the following on the ISA-LNS groups configuration form:

- General properties, such as Group Number, Description, and Administrative State
- ISA-LNS Group members

Note — You can configure an ISA broadband application MDA only on an IOM3-XP module in a Release 8.0 or later 7750 SR -7 or 7750 SR-12.

18.6 Working with ISA-NAT groups

An ISA-NAT group provides a redundant NAT function for routing instances using ISA Broadband Applications MDAs. An ISA-NAT group can contain up to six MDAs in a warm redundancy configuration. At least one member MDA must be in the active role for an ISA-NAT group to be operational. See chapter 30 for information about configuring the NAT function on a routing instance. See the NE documentation for more information about NAT deployment.

Note 1 — You can install an ISA-NAT Broadband Applications MDA in an IOM3-XP module.

Note 2 — The same ISA Broadband Applications MDA can belong to an ISA-NAT group and an ISA-LNS group.

Note 3 — ISA-NAT is supported on a Release 8.0 or later 7750 SR-7 or 7750 SR-12 in chassis mode B or higher. See chapter 19 for information about chassis modes.

18.7 Working with ISA-Video groups

ISA-Video groups are created to provide packet buffering and packet processing in support of the IPTV video features.

When configured in the router, video ISAs are logically grouped into video groups. An ISA-Video group allows more than one video ISA to be treated as a single logical entity for a specific application, where the system performs a load-balancing function when it assigns tasks to a member of the group.

ISA-Video groups provide a redundancy mechanism to guard against hardware failure within a group. ISA-Video groups pool the processing capacity of all the group members and increase the application throughput because of the increased packet processing capability of the group.

You must configure the following on the ISA-Video groups configuration form:

- General parameters
- ISA-Video Group members

You can add up to four MDAs to an ISA-Video group, and up to four ISA-Video groups on each NE. All members of an ISA-Video group are primary members.

Note — If the parameter ad Insert server is enabled, only one MDA can be added to an ISA-Video group.

18.8 Working with IGH objects

IGHs are navigation tree objects located below the device icon. IGHs are configured manually using the configuration forms available when you choose Create IGH from the IGH object navigation tree contextual menu.

You create an IGH to group together IP links and POS links so that if a configured number of links go out of service for any reason, the remaining links in the IGH go out of service too. This causes the routing protocols to re-converge to switch from the primary path to an alternate path.

The following requirements and restrictions apply to IGHs.

- IGHs are supported only on network links.
- IGHs are supported only on SONET/TDM interfaces with PPP auto encapsulation.
- A port or channel needs to be bound to a router interface after the member is added to an IGH.
- You can assign a port to only one IGH.

18.9 Working with LAG objects

LAGs are navigation tree objects located below the device icon. LAGs are configured manually using the configuration forms available when you choose Create LAG from the LAG object navigation tree contextual menu.

The following minimum configuration is required to enable LACP.

- Enable LACP at either end of the LAG group.
- Set one end of the LAG group as LACP active.

You must configure the following in the LAG configuration forms:

- General properties, such as LAG description, configured address, encapsulation type, and administrative state
- Link aggregation group parameters, such as port threshold, port threshold action, and dynamic cost
- LACP parameters, such as LACP mode, LACP transmit interval, actor administration key, LACP transmission standby, and LACP selection criteria
- LAG members, which are the compatible ports that can belong to a LAG

Because all ports can have their own MAC address, when ports are part of a LAG, the LAG must have an MAC address.

The port configuration of the first port added to the LAG is used to compare with subsequently added ports. If a discrepancy is found with a newly added port, that port is not added to the LAG.

Up to 16 ports can be added to or removed from a LAG on IOM 3 and IMM cards in chassis mode D. Otherwise, up to only eight ports can be added to or removed from a LAG. All ports added to a LAG must have the same parameter settings.

Only ports belonging to one LAG subgroup are considered eligible members of a LAG and can be selected as active links.

See section 12.22 for OmniSwitch-specific LAG information.

See section 12.19 for 9500 MPR LAG information.

18.10 Workflow to manage logical group objects

The following workflow describes the sequence of high-level tasks required to manage and configure logical group objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 13 for more information about device commissioning. See chapter 14 for more information about device discovery.

Note — Logical group objects can be accessed using the equipment navigation tree. See chapter 4 for more information about using the equipment navigation tree.

1 As required, configure CCAG objects. See Procedure 18-1 for more information.

2 As required, create and configure ISA-AA groups and ISA-AA partitions. See Procedure 18-2 for more information. Additionally, perform the following, as required:

  a Configure QoS on an ISA-AA group. See Procedure 18-3 for more information.

  b Add a subscriber policy override to an ISA-AA group or ISA-AA partition. See Procedure 18-4 for more information.

  c Enable and configure Cflowd on an ISA-AA group and ISA-AA partition. See Procedure 18-5 for more information.

3 As required, configure ISA-Tunnel groups. See Procedure 18-6 for more information.

4 As required, configure ISA-LNS groups. See Procedure 18-7 for more information.

5 As required, create and configure ISA-NAT groups. See Procedure 18-8 for more information. Additionally, perform the following, as required:

   a Configure statistics on an ISA-NAT group. See Procedure 18-9 for more information.

   b Start or stop a NAT address-pool drain operation. See Procedure 18-10 for more information.

6 As required, configure ISA-Video groups. See Procedure 18-11 for more information.

7 As required, configure IGH objects. See Procedure 18-12 for more information.

8 As required, configure LAG objects:

   a Create and configure a LAG. See Procedures 18-13 and 18-14 for more information.

   b Create and configure a LAG on an OmniSwitch. See Procedure 18-15 for more information.

   c Create and configure a dynamic LAG member on an OmniSwitch. See Procedure 18-16 for more information.

   d Configure a Radio LAG or Ethernet LAG on the 9500 MPR. See Procedure 18-17 for more information.

   e Delete a 9500 MPR LAG member. See Procedure 18-18 for more information.

18.11 Logical group object configuration procedures

Use the following procedures to configure NE logical groups using the navigation tree.

Procedure 18-1 To create and configure a CCAG

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a CCAG and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click the CCAGs icon and choose Create CCAG. The CCAG (Create) form opens with the General tab displayed.

5 Configure the parameters:

- CCAG ID
- Description
- CCA Rate Enabled
- CCA Rate (kbps)
- Access Adapt QoS
- Administrative State

6 Click on the CCAG MDA Members tab button to display and configure CCAG MDA members associated with this CCAG.

7 Click on the Create button. The CCAG MDA Member (Create) form opens.

8 Click on the Select button. The Select Member MDA - CCAG MDA Member form opens with a list of available VSM-CCA cards.

9 Choose the MDA to add to this CCAG and click the OK button. The Select Member MDA - CCAG MDA Member form closes and the CCAG MDA Member (Create) form reappears.

10 Click on the OK button. The CCAG MDA Member (Create) form closes.

11 Click on the CCAG Paths tab button. The Alpha and Beta paths are displayed. To modify a path, go to step 12. Otherwise, go to step 25.

12 Choose a path and click on the Properties button. The CCAG Internal Path (Edit) form opens with the General tab displayed.

13 Configure the parameters:

- Path Rate Enabled
- Path Rate (Kb/s)
- Path Rate Option
- Path Weight (%)

14 Click on the Path Cross Connects tab button. This tab displays the cross- connects associated with the path.

15 Choose a cross-connect to be configured and click Edit. The Cross Connect (Edit) form opens with the General tab displayed.

16 Configure the parameters:

- Description
- Configured MAC
- MTU (octets)

17 Click on the States tab button.

18 Configure the Administrative State.

19 Click on the Policies tab button.

20 To specify an egress slope policy other than the default, perform the following steps.

i Click on the Clear button in the Egress Slope Policy panel.

ii Click on the Select button in the Egress Slope Policy panel. The Select Egress Slope Policy form opens.

iii Choose a policy and click on the OK button. The Select Egress Slope Policy form closes and the policy name is displayed on the Cross Connect (Edit) form.

21 Configure the parameters:

- Committed Burst Size (%)
- Committed Burst Size (%)

22 To specify an ingress slope policy other than the default, perform the following steps.

i Click on the Clear button in the Ingress Slope Policy panel.

ii Click on the Select button in the Ingress Slope Policy panel. The Select Ingress Slope Policy form opens.

iii Choose a policy and click on the OK button. The Select Ingress Slope Policy form closes and the policy name is displayed on the Cross Connect (Edit) form.

23 Click on the OK button. The Cross Connect (Edit) form closes and the CCAG Internal Path (Edit) form reappears.

24 Click on the OK button. The CCAG Internal Path (Edit) form closes and the CCAG (Edit) form reappears.

25 Click on the OK button. The CCAG (Edit) form closes.

Procedure 18-2 To create and configure an ISA-AA group and ISA-AA partition

When you create or delete an ISA-AA partition, a default AA group partition policy and a default AA accounting policy are automatically created or deleted under the ISA-AA partition.

Note — An ISA-AA partition provides ISA-AA group functions but only in the context of the created partition. Application ID, policy, and statistics configuration apply only to the partition you created for the ISA-AA group.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to create an ISA-AA group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

Note — You can also create an ISA-AA group or ISA-AA partition from the Manage→ISA Functions→ISA-AA form.

4 Right-click on the ISA-AA Group icon and choose Create ISA-AA Group. The ISA-AA Group (Create) form opens.

5 Configure the parameters:

- Group Number
- Description
- Operation Upon Failure
- Administrative State
- Partitions
- Subscriber Scale
- Overload Cut-Through
- Number of IPv4 Transit Prefix Entries
- Match All HTTP Requests
- HTTP X-Online-Host
- Capacity Cost High Threshold
- Capacity Cost Low Threshold

Note — If there are AA group policies on the ISA-AA group that you are configuring, you cannot modify the Partitions parameter from “Enabled” to “Disabled” or from “Disabled” to “Enabled.” Before you can modify the Partitions parameter, you must delete the AA group policies and the associated SAP dependencies.

6 If you set the Partitions parameter to Enabled, perform the following steps to create and configure an ISA-AA partition.

i Click on the ISA-AA Partitions tab button.

ii Click on the Create button. The ISA-AA Group Partition (Create) form opens.

iii Configure the parameters:

- Partition ID
- Description

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The ISA-AA Group (Edit) form appears with the ISA-AA partition listed.

vi If required, repeat step 6 to create another ISA-AA partition.

7 Specify a traffic forwarding class to divert to the ISA-AA group.

i Click on the ISA-AA Group Diverted FCs tab button.

ii Click on the Create button. The ISA-AA Group Diverted FC (Create) form opens.

iii Configure the Forwarding Class Name parameter.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The ISA-AA Group Diverted FC (Create) form closes.

8 Specify an ISA-AA MDA for the ISA-AA group.

i Click on the ISA-AA Group Members tab button.

ii Click on the Create button. The ISA-AA Group Member (Create) form opens.

iii Configure the ISA-AA MDA Role parameter.

iv Click on the Select button. The Select Member MDA - ISA-AA Group Member form opens with a list of available ISA-AA cards.

v Choose the MDA to add to this ISA-AA Group and click the OK button. The Select Member MDA - ISA-AA Group Member form closes and the ISA-AA MDA Member (Create) form reappears.

vi Click on the OK button. The ISA-AA Group Member (Create) form closes.

Note — The MDA slot number assigned to an AA subscriber or AA SAP on the AA Subscriber or AA SAP Summary form is displayed as Unassigned if the AA subscribers in the configuration file cannot fit after an NE reboot.

9 Perform Procedure 18-3 to specify the QoS parameters for the ISA-AA group.

10 Add a special-study subscriber to the ISA-AA group or ISA-AA group partition.

i Click on the AA Special Study tab button.

ii Click on the Subscribers tab button.

iii Click on the Create button. The AA Special Study Subscriber (Create) form opens.

iv Configure the parameters:

- AA Subscriber Name
- AA Stats Type

v Click on the OK button. The AA Special Study Subscriber (Create) form closes.

11 Add a special-study SAP to the ISA-AA group or ISA-AA partition.

i Click on the AA Special Study tab button.

ii Click on the SAPs tab button.

iii Click on the Add Per-SAP Protocols button to add a SAP for per-protocol monitoring, if required. The Select Per-SAP Protocols form opens. Otherwise, go to step 11 v.

iv Choose a SAP in the list and click on the OK button. The Select Per-SAP Protocols form closes and the SAP is listed on the AA Special Study SAPs tab.

v Click on the Add Per-SAP Applications button to add SAP for per-application monitoring, if required. The Select Per-SAP Applications form opens. Otherwise, go to step 12.

vi Choose a SAP in the list and click on the OK button. The Select Per-SAP Protocols form closes and the SAP is listed on the AA Special Study SAPs tab.

vii Click on the OK button. The AA Special Study Subscriber (Create) form closes.

12 Add AA objects for custom per-SAP or per-subscriber statistics collection.

i Click on the AA Subscriber Stats Objects tab button.

ii Click on the Add Applications button to add an application, if required. The Select Applications form opens.

iii Choose one or more applications in the list and click on the OK button. The Select Applications form closes and the applications are listed on the AA Subscriber Stats Objects tab.

iv Click on the Add Application Groups button to add an application group, if required. The Select Application Groups form opens.

v Choose one or more application groups in the list and click on the OK button. The Select Application Groups form closes and the application groups are listed on the AA Subscriber Stats Objects tab.

vi Click on the Add Protocols button to add a protocol, if required. The Select Protocols form opens.

vii Choose one or more protocols in the list and click on the OK button. The Select Protocols form closes and the protocols are listed on the AA Subscriber Stats Objects tab.

viii Click on the Add Custom Protocols button to add a custom protocol, if required. The Select Custom Protocols form opens.

ix Choose one or more custom protocols in the list and click on the OK button. The Select Custom Protocols form closes and the custom protocols are listed on the AA Subscriber Stats Objects tab.

13 Add special study spoke SDP bindings to the ISA-AA group or ISA-AA partition.

i Click on the AA Special Study tab button.

ii Click on the Spoke SDP Bindings tab button.

iii Click on the Add Per-Spoke SDP Binding Protocols button to add a per-spoke SDP binding protocol, if required. The Select Per-Spoke SDP Binding Protocol form opens.

iv Choose one or more protocols in the list and click on the OK button. The Select Per-Spoke SDP Binding Protocol form closes and the protocols are listed on the AA Special Study Spoke SDP Bindings form.

v Click on the Add Per-Spoke SDP Binding Applications button to add a per-spoke SDP binding application, if required. The Select Per-Spoke SDP Binding Applications form opens.

vi Choose one or more applications in the list and click on the OK button. The Select Per-Spoke SDP Binding Applications form closes and the applications are listed on the AA Special Study Spoke SDP Bindings form.

14 Add a special-study transit subscriber to the ISA-AA group or ISA-AA group partition.

i Click on the AA Special Study tab button.

ii Click on the Transit Subscribers tab button.

iii Click on the Create button. The AA Special Study Transit Subscriber (Create) form opens.

iv Configure the parameters:

- Transit Subscriber Name
- AA Stats Type

v Click on the OK button. The AA Special Study Transit Subscriber (Create) form closes.

15 Perform Procedure 18-4 to add an AA subscriber policy override to the ISA-AA group or ISA-AA partition.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button to apply the changes. The ISA-AA Group (Edit) form closes.

Procedure 18-3 To configure QoS on an ISA-AA group

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Right-click on the device where the desired ISA-AA group is created and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
3. On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.
4. Expand the ISA-AA Groups icon.
5. Right-click on the desired ISA-AA Group and choose Properties. The ISA-AA Group (Edit) form opens.
6. Click on the QoS tab button.
7. Click on the Egress From-Subscriber tab button.
8. Configure the following parameters:

   Note 1 — You must deselect the Default check box before you can use the slider to specify values for the Reserved CBS (%) and the Buffer Utilization High Water Mark parameters.

   Note 2 — The value of the Buffer Utilization High Water Mark parameter must be higher than the value of the Buffer Utilization Low Water Mark parameter.

   - Reserved CBS (%)
   - Buffer Utilization High Water Mark
   - Buffer Utilization Low Water Mark
9. Click on the Select button in the Slope Policy panel. The Select Slope Policy form opens.
10. Choose a policy from the list and click on the OK button. The Select Slope Policy form closes.
11. Click on the Select button in the Network Queue Policy panel. The Select Network Queue Policy form opens.
12. Choose a policy from the list and click on the OK button. The Select Network Queue Policy form closes.
13. Click on the Select button in the Port Scheduler Policy panel. The Select Port Scheduler Policy form opens.
14. Choose a policy from the list and click on the OK button. The Select Port Scheduler Policy form closes.
15. Click on the Egress To-Subscriber tab button.

16 Configure the parameters:

Note 1 — You must deselect the Default check box before you can use the slider to specify values for the Reserved CBS (%) and the Buffer Utilization High Water Mark parameters.

Note 2 — The value of the Buffer Utilization High Water Mark parameter must be higher than the value of the Buffer Utilization Low Water Mark parameter.

- Reserved CBS (%)
- Buffer Utilization High Water Mark
- Buffer Utilization Low Water Mark

17 Click on the Select button in the Slope Policy panel. The Select Slope Policy form opens.

18 Choose a policy from the list and click on the OK button. The Select Slope Policy form closes.

19 Click on the Select button in the Network Queue Policy panel. The Select Network Queue Policy form opens.

20 Choose a policy from the list and click on the OK button. The Select Network Queue Policy form closes.

21 Click on the Select button in the Port Scheduler Policy panel. The Select Port Scheduler Policy form opens.

22 Choose a policy from the list and click on the OK button. The Select Port Scheduler Policy form closes and the ISA-AA Group (Edit) form appears.

23 Click on the OK button. A dialog box appears.

24 Click on the Yes button to apply the changes. The ISA-AA Group (Edit) form closes.

25 Close the Network Element (Edit) form.

Procedure 18-4 To add an AA subscriber policy override to an ISA-AA group or ISA-AA partition

The AA subscriber policy override is rejected if the subscriber does not have an application profile assigned. You can add an AA subscriber policy override to a SAP or Spoke SDP, but not to an ESM subscriber.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where the desired ISA-AA group is created and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the ISA-AA Groups icon.

5 Right-click on the desired ISA-AA Group and choose Properties. The ISA-AA Group (Edit) form opens.

6 Click on the AA Subscriber Policy Overrides tab button.

Note 1 — The AA subscriber policy override is rejected if the subscriber does not have an application profile assigned.

Note 2 — You can add an AA subscriber policy override to a SAP or Spoke SDP, but not to an ESM subscriber.

7 Click on the Create button. The AA Subscriber Policy Override (Create) form opens with the General tab displayed.

8 Configure the AA Subscriber Type parameter.

9 Perform one of the following:

a If you chose SAP, go to step 10.

b If you chose Spoke SDP Binding, go to step 12.

c If you chose Transit, go to step 14.

10 Click on the Select button in the SAP Subscriber panel. The Select SAP Subscriber - AA Subscriber Policy Override form opens.

11 Choose a SAP subscriber from the list and click on the OK button. The Select SAP Subscriber - AA Subscriber Policy Override form closes and the AA Subscriber Policy Override (Create) form refreshes with the SAP subscriber. Go to step 16.

12 Click on the Select button in the Spoke SDP Binding Subscriber panel. The Select Spoke SDP Binding Subscriber - AA Subscriber Policy Override form opens.

13 Choose a Spoke SDP Binding Subscriber in the list and click on the OK button. The Select Spoke SDP Binding Subscriber - AA Subscriber Policy Override form closes and the AA Subscriber Policy Override (Create) form refreshes with the Spoke SDP Binding name. Go to step 16.

14 Click on the Select button in the Transit Subscriber panel. The Select Transit Subscriber - AA Subscriber Policy Override form opens.

15 Choose a transit subscriber from the list and click on the OK button. The Select Transit Subscriber - AA Subscriber Policy Override form closes and the AA Subscriber Policy Override (Create) form refreshes with the transit subscriber.

16 Click on the ASO Characteristics tab button.

17 Click on the Create button. The AA Subscriber Policy Override ASO Characteristic (Create) form opens.

18 Click on the Select button beside the Override ASO Characteristic Name parameter. The Select Application Service Option form opens.

19 Choose an Application Service Option from the list and click on the OK button. The AA Subscriber Policy Override ASO Characteristic form refreshes with the ASO Characteristic Name.

20 Click on the Select button beside the Override ASO Characteristic Value parameter. The Select Application Service Option Characteristic Value form opens.

21 Choose an ASO Characteristic Value from the list and click on the OK button. The AA Subscriber Policy Override ASO Characteristic form refreshes with the ASO Characteristic Value.

22 Click on the OK button. The AA Subscriber Policy Override ASO Characteristic (Create) form closes and the AA Subscriber Policy Override (Create) form appears.

23 Click on the OK button. The AA Subscriber Policy Override (Create) form closes and the ISA-AA Group (Edit) form appears.

24 Click on the OK button. A dialog box appears.

25 Click on the Yes button to apply the changes. The ISA-AA Group (Edit) form closes.

26 Close the Network Element (Edit) form.

Procedure 18-5 To enable and configure Cflowd on an ISA-AA group or ISA-AA partition

Note — Before you perform this procedure, you must first enable global Cflowd on the NE. See Procedure 17-4 in chapter 17 for more information.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device that contains the ISA-AA group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the ISA-AA Group icon and click on the ISA-AA group on which you are configuring Cflowd. The ISA-AA Group (Edit) form opens.

5 If you are configuring Cflowd on an ISA-AA partition click the ISA-AA Partitions tab button. Otherwise go to step 7.

6 Select a partition from the list and click Properties. The ISA-AA Group Partition (Edit) form opens.

7 Click on the CFLOWD tab button. The General tab is displayed.

8 Configure the remaining parameters:

- Sampling Rate
- Volume Administrative State
- TCP Performance: Sample Flow Rate
- TCP Performance: Performance Administrative State
- RTP Performance: Sample Flow Rate
- RTP Performance: Performance Administrative State
- Template Re-transmit
- Administrative State

If you are configuring Cflowd on an ISA-AA partition, only the Volume Administrative State, TCP Performance: Performance Administrative State, and RTP Performance: Performance Administrative State parameters in this list are configurable.

9 If you are configuring Cflowd on an ISA-AA partition go to step 13.

10 Click on the Collector tab button.

11 Perform the following steps to add a collector.

i Click on the Create button. The Cflowd Collector (Create) form opens.

ii Configure the parameters:

- Host Address
- Collector Port
- Description
- Administrative State
- Version

iii Click on the OK button. The CFLOWD Collector (Create) form closes and a dialog box appears.

iv Click on the OK button. The collector is listed on the ISA-AA group properties form.

12 Repeat step 11 to add another collector, if required.

Note — A Cflowd configuration on an ISA-AA group can contain a maximum of two collectors.

13 To add an AA application or AA application group for Cflowd performance monitoring, click on the Performance tab button. Otherwise, go to step 17.

14 Perform the following steps to add one or more applications, if required.

i Click on the Add Applications RTP or Add Applications TCP button. The Select Applications form opens.

ii Choose one or more applications in the list and click on the OK button. The Select Applications form closes, and the applications are listed on the ISA-AA group properties form.

15 Perform the following steps to add one or more application groups, if required.

   i Click on the Add Application Groups RTP or Add Application Groups TCP button. The Select Application Groups form opens.

   ii Choose one or more applications in the list and click on the OK button. The Select Applications form closes, and the applications are listed on the ISA-AA group properties form.

16 If you are configuring Cflowd on an ISA-AA partition, click OK to close the ISA-AA Group Partition (Edit) form.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The NE properties form closes.

Procedure 18-6 To create and configure an ISA-Tunnel group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to create an ISA-Tunnel group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the ISA-Tunnel Group icon and choose Create ISA-Tunnel Group. The ISA-Tunnel Group (Create) form opens.

5 Configure the parameters:

- Group Number
- Description
- Administrative State

6 Click on the Apply button.

7 Click on the ISA Tunnel Group Members tab button.

8 Click on the Create button. The ISA Group Member (Create) form opens.

9 Click on the Select button. The Select Daughter Card - ISA Group Member form opens with a list of available ISA IPsec cards.

10 Choose the MDA to add to this ISA-Tunnel group and click the OK button. The Select Daughter Card - ISA Tunnel Group Member form closes and the ISA Group Member (Create) form reappears.

11 Click on the OK button. The ISA Group Member (Create) form closes.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The Tunnel Group form closes.

14 Repeat steps 4 to 13 to configure the backup ISA-Tunnel group member.

Procedure 18-7 To create and configure an ISA-LNS group

Perform this procedure to create and configure an ISA-LNS group. You can configure an IES or VPRN group interface to terminate LNS PPP sessions. See chapter 73 for information about configuring an IES group interface. See chapter 74 for information about configuring a VPRN group interface.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to create an ISA-LNS group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the ISA-LNS Groups icon and choose Create ISA-LNS Group. The ISA-LNS Group (Create) form opens.

5 Configure the parameters:

- Group Number
- Description
- Administrative State

6 Click on the Apply button. The ISA-LNS Group (Edit) form opens with the General tab displayed.

7 Click on the ISA-LNS Group Members tab button.

8 Click on the Create button. The ISA-LNS Group Member (Create) form opens with the General tab displayed.

Note — You can configure up to six ISA-LNS group members. For each group member, you must choose an ISA Broadband Applications MDA. An ISA Broadband Applications MDA can be configured only on an IOM3-XP module on a 7750 SR.

9 Click on the Select button. The Select Member MDA - ISA-LNS Group Member form opens with a list of available ISA broadband applications cards.

10 Choose the MDA to add to the ISA-LNS Group and click the OK button. The Select Member MDA - ISA-LNS Group Member form closes and the ISA-LNS Group Member (Create) form reappears. The Slot Name field displays your selection.

11 Click on the OK button. The ISA-LNS Group Member (Create) form closes.

12 Repeat steps 4 to 11 to configure another ISA-LNS Group member, if required.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The ISA-LNS Group Member (Create) form closes.

Procedure 18-8 To create and configure an ISA-NAT group

Perform this procedure to create and configure an ISA-NAT group. See chapter 30 for information about configuring the NAT function on a routing instance.

Note — You can create an ISA-NAT group only on a Release 8.0 or later 7750 SR-7 or 7750 SR-12 in chassis mode B or higher. See chapter 16 for information about chassis modes.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to create an ISA-NAT group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the ISA-NAT Groups icon and choose Create ISA-NAT Group. The ISA-NAT Group (Create) form opens.

5 Configure the parameters:

- Group Number
- Description
- Active MDA Limit
- Reservation Count
- Session Watermark High
- Session Watermark Low

6 Click on the Apply button. The ISA-NAT Group (Create) form refreshes with additional tabs, and the form name changes to ISA-NAT Group (Edit).

7 Click on the ISA-NAT Group Members tab button.

8 Click on the Create button. The MDA (Create) form opens.

Note — You can configure up to six ISA-NAT group members. Each group member must be an ISA Broadband Applications MDA.

9 Click on the Select button. The Select Daughter Card form opens.

10 Choose an MDA in the list and click the OK button. The Select Daughter Card form closes, and the MDA (Create) form displays the MDA identifier.

11 Click on the General tab button.

12 Configure the Administrative State parameter.

> **Note —** You can set the Administrative State parameter to Up only when the ISA-NAT group contains at least one member MDA and when the Active MDA Limit parameter is set to a value greater than 0.

13 Click on the OK button. The MDA (Create) form closes and a dialog box appears.

14 Click on the OK button. The ISA-NAT Group (Edit) form lists the member MDA.

15 Repeat steps 8 to 14 to configure another ISA-NAT group member, if required.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The ISA-NAT Group (Edit) form closes.

Procedure 18-9 To configure statistics on an ISA-NAT group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure statistics and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the ISA-NAT Groups icon and click on the ISA-NAT group on which you want to configure statistics. The ISA-NAT Group (Edit) form opens with the General tab displayed.

5 Click on the ISA-NAT Group Members tab button.

6 Click on the Search button. A list of ISA-NAT Group Members is displayed.

7 Select an ISA-NAT group member from the list and click on the Properties button. The ISA-NAT Group Member (Edit) form opens.

8 Click on the Statistics tab button.

9 In the Select Object Type area, choose Network Access Translation ISA Member Stats (Network Address Translation), Network Access Translation ISA Member Usage Stats (Network Address Translation), or Network Access Translation Policy Stats (Network Address Translation) from the contextual menu.

10 Click on the Collect button.

11 A statistics record appears on the ISA-NAT Group Member (Edit) form. Select the record.

12 Click on the Properties button. The Statistics Record form opens.

13 View the read-only statistics parameter values for the ISA-NAT group member.

14 Click on the Close button. The Statistics Record form closes.

15 Close the ISA-NAT Group Member (Edit) form.

16 Close the ISA-NAT Group (Edit) form.

Procedure 18-10 To start or stop a NAT address-pool drain operation

Perform this procedure to control the removal, or draining, of the host sessions associated with a NAT pool address range.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance that has one or more configured NAT pools. The path is Routing→NE→Routing Instance.

3 Right-click on the routing instance and click on the Properties button. The Routing Instance properties form opens.

4 Click on the NAT Configuration tab button.

5 Click on the Search button. A list of NAT configurations is displayed.

6 Choose the required NAT configuration in the list and click on the Properties button. The NAT Configuration (Edit) form opens with the General tab displayed.

7 Click on the NAT Pools tab button.

8 Click on the Search button. A list of address pools is displayed.

9 Choose the required address pool in the list and click on the Properties button. The NAT Pool (Edit) form opens.

Note — You can also select multiple address pools and use the Drain or Stop Drain buttons to control the draining for the selected address pools, as described in subsequent procedure steps.

10 To start a drain operation on the address pool, click on the Drain button. The number of host sessions associated with the address range decreases as sessions close.

11 To stop an active drain operation on the address pool, click on the Stop Drain button. New host sessions are allowed to use the address range.

12 Close the open forms, as required.

Procedure 18-11 To create and configure an ISA-Video group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to create an ISA-Video group and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the ISA-Video Group icon and choose Create ISA-Video Group. The ISA-Video Group (Create) form opens.

5 Configure the parameters:

- Group Number
- Description
- Administrative State
- Local Retransmission Server
- Fast Channel Change Server
- Ad Insert Server
- Reserve Retransmission Bandwidth (Mbps)
- Stream Selection
- Analyzer

6 Click on the Apply button. The form displays four additional tabs.

7 Click on the Video Group Members tab button.

8 Click on the Create button. The Video Group Member (Create) form opens.

9 Click on the Select button. The Select Daughter Card - Video Group Member form opens with a list of available ISA Video cards.

10 Choose the MDA to add to this Video Group and click the OK button. The Select Daughter Card - Video Group Member form closes and the Video Group Member (Create) form reappears. The Slot Name field displays your selection.

11 Click on the OK button. The Video Group Member (Create) form closes.

12 Repeat steps 4 to 11 to configure another ISA-Video Group member, if required.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The ISA-Video Group (Create) form closes.

Procedure 18-12 To create an IGH and add members

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device on which to create an IGH and add members and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the IGH object and choose Create IGH from the contextual menu. The Create IGH form opens.

5 Configure the parameters:

- IGH ID
- Minimum Active Link Threshold
- Administrative State

6 Click on the Ok button. The Create IGH form closes.

7 Expand the IGH object and right-click on the IGH group object. Choose Create IGH Members from the contextual menu. The Create IGH Members form opens.

8 Click on the Select button beside the CLI Name parameter. The Select Port States - IGH Member form opens.

9 Choose a port from the list and click on the Ok button. The Create IGH Members form reappears.

10 Click on the OK button. The Create IGH Members form closes.

11 Repeat steps 9 and 10 to add more members, if required.

18.12 LAG configuration procedures

Use the following procedures to manage LAGs using the navigation tree.

Note — You cannot use the 5620 SAM to manage LAGs on the 7250 SAS.

Procedure 18-13 To create a LAG

Note — This procedure applies to 7210 SAS, 7450 ESS, 7710 SR, 7705 SAR and 7750 SR nodes. See Procedure 18-16 for information about how to configure a LAG on an OmniSwitch. See Procedure 18-17 about how to configure a LAG on a 9500 MPR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a LAG and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the LAGs object and choose Create LAG from the contextual menu. The Create LAG form opens.

5 Configure the parameters:

Note — The parameters that appear, and which can be configured, are dependant on the device type that the LAG is being configured for.

- LAG ID
- Auto-Assign ID
- Port Type
- Description
- Configured Address
- L2Uplink
- Mode
- Encap Type
- Administrative State

If you are creating a LAG for HSMDA, the Port Type parameter must be set to hsmda. The Encap Type must be either Dot1Q or Q in Q. Setting Mode to network creates a network LAG, and setting it to access creates an access LAG.

6 If you are configuring a LAG on a 7210 SAS-D 6F 4T ETR, 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, or 7210 SAS-M 24F 2XFP ETR, you can add the LAG to an SHG. See Procedure 20-16 in chapter 20 for information about creating a 7210 SAS SHG.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - LAG form opens.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group - LAG form closes and the Create LAG form refreshes with the SHG name.

Note 1 — A LAG cannot be added to or deleted from an SHG if it has a SAP configured on it.

Note 2 — A LAG cannot belong to more than one SHG; you must remove all SHGs from the LAG before you can add the LAG to a different SHG.

7 If you are configuring a LAG on a 7210 SAS-D 6F 4T ETR or 7210 SAS-E, go to step 12.

8 Click on the Next button. The Configure LAG Parameters form opens.

9 Configure the parameters:

- Port Threshold
- Port Threshold Action
- Dynamic Cost

10 Click on the Next button.

a If you set the Mode parameter in step 5 to Access, the Configure Access Parameters form opens. Go to step 11.

b If you set the Mode parameter in step 5 to Network, the Configure LACP form opens. Go to step 13.

11 Configure the QoS Adaptation and Enable Per Forwarding Path Ingress Queue parameters.

Note — If you are creating a LAG for HSMDA, the QoS Adaptation parameter must be set to Link, otherwise the LAG will not be created.

12 Click on the Next button. The Configure LACP form opens.

13 Configure the parameters:

Note — The availability of configurable parameters depends on the node type for which the LAG is being configured.

- LACP Enabled
- Standby Signalling
- LACP Mode
- LACP Transmit Interval
- LACP Transmit Standby
- Auto-Generate
- Actor System ID
- Partner System ID
- LACP System ID
- LACP System Priority
- Actor System Priority
- Partner System Priority
- Hold Time (100s of milliseconds)
- Active Sub-Group Selection Criteria
- Slave to Partner

Note 1 — The LACP Enabled parameter must be enabled before you can configure LACP and select a subgroup as an active subgroup.

Note 2 — The LACP Mode, LACP Transmit Interval, Actor Administration Key, LACP System ID, and LACP System Priority parameters are configurable when the LACP Enabled parameter is enabled.

14 Click on the Next button. The Configure LAG Members form opens.

15 Click on the Create button to add network ports to LAGs. The Only show compatible ports form appears.

16 Configure the Show Only Compatible Ports and Class parameters.

17 Click on the Next button. The Select Ports form opens.

18 Choose compatible ports from the list to construct the LAG.

Add ports to the LAG as follows:

- Choose one or more ports—up to two if you are configuring a 7210 SAS-E, and up to four if you are configuring a 7210 SAS-D 6F 4T ETR, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, or 7210 SAS-M 24F 2XFP ETR.
- Click on the Next button. The Specify the Member Properties form opens.

Note 1 — For ports to appear as compatible ports, ensure no SAPs or services are configured on them.

Note 2 — If there are no compatible ports to choose from and you have decided that you want to edit some of the existing ports that are not compatible to be compatible, disable the Show compatible ports only parameter. Click on the Next button. Choose ports to edit from the list and click on the Properties button.

Note 3 — For HSMDAv2 ports in a LAG, you must set the Auto-Negotiate parameter to False or Limited. Refer to Procedure 20-1 in chapter 20 for more information on configuring Ethernet ports.

Note 4 — You must use the same load balance algorithm for the ports associated with the LAG.

19 Configure the parameters:

- Priority
- Sub-Group ID

20 If required, perform step 36 of Procedure 20-1 to add Egress Secondary Shapers to a port member of an HSMDA LAG. The following devices support this function:

- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7450 ESS-6, Release 7.0 R3 or later
- 7450 ESS-7, Release 7.0 R3 or later
- 7450 ESS-12, Release 7.0 R3 or later
- 7750 SR-7, Release 7.0 R3 or later
- 7750 SR-12, Release 7.0 R3 or later

Note 1 — The add/delete/modify functions for Egress Secondary Shapers apply only to the primary port.

Note 2 — There can be a total of 64 egress secondary shapers per MDA, including the default shaper.

Note 3 — The Egress Secondary Shapers on the primary port of the LAG are propagated to each non-primary port member of the LAG, with a maximum 8 ports per LAG. These propagated shapers cannot be deleted.

For adding any new port to the LAG, the user must configure each Egress Secondary Shaper as per the primary port, otherwise the addition of the port is blocked.

Note 4 — When adding a port member to a LAG, the primary port and each selected port (maximum 8 ports) secondary shapers must have the same name and rate.

Ports with Egress Secondary Shapers cannot be added to a configured LAG which do not match the Egress Secondary Shapers of the primary port.

Note 5 — Shapers are not removed from the port when the port is removed from a LAG.

Note 6 — The SAP reference to the Egress Secondary Shapers within a LAG is supported. Only the primary port of the SAP on the LAG is used to determine the list of Egress Secondary Shapers for the SAP.

When port members are removed from the LAG, care must be taken to ensure that the last port member is not removed if the LAG is referenced to a SAP. Shapers must exist on a LAG to be referenced on a SAP. See chapters 64 to 76 for more information.

21 Click on the Finish button. The Specify Member Properties form closes and the Configure LAG Members form reappears. A dialog box appears.

22 Click on the OK button.

23 Click on the Finish button. The Configure LAG Members form closes and the Create LAG form reappears.

24 Click on the Close button.

25 Use the Properties contextual menu to view information about the created LAG or to modify LAG parameters.

- The General tab displays the LAG ID, the LAG description and configured MAC address.
- The Link Aggregation Group tab displays the threshold parameters, cost information, and the primary port in the LAG, along with all the other LAG member ports.
- LAG member ports can be added from the LAG Members tab.
- Statistics, terminations, and fault information is available from the appropriate tabs.

26 Expand the LAG object in the navigation tree to view the created LAG groups. Expand the LAG group object to view the subgroup member ports, the priority, the subgroup ID, and the subgroup mode.

Procedure 18-14 To configure a LAG

Note — This procedure applies to 7210 SAS, 7450 ESS, 7710 SR, 7705 SAR and 7750 SR nodes. See Procedure 18-16 for information about how to configure a LAG on an OmniSwitch. See Procedure 18-17 for information about how to configure a LAG on a 9500 MPR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device that contains the LAG that you want to configure and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the LAGs icon and click on the LAG that you want to configure. The LAG (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Configured Address
- Mode
- OLC State

6 If you are configuring a LAG on a 7210 SAS you can add the LAG to an SHG. See Procedure 20-16 in chapter 20 for information about creating a 7210 SAS SHG.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - LAG form opens.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group - LAG form closes and the Create LAG form refreshes with the SHG name.

Note 1 — A LAG cannot be added to or deleted from an SHG if it has a SAP configured on it.

Note 2 — A LAG cannot belong to more than one SHG; you must remove all SHGs from the LAG before you can add the LAG to a different SHG.

7 If you are configuring a LAG on a 7210 SAS, go to step 12.

8 Click on the Link Aggregation Group tab button.

9 Configure the parameters:

- Port Threshold
- Port Threshold Action
- Dynamic Cost

10 Click on the States tab button.

11 Configure the Administrative State parameter.

12 Click on the Access tab button.

13 Configure the parameters:

- QoS Adaptation
- Enable Per Forwarding Path Ingress Queue

Note — If you are configuring a LAG for HSMDA, the QoS Adaptation parameter must be set to Link.

14 Click on the LACP tab button.

15 Configure the parameters:

- LACP Enabled
- LACP Mode
- LACP Transmit Interval
- LACP Transmit Standby
- Auto-Generate
- Actor System ID
- Partner System ID
- LACP System ID
- LACP System Priority
- Actor System Priority
- Partner System Priority
- Hold Time (100s of milliseconds)
- Active Sub-Group Selection Criteria
- Slave to Partner

The LACP Enabled parameter must be enabled before you can configure LACP and select a subgroup as an active subgroup.

The LACP Mode, LACP Transmit Interval, and Actor Administration Key parameters are configurable when the LACP Enabled parameter is enabled.

16 Click on the Next button. The Configure LAG Members form opens.

17 Click on the LAG Members tab. To add LAG members, perform steps 15 to 23 of Procedure 18-13.

18 If the LAG that you are configuring is in Network mode, the Network Interfaces tab is displayed. Click on the Create button. The Create Network Interface form opens. Perform steps 4 to 49 of Procedure 30-7 in chapter 30 to create a network interface. Otherwise go to step 22.

19 If the LAG that you are configuring is in Access mode or Hybrid mode and has an encapsulation type of dot1q or Q in Q, the MEPs tab is displayed. To add a facility MEP to the LAG, perform the following steps.

Note — Only one facility MEP can be configured on a LAG.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens on the General tab.

iii Click on the Select button to choose a global MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- CCM Messages Enabled
- Description
- CCM Messages Enabled
- Interface Type
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- Facility Fault Notify
- Facility VLAN ID

Note — To enable fault propagation on a facility LAG MEP, Facility Fault Notify must be enabled.

vi If the MD for the MEP has a Name Type of none the Y.1731 Tests tab is configurable; click on the Y.1731 Tests tab button. Otherwise, go to step vii.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the OK button. A dialog box appears.

ix Click on the OK button. The MEP (Create) form closes.

20 To add a facility tunnel MEP to the LAG, perform the following steps.

Note — The LAG that you are configuring must be in Access mode or Hybrid mode and must have an encapsulation type of Q in Q.

i Click on the MEPs tab button.

ii Click on the Create button. The MEP (Create) form opens on the General tab.

iii Click on the Select button to choose a global MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- CCM Messages Enabled
- Description
- CCM Messages Enabled
- Interface Type
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- Facility Fault Notify
- Facility VLAN ID

Note 1 — To enable the fault propagation on a facility tunnel MEP, Facility Fault Notify must be enabled.

Note 2 — To link the facility tunnel status to the SAP, Facility VLAN ID must match the outer encapsulation value of the SAP.

Note 3 — To accept the fault notification from a facility MEP on the site where the SAP is located and on the SAP, Tunnel Fault Management must be set to Accept.

vi If the MD for the MEP has a Name Type of none the Y.1731 Tests tab is configurable; click on the Y.1731 Tests tab button. Otherwise, go to step vii.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the OK button. A dialog box appears.

ix Click on the OK button. The MEP (Create) form closes.

21 To configure Ethernet-CFM redundancy on a facility MEP:

Note 1 — Ethernet-CFM redundancy must be configured on the node. See Procedure 17-2 for information. See chapter 80 for information about Ethernet-CFM redundancy.

Note 2 — The tunnel MEP must be part of an MC-LAG with Ethernet-CFM redundancy configured.

i Click on the MEPs tab button.

ii Click on the Search button. A list of MEPs is displayed.

iii Choose the facility MEP for which you need to configure Ethernet-CFM redundancy and click on the Properties button. The MEP (Edit) form opens.

iv Scroll to the Facility MEPS panel and select the Create Redundant MEP check box.

v Click on the OK button. The MEP (Edit) form closes. A redundant tunnel MEP with the same ID and Operational MAC address is created on the peer LAG. The redundant MEP has the same state as the MC-LAG in which that MEP resides.

22 Click on the OK button. A dialog box appears.

23 Click on the Yes button. The LAG (Edit) form closes.

Procedure 18-15 To create and configure an OmniSwitch LAG

Perform the following procedure to configure a static or dynamic LAG.

Workflow for a static LAG:

- create a static LAG on the local and remote switches
- assign ports to the LAG on the local and remote switches
- create a VLAN for the static LAG on the local and remote switches (optional)

Workflow for a dynamic LAG:

- create a dynamic LAG on the local (actor) and remote (partner) switches
- assign ports with the same actor administrative key (which allows them to be aggregated) to the local and remote LAG
- create a VLAN for the dynamic link aggregation group on the local and remote switch (optional)

Note 1 — You can configure MVRP fixed ports/LAGs, 802.1 Q ports/LAGs, aggregate ports/LAGs, and VLAN Stacking Network ports/LAGs.

Note 2 — When a port is assigned to a LAG member, you cannot modify the port properties using the 5620 SAM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the LAG and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the LAGs icon, right-click on a LAG object and choose Create LAG from the contextual menu. The Create LAG - Define General Properties form opens.

5 Configure the parameters:

- LAG ID
- Auto-Assign ID
- Mode
- Administrative State
- Automatic VLAN Binding

The Automatic VLAN Binding parameter can only be configured for network LAGs.

6 Click on the Next button. The Create LAG - Configure LAG Parameters form opens.

7 Configure the parameters:

- Size
- Name
- Type

8 Perform one of the following:

a If you set the Type parameter to Static, go to step 15.

b If you set the Type parameter to Dynamic, go to step 9.

9 Click on the Next button. The Create LAG - Configure LACP form opens.

10 Configure the parameters:

- Actor Administration Key
- Actor System ID
- Partner System ID
- Actor System Priority
- Partner System Priority
- Partner Administration Key

11 Click on the Finish button. The Create LAG - Wizard Completed form opens.

12 Enable the View the newly created interface check box if you need to view the LAG properties.

13 Click on the Close button. The Create LAG form closes.

See Procedure 18-16 in this section for information about adding members to a dynamic LAG.

14 Go to step 25.

15 Click on the Next button. The Create LAG - Configure LAG Members form opens.

16 Click on the Create button to add ports to the LAG. The Create LAG Member - Only show compatible ports form appears.

17 Configure the Show Only Compatible Ports and Class parameters.

18 Click on the Next button. The Create LAG Member - Select Ports form opens.

19 Click on the Search button to display a list of compatible ports. Choose ports from the list to construct the LAG.

Add ports to the LAG as follows:

- Choose up to the maximum number of ports you require from the list of ports. You can select more than one port at a time from the list.
- Click on the Next button. The Specify the Member Properties form opens.

Note 1 — If there are no compatible ports to choose from and you have decided that you want to edit some of the existing ports that are not compatible to be compatible, disable the Show compatible ports only parameter. Click on the Next button. Choose ports to edit from the list and click on the Properties button.

Note 2 — Mobile, UNI, and NNI ports cannot be members of a LAG.

Note 3 — Only network ports can be members of a network LAG and only access ports can be members of an access LAG.

20 Click on the Finish button. A dialog box appears.

21 Click on the OK button. The Create LAG - Configure LAG Members form displays the LAG members.

22 Click on the Finish button. The Create LAG - Wizard Completed form opens.

23 Enable the View the newly created interface check box if you need to view the LAG properties.

24 Click on the Close button to close the form.

25 Use the Properties contextual menu to view information about the created LAG or to modify LAG parameters.

- The General tab displays the LAG ID and LAG description.
- The Link Aggregation Group tab displays the primary port in the LAG along with all the other LAG member ports.
- LACP parameters can be modified from the LACP tab.
- LAG member ports can be added from the LAG Members tab.
- A UNI policy can be applied to a LAG used as a SAP in a stacked VLAN from the Policies tab.
- An MVRP configuration and VLAN restriction can be applied to a LAG from the MVRP tab. If a port is a LAG member, you cannot modify parameters on the MVRP general tab on that physical port.
- Statistics, network interfaces, and fault information is available from the appropriate tabs.

26 Expand the LAG object in the navigation tree to view the created LAG groups and the unassigned dynamic LAG members group. Expand the LAG group object to view the subgroup member ports, the priority, and the LACP state. Expand the Unassigned Dynamic LAG Members group object to view dynamic LAG members that have not been assigned to a dynamic LAG group.

Procedure 18-16 To create and configure OmniSwitch dynamic LAG members

Perform the following procedure to add members to a dynamic LAG and modify existing dynamic LAG members.

Note 1 — LAG members are not added during the creation of the dynamic LAG, as they are with static LAGs. When a new dynamic LAG member is created it is placed into the Unassigned Dynamic LAG Members object. The new dynamic LAG members remain under the Unassigned Dynamic LAG Members object until the system identifies a LAG with matching properties. When an unassigned LAG member joins a LAG, the member is removed from the Unassigned Dynamic LAG Members object and added to the appropriate LAG object.

Note 2 — When a port is assigned to a LAG member, you cannot modify the port properties using the 5620 SAM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the LAG members and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4. Right-click on the Unassigned Dynamic LAG Members object and choose Create LAG Members from the contextual menu. The Create LAG Member - Only show compatible ports form appears.

5. Configure the Show Only Compatible Ports and Class parameters.

6. Click on the Next button. The Create LAG Member - Select Ports form opens.

7. Click on the Search button to display a list of compatible ports. Choose ports from the list to construct the LAG.

   Add ports to the LAG as follows:

   - Choose up to the maximum number of ports you require from the list of ports. You can select more than one port at a time from the list.
   - Click on the Next button. The Specify the Member Properties form opens.

   Note 1 — If there are no compatible ports to choose from and you have decided that you want to edit some of the existing ports that are not compatible to be compatible, disable the Show compatible ports only parameter. Click on the Next button. Choose ports to edit from the list and click on the Properties button.

   Note 2 — For all ports in an LAG, you must disable auto-negotiation, configure the same speed, and set the ports to full duplex. Mobile ports cannot be part of a LAG.

8. Configure the parameters:

   - Priority
   - System Id
   - System Priority
   - Admin Key
   - Admin State

9. Click on the Finish button. The Create LAG - Wizard Completed form opens.

10. Enable the View the newly created interface check box if you need to view the LAG properties.

11. Click on the Close button to close the form.

12. If you need to modify a dynamic LAG member, go to step 13.

13. Right click on a LAG member and choose Properties from the contextual menu.

14. The LAG Member (edit) form opens on the General tab.

15. Configure the Priority parameter in the LAG Member panel, if required.

16. Configure parameters in the Actor panel, if required.

   - System Id
   - System Priority
   - Admin Key
   - Admin State

17 Configure parameters in the Partner panel, if required.

- Admin Key
- Admin System Id
- Admin Port
- Admin System Priority
- Admin Port Priority
- Admin State

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button to save your changes and close the form.

20 Click on the Close button to close the form.

Procedure 18-17 To configure a Radio LAG or Ethernet LAG on the 9500 MPR

Note — You cannot configure Radio LAG or Ethernet LAG on the 9500 MPR, Release 3.1 ANSI and ETSI. Only service creation and discovery are supported for Radio LAG Release 3.1.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the LAG and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the LAGs icon, right-click on a LAG object and choose Create LAG from the contextual menu. The Create LAG - Define General Properties form opens.

5 Configure the parameters:

- LAG ID
- Auto-Assign ID

6 Click on the Next button. The Create LAG - Configure LAG Parameters form opens.

7 Configure the parameters:

- Name
- Lag Aggregation Type
    - Radio L1
    - Radio L2
    - Ethernet
- Size

8 Click on the Next button. The Create LAG - Configure LACP form opens.

9 Configure the parameters:

- Actor Administration Key
- LACP
    - Active
    - Passive
    - Disabled
- Timeout
    - Short
    - Long

Note — LACP and Timeout are applicable only to Ethernet Lag Aggregation Type.

10 Click on the Next button. The Create LAG - Configure LAG Members form opens.

11 Click on the Create button to add ports to the LAG. The Create LAG Member - Only show compatible ports form appears.

12 The Show Only Compatible Ports parameters does not apply to the 9500 MPR. The Class parameters depends on the Lag Aggregation Type selected in step 7.

13 Click on the Next button. The Create LAG Member - Select Ports form opens.

14 Click on the Search button to display a list of compatible ports. Choose ports from the list to construct the LAG.

Note 1 — Mixed ports cannot be associated with a LAG, for example, MPT-HC, MPT-MC, MPT-HL or ODU. Before you associate a Radio port with a LAG the PPP-RF must be disabled.

Note 2 — The Radio LAG mode is always in network mode. By default, Ethernet LAG is in access mode and can be used as a SAP. If a physical link is created using Ethernet LAGs as the endpoints, the mode automatically changes from access to network mode.

If a physical link is created between MPR and non-MPR LAG ports, and the MPR LAG port must be used as a SAP, the user must change the mode to access. See step 20 for more information about how to manually change the mode.

Note 3 — An Ethernet member port with a physical link or protection cannot be added to a LAG. To add the port you must first delete the physical link and you can then add the port to the LAG. See chapter 5 for more information about how to delete a physical link.

Note 4 — For Fast Ethernet LAG, electrical ports cannot be grouped with the optical ports.

Add ports to the LAG as follows:

- Choose up to the maximum number of ports you require from the list of ports. You can select more than one port at a time from the list.

15 Click on the Finish button. A dialog box appears.

16 Click on the OK button. The Create LAG - Configure LAG Members form displays the LAG members.

17 Click on the Finish button. The Create LAG - Wizard Completed form opens.

18 Enable the View the newly created interface check box if you need to view the LAG properties.

19 Click on the Close button to close the form.

20 Use the LAG Properties contextual menu to view information about the created LAG or to modify LAG parameters. The LAG [Edit] form is displayed.

- The General tab displays the LAG ID and LAG description. For Radio LAG and Ethernet LAG select one the following Mode.
  - Access (Ethernet LAG only)
  - Network (Radio LAG only)
- The Link Aggregation Group tab displays the number of ports in the LAG along with all the other LAG member ports and the Lag Aggregation Type.
  - For Ethernet LAG, select Hash and Size from the drop-down menu.
  - For Radio LAG, select Size from the drop-down menu.
- LACP parameters can be modified from the LACP tab.
- LAG member ports can be added from the LAG Members tab. See steps 10 to 17.
- VLAN port configuration parameters can be modified from the VLAN Port Configuration tab.
- LAG state cannot be Down if a service is associated with the LAG. The Administrative State can be configured to Up in the States tab button, only if a minimum of one port is associated with a LAG.

21 Expand the LAG object in the navigation tree to view the created LAG groups and the unassigned dynamic LAG members group. Expand the LAG group object to view the subgroup member ports, the priority, and the LACP state. Expand the Unassigned Dynamic LAG Members group object to view dynamic LAG members that have not been assigned to a dynamic LAG group.

Procedure 18-18 To delete a 9500 MPR LAG

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Select the device where you want to delete the LAG.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the LAGs icon, right-click on a LAG object and choose Delete from the contextual menu. A dialog box is displayed.

5 Select Yes, to complete the deletion.

Note — A LAG can be deleted only if a member is not associated with the LAG. To delete the last member from a LAG, the Administrative State of the LAG must be set to Down. A LAG can be shutdown only when the LAG is not a part of any service or physical link.

Creating a 9500 MPR service over a VLAN path for Radio and Ethernet ports and LAGs

See Chapter 5 for more information about how to create a physical link between Ethernet LAGs.

See Chapter 70 to create a 9500 MPR Cpipe service and create a VLAN path. See Procedure 20-13 in chapter 20 to associate the Ethernet and Radio LAG service with a TDM port.

19 — Shelf object configuration

19.1 Shelf object configuration overview

In the equipment navigation tree, shelf objects are children of device objects. They appear below logical group objects in the navigation tree. Card slot objects are children of shelf objects, and as such appear below the shelf object in the navigation tree. Daughter card slot objects are created in the navigation tree as children of the card slot object, after the card slot object is configured. APS bundle objects appear below the shelf object and Bundle objects appear below daughter card objects that are configured as channelized MDAs.

This chapter contains the procedures to configure shelf, card slot, daughter card slot, and bundle objects using the navigation tree. See chapter 4 for more information about using the navigation tree. See chapter 40 for more information about APS bundles.

19.2 Working with shelf objects

Shelf objects represent the hardware that is configured on a shelf. When you choose the shelf object in the navigation tree and click on Properties in the contextual menu, you can view the states and conditions of the shelf including:

- general information
- fan tray state and speed
- power supply tray statuses
- LED statuses
- card slots
- hardware environment information
- timing
- statistics
- dry contacts
- faults
- port segregation
- software control module
- software bank information
- cross connects

The Display tab displays a graphical representation of the device's shelf and its equipment components, such as the empty card slots and the cards that are installed on the device. You can double-click on an object under this tab to open its Properties configuration form. Right-click on the object and you have full access to the contextual menus for the object and any child objects, for example the ports of a card (dynamic graphical representation only).

Note — When you display a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device, the element manager for the device launches. The 5620 SAM permits users to launch the Telco element manager from the client GUI. This functionality is provided as a convenience to users, and is not part of the 5620 SAM. Contact Telco Systems for more information or support. See the appropriate device user guide for more information.

See Procedure 20-26 in chapter 20 for information on configuring 9500 MPR port segregation.

Chassis modes

The chassis mode of a device indicates the minimum IOM or IMM card type that is initialized by the device and determines the scaling numbers and features that are available to the system. The chassis mode can be configured on the following device types:

- 7450 ESS-4, 7450 ESS-6, 7450 ESS-7, and 7450 ESS-12
- 7450 ESS-6v
- 7750 SR-7 and 7750 SR-12

See the appropriate device Release Notice for scaling information.

Tables 19-1 and 19-2 list the chassis modes that you can configure on each IOM and IMM card type for the supported devices.

Table 19-1 Chassis modes and 7750 SR IOM and IMM card compatibility

Card	Chassis mode	NE release
2 x 10-Gig MDA IOM	A	All supported releases
2 x 10-Gig MDA IOM Card, B	A and B	
2 x 10-Gig MDA IOM 2	A, B, and C	
2 x XP MDA IOM 3	A, B, C, and D	
2 x XP MDA IOM 3, B	A, B, C, and D	9.0 R6 or later
4-Port 10 GE XFP IMM	A, B, C, and D	All supported releases
8-Port 10 GE XFP IMM		
48-Port GIGE SFP IMM		
48-Port GIGE SFP IMM, B		9.0 R6 or later
48-Port GIGE TX IMM		All supported releases
48-Port GIGE TX IMM, B		9.0 R6 or later
12-Port 10GE SFP IMM		8.0 R5 or later
1-Port 100GE CFM IMM		
3-Port 40GE QSFP possibly oversubscribed IMM		9.0 R4 or later

Table 19-2 Chassis modes and 7450 ESS IOM card compatibility

Card	Chassis mode	7450 ESS-7, 7450 ESS-12, and 7450 ESS-4	7450 ESS-6	7450 ESS-6v
2 x 10-Gig MDA IOM	A	All supported releases	All supported releases	All supported releases
2 x 10-Gig MDA IOM Card, B	A and B			
2 x 10-Gig MDA Oversubscribed IOM	A and B			
2 x XP MDA IOM 3	A, B, and B	All supported releases	All supported releases	All supported releases
2 x XP MDA IOM 3, B	A, B, C, and D	9.0 R6 or later	9.0 R6 or later	9.0 R6 or later
48-Port GIGE SFP IMM		All supported releases	All supported releases	All supported releases
48-Port GIGE SFP IMM, B		9.0 R6 or later	9.0 R6 or later	9.0 R6 or later
48-Port GIGE TX IMM		All supported releases	All supported releases	All supported releases
48-Port GIGE TX IMM, B		9.0 R6 or later	9.0 R6 or later	9.0 R6 or later
3-Port 40GE QSFP possibly oversubscribed IMM		9.0 R4 or later	—	—

Timing synchronization

Timing synchronization parameters can be configured on 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, 7750 SR-c4, and 7750 SR-c12 shelves that contain the following daughter cards:

- 10 Gigabit Ethernet with 2- and 4-port configurations
- 10/100/1000 Ethernet SFP with 20 ports
- 10 Gigabit Ethernet XFP with 4-, 8-, and 48-port configurations
- 10-port Gigabit Ethernet SFP HA
- 16 x Channelized DS1/E1 ASAP
- 16 x Channelized DS1/E1 ASAP v2
- 8-port Ethernet
- 8-port Ethernet v2
- 4-port OC3/STM1 ASAP SFP

See Procedure 19-5 for more information about configuring timing synchronization.

IEEE 1588 PTP clock

The IEEE 1588 PTP clock allows you to synchronize NE times with up to three reference points. The 5620 SAM supports IEEE 1588 PTP clocks on the 7450 ESS, 7705 SAR, 7705 SAR-M/ME, 7710 SR, 7750 SR, 7750 SR-c4, and 7750 SR-c12. Each NE can be configured with an ordinary master, ordinary slave or boundary clock. The 7705 SAR-M/ME can also be configured with a transparent clock.

19.3 Working with card and card slot objects

When you click on the plus sign beside the shelf object, all the card slots contained in the shelf appear in the navigation tree. They can appear as empty card slots when a card is not provisioned for the slot. Card slot objects for the OS 6250, OS 6400, OS 6850, OS 6850E, and OS 6855 appear automatically when a physical device exists because the entire device is represented by a card slot object, because there are no daughter cards associated with these devices. Card slots can be configured with CMM or Ethernet card types for the OS 9600, OS 9700, OS 9800, OS 9700E, and OS 9800E devices, but there are no daughter cards associated with these devices.

When the 5620 SAM discovers a 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, or 7210 SAS-X 24F 2XFP, or 7705 SAR-F, the integrated IOM and daughter card objects appear automatically in the navigation tree.

Card slot objects for the 9500 MPR can be configured for plug-in cards; there are no daughter cards associated with this device.

Choose Configure Card from the contextual menu of the object and assign a supported card type for the slot. The Assigned Card Type parameter lists the card types can be assigned to the card slots.

Some card types can be pre-provisioned in a slot before the card is installed in the chassis. A card and daughter card must be provisioned before a port can be configured.

When a card is first configured, the administrative state can be down. The resource is not operationally up until the card is equipped and the administrative state is up. A card can only be provisioned in a slot that is vacant, and no other card can be provisioned (configured) for that specific slot.

To reconfigure a slot position, delete the card currently in the slot and configure the new card type added to the slot. A card can only be provisioned in a slot when the card type is allowed in the slot.

Note — You can also reconfigure a slot position by changing the chassis mode. The chassis mode determines the minimum card requirements. See section 19.2 for more information about chassis modes.

For example, if a 2 x 10-Gig MDA IOM 2 card is installed in the chassis that is running in chassis mode B, the card behaves as a 2 x 10-Gig MDA IOM Card, B. You can upgrade the chassis mode to C to make the IOM card behave as a 2 x 10-Gig MDA IOM 2 card.

Card provisioning and chassis modes

The behavior of the installed card depends on the chassis mode that has been configured on the device. Table 19-3 describes the behavior of the provisioned (configured) card types and installed cards in each chassis mode.

Table 19-3 Behavior of installed IOM cards

Provisioned card type	Installed card type	Behavior
2 x 10-Gig MDA IOM	2 x 10-Gig MDA IOM	The IOM card appears and behaves at the scaling limits of the 2 x 10-Gig MDA IOM.
	2 x 10-Gig MDA IOM Card, B	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM. The 2 x 10-Gig MDA IOM Card, B is fully backward-compatible with the 10-Gig MDA IOM.
	2 x 10-Gig MDA IOM 2	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM. The 2 x 10-Gig MDA IOM 2 is fully backward-compatible with the 10-Gig MDA IOM.
	2 x XP MDA IOM 3 (1)	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM. The 2 x XP MDA IOM is fully backward-compatible with the 10-Gig MDA IOM.
2 x 10-Gig MDA IOM Card, B	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card appears and behaves at the scaling limits of the 2 x 10-Gig MDA IOM Card, B.
	2 x 10-Gig MDA IOM 2	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM Card, B. The 2 x 10-Gig MDA IOM 2 is fully backward-compatible with the 10-Gig MDA IOM Card, B.
	2 x XP MDA IOM 3 (1)	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM Card, B. The 2 x XP MDA IOM 3 is fully backward-compatible with the 10-Gig MDA IOM Card, B.
2 x 10-Gig MDA IOM 2	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM 2	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C and D
	2 x XP MDA IOM 3 (1)	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C and D

(1 of 2)

Provisioned card type	Installed card type	Behavior
2 x XP MDA IOM 3 card [(1)]	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM 2	The IOM card fails because the minimum card requirements are not met.
	2 x XP MDA IOM 3 [(1)]	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C • 2 x XP MDA IOM 3 in chassis mode D. With mixed mode enabled for 7750 SR, only the IPv6 features of the IOM3 card are enabled, but no other IOM3 features are available.
2 x XP MDA IOM 3, B card [(1)]	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM 2	The IOM card fails because the minimum card requirements are not met.
	2 x XP MDA IOM 3 [(1)]	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C • 2 x XP MDA IOM 3 in chassis mode D. With mixed mode enabled for 7750 SR, only the IPv6 features of the IOM3 card are enabled, but no other IOM3 features are available.

(2 of 2)

Note

(1) Also applies to any IMM

19.4 Working with daughter card objects

After the card is created in the card slot you can create and configure MDAs, also known as daughter card objects, in the daughter card slot that appears when you click on the plus sign beside the card object. The daughter card slots in the card appear in the navigation tree. They appear as empty daughter card slots when a daughter card is not provisioned for the slot. When a daughter card is provisioned for the slot, it is identified.

See the appropriate device section in chapter 12 for device-specific daughter card information.

Each 5620 SAM license key allows a specific number of MDA cards of each node type to be managed. You can purchase additional MDA management capacity as required. MDA cards fall into two licensing categories: premium and standard. Generally, all non high performance MDA cards are considered standard. All IMM, High Speed MDA (HSMDA) and Extended Performance (XP) MDA cards are considered premium.

Note 1 — When the 5620 SAM has discovered the number of premium MDAs allowed by the license key, the 5620 SAM can no longer discover 7210 SAS-M, 7210 SAS-X, 7710 SR, and 7450 ESS devices.

Note 2 — Upgrading the 5620 SAM to a new major release may require adjustment to the license keys to avoid license keys warnings with exception MDA cards. See the appropriate *5620 SAM Release Description* for information about which exception MDA cards have been downgraded.

IMM daughter cards

The IMM card integrates IOM 3 and high bandwidth MDA functionality on a single card that fits into existing IOM slots. When you configure the IMM the integrated MDAs are automatically configured. The 5620 SAM equipment tree displays the IMM with two daughter cards, each having half of the total number of ports supported by the IMM.

Each daughter card object contains a number of ports that are specific to the type of service required. The port objects are created automatically under the daughter card but they must be configured based on the function served by the port; for example, as an access interface for a VPRN service.

You can associate policies to daughter cards. Network buffer policies are used to create and edit QoS buffer pool resources on egress network ports, channels, and ingress ports. Ingress and egress network ports and channels have a dedicated buffer pool for egress queuing. The ingress and egress network traffic is handled by a buffer pool at the ingress and a buffer pool at the egress.

You can also configure multicast path management on an IMM daughter card. See chapter 49 for more information.

MDA modes for the 7705 SAR

The 5620 SAM allows you to configure the MDA mode of some MDA types on the 7705 SAR. The MDA mode on a channelized ASAP determines the capabilities that are available to the MDA. The MDA mode on an XMDA determines the number of ports that are available to the MDA. See the MDA Mode parameter description for more information.

19.5 Working with bundle objects

Bundle objects can be configured as multilink PPP, IMA group, or FR group bundles. Multilink PPP, IMA group, and FR group bundles appear as Bundle objects under the daughter card object if the daughter card has been configured as a channelized MDA.

APS Bundle objects appear in the navigation tree as children of the shelf object. APS Bundle objects are configured to protect multilink PPP and IMA bundles on channelized ASAP MDAs. See chapter 40 for more information on APS and APS bundles.

Multilink PPP bundles

You can create multilink PPP bundles to:

- bundle DS0 channels together to be used as a SAP
- provide a mechanism to distribute data across multiple links to achieve higher bandwidth

The following general rules apply to multilink bundles.

- Table 19-4 lists the maximum number of multilink bundles that can be created on each MDA.
- DS0 channels can be aggregated on a single MDA only.
- Up to 8 members can be added to a bundle.
- The Encap Type parameter of a member cannot be set to FR.
- A DS0 channel can host only one SAP.
- If a channel is being used as a SAP, it cannot be added to a bundle.

Table 19-4 Multilink bundle configuration maximum

MDA	Bundle maximum
All MDAs other than channelized ASAP MDAs	56
• 1 x OC12 Deep Channel • 4 x OC3 Deep Channel • 12 x DS3/E3 Deep Channel • 4 x DS3/E3 Deep Channel • 8 x DS1/E1 Channel CMA (7710 SR)	56
4 x Channelized DS3/E3 ASAP MDA	112
• 4 x Channelized OC3 ASAP • 1 x Channelized OC12 ASAP • 12 x Channelized DS3/E3 ASAP	256

See Procedure 19-28 to create a multilink PPP bundle.

IMA group bundles

IMA group bundles combine ATM-encapsulated DS0 channel groups into a single ATM interface. The following general rules apply to IMA group bundles.

- IMA group bundles can only be created on:
  - channelized ASAP MDAs with SDH or SONET framing the 7750 SR or 7710 SR
  - ATM DS1/E1 CMA on the 7710 SR
  - channelized DS1/E1 ASAP daughter cards on the 7705 SAR
- The encapsulation type of the DS0 group channel must be ATM.

- The Clock Source parameter of the DS1 channel must be set to Node-Timed.
- Table 19-5 lists the maximum number of IMA group bundles that can be created on each MDA.
- IMA group members must be on the same MDA.

Table 19-5 IMA group bundle configuration maximums

Device	MDA	Bundle maximum
7750 SR, all supported releases	All MDAs other than channelized ASAP MDAs	56
7750 SR, all supported releases 7710 SR, all supported releases	4 x Channelized DS3/E3 ASAP MDA	112
7750 SR, all supported releases 7710 SR, all supported releases	• 4 x Channelized OC3 ASAP • 1 x Channelized OC12 ASAP • 12 x Channelized DS3/E3 ASAP	256
7710 SR, all supported releases	8 x ATM DS1/E1 CMA	8
7705 SAR, all supported releases	16 x Channelized DS1/E1 ASAP	8
7705 SAR, Release 2.1 or later	2 x Channelized OC3/STM1 ASAP	16

See Procedure 19-30 to create a multilink PPP bundle.

FR group bundles

FR group bundles are used to fragment lower priority DLCI frames to minimize jitter and delay on higher priority DLCI frames. The following general rules apply to FR group bundles.

- FR group bundles can only be created on channelized ASAP MDAs.
- FRF12 cannot be enabled on a SAP that is using an FR group bundle.
- DS0 channel groups must have all their timeslots selected and have their encapsulation type set to FR to be configured as bundle members.

Note — You can configure a maximum of 128 FR group bundles on an MDA.

See Procedure 19-32 to create a multilink PPP bundle.

19.6 Workflow to manage shelf objects

The following workflow describes the sequence of high-level tasks required to manage and configure shelf objects and shelf object children. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 13 for more information about device commissioning. See chapter 14 for more information about device discovery.

Note — Shelf objects and shelf object children can be accessed using the equipment navigation tree. See chapter 4 for more information about using the equipment navigation tree.

1 As required, perform the following procedures to configure shelf objects.

- **a** Configure the chassis mode of a device. See Procedure 19-1 for more information.
- **b** Configure dry-contact sensor monitoring. See Procedure 19-2 for more information.
- **c** Configure switch fabric multicast ingress replication rates. See Procedure 19-3 for more information.
- **d** Enable mixed mode on a 7450 ESS or 7750 SR device. See Procedure 19-4 for more information.
- **e** Configure timing synchronization. See Procedure 19-5 for more information.
- **f** Configure the IEEE 1588 clock on a 7705 SAR, version 4 or later. See Procedure 19-6 for more information.
- **g** Modify the IEEE 1588 PTP clock on the 7705 SAR. See Procedure 19-7 for more information.
- **h** Modify the IEEE 1588 PTP port on the 7705 SAR. See Procedure 19-8 for more information.
- **i** Configure auxiliary alarm definitions on the 7705 SAR. See Procedure 19-9 for more information.
- **j** Configure the IEEE 1588 PTP clock on a 7x50 SR device. See Procedure 19-10 for more information.
- **k** Configure the IEEE 1588 PTP peer on a 7x50 SR device. See Procedure 19-11 for more information.
- **l** Manage 9500 MPR running software. See Procedure 19-12 for more information.
- **m** Manage OmniSwitch running configuration. See Procedure 19-13 for more information.
- **n** Configure OmniSwitch health monitoring. See Procedure 19-14 for more information.

2 Assign a card type to a chassis slot. See Procedure 19-15 for more information.

3 As required, configure the card and card slot objects as follows:

   a Configure an egress WRED queue control on an IOM 3 or IMM forwarding plane. See Procedure 19-16 for more information.

   b Configure IMPM on a 2 x XP MDA IOM 3 or IMM forwarding plane. See Procedure 19-17 for more information.

   c Enable named pool mode. See Procedure 19-18 for more information.

   d Add or remove 9500 MPR card protection. See Procedures 19-19 and 19-20 for more information.

   e Configure OmniSwitch PoE ports. See Procedure 19-21 for more information.

   f Configure OmniSwitch stacks. See Procedure 19-22 for more information.

   g Configure an OmniSwitch CPU temperature threshold. See Procedure 19-23 for more information.

4 As required, configure daughter card objects as follows:

   a Configure an MDA. See Procedure 19-24 for more information.

   b Configure IMPM on an MDA. See Procedure 19-25 for more information.

   c View operational multicast channel properties on an MDA. See Procedure 19-26 for more information.

   d Configure a module card on the 7705 SAR-M/ME. See Procedure 19-27 for more information.

5 As required, create or modify bundle objects as follows:

   a multilink PPP bundle; see Procedures 19-28 and 19-29 for more information

   b IMA group bundle; see Procedures 19-30 and 19-31 for more information

   c FR group bundle; see Procedures 19-32 and 19-33 for more information

   d MLPPP bundle as a network interface on a channelized ASAP MDA; see Procedure 19-34 for more information

19.7 Shelf object configuration procedures

Use the following procedures to configure shelf objects using the navigation tree.

Procedure 19-1 To configure the chassis mode of a device

Perform this procedure to configure the chassis mode for the device. See chapter 16 for more information about chassis modes.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the chassis mode and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Administrative Mode

  If you downgrade the administrative chassis mode, the device must be rebooted to change the operational chassis mode.
- Force Mode

  Forcing a chassis mode change does not change the operational chassis mode unless there is a compatible card type equipped on the device. See chapter 16for more information about the minimum card type that must be installed for each chassis mode.

5 Click on the OK button. The Shelf (Edit) form closes.

Procedure 19-2 To configure dry contact sensors

Perform this procedure to configure dry contact sensors on a 7250 SAS-ESA or 7210 SAS-M 24F 2XFP ETR. See chapter 12 for information about dry contact sensors.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a dry contact sensor and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the External Alarms tab button. The Shelf Dry Contacts tab button is displayed.

5 Choose one of the dry contacts and click on the Properties button. The DryContact (Edit) form opens.

6 Configure the parameters:

- Name
- Description
- Monitored Status
- Polarity
- Alarm Severity
- Alarm Trigger Message
- Alarm Clear Message
- Control Status
- Control Type
- Connected To

7 Click on the OK button to close the DryContact (Edit) form.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The Shelf (Edit) form closes.

Procedure 19-3 To configure switch fabric multicast ingress replication rates

Perform this procedure to configure the total multicast replication rates for primary and secondary ingress paths for each switch fabric multicast plane.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure switch fabric multicast ingress replication rates and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Multicast tab button.

5 Configure the parameters:

- Primary Multicast Bandwidth (mbps)
- Secondary Multicast Bandwidth (mbps)
- Primary Multicast Bandwidth for Dual-SFM Mode (mbps)
- Secondary Multicast Bandwidth for Dual-SFM Mode (mbps)

6 Click on the OK button. The Shelf (Edit) form closes.

Procedure 19-4 To enable mixed mode on a 7450 ESS or 7750 SR device

Perform this procedure to enable mixed mode on a 7450 ESS or 7750 SR. Enabling mixed mode on a 7450 ESS-6v, 7450 ESS-7, or 7450 ESS-12, enables the support of features on the IOM3-XP and associated MDA-XPs or IMMs.

The 7750 SR-7 and 7750 SR-12, Release 9.0 R1 and later, support mixed mode. This support allows you to enable IPv6 on a 7750 SR in chassis mode A or B, without having to upgrade the entire chassis. Slots with network ports, and ports that require IPv6 support, can then be selectively upgraded for IOM3-XPs or IMMs.

Note — On the 7750 SR-7 and 7750 SR-12, Release 9.0 R5 and later, mixed mode cannot be enabled if an ISA TMS daughter card is configured on the node.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7450 ESS-6v, 7450 ESS-7, 7450 ESS-12, 7750 SR-7, or 7750 SR-12 device on which you want to enable mixed mode, and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Enable the Mixed Mode State on Chassis Enabled parameter.

5 Click on the OK button. The Shelf (Edit) form closes.

Procedure 19-5 To configure timing synchronization

Perform this procedure to configure timing synchronization. See chapter 16 for more information about timing synchronization.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure timing synchronization and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Timing tab button.

5 Configure the parameters, as required:

- Reference Input Mode (revertive)
- Reference Input Mode
- Reference Input Mode (revertive)
- Quality Level Reference
- First Timing Reference Input
- Second Timing Reference Input
- Third Timing Reference Input
- Fourth Timing Reference Input
- Type
- Interface Name
- Port or Channel Name
- Administrative State
- Quality Level Override
- First Timing Reference PTP Clock
- Second Timing Reference PTP Clock
- Role
- Wait to Restore Time (Min):
- Wait to Restore Time (Secs):
- Interface Type
- Input Administrative State
- Output Administrative State
- Output Line Length
- SSM
- Input Type
- Impedance Type
- Output Type
- Status
- Primary Reference Type
- Secondary Reference Type
- Sync In Port
- Sync Out Port

Note — The parameters that appear on the Shelf (Edit) form may vary, depending on the device type and version you are configuring.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button.The Shelf (Edit) form closes.

Procedure 19-6 To configure the IEEE 1588 PTP clock on a 7705 SAR-M/ME, or on a 7705 SAR, Release 4 or later

Perform this procedure to configure the IEEE 1588 PTP clock on a 7705 SAR-M/ME or a version 4.0 Release 3 or later 7705 SAR that is configured as an IEEE 1588 PTP client. See Procedure 19-5 for more information about how to configure the 7705 SAR as a PTP client.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR device where you want to configure the IEEE 1588 PTP clock and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the IEEE PTP Clock tab button.

4 Click on the Create button. The IEEE 1588 PTP Clock (Create) form opens.

5 Configure the parameters:

- Clock ID
- Clock Type
- Clock Slave Only
- Admin State
- PTP Profile
- Dynamic Peers
- Clock Priority 1
- Clock Priority 2
- Domain

6 Click on the Select button beside the Clock MDA parameter and choose a source MDA for the PTP clock.

7 Click on the Select button beside the Interface Name parameter and choose a source interface for the PTP clock.

8 Click on the Apply button. A dialog box opens.

9 Click on the OK button.

10 As required, turn up PTP ports on the IEEE 1588 PTP clock.

i Choose a PTP port from the PTP Port panel and click on the Properties button. The IEEE 1588 PTP Port (Edit) form opens with the General tab displayed.

ii Configure the Admin State parameter.

iii Click on the OK button. The IEEE 1588 PTP Port (Edit) form closes.

11 Click on the OK button. A dialog box opens.

12 Click on the OK button. The IEEE 1588 PTP Clock (Create) form closes.

13 Click on the OK button to save the configuration and close the Network Element (Edit) form.

Procedure 19-7 To configure the IEEE 1588 PTP clock on the 7705 SAR

Perform this procedure to configure the IEEE 1588 PTP clock on a pre-version 4.0 Release 3 7705 SAR that is configured as an IEEE 1588 PTP client. See Procedure 19-5 for more information about how to configure the 7705 SAR as a PTP client.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR device where you want to modify the IEEE 1588 PTP clock and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Timing tab button.

5 Click on the PTP Clock Properties button. The PTP Clock (Edit) form opens.

6 Configure the Domain parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The PTP Clock (Edit) form closes.

9 Click on the OK button to save the configuration and close the Shelf (Edit) form.

Procedure 19-8 To modify the IEEE 1588 PTP port on the 7705 SAR

Perform this procedure to modify the IEEE 1588 PTP port on a 7705 SAR that is configured as an IEEE 1588 PTP client. See Procedure 19-5 for more information about how to configure the 7705 SAR as a PTP client.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR device where you want to modify the IEEE 1588 PTP port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Timing tab button.

5 Click on the PTP Port Properties button. The PTP Port (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Master 1 Address
- Master 2 Address
- Announce Receive Timeout
- Announce Interval
- Sync Interval

7 Click on the Recovered Clock History Master One tab button to view master 1 clock recovery statistics.

8 Click on the Recovered Clock History Master Two tab button to view master 2 clock recovery statistics.

9 Click on the OK button. The PTP Port (Edit) form closes.

10 Click on the OK button to save the configuration and close the Shelf (Edit) form.

Procedure 19-9 To configure auxiliary alarm definitions on the 7705 SAR

Perform this procedure to configure auxiliary alarm definitions for the auxiliary alarms daughter card on a 7705 SAR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR device where you want to configure auxiliary alarm definitions and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the External Alarms tab button.

5 As required, configure auxiliary alarm digital inputs.

- **i** Click on the Auxiliary Alarm Digital Inputs tab button.
- **ii** Select a digital input from the list and click on the Properties button. The Auxiliary Alarm Digital (Edit) form opens with the General tab displayed.
- **iii** Configure the parameters:
  - Optional Name
  - Description
  - Administrative State
  - Detection (s)
  - Clearing (s)
  - State
- **iv** Click on the OK button. The Auxiliary Alarm Digital (Edit) form closes.
- **v** Repeat steps i to iv to configure more auxiliary alarm digital inputs, as required.

6 Click on the Auxiliary Alarm Definitions sub-tab button.

7 Click on the Create button. The Auxiliary Alarm Definition (Create) form opens.

8 Configure the following parameters:

- ID
- Auto-Assign ID
- Description
- Administrative State
- Severity

9 Click on the Inputs tab button and configure the following parameters:

- Trigger Rule
- Analog Threshold (mV)
- Operation
- Input 1 through Input 8 (as required)

10 Click on the Outputs tab button and configure the following parameters:

- Log Event
- Update Chassis Relays

11 Click on the OK button in the Auxiliary Alarm Definition (Create) form. A dialog box appears.

12 Click on the OK button.

13 Click on the OK button to save the configuration and close the Shelf (Edit) form.

Procedure 19-10 To configure the IEEE 1588 PTP clock on a 7x50 SR7, SR12, ESS7, ESS12, or SR-c4, version 9 release 4 or later

Perform this procedure to configure the IEEE 1588 PTP clock on a version 9.0 Release 4 or later 7x50 SR7, SR12, ESS7, ESS12 or SR-c4 that is configured as an IEEE 1588 PTP client. See Procedure 19-5 for more information about how to configure the nodes as PTP clients.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the IEEE 1588 PTP clock and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the IEEE PTP Clock tab button.

4 Select an IEEE 1588 PTP Clock from the list and click on the Properties button. The IEEE 1588 PTP Clock (Edit) form opens.

5 Configure the parameters:

- Clock Type
- Admin State
- Clock Priority 1
- Clock Priority 2
- Domain
- Network Type

6 Click on the OK button. The IEEE 1588 PTP Clock (Edit) form closes.

7 Click on the OK button to save the configuration and close the Network Element (Edit) form.

Procedure 19-11 To configure the IEEE 1588 PTP peer on a 7x50 SR7, SR12, ESS7, ESS12, or SR-c4, version 9 release 4 or later

Perform this procedure to configure the IEEE 1588 PTP peer on a version 9.0 Release 4 or later 7x50 SR7, SR12, ESS7, ESS12 or SR-c4 that have the IEEE 1588 PTP clock configured. See Procedure 19-10 for more information about how to configure the IEEE 1588 PTP clock on the nodes.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the IEEE 1588 PTP clock and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the IEEE PTP Clock tab button.

4 Choose an entry in the list and click on the Properties button. The IEEE 1588 PTP Clock (Edit) form opens.

5 Click on the IEEE PTP Peers tab button.

6 Perform one of the following:

  a To create an IEEE 1588 PTP peer on a slave, go to step 7.

  b To modify an existing IEEE 1588 PTP peer on a slave, go to step 10.

7 Click on the Create... button. The IEEE 1588 PTP Peer (Create) form opens

8 Configure the parameters:

- Peer ID
- Peer IP Address
- Peer Priority
- Administrative State

9 Go to step 12.

10 Select an IEEE 1588 PTP peer from the list and click on the Properties button. The IEEE 1588 PTP Peer (Edit) form opens.

11 Configure the parameters:

- Peer Priority
- Administrative State

12 Click on the OK button. The IEEE 1588 PTP Peer (Create) form closes and a dialog box appears.

13 Click on the OK button. The IEEE 1588 PTP Clock (Edit) form reappears with the IEEE 1588 PTP Peer information displayed.

14 Click on the OK button. The Network Element (Edit) form reappears.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button to save the configuration and close the Network Element (Edit) form.

Procedure 19-12 To manage 9500 MPR running software

Perform this procedure to manage the software in the 9500 MPR committed and standby banks. You can upgrade or downgrade the running software version on a 9500 MPR. See chapter 23 for information about creating software upgrade policies and performing software upgrades.

Warning — A 9500 MPR may require a firmware upgrade before a device software upgrade. To avoid a service outage, ensure that the device firmware version supports the software upgrade. See the device software Release Notes to obtain information about firmware and software version compatibility.

Caution — When you reboot a 9500 MPR that is in service it is service-affecting. Ensure that the reboot activity occurs during a maintenance window.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the 9500 MPR device that you need to upgrade or downgrade and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Software Bank Details tab button. The committed and standby software information is displayed. The committed software is the software currently running on the 9500 MPR. The standby software is new software that was uploaded to the 9500 MPR or formerly committed software.

6 Verify that the operational state of the standby software is Enabled, by examining the Operational State column of the displayed list.

You can also examine the Software Version of the standby and committed software. If the software version of the standby software is newer than the committed software version, the 9500 MPR can be upgraded. If the standby software version is older than the committed software version, the 9500 MPR can be downgraded.

7 Choose the standby entry from the displayed list.

8 Click on the Properties button.

9 The MPRSoftwarePackage (Edit) form opens with the Software Bank Details tab displayed.

10 Configure the Activation parameter.

11 Click on the OK button. The MPRSoftwarePackage (Edit) form closes. The entry in the Activation column for the standby software should be the same as the option chosen in step 10.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. When the standby and committed software versions are different or the forced activation option is selected, the 9500 MPR reboots using the standby software. If the standby and committed software versions are the same and the activation option is chosen, the 9500 MPR does not reboot and the Shelf (Edit) form closes.

14 When the 9500 MPR reboots you can confirm that the 9500 MPR is running the software stored in the former standby bank. The former standby software is the committed software and the previous committed software is the standby software.

Procedure 19-13 To manage an OmniSwitch running configuration

Caution — When you reboot an OmniSwitch that is in service it is service-affecting. Ensure that the reboot activity occurs during a maintenance window.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on a device and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Software Control Module tab button.

6 Configure the Command to Apply parameter.

  a If you specify Copy certified to working, configure the Active Timeout parameter.

  b If you specify Reload from working, configure the Delayed Activation Timer parameter.

7 Click on the OK button. The Shelf (Edit) form closes.

Procedure 19-14 To configure OmniSwitch Health Monitoring

The OmniSwitch Health Monitoring function monitors the consumable resources, such as bandwidth and CPU usage, of the switch. This function monitors the switch and at fixed intervals collects the current values for each resource being monitored. You can specify resource threshold limits and when a resource value falls above or below a threshold, traps are sent to the 5620 SAM.

Perform the following procedure to configure health monitoring on an OmniSwitch.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the OmniSwitch device that you need to configure OmniSwitch Health Monitoring and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Health Monitoring tab button.

6 Configure the following parameters:

- Rx Threshold (%)
- TxRx Threshold (%)
- Temperature Threshold Unit
- Temperature Threshold
- Memory Threshold (%)
- CPU Threshold (%)
- Sampling Interval (seconds)

7 Click on the Statistics tab button and search for Card Health Stats (Physical Equipment) or Device Health Stats (Physical Equipment) to view card statistics or chassis statistics respectively. Statistics can also be viewed from the card-level statistics tab.

8 Click on the Faults tab button to view alarm information.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The Shelf (Edit) form closes.

19.8 Card and card slot object configuration procedures

Use the following procedures to configure card and card slot objects using the navigation tree.

Procedure 19-15 To assign a card type

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to assign a card type and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on an empty Card Slot object and choose Configure Card from the contextual menu. The Card Slot (Create) form opens.

5 Configure the parameters:

- Capability
- Assigned Card Type
- Shutdown IOM for Memory Parity Errors
- OLC State

Note — The correct chassis mode must be configured for the assigned card types. The chassis mode determines the behavior of the card and establishes the scaling limits and available features. See Procedure 19-1and 19-4 for more information.

6 Click on the OK button. The Card Slot (Create) form closes.

The card and slot appear in the navigation tree and in the equipment inventory list.

Procedure 19-16 To configure egress WRED queue control on an IOM 3 or IMM forwarding plane

Perform this procedure to configure the egress WRED queue control function on an IOM 3 or IMM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure egress WRED queue control on an IOM 3 or IMM forwarding plane and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Card Slot icon. The Card Slot (Create) form opens with the General tab displayed.

5 Click on the Forwarding Plane tab button.

6 Choose an entry in the list and click on the Properties button. The Forwarding Plane (Edit) form opens.

7 Configure the Egress WRED Queue Control parameters:

- Administrative State
- Buffer Allocation Min (%)
- Buffer Allocation Max (%)
- Reserved CBS Min (%)
- Reserved CBS Max (%)

8 Click on the Select button in the Slope Policy panel. The Select Slope Policy - Forwarding Plane form opens.

9 Choose a policy in the list and click on the OK button. The Select Slope Policy - Forwarding Plane form closes, and the slope policy name is displayed in the Slope Policy panel.

10 Click on the OK button. The Forwarding Plane (Edit) form closes.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 19-17 To configure IMPM on a 2 x XP MDA IOM 3 or IMM forwarding plane

Perform this procedure to configure IMPM on a 2 x XP MDA IOM 3 or an IMM.

Note — See Procedure 19-25 for information about configuring IMPM on an MDA that is not installed in a 2 x XP MDA IOM 3 or in an IMM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure IMPM and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Card Slot icon. The Card Slot (Create) form opens with the General tab displayed.

5 Click on the Forwarding Plane tab button.

6 Choose an entry in the list and click on the Properties button. The Forwarding Plane (Edit) form opens.

7 Click on the Clear button to remove the selected policy. The Select button in the BW Policy panel is enabled.

8 Click on the Select button in the BW Policy panel. The Select BW Policy form opens.

9 Choose a policy in the list and click on the OK button. The Select BW Policy form closes, and the policy name is displayed in the BW Policy panel.

10 Configure the Admin State parameter.

11 Configure the following parameters:

- High Bandwidth Source
- High Bandwidth Multicast Traffic Taps Group
- High Bandwidth Alarm

12 Click on the OK button. The Forwarding Plane (Edit) form closes.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 19-18 To enable named pool mode

Perform this procedure to allow named pools to be created for an MDA. Set the pool mode parameter when you are configuring the card.

Caution — The Pool Mode parameter can be enabled and disabled at anytime, however changing the pool mode resets the IOM when MDAs are provisioned on the slot. If MDAs are not provisioned the IOM is not reset.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to enable named pool mode and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Click on a card slot object. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the IO Card tab button.

6 Configure the Pool Mode parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 19-19 To add 9500 MPR card protection

The 9500 MPR supports card protection for all card types. EPS card protection for the CORE-ENH card in slot 1 is automatically configured by the system when an optional spare CORE-ENH card is provisioned into slot 2. Radio modem and 32 x DS1/E1 cards in slots 3, 5, and 7 can be protected by corresponding identical cards in slots 4, 6, and 8. Protection for cards in slots 3, 5, and 7 must be configured. The protected card is referred to as the main card and the protecting card is referred to as the spare card. Use the following procedure to configure optional card protection for radio modem and 32 x DS1/E1 cards.

Note 1 — All cross connections, flow-ids, and sync sources must be removed from the port under the spare card slot before protection can be enabled.

Note 2 — To configure protection type 1+1 FD on Radio, the Mode cannot be Adaptive Modulation.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR icon, right-click on the 9500 MPR object where you want to add card protection and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Click on the card slot object that you need to configure. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the Protection tab button.

6 Configure the following parameters on the main/spare card:

- Protection Type
- Restoration Criteria
- Commands

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Create) form closes.

9 Verify that the protection has been enabled. The status of the main card should be Active and the status of the spare card should be Standby.

Procedure 19-20 To remove 9500 MPR card protection

Note — If 1+1 HSB is configured as the protection type for a Radio card, the transmitter must be muted from the NEtO to remove the protection.

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Expand the 9500 MPR icon, right-click on the 9500 MPR object where you want to remove card protection and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
3. On the Network Element (Edit) form navigation tree, expand the Shelf icon.
4. Click on the card slot object that you need to configure. The Card Slot (Edit) form opens with the General tab displayed.
5. Click on the Protection tab button.
6. Set the Protection Type parameter to No Protection.
7. Click on the OK button. A dialog box appears.
8. Click on the Yes button. The Card Slot (Create) form closes.
9. Verify that the protection has been removed from the previously main and spare cards.

Procedure 19-21 To configure OmniSwitch PoE Ports

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Expand the OmniSwitch icon, right-click on an OmniSwitch device and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
3. On the Network Element (Edit) form navigation tree, expand the Shelf icon.
4. Click on a slot object. The Card Slot (Edit) form opens with the General tab displayed.
5. Click on the PoE tab button.
6. Configure the parameters:
   - Slot Priority
   - Power State
   - Port Maximum Power (MilliWatts)
   - Maximum Power (Watts)
   - Enable Priority Disconnect
   - Enable Power Capacitor Detection
   - Combo Port

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 19-22 To configure OmniSwitch stacks

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch icon, right-click on an OmniSwitch device and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Click on a slot object. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the Stack Configuration tab button.

6 Configure the parameters, as applicable to a given OmniSwitch NE:

- Saved Slot NI Number
- Command Action
- Stacking Action
- Administrative
- Operational

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 19-23 To configure an OmniSwitch CPU temperature threshold

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch icon, right-click on an OmniSwitch device and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Click on a slot object. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the Hardware Environment tab button.

6 Configure the Temperature Threshold (Celsius) parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

19.9 Daughter card slot object configuration procedures

Use the following procedures to configure daughter card slot objects using the navigation tree.

Procedure 19-24 To configure an MDA

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an MDA and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon and the Card Slot icon.

4 Perform one of the following.

a To add a daughter card to an empty daughter card slot, right-click on the daughter card slot and choose Configure Daughter Card from the contextual menu. The Daughter Card Slot (Create) form opens.

b To modify an existing daughter card, click on the daughter card slot. The Daughter Card Slot (Edit) form opens.

Note — If daughter card in your configuration is managed by 5620 SAM but becomes no longer supported by 5620 SAM (for instance, an obsoleted MDA), it will be displayed under the equipment tree as type Unspecified. To delete such a card from 5620 SAM, you must remove the MDA from the device. Once a card is removed from the device, it is also automatically deleted from 5620 SAM.

5 Configure the parameters:

- Assigned Daughter Card Type
- In MDA Carrier Module Slot
- OLC State
- ATM Mode

Note 1 — The Assigned Daughter Card Type and In MDA Carrier Module Slot parameters are configurable only during daughter-card creation.

Note 2 — The ATM Mode parameter can only be configured on an MDA card of type 4 x ATM OC3/OC12, 4 x ATM OC3 STM1, or 16 port ATM OC3 STM1 on 7x50 cards (including the Portugal and Alberta cards but excluding SR-C12 and SR-c4 chassis) beneath an IOM 3 card.

Note 3 — The ATM Mode parameter must be set to a value of max16k-vc for PPPoA and PPPoEoA to be supported.

6 If you are creating a daughter card on a 7710 SR, perform the following steps.

i Click on the MDA Carrier Module tab button.

ii Configure the Assigned MCM Card Type parameter.

7 Click on the Apply button.

8 Click on the Daughter Card tab button.

9 Configure the parameters:

- Administrative State
- MDA Mode
- Synchronous Ethernet

Note 1 — The MDA Mode parameter can only be configured on 16 x Channelized DS1/E1 ASAP v2, 32 x Channelized DS1/E1 ASAP v2, 4 x Channelized DS1/E1 ASAP, or XMDA 1p x 10GigE / 10p x 1GigE SFP.

Note 2 — Before you configure the MDA Mode parameter, you must shut down all of the ports and remove all of the subchannels and bundles from the MDA.

10 Configure the following parameters in the Voice panel, if required:

- Companding Law
- Signalling Type

11 Perform the following steps to configure named buffer pools, if required.

Note — You must enable pool mode on the parent I/O card to enable named buffer pool support. See Procedure 19-18 for more information.

i Click on the Select button beside the Name parameter in the Ingress Pool Policy panel. The Select Ingress Pool Policy form opens.

ii Choose a policy in the list and click on the OK button. The Select Ingress Pool Policy form closes, and the policy name is displayed in the Ingress Pool Policy panel.

iii If you are configuring an HSMDA daughter card, go to step 12.

Note — HSMDA daughter cards support only ingress named buffer pool policies, and not egress named buffer pool policies.

iv Click on the Select button beside the Name parameter in the Egress Pool Policy panel. The Select Egress Pool Policy form opens.

v Choose a policy in the list and click on the OK button. The Select Egress Pool Policy form closes, and the policy name is displayed in the Egress Pool Policy panel.

12 Perform the following steps to configure HSMDA pool policies, if required.

Note — You must enable pool mode on the parent I/O card to enable HSMDA pool support. See Procedure 19-18 for more information.

i Click on the Select button in the Egress HSMDA Pool Policy panel. The Select Egress HSMDA Pool Policy form opens.

ii Choose a policy in the list and click on the OK button. The Select Egress HSMDA Pool Policy form closes, and the policy is displayed in the Egress HSMDA Pool Policy panel.

13 Configure the following parameters in the HSMDA Aggregate Queue Burst panel, if required:

- Threshold Low Burst Multiplier
- Threshold High Burst Increase

14 Perform the following steps to add a fabric profile, if required.

i Click on the Select button in the Network Ingress Fabric Profile panel. The Select Fabric Profile form opens.

ii Choose a profile in the list and click on the OK button. The Select Network Ingress Fabric Profile form closes, and the profile name is displayed in the Network Ingress Fabric Profile panel.

iii Click on the Select button in the Access Ingress Fabric Profile panel. The Select Fabric Profile form opens.

iv Choose a profile in the list and click on the OK button. The Select Access Ingress Fabric Profile form closes, and the profile name is displayed in the Access Ingress Fabric Profile panel.

15 Perform steps 2 to 5 of Procedure 19-25 to configure IMPM on the daughter card, if required.

16 If you configured named buffer pools in step 11, perform the following steps to configure the associated Q1 pools. Otherwise, go to step 17.

Note — You cannot use this step to configure 7710 SR QoS policies.

i Click on the QoS Pool tab button.

ii Choose a pool in the list and click on the Properties button. The QoS Pool (Edit) form opens.

iii Configure the parameters:

- Reserved CBS (%)
- Default Reserved CBS
- Amber Alarm Action Max (%)
- Amber Alarm Action Step (%)
- Amber Alarm Threshold (%)
- Red Alarm Threshold (%)

iv Click on the Select button in the Slope Policy panel. The Select Slope Policy - QoS Pool form opens.

v Choose a policy in the list and click on the OK button. The Select Slope Policy - QoS Pool form closes, and the slope policy name is displayed in the Slope Policy panel.

17 Perform the following steps to configure ATM, if required.

i Click on the ATM tab button.

ii Select an ATM configuration from the list and click on the Properties button. The ATM Configuration (Edit) form opens.

iii Click on the VP Shaping tab button.

iv Click on the Create button. The ATM VP Shaper (Create) form opens.

v Configure the VP ID parameter.

vi Click on the Select button in the ATM QoS Policy panel. The Select ATM QoS Policy - ATM VP Shaper form opens.

vii Select an ATM QoS Policy from the list and click on the Properties button. The ATM QoS Policy (Edit) form opens.

- **viii** Click on the QoS tab button.
- **ix** Configure the VP Shaping Weight parameter.
- **x** Click on the OK button. A dialog box appears.
- **xi** Click on the Yes button. The ATM QoS Policy (Edit) form closes.
- **xii** Click on the OK button. The Select ATM QoS Policy - ATM VP Shaper form closes.
- **xiii** Click on the OK button. A dialog box appears.
- **xiv** Click on the OK button. The ATM VP Shaper (Create) form closes.
- **xv** Repeat steps iv to xiv to create additional ATM VP shapers, if required.
- **xvi** Click on the OK button. A dialog box appears.
- **xvii** Click on the Yes button. The ATM Configuration (Edit) form closes.

18 Click on the OK button. A dialog box appears.

If you are adding a new daughter card, the daughter card and the contained ports are displayed in the navigation tree.

19 Click on the Yes button. The Daughter Card Slot properties form closes.

Procedure 19-25 To configure IMPM on an MDA

Perform this procedure to configure IMPM on an MDA that is not installed in a 2 x XP MDA IOM 3 or an IMM.

Note — See Procedure 19-17 for information about configuring IMPM on a 2 x XP MDA IOM 3 or IMM.

1 Perform steps 1 to 8 of Procedure 19-24.

2 Configure the following parameters in the Daughter Card Details panel:

- High Bandwidth Source
- High Bandwidth Multicast Traffic Taps Group
- High Bandwidth Alarm

3 Click on the Select button in the BW policy panel to choose a multicast bandwidth policy. The Select BW Policy form opens.

4 Choose a policy in the list and click on the OK button. The Select BW Policy form closes and the policy name is displayed in the BW Policy panel.

Note — The multicast bandwidth policy named “default” cannot be modified or deleted.

5 Configure the following parameters in the Multicast Path Management panel:

- Admin State
- Primary Path Limit (mbps)
- Secondary Path Limit (mbps)
- Ancillary Path Limit (mbps)

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Daughter Card Slot properties form closes.

Procedure 19-26 To view operational multicast channel properties on an MDA

Perform this procedure to view specific information about an operational multicast channel on an MDA that is configured to use an Ingress Multicast Bandwidth policy.

Note — You can also view operational multicast channel information in the following locations:

- the Mcast Path Mgmt tab on the properties form of a VPLS or VPRN service site
- the Mcast Path Mgmt Channels tab on the properties form of a routing instance.

Each properties form contains information about the ingress MDA of each operational channel.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to view operational multicast channel properties on an MDA and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Card Slot icon. The Card Slot (Create) form opens with the General tab displayed.

5 Click on the daughter card slot object. The Daughter Card Slot (Edit) form opens with the General tab displayed.

6 Click on the Mcast Path Mgmt Channels tab button.

7 Click on the Search button. A list of operational channels is displayed.

8 View the information, which includes the service site or routing instance associated with the channel, and the following properties:

Note — Channel information is displayed only when the MDA receives multicast traffic for a previously configured multicast group.

- Group Address—the operational channel multicast group address
- Source Address—the operational channel multicast source address
- Bandwidth—the operational bandwidth of the channel
- Administrative Bandwidth—the administrative bandwidth of the channel
- Last Highest Bandwidth—the value of the multicast bandwidth that is currently allocated to the channel forwarding path on the MDA. This value is calculated based on periodic statistics polls and represents the highest recorded bandwidth value since the most recent restart of the bandwidth update timer for the channel.
- Second Highest Bandwidth—the second-highest recorded bandwidth value for the channel since the most recent restart of the bandwidth update timer. The value is calculated based on periodic statistics polls and is reset to zero every time the bandwidth update timer for the channel is restarted.
- BW Update Timer expiration—the time that remains before the bandwidth update timer for the channel expires
- Current Path—the path that the channel traffic uses to reach the switching fabric; the path value is primary, secondary, or ancillary
- Explicit Path—indicates whether the current path is explicitly specified by a Multicast Info Policy
- Preference Level—the preference level of the channel
- Black-Hole—whether the channel is in the Black-Hole state
- Black-Hole Rate—specifies the bandwidth rate, in kb/s, at which the channel enters the Black-Hole state

9 Close the Daughter Card Slot (Edit) form.

Procedure 19-27 To configure a module card on the 7705 SAR-M/ME

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR-M/ME device on which you need to configure an MDA and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon and the Card Slot icon.

4 Right-click on the third Daughter Card Slot icon and choose Configure Daughter Card from the contextual menu. The Daughter Card Slot (Create) form opens with the General tab displayed.

Note — Only the third daughter card slot can be configured with module cards. The other two slots are configured with integrated cards that cannot be removed.

5 Configure the Assigned Daughter Card Type parameter.

6 Click on the Apply button. The Daughter Card Slot form refreshes.

7 Click on the Daughter Card tab button.

8 Configure the parameters:

- Administrative State
- Fabric Stats

9 Add a fabric profile, if required:

i Click on the Select button in the Network Ingress Fabric Profile panel. The Select Fabric Profile form opens.

ii Choose a profile and click on the OK button. The Select Network Ingress Fabric Profile form closes and the profile name is displayed in the Network Ingress Fabric Profile panel.

iii Click on the Select button in the Access Ingress Fabric Profile panel. The Select Fabric Profile form opens.

iv Choose a profile and click on the OK button. The Select Access Ingress Fabric Profile form closes and the profile name is displayed in the Access Ingress Fabric Profile panel.

If you are configuring a 1 Colour Optical Add/Drop Mux card, go to step 25.

10 Click on the Ports tab button.

11 Choose a port and click on the Properties button. The Physical Port (Edit) form opens with the General tab displayed.

Note — The first port on the DCM includes four SHDSL lines. The second port includes two XDSL lines.

12 Configure the parameters:

- Description
- Configured MAC
- Mode
- Encap Type
- Speed
- MTU (bytes)
- DDM Event Suppression
- OLC State

13 Click on the States tab button.

14 Configure the Administrative State parameter. If you are configuring a DCM or DSL module, go to step 17.

15 Click on the GPON tab button.

16 Configure the parameters and go to step 22:

- Subscriber Location ID (SLID)
- Dot1 Q Ethertype
- CFM LoopBack Mode
- Egress Rate (Kbps)
- Type
- Time (seconds)

17 Click on the DSL tab button.

18 Configure the parameters:

- Dot1 Q Ethertype
- CFM LoopBack Mode
- Adsl2Plus
- Egress Rate (Kbps)
- Type
- Time (seconds)
- Synchronous status messages
- SSM Code-Type

19 Configure XDSL or SHDSL lines, if required.

i Click on the XDSL or SHDSL tab button, as appropriate.

ii Choose an XDSL or SHDSL line and click on the Properties button. The XDSL Line (Edit) or SHDSL Line (Edit) form opens with the General tab displayed.

iii Configure the Administrative State parameter.

iv Click on the OK button. The XDSL Line (Edit) or SHDSL Line (Edit) form closes.

v Repeat steps i to iv to configure more lines, if required.

20 Click on the Ethernet tab button.

21 Perform steps 7 to 11 of Procedure 38-42.

22 Click on the OK button. A dialog box appears.

23 Click on the Yes button. The Physical Port (Edit) form closes.

24 If you are configuring a DCM, repeat steps 11 to 23 to configure the second port.

25 Close the Daughter Card Slot (Edit) form.

19.10 Bundle configuration procedures

Use the following procedures to manage bundles using the navigation tree.

Procedure 19-28 To create a multilink PPP bundle

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to a multilink PPP bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the Bundles object and choose Create Bundle from the contextual menu. The Create Multilink Bundle form opens.

5 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description

6 Click on the Next button. The Configure Bundle Parameters form opens.

7 Set the Bundle Type parameter to PPP.

Note 1 — To create an IMA group bundle, perform Procedure 19-30.

Note 2 — To create an FR group bundle, perform Procedure 19-32

8 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)
- Bundle MRRU (bytes)
- Short Sequence
- Link Fragmentation and Interleaving

9 Click on the Next button. The Configure Bundle Members form opens.

10 Click on the Add button to add DS0 channel groups to the bundle.

The Add Bundle Member series of configuration steps appears.

11 Configure the Show Only Compatible Channels parameter.

12 Click on the Next button.

The Select Channels form opens.

13 Select compatible channels from the list to construct the bundle.

Add channels to a bundle as follows:

- Choose up to eight channel groups from the list of channels.

Note 1 — If there are no compatible channels to choose from and you have decided that you want to edit some of the existing channels that are not compatible to be compatible, click on the Back button and disable the Show Only Compatible Channels parameter. Click on the Next button. Choose channels to edit from the list and click on the Properties button.

Note 2 — The channel group with the lowest Port ID is chosen as the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member to select it as a compatible member.

14 Click on the Finish button. The Configure Bundle Members form closes and the Create Multilink Bundle form re-opens.

15 Click on the Finish button.

16 Click on the Close button. The Create Multilink Bundle form closes.

17 Use the Properties contextual menu to view information about the created bundle, or modify bundle parameters.

- The General tab displays the Bundle ID, CLI name, MTU (bytes), Mode, and Encap Type parameters.
- The MultiLink Bundle tab displays the bundle type, bundle parameters, and link information.
- The L2 Interfaces and L3 Interfaces tab lists the interfaces that the bundle is assigned to.
- The States tab displays information about the operational and administrative state of the bundle.
- The Bundle Members tab lists the bundle members. From this form you can view member information and add or remove members from the bundle.
- Statistics and fault information is available from the appropriate tabs.

Procedure 19-29 To modify a multilink PPP bundle

Perform the following procedure to edit multilink PPP bundle parameters, add group members, and configure MC MLPPP to allow multiple classes of services to be transmitted over the bundle.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to modify a multilink PPP bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Bundles icon and click on a multilink bundle object. The Multilink Bundle (Edit) form for the PPP bundle opens with the General tab displayed.

5 Configure the Description parameter.

6 Click on the Multilink Bundle tab button.

7 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)
- Bundle MRRU (bytes)
- Short Sequence
- Link Fragmentation and Interleaving

8 Click on the States tab.

9 Configure the Administrative State parameter, if required.

10 Configure the MLPPP bundle for multiclass service transmission. Perform the following steps.

Note — Consider the following when you configure MC MLPPP.

- MC MLPPP is supported only on channelized ASAP MDAs in the 7705 SAR, Release 2.0 or later, 7710 SR, and 7750 SR.
- You must configure MC MLPPP before you add bundle members to the multilink bundle.
- MC MLPPP is not supported when the port is configured as network mode.
- MC MLPPP is not supported when LFI is enabled.

i Click on the MLPPP tab button.

ii Configure the parameters:

- End Point ID
- End Point Class ID
- Class Count
- Magic Number
- Stateless Aps Switchover

Note — The Magic Number parameter is configurable only on 7710 SR and 7750 SR channelized ASAP MDAs.

iii Click on the Select button in the MLPPP Ingress QoS Profile or MLPPP Egress QoS Profile panel to choose an MLPPP ingress or egress QoS profile. If a profile is already selected, click on the Clear button to clear the selection and enable the Select button. The Select MLPPP Ingress QoS Profile or Select MLPPP Egress QoS Profile form opens.

Note — You can only apply QoS profiles to an MLPPP bundle if the Class Count parameter is set to 4.

iv Select a profile and click on the OK button. The Select MLPPP Ingress QoS Profile or Select MLPPP Egress QoS Profile form closes.

v Click on the OK button. A dialog box appears.

vi Click on the Yes button.

11 To add members to the multilink bundle, perform the following steps.

i Click on the Bundle Members tab button.

ii Click on the Add button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.

iii Perform steps 11 to 13 of Procedure 19-28.

iv Click on the Finish button. The Add Bundle Member series of configuration steps closes.

Note — You can also add bundle members to the multilink bundle using the contextual menu in the navigation tree.

12 Click on the L2 Access Interfaces and L3 Access Interfaces tab buttons to view the interfaces that the bundle is assigned to.

13 Click on the Service Access Points tab button to view SAP information.

14 Click on the Statistics tab button to view statistical information.

15 Click on the Faults tab button to view information about alarms.

16 Click on the Close button. The Multilink Bundle (Edit) form closes.

Procedure 19-30 To create an IMA group bundle

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create an IMA group bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the Bundles object and choose Create Bundle from the contextual menu. The Create Multilink Bundle form opens.

5 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description

6 Click on the Next button. The Configure Bundle Parameters form opens.

7 Set the Bundle Type parameter to IMA.

Note 1 — To create a PPP group bundle, perform Procedure 19-28.

Note 2 — To create an FR group bundle, perform Procedure 19-32

8 Configure the parameters:

- Bundle Type
- Red Diff Delay (milliseconds)
- Minimum Links
- IMA Version
- ATM Interface Cell Format
- ATM Minimum VPI Value
- Test Pattern
- Link Activation Timer
- Link Deactivation Timer
- Maximum Links

9 Click on the Next button. The Configure Bundle Members form opens.

10 Perform one of the following:

a To create the multilink bundle without adding any members, go to step 11.

b Add DS0 channel groups to the bundle by performing the following steps.

i Click on the Add button. The Add Bundle Member series of configuration steps appears.

ii Click on the Next button. The Select Channels form opens.

iii Choose up to 8 channel groups from the list of channels to construct the bundle.

Note — The channel group with the lowest Port ID is chosen as the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member to select it as a compatible member.

11 Click on the Finish button. The Configure Bundle Members form closes and the Create Multilink Bundle form reappears.

12 Close the Create Multilink Bundle form.

Procedure 19-31 To modify an IMA group bundle

Perform the following procedure to edit IMA group bundle parameters, add group members, and specify a test member for IMA group bundle connectivity testing.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to modify an IMA group bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Bundles icon and click on an IMA group bundle object. The Multilink Bundle (Edit) form for the IMA group bundle opens with the General tab displayed.

5 Configure the Description parameter.

6 Click on the Multilink Bundle tab button.

7 Configure the parameters:

- Red Diff Delay (milliseconds)
- Minimum Links
- IMA Version
- ATM Interface Cell Format
- ATM Minimum VPI Value
- Test Pattern
- Link Activation Timer
- Link Deactivation Timer
- Maximum Links

8 To specify the IMA member that is used to test link connectivity in the IMA group bundle, perform the following steps.

i Click on the Select button beside the Test Member parameter. The Select Interface - Multilink Bundle form opens.

ii Choose an interface from the list.

iii Click on the OK button. The Select Interface - Multilink Bundle form closes and the Multilink Bundle (Edit) form refreshes with the test member information.

9 Click on the More Actions button and choose Test Pattern Start to run the test. You can click on the More Actions button and choose Test Pattern Stop at any time to stop the test. The Multilink Bundle (Edit) form refreshes with the link connectivity information.

10 Click on the States tab.

11 Configure the Administrative State parameter, if required.

12 To add members to the IMA group bundle, perform the following steps.

- **i** Click on the Bundle Members tab button.
- **ii** Click on the Add button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.
- **iii** Perform step 10 b of Procedure 19-30.

Note — You can also add bundle members to the IMA group bundle using the contextual menu in the navigation tree.

13 Click on the L2 Access Interfaces and L3 Access Interfaces tab buttons to view the interfaces that the bundle is assigned to.

14 Click on the Service Access Points tab button to view SAP information.

15 Click on the Statistics tab button to view statistical information.

16 Click on the Faults tab button to view information about alarms.

17 Click on the Close button. The Multilink Bundle (Edit) form closes.

Procedure 19-32 To create an FR group bundle

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create an FR group bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Right-click on the Bundles object and choose Create Bundle from the contextual menu. The Create Multilink Bundle form opens.

5 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description

6 Click on the Next button. The Configure Bundle Parameters form opens.

7 Set the Bundle Type parameter to FR.

Note 1 — To create a PPP group bundle, perform Procedure 19-28.

Note 2 — To create an IMA group bundle, perform Procedure 19-30

8 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)

9 Click on the Next button. The Configure Bundle Members form opens.

10 Perform one of the following:

a To create the multilink bundle without adding any members, go to step 11.

b Add DS0 channel groups to the bundle by performing the following steps.

i Click on the Add button. The Add Bundle Member series of configuration steps appears.

ii Click on the Next button. The Select Channels form opens.

iii Choose up to 8 channel groups from the list of channels to construct the bundle.

Note — The channel group with the lowest Port ID is chosen as the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member to select it as a compatible member.

11 Click on the Finish button. The Configure Bundle Members form closes and the Create Multilink Bundle form reappears.

12 Close the Create Multilink Bundle form.

Procedure 19-33 To modify an FR group bundle

Perform the following procedure to edit FR group bundle parameters, add group members, and specify a test member for FR group bundle connectivity testing.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to modify an FR group bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Bundles icon and click on an FR group bundle object. The Multilink Bundle (Edit) form for the FR group bundle opens with the General tab displayed.

5 Configure the Description parameter.

6 Click on the Multilink Bundle tab button.

7 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)

8 Click on the MLFR tab button.

9 Configure the parameters:

- Hello Timer
- Ack Timer
- Hello Retry Count

10 Click on the Select button beside the MCFR Ingress Qos Profile parameter. The Select MCFR Ingress Qos Profile - MultiClass Mlfr list form opens.

11 Choose a profile from the list and click on the OK button. The Select MCFR Ingress Qos Profile - MultiClass Mlfr list form closes and the Multilink Bundle (Edit) form is refreshed with the MCFR Ingress QoS Profile information.

12 Click on the Select button beside the MCFR Egress Qos Profile parameter. The Select MCFR Egress Qos Profile - MultiClass Mlfr list form opens.

13 Choose a profile from the list and click on the OK button. The Select MCFR Egress Qos Profile - MultiClass Mlfr list form closes and the Multilink Bundle (Edit) form is refreshed with the MCFR Egress QoS Profile information.

14 Click on the States tab.

15 Configure the Administrative State parameter, if required.

16 To add members to the FR group bundle, perform the following steps.

i Click on the Bundle Members tab button.

ii Click on the Add button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.

iii Perform step 10 b of Procedure 19-30.

Note — You can also add bundle members to the FR group bundle using the contextual menu in the navigation tree.

17 Click on the L2 Access Interfaces and L3 Access Interfaces tab buttons to view the interfaces that the bundle is assigned to.

18 Click on the Service Access Points tab button to view SAP information.

19 Click on the Statistics tab button to view statistical information.

20 Click on the Faults tab button to view information about alarms.

21 Configure the FR interface, if required. Perform the following steps:

i Click on the More Actions button and choose Edit FR. The FR Interface form opens with the General tab displayed.

ii Configure the parameters:

- LMI Type
- LMI Mode
- Error Threshold
- Monitored Events
- Polling Interval
- Full Enquiry Interval

22 Click on the OK button. The FR Interface form closes.

23 Click on the Close button. The Multilink Bundle (Edit) form closes.

Procedure 19-34 To configure an MLPPP bundle as a network interface on a channelized ASAP MDA

1 Perform Procedure 19-28 to create a MLPPP bundle on a channelized ASAP MDA.

Note — Consider the following when configuring an MLPPP as a network interface.

- LFI is not supported on MLPPP network interfaces.
- MC MLPPP is not supported on MLPPP network interfaces.
- IPv6 network interfaces are not supported.
- Up to 8 network interface members can be added to a bundle.

2 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

3 Right-click on the device where you want to configure an MLPPP bundle and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand the Bundles icon and click on the bundle created in step 1. The Multilink Bundle (Edit) form opens with the General tab displayed.

6 Click on the Bundle Members tab button.

7 Click on the Search button and choose a bundle member from the list. Click on the Properties button. The Bundle Member (Edit) form opens.

8 Click on the Port tab button.

9 Click on the Properties button beside the port name. The DS0 Channel Group (Edit) form opens with the General tab displayed.

10 Set the Mode parameter to Network.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The DS0 Channel Group (Edit) form closes.

13 Close the Bundle Member (Edit) form.

14 The Multilink Bundle (Edit) form refreshes with new tabs.

15 Click on the Network Interfaces tab button.

16 Click on the Create button. The Create Network Interface - Routing Instance form opens.

17 Perform steps 4 to 42 of Procedure 30-7 to create a network interface on the DS0 channel.

The port in step 6 of Procedure 30-7 is set to the DS0 channel by default. Go to step 11 of Procedure 30-7.

18 The L3 interface appears on the Network Interfaces tab. Close the Multilink Bundle (Edit) form.

20 — Port and channel object configuration

20.1 Port and channel object configuration overview

Port objects are children of daughter card slot objects. They appear below the daughter card slot after the daughter card is configured. Channel objects are children of port objects. They appear on the navigation tree below the port object after the channel is configured.

Properties forms for port objects and channel objects are accessed using the 5620 SAM navigation tree.

This chapter contains the procedures to configure devices using the navigation tree. See chapter 4 for more information about using the navigation tree.

20.2 Working with port and channel objects

The types of ports available depend on the daughter cards that are configured in the chassis. For some OmniSwitch devices, the ports that are available depend on the chassis type, for others the type of card that is configured for the card slot. Ethernet ports cannot be channelized. SONET/SDH and TDM ports can be channelized. The following types of ports are supported:

- Fast Ethernet (10/100/1000 Base-T)
- Gigabit Ethernet (1000Base-T)
- 10 Gigabit Ethernet (10000Base-T)
- 10 Gigabit Ethernet (10GBase-T)
- 40 Gigabit Ethernet (10GBase-T)
- Ethernet combo
- PoE
- OC-3/STM-1, OC-12/STM-4, OC-48/STM-16, and OC-192/STM-64 SONET/SDH
- channelized OC-3 and DS3/E3
- channelized ASAP OC-3/STM-1, OC-12/STM-4, DS1/E1, and DS3/E3

The port syntax for most devices that support daughter cards is card slot/daughtercard/port. For example, Port 1/1/1 represents port 1 of daughter card 1 in slot 1. The port syntax for the OmniSwitch is card slot/port. In every case, ports are created automatically when the daughter card is created. You must select one port object at a time and configure the properties of the port for the service that you need the port to provide. The properties vary depending on whether the port type is one of the Ethernet ports, SONET/SDH ports, or TDM ports. Channel objects are created on SONET/SDH or TDM ports for any type of channelization on the port whether it is a clear channel application or a sub-channel application.

Use the properties forms available from the contextual menus in the navigation tree to configure port and channel parameters. You can configure the port mode as network, access, or hybrid.

- Network ports pass network-level traffic.
- Access ports are customer-facing and pass service-level traffic.
- Hybrid ports can pass network-level and access-level traffic.

Note 1 — By default, a port is in Network mode.

Note 2 — See Procedure 20-2 to change the port mode.

Clear channel ports (OC-192/OC-48c/OC-12c/OC-3c) are either network or access ports. Channelized ports (CHOC-12/CHOC-3c/ DS3/E3) are always in access mode, however, the ASAP CHOC-3 supports both access and network modes. The ASAP DS1/E1 ports support:

- access mode for ATM/IMA and TDM
- network mode for PPP/MLPPP

Network ports are used in the service provider transport or infrastructure network, such as an IP/MPLS-enabled backbone network or uplink ports for rings using L2 Ethernet switches, such as the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco. A port that is in network mode can be assigned an IP address and host an L3 interface that can perform IP routing functions.

Note — The number of network interfaces that you can configure on one port is increased considerably in Release 8.0 and later NEs to support hybrid port applications. See the appropriate device documentation for specific interface configuration limits.

Access ports are associated with a SAP, a subscriber, and a service to provide connectivity. Access ports and channels are configured with encapsulation values to differentiate the service on the port or channel. When a port is access mode, one or more services can be configured on the port. A channelized port that is to act as an endpoint must be in access mode. You can convert access ports to hybrid ports and migrate any existing SAPs. See Procedure 20-3 for more information.

Hybrid ports are ports that can host SAPs and network interfaces simultaneously. This enables a customer to use one uplink port for enterprise and end-user traffic. A hybrid port preserves the existing network and access port functionality, and uses the same QoS, scheduler, and port scheduler resources as other ports, but requires the configuration of weight values that allocate buffer percentages to the access and network traffic on the port.

The 5620 SAM supports hybrid mode configuration for Ethernet ports on Release 8.0 or later of the 7450 ESS, 7750 SR-7, and 7750 SR-12 in any chassis mode.

Note — The 7450 ESS-1 and 7750 SR-1 do not support hybrid port mode.

You can configure a hybrid port on an Ethernet MDA in an IOM-3XP, or on a CMA in an IOM-XP. The 7750 SR supports hybrid port configuration on an IMM in addition to an IOM-3XP.

Note — Hybrid port configuration is not supported on an HSMDA or a VSM MDA.

A hybrid port supports dot1q and Q in Q encapsulation, but does not support null encapsulation, in order to accommodate single-SAP operation. The available VLAN tags are shared among the VLAN SAPs and VLAN network IP interfaces. When you create a SAP or L3 interface on a hybrid port, the outer VLAN tag must not be in use by another SAP or L3 interface on the port.

By default, the MTU of a hybrid port is set to the larger of the network and access MTUs to accommodate the creation of L3 interfaces and SAPs.

Note 1 — A hybrid port can participate in a single-chassis LAG.

Note 2 — A hybrid port cannot participate in an MC-LAG or MC ring.

See the appropriate device documentation for more information about hybrid ports.

When working with a TDM port, you must specify the Line Buildout as either short or long. That is, for a DS3 port the Line Buildout parameter must be configured. If the TDM port is in the context of a SONET STS-1 sub-channel, for example, the DS3 channel is built on the STS-1 channel of a SONET port, the line buildout parameter is not required.

At the connection termination points, you are required to configure the Encap Type as required, the MTU size as required, and the configured MAC address as required when configuring the port or channel.

Policies can be added or deleted as required using the manage policy forms.

You can associate policies to ingress and egress access and network ports. Buffer policies are used to create and edit QoS buffer pool resources on network ports, access ports, and access channels. Egress network ports, access ports, and access channels have a dedicated buffer pool for queuing. The traffic is handled by a single buffer pool, one at the ingress, and one at the egress.

You can configure the amount of egress buffer space to be allocated to the port or channel. By default, all egress buffers are allocated fairly among the egress ports and channels based on their relative egress bandwidth.

The egress buffers for egress network ports and channels are put into per-port or per-channel egress buffer pools and are used by the egress network forwarding class queues on that port or channel. The ingress buffers allocated to network ports and channels are summed into a single pool and are used by the ingress network forwarding class queues (defined by the network ingress buffer policy).

The egress and ingress buffers allocated to access ports and channels are put into an egress buffer pool and ingress buffer pool for the port or channel. The access buffer pools are used by egress and ingress service queues created by the SAP-egress and SAP-ingress policies in use by services on the port or channel.

Changing the size of an egress buffer pool should be carefully planned. By default, there are no free buffers to increase the size of a pool. In order to increase a pool on one port or channel, the same amount of buffers must be freed from other egress buffer pools on the same daughter card.

Digital diagnostics monitoring

The 5620 SAM displays the following digital diagnostics monitoring data and alarm and warning information for ports on SFPs and XFPs optical modular transceivers:

- temperature
- supply voltage (SFP)
- TX bias
- TX output power
- RX received optical power
- external calibration

The transceiver is programmed with warning and alarm thresholds for low and high conditions that can generate system events. The thresholds for SFPs and XFPs are programmed by the transceiver manufacturer. The 5620 SAM raises an alarm when these thresholds are exceeded.

You can view digital diagnostics monitoring information from the DDM tab on the property form of supported ports. The External Calibration tab is available if the ports on SFPs and XFPs optical modular transceivers support the external calibration functionality.

Tagged and untagged VLAN ports

Consider the following when you create VLANs on CLE devices, such as 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch devices.

- You must configure the 7250 SAS and Telco uplink ports in network mode, to allow a physical connection, which is called the uplink, to the network device that feeds the traffic ring, such as a 7450 ESS.
- The 5620 SAM supports tagged and untagged ports as VLAN access ports.

Table 20-1 describes the behavior when ingress tagged or untagged traffic enters and then exits a VLAN.

Table 20-1 Tagged and untagged traffic behavior

<table>
<tr><th>Ingress traffic configuration</th><th>Ingress VLAN port configuration</th><th>Action</th><th>Egress VLAN port configuration and action</th></tr>
<tr><td rowspan="4">Untagged</td><td rowspan="2">Untagged</td><td rowspan="4">The VLAN allows the traffic and passes it based on the default VLAN ID.
The MAC address of the destination is learned.</td><td>If the egress VLAN port is untagged, the traffic remains untagged.</td></tr>
<tr><td>If the egress VLAN port is tagged, a tag is added to the traffic.</td></tr>
<tr><td rowspan="2">Tagged</td><td>If the egress VLAN port is untagged, the traffic remains untagged.</td></tr>
<tr><td>If the egress VLAN port is tagged, a tag is added to the traffic.</td></tr>
<tr><td rowspan="4">Tagged</td><td rowspan="2">Untagged</td><td rowspan="2">The VLAN allows the traffic if the tag matches the default VLAN ID.
The MAC address of the destination is learned.
If the tag does not match the default VLAN ID, the traffic is dropped.</td><td>If the egress VLAN port is untagged, the tag of the traffic is removed.</td></tr>
<tr><td>If the egress VLAN port is tagged, the traffic remains tagged.</td></tr>
<tr><td rowspan="2">Tagged</td><td rowspan="2">The VLAN allows the traffic:
• if the tag matches the default VLAN ID
• if the tag matches another VLAN ID
The MAC address of the destination is learned.
If the tag does not meet either condition, the traffic is dropped.</td><td>If the egress VLAN port is untagged, the tag of the traffic is removed.</td></tr>
<tr><td>If the egress VLAN port is tagged, the traffic remains tagged.</td></tr>
</table>

Figures 20-1 and 20-2 show how tagged and untagged traffic is handled on the devices, based on the VLAN ID.

Figure 20-1 Untagged traffic and VLANs

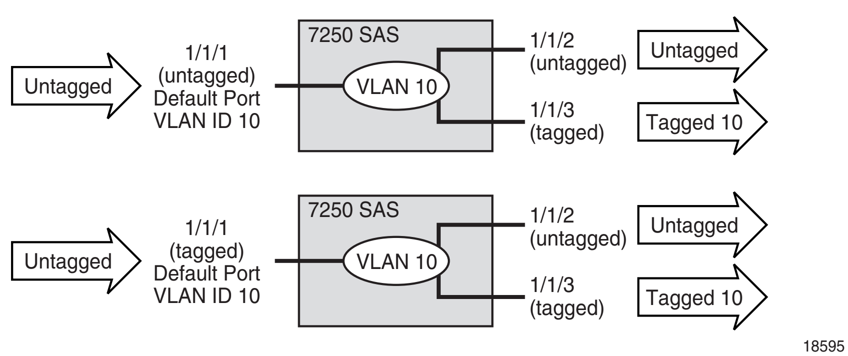


Figure 20-2 Tagged traffic and VLANs

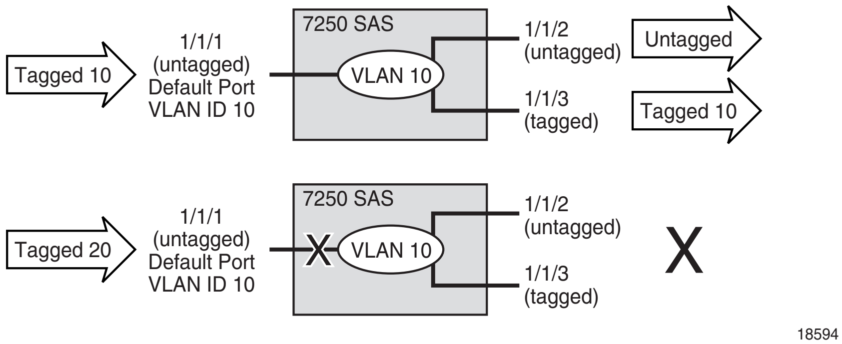


Connection termination points for services and interfaces

Connection termination points are objects that represent terminating endpoints for a service, for example the endpoint of a VLL service. Connection termination points can be Layer 2 or Layer 3 interfaces, depending on the type of service being created. At the connection termination points you must configure the mode as Access or Network, the Encap Type as required, the MTU size as required, and the configured MAC address as required when configuring the port or channel. The following objects can be used for connection termination points:

- STS-3 to STS-192 clear channels
- DS3 clear channel
- DS0 groups
- ports
- bundle

STS-3 to STS-192 clear channel

STS-3 to STS-192 clear channel SONET/SDH ports can be used to create SAPs or IP interfaces with one clear channel on each port that operates at the rate of the parent object. Clear channel SONET applications can be performed on any OC-*n* card. SONET channel termination for 1 x 10-Gig MDAs are not supported. See “SONET clear channel applications” in this section for more information.

DS3 clear channel

A DS3 clear channel can be a connection termination point when it is explicitly configured as unchannelized, that is, when the Configuration Type is set to None, which is the default setting for a DS3. DS3 clear channel connections cannot be channelized to a lower level than the one full DS3 channel. See “TDM channelization and clear channel applications” in this section for more information.

DS0 channel groups

A TDM channel group connects a group of DS0s by allocating a specific number of spans or interfaces and channels to a group of channels. The DS0 channel group defines the incoming and outgoing parameters for a group of channels such as IP profiles, routing tables, and translation tables to be assigned during the configuration of the specific channel group.

To use a DS1 or E1, you must create at least one DS0 group for the DS1 or E1. The 5620 SAM supports the automatic configuration of sub-channels and assignment of timeslots on the ports within DS0 groups. Depending on the TDM port selected, the 5620 SAM automatically creates the DS0 channel groups with the appropriate type of timeslots. For example, you can assign timeslots to a DS0 channel group as follows:

- For DS1 channel types: Use four timeslots per channel group, which results in six DS0 channel groups with IDs from 1 to 6. Each contains four timeslots.
- For E1 channel types: Use five timeslots per channel group, which results in six DS0 channel groups with IDs from 1 to 6. Each contains five timeslots, with one timeslot not assigned.

You can view the channels that are assigned in DS0 groups using the associate properties form. You can also disable, enable, or reassign the assignment of timeslots as required, in a DS0 group.

See “TDM channelization and clear channel applications” in this section for more information about DS0 channel groups. See Procedure 20-36 for information about creating channels on ports for card types that support multiple sub-channels. See Procedure 20-41 for information about creating TDM DS1 or E1 channels and DS0 channel groups.

SONET STS-1 sub-channels

Only the DS0 group level can be used as a connection termination point for SONET STS-1 sub-channels. Channelization on the 1 × OC12 can be used to create up to 12 SONET STS-1 sub-channels. Each STS-1 channels can be used to create a DS3 frame on which you can build DS1 or E1 channels that can be configured to the DS0 channel group level. You can configure the DS0s of a DS0 group in any sequence and you do not need to use all DSOs. For example, you can use DS0 1, 3, 5, and 9. See “SONET VT1.5 and VT2 payloads” in this section for more information.

Only the DS0 group level can be used as an endpoint on the channelized 12 × DS3 card. Channelization can be used on each DS3 port of the card to create independent TDM channels in the form of DS1 or E1 data channels that handle DS0 groups. The DS0s of a DS0 group can be configured in any sequence and you do not need to use all DS0s. For example, you can use DS0 1, 3, 5, and 9. See “SONET and SDH sub-channel applications and structure” in this section for more information.

Ethernet ports

Ethernet ports can be configured as connection termination points in SAPs and IP interfaces. They cannot be channelized.

You must configure the class of port, such as fast Ethernet, Gigabit Ethernet, or 10G Ethernet. You must also configure the port encapsulation at the connection termination point. Ethernet access ports use:

- dot1q—supports multiple services on the port; the outer encapsulation value that distinguishes services is the VLAN ID in the IEEE 802.1Q header
- Q in Q—supports multiple services on the port/channel; the inner and outer encapsulation values that distinguish services is the VLAN ID in the IEEE 802.1Q header
- null—supports a single service on the port

You must configure the duplex parameter from the Ethernet tab if the port is to be added to a LAG. Configure the Dot1 Q Ethertype and Q in Q Ethertype parameters from the Ethernet tab, if required. The range is 1536 to 65 535.

You must also configure the speed parameter from the General tab. The options are 10, 100, 1000, or 10 000, depending on the speed of the Ethernet interface.

Most OmniSwitch chassis offer four hybrid or combo ports. These ports consist of four paired 10/100/1000Base-T ports and four 1000 SFP ports. Preferences for these ports are configurable and, depending on the configuration, redundancy can be provided if a link fails.

PoE is supported on the OmniSwitch, except for the Metro version of the OS 6250, and provides power directly from the Ethernet ports. Powered devices such as IP phones, wireless LAN stations, Ethernet hubs, and other access points can be plugged directly into the Ethernet ports. The powered devices receive both electrical power and data flow from the RJ-45 ports.

OmniSwitch learned port security

LPS provides a mechanism to control network device access on one or more OmniSwitch ports. Configurable LPS parameters allow you to restrict the source learning of host MAC addresses to:

- a specific amount of time in which the switch allows source learning to occur on all LPS ports
- a maximum number of learned MAC addresses allowed on the port
- a list of configured authorized source MAC addresses allowed on the port

The following options allow you to specify how the LPS port handles unauthorized traffic.

- Block only traffic that violates LPS port restrictions; authorized traffic is forwarded on the port.
- Disable the LPS port when unauthorized traffic is received; all traffic is stopped and a port reset is required to return the port to normal operation

See Procedure 31-54 for information about enabling LPS on Ethernet ports and configuring LPS properties. See Procedure 20-34 for information about configuring static MAC addresses on LPS enabled Ethernet ports

Note — A deployment error is displayed in 5620 SAM while creating a LAG with ports. This deployment failure occurs if there is an LPS/VLAN configuration done on a specific port, using CLI.

MTU size and port configuration

You must specify the MTU size for an Ethernet port using the MTU (bytes) parameter on the General tab at the connection termination endpoint.

Consider the following when you configure MTU parameters.

- The managed devices must handle MTU limitations at many service points. The physical (access and network) ports, service, and service tunnel MTU values must be individually defined.
- The ports to be designated as network ports and the ports to be designated as access ports intended to carry service traffic must be identified.
- MTU values should not be frequently modified.
- Service MTU values must be less than or equal to the service tunnel MTU.
- Service MTU values must be less than or equal to the access port MTU.
- The MTU value for an in-band management port should be less than or equal to the MTU value for the peer port connected to the in-band management port.

See the device specific documentation for end-to-end considerations for configuring maximum MTU size throughout the managed network.

The Ethernet port MTU parameter indirectly defines the largest physical packet that the port can transmit or that the far-end Ethernet port can receive. Packets received that are larger than the MTU are discarded. Packets that cannot be fragmented at egress and that exceed the MTU are discarded.

The parameters for MTU configuration include the destination MAC address, source MAC address, Ethernet encapsulation type, length field, and complete Ethernet payload.

The MTU value for a port is associated with the port mode, such as access or network, and the port encapsulation type. If you change the mode or encapsulation type value for a port, the 5620 SAM adjusts the MTU value to a default value. If you do not want the MTU values for ports to revert to the defaults, you can configure the 5620 SAM to retain the currently configured MTU values for ports regardless of a mode or encapsulation type change. See Procedure 20-4 for more information.

HSMDA Egress Secondary Shapers

The egress port scheduler combines all subscriber queues of the same scheduling class and services the queues in a byte fair round robin fashion. This results in more packets being forwarded into the aggregation network towards a DSLAM than the DSLAM can accept. If the HSMDA egress port is congested, the egress bandwidth represented by the downstream discarded packets to the DSLAM may be allocated packets destined to other DSLAMs.

The HSMDA supports egress secondary shapers to provide a control mechanism to prevent downstream overruns without affecting the class-based scheduling behavior on the port. All subscribers destined to the same DSLAM have their queue groups mapped to the same egress secondary shaper. As the scheduler services the queues within the groups according to scheduler class, the destination shaper is updated.

After the shapers rate threshold is exceeded, scheduling for all queues associated with the shaper is stopped. When the dynamic rate drops below the threshold, the queues are allowed to be placed back on the scheduler service lists. By removing the queues from their scheduling context for a downstream congested DSLAM, the port scheduler is allowed to fill the egress port with packets destined to other DSLAMs without affecting class behavior on the port.

Egress secondary shapers are configured per port.

Moving and copying SAPs between ports

You can move and copy SAPs between physical Ethernet ports, logical ports, or a combination of both. You can also move and copy SAPs between endpoints configured with ATM encapsulation. For example, you can move a SAP on an IMA bundle to another bundle or to a TDM channel configured with ATM encapsulation. This functionality is typically used in redundancy scenarios, or to recover from a hardware failure.

Consider the following before you attempt to copy or move a SAP:

- Ports:
  - The source and destination ports can be on the same or different chassis. Inter-chassis copy or move is supported only when both NEs are of the same type, in the same chassis mode, and at the same major software release, for example, 8.0 R1 and 8.0 R3.
  - The source and destination ports can be the same. This configuration allows you to change the encapsulation values for a group of SAPs on the same port using outer and inner encapsulation offset values. These values can be positive or negative, depending on whether the encapsulation values must increase or decrease.
  - The physical Ethernet ports can be of different types; for example, Fast Ethernet (10/100/1000 Base-T), Gigabit Ethernet (1000 Base-T), and 10 Gigabit Ethernet (10 GBase-T).
  - The source and destination ports must be configured as access ports.
  - The encapsulation type must be the same on the source and destination ports.
  - You cannot copy or move a SAP between an HSMDA port and a non-HSMDA port.
- SAPs:
  - The SAPs can be associated with either L2 access interfaces on services such as Apipes, Epipes, Ipipes, VPLS, and MVPLS, or L3 access interfaces or subscriber interfaces that are associated with services such as IES and VPRN.
  - The copy and move operation does not copy and move MEPs that are configured on a VPLS, MVPLS and Epipe L2 access interface. MEP configuration is discarded during the copy and move operation.
  - For L2 and L3 access interfaces, you can move all SAPs or a subset of the SAPs on a port. You can also copy all SAPs or a subset of the SAPs on a port for L2 access interfaces.
  - All SAPs associated with a specific port within a group interface contained in an L3 subscriber interface can be moved at the same time.
  - The copy and move operations fail if the encapsulation value for a SAP on the source port is used by a SAP on the destination port. You can modify the SAP encapsulation values used on the destination port, if required.
  - The selected SAPs on the source port do not need to belong to the same service.
  - If a SAP on the source port belongs to a service not supported on the destination port, the SAP is not copied or moved.
  - The maximum number of SAPs varies for ports and MDAs. The SAP copy or move operation fails if the SAP capacity is exceeded for the destination port.
  - You cannot change SAP encapsulation from bridged to routed if ARP and DHCP options have been configured.
- SAP attributes:
  - VPLS and MVPLS dynamic FIB entries that are associated with copied or moved SAPs are discarded. Static FIB entries are transferred to the destination port after a successful SAP copy or move.
  - All SAP redundancy relationships at the source port, such as those provided by an MVPLS, are discarded during a copy or move operation.
  - All alarms, statistics, or OAM test results that are associated with a copied or moved SAP are discarded.

- When a source SAP belongs to an SHG, the 5620 SAM attempts to preserve the SHG membership. The destination SHG must have the same name as the source SHG, and must have the same residential SHG status. If an SHG with the same name does not exist on the destination service site, the 5620 SAM creates it.
- When a source SAP is uses an aggregation scheduler, the scheduler is copied to the destination. The aggregation scheduler must be unique to the destination NE and must have the same scope, for example, MDA or port.

See Procedures 20-5, 20-6, 20-7, and 20-8 to copy or move access interface SAPs between ports.

SONET/SDH and TDM port encapsulation

SONET/SDH and TDM ports can be configured as connection termination points in SAPs and IP interfaces. They can be channelized.

An access port is used for customer-facing traffic on which services are configured. SAPs can only use an access port. When a port is configured for access mode, the appropriate encapsulation type must be specified to distinguish the services on the port.

You must configure the Encap Type parameter from the General tab at the connection termination point. SONET/SDH or TDM ports or channels support the following encapsulation types, depending on the MDA type:

- BCP Null
- IPCP
- BCP Dot1 Q
- FR — Support multiple services using the DLCI header to distinguish services
- ATM — Support multiple services using the VCI or VPI of the PVC
- PPP Auto
- CEM

MTU size considerations apply to SONET/SDH and TDM channels. See “MTU size and port configuration” in section 20.2 for more information.

SONET clear channel applications

Ports on OC-*n* cards can be used for SONET clear channel applications. SONET or TDM clear channel applications allow you to create a full channel on a port which can be configured as access or network mode for SONET and access only for TDM. For example, when you create a 16 × OC3 SFP card, 16 ports are created. You can create one full channel on each of these ports. For more information about the 4-port OC3/STM1 ASAP SFP card for clear channel support on the 7705 SAR-8, see OC3/STM1 clear channel support on the 7705 SAR-8 in this section.

STS-192/48/12/3 clear channel applications use the following syntax:

```
card slot/daughtercard/port.STSType
```

For example, the clear channel STS-12 on slot 4, MDA 1, port 1 is named 4/1/1.sts12

Table 20-2 lists available SONET channel applications and parameters for clear channel, sub-channel, and TDM applications.

Table 20-2 SONET channel parameters

Applications	Channel ranges								
	STS-192	STS-48	STS-3	STS-1	DS3	DS1	DS0	E1	DS0
SONET Clear channel	1	1	1		1				
SONET Sub channel			1 to 4	1 to 3	1	1 to 28	1 to 24	1 to 21	2 to 32
TDM					1	1 to 28	1 to 24	1 to 21	2 to 32

OC3/STM1 clear channel support on the 7705 SAR-8

The 7705 SAR-8 supports the 4-port OC3/STM1 ASAP SFP card. The 4-port OC3/STM1 ASAP SFP card supports access mode for ATM-encapsulated traffic only. See ATM encapsulation in this section for more information. The interface must be configured as UNI.

All of the ports on this card can be independently configured for either SONET (OC3) or SDH (STM1) framing. The transmit clock rate for a port can be device- or loop-timed.

The section trace (J0) byte can be configured by the operator to check the physical cabling. The port can activate and deactivate local line and internal loopbacks. The MTU size for a 4-port OC3/STM1 ASAP SFP access port is fixed at 1572 for ATM encapsulation.

CSM activity switches for a 4-port OC3/STM1 ASAP SFP card on the 7705 SAR-8 are hitless on the data path.

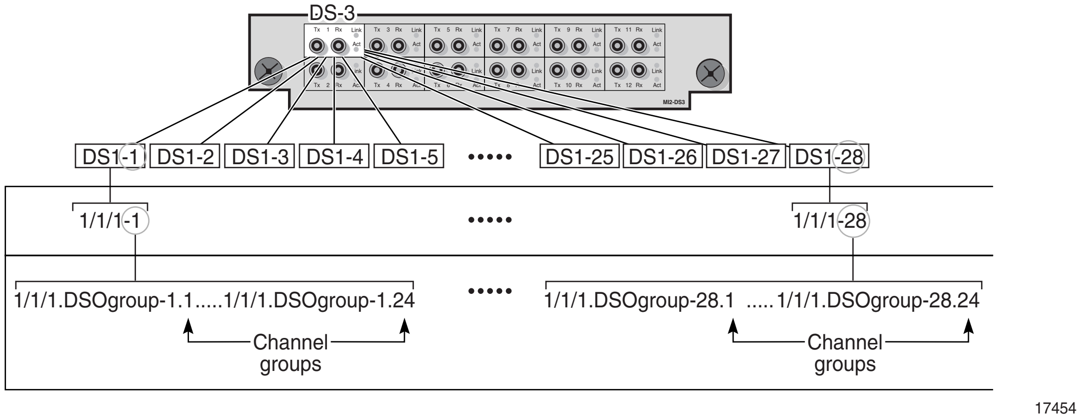
Note — Channels on the 4-port OC3/STM1 ASAP SFP adapter card cannot be configured as IES SAPs.

TDM channelization and clear channel applications

When you create a 4 or 12 ×DS3/E3 card, 4 or 12 DS3/E3 ports are created. You can then create DS3/E3 channels using the 5620 SAM, one per port. Each DS3/E3 channel can be channelized into 28 independent DS1 or 21 independent E1 data channels or, in clear channel applications, the DS3 can be the connection termination point. For channelized DS3 connections, each DS1 channel can be channelized to 24 DS0 groups and each E1 channel can be channelized to 31 DS0 groups. To use a DS1 or E1, you must create at least one DS0 group for the DS1 or E1.

By default, DS3 ports are automatically created for clear channel connections. To create a channelized DS3, you must configure the DS3 channel type as E3 or DS3 on the port. To channelize the DS3 to the DS0 level, you must set the Channelization Type to Channelized DS1 or E1. Figure 20-3 shows the channelized DS3 port structure for DS1 channels.

Figure 20-3 Channelized 12 × DS3 port structure for DS1 Channels



The channelized DS3 port structure for E1 channels has the following parameter values:

- each DS3 port supports 21 E1 channels
- each E1 channel supports 31 DS0 channel groups

TDM-based DS3 channelization uses the following syntax:

DS3 channel configured for TDM:

```
card slot/daughtercard/port.DS3-
```

DS1 channel from a TDM-based DS3 channel:

```
slot/daughtercard/port.DS1-[DS3#].[DS1#]
```

E1 channel from a TDM-based DS3 channel:

```
slot/daughtercard/port.DS1-[DS3#].[E1#]
```

DS0 group channel from the DS1 channel:

```
slot/daughtercard/port.DS0Grp-[STS3#].[STS1#].[DS1#/E1#].[Group#]
```

Table 20-3 provides an example of the naming conventions for a 12 × DS3 port.

Table 20-3 Example of TDM channel naming convention

Syntax	Description	Additional information
Channel 1/1/1.ds3	1/1/1 is the slot number/daughtercard number/port number .ds3 identifies the channel as DS3	Because DS3s are unchannelized by default, you must configure the Channelization Type as Channelized.
Channel 1/1/1.ds1-1.2	.ds1 identifies the channel as DS1 1 is the DS3 number .2 is the DS1 number (1 to 28)	Identifies the DS1 channel and shows how the DS3 level acts as a place holder for the DS1s.

(1 of 2)

Syntax	Description	Additional information
Channel 1/1/1.e1-1.2	.e1 identifies the channel as E1 1 is the DS3 number .2 is the E1 number (1 to 21)	Identifies the E1 channel and shows how the DS3 level acts as a place holder for the E1s.
Channel 1/1/1.ds0Grp-1.2.23	.ds0Grp- identifies the channel as a DS0 group 1 is the DS3 number .2 is the DS1 number (1 to 28) or E1 number (1 to 21) .23 identifies the DS0 channel group (1 to 24) on the DS1 or (2 to 32) on the E1	The DS0 group is configured on the DS1 or E1 channel. Only a DS0 can be used as a CTP.

(2 of 2)

ATM encapsulation

SONET/SDH clear channels can be provisioned so that ATM cells are encapsulated in SONET/SDH frames. The entire SONET/SDH path of the port is then used to carry ATM cells. The channel of the port becomes the ATM interface. ATM encapsulation is supported on the following daughter cards:

- 16 × ATM OC3 SFP
- 16 × ATM OC3 SFP B
- 4 × ATM OC12/OC3 SFP
- 4 × ATM OC12/OC3 SFP B
- 4 × OC3/STM1 ASAP SFP
- 4 × Any Service Channelized OC3
- 16 x Any Service Channelized DS1/E1

SONET/SDH clear channel applications with ATM encapsulation use the following syntax:

```
Daughter Card Slot - 3 (16 x ATMOC3), OK

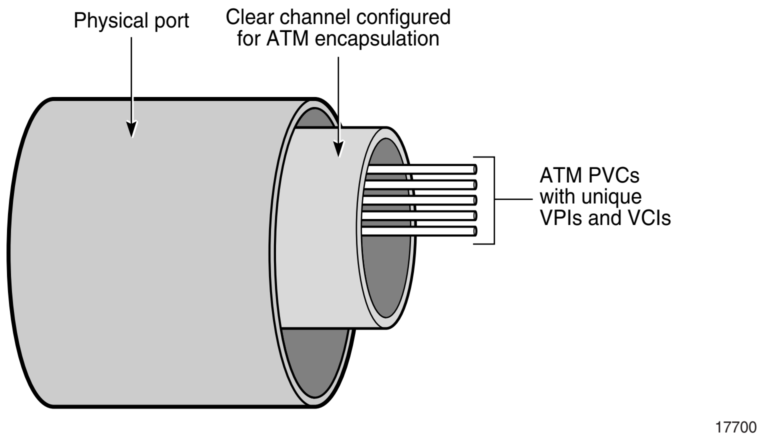
Port 3/1/1 - Speed: OC3, State: OK

Channel 3/1/1.sts3, Mode: Access, Encap: ATM, State: Ok
```

Customer devices with ATM interfaces are connected directly or using the ATM access network to a 7750 SR that offers IES or VPRN services.

A SONET/SDH clear channel with ATM encapsulation can carry multiple ATM PVCs. ATM PVCs cannot be created from the 5620 SAM. They are created automatically by the router when a new Layer 3 interface over ATM is created. Figure 20-4 shows an example of ATM PVCs on a SONET/SDH clear channel.

Figure 20-4 ATM PVCs on a SONET/SDH clear channel



ILMI links between ATM interfaces

ILMI links can be configured between ATM interfaces. ILMI is a protocol that sets and sends physical layer, ATM layer, virtual path, and virtual channel parameters that are exchanged by ATM interfaces.

When ILMI is run between two ATM interfaces, the interfaces exchange ILMI packets that consist of SNMP messages across the physical connection. An ILMI link allows ILMI to run on an available virtual channel. When an ILMI link is created to carry ILMI messages, a PVC is automatically created with default PVC attributes. The PVC is deleted when the ILMI link is removed.

IMA

IMA is supported on channelized ASAP MDAs on the 7750 SR, 7710 SR, 7705 SAR, and ATM DS1/E1 CMA on the 7710 SR. IMA group bundles aggregate E1 or DS1 ATM paths into a single logical ATM interface. Each IMA group bundle can have from 1 to 8 members, or links. Up to 56 IMA group bundles can be configured on a single 7750 SR or 7710 SR MDA. Up to 8 IMA group bundles can be configured on a single 7705 SAR daughter card.

For the 9500 MPR, IMA is supported on the 16 x E1 ASAP Access (ETSI) card. Each IMA group bundle can have up to 16 links and there can be up to 8 IMA groups on a card.

Each ATM Interface supports up to 48 VP/VC connection points. Each 16 x E1 ASAP Access (ETSI) board supports up to 128 VP/VC connection points.

An IMA group bundle has the following common interface properties:

- ATM encapsulation type is displayed on the ATM Interface properties form by clicking on the “Edit ATM button”.
- The ATM interface characteristics can be viewed by clicking on the “Edit ATM button” button on the Bundle Properties form. This button is displayed on the Bundle Properties form only for the 9500 MPR.
- The interface mode is access only for the 9500 MPR.

- MTU value (of the primary link)

Note — The two following paragraphs do not apply to the 9500 MPR.

Member links inherit the common properties of the IMA group to which they belong. Only the properties of the primary link can be changed. The primary link is the member with the lowest interface index or initialization sequence. The primary link may change as member links are added and deleted from the IMA group.

Consider the following when you create a multilink IMA group bundle.

- When a path becomes a member of an IMA group bundle, it is no longer a physical ATM path interface.
- The members of the IMA group bundle inherit all of the properties of the primary link, such as the SONET configuration and MTU. If you modify the configuration of the primary link, the configuration of the bundle members is also modified.
- Member links that are added after the primary link has been added to the IMA group bundle must match the configuration of the primary link.
- You cannot configure services on a member link.

20.3 SONET and SDH sub-channel applications and structure

SONET sub-channel applications allow you to create multiple STS-1 channels on deep channelized OC-12 and OC-3 ports, and to configure multiple DS0 connection termination points.

An STS-1 sub-channel is configured, or channelized, to carry one of the following payload types:

- DS3
- VT1.5
- VT2

Because of the differences between SONET and SDH in multiplexing and mapping of tributary payloads into higher digital levels, some building blocks of SDH have no SONET equivalent and therefore the containment hierarchy and terminology for SDH is different from SONET. See “Comparison of SONET and SDH hierarchies” and “SDH AU-4 and AU-3 sub-channel applications” in this section.

SONET DS3 payload

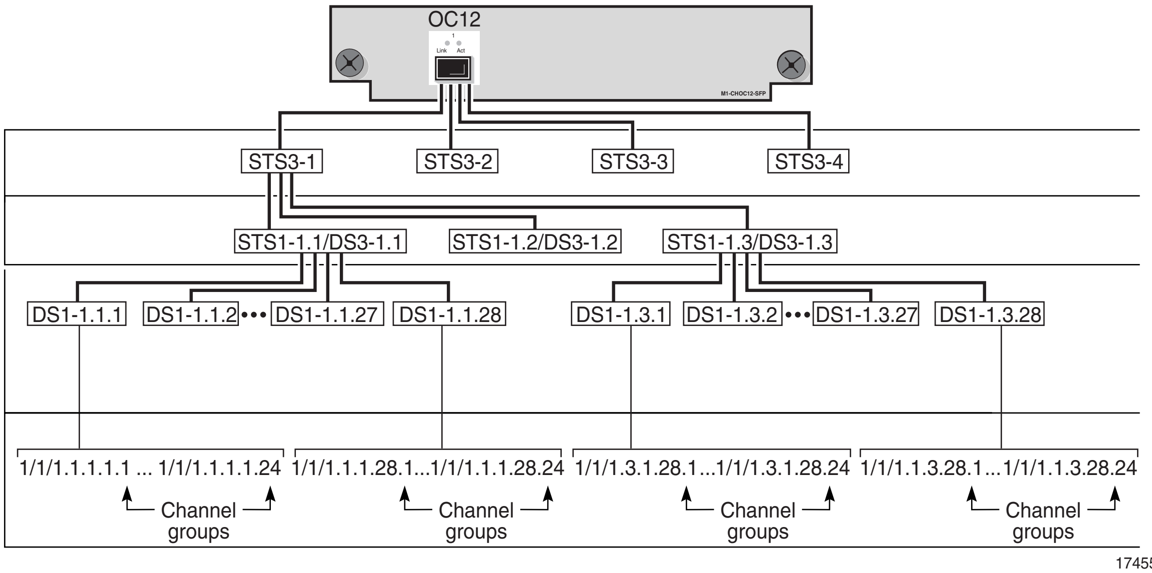
The following example, illustrated in Figure 20-5, shows the channelization sequence for a DS3 payload on a 1 × OC12 Deep Channel card.

1. One OC-12 port is created when you create a channelized 1 × OC12 Deep Channel card.
2. This port can be channelized into 12 SONET STS-1 sub-channels from the four STS-3s available on the port.

3 You can then configure each of these STS-1s to carry a DS3 frame

4 Each DS3 frame can be channelized into 28 independent DS1 data channels or 21 independent E1 data channels. Each channel must be created one at a time.

Figure 20-5 Channelized 1 × OC-12 port structure using STS-1/DS3 sub-channels



SONET VT1.5 and VT2 payloads

The following example, illustrated in Figure 20-6, shows the channelization sequence for a VT1.5 or VT2 payload on a 1 × OC12 Deep Channel card.

1 One OC-12 port is created when you create a channelized 1 × OC12 Deep Channel card.

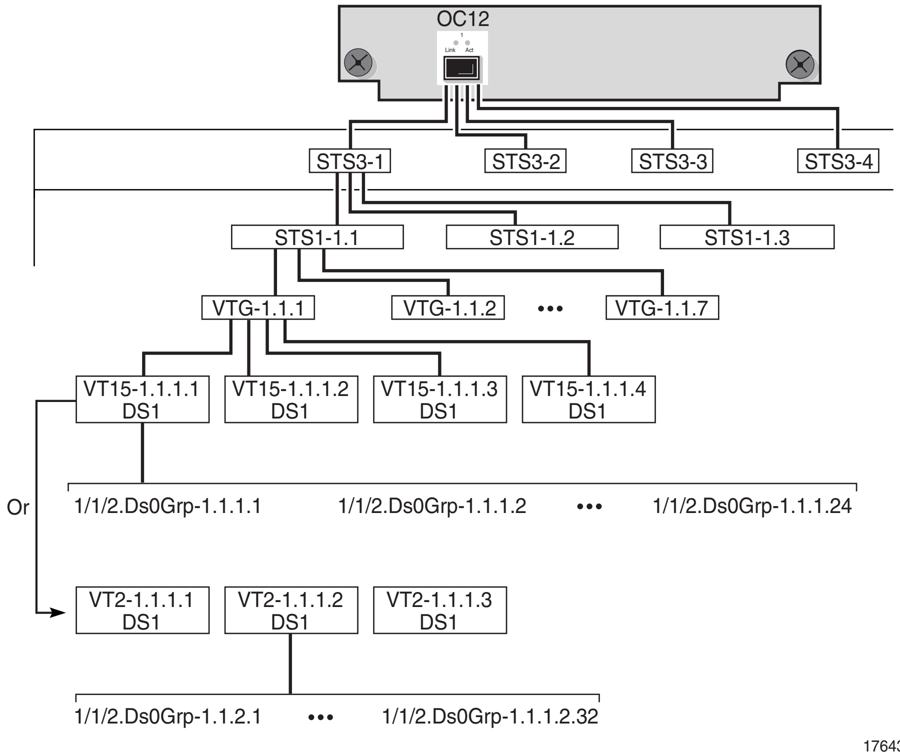
2 This port can be channelized into 12 SONET STS-1 sub-channels from the four STS-3s available on the port.

3 You can then configure each of these STS-1s to be channelized to carry up to 28 DS1. For SONET sub-channel configuration you must select payload type VT1.5 or VT2. When you choose VT1.5 payload type, seven VTG are implicitly created.

4 Each VTG is channelized into four independent VT1.5 channels or three VT2 channels, each of which can carry an independent DS1 data channel. Each channel must be created one at a time.

5 Each VT1.5 DS1 channel can be configured to handle up to 24 DS0 groups. Each VT2 DS1 channel can be configured to handle up to 32 DS0 groups. To use a DS1, you must create at least one DS0 group for the DS1 or E1.

Figure 20-6 Channelized 4 × OC-3 port structure using VT sub-channels



SONET sub-channel syntax

The 5620 SAM uses the following SONET syntax for the STS-1 sub-channel:

```
card slot/daughtercard/port.STS1-[STS3#].[STS1#]
```

DS3 channels from an STS-1 sub-channel use the following syntax:

```
slot/daughtercard/port.DS3-[STS3#].[STS1#]
```

DS1 channels from a DS3 channel use the following syntax:

```
slot/daughtercard/port.DS1-[STS3#].[STS1#].[DS1#]
```

E1 channels from a DS3 channel use the following syntax:

```
slot/daughtercard/port.DS1-[STS3#].[STS1#].[E1#]
```

VT15 or VT2 from a VT group use the following syntax:

```
slot/daughtercard/port.VTG#-[STS3#].[STS1#]
```

DS1 channels from a VT15 or VT2 use the following syntax:

```
slot/daughtercard/port.DS1-[STS3#].[STS1#].[VT15#] or
[VT2#}.[VTG#].[DS1#]
```

Table 20-4 shows an example of the SONET sub-channel syntax.

Table 20-4 Example of SONET sub-channel syntax for an OC-12 port

Syntax	Description	Additional information
Channel 1/1/1.sts1-2.2	1/1/1 is the slot number/daughtercard number/port number 2 is the STS-3 number (1 to 4) .2 is the STS-1 number (1 to 3)	The sts1 parameter is 2.2 which means that it is the fifth STS-1. There are four STS-3s for an OC-12 and each STS-3 has three STS-1s such that the fifth STS-1 is the second STS-1 of the second STS-3.
Channel 1/1/1.ds3-2.2	.ds3-2 is the STS3 number (1 to 4) .2 identifies the STS-1 number (1 to 3)	Identifies the DS3 channel and shows how the sts1 level acts as a place holder for the DS3
Channel 1/1/1.ds1 2.2.25	.ds1-2.2.25 identifies a DS1 channel (1 to 28) on the DS3	The DS1 is configured on the DS3.
Channel 1/1/1.e1 2.2.21	.e1-2.2.21 identifies a E1 channel (1 to 21) on the DS3	The E1 is configured on the DS3.
Channel 1/1/1.DS0Grp-2.2.20.5	.DS0Grp-2.2.20.5 identifies one of the DS0 channel groups: 1 to 28 for DS1; 2 to 32 for E1	The DS0 is configured on the DS1 or E1 channel.
Channel 1/1/1.ds1 2.2.3.18	ds1 2.2.3.18 identifies a DS1 channel on the VT15 or VT2 payload, where 3 is the VT group.	—

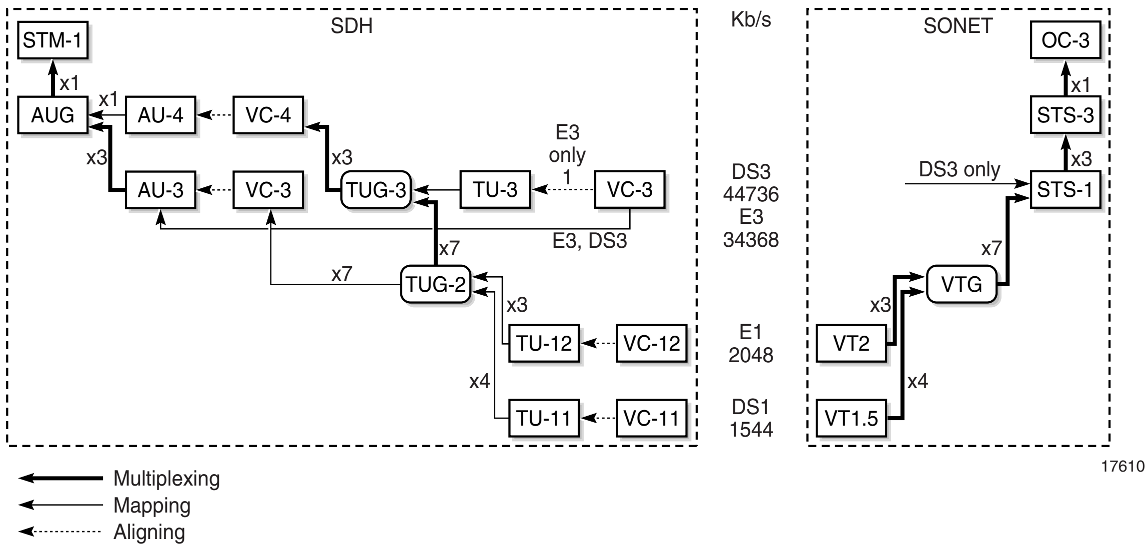
Comparison of SONET and SDH hierarchies

SONET and SDH are compatible digital hierarchies that support identical transmission rates with similar framing structures. However, SONET and SDH standards differ in the way they multiplex and map tributary payloads into higher digital levels. Because of these differences, some SDH framing blocks do not have equivalent blocks in SONET.

SONET provides one STS sub-channel, the STS-1, for mapping lower-capacity, deep-channel payloads while SDH provides two alternative sub-channels, the AU3 and the AU4. After an AU3 sub-channel is created, an AU4 cannot be created on that port in the case where the port is an OC-3 (STM-1). Conversely, if an AU4 sub-channel is created, an AU3 cannot be created on that port in the case where the port is an OC-3 (STM-1).

SONET and SDH transmission rates converge at 155.520 Mb/s where the SONET STS-3c is equivalent to the SDH STM-1 bit rate. For lower-capacity payloads, such as DS1, E1, DS3, and E3, SONET provides one unique mapping path for each payload while SDH permits two alternative paths for each payload as shown Figure 20-7.

Figure 20-7 Supported SONET/SDH multiplexing structures



SDH AU-4 and AU-3 sub-channel applications

SDH sub-channel applications allow you to create AU4 or AU3 channels on deep channelized OC-12 (STM-4) and OC-3 (STM-1) ports, and to configure multiple DS0 connection termination points.

After an AU4 sub-channel is created, it implicitly contains three TUG-3 groups. A TUG-3 is channelized to carry one of the following payload types:

- TU3
- TU11
- TU12

After an AU-3 sub-channel is created, it is channelized to carry one of the following payload types:

- DS3, E3
- TU11
- TU12

SDH TU3 payload

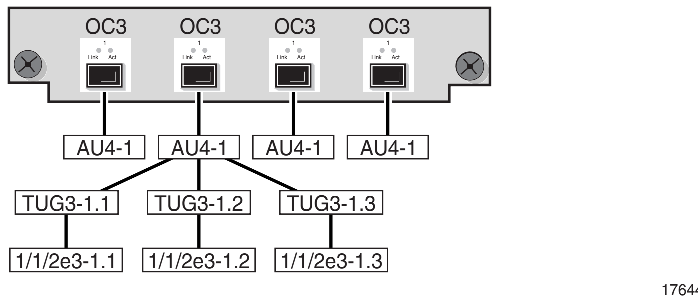
The following example, illustrated in Figure 20-8, shows the channelization sequence for a TU3 payload on a 4 × OC3 Deep Channel card.

1. Four OC-3 ports are created when you create a channelized 4 × OC3 Deep Channel card.
2. The user creates each required AU4 sub-channel.
3. Each AU4 sub-channel implicitly contains three TUG3 groups.

4 You can then configure each TUG3 to carry a TU3 frame

5 Each TU3 frame is channelized into an independent E3 data channel and cannot be changed.

Figure 20-8 Channelized 4 × OC-3 port structure using AU4/TU3 sub-channels



SDH E3 or DS3 payload

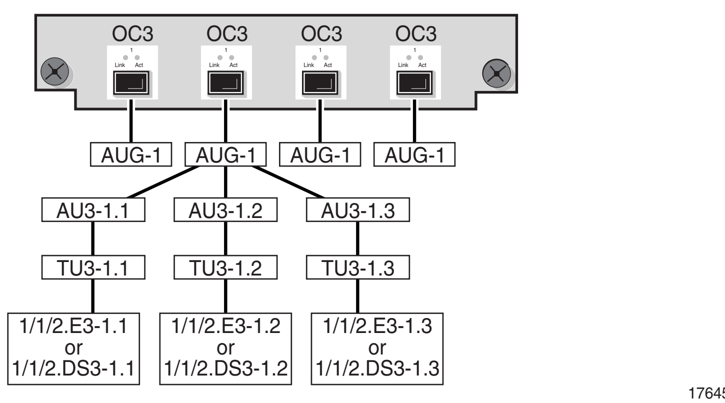
The following example, illustrated in Figure 20-9, shows the channelization sequence for an E3 or DS3 payload on a 4 × OC3 Deep Channel card using AU3 sub-channels.

1 Four OC-3 ports are created when you create a channelized 4 × OC3 Deep Channel card.

2 Each port can be channelized into up to three AU3 sub-channel.

3 Each AU3 frame can be channelized into an independent E3 or DS3 data channel.

Figure 20-9 Channelized 4 × OC-3 port structure using AU3/E3 sub-channels



SDH TU11 and TU12 payloads

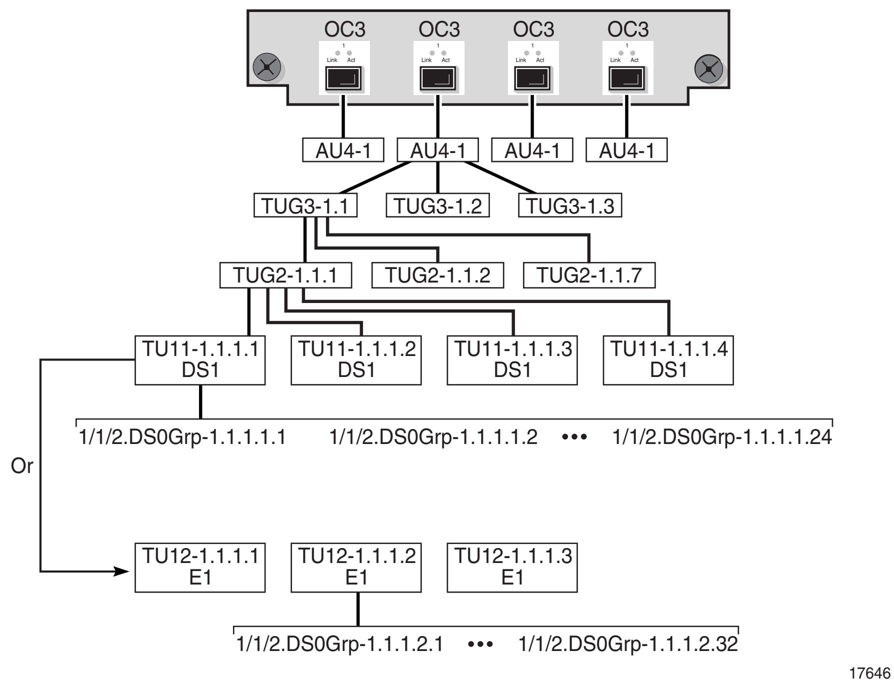
TU11 and TU12 payloads can be channelized using an AU4 sub-channel or an AU-3 sub-channel. An AU4 sub-channel implicitly contains three TUG3 groups. A TUG3 and an AU3 channelized to carry TU11 or TU12 payloads implicitly contain seven TUG2 tributary groups.

The following example, illustrated in Figure 20-10, shows the channelization sequence for a TU11or a TU12 payload on a 4 × OC3 Deep Channel card.

1 Four OC-3 ports are created when you create a channelized 4 × OC3 Deep Channel card.
2 Each port can be channelized into one AU4 sub-channel or three AU3 sub-channels.
3 Each AU4 sub-channel implicitly contains three TUG3 groups.
4 You can then configure each TUG3 group or each AU3 sub-channel to carry a TU11 or TU12 payload.
5 Each TUG3 group or AU3 sub-channel implicitly contains seven TUG2 tributary groups.
6 Each TUG2 group can be channelized into three independent TU12 channels or four independent TU11 channels.
7 Each TU12 can contain an E1 or DS1 data signal. Each TU11 can contain a DS1 data signal. Each E1 can be configured to handle up to 31 DS0 groups. Each DS1 can be configured to handle up to 24 DS0 groups. To use an E1 or a DS1, you must create at least one DS0 group for the DS1 or E1.

Note — On the same TUG3 or AU3, you cannot mix TU-1*X* with DS1 and E1 payload types. Every TU-1*X* on the same TUG3 or AU3 must use the same payload type, either E1 or DS1, not a mix of both. The mix is shown in for illustrating the structure.

Figure 20-10 Channelized 4 × OC-3 port structure using AU4/TU sub-channels



20.4 Workflow to manage port objects

The following workflow describes the sequence of high-level tasks required to manage and configure port objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 13 for more information about device commissioning. See chapter 14 for more information about device discovery.

Note — After they are configured, port objects can be accessed using the equipment navigation tree. See chapter 4 for more information about using the equipment navigation tree.

1. As required, configure Ethernet ports. See Procedure 20-1 for more information.
2. As required, change the port mode. See Procedure 20-2 for more information.
3. As required, migrate SAPs from access mode to hybrid mode. See Procedure 20-3 for more information.
4. As required, configure the 5620 SAM to retain non-default port MTU values. See Procedure 20-4 for more information.
5. As required, copy or move L2 access interface SAPs between ports. See Procedure 20-5 for more information.
6. As required, move L3 access interface SAPs within or between ports on the same NE. See Procedure 20-6 for more information.

7 As required, move L3 subscriber interface SAPs between ports on the same NE. See Procedure 20-7 for more information.

8 As required, copy L3 access interface SAPs between ports on the same NE. See Procedure 20-8 for more information.

9 As required, add a queue group to an Ethernet port. See Procedure 20-9 for more information.

10 As required, configure SONET ports. See Procedure 20-10 for more information.

11 As required, configure an HSMDA port scheduler override. See Procedure 20-11 for more information.

12 As required, configure TDM DS3 ports. See Procedure 20-13 for more information.

13 As required, configure serial ports. See Procedure 20-13 for more information.

14 As required, configure ports on 7210 SAS devices, as follows:

- **a** Configure a 7210 SAS-M channelized TDM DS1 or E1 port; see Procedure 20-14 for more information
- **b** Assign policies to a 7210 SAS Ethernet port. See Procedure 20-15 for more information.
- **c** Configure an SHG for 7210 SAS NEs. See Procedure 20-16 for more information.

15 As required, configure ports on 7250 SAS devices, as follows:

- **a** 7250 SAS CES TDM DS1 or E1 port; see Procedure 20-17 for more information
- **b** Telco and 7250 SAS uplink ports as network ports; see Procedure 20-18 for more information

16 As required, configure a 7705 SAR ASAP channelized TDM port. See Procedure 20-19 for more information.

17 As required, configure a 7710 SR channelized TDM DS1 or E1 port. See Procedure 20-20 for more information.

18 As required, configure ports on 9500 MPR devices:

- **a** 9500 MPR Ethernet ports; see Procedure 20-21 for more information
- **b** ports on a 2xSTM card for 9500 MPR; see Procedure 20-22 for more information
- **c** ports on a 1xSTM Channelized card for 9500 MPR; see Procedure 20-23 for more information
- **d** 9500 MPR E1 and DS1 ports; see Procedure 20-24 for more information
- **e** 9500 MPR DS3 ports; see Procedure 20-25 for more information
- **f** 9500 MPR radio modem ports; see Procedure 20-26 for more information

19 As required, configure the following on 9500 MPR devices:

- **a** 9500 MPR port segregation; see Procedure 20-27 for more information
- **b** analog performance management on 9500 MPR radio modem ports; see Procedure 20-28 for more information
- **c** power source type on 2+2 x Ethernet (EAS) card slots for 9500 MPR; see Procedure 20-29 for more information
- **d** power level performance management on 9500 MPR radio modem ports. See Procedure 20-30 for more information.
- **e** add 9500 MPR port protection; see Procedure 20-31 for more information.
- **f** loopback test on a 9500 MPR DS1, ES1, or radio modem port; see Procedure 20-33 for more information

20 As required, configure OmniSwitch Ethernet ports. See Procedure 20-34 for more information.

20.5 Workflow to manage channel objects

The following workflow describes the sequence of high-level tasks required to manage and configure channel objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered, and that the port objects have been configured. See chapter 13 for more information about device commissioning. See chapter 14 for more information about device discovery.

Note — After they are configured, channel objects can be accessed using the equipment navigation tree. See chapter 4 for more information about using the equipment navigation tree.

1 As required, configure SONET clear channels. See Procedure 20-35 for more information.

2 As required, create channels on ports for card types that support multiple sub-channels. See Procedure 20-36 for more information.

3 As required, configure SONET sub-channels. See Procedure 20-37 for more information.

4 As required, configure SDH sub-channels. See Procedure 20-38 for more information.

5 As required, create VT15 (TU11) or VT2 (TU12) sub-channels. See Procedure 20-39 for more information.

6 As required, create TDM DS1 channels. See Procedure 20-42 for more information.

7 As required, configure TDM DS1 or E1 channels. See Procedure 20-41 for more information.

8 As required, configure serial channels. See Procedure 20-42 for more information.

9 As required, create TDM DS3 channels. See Procedure 20-43 for more information.

10 As required, configure TDM DS3 channels. See Procedure 20-44 for more information.

11 As required, configure a DS3 or E3 channel as a network interface on a channelized ASAP MDA. See Procedure 20-45 for more information.

12 As required, configure an L3 interface on a DS3 or E3 channel on a channelized ASAP MDA. See Procedure 20-46 for more information.

13 As required, configure a PVC. See Procedure 20-47 for more information.

14 As required, create an ILMI link. See Procedure 20-48 for more information.

15 As required, modify an ILMI link. See Procedure 20-49 for more information.

20.6 Port configuration procedures

Use the following procedures to manage ports using the navigation tree.

Procedure 20-1 To configure Ethernet ports

Perform this procedure, as required, depending on the daughter card and port type that you are configuring. Different card types display different port configuration parameters.

Note — Before you can configure 802.1X on an Ethernet access port, 802.1X must be enabled on the device and an 802.1X policy must be created and distributed to the device.

See Procedure 17-6 in chapter 17 for information about enabling 802.1X on a device. See chapter 54 for information about creating and distributing 802.1X policies.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an Ethernet port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Configured MAC
- Mode
- L2Uplink
- Encap Type
- Speed
- MTU (bytes)
- DDM Event Suppression
- Hold Time Up (seconds)
- Hold Time Down (seconds)
- Load Balance Algorithm
- Ingress Percentage of Rate (%)
- Egress Percentage of Rate (%)
- Default VLAN
- Channel
- Rx Decision Threshold Voltage Adjustment
- Optical Transport Channel Unit
- OLC State

Only one MAC address can be assigned to a port. When a new MAC address is configured while the port is operational, IP issues an ARP, if appropriate, and BPDUs are sent with the new MAC address. A default MAC address is assigned by the system.

If the port is a LAG member, the Hold Time Up (seconds) parameter is configurable only if the port is the primary member. The Hold Time Down (seconds) parameter is not configurable when the port is a LAG member.

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

6 If you set the Mode parameter to Hybrid, configure the following parameters in the Hybrid Ingress Buffer Allocation panel. Otherwise, go to step 9:

- Access Weight
- Network Weight

7 If you set the Mode parameter to Hybrid, configure the following parameters in the Hybrid Egress Buffer Allocation panel:

- Access Weight
- Network Weight

8 If you change the Mode parameter from Access to Hybrid and there are SAPs on the port, perform Procedure 20-3 to migrate the SAPs.

9 If you are configuring a 7210 SAS Ethernet port you can add the port to an SHG. See Procedure 20-16 for information about creating a 7210 SAS SHG.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - Physical Port list form opens.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group - Physical Port list form closes, and the Physical Port (Edit) form refreshes with the SHG name.

Note 1 — A port cannot be added to or deleted from an SHG if it has a SAP configured on it or is a member of a LAG.

Note 2 — A port cannot belong to more than one SHG; you must remove any SHGs from the port before you can add the port to a different SHG.

10 Configure the Named Pool Buffer Policy for the port.

i Click on the Select button beside the Name parameter in the Ingress Pool Policy panel. A Select Ingress Pool Policy window opens with a list of ingress pool policies.

ii Choose a policy from the list.

iii Click on the OK button, the Select Ingress Pool Policy window closes and the Name parameter refreshes with the selected policy.

iv Configure the Ingress Percentage of Rate (%) parameter.

v Click on the Select button beside the Name parameter in the Egress Pool Policy panel. A Select Egress Pool Policy window opens with a list of egress pool policies.

vi Choose a policy from the list.

vii Click on the OK button, the Select Egress Pool Policy window closes and the Name parameter refreshes with the selected policy.

viii Configure the Egress Percentage of Rate (%) parameter.

Note — Ensure that the named pool mode is enabled. See Procedure 19-18 in chapter 19 for more information.

11 Click on the States tab button.

12 Configure the Administrative State parameter.

13 Click on the Policies tab button. The Policies form opens with the General tab displayed.

Note — The types of policies that you can choose depend on the type of NE, daughter card, and the mode type of the port you are configuring.

- The Network Queue and Accounting Policies panel are only displayed for network ports.
- The Port Scheduler panel is only displayed for ports on non-HSMDA daughter cards.
- The HSMDA Egress Scheduler panel is only displayed for ports on HSMDA daughter cards.

14 Click on the Select button in the Accounting Policy panel to assign an accounting policy to the port, if applicable. The Select Accounting Policy - Physical Port form opens.

15 Choose an accounting policy from the list and click on the OK button. The Select Accounting Policy - Physical Port form closes.

16 Configure the Collect Accounting Statistics parameter, and if required.

17 If you are configuring a 7210 SAS Ethernet port, perform Procedure 20-15. Otherwise continue to step 18.

18 Click on the Select button in the Network Queue panel to assign a network queue policy to the port, if applicable. The Select Network Queue Policy - Physical Port form opens.

19 Choose a network queue policy from the list and click on the OK button. The Select Network Queue Policy - Physical Port form closes.

20 Click on the Select button in the Port Scheduler Policy panel to assign a port scheduler policy to the port, if applicable. The Select Port Scheduler Policy - Physical Port form opens.

21 Choose a port scheduler policy from the list and click on the OK button. The Select Port Scheduler Policy - Physical Port form closes.

22 Click on the Select button in the HSMDA Egress Scheduler Policy panel to assign a scheduler policy to the port, if applicable. The Select HSMDA Egress Scheduler Policy - Physical Port form opens.

23 Choose a policy from the list and click on the OK button. The Select HSMDA Egress Scheduler Policy - Physical Port form closes.

24 Click on the Ethernet tab button. The Ethernet port configuration form opens with the General tab displayed.

25 Configure the parameters:

- Auto-negotiate
- Duplex
- Dot1 Q Ethertype
- Q in Q Ethertype
- Ingress Rate ()
- Egress Scheduler Mode
- CFM LoopBack Mode
- Egress Rate (Kbps)
- Egress Max-Burst
- Flow
- Ethernet Down Reason
- Down When Looped
- Down On Internal MAC Tx Error
- IP MTU (bytes)
- Port Clock Mode
- Retry Timeout (Sec)
- XGig Mode
- Forward All Multicast Traffic
- Forbid IGMP Snooping
- Backpressure
- Broadcast Limit (Pkts/s)
- Detect Remote Faults
- Detection
- Keep Alive Interval (Sec)
- Single Fiber
- Type
- Time (seconds)
- Swap MAC Address
- Synchronous status messages
- SSM Code-Type
- Tx DUS/DNU

The Dot1 Q Ethertype and Q in Q Ethertype parameters are not configurable for the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco devices. The XGig Mode parameter is only configured for 1 x 10-Gig and 12 x 10-Gig Ethernet interfaces, and is used to treat the port as a WAN-PHY interface, which encapsulates Ethernet frames over SONET.

The Flow parameter is configurable on Telco devices when the Auto-negotiate parameter is set to False.

In the Ethernet Down Reason parameter, the No Service Port option is available only for 7210 SAS-M NEs. The No Service Port applies to BOF which can be configured using CLI. These two ports cannot be used for user traffic. This is a read-only check box which indicates that the ports are down because it was classified as “No Service Port”.

The Backpressure, Broadcast Limit (Pkts/s), Detect Remote Faults, Detection, Forward All Multicast Traffic, and Forbid IGMP Snooping parameters are only configurable on the 7250 SAS, 7250 SAS-ES, and 7250 SAS-ESA.

The Keep Alive Interval (Sec) and Retry Timeout (Sec) parameters are only displayed when the Down When Looped parameter is enabled.

The Single Fiber parameter is configurable for 1 and 10 Gigabit Ethernet network ports on the 7750 SR and 7450 ESS, and is supported only on the 2 x XP MDA IOM 3 and IMM.

The Auto-negotiate and Duplex parameters are not supported on the 3-port 40GE QSFP IMM.

The Type and Time (seconds) parameters in the Timed Loopback panel are configurable only on Ethernet ports on the 7705 SAR, Release 2.1 or later.

Note — Management connectivity between the 5620 SAM and the 7705 SAR may be lost if a line loopback is applied to an Ethernet port that is carrying in-band management traffic. The line loopback remains in effect until the timer expires and the 7705 SAR removes the loopback.

26 To configure CRC threshold parameters, perform the following steps:

i Remove the check mark from the Disable check box and configure the CRC SD Threshold and CRC SD Threshold Multiplier parameters.

ii Remove the check mark from the Disable check box and configure the CRC SF Threshold and CRC SF Threshold Multiplier parameters.

iii Configure the Down On Internal MAC Tx Error parameter.

27 If the port is an access or hybrid port with Q in Q or dot1q encapsulation, the MEPs tab is displayed. Click on the MEPs tab button to add a facility MEP, if required and perform the following steps.

Note — Only one facility MEP can be configured on a port.

i Click on the Create button. The MEP (Create) form opens on the General tab.

ii Click on the Select button to choose a global MEG. The Select Maintenance Entity Group form opens.

iii Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

iv Configure the parameters:

- Auto-Assign ID
- CCM Messages Enabled
- Description
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- Facility Fault Notify

Note — To enable fault propagation on a facility LAG MEP, Facility Fault Notify must be enabled.

v If the MD for the MEP has a Name Type of none the Y.1731 Tests tab is configurable; click on the Y.1731 Tests tab button. Otherwise, go to step vii.

vi Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The MEP (Create) form closes.

28 Click on the 802.3ah tab button to configure and initiate the 802.3ah EFM OAM diagnostic as described in Procedure 38-48. Otherwise, continue to step 29.

29 Click on the 802.1x Port tab button, if required.

30 Configure the parameters:

- Initialize
- Reauthenticate Control

Note — You cannot configure the parameters for the 7710 SR.

31 Click on the 802.1x Port Authenticator tab button, if required. You cannot configure the parameters for the 7710 SR.

32 Configure the parameters:

- Controlled Port Control
- Quiet Period
- Tx Period
- Supplicant Timeout
- Server Timeout
- Max Req
- Reauth Period
- Reauth Enabled

33 Click on the Select button to choose a RADIUS policy. The Select Policy - Physical Port form opens.

34 Choose a RADIUS policy in the list and click on the OK button. The Select Policy - Physical Port form closes and the Physical Port (Edit) form displays the RADIUS policy name.

35 Go to Procedure 20-9 to add a queue group to the port.

36 If the port is an HSMDA access port, the Egress Secondary Shapers tab button is present. Click on the Egress Secondary Shapers tab button to add an egress secondary shaper to the port, if required, and perform the following steps.

Note 1 — An HSMDA port is initially created with a default egress secondary shaper. The default shaper cannot be deleted, but it can be modified.

Note 2 — Non-default egress secondary shapers can only be created if the port's Mode parameter is not set to the network option.

Note 3 — You cannot switch the Mode of an HSMDA port to network if there are non-default egress secondary shapers on that port. An error message will be issued. You must delete any non-default egress secondary shapers from the port before switching its Mode to network.

i Click on the Create button. The HSMDA Egress Secondary Shaper (Create) form opens, with the General tab displayed.

ii Configure the parameters:

- Name
- Low Burst Max Class
- Rate (Mbps)
- Monitor Threshold (Kbytes)
- Low Burst Limit
- High Burst Increase

The Rate (Mbps) parameter can only be configured if the associated MAX check box is not enabled.

iii Click on the Classes tab button.

iv Configure the Class Rate (kbps), Class Monitor Threshold (Kbytes) and Class Burst Threshold (bytes) parameters for Classes 1 through 8, as required.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The new entry appears in the list.

37 Click on the LLDP tab button, if required. The LLDP configuration form opens with the Nearest Bridge sub-tab displayed.

38 Configure the parameters:

- Administrative Status
- Notifications
- Transmit Management Address
- LLDP TLVs

39 Repeat step 38 for the Nearest Non TPMR and Nearest Customer sub-tabs under the LLDP tab, as required.

40 Click on the Remote Peers sub-tab under the LLDP tab to search for and display LLDP remote peers associated with the port. These remote peers are used to determine the physical topology of the network.

41 The Access Group tab is present if the port is on a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device. Click on the Access Group tab, if required. Otherwise, go to step 57.

42 Click on the Create button to create an access group, or select an existing access group in the list and click on the Properties button. The Port Access Group (Create) form opens.

43 Configure the parameters:

- Displayed Name
- Description
- Type

44 Click on the OK button. A dialog box appears.

45 Click on the OK button. The new access group appears in the list.

46 The QoS tab is present if the port is on a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device. Click on the QoS tab button, if required. Otherwise, go to step 58.

47 Click on the Create button to configure QoS settings for the port. The QoSPort (Create) form opens.

48 Configure the parameters:

- Displayed Name
- Description
- Priority
- Queue Algorithm
- Drop Algorithm
- Shaper Rate

49 Click on the OK button. A dialog box appears.

50 Click on the OK button. The new QoS entry appears in the list.

51 Click on the Qos Pool tab button, if required.

52 Choose a QoS pool from the list and click on the Properties button. The QoS Pool (Edit) form opens.

53 Click on the Select button in the Slope Policy panel. The Select Slope Policy - QoS Pool form opens.

54 Choose a slope policy in the list and click on the OK button. The Select Slope Policy - QoS Pool form closes and the QoS Pool (Edit) form refreshes with the name of the slope policy.

55 Configure the parameters:

- Reserved CBS (%)
- Default Reserved CBS
- Amber Alarm Action Max (%)
- Amber Alarm Action Step (%)
- Amber Alarm Threshold (%)
- Red Alarm Threshold (%)

56 Click on the OK button. The QoS Pool (Edit) form closes.

57 Perform one of the following:

a Click on the Override Policy Items tab button to configure HSMDA overrides. See Procedure 20-11 for more information.

b Continue to step 58.

58 To configure a 1x10-Gig Ethernet DWDM tunable optics MDA or a 1-Port OC768 OTU3 Long Reach DWDM Tunable IMM on a 7750 SR or 7450 ESS, click on the Optical Transport Channel Unit tab button. Otherwise, go to step 70.

59 Configure the following parameters on the General tab:

- FEC Mode
- SF-SD Method
- SF Threshold (10E-n bits received)
- SD Threshold (10E-n bits received)
- Configured Data Rate (Gb/s)
- Transmitter Mode
- Transmitter String
- Async Mapping
- Transmitter Bytes
- Expected Rx Mode
- Expected Rx String
- Expected Rx Bytes
- OTU-TIM reaction
- ODU-TIM reaction
- OPU-TIM reaction
- Payload Type (hex)
- Expected Payload Type (hex)
- OPU-PLM reaction

60 Click on the OTU Alarms tab button and select the OTU alarms for the Configured Alarms parameter.

61 Click on the Select button in the DWDM panel to choose a channel. The Wave Length Reference - Physical Port form opens.

62 Use the configurable filter and click on the Search button to generate a list of configurable channels and related wavelengths and frequencies.

63 Select a channel and click on the OK button. The Wave Length Reference - Physical Port form closes and the channel number, wavelength, and frequency are displayed in the DWDM panel of the Physical Port (Edit) form.

64 Click on the Optical tab button and configure the following parameters on the Wavelength Track tab:

- Wave Tracker Encode
- Wave Tracker Power Control
- Configured Alarms
- Wave Key1
- Wave Key2
- Target Power

65 Click on the Optical Amplifier tab button and configure the Configured Alarms parameter.

66 Click on the Optical Tunable Dispersion Compensation Module tab button.

67 Configure the following parameters:

- Channel
- Dispersion
- Control Mode
- Configured Alarms

68 Click on the Apply button. A dialog box appears.

69 Click on the Yes button.

70 Click on the other tab buttons to view and edit additional port information.

71 Click on the Cancel if no changes were made, otherwise click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-2 To change the port mode

Perform this procedure to change the port mode between Network and Access modes.

Note — Save the device configuration before you perform this procedure. See the appropriate NE documentation for more information.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to change the port mode and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port. The Physical Port (Edit) form opens with the General tab displayed.

5 Change the Mode parameter as required and click on the Apply button.

6 If you are changing the mode from Access to Network and there are services configured on the port, one of two warnings is presented in a dialog box, depending on the permissions associated with your user role.

a The default warning dialog indicates that the object has dependencies that will be deleted if you apply the port mode change.

i Click on View Dependencies button to see the number of dependencies (services and interfaces) associated with the port.

ii Click on the OK button.

iii Confirm that you understand the implications of changing the port mode by enabling the “I understand the implications of this action” check box. A confirmation dialog box appears.

iv Click on the Yes button. Any services and interfaces associated with the port, including SAPs, are deleted, and the mode for the port is changed to Network.

Note — Changing the port mode from Access to Network without first removing the dependencies results in a TopologyMisconfigured alarm.

b For users who have the port.RestrictNodeConfigModify permission associated with their role, a warning form appears, indicating that the object has dependencies that must be removed before proceeding.

i Click on View Dependencies button to see the number of dependencies (services and interfaces) associated with the port.

ii Click on the OK button.

iii Remove the services or interfaces associated with the port. You can manually delete them or move them to other ports as described in this chapter.

iv Repeat steps 3 to 5 to change the port mode to Network.

Procedure 20-3 To migrate SAPs from access mode to hybrid mode

Perform this procedure on Ethernet or SC-LAG access ports that contain SAPs.

Note — Save the device configuration before you perform this procedure. See the appropriate NE documentation for more information.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to migrate SAPs and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on an Ethernet port or SC-LAG port. The Physical Port (Edit) form opens with the General tab displayed.

5 Change the Mode parameter from Access to Hybrid. A dialog box opens.

6 Click on the Yes button. A warning form appears, stating that you must perform an admin save.

7 Perform Procedure 23-4 in response to the warning form.

8 Select the I understand the implications of this action check box and click on the Yes button. The SAP Migration Result window displays information about the number of SAPs migrated.

9 Click on the OK button to close the windows.

Procedure 20-4 To configure the 5620 SAM to retain non-default port MTU values

Use this procedure to configure a 5620 SAM server for non-default MTU refresh behavior.

Note — If the 5620 SAM system is deployed in a redundant configuration, you must perform this procedure on each main server in the 5620 SAM server cluster.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3 Open the nms-server.xml file with a plain-text editor.

4 Add the following line to the end of the file:

```
<customMTURefresh refresh="true"/>
```

5 Save the nms-server.xml file.

6 Close the nms-server.xml file.

7 Open a console window.

8 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the console prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The 5620 SAM server reads the nms-server.xml file and puts the configuration change into effect.

10 Close the console window.

Procedure 20-5 To copy or move L2 access interface SAPs between ports

Note — In this release, you cannot move or copy an MSAP.

You can also use the 5620 SAM clipboard functionality to copy or move SAPs. See chapter 3 for information about using the 5620 SAM clipboard.

1 For the source NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

2 On the source NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

admin save *file_name* ↵

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the copy or move operation

Caution — An unsuccessful SAP copy or move may result in the deletion of one or more source SAPs from the source NE. The backed-up configuration file is required to restore the configuration on the source NE if a SAP copy or move operation fails.

See the appropriate device documentation for more information about saving the device configuration to a file.

3 For the destination NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

4 On the destination NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

admin save *file_name* ↵

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the copy or move operation

See the appropriate device documentation for more information about saving the device configuration to a file.

5 Open the Deployment form to monitor deployments as they occur during the SAP copy or move operation. Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Incomplete Deployments tab is displayed.

Caution — Alcatel-Lucent strongly recommends that you monitor the NE deployments and the Alarm window during a SAP copy or move operation to ensure that faults that may arise during the operation are immediately detected.

The Incomplete Deployments tab of the Deployment form notifies the 5620 SAM operator of configuration changes that are not successfully deployed to the NE, and the 5620 SAM Alarm window alerts the operator to object failures on the NE that are related to the copy or move operation.

6 Choose Tools→Copy/Move SAPs. The Copy/Move SAPs form opens with the General tab displayed.

7 Arrange the forms on the GUI so that the Copy/Move SAPs form, the Deployment form, and the Alarm window are all shown.

8 Click on the Result Export Path tab button. The Result Export Path form opens.

9 Specify the file name and location in which to save a text file that contains the results of the SAP copy or move operation.

10 Click on the Set button. The Result Export Path form closes.

11 Click on the Select button beside the Source Node parameter. The Select Network Elements form opens.

12 Choose a source NE from the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Source panel.

13 Click on the Select button beside the Source Port parameter. The Select Port form opens.

14 Configure the filter criteria. A list of available ports is displayed.

15 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Source panel.

16 Click on the Select button beside the Destination Node parameter. The Select Network Elements form opens.

17 Select a destination NE in the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Destination panel.

18 Click on the Select button beside the Destination Port parameter. The Select Port form opens.

19 Configure the filter criteria. A list of available ports is displayed.

20 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Destination panel.

21 Configure the parameters:

- Current Mode
- Outer Encap Value Start
- Outer Encap Value End
- Inner Encap Value Start
- Inner Encap Value End
- Service Type
- Outer Encap Value Offset
- Inner Encap Value Offset
- Action Type
- Continue on individual Failure

22 Click on the Execute button to begin the copy or move operation. The Execution Result panel displays the execution state of the copy or move operation and the number of successful and failed operations based on the input criteria.

Note — When you copy or move a SAP on an L2 interface and there is a non-zero value assigned to the PIM Snooping parameter Maximum Number of Groups, the value is not copied or moved to the new location. You must manually configure the Maximum Number of Groups parameter in the new location.

23 Monitor the Deployments form and the Alarm window for any deployment failures and faults related to the SAP copy or move operation. Click on the Refresh button of the Deployments form to update the list, if required.

24 Click on the Result tab button to view a list of the successful and failed operations as identified by the 5620 SAM.

25 Click on the Refresh Result button to view the most recent results.

26 To view the information for an individual SAP copy or move operation, move the mouse pointer over the Message field of the operation.

27 If a copy or move operation fails, you can restore the previous source NE configuration using the backup configuration file created in step 2. To restore the previous NE configuration:

i Open a CLI on the source NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file that was specified in step 2

The SAPs that were deleted during the unsuccessful copy or move operation are restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

admin save ↵

28 If a copy or move operation partially fails, you can restore the previous destination NE configuration using one of the following methods.

Note — If the copy or move operation fails completely, there is no need to restore the previous configuration because no SAPs are created on the destination NE.

a Restore the backed-up configuration file.

i Open a CLI on the destination NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file specified in step 4

The previous configuration is restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

admin save ↵

b Manually delete the SAPs that the copy or move operation created on the destination NE.

29 Restore the previous automatic configuration backup functionality in the backup policy used by the source NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

30 Restore the previous automatic configuration backup functionality in the backup policy used by the destination NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

31 Close the Copy/Move SAPs and the Deployments forms.

Procedure 20-6 To move L3 access interface SAPs within or between ports on the same NE

Perform this procedure to move one or more L3 access interface SAPs within a port, or from one port to another port on the same NE.

To copy one or more L3 access interface SAPs from one port to another port on the same NE, see Procedure 20-8 for more information.

To copy or move L3 access interface SAPs from one port to another on different NEs, see the *5620 SAM Scripts and Templates Developer Guide* for information about the administrative tasks associated with service templates.

You can also use the 5620 SAM clipboard functionality to move SAPs. See chapter 3 for information about using the 5620 SAM clipboard.

Note — L3 access interfaces are not bound to a port; for example, loopback interfaces cannot be moved.

1. For the NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

2. On the NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

   admin save *file_name* ↵

   where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the move operation

   See the appropriate device documentation for more information about saving the device configuration to a file.

3. Open the Deployment form to monitor deployments as they occur during the SAP move operation. Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Incomplete Deployments tab is displayed.

   Caution — Alcatel-Lucent strongly recommends that you monitor the NE deployments and the Alarm window during a SAP move operation to ensure that faults that may arise during the operation are immediately detected.

   The Incomplete Deployments tab of the Deployment form notifies the 5620 SAM operator of configuration changes that are not successfully deployed to the NE, and the 5620 SAM Alarm window alerts the operator to object failures on the NE that are related to the move operation.

4. Choose Tools→Copy/Move SAPs. The Copy/Move SAPs form opens with the General tab displayed.

5. Arrange the forms on the GUI so that the Copy/Move SAPs form, the Deployment form, and the Alarm window are all shown.

6. Click on the Result Export Path tab button. The Result Export Path form opens.

7. Specify the file name and location in which to save a text file that contains the results of the SAP move operation.

8 Click on the Set button. The Result Export Path form closes.

9 Click on the Select button beside the Source Node parameter. The Select Network Elements form opens.

10 Choose an NE from the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Source panel.

11 Click on the Select button beside the Source Port parameter. The Select Port form opens.

12 Configure the filter criteria. A list of available ports is displayed.

13 Choose a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Source panel.

14 Click on the Select button beside the Destination Port parameter. The Select Port form opens.

15 Configure the filter criteria. A list of available ports is displayed.

16 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Destination panel.

17 Configure the parameters:

- Current Mode
- Outer Encap Value Start
- Outer Encap Value End
- Inner Encap Value Start
- Inner Encap Value End
- Service Type
- Outer Encap Value Offset
- Inner Encap Value Offset
- Continue on individual Failure

18 Click on the Execute button to start the move operation. The Execution Result panel displays the execution state of the move operation and the number of successful and failed operations based on the input criteria.

19 Monitor the Deployments form and the Alarm window for any deployment failures and faults related to the SAP move operation. Click on the Refresh button of the Deployments form to update the list, if required.

20 Click on the Result tab button to view a list of the successful and failed operations as identified by the 5620 SAM.

21 Click on the Refresh Result button to view the most recent results.

22 To view the information for an individual SAP move operation, move the mouse pointer over the Message field of the operation.

23 If a move operation fails, you can restore the previous NE configuration using the backup configuration file created in step 2. To restore the previous NE configuration:

i Open a CLI on the NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file specified in step 2

The SAPs that were deleted during the unsuccessful move operation are restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

admin save ↵

24 Restore the previous automatic configuration backup functionality in the backup policy used by the NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

25 Close the Copy/Move SAPs and the Deployments forms.

Procedure 20-7 To move L3 subscriber interface SAPs between ports on the same NE

Perform this procedure to move one or more L3 subscriber interface SAPs from one port to another port on the same NE.

To copy or move L3 subscriber interface SAPs from one port to another on different NEs, see the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

You can also use the 5620 SAM clipboard functionality to move SAPs. However, you can only move all of the SAPs in a group interface; you cannot be used to move a subset of SAPs. See chapter 3 for information about using the 5620 SAM clipboard.

1 For the NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

2 On the NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

admin save *file_name* ↵

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the move operation

See the appropriate device documentation for more information about saving the device configuration to a file.

3 Open the Deployment form to monitor deployments as they occur during the SAP move operation. Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Incomplete Deployments tab is displayed.

Caution — Alcatel-Lucent strongly recommends that you monitor the NE deployments and the Alarm window during a SAP move operation to ensure that any faults that arise during the operation are immediately detected.

The Incomplete Deployments tab of the Deployment form notifies the 5620 SAM operator of configuration changes that are not successfully deployed to the NE, and the 5620 SAM Alarm window alerts the operator to object failures on the NE that are related to the move operation.

4 Choose Tools→Copy/Move SAPs. The Copy/Move SAPs form opens with the General tab displayed.

5 Arrange the forms on the GUI so that you can view the entire Copy/Move SAPs form, the Deployment form, and the Alarm window.

6 Click on the Result Export Path tab button. The Result Export Path form opens.

7 Specify the file name and location in which to save a text file that contains the results of the SAP move operation.

8 Click on the Set button. The Result Export Path form closes.

9 Click on the Select button beside the Source Node parameter. The Select Network Elements form opens.

10 Choose an NE from the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Source panel.

11 Click on the Select button beside the Source Port parameter. The Select Port form opens.

12 Configure the filter criteria. A list of available ports is displayed.

13 Choose a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Source panel.

14 Configure the filter criteria. A list of available ports is displayed.

15 Choose a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Destination panel.

16 Configure the parameters:

- Current Mode
- Service Type
- Outer Encap Value Offset
- Inner Encap Value Offset
- Continue on individual Failure

17 Click on the Execute button to start the move operation. The Execution Result panel displays the state of the move operation, and the number of successful and failed operations based on the input criteria.

18 Monitor the Deployments form and the Alarm window for any deployment failures and faults related to the SAP move operation. Click on the Refresh button of the Deployments form to update the list, if required.

19 Click on the Result tab button to view a list of the successful and failed operations, as identified by the 5620 SAM.

20 Click on the Refresh Result button to view the most recent results.

Note — If one SAP fails, all SAPs under the same group interface fail because the SAPs can only move together. In this case, there is insufficient information to determine which SAP caused the problem using the 5620 SAM.

21 To view information about an individual SAP move operation, move the mouse pointer over the Message field of the operation.

22 If a move operation fails, you can restore the previous NE configuration using the backup configuration file created in step 2. To restore the previous NE configuration:

i Open a CLI on the source NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file specified in step 2

The SAPs that were deleted during the unsuccessful move operation are restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

admin save ↵

23 Restore the previous automatic configuration backup functionality in the backup policy used by the NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See chapter 23 for more information about configuring automatic configuration backup for an NE.

24 Close the Copy/Move SAPs and the Deployments forms.

Procedure 20-8 To copy L3 access interface SAPs between ports on the same NE

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 Click on the L3 Access Interfaces tab button.

5 Choose an L3 access interface and click on the Properties button. The L3 Access Interface (Edit) form opens.

6 Click on the Port tab button.

7 Click on the More Actions button and choose Copy.

   a If you are copying an IES L3 access interface, an L3 Access Interface (Create) form opens. Go to step 9.

   b If you are copying a VPRN L3 access interface, a Select Site form opens. Go to step 8.

8 Select a site and click on the OK button. The L3 Access Interface (Create) form opens.

9 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

10 Click on the Port tab button.

11 Click on the Select button in the Terminating Port panel to choose a port to associate with the L3 access interface. The Select Terminating Port - L3 Access Interface form opens.

12 Configure the filter criteria. A list of available ports appears.

Note — Only ports in access mode appear in the list.

13 Select a port and click on the OK button. The Select Terminating Port - IES Service Access Point form closes, and the IES Service Access Point (Create) form reappears with the port information displayed.

14 Click on the OK button. A dialog box appears.

15 Click on the OK button to confirm the action. The L3 Access Interface (Create) form closes and the service configuration form appears with the newly created L3 access interface.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The service configuration form closes.

Procedure 20-9 To add a queue group to an Ethernet port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on a device where an Ethernet port is configured and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and right-click on an Ethernet port. Select Properties from the contextual menu. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the Ethernet tab button.

6 Perform one of the following:

a Click on the Network Egress Queue Group tab button.

b Click on the Access Egress Queue Group tab button.

c Click on the Access Ingress Queue Group tab button.

Note — The Network Egress Queue Group tab button is available if queue groups are supported on the port, depending on the NE release and IOM type. See section “Port queue groups” in chapter 65 for more information about supported devices and IOM types.

7 Click on the Create button. The Queue Group (Create) form opens with the General tab displayed.

8 Click on the Select button in the Queue Group Template Policy panel. The Select Queue Group Template Policy - Queue Group list form opens.

9 Choose a queue group template policy from the list and click on the OK button. The Select Queue Group Template Policy - Queue Group list form closes.

10 Configure the Description parameter.

11 Click on the Select button beside the ID parameter in the Accounting Policy panel. The Select Accounting Policy - Queue Group list form opens.

> **Note —** Only the accounting policies with the Type parameter configured to one of the following options are listed:
>
> - Queue Group Octets
> - Queue Group Packets
> - Combined Queue Group

12 Choose an accounting policy from the list and click on the Ok button. The Select Accounting Policy - Queue Group list form closes and the Queue Group (Create) form refreshes with the accounting policy information.

13 Configure the Collect Accounting Statistics parameter.

14 Click on the Select button in the Scheduler Policy panel to assign a scheduler policy to the port. The Select Scheduler Policy - Queue Group list form opens.

15 Choose a scheduler policy from the list and click on the OK button. The Select Scheduler Policy - Queue Group list form closes.

16 If you are adding an access ingress queue group, go to step 23. Otherwise, continue to step 17.

17 Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only if you did not select a scheduler policy in step 15.
The Frame-Based Accounting parameter is configurable only if you configure the Aggregate Rate Limit (kbps) parameter.

18 If you are adding a network egress queue group, go to step 23. Otherwise, continue to step 19.

19 Click on the Host Matching tab button.

20 Click on the Create button. The Host String (Create) form opens.

21 Configure the Host String parameter.

22 Click OK. The Host String (Create) form closes and the information on the Host Matching tab is updated.

23 Click on the Overrides: Queue tab button.

24 Click on the Create button. The Queue Override (Create) form opens.

25 Click on the Select button beside the ID parameter to select an egress queue. The Select Queue - Queue Override list form opens.

26 Choose an entry from the list and click on the OK button. The Select Queue - Queue Override list form closes and the Queue Override (Create) form refreshes with the queue information.

27 Click on the Override Policy Items tab button.

28 Configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- PIR Adaptation
- CIR Adaptation
- PIR (kbps)
- CIR (kbps)

The parameters are configurable when the Override check box is enabled.

29 Click on the OK button to save the configuration and close the Queue Override (Create) form. A dialog box appears.

30 Click on the OK button.

31 Click on the OK button to save the configuration and close the Queue Group (Create) form. A dialog box appears.

32 Click on the OK button. A dialog box appears.

33 Click on the Yes button to save the configuration and close the Physical Port (Edit) form.

34 Close the Network Element (Edit) form.

Procedure 20-10 To configure SONET ports

Perform the steps in this procedure as required depending on the daughter card and port type that you are configuring.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a SONET ports and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Speed
- DDM Event Suppression
- OLC State

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Click on the Channels tab button to configure the SONET/SDH channel.

- **a** Click on the Create button to create a new channel.
- **b** Choose a channel from the list and click on the Properties button to view and edit the channel parameters.
- **c** Choose a channel from the list and click on the Delete button to remove a channel from the port.

9 Click on the SONET tab button.

10 Configure the parameters:

- Framing
- Clock Source
- Loopback
- Single Fiber
- Hold Time Down (100s of ms)
- Hold Time Up (100s of ms)
- Tx DUS/DNU

11 Click on the SONET Monitoring tab button.

12 Configure the parameters:

- BER Signal Degradation Threshold
- BER Signal Failure Threshold
- Report Alarms

13 Click on the SONET Overhead tab button.

14 Configure the parameters:

- SONET Section Trace Mode
- J0 Byte
  Enter a J0 byte that identifies the circuit. This byte is inserted continuously at source. This can be checked against the expected value by the receiver. If no byte is entered, then null is used. The parameter is configurable when the SONET Section Trace Mode is set to Byte.
- J0 String
  The parameter is configurable when the SONET Section Trace Mode is set to String.

15 Click on the other tab buttons in the properties form to view and edit additional port information.

16 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-11 To configure an HSMDA override

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an HSMDA override and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon to the HSMDA card level.

4 Expand the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the Override Policy Items tab button. The Override configuration form opens with the HSMDA Scheduler tab displayed.

6 Click on the Create button. The Port Egress HSMDA Scheduler Policy Override (Create) form opens with the General tab displayed.

7 Click on the Override tab button.

8 Configure the parameters:

- Maximum Rate (Mbps)
- Rate (Mbps)
- Weight in Group

The Rate (Mbps) parameter is configurable when a Group is not specified for the applied HSMDA scheduler policy. The Weight in Group parameter is only configurable when Group 1 or Group 2 is specified for the HSMDA scheduler policy.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Override configuration form is updated with the scheduler override.

11 Close the Physical Port (Edit) form.

Procedure 20-12 To configure TDM DS3 ports

Perform the steps in this procedure as required depending on the port type that you are configuring.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a TDM DS3 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the General tab parameters:

- Description
- Speed
- OLC State
- DDM Event Suppression

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Click on the DS3/E3 tab button.

9 Configure the parameters:

- Line Buildout
- Type

10 Click on the other tab buttons in the properties form to view and edit additional port information.

11 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-13 To configure serial ports

Perform this procedure to configure a port on a 12 x Serial Data card on the 7705 SAR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to configure a serial port and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Speed
- Serial Type
- OLC State

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Click on the other tab buttons in the properties form to view and edit additional port information.

9 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-14 To configure a 7210 SAS-M channelized TDM DS1 or E1 port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7210 SAS-M channelized TDM DS1 or E1 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a 7210 SAS-M port object that contains a channelized DS1 or E1. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- OLC State

6 Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - Physical Port form opens.

7 Choose an SHG and click on the OK button. The Select Split Horizon Group - Physical Port form closes and the Physical Port (Edit) form refreshes with the SHG name.

Note — To create or delete a 7210 SAS SHG, see Procedure 20-16.

8 Click on the DS1/E1 tab button.

9 Configure the parameters:

- Port Type
- Line Length
- Line Impedance

Note — The Line Impedance parameter only appears when the Port Type parameter is set to E1.

10 Click on the Qos Pool tab button.

11 Choose a QoS pool from the list and click on the Properties button. The QoS Pool (Edit) form opens.

12 Click on the Select button in the Slope Policy panel. The Select Slope Policy - QoS Pool form opens.

13 Choose a slope policy in the list and click on the OK button. The Select Slope Policy - QoS Pool form closes and the QoS Pool (Edit) form refreshes with the name of the slope policy.

14 Click on the OK button. The QoS Pool (Edit) form closes.

15 Click on the States tab button.

16 Configure the Administrative State parameter.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 20-15 To assign policies to a 7210 SAS Ethernet port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on a 7210 SAS device with a configured Ethernet port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the Policies tab button. The Policies form opens with the General tab displayed.

6 Perform one of the following to assign policies to a 7210 SAS Ethernet port.

   a If the port is in access mode, go to step 7.

   b If the port is in network mode or is an L2Uplink port, go to step 8.

7 You can assign port scheduler and access egress policies, and enable queues for statistics collection when the 7210 SAS port mode is access.

   i Click on the 7210 Specific tab button.

   ii Click on the Clear button in the PortScheduler Policy panel to remove the selected policy.

   iii Click on the Select button in the PortScheduler Policy panel to assign a port scheduler policy to the port. The Select PortScheduler Policy - Sas Port form opens.

iv Choose a policy from the list and click on the OK button. The Select PortScheduler Policy - Sas Port form closes.

v Click on the Clear button in the Access Egress Policy panel to remove the selected policy.

vi Click on the Select button in the Access Egress Policy panel to assign an access egress policy to the port. The Select Access Egress Policy - Sas Port form opens.

vii Choose a policy from the list and click on the OK button. The Select Access Egress Policy - Sas Port form closes.

viii If you are configuring the collection of egress packet forwarding statistics, click on the 7210 Statistics tab button. Otherwise, go to step 9.

ix Configure the Queue 1 through Queue 8 parameters, as required.

Note — Enabling these queues is only applicable to the 7210 SAS-E. While any queue of any port can be enabled, only eight counters in total can be enabled for each 7210 SAS-E device.

x Go to step 9.

8 You can assign accounting, port scheduler, network, and network queue policies when the 7210 SAS port mode is network or when it is an L2Uplink port.

i Click on the 7210 Specific tab button.

ii Click on the Clear button in the PortScheduler Policy panel to remove the selected policy.

iii Click on the Select button in the PortScheduler Policy panel to assign a port scheduler policy to the port. The Select PortScheduler Policy - Sas Port form opens.

iv Choose a policy from the list and click on the OK button. The Select PortScheduler Policy - Sas Port form closes.

v Click on the Clear button in the Network Policy panel to remove the selected policy.

vi Click on the Select button in the Network Policy panel to assign a network policy to the port. The Select Network Policy - Sas Port form opens.

vii Choose a policy from the list and click on the OK button. The Select Network Policy - Sas Port form closes.

viii Click on the Clear button in the Network Queue panel to remove the selected policy.

ix Click on the Select button in the Network Queue panel to assign a network queue policy to the port. The Select Network Queue Policy - Physical Port form opens.

x Choose a policy from the list and click on the OK button. The Select Network Queue Policy - Physical Port form closes.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button to apply the changes. The Physical Port (Edit) form closes.

11 Close the Network Element (Edit) form.

Procedure 20-16 To create a 7210 SAS SHG

Traffic that arrives on a access or access uplink port or LAG within an SHG is not copied to other ports and LAGs in the same SHG; the traffic is copied to ports and LAGs in other SHGs if they exist within the same VPLS. Ports and LAGs are added to an SHG when you configure a port or LAG on a 7210 SAS. SHGs are not supported for a VPLS instance.

1 Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the SHG and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Split Horizon Groups tab button.

4 Click on the Create button. The Split Horizon Group (Create) form opens.

5 Configure the parameters:

- Name
- Description

6 Click on the OK button. A dialog box appears.

7 Click on the OK button. The SHG is added to the displayed list.

Note 1 — Only one SHG can be configured per service.

Note 2 — A SHG and a Mesh SDP Binding cannot exist simultaneously on a single service.

8 Repeat steps 4 to 7 to add another SHG, if required.

9 To view the ports, LAGs, and faults that are associated with an SHG, choose an SHG from the list and click on the Properties button.

10 If you need to delete an SHG, select the SHG and click on the Delete button. A dialog box appears.

11 Enable the check box and click on the Yes button. You cannot delete an SHG if there are any ports or LAGs bound to it.

12 Close the Network Element (Edit) form.

Procedure 20-17 To configure a 7250 SAS CES TDM DS1/E1 port

Perform this procedure to configure a TDM DS1/E1 port on a CES 2-Port Gig Ethernet MDA card.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7250 SAS CES TDM DS1/E1 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a 7250 SAS CES port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Click on the T1/E1 tab button.

9 Configure the parameters:

- Line Buildout
- Line Length
- Line Impedance

10 Click on the OK button. A dialog box appears.

11 Click on the OK button.

Procedure 20-18 To configure Telco and 7250 SAS uplink ports as network ports

When you add a 7250 SAS or Telco device to a ring group, the device ports can be used as VLAN service access points or as network uplink ports that receive ring group traffic from a device such as a 7450 ESS.

By default, the Mode parameter for 7250 SAS or Telco devices is set to Access. You can configure the required ports to act as uplink ports by setting the parameter to Network.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure network ports and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Set the Mode parameter to Network.
  An access port is used for customer-facing traffic on which services are configured. The Encap Type parameter for an access port must be set to Dot1 Q.
  A network port participates in the service provider transport or infrastructure network. For 7250 SAS and Telco devices, the network port acts as the uplink for the ring to the transport network. The Encap Type parameter for an uplink port must be set to Dot1 Q.
- Speed
- OLC State

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Configure the other Ethernet port parameters, as described in Procedure 20-1.

Procedure 20-19 To configure a 7705 SAR ASAP channelized TDM port

This procedure applies to 7705 SAR channelized TDM DS1/E1 ports and channelized TDM DS3/E3 ports.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7705 SAR ASAP channelized TDM port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a 7705 SAR port object that contains a channelized port (DS1/E1 or DS3/E3). The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- OLC State

6 Click on the DS1/E1 or DS3/E3 tab button.

7 Configure the parameters:

- Port Type
- Line Length
- Line Impedance

All ports of the ASAP daughter card are automatically configured to the same port type when the first port is configured. A mix of DS1 and E1 ports or DS3 and E3 ports is not supported. The Port Type parameter can only be modified when no channels are configured on any port of the daughter card. If all of the channels are deleted on the daughter card, the port type is automatically set to DS1 or DS3 for all ports.

8 Click on the States tab button.

9 Configure the Administrative State parameter.

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-20 To configure a 7710 SR channelized TDM DS1 or E1 port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a 7710 SR channelized TDM DS1 or E1 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a 7710 SR port object that contains a channelized DS1 or E1. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- OLC State

6 Click on the DS1/E1 tab button.

7 Configure the parameters:

- Port Type
- Line Buildout
- Line Length
- Db Loss

8 Click on the States tab button.

9 Configure the Administrative State parameter.

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-21 To configure 9500 MPR Ethernet ports

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure an 9500 MPR Ethernet port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Configure the Port Usage parameter if you are provisioning the following ports:

- ports 1 to 4 on the 2+2 x Ethernet (EAS) card
- ports 5 to 8 on the 4+4 x Ethernet (EAS) card
- ports 1 to 6 on the core-enhanced card

7 Configure the OLC State parameter.

8 Click on the States tab button.

9 Configure the Administrative State parameter.

10 Click on the Ethernet tab button. The Ethernet port configuration form opens with the General tab displayed.

11 Configure the parameters:

- Auto-negotiate
- Advertised Capability

Note — Check what combination is supported for Advertised Capability in the *9500 MPR User Guide*.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 20-22 To configure ports on a 2xSTM card for 9500 MPR

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the card where you need to configure the 2xSTM card type and choose Configure card from the contextual menu. The Card Slot (Create) form opens with the General tab displayed.

4 Set the Assigned Card Type parameter to 2xSTM. The card is configured and two ports are displayed.

5 Expand to the port level and right-click on Properties. The Physical Port (Edit) form opens with the General tab displayed.

6 In the Port Usage panel, configure the ports by selecting one of the following:

- EMPTY
- SFP-O
- SFP-E

a When you set the card to SFP-O, the 2xSTM port is configured and the Protection tab is enabled, see Procedure 19-19 in chapter 19 for more information on card Protection. When the card is set to EMPTY, all the configured ports revert back to an empty slot after the port is shutdown.

b When you set the card to SFP-E, the 2xSTM port is configured but the Protection tab is disabled.

c When you set the card to EMPTY, all the configured ports revert back to an empty slot after the port is shutdown.

Note 1 — You need to shut down the configured port to remove the port. Select the port and choose Port→Shut Down. Choose Port→Properties. Configure the Port Usage parameter to EMPTY. The SFP-O ports are removed. You can now configure other ports.

Note 2 — Protection for cards is at the card level. It cannot be configured at the port level. Configure protection for the main cards and the spare cards. Protection is enabled only for the SFP-O port.

Note 3 — 1+1 Protection can be set at different card levels. This provides redundancy. Both cards should be enabled and configured to SFP-O before protection is set.

7 After the SFP-O ports are configured, choose Card→Properties. The Card [Edit] form is displayed with the Protection tab enabled.

8 Set the Protection Type parameter to 1+1 EPS protection. All of the SFP-O ports are protected.

9 Click on the OK button to save the change. A dialog box appears.

10 Click on the Yes button. The Card [Edit] form closes.

Procedure 20-23 To configure a port on a 1xSTM Channelized card for 9500 MPR

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the card where you need to configure the 1xSTM Channelized card type and choose Configure card from the contextual menu. The Card Slot [Create] form opens with the General tab displayed.

4 Set the Assigned Card Type parameter to 1xSTM (Channelized).

5 Expand to the port level and right-click on Properties. The Physical Port [Edit] form opens with the General tab displayed.

6 In the Port Usage panel configure the port by selecting one of the following:

- EMPTY
- SFP-O
- SFP-E

a When you set the card to SFP-O, the 1xSTM Channelized port is configured, 63E1 channels are created. You can enable the E1 channel, see Procedure 20-24 for more information. The Protection tab is enabled, see Procedure 19-19 in chapter 19 for more information on card Protection. If the card is set to EMPTY, the configured port reverts back to an empty slot after the port is shutdown.

b When you set the card to SFP-E, the 1xSTM Channelized port is configured, 63E1 channels are created, but the Protection tab is disabled.

c When you set the card to EMPTY, the configured port reverts back to an empty slot after the port is shutdown.

Note 1 — You need to shut down the configured port to remove the port. Select the port and choose Port→Shut Down. Choose Port→Properties. Configure the Port Usage parameter to EMPTY. The SFP-O ports are removed. You can now configure other ports.

Note 2 — Protection for cards is at the card level. It cannot be configured at the port level. Configure protection for the main cards and the spare cards. Protection is enabled only for the SFP-O port.

Note 3 — 1+1 Protection can be set at different card levels. This provides redundancy. Both cards should be enabled and configured to SFP-O before protection is set.

7 Once the SFP-O port is configured, select Card→Properties. The Card [Edit] form is displayed with the Protection tab enabled.

8 From the Protection Type drop down menu, select 1+1 EPS protection. The SFP-O port is protected.

9 Click on the OK button to save the change. A dialog box appears.

10 Click on the Yes button. The Card [Edit] form closes.

Procedure 20-24 To configure 9500 MPR E1 and DS1 ports

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure a 9500 MPR E1 or DS1 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Configure the OLC State parameter.

7 Click on the States tab button.

8 Configure the Administrative State parameter.

9 Click on the DS1/E1 tab button.

10 Configure the parameters:

- Signal Mode
- Line Code
- Line Code

If you are configuring an E1 port you can only configure the Signal Mode parameter.

11 Click on the other tab buttons in the properties form to view additional port information.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 20-25 To configure 9500 MPR DS3 ports

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Expand the 9500 MPR NEs icon.
3. Right-click on the device where you want to configure a 9500 MPR DS3 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.
4. On the Network Element (Edit) form navigation tree, expand the Shelf icon.
5. Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.
6. Configure the OLC State parameter.
7. Click on the States tab button.
8. Configure the Administrative State parameter.
9. Click on the DS3/E3 tab button.
10. Configure the parameters:
    - Signal Mode
    - Line Code
    - AIS Signal Type
11. Click on the other tab buttons in the properties form to view additional port information.
12. Click on the OK button. A dialog box appears.
13. Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 20-26 To manage 9500 MPR radio modem ports

Note — The 5620 SAM supports limited configuration of radio modem ports on the 9500 MPR.

You can configure MPT radio ports for SFP, MPT-HC, MPT-HCv2, MPT-MC, MPT-HL, or MPT-ACC depending on the card type that is installed in the 9500 MPR device.

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Expand the 9500 MPR NEs icon.

3 Right-click on the device where you need to configure a 9500 MPR radio modem port and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and select a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Configure the Port Usage parameter if you are provisioning the following ports:

- ports 1 to 4 on the 2+2 x Ethernet (EAS) card
- ports 5 to 8 on the 4+4 x Ethernet (EAS) card
- ports 1 to 6 on the core-enhanced card

7 Configure the OLC State parameter.

8 Click on the Radio tab button to view radio modem port parameters.

9 Click on the other tab buttons in the properties form to view additional port information, such as physical links and statistics.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 20-27 To configure 9500 MPR port segregation

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure port segregation and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Port Segregation tab button.

6 Click on the Add button.

7 The Add Member Wizard form appears with the From Port step displayed.

8 Click on the Select button beside the From Port field. The Select From Port - Port Segregation form opens.

9 Select a port from the list.

10 Click on the OK button. The Select From Port - Port Segregation form closes. and the Add Member Wizard form reappears.

11 Click on the Next button. The To Port step is displayed.

12 Choose a port from the list and click on the Finish button.

13 A dialog box appears. Click on the OK button. The Add Member Wizard form closes.

14 Perform one of the following.

  a To add more port combinations, repeat steps 6 to 13.

  b Go to step 15.

15 Click on the OK button. The Shelf (Edit) form closes.

Procedure 20-28 To configure analog performance management on 9500 MPR radio modem ports

This procedure provides the analog radio statistics for 9500 MPR radio modem ports.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure analog performance management and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Click on the Statistics tab button.

7 In the Select Object Type area, choose Radio Analog Statistics (Radio Equipment) from the contextual menu.

8 Click on the Collect button.

9 A statistics record appears on the Physical Port (Edit) form. Select the record.

10 Click on the Properties button. The Statistics Record - Radio Analog Statistics form opens.

11 View the read-only analog performance parameter values for the radio modem port.

12 Click on the Close button. The Statistics Record - Radio Analog Statistics form closes.

13 Close the Physical Port (Edit) form.

Procedure 20-29 To configure power source type on 2+2 x Ethernet (EAS) card slots for 9500 MPR

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure a power source type and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the card level and click on a 2+2 x Ethernet (EAS) card slot object. The Card Slot (Edit) form opens with the General tab displayed.

6 Click on the Power Source tab button.

7 Select a displayed interface or click on the Search button if no interface is displayed, then select a displayed interface. The Power Source (edit) form opens.

8 In the Power Source panel, configure the Type parameter.

9 Click the OK button. The Power Source (Edit) form closes.

10 The Card Slot (Edit) form reappears. Click on the OK button. A dialog box appears. Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 20-30 To configure power level performance management on 9500 MPR radio modem ports

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure power level performance management and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

6 Click on the Statistics tab button.

7 In the Select Object Type area choose one of the following from the contextual menu:

- Hop Current Data Stats
- Link Current Data Stats
- RSL Hop Current Data Stats
- TSL Hop Current Data Stats

8 Click on the Collect button.

9 A statistics record appears on the Physical Port (Edit) form. Select the record.

10 Click on the Properties button. The Statistics Record - RSL/TSL Hop Current Data Stats form opens.

11 View the read-only power level performance parameter values for the radio modem port.

12 Click on the Close button. The Statistics Record - Radio Analog Statistics form closes.

13 Close the Physical Port (Edit) form.

Procedure 20-31 To add 9500 MPR port protection

Note 1 — The Protection tab button only appears for MPT-type ports of EAS modules if the corresponding spare port has been configured as MPT.

Note 2 — All cross connections, flow-ids, and sync sources must be removed from the port under the spare card slot before protection can be enabled.

Note 3 — To configure protection type 1+1 FD on MPT/Radio, the Mode cannot be Adaptive Modulation.

Note 4 — In Release 3.0.0, for the 2+2 EAS MPT ports, the protect port can be chosen as either the consecutive port of the same card or the same port of the corresponding even slot.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR icon, right-click on the 9500 MPR object you need to configure as the main port of the protection pair and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Card Slot icon and click on the port object that you need to configure. The Port (Edit) form opens with the General tab displayed.

5 Click on the Protection tab button.

6 Configure the Protection Type parameter on the main/spare MPT port.

7 For radio ports, configure the parameters:

- Restoration Criteria in the Receiver Protection Scheme Parameters panel
- Commands Receiver Protection Scheme Parameters panel
- Restoration Criteria in the Transmitter Protection Scheme Parameters panel.
- Commands in the Transmitter Protection Scheme Parameters panel.

Note — For Protection Type 1+1 FD, Transmitter Protection Scheme parameters are not applicable.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The Port (Edit) form closes.

10 Verify that the protection has been enabled. The status of the main port should be Active and the status of the spare port should be Standby.

Procedure 20-32 To remove 9500 MPR port protection

Note — If 1+1 HSB is configured as the protection type for an MPT port, the transmitter must be muted from the NEtO to remove the protection.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR icon, right-click on the 9500 MPR spare port object and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand the Card Slot icon and click on the port object that you need to configure. The Port (Edit) form opens with the General tab displayed.

5 Click on the Protection tab button.

6 Set the Protection Type parameter to No Protection.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Port (Edit) form closes.

9 Verify that the protection has been removed from the previously main and spare ports.

Procedure 20-33 To configure a loopback test on a 9500 MPR DS1, ES1 or radio modem port

Perform the steps in this procedure as required on the port type that you are configuring.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the 9500 MPR NEs icon.

3 Right-click on the device where you want to configure a loopback test and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

5 Expand to the port level and click on a 9500 MPR port object (DS1, ES1, or radio modem). The Physical Port (Edit) form opens with the General tab displayed.

6 Click on the Loopback tab button.

7 Select an interface. Click on the Properties button.

8 The Loopback (Edit) form opens.

9 Configure the parameters:

- Activation
- Timeout Period (Days)
- Timeout Period (Hrs)
- Timeout Period (Mins)

10 Click on the OK button. The Loopback (Edit) form closes.

11 On the Physical Port (Edit) form, click on the OK button.

12 The Physical Port (Edit) form closes.

Note — If the card containing the ports is not equipped but configured, a loopback test cannot be performed on the physical ports of the card.

Procedure 20-34 To configure OmniSwitch Ethernet ports

Perform the steps in this procedure as required depending on the OmniSwitch chassis type and port type that you are configuring. Different chassis types display different port configuration parameters.

Note — You can configure MVRP fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the device for which you need to configure an OmniSwitch Ethernet port and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Mode

  An access port is used for customer-facing traffic on which VLAN services are configured.

  A network port or channel is configured for network access in the service provider transport or infrastructure network. Typically, only one OmniSwitch network port is required for tree topology, and two ports are required for ring topology.
- Speed
- MTU (bytes)
- Automatic VLAN Binding
- OLC State

6 Click on the States tab button.

7 Configure the Administrative State parameter.

8 Click on the Policies tab button.

Note — A port must have a service access point associated with it before you can apply a UNI policy to the port.

9 Click on the Select button in the UNI Profile panel to assign a UNI policy to the port. The Select UNI Profile - Physical Port form opens.

10 Choose a User Network Interface (UNI) profile policy from the list and click on the OK button. The Select UNI Policy - Physical Port form closes.

11 Click on the Ethernet tab button. The Ethernet port configuration form opens with the General tab displayed.

12 Perform one of the following:

a For OS 6900 and OS 10K devices, configure the following parameters:

- Duplex
- Enable Broadcast Limit Mode
- Broadcast Limit
- Enable Multicast Limit Mode
- Multicast Limit
- Enable Unknown Unicast Limit Mode
- Unknown Unicast Limit
- Type

b For all other OmniSwitch devices, configure the following parameters:

- Duplex
- Auto-negotiate
- Enable Port Mobility
- Dot1 Q Acceptable Frames
- Broadcast Limit (kbps)
- Enable Multicast Limit Mode
- Inter-Frame Gap (bytes)
- Detection
- Default VLAN Restore
- Default VLAN Enable
- Ignore BPDU
- Authenticate
- Ingress Filtering

The Inter-Frame Gap (bytes) parameter is only configurable on Gigabit Ethernet ports.

The Default VLAN Restore, Default VLAN Enable, Ignore BPDU, Authenticate, and Ingress Filtering parameters are only configurable when the Enable Port Mobility parameter is set to Enable.

13 Click on the LLDP tab button, if required. The LLDP configuration form opens with the Nearest Bridge tab displayed.

14 Configure the parameters:

- Administrative Status
- Notifications
- Transmit Management Address
- LLDP TLVs

15 Click on the Remote Peers sub-tab under the LLDP tab to search for and display LLDP remote peers that are associated with the port. The remote peers are used to determine the physical topology of the network.

16 Click on the MVRP tab button to configure MVRP, if required.

17 Configure the parameters on the General tab:

- Status
- Registration Mode
- Applicant Mode
- Periodic Transmission Status
- Join Timer
- Leave Timer
- Leave All Timer
- Periodic Timer

18 Click on the VLAN Restrictions tab button to configure VLAN restrictions, if required:

i Click on the Create button. The MVRP VLAN Registration form appears.

ii Configure the parameters:

- VLAN
- Restrict-Static-VLAN-Registration
- Restrict-Registration
- Restrict-Advertisement

iii Click on OK to close the MVRP VLAN Registration form. The list on the VLAN Restrictions tab is updated with the new MVRP VLAN Registration entry.

19 Click on the QoS tab button, if required. The QoS configuration form opens with the General tab displayed.

20 Configure the parameters:

- QoS Status
- Trusted
- Default 802.1p
- Default DSCP
- Max Egress BW (kbps)
- Max Ingress BW (kbps)
- Servicing Mode
- Default Classification

21 Click on the Queue tab button.

22 If you specified WRR or DRR for the Servicing Mode parameter, configure the Q0 to Q7 parameters in the Weight panel.

23 Configure the Q0 to Q7 parameters in the Minimum Bandwidth (Kbps) panel.

24 Configure the Q0 to Q7 parameters in the Maximum Bandwidth (Kbps) panel.

25 Click on the DHCP Snooping tab button, if required. The tab is only available when the port is associated with a VLAN that has DHCP snooping enabled or DHCP snooping is enabled at the switch level.

26 Configure the parameters:

- Trust Mode
- IP Source Filtering

27 Click on the Ethernet Hybrid tab button, if required. The tab is only available for hybrid Ethernet ports.

28 Configure the parameters:

- Mode
- Speed
- Duplex
- Auto-negotiate
- Detection

29 Click on the PoE tab button, if required. The tab is only available for PoE ports.

30 Configure the parameters:

- Power State
- Maximum Power (milliwatt)
- Power Priority

31 Click on the LPS Learned MAC Entries tab button to view the MAC addresses learned on the port. LPS must be enabled on the port. See Procedure 31-54 for linformation about configuring LPS on an Ethernet port.

32 Click on the Create button to add static MAC address entries, if required. The MAC Entries (Create) form opens.

Note — A port must be LPS-enabled and belong to a VLAN before you can add static MAC addresses to the port.

33 Click on the Select button. The Select VLAN Site - MAC Entries form opens.

34 Configure the filter criteria. A list of VLANs appears at the bottom of the Select VLAN Site - MAC Entries form.

35 Choose a VLAN from the list.

36 Click on the OK button. The Select VLAN Site - MAC Entries form closes.

37 Configure the MAC Address parameter and click on the Apply button to save the changes

38 Repeat steps 32 to 37 to add another MAC address, if required.

39 Click on the OK button. A dialog box appears.

40 Click on the Yes button. The Select VLAN Site - MAC Entries form closes.

41 Click on the OK button. The Physical Port (Edit) form closes.

20.7 Channel and framing link configuration procedures

Use the following procedures to manage channels and framing links using the navigation tree.

Procedure 20-35 To configure SONET clear channels

Perform this procedure to configure SONET clear channels on OC3 to OC192 ports that provide clear channel services. Each port supports one clear channel.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a clear channel port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a clear channel port object. The Physical Port (Edit) form opens with the General tab displayed. SONET is the default framing scheme.

Note — A clear channel port is a port on a card that is not designated Deep Channelized.

5 Configure the parameters:

- Description
- Speed

6 Click on the Apply button.

7 In the navigation tree, right-click on the port and choose Create Channel. The Channel (Create) form opens with the General tab displayed. If there are no channels available on that port, the Create Channel menu option menu is dimmed.

8 Configure the parameters:

- Description
- Configured MAC
- Mode
- Encap Type
- MTU (bytes)
- DDM Event Suppression
- Load Balance Algorithm

The Encap Type parameter is configurable when the Mode parameter is set to Access.

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

9 Click on the Apply button to save the changes. The STS*n* clear channel appears in the navigation tree under the port of the daughter card.

a If the Encap Type parameter of the port is ATM, the form is refreshed.

b If the Encap Type parameter of the port is not ATM, go to step 14.

10 Click on the More Actions button and choose Edit ATM to configure the ATM interface. The ATM interface form opens with the General tab displayed.

11 Configure the parameters:

- ATM Interface Cell Format
- ATM Minimum VPI Value
- Interface Mapping

12 To create an ILMI link, see Procedure 20-48.

13 Click on the OK button. The ATM Interface form closes.

14 Close the Channel (Edit) form.

Procedure 20-36 To perform a bulk channel creation on ports for card types that support multiple sub-channels

Perform this procedure to create the maximum number of channels on ports for card types that support multiple sub-channels. Table 20-5 lists the nodes and cards that support bulk channel creation.

Table 20-5 Node and cards that support bulk channel creation

Node	OC3	OC12	DS3 ASP	E3 ASP
7450 ESS	X	X	X	X
7705 SAR-M	X	—	—	—
7710 SR	X	X	X	X
7750 MG	X	X	X	X

Note — This procedure assumes you have pre-configured a node with an appropriate daughter card that supports multiple sub-channels.

1 Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

2 Locate and expand the device on which you need to perform a bulk channel creation.

3 Right-click on a port object and choose Create Maximum Number Of Channels from the contextual menu. The Create Maximum Number Of Channels form opens.

4 Configure the parameters, as required:

- Channel Type
- STs1 Channel Payload Type
- Ds3 Channel Payload Type
- Vt15 Channel Payload Type
- Time Slots per DS0 Channel Group
- Encap Type

5 Click on the Execute button. The channels and sub-channels appear in the navigation tree under the port of the daughter card.

Procedure 20-37 To configure SONET sub-channels

SONET sub-channels are available on deep channelized OC12 and OC3 ports. SONET STS1 channels support the following payload types:

- DS3
- VT15
- VT2

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure SONET sub-channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level, right-click on a port object and choose Create Channel. The Create Channel form opens with the General tab displayed.

Note — When there are no channels available on that port, the Create Channel menu option menu is dimmed

5 Configure the parameters:

- Local Channel ID
  - For an OC3 port, use a value from 1 to 3.
  - For an OC12 port, use a value in the format <1 to 4>.<1 to 3>
- Payload Type
- DDM Event Suppression

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

6 Click on the Apply button.

The STS1 (AU3) channel appears in the navigation tree under the port of the daughter card.

7 Create the STS1 (AU3) sub-channels according to the payload type configured:

a To create VT15 (Sdh TU11) sub-channels, go to Procedure 20-39.

b To create VT2 (Sdh TU12) sub-channels, go to Procedure 20-39.

c To create a DS3 or E3 (SDH framing only) clear channel, go to step 8.

8 To create a DS3 or E3 clear channel, perform the following steps:

i From the navigation tree, select an STS1 or AU3 channel and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens.

- For AU3 channels, DS3 and E3 channelization is available.
- For STS1 channels, only DS3 channelization is available.

ii Configure the Description parameter.

iii Configure the Channelized parameter.

- Choose Ds1 to channelize the DS3 to carry up to 28 DS1 channelized to the DS0 level.
- Choose E1 to channelize the DS3 to carry up to 21 E1 channelized to the DS0 level.
- Choose None to create a DS3 or E3 clear channel. Configure the following parameters:
  - Configured MAC
  - Encap Type
  - Speed
  - MTU (bytes)
  - Load Balance Algorithm

iv Click on the OK button.

If you set the Channelized parameter to None, a DS3 clear channel in Access mode is created under the STS1 or the AU3 in the navigation tree.

If you set the Channelized parameter to DS1, a DS3 channelized for DS1 is created under the STS1 (AU3). Go to step 11 in Procedure 20-43 to create the DS1 channels.

If you set the Channelized parameter to E1, a DS3 channelized for E1 is created under the STS1 (AU3) in the navigation tree. Go to step 11 in Procedure 20-43 to create the E1 channels.

Procedure 20-38 To configure SDH sub-channels

SDH sub-channels are available on deep channelized OC12 and OC3 ports. SDH AU4 channels support the following payload types:

- TU3
- TU11
- TU12

SDH AU3 channels support the following payload types:

- DS3
- E3
- TU11
- TU12

Perform this procedure to configure SDH sub-channels on ports that provide channelized services. You must first configure port framing to SDH since default framing on SONET/SDH ports is SONET.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure SDH sub-channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a deep channelized port. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the SONET tab button and set the Framing parameter to SDH.

6 Click on the OK button.

7 Right-click on the port again and choose Create Channel from the contextual menu. The Channel Type Selection window opens.

8 Choose one of the following channel types and click on the OK button:

a SONET Sts1 (Sdh Au3).

SONET STS1 channelization and SDH AU3 channelization are equivalent. Go to step 5 of Procedure 20-37.

b SONET Sts3 (Sdh Stm1).

The Sts3 SONET Channel (Create) form opens with the General tab displayed. If there are no channels available on that port, the Create Channel menu option menu is dimmed.

The Payload Type parameter for SDH STM1 (AU4) is set to TUG3. There is no SONET framing equivalent. Go to step 9.

9 Configure the parameters:

- Description
- Local Channel ID

10 Click on the States tab button.

11 Configure the Administrative State

12 Click on the OK button. The STM1 (AU4) channel appears in the navigation tree under the port of the daughter card. It contains three TUG3 groups.

13 Right-click on a TUG3 group and choose Properties from the contextual menu. The Sdh Tug3 (Edit) form opens with the General tab displayed.

14 Choose one of the following options to configure the Payload Type parameter:

a PDH Tu3. Click on the Cancel button and go to step 15 to create a TU3 channel.

b SONET VT15 (SDH Tu11). Click on the Apply button and go to Procedure 20-39.

c SONET VT2 (SDH Tu12). Click on the Apply button and go to Procedure 20-39.

15 To create a TU channel, right-click on the TUG3 group and choose Create Channel from the contextual menu. The TU3 Channel (Create) form opens.

16 Configure the parameters:

- Description
- Payload Type

17 Click on the States tab button.

18 Configure the Administrative State

19 Click on the OK button. A TU3 channel is created under the TUG3 group in the navigation tree.

20 Right-click on the Tu3 and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens with the General tab displayed.

The E3 is the only payload type available.

21 Configure the parameters:

- Description
- Configured MAC
- Encap Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

22 Click on the States tab button.

23 Configure the Administrative State

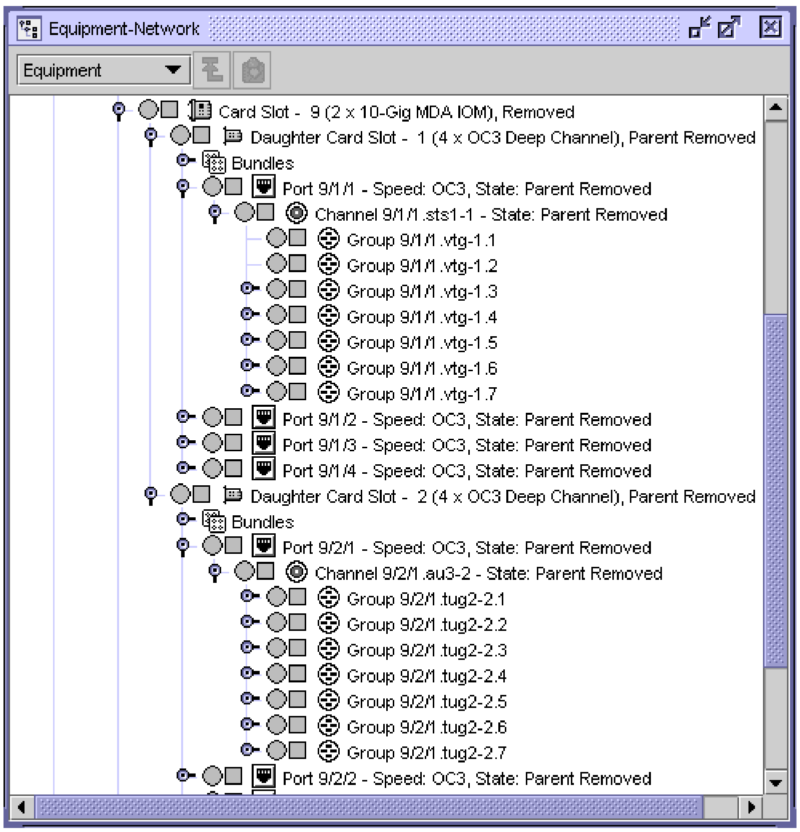
24 Click on the OK button. An E3 clear channel is created under the AU4/TUG3 in the navigation tree.

Procedure 20-39 To create VT15 (TU11) or VT2 (TU12) sub-channels

A SONET VTG and an SDH TUG2 are equivalent groups. A VTG contains four VT15 channels or three VT2. A TUG2 contains four TU11 channels or three TU12. An SDH TUG 3 has no SONET equivalent, however, it contains seven TUG2. (An STM1/AU4 contains three TUG3). See “Comparison of SONET and SDH hierarchies” in section 20.3.

An STS1 channelized to carry a VT15 or VT2 payload type contains seven VTG. An AU3 or a TUG3 channelized to carry a TU11 or TU12 payload type contain seven TUG2. STS1 and AU3 channelization are shown in Figure 20-11.

Figure 20-11 SONET VTG and SDH TUG2 in navigation tree



Each VTG (TUG2) supports up to four VT15 (TU11) channels or three VT2 (TU12) channels. Create each VTG/TUG2 channel one at time.

1 Complete Procedure 20-37 or Procedure 20-38 to carry a VT15 (TU11) or VT2 (TU12) payload type.

  a Go to step 2 to create a VT15 (TU11) channel.

  b Go to step 3 to create a VT2 (TU12) channel.

2 To create a VT15 (TU11) channel, perform the following steps:

  i Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

  ii Right-click on the device where you want to create a VT15 (TU11) channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

  iii On the Network Element (Edit) form navigation tree, expand the Shelf icon.

  iv Expand to the channel level, right-click on a VTG or TUG2 channel group that is to carry a VT15 (TU11) payload and choose Create Channel from the contextual menu. The SONET VT (SDH Tu) Channel (Create) form opens.

  v Configure the parameters:

  - Local Channel ID

    Set the Local Channel ID to a value in the range 1 to 4 since there are four VT15 (TU11) in a VTG (TU2).
  - Description

  The default payload type for a VT15 (TU11) channel is PDH DS1. There is no other available payload type.

  vi Click on the OK button. A VT15 channel is created under the VTG or a TU11 channel is created under the TUG2 in the navigation tree.

  vii Right-click on a VT15 or TU11 channel and choose Create Channel from the contextual menu. The DS1/E1 Channel (Create) form opens.

  The Local Channel ID is equal to the VT15 channel Local Channel ID parameter and the channel type is set to DS1 since a VT15 or TU11 channel supports one DS1.

  viii Click on the OK button A DS1 channel is created under the VT15 or the TU11 in the navigation tree.

  You can create up to 28 VT15 (TU11) channels on a VTG (TUG2).

ix Repeat steps 1 and 2 for each VT15 (TU11) channel that you want to create.

x Since a DS1 channel is not used as a SAP, create a DS0 group for each DS1 channel created. Go to step 12 of Procedure 20-43.

3 To create a VT2/TU12 channel, complete these steps:

i From the navigation tree, select a VTG or TUG2 channel group to carry a VT2 (TU12) payload and choose Create Channel from the contextual menu. The SONET VT (SDH Tu) Channel (Create) form opens.

ii Configure the parameters:

- Local Channel ID
  Set the Local Channel ID to a value in the range 1 to 3 since there are three VT2 (TU12) in a VTG (TUG2).
- Description
- Payload Type
  PDH E1 is not available for SONET framing.

iii Click on the OK button. A VT2 channel is created under the VTG, or a TU12 channel is created under the TUG2 in the navigation tree.

iv Right-click on the VT2 or TU12 channel and choose Create Channel from the contextual menu. The DS1/E1 Channel (Create) form opens.

The Local Channel ID is equal to the VT2 channel Local Channel ID parameter, since a VT2 channel supports one E1 or DS1.

v Click on the States tab button.

vi Configure the Administrative State parameter.

vii Click on the OK button. A DS1 channel is created under the VT2 in the navigation tree. An E1 or DS1 is created under the TU12. You can create up to 21 VT2 (TU12) channels on a VTG (TUG2).

viii Repeat steps 1 and 2 for each VT2 (TU12) that you want to create.

ix Since a DS1/E1 channel is not used as a SAP, create a DS0 group for each DS1 or E1 channel created. Go to step 12 of Procedure 20-43.

Procedure 20-40 To create TDM DS1 channels

Perform this procedure to create DS1 channel and children objects from a channelized DS1 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure TDM DS1 channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- OLC State

6 Select the DS1/E1 tab and configure the parameters:

- Port Type
- Line Length

7 Click on the OK button.

8 Right-click on the port again and choose Create Channel from the contextual menu. The DS1/E1 Channel (Create) form opens. If there are no channels available on that port, the Create Channel menu option is dimmed.

9 Click on the OK button.

10 To create DS0 channel groups, complete these steps:

i From the navigation tree, select a DS1 or E1 channel and choose Create Channel from the contextual menu. The DS0 Channel Group (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Local Channel ID
  For a DS0 group from a DS1 choose from 1 to 24. For a DS0 group from an E1, choose from 2 to 32.
- Description
- Mode
- Encap Type
- MTU (bytes)

Note 1 — All channel groups on a 7705 SAR ASAP port must have the same mode configured. When the first channel group is configured, all other channel groups on the port must be set to the same mode.

Note 2 — The default encapsulation type for the 7705 SAR is N/A. The encapsulation type must be changed from N/A to a valid type. After a valid encapsulation type is configured for a channel group, the encapsulation type cannot be changed for that channel group. To change the encapsulation type, the channel group must be deleted and recreated.

Note 3 — On a 16/32x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 19-24 for more information on configuring the MDA mode.

iii Click on the Channel Group tab button.

iv Configure the parameters:

- CRC Precision
- Scramble
- Idle Cycle Flags
- Time Slots

  Choose one or more timeslots. You can use the Select All and Deselect All buttons.

v Click on the OK button. The timeslot is assigned to the DS0 channel group in the navigation tree.

Procedure 20-41 To configure TDM DS1 or E1 channels

Perform this procedure to edit properties of a DS1/E1 channel and children objects from a channelized DS1/E1 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure TDM DS1 or E1 channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a DS1 or E1 channel. The DS1/E1 Channel (Edit) form opens with the General tab displayed.

5 Click on the States tab button.

6 Configure the Administrative State parameter.

7 Add a DS0 channel group, if required. Perform the following steps:

i Click on the SubChannels tab button.

ii Click on the Create Cha... tab button. The DS0 Channel Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Local Channel ID
- Description
- Mode
- Encap Type
- Speed
- MTU (bytes)

Note — On a 16/32x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 19-24 for more information on configuring the MDA mode.

iv Click on the OK button. The DS0 Channel Group (Create) form closes and a dialog box appears.

v Click on the OK button.

8 Click on the Channel tab button.

9 Configure the parameters:

- Channel Framing
- Clock Source
- Loopback
- Report Alarms
- Respond to Remote Loop Signal
- Signal Mode

10 Click on the Statistics tab button to view statistical information.

11 Click on the Faults tab button to view alarm information.

Note — If are configuring a 7705 SAR and selected a clock source of adaptive, you can click on the Adaptive Clock History tab button to view channel adaptive clock performance data for the preceding 15 minutes.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The DS1/E1 Channel (Edit) form closes.

Procedure 20-42 To create serial channels

Perform this procedure to create serial channel and child objects from a Serial Data Interface port.

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2. Right-click on the device where you want to configure serial channels and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3. On the Network Element (Edit) form navigation tree, expand to the port level.

4. Right-click on the port and choose Create Channel from the contextual menu. The Serial Channel (Create) form opens. If there are no channels available on that port, the Create Channel menu option is dimmed.

5. Click on the States tab button.

6. Configure the Administrative State parameter.

7. Click on the Apply button. The Serial Channel (Edit) form refreshes with additional tabs.

8. Click on the Channel tab button.

9. Configure the parameters:

    - Device Mode
    - Gender
    - Speed
    - Loopback
    - Multidrop Data Bridge
    - S-Bit Signalling
    - HCM Data Position
    - Character Length
    - Parity
    - Stop Bits
    - Report Alarms
    - DTR / DSR Input
    - RTS / DCD / C / I Input
    - ALB / CTS Input
    - RDL / RI Input
    - DSR / DTR Output
    - DCD / RTS / I / C Output
    - CTS / ALB Output
    - RI / RDL Output

    Depending on the serial type of the configured port, different parameters are configurable in the Control Leads panel.

10. Create DS0 channel groups:

    i. Click on the SubChannels tab button.

    ii. Click on the Create Cha... button. The DS0 Channel Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Description
- Encap Type
- MTU (bytes)

Note 1 — The default encapsulation type for the 7705 SAR is N/A. The encapsulation type must be changed from N/A to a valid type. After a valid encapsulation type is configured for a channel group, the encapsulation type cannot be changed for the channel group. To change the encapsulation type, the channel group must be deleted and re-created.

Note 2 — On an SDI MDA, you must configure the serial type to X.21 or V.35 to use the FR encapsulation type. See Procedure 20-13 for more information.

iv Click on the OK button. The DS0 Channel Group (Create) form closes.

11 Close the Serial Channel (Edit) form.

Procedure 20-43 To create TDM DS3 channels

Perform this procedure to create DS3 channel and children objects from a channelized DS3 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a TDM DS3 channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- OLC State

6 Choose the DS3/E3 tab and configure the parameters:

- Line Buildout
- Type. Choose DS3.

7 Click on the OK button.

8 Right-click on the port again and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens. If there are no channels available on that port, the Create Channel menu option is dimmed.

9 To configure the DS3/E3 channel, complete these steps:

a Configure the Channelized parameter to DS1 or E1, if you want to channelize to the DS0 level.

b Configure the Channelized parameter to None if this is a clear channel application.

Configure the parameters as required:

- Description
- Configured MAC
- Encap Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

The Local Channel ID parameter is configured automatically and the mode is always Access for TDM.

Note — On a 4x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 19-24 for more information on configuring the MDA mode.

10 Click on the OK button.

If this is a Channelized DS1 or E1 application, continue to step 11.

11 To create Ds1 or E1 channels, complete these steps:

i From the navigation tree, select a Ds3 channel and choose Create Channel from the contextual menu. The Create DS1/E1 Channel form opens.

ii Configure the Local Channel ID parameter.

- For DS1 choose from 1 to 28.
- For E1 choose from 1 to 21.

iii Click on the OK button. The DS1 or E1 channels are created under the DS3 in the navigation tree.

12 To create DS0 channel groups, complete these steps:

i From the navigation tree, select a DS1 or E1 channel and choose Create Channel from the contextual menu to create DS0 groups. The DS0 Channel (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Local Channel ID
  For a DS0 group from a DS1 choose from 1 to 24. For a DS0 group from an E1, choose from 2 to 32.
- Description
- Configured MAC
- Mode
- Encap Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

Note — On a 4x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 19-24 for more information on configuring the MDA mode.

iii Click on the Channel Group tab button.

iv Configure the parameters:

- CRC Precision
- Idle Cycle Flags
- Time Slots
  Choose one or more timeslots. You can use the Select All and Deselect All buttons.
- BER SF Link Down

v Click on the OK button. The timeslot is assigned to the DS0 channel group in the navigation tree.

Procedure 20-44 To configure TDM DS3 channels

Perform this procedure to edit properties of a DS3 channel and children objects from a channelized DS3 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure TDM DS3 channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a DS3 channel. The DS3/E3 Channel (Edit) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Configure the Channelized parameter and click on the Apply button.

a If you choose None, go to step 7.

b If you choose DS1 or E1, perform steps 12 to 35.

7 Configure the parameters:

- Configured MAC
- Speed
- MTU (bytes)
- Load Balance Algorithm

8 Configure the Encap Type parameter and click on the Apply button.

a If you choose BCP Null, BCP DOT1 Q, or IPCP, go to step 9.

b If you choose FR, go to step 10.

c If you choose Cisco HDLC, go to step 11.

d If you choose WAN Mirror, perform steps 13 to 22.

9 Configure the PPP interface for the channel, if required. Perform the following steps:

i Click on the More Actions button and choose Edit PPP. The PPP Interface form opens with the General tab displayed.

ii Configure the parameters:

- Period
- Drop Count

iii To view port, PPP control protocol, statistics, or alarm information for the PPP interface, click on the appropriate tab button.

iv Click on the OK button. The PPP Interface form closes.

v Perform steps 13 to 22.

10 Configure the FR interface, if required. Perform the following steps:

i Click on the More Actions button and choose Edit FR. The FR Interface form opens with the General tab displayed.

ii Configure the parameters:

- LMI Type
- LMI Mode
- Link Identifier
- Error Threshold
- Monitored Events
- Polling Interval
- Full Enquiry Interval

iii Click on the Frf12 tab button.

iv Set the Mode parameter to Enabled.

v Configure the Fragment Threshold parameter.

vi Click on the Select button beside the MCFR Egress QoS Profile parameter. The Select MCFR Egress Qos Profile - FR Configuration form opens.

vii Choose a profile from the list and click on the OK button. The Select MCFR Egress Qos Profile - FR Configuration form closes and the FR Interface form is refreshed with the MCFR Egress QoS Profile information.

viii To view port, statistical, or alarm information for the FR interface, click on the appropriate tab button.

ix Click on the OK button. The FR Interface form closes.

x Perform steps 13 to 22.

11 Configure the Cisco HDLC information.

i Click on the Cisco HDLC tab button.

ii Configure the parameters:

- Keep Alive (seconds)
- Up Count
- Down Count

iii Perform steps 13 to 22.

12 Configure the DS1 and DS0 channels. Perform the following steps:

i Click on the SubChannels tab button.

ii Click on the Create button. The DS1/E1 Channel (Create) form opens with the General tab displayed.

iii Configure the Local Channel ID parameter.

iv Click on the States tab button.

v Configure the Administrative State parameter.

vi Click on the OK button. The DS1/E1 Channel (Create) form closes.

13 Click on the States tab button.

14 Configure the Administrative State parameter.

15 Click on the Channel tab button.

16 Configure the parameters:

- Channel Framing
- CRC Precision
- Clock Source
- Idle Cycle Flags
- Loopback
- Subrate CSU Mode
- Subrate Range
- Loop Respond
- Report Alarms
- Bit Error Insertion Rate (E3 only)
- Pattern (E3 only)
- Duration (seconds) E3 only

17 Click on the Message Data Link tab button.

18 Configure the parameters:

The MDL Message Type parameter specifies the Line Message Data Link message for a DS3 and specifies the transmission method of a message over a channelized interface. The parameter is only applicable if the DS3 is using C-bit framing. The default is disabled. Click on the check boxes to enable transmission methods and enter text strings to choose the message options for this parameter as required. The transmission options are:

- Test Signal
- DS3 Path
- Idle Signal

Table 20-6 describes the MDL message options.

Table 20-6 MDL message options

Option	String Length	Description
Port Number String	0 to 38 characters	specifies the port ID code
Generator Number String	0 to 38 characters	specifies the generator number to send in the MDL test signal message
Equipment ID Code	0 to 10 characters	specifies the Equipment ID code
Location ID Code	0 to 11 characters	specifies the Location ID code
Frame ID Code	0 to 10 characters	specifies the Frame ID code
Unit ID Code	0 to 6 characters	specifies the unit ID code
Facility ID Code	0 to 38 characters	specifies the facility ID code

19 Click on the Terminations tab button to view channel termination information.

20 Click on the Statistics tab button to view statistical information.

21 Click on the Faults tab button to view alarm information.

22 Click on the OK button. The DS3/E3 Channel (Edit) form closes.

23 Right-click on a DS1 channel in the navigation tree and choose Properties from the contextual menu. The property form for the channel opens with the General tab displayed.

24 Click on the States tab button.

25 Configure the Administrative State parameter, if required.

26 Add a DS0 channel group, if required. Perform the following steps:

i Click on the SubChannels tab button.

ii Click on the Create button. The DS0 Channel Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Local Channel ID
- Description
- Configured MAC
- Encap Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

Note — On a 4x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 19-24 for more information on configuring the MDA mode.

iv Click on the OK button. The DS0 Channel Group (Create) form closes.

27 Click on the Channel tab button.

28 Configure the parameters:

- Channel Framing
- Clock Source
- Idle Cycle Flags
- Loopback
- Bit Error Insertion Rate (E3 only)
- Pattern (E3 only)
- Duration (seconds) E3 only

29 Click on the Statistics tab button to view statistical information.

30 Click on the Faults tab button to view information about alarms.

31 Click on the OK button. The channel properties form closes.

32 Configure timeslots for the DS0 channel group. Perform the following steps.

i Choose a DS0 channel in the navigation tree and choose Properties from the contextual menu. The property form for the channel opens with the General tab displayed.

ii Configure the parameters, as required.

iii Click on the States tab button.

iv Configure the Administrative State parameter.

v Click on the Channel Group tab button.

vi Configure the parameters:

- CRC Precision
- Idle Cycle Flags
- Time Slots
  Choose one or more timeslots. You can use the Select All and Deselect All buttons.

vii If you set the Encap Type parameter is set to BCP Null, BCP DOT1 Q, or IPCP in step ii, you can configure the PPP for the timeslot on the Channel Groups tab.

- Click on the More Actions button and choose Edit PPP. The PPP Interface form opens with the General tab displayed.
- Configure the parameters:
  - Period
  - Drop Count
  - Compression
    The Compression parameter is configurable when the DS1 or E1 channel group is on an ASAP MDA in a 7710 SR or 7750 SR.
- Click on the OK button. The PPP Interface form closes and the DS0 Channel Group (Edit) form reappears.

33 Click on the Statistics tab button to view statistical information.

34 Click on the Faults tab button to view information about alarms.

35 Click on the OK button. The DS3/E3 Channel (Edit) form closes.

Procedure 20-45 To configure a DS3/E3 channel as a network interface on a channelized ASAP MDA

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a DS3/E3 channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level.

5 Perform one of the following.

  a If you are configuring an OC-*n* channelized ASAP MDA, right-click on an available port and choose Create Channel from the contextual menu. The Sts SONET Channel (Create) form opens with the General tab displayed; go to step 6.

  b If you are configuring a DS3/E3 channelized ASAP MDA, right-click on an available port and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens with the General tab displayed; go to step 11.

6 Configure the parameters:

- Local Channel ID
- Description
- Payload Type

7 Click on the States tab button.

8 Configure the Administrative State parameter.

9 Click on the OK button.The Sts SONET Channel (Create) form closes and the STS1 channel appears in the navigation tree under the port of the channelized ASAP daughter card.

10 Right-click on the STS1 channel and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Description
- Configured MAC
- Mode
  You must set the Mode parameter to Network.
- Encap Type
  The only available encapsulation type available in network mode is PPP.
- Speed
  The only available speed is line rate.
- MTU (bytes)
- Load Balance Algorithm

12 Click on the States tab button.

13 Configure the Administrative State parameter.

14 Click on the Apply button. The form displays additional tabs.

15 Click on the Channel tab button.

16 Configure the parameters:

- Channel Framing
- CRC Precision
- Clock Source
- Idle Cycle Flags
- Loopback
- Subrate CSU Mode
- Loop Respond
- Report Alarms

17 Click on the Message Data Link tab button.

18 Configure the parameters:

The MDL Message Type parameter specifies the Line Message Data Link message for a DS3 and specifies the transmission method of a message over a channelized interface. The parameter is only applicable if the DS3 is using C-bit framing. The default is disabled. Click on the check boxes to enable transmission methods and enter text strings to choose the message options for this parameter as required. The transmission options are:

- Test Signal
- DS3 Path
- Idle Signal

Table 20-7 describes the MDL message options.

Table 20-7 MDL message options

Option	String Length	Description
Port Number String	0 to 38 characters	specifies the port ID code
Generator Number String	0 to 38 characters	specifies the generator number to send in the MDL test signal message
Equipment ID Code	0 to 10 characters	specifies the Equipment ID code
Location ID Code	0 to 11 characters	specifies the Location ID code
Frame ID Code	0 to 10 characters	specifies the Frame ID code
Unit ID Code	0 to 6 characters	specifies the unit ID code
Facility ID Code	0 to 38 characters	specifies the facility ID code

19 Click on the OK button. The DS3/E3 or Sts SONET Channel (Create) form closes and a DS3/E3 channel appears in the navigation tree under the port on the channelized ASAP MDA.

Procedure 20-46 To configure an L3 interface on a DS3/E3 channel on a channelized ASAP MDA

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an L3 interface and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a DS3/E3 channel on a channelized ASAP MDA port. The DS3/E3 Channel (Edit) form opens with the General tab displayed.

5 Click on the Policies tab button to configure the policies for the DS3/E3 channel. Perform the following steps.

- **i** Click on the Select button beside the Network Queue Policy Name parameter. The Select Network Queue Policy - DS3/E3 Channel list form opens.
- **ii** Select a network queue policy from the list and click on the OK button. The Select Network Queue Policy - DS3/E3 Channel list form closes and the DS3/E3 Channel (Edit) form reappears.
- **iii** Click on the Select button beside the ID parameter in the Accounting Policy panel. The Select Accounting Policy - DS3/E3 Channel list form opens.
- **iv** Select an accounting policy from the list and click on the Ok button. The Select Accounting Policy - DS3/E3 Channel list form closes and the DS3/E3 Channel (Edit) form refreshes with the accounting policy information.
- **v** Configure the Collect Accounting Statistics parameter.
- **vi** Click on the Select button in the Port Scheduler Policy panel to assign a port scheduler policy to the port. The Select Port Scheduler Policy - Physical Port form opens.
- **vii** Select a port scheduler policy from the list and click on the OK button. The Select Port Scheduler Policy - Physical Port form closes.

6 Click on the Network Interfaces tab button.

7 Click on the Create button. The Create Network Interface - Routing Instance form opens.

8 Perform steps 4 to 42 of Procedure 30-7 to create a network interface on the DS3/E3 channel.

The port in step 6 of Procedure 30-7 is set to the DS3/E3 channel by default. Go to step 11 of Procedure 30-7.

9 The L3 interface appears on the Network Interfaces tab. Close the Ds3/E3 Channel (Edit) form.

Procedure 20-47 To configure a PVC

PVCs are automatically created by the device when a new L3 interface over ATM is created on the 5620 SAM, and when a new ILMI link is created between ATM interfaces. See Procedure 20-48 for more information about creating ILMI links.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a PVC and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a SONET/SDH ATM clear channel. The property form for the channel opens with the General tab displayed.

5 Click on the L3 Interfaces tab button.

6 Choose the appropriate interface from the list and click on the Properties button. The L3 Interface form opens.

7 Click on the ATM tab button.

8 Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling

9 Click on the Apply button to save the changes.

10 To view more information about the PVC:

  i Click on the View PVC Connection button. The ATM PVC Connection form opens.

  ii Click on the tab buttons to view information for the ATM PVC connection.

11 Click on the Cancel button to close the ATM PVC Connection form, the L3 Interface form, and the channel form.

Procedure 20-48 To create an ILMI link

Perform this procedure to create an ILMI link between device ATM interfaces. This functionality is supported on the 7750 SR and 7710 SR. Ensure that ATM QoS policies are configured before you create the ILMI link. See chapter 46 for more information about creating ATM QoS policies.

1 Perform one of the following to open the ATM Interface properties form.

a Use the navigation tree

i Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

ii Right-click on the device where you want to create an ILMI link and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

iii On the Network Element (Edit) form navigation tree, expand the Shelf icon.

iv Expand to the port level and click on a clear channel port. The Physical Port (Edit) form opens with the General tab displayed.

Note — A clear channel port is a port on a card that is not designated Deep Channelized.

v Click on the Channels tab button.

vi Choose the appropriate channel from the list and click on the Properties button. The Channel (Edit) form opens.

vii Click on the More Actions button and choose Edit ATM. The ATM Interface form opens with the General tab displayed.

b Use the Manage Equipment list form to search for a clear channel port with an ATM interface.

i Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

ii Choose Port from the object drop-down list.

iii Configure the filter criteria to search for ATM encapsulation types.

iv Click on the Search button. The Select form displays the results of the search.

v Select an entry by double-clicking. Alternatively, select an entry and click on the Properties button. The Select form closes and the Channel (Edit) form opens.

vi Click on the More Actions button and choose Edit ATM. The ATM Interface form opens with the General tab displayed.

2 Click on the Create ILMI Link button. The Configure ILMI Link form opens with the General tab displayed.

3 Configure the parameters:

- Administrative Status
- Protocol Version
- IME Type
- Egress Traffic Descriptor

  Choose an ATM QoS policy by clicking on the Select button to open the egress traffic descriptor list form. Click on the Search button and choose an ATM traffic descriptor profile from the list to associate with the ILMI link. Click on the OK button.
- Ingress Traffic Descriptor

  Choose an ATM QoS policy by clicking on the Select button to launch the ingress traffic descriptor list form. Click on the Search button and choose an ATM traffic descriptor profile from the list to associate with the ILMI link. Click on the OK button.
- Keep-Alive Polling Frequency (seconds)
- Keep-Alive Polling Count
- Keep-Alive Test Frequency (seconds)
- Restore Keep-Alive Defaults
- ILMI Link VCI
- ILMI Link VPI

The Restore Keep-Alive Defaults parameter restores the default values of the Keep-Alive Polling Frequency (seconds), Keep-Alive Polling Count, and Keep-Alive Test Frequency (seconds) parameters.

The Keep-Alive Test Frequency (seconds) parameter is configurable when the Protocol Version parameter is set to 4.0.

4 Click on the Finish button. The Configure ILMI Link form closes and the ATM Interface form reappears.

5 Close the ATM Interface form. The Channel (Edit) form reappears.

6 Close the Channel (Edit) form.

Procedure 20-49 To modify an ILMI link

1 Perform step 1 of Procedure 20-48 to open the ATM Interface form.

2 Click on the Edit ILMI Link button. The Configure ILMI Link form opens with the ILMI Link Configuration tab displayed.

3 Configure the parameters, as required.

- Administrative Status
- Protocol Version
- IME Type
- Egress Traffic Descriptor

  Choose an ATM QoS policy by clicking on the Select button to open the egress traffic descriptor list form. Click on the Search button and choose an ATM traffic descriptor profile from the list to associate with the ILMI link. Click on the OK button.
- Ingress Traffic Descriptor

  Choose an ATM QoS policy by clicking on the Select button to launch the ingress traffic descriptor list form. Click on the Search button and choose an ATM traffic descriptor profile from the list to associate with the ILMI link. Click on the OK button.
- Keep-Alive Polling Frequency (seconds)
- Keep-Alive Polling Count
- Keep-Alive Test Frequency (seconds)
- Restore Keep-Alive Defaults

The Restore Keep-Alive Defaults parameter restores the default values of the Keep-Alive Polling Frequency (seconds), Keep-Alive Polling Count, and Keep-Alive Test Frequency (seconds) parameters.

The Keep-Alive Test Frequency (seconds) parameter is configurable when the Protocol Version parameter is set to 4.0.

4 Click on the Peer Interface Configuration tab to view ILMI properties of the peer interface of the link.

5 Click on the OK button to close the Configure ILMI Link form. The ATM Interface form reappears.

6 To remove an ILMI link, click on the Remove ILMI Link button. Removing the ILMI link also removes the PVC.

Note — An ILMI link can be removed only if its Administrative Status parameter is set to Disabled.

7 Click on the Cancel button to close the ATM Interface form. The Channel (Edit) form reappears.

8 Click on the Cancel button to close the Channel (Edit) form.

21 — NE user and device security

21.1 NE user and device security overview

The 5620 SAM provides security support for accessing managed devices, such as the 7750 SR, as follows:

- create and manage users, profiles and passwords for access to NEs
- configure RADIUS or TACACS+ authentication to control access to the managed devices using 5620 SAM user accounts
- configure device system security through traffic filtering and blocking

RADIUS is an access server AAA protocol. The protocol provides a standardized method of exchanging information between a RADIUS client, which is located on the 7750 SR and managed by the 5620 SAM, and a RADIUS server, which is located externally from the 7750 SR and the 5620 SAM.

RADIUS functionality provides an extra layer of login security. The RADIUS client relays user account information to the RADIUS server. The server authenticates the user and returns user privilege information to the RADIUS client. This determines the level of access that the user has to the device. For example, the user may not be able to FTP information to or from the device.

TACACS+ provides functionality that is similar to RADIUS.

Note 1 — The 5620 SAM server checks for reachability to the TACACS+ server using UDP port 49 to prevent long timeout issues. However, all subsequent communication is over TCP port 49.

Note 2 — You cannot use the 5620 SAM to configure NE security support on the 7250 SAS.

User and group permissions on managed devices

The following general rules apply to managed device users, such as 7750 SR users and groups:

- The authentication settings on the device override any configured and distributed authentication settings on the 5620 SAM. For example, if you configure a user account with SHA authentication, and distribute the account to a device configured to use MD5 authentication, authentication is changed to MD5 for that account.
- The management access and CPM filters applied to the managed device must be manually distributed.
- The system administrator can limit the type of access per managed device, for example, allowing FTP access, but denying console, Telnet, and SNMP access.

- User profiles exist independently of users, and are not in effect until they are linked to a user.
- Create device user accounts as a backup to RADIUS or TACACS+ authentication. If the RADIUS or TACACS+ server fails, or there are user issues on the servers, the 7750 SR user account can be used to access the managed device.

Caution — The 5620 SAM cannot obtain a secret value from an NE during resynchronization. Alcatel-Lucent recommends that you use only the 5620 SAM to configure a shared authentication secret. Do not configure a shared authentication secret directly on a managed NE using another interface, for example, a CLI, or the 5620 SAM cannot synchronize the security policy with the NE.

User and user accounts when combined local and remote authentication is used

Many organizations already have existing TACACS+ or RADIUS authentication of users, based on long standing TACACS+ and RADIUS user accounts and passwords. You can incorporate new 5620 SAM client GUI user accounts for local authentication on the 5620 SAM server with existing TACACS+ or RADIUS system and users.

Consider the following:

- system administrators can use existing TACACS+ or RADIUS user accounts
- you can create 5620 SAM client user accounts that match the exact TACACS+ or RADIUS user account, for example, if the RADIUS user account is jane, you can create a 5620 SAM user jane
- the 5620 SAM user name can be 1 to 80 characters, flexible enough to match most remote authentication user accounts
- 5620 SAM users already authenticated remotely can log in to 5620 SAM using their RADIUS or TACACS+ passwords
- for 5620 SAM users to be authenticated locally, their account passwords must meet 5620 SAM password requirements, described in this section

For example, for user Jane:

- RADIUS user name is jane and password is accessforjane
- 5620 SAM user name is jane and password is LetJane1In!

When Jane is authenticated by RADIUS, she can log in to the 5620 SAM client by typing in jane and accessforjane. If the RADIUS server was down, and she could not be authenticated remotely, to be authenticated locally Jane must log in to the 5620 SAM client by typing jane and LetJane1In!

RADIUS and TACACS+ policies and permissions

See the appropriate RADIUS and TACACS+ documentation for information about installing, configuring, maintaining lists of users, and managing these authentication servers.

For TACACS+ users, you can specify the following in a user template that is read by the global TACACS+ policy:

- The type of permitted NE access, for example, console, FTP, or both
- A home directory
- A login script that runs when the user logs in

You can enable or disable the user template as required to suit your current global policy requirements.

CPM filters and traffic management

Device CPMs provide dedicated traffic management and queuing hardware for protecting the control plane. You can use CPM filters to specify which types of traffic to accept or deny, and to allocate and rate-limit the shaping queues for traffic directed to the CPMs.

Note 1 — The 7705 SAR does not support IPv6 CPM IP filters, queue filters, or MAC CPM IP filters.

Note 2 — There is no partial distribution of CPM IP filter policies to the 7705 SAR. When you distribute a CPM IP Filter policy to a specific 7705 SAR, every entry, property, and value within that policy must be supported by that 7705 SAR, or distribution of that policy is blocked to that 7705 SAR.

The 5620 SAM supports the following CPM traffic management functionality:

- traffic classification using CPM filters
    - Packets going to the CPM are first classified by the IOM into forwarding classes before recognition by the CPM hardware. You can use CPM filters to further classify the packets using L3/L4 information, for example, destination IP, DSCP value, and TCP SYN/ACK.
- queue allocation
    - Queues 1 — 8 are the default queues. They cannot be modified or deleted. Unclassified traffic is directed to the default queues.
    - Queues 9 — 32 are reserved for future use.
    - Queues 33 — 2000 are available for allocation.
    - Queues 2001 — 8000 are used for per-peer queuing.
- queue configuration
    - PIR
    - CIR
    - CBS
    - MBS

DoS protection

The 7750 SR-7, 7750 SR-12, 7450 ESS-7, and 7450 ESS-12 support the use of DoS protection on network and access interfaces. To protect NEs from the high incoming packet rates that characterize DoS attacks, you can use the 5620 SAM to configure DoS protection for the following scenarios:

- the arrival of unprovisioned link-layer protocol packets that are received from CE devices in the core network
- the arrival of excessive subscriber control-plane packets on L2 or L3 access interfaces in aggregation networks
- the arrival of excessive Ethernet CFM frames on L2 and L3 access interfaces, SAPs, and SDP bindings, based on a combination of CFM OpCode and MEG-level values

DoS protection limits the number of packets that are received each second, and optionally logs a violation notification if a policy limit is exceeded. You can use the NE System Security form to view the violations for a specific NE.

DoS protection in the core network

DoS protection in the core network limits the number of link-layer protocol packets that each network interface on an NE accepts for protocols that are not enabled on the interface. The interface drops the excessive packets before they are queued or processed by the CPU.

You can configure global DoS protection on an NE using the NE System Security form. DoS protection controls the following for unprovisioned link-layer protocols:

- the packet arrival rate per source on each network interface
- the overall packet arrival rate per source on the NE
- whether an NE sends a notification trap if a policy limit is exceeded

An NE that supports DoS protection automatically applies default DoS protection parameters to each network and access interface. These defaults limit only the overall packet arrival rate and apply to all of the interfaces on the NE.

DoS protection policies in aggregation networks

In a subscriber aggregation network, an NE typically receives few control-plane packets from a specific subscriber. If one or more subscribers generate excessive control-plane traffic, DoS protection policies can help to ensure that NEs do not become overburdened by these unwanted packets.

You can configure DoS protection policies to control the following on network interfaces, VPLS L2 access interfaces, and IES and VPRN L3 access interfaces:

- the control-plane packet arrival rate per subscriber host
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

An NE that supports DoS protection automatically assigns a default DoS protection policy to each network and access interface. This default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified.

See Procedure 21-3 for information about creating or modifying a DoS protection policy and assigning the policy to one or more NEs. See the appropriate service chapter for information about applying DoS protection policies to interfaces.

IP security

The 5620 SAM supports the IPsec MDA which provides IP security support including tunneling and encryption functions. See the 7750 SR IP security node documentation for more information about configuring IP security.

21.2 Workflow to manage NE user and device security

Note — 5620 SAM security management support for the OmniSwitch is limited to the configuration of RADIUS and TACACS+ access policies for user authentication.

This workflow describes the procedures for managing NE user and device security.

1. Specify the type of authentication keys used on the device; for example, SHA or MD5. See chapter 14 for more information.

2. Create site management access filter policies for each device from the 5620 SAM. See Procedure 21-1 for more information.

3. Create filter policies for device CPM modules. See Procedure 21-2 for more information.

4. Create site user profiles based on job classifications and the access needed to the managed devices. See Procedure 21-5 for more information.

5. Create individual site user accounts based on the configured profiles. See Procedure 21-6 for more information.

6. As required, manage user profiles and user accounts. See chapter 9 for more information:

    - modify profiles and users
    - delete profiles and users
    - change passwords as specified in the password policy

7. Create RADIUS or TACACS+ policies for user authentication. See Procedure 21-8, Procedure 21-9, and Procedure 21-11 for more information.

8. As required, configure NE system security parameters such as the following:

    - peer queuing for hardware CPM queues
    - enabling or disabling FTP, Telnet, or SSH servers on managed devices
    - RADIUS and TACACS+ user templates
    - global NE DoS protection parameters

    See Procedure 21-10 for more information.

9 Specify password policies for access to managed devices and users. See Procedure 21-7 for more information.

10 Create NE DoS protection policies, as required. See Procedure 21-3 for more information.

11 Create subscriber authentication policies for DHCP sessions, as required. See Procedure 21-12 for more information.

12 Modify the security policies, as required. See Procedure 21-13 for more information.

13 Release and distribute the policies to the managed devices. See Procedure 21-14 for more information.

Note 1 — Before you distribute policies to managed devices, ensure the management access filter Action parameter is not set to deny. Shut down the filter, distribute the policies, and then turn the filter back up.

Note 2 — If the policy is in draft mode, the Distribution option, located under the More Actions button, is disabled and the policy cannot be distributed. You must first release the policy for distribution.

When you change the configuration mode of a management access filter or CPM IP filter to released, the policy is not distributed to existing local definitions. When all other policies are changed to released, the policy is distributed to existing local definitions

14 Delete policies, as required. See Procedure 21-15 for more information.

21.3 NE user and device security procedures

This section provides procedures to create and manage security on the managed devices.

Procedure 21-1 To create or modify a site management access filter policy for a managed device

A site management access filter performs the following functions:

- Restricts the type of management access allowed
- Specifies a strict underlying connection protocol usage and the accepted IP addresses and ports that can gain access to the device

Note — You need an account with an assigned administrator scope of command role to the sitesec package, or scope of command role with write access permissions to the sitesec package, to perform this procedure

1 Choose Administration→Security→NE Management Access Filters from the 5620 SAM main menu. The NE Management Access Filter form opens.

2 Perform one of the following:

a Specify a filter to search for and edit and existing site management access filter. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

b Click on the Create button. The Site Management Access Filter (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description

4 Configure the following parameters on the IPv4, IPv6, and MAC panels, as required:

- Default Filter Action
- Administrative State

5 Click on the IPv4 Entries tab button.

6 Perform one of the following.

a Click on the Create button to add a new site entry. The Site MAF Match Entry (Create) form opens.

b Select an entry in the list and click on the Properties button to modify an existing entry. The Site MAF Match Entry (Edit) form opens.

7 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Action
- Source IP
- Source IP Mask
- Source Port Type
- Source Port ID
- Destination Port
- Destination Port Mask
- Protocol
- Log
- Router

When you set the Action parameter to deny, you cannot distribute the policy to the managed device. Before setting the parameter to deny, set the parameter to permit, distribute the configuration to the managed devices, then reconfigure the parameter to deny.

8 Click on the OK button. The Site MAF Match Entry (Create) or Site MAF Match Entry (Edit) form closes.

9 Click on the IPv6 Entries tab button.

10 Perform one of the following.

a Click on the Create button to add a new site entry. The Site IPv6 MAF Match Entry (Create) form opens.

b Select an entry in the list and click on the Properties button to modify an existing entry. The Site IPv6 MAF Match Entry (Edit) form opens.

11 Configure the parameters:

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Action
- Source IP
- Source IP Mask
- Source Port Type
- Source Port ID
- Destination Port
- Destination Port Mask
- Next Header
- Log
- Flow Label
- Router

When you set the Action parameter to deny, you cannot distribute the policy to the managed device. Before setting the parameter to deny, set the parameter to permit, distribute the configuration to the managed devices, then reconfigure the parameter to deny.

12 Click on the OK button. The Site IPv6 MAF Match Entry (Create) or Site IPv6 MAF Match Entry (Edit) form closes.

13 Click on the MAC Entries tab button.

Note — MAC MAF functionality is supported on the 7750 SR, 7450 ESS, and 7710 SR Release 6.1 R4 or later.

14 Click on the Create button. The Site MAC MAF Match Entry (Create) form opens with the General tab displayed.

15 Configure the parameters:

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description

16 Click on the Filter Properties tab button.

17 Configure the parameters:

- Action
- Frame Type
- Source MAC
- Destination MAC
- Src Mask
- Dst Mask
- Dot1p
- Dot1p Mask
- CFM Opcode
- CFM Val 1
- CFM Val 2
- Service Id

18 Perform one of the following.

a If you set the Frame Type parameter to e802dot2LLC in step 17, configure the following parameters. Otherwise, go to step 19.

- DSAP
- DSAP Mask
- SSAP
- SSAP Mask

b If you set the Frame Type parameter to e802dot2SNAP in step 17, configure the following parameters. Otherwise, go to step 19.

- SNAP OUI
- SNAP PID

c If you set the Frame Type parameter to Ethernet II in step 17, configure the Ether Type parameter. Otherwise, go to step 19.

19 Click on the OK button to save the configuration and close the CFM MAC Filter Entry (Create) or CFM MAC Filter Entry (Edit) form.

20 Click on the OK button. A confirmation window appears.

21 Confirm the action.

22 Repeat for each site management access filter you want to create or modify.

> **Note —** If the policy is in draft mode, the Distribution option, located under the More Actions button, is disabled and the policy cannot be distributed. You must first release the policy for distribution. When you switch the configuration mode to released, the policy is not distributed to existing local definitions. See Procedure 21-14 for more information about how to release a policy.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-2 To create or modify a CPM filter policy for a managed device

A device CPM module provides traffic management and queuing hardware for protecting the control plane. The device provides dedicated 10 Gb/s hardware protection for the control planes. You can create CPM filters for the following traffic management functions:

- Drop traffic
- Accept traffic
- Allocate dedicated hardware shaping queues for traffic directed to the control processors

> **Note 1 —** You need an account with an assigned administrator scope of command role to the sitesec package, or scope of command role with write access permissions to the sitesec package, to perform this procedure
>
> **Note 2 —** The 7705 SAR does not support IPv6 CPM filters, Queue filters, or MAC CPM filters.

1 Choose Administration→Security→NE CPM Filter from the 5620 SAM main menu. The NE CPM Filter form opens.

2 Perform one of the following steps.

  a Specify a filter to search for and edit and existing site management access filter. Use the filters to search for and open an existing policy by choosing a policy in the filtered list and clicking on the Properties button.

  b Click on the Create button. The CPM Filter (Create) form opens.

3 Click on the General tab button.

4 Configure the parameters as required.

- Displayed Name
- Description
- Default Filter Action
- Administrative State
- IPv6 Administrative Status

Note — The 7705 SAR does not support IPv6 and MAC CPM filters.

5 Click on the IPv4 Entries tab button.

6 Perform one of the following steps.

a Click on the Create button to add a new filter entry.

b Click on an entry in the list and click on the Properties button to modify an existing entry.

The CPM IP Filter Entry (Create) form opens with the General tab displayed.

7 Configure the parameters.

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description

8 Click on the Filter Properties tab button.

9 Configure the parameters:

Note — The configurable parameters available depends on the choice of protocol.

- Action
- Protocol
- Queue ID
- DSCP
- Source IP
- Source Mask
- Destination IP
- Destination Mask
- Destination Port
- Routing Instance
- Fragment
- IP Option
- IP Option Mask
- Option Present
- Multiple Option
- ICMP Code
- ICMP Type
- Source Port
- TCP Ack
- TCP Syn

The Queue ID parameter is configurable when the Action parameter is set to queue.

10 Click on the OK button. The new CPM IP filter entry appears in the list.

11 Click on the IPv6 Entries tab button.

12 Perform one of the following steps.

a Click on the Create button to add a new filter entry.

b Select an entry in the list and click on the Properties button to modify an existing entry.

The CPM IPv6 Filter Entry (Create) form opens with the General tab displayed.

13 Configure the parameters.

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description

14 Click on the Filter Properties tab button.

15 Configure the parameters:

- Action
- Next Header
- Queue ID
- DSCP
- Source IP
- Source Mask
- Destination IP
- Destination Mask
- Routing Instance
- Flow Label

The Queue ID parameter is configurable when the Action parameter is set to queue.

16 Click on the OK button. The new CPM IPv6 filter entry appears in the list.

17 Click on the MAC Entries tab button.

Note — MAC CPM filters are supported only on the 7750 SR and 7450 ESS, Release 6.1 R4 or later.

18 Perform one of the following steps.

a Click on the Create button to add a new MAC entry. The CPM MAC Filter Entry (Create) form opens with the General tab displayed.

b Select an entry from the list and click on the Properties button to modify an existing CPM MAC entry. The CPM MAC Filter Entry (Edit) form opens with the General tab displayed.

19 Configure the parameters:

- Entry ID
- Auto-Assign ID
- Displayed Name
- Description

20 Click on the Filter Properties tab button.

21 Configure the parameters:

- Action
- Frame Type
- Source MAC
- Destination MAC
- Src Mask
- Dst Mask
- Dot1p
- Dot1p Mask
- CFM Opcode
- CFM Val 1
- CFM Val 2
- Service Id

22 Perform one of the following.

a If you set the Frame Type parameter to e802dot2LLC in step 21, configure the following parameters. Otherwise, go to step 24.

- DSAP
- DSAP Mask
- SSAP
- SSAP Mask

b If you set the Frame Type parameter to Ethernet II in step 21, configure the Ether Type parameter. Otherwise, go to step 24.

23 Click on the OK button to save the configuration and close the CFM MAC Filter Entry (Create) or CFM MAC Filter Entry (Edit) form.

24 Click on the Queues tab button.

25 Perform one of the following steps.

a Click on the Create button to add a new CPM filter queue. The CPM Filter Queue (Create) form opens with the General tab displayed.

b Click on an entry in the list and click on the Properties button to modify an existing CPM filter queue.

26 Configure the parameters.

- ID
- Displayed Name
- Description

27 Click on the CIR/PIR tab button.

28 Configure the parameters.

- CIR (kb/s)
- PIR (kb/s)
- MAX

Ensure that the CIR value is lower than the PIR value.

29 Click on the Burst Size tab button.

30 Configure the parameters.

- Committed Burst Size (KB)
- Maximum Burst Size (KB)

The parameters are configurable when the Default check box above each is deselected.

Ensure that the Committed Burst Size (KB) parameter value is lower than the Maximum Burst Size (KB) parameter value.

31 Click on the OK button. A dialog box appears.

32 Click on the OK button. The CPM IP Filter (Create) form reappears.

33 Repeat for each CPM filter that you want to create or modify.

34 Click on the Apply button to save the changes.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-3 To create or modify an NE DoS protection policy

Perform this procedure to control the amount of subscriber-based control-plane traffic that NE interfaces receive.

Note — You need an account with an assigned administrator scope of command role to the sitesec package, or scope of command role with write access permissions to the sitesec package, to perform this procedure

1 Choose Administration→Security→NE DoS Protection from the 5620 SAM main menu. The NE DoS Protection form opens.

2 Perform one of the following.

a Create a policy.

i Click on the Create button. The NE DoS Protection (Create) form opens.

ii Configure the following parameters:

- Auto-Assign ID
- Policy ID

iii Click on the Apply button. The form displays additional buttons and the form name changes to NE DoS Protection (Edit).

b Modify an existing policy.

i Configure the filter criteria. A list of DoS protection policies is displayed.

ii Select a policy in the list and click on the Properties button. The NE DoS Protection (Edit) form opens.

3 Configure the following parameters:

- Description
- Packet Rate Limit (pps)
- Overall Rate Limit (pps)
- Out Profile Rate (pps)
- Receive Notification

4 Perform the following steps to configure CFM frame-rate limiting, if required.

i Click on the CFM Rate Limiting tab button.

ii Click on the Create button. The CfmRateLimiting (Create) form opens.

iii Configure the parameters:

- Policy ID
- Description
- Packet Rate Limit (pps)
- Level Set

iv Click on the Add button in the Op Code Set panel. The Select Property form opens.

Note — You must specify at least one OpCode value.

v Select one or more OpCodes in the list and click on the OK button. The OpCode entries are listed on the CfmRateLimiting (Create) form.

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The CfmRateLimiting (Create) form closes.

5 Distribute the policy to NEs, as required, as described in Procedure 21-14.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The NE DoS Protection (Edit) form closes.

Procedure 21-4 To view NE DoS protection violations

1 Choose Administration→Security→NE System Security from the 5620 SAM main menu. The Select Site form opens.

2 Select a managed device in the list and click on the OK button. The NE System Security (Edit) form opens with the General tab displayed.

3 Click on the NE DoS Protection tab button.

4 Perform one of the following to view a specific violation type.

a Click on the Per Source Violations tab button to view a list of the violations that are associated with subscriber hosts.

b Click on the Link Specific Port Violations tab button to view a list of the violations at the port level. The following kinds of violations are listed:

- violations that exceed the Link Rate Limit (pps) parameter value specified for the NE
- violations that exceed the Port Overall Rate Limit (pps) parameter value specified for the NE.

c Click on the Network Interface Violations tab button to view a list of the violations for network interfaces that exceed the Overall Rate Limit (pps) parameter value specified in an associated NE DoS protection policy.

d Click on the SAP Interface Violations tab button to view a list of the violations for SAPs that exceed the Overall Rate Limit (pps) parameter value specified in an associated NE DoS protection policy.

5 Repeat step 4 as required to view another violation type.

6 Close the NE System Security (Edit) form.

Procedure 21-5 To create a user profile for managed device access

A site user profile specifies the commands or command groups that are permitted or denied on the managed device by the 5620 SAM.

Note — You need an account with an assigned administrator scope of command role to the sitesec package, or scope of command role with write access permissions to the sitesec package, to perform this procedure

1 Choose Administration→Security→NE User Profiles from the 5620 SAM main menu. The NE User Profiles form opens.

2 Click on the Create button. The Site User Profile (Create) form opens.

3 From the General tab, configure the parameters.

- Displayed Name
- Description
- Default Profile Action
- LI Profile

Note — To configure the LI Profile parameter you must have LI privileges. For more information about LI, see chapter 34.

4 Click on the Apply button.

5 Click on the Entries tab button.

6 Click on:

a The Create button to add a new site entry.

b An entry in the table and click on the Properties button to modify an existing entry.

The Site User Profile Match Entry (Create) form opens when you create a new entry.

7 Configure the parameters.

- ID
- Auto-Assign ID
- Displayed Name
- Description
- Action
- Match String

Specify the Match String parameter. A match string is a CLI command prefix, which defines the scope of the user profile. For example, when you set the match string to “config” and specify a deny action, this user profile cannot use any CLI commands that begin with the word “config”.

8 Click on the Apply button to save the changes. The site user profile match entry appears in the list form.

9 Verify the action.

10 Click on the OK button to close the form.

11 Repeat for each required site user profile.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-6 To configure a user account for access to a managed device

Perform this procedure to create a user account on a device for managed device access when the authentication servers are unavailable, or to specify the allowed types of device access, for example, Telnet, SNMPv3, FTP, or console.

Note — You need an account with an assigned administrator scope of command role to the sitesec package, or scope of command role with write access permissions to the sitesec package, to perform this procedure

1 Choose Administration→Security→NE User Configuration from the 5620 SAM main menu. The NE User Configuration form opens.

2 Click on the Create button. The NE User (Create) form opens with the General tab displayed.

3 Configure the parameters.

- User Name
- Additional ID
- Description
- Access
- Password
- Confirm Password
- Home Directory
- Restrict to Home
- Console Login Exec File
- Console Cannot Change Password
- Console New Password At Login

Note — For SNMP v2 managed NEs, you can create and update an SNMP user configuration policy when SNMP is not enabled for the Access parameter.

4 When a user has console permission, you can configure the parameters in the Console Profiles tab.

i Click on the Console Profiles tab button. The list of profiles numbered one through eight appears.

Each user can have up to eight profiles.

ii Click on the Select button beside Profile 1 and Profile 2 to 8 parameters. Profile 1 is automatically configured to use the system-generated default profile.

The Select Site User Profile form opens. Default profiles and the profiles created in Procedure 21-5 are listed.

iii Choose a profile from the list.

iv Click on the OK button. The profile name appears beside the profile number.

5 When a user has SNMPv3 permissions, you can configure the authentication parameters. Ensure that the SNMPv3 user and user group has been created on the managed device. If MD5 or SHA authentication and DES privacy is used, ensure the keys have been created and associated with the managed device and the SNMPv3 user group, as described in Procedure 14-1.

i Click on the SNMP v3 tab button.

ii Configure the parameters.

- Authentication Protocol
- Privacy Protocol
- New Authentication Password
- Confirm New Auth Password
- New Privacy Password
- Confirm New Privacy Password

iii Click on the OK button to save the changes.

iv Verify the action.

6 Click on the Apply button to save the changes.

7 Close the form.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-7 To create or modify a password policy

Perform this procedure to create a policy that specifies the rules to which a password must conform on one or more devices.

Note — You need an account with an assigned administrator scope of command role to the sitesec package, or scope of command role with write access permissions to the sitesec package, to perform this procedure

1 Choose Administration→Security→NE Password Policy from the 5620 SAM main menu. The NE Password Policy form opens.

2 Click on the Create button. The Site Password Policy (Create) form opens.

3 Configure the parameters.

- ID
- Auto-Assign ID
- Name
- Description
- Complexity
- Lockout Time (minutes)
- Password Never Expires
- Maximum Attempts
- Maximum Attempts Time (minutes)
- Days Before Expiration
- Minimum Length
- Health Check
- Health Check Interval
- Authentication Order 1
- Exit On Reject
- Admin Password

If the password can expire, specify the expiration parameter to indicate the number of days that the password can be active before the old password expires and a new password must be set.

Use the Maximum Attempts and Maximum Attempts Time (minutes) parameters to specify the number of attempts allowed within a specified time.

If the maximum number of password attempts in the specified time is exceeded, set how long the account is locked out using the Lockout Time (minutes) parameter.

4 Specify the types and order of password authentication to be used to verify the user account password using the Authentication Order 1 through 3 parameters. Set the order from the most preferred method of authentication to the least preferred method of authentication.

5 Click on the OK button to save the changes.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-8 To create an NE RADIUS access policy

See the appropriate RADIUS documentation for more information about configuring RADIUS servers.

1 Choose Administration→Security→NE RADIUS Authentication from the 5620 SAM main menu. The NE RADIUS Authentication form opens.

2 Click on the Create button. The Site RADIUS Policy (Create) form opens.

3 Configure the parameters.

- Displayed Name
- Description
- Administrative State
- Enable Accounting
- Enable Authorization
- RADIUS Authorization Algorithm
- Retry Attempts
- Timeout (seconds)
- Authentication Port
- Source Address
- Accounting Port
- Enable User Template

Note — The Source Address parameter on the Site RADIUS Policy (Create) form is configurable but is not used. You must use the Source Address tab of the routing instance properties form for the device to specify the source address of the RADIUS server.

4 Click on the Servers tab button to configure a connection to the RADIUS servers. You can configure up to five RADIUS servers.

i Click on the Create button. The Site RADIUS Server (Create) form opens.

ii Configure the parameters.

- ID
- Displayed Name
- Description
- Address
- Secret Name

iii Click on the OK button to save the changes.

5 Click on the Apply button to save the changes.

You must distribute policies to specific devices, as described in Procedure 21-14.

Ensure that the authentication order uses RADIUS first. See Procedure 21-7 for more information.

Procedure 21-9 To create an NE TACACS+ access policy

See the appropriate TACACS+ documentation for more information about configuring TACACS+ servers.

See section 9.4 for a sample configuration.

1 Choose Administration→Security→NE TACACS+ Authentication from the 5620 SAM main menu. The NE TACACS+ Authentication form opens.

2 Click on the Create button. The Site TACACS+ Policy (Create) form opens with the General tab displayed.

3 Configure the parameters.

- Displayed Name
- Description
- Administrative State
- Enable Accounting
- Accounting Type
- Enable Authorization
- Timeout (seconds)
- Single Connection
- Source Address
- Enable User Template

Note — The Source Address parameter on the Site TACACS+ Policy (Create) form is configurable but is not used. You must use the Source Address tab of the routing instance properties form for the device to specify the source address of the TACACS+ server.

4 Click on the Servers tab button to configure a connection to the TACACS+ servers. You can configure up to 5 TACACS+ servers.

i Click on the Create button.

The Site TACACS+ Server (Create) form opens.

ii Configure the parameters.

- ID
- Displayed Name
- Description
- Address
- Secret Name

iii Click on the OK button to save the changes.

5 Click on the Apply button to save the changes.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-10 To configure NE system security

1 Choose Administration→Security→NE System Security from the 5620 SAM main menu. The Select Site form opens.

2 Select a managed device in the list and click on the OK button. The NE System Security (Edit) form opens with the General tab displayed.

3 Click on the Servers Configuration tab button to configure the type of servers that you want to configure on the managed device.

4 Configure the parameters:

- Servers Enabled
- SSH
- Graceful Shutdown
- Minimum TTL Value
- Graceful Shutdown
- Minimum TTL Value

Note — The 7705 SAR may become temporarily unreachable when enabling SSH and starting the SSH server on the device.

5 Click on the CPM-Per-Peer-Queuing tab button to ensure that the managed device allocates a separate CPM hardware queue for the peer, for example, a BGP or T-LDP peer.

6 Configure the CPM Per-Peer-Queuing parameter.

7 Click on the System User Template tab button. The default template is displayed.

8 Select the default template and click on the Properties button. The System User Template (Edit) form opens.

9 Configure the parameters.

- Access
- Home Directory
- Restricted to Home Directory
- Console Login Exec File

10 Click on the OK button. The System User Template (Edit) form closes.

11 Click on the NE DoS Protection tab button to configure global DoS functionality for the NE.

12 Configure the parameters:

- Link Rate Limit (pps)
- Port Overall Rate Limit (pps)
- Protection Administrative State
- Allow Sham Links

13 Click on the following tab buttons to view violations information, as required. See Procedure 21-4 for more information.

- Per Source Violations
- Link Specific Port Violations
- Network Interface Violations
- SAP Violations

14 Click on the Faults tab button to view alarm information, as required.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The NE System Security (Edit) form closes.

You must distribute policies to specific devices, as described in Procedure 21-14.

Procedure 21-11 To create an OmniSwitch RADIUS or TACACS+ security policy

See the appropriate RADIUS or TACACS+ documentation for information about configuring RADIUS and TACACS+ servers.

1 Choose Administration→Security→NE AOS Security Authentication from the 5620 SAM main menu. The NE AOS Security Authentication form opens.

2 Click on the Create button. The Site AOS Security Policy (Create) form opens with the General tab displayed.

3 Configure the parameters.

- Displayed Name
- Description
- Protocol Name

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Perform one of the following:

a If you set the Protocol Name parameter to RADIUS in step 3, go to step 5.

b If you set the Protocol Name parameter to TACACS+ in step 3, go to step 8.

5 Configure the parameters.

- IP Address
- IP Address 2
- Time Out
- Retries
- Secret
- Authentication Port
- Account Port

6 Click on the Apply button to save the changes.

7 To configure multiple RADIUS servers, repeat steps 3 to 4 to add more RADIUS servers; otherwise go to step 11.

8 Configure the parameters:

- IP Address
- IP Address 2
- Time Out
- Secret
- Port

9 Click on the Apply button to save the changes.

10 To configure multiple TACACS+ servers, repeat steps 3 to 4 to add more TACACS+ servers; otherwise go to step 11.

11 Close the Site AOS Security Policy (Create) form.

You must distribute the security policies to specific devices, as described in Procedure 21-14.

Ensure that the authentication order uses RADIUS first. See Procedure 21-7 for more information.

Procedure 21-12 To create a subscriber authentication policy

The 5620 SAM provides security support for creating DHCP sessions on the 7450 ESS, 7750 SR, and 7710 SR. The 5620 SAM allows you to create a policy that uses RADIUS authentication to grant network access to a dynamic host. You can apply the policy to a VPLS or IES SAP, or to a VPRN or IES group interface. Authentication is not performed for statically provisioned hosts.

Perform this procedure to create a DHCP-based subscriber authentication policy that defines the parameters for dynamically created subscriber host sessions and authenticates the sessions. The 5620 SAM supports up to 32 subscriber authentication policies.

See chapter 71 for information about configuring a VPLS and chapter 73 for information about configuring an IES.

1 From the 5620 SAM main menu, choose Administration→Security→Subscriber Authentication Policy Manager. The Subscriber Authentication Policy Manager form opens.

2 Click on the Create button. The Subscriber Authentication Policy (Create) form opens with the General tab displayed.

3 Configure the parameters.

- Displayed Name
- Description
- Retry Attempts
- Timeout (seconds)
- Re-Authenticate When DHCP Lease Expires
- Accept CoA
- Access Algorithm
- RADIUS Attributes
- Source Address
- PPPoE Access Method
- Authentication Hold Down Time
- User Name Format
- Append To User Name
- Password
- Calling Station ID Type
- Port Type
- Port Type Value
- Port Prefix Type
- Port Prefix String
- Port Suffix Type
- Fallback Action

Note — The Calling Station ID Type parameter is configurable when the Calling Station ID option is enabled for the RADIUS Attributes parameter.

The Port Type parameter is configurable when the NAS Port Type option is enabled for the RADIUS Attributes parameter.

The Port Type Value parameter is configurable when the NAS Port Type option is enabled for the RADIUS Attributes parameter, and the Port Type parameter is set to Config.

The Port Prefix Type, Port Prefix String, and Port Suffix Type parameters are configurable when the NAS Port ID option is enabled for the RADIUS Attributes parameter.

4 Configure the Router Instance parameter. If you set the parameter value to VPRN, go to step 5. Otherwise, go to step 7.

5 Configure a VPRN service as a virtual router instance for the subscriber authentication policy. Perform the following steps.

i Click on the Select button in the VPRN ID panel. The Select VPRN ID - Subscriber Authentication Policy list form opens.

ii Select a VPRN site from the list and click on the OK button. The Select VPRN ID - Subscriber Authentication Policy list form closes and the Subscriber Authentication Policy (Create) form refreshes with the VPRN service information.

Note — You must select a VPRN site before you add RADIUS servers in step 7.

6 If you want to configure PAP/CHAP user name re-writing, configure the following parameters:

- User Name Operation
- Domain Name

7 Click on the RADIUS Servers tab button, if required. Otherwise, go to step 12.

8 Click on the Create button. The RadiusEntry (Create) form opens with the General tab displayed.

9 Configure the parameters.

- ID
- Auto-Assign ID
- Description
- Address
- Port
- CoA Only
- Secret Name

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The RadiusEntry (Create) form closes and the Subscriber Authentication Policy (Create) form refreshes with the RADIUS server information displayed in a list in the RADIUS Servers tab.

12 Click on the Apply button. The Subscriber Authentication Policy (Create) form refreshes with additional buttons and tabs.

13 Click on the More Actions button and choose Distribute to manually distribute the policy to the selected devices.

See Procedure 21-14 for information about distributing security policies. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — If the policy is in draft mode, the Distribution option is disabled and the policy cannot be distributed. You must first release the policy for distribution. When you switch the configuration mode to released, the policy is distributed to existing local definitions. See Procedure 21-14 for more information about how to release a policy.

14 Close the Subscriber Authentication Policy (Create) form. The Subscriber Authentication Policy Manager form refreshes with the policy information displayed in a list.

Procedure 21-13 To modify a security policy

1 Choose the appropriate policy from the Administration→Security→*option* 5620 SAM main menu. The appropriate form opens.

2 Set the filter criteria, if applicable. You can filter or local or global policies by using the Policy Scope parameter. When you set the parameter to Local, you can search on a specific managed device by clicking on the Select button beside the Local Node IP Address parameter.

3 Click on the Search button. A policy list opens.

4 Specify whether to modify the global or the local instance of the policy.

- **a** Local policies have a check mark for the Local column.
- **b** Global policies do not have a check mark for the Local column.

5 Choose a policy from the list.

6 Click on the Properties button.

7 Configure the policy parameters, as required.

From either a local or global policy, you can click on the Local Definitions or Global Definitions tab button to view the local instances of policies or the global policy used to define the local instance.

8 Save the changes and close the file. You must distribute global policies to the managed devices. You do not distribute modified local policies.

Procedure 21-14 To distribute a security policy

1 Create policies, as described in Procedures 21-1 to 21-12.

2 Choose the appropriate policy from the Administration→Security→*option* 5620 SAM main menu. The appropriate form opens.

3 Set the filter criteria, if applicable.

4 Click on the Search button. A policy list opens.

5 When:

a A management access filter is configured to deny access to managed devices, ensure the following:

i List the applicable management access filters. A list of management access filters opens.

ii Shut down the management access filter.

iii Distribute the policies. Complete steps 6 to 14.

b If no management access filter is configured, go to step 6.

6 Choose a policy from the list.

7 Click on the Properties button if you are distributing a CPM IP, NE DoS protection, or management access filter. The *Policy_Type*, Global (Edit) form opens.

8 When the policy is in draft configuration mode, the Distribute option, located under the More Actions button, is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution by performing the following steps. Otherwise, go to step 9.

i Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears.

ii Click on the Yes button. The configuration mode of the policy is changed to Released.

Warning — When you change the configuration mode of a management access filter or CPM IP filter to released, the policy is not distributed to existing local definitions. When all other policies are changed to released, the policy is distributed to existing local definitions.

iii View the local policy, if necessary, by clicking on the Local Definitions tab button and double-clicking on the local policy in the list.

iv Close the local policy form.

9 Click on the More Actions button and choose Distribute. The Distribute form opens.

10 Choose a row or rows from the Available Nodes list.

11 Click on the right arrow button. The chosen device or devices move to the Selected Nodes panel on the right side of the form.

12 Click on the More Actions button and choose Distribute. CPM IP and management access filters require that you confirm the policy distribution. The policy is distributed to the device or devices.

13 Close the Distribute form. The *Policy_Type*, Global (Edit) form reappears.

14 Configure the distribution mode of the local definitions by performing the following steps.

i Click on the More Actions button and choose Distribution Mode. The Distribution Mode - *Policy* form opens.

ii Configure the Distribution Mode parameter. The existing local definitions that are configured with the selected distribution mode are listed.

iii Choose one ore more rows from the Available Nodes list.

iv Click on the right arrow button. The chosen device or devices move to the Selected Nodes panel on the right side of the form.

v Depending on the distribution mode of the chosen device or devices, perform one of the following steps:

- Click on the Sync With Global button.
- Click on the Local Edit Only button.

vi Close the Distribution Mode - *Policy* form. The *Policy_Type*, Global (Edit) form reappears.

15 Turn up the management access filter if you performed step 5 a ii. Otherwise, go to step 16.

16 Close the *Policy_Type*, Global (Edit) form.

17 Close the policy manager form.

Procedure 21-15 To delete a security policy

Note 1 — When you delete site management access filter policies in which the Action parameter is set to deny, ensure that you edit the policy to set the parameter to permit before it is deleted, otherwise, the 5620 SAM may be isolated.

Note 2 — You cannot remove a site management access filter if the filter administrative state is up and the default action of the filter is set to deny or deny host unreachable.

Note 3 — If you attempt to delete an OmniSwitch RADIUS or TACACS+ security policy that has been applied to an authentication service, the 5620 SAM generates a deployment error. You must use the OmniSwitch CLI to delete the policy from the authentication service before you can delete the policy from the 5620 SAM.

1 Choose the appropriate policy from the Administration→Security→*option* 5620 SAM main menu. The appropriate form opens.

2 Set the filter criteria, if applicable.

3 Click on the Search button. A policy list opens.

4 Choose a policy from the list.

5 Click on the Delete button.

6 Click on the Yes button. The policy is deleted.

22 — Inventory management

22.1 Inventory management overview

The 5620 SAM client GUI provides multiple ways of generating inventory data about managed devices and the managed network. You can also use the 5620 SAM-O interface to generate inventory data. See the *5620 SAM XML OSS Interface Developer Guide* for more information.

Use the list, properties, and equipment management forms to generate inventories for:

- required data for SLA audits
- equipment, such as cards, needed for sparing
- installed and in-operation equipment
- vintages, CLEI codes, and identifications

You can generate inventory data based on:

- the entire managed network, which includes all 5620 SAM-managed devices
- a managed device

Note — Not all columns in the inventory lists are applicable to all equipment types. For example, not all card types have an associated CLEI code. In situations such as this, the inventory list displays "N/A" in the column.

Figure 22-1 shows how to use the Manage Equipment form to filter and inventory data for all managed devices.

Figure 22-1 Generating inventory data for all managed devices

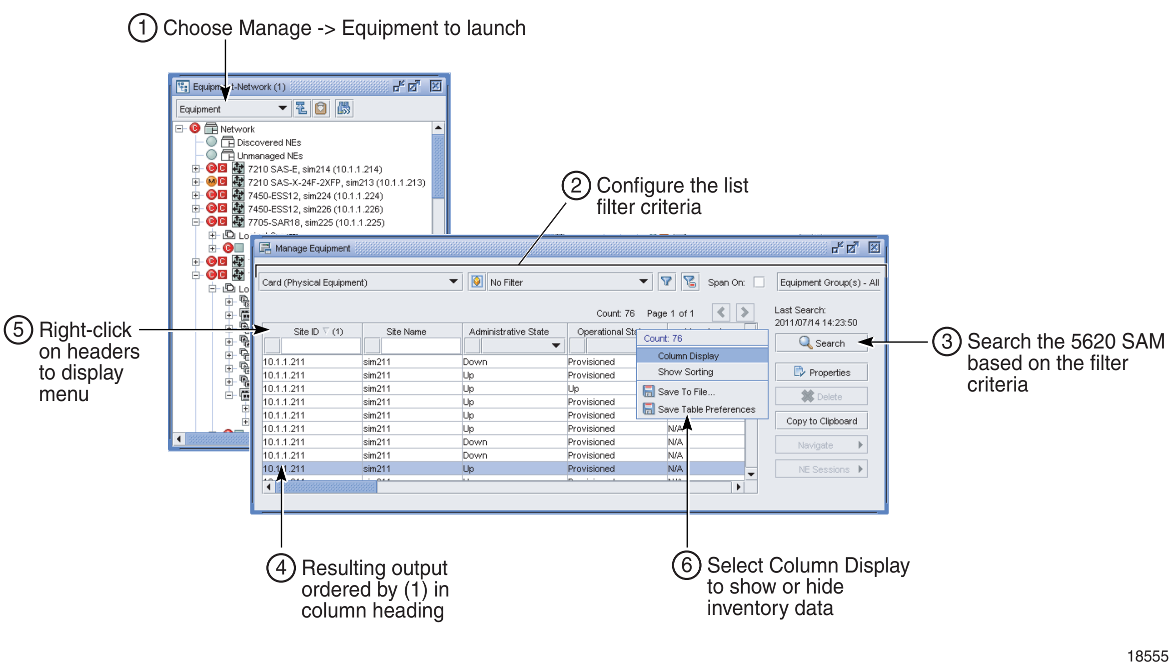


Figure 22-2 shows how to use the properties form for a network object, in this case a shelf on a managed device, to inventory data for the managed device.

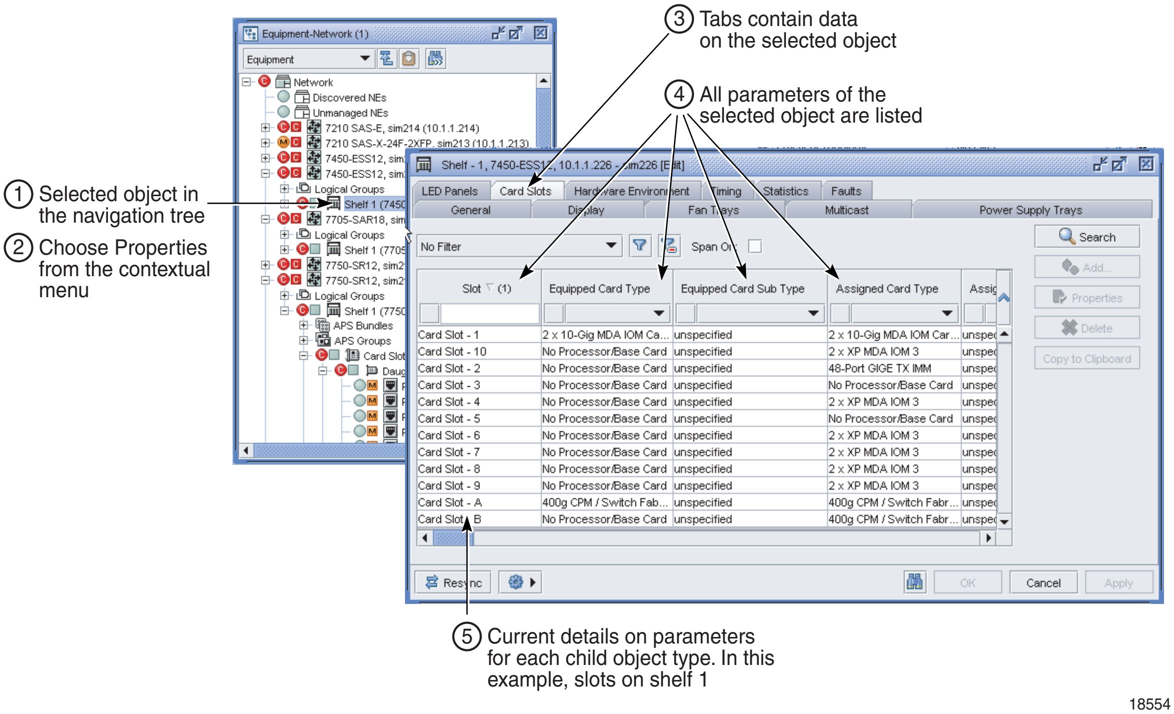
Figure 22-2 Generating inventory data for a managed device



Save the data in CSV or HTML format. You can use the saved file for further processing on another platform; for example, as input to a back-office parts management system. Figure 22-3 shows the output of an inventory list saved in CSV format.

Figure 22-3 CSV inventory output

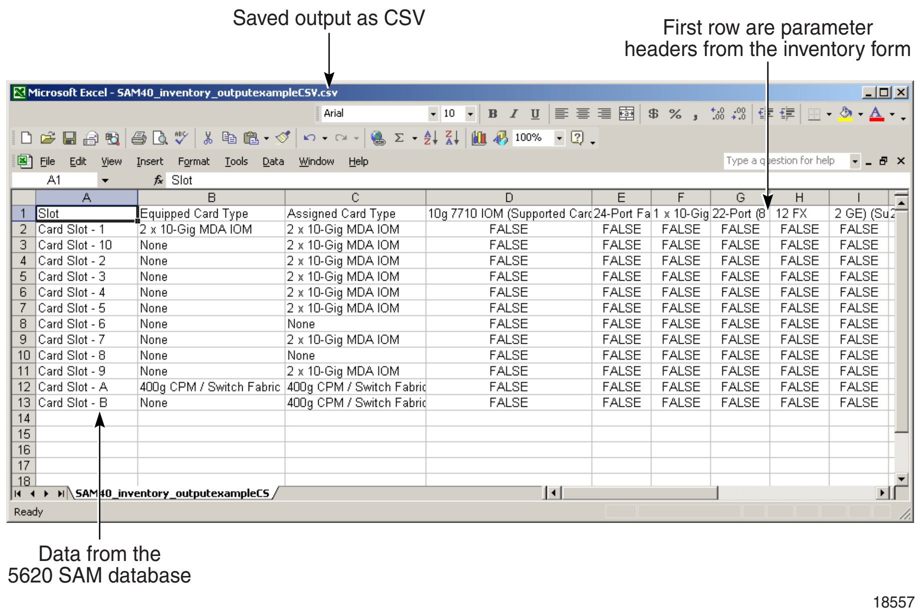


Figure 22-4 shows the output of an inventory list saved in HTML format.

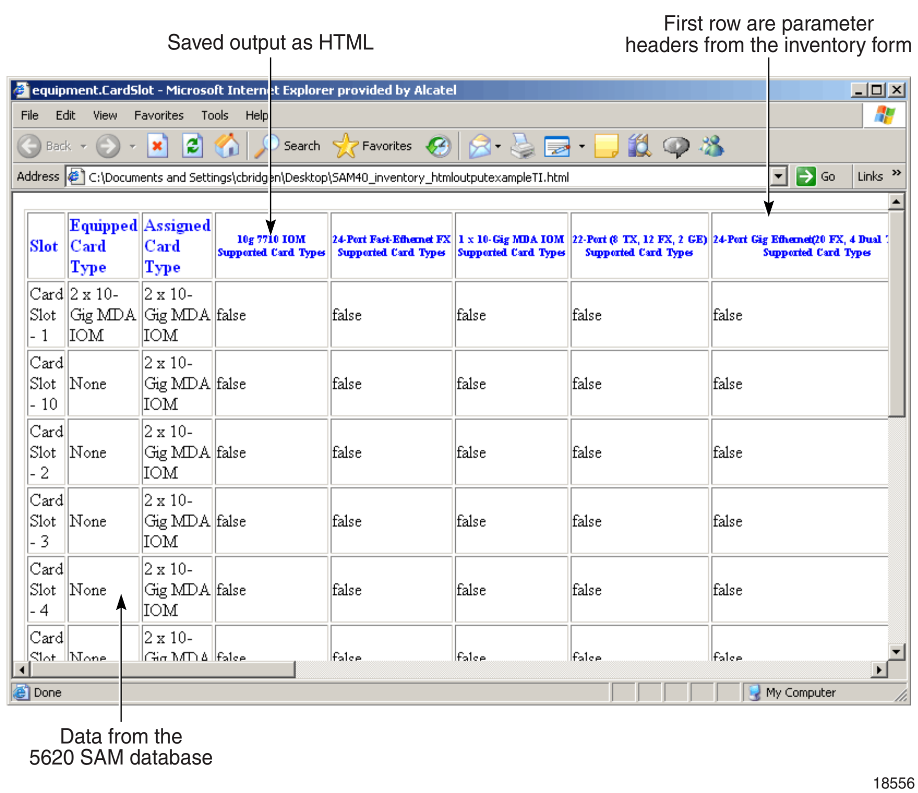
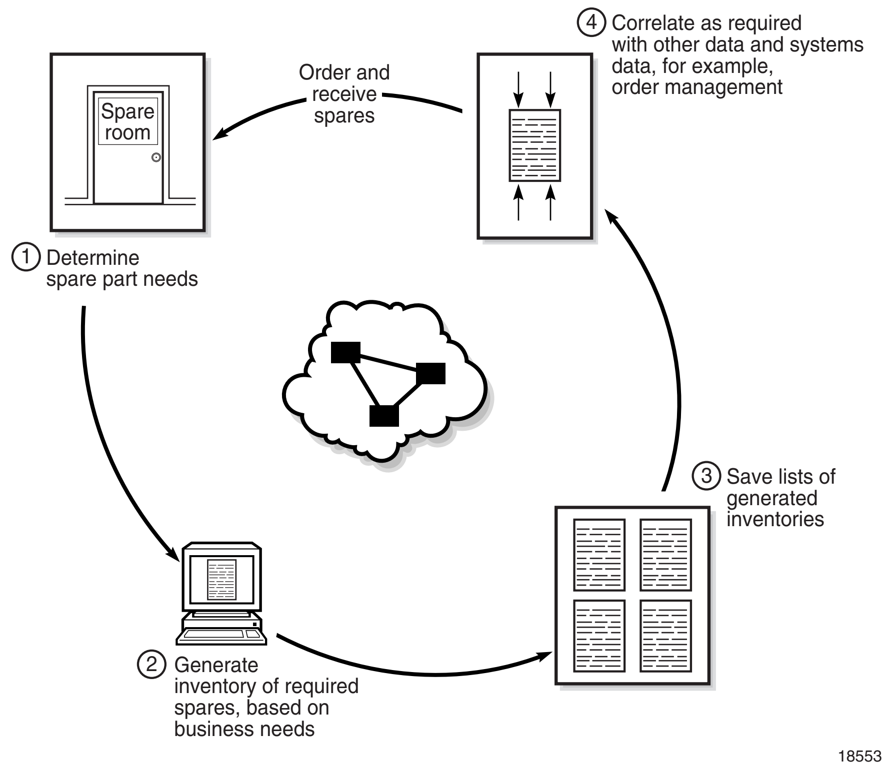
Figure 22-4 HTML inventory output



22.2 Sample inventory management workflow

Figure 22-5 shows an example of an inventory management workflow using the client GUI to generate a list of required spare parts, based on business needs.

Figure 22-5 Example of an inventory management workflow



This example is configured using the following high-level tasks.

1. Determine spare part needs based on business needs and future growth plans.
2. Using the 5620 SAM, generate inventory lists of required spares, keeping in mind the following points.
   - Filter the list form to list only those objects that you want; for example, cards of a certain type required for sparing.
   - Generate multiple lists, based on business needs.
3. Using the 5620 SAM, save lists of required spares in a format compatible with your back-office systems; for example, CSV or HTML. Move the lists to another system, as required by the back-office applications; for example, an order management or data management system.
4. Correlate inventory lists with data from other back-office systems, as required by business needs.

22.3 Workflow for inventory management

1. Determine inventory management needs.
2. Provide inventory management list requirements to NOC operators.
3. As required, generate inventory lists for a managed device or for the entire network. See Procedure 22-1 for more information.
4. As required, generate inventory lists for a managed device from the 5620 SAM client GUI:
    - a Generate inventory lists for CLEI codes. See Procedure 22-5 for more information.
    - b Generate inventory lists for card software versions. See Procedure 22-6 for more information.
    - c Generate inventory lists for port types. See Procedure 22-7 for more information.
    - d Generate inventory lists for shelf data. See Procedure 22-8 for more information.
5. As required, generate inventory lists for the entire network from the 5620 SAM client GUI:
    - a Generate inventory lists for all managed cards. See Procedure 22-9 for more information.
    - b Generate inventory lists for all managed fan trays. See Procedure 22-10 for more information.
    - c Generate inventory lists for all managed flash memory. See Procedure 22-11 for more information.
    - d Generate inventory lists for all managed physical links. See Procedure 22-12 for more information.
    - e Generate inventory lists for all managed ports. See Procedure 22-13 for more information.
    - f Generate inventory lists for all managed power supply trays. See Procedure 22-14 for more information.
    - g Generate inventory lists for all managed processors. See Procedure 22-15 for more information.
    - h Generate inventory lists for all managed shelves. See Procedure 22-16 for more information.
    - i Generate inventory lists for all management ports. See Procedure 22-17 for more information.
    - j Generate inventory data for network device SLA audits. See Procedure 22-18 for more information.
6. As required, save search filters. See Procedure 22-4 for more information.

7 As required, save inventory lists in the required formats:

a Save inventory lists in HTML format. See Procedure 22-2 for more information.

b Save inventory lists in CSV format. See Procedure 22-3 for more information.

8 Move inventory lists to other platforms for post-processing.

22.4 Inventory management procedures

Use the following procedures to perform inventory management tasks.

Procedure 22-1 To list and sort inventory data

Perform this procedure to list and sort inventory data for a device or for the entire network.

1 Inventory can be listed and sorted for a device or for the entire network.

a To list and sort inventory for a device, perform steps 2 to 6.

b To list and sort inventory for the entire network, perform steps 7 to 11.

2 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

3 Choose a Network Element (Network) from the object drop-down list and click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab button and choose a network object from the object drop-down list. The list form displays the results of the inventory search for the selected device.

6 Go to step 11.

7 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

8 Choose a network object from the object drop-down list.

9 Configure the filter criteria.

10 Click on the Search button. The list form displays the results of the inventory search.

11 Sort the results.

a To count the number of items in the list, generate an inventory of data and right-click on the list heading. The Count shows the number of objects in the list.

b To sort in ascending or descending order, click on the column heading. The arrow direction changes to indicate the order in which the data is sorted.

c To move a column, click on the column, drag the column to the right or left, and drop the column in its new location.

d To remove a column,

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Displayed on Table list box, choose the columns that you need to remove from the table and click the left arrow. The specified columns are moved to the Available for Table list box.

iii Click on the OK button to apply the changes and close the Column Display window. The specified columns are removed from the table.

e To sort multiple columns, right-click on a column heading and choose Show Sorting from the contextual menu. The Show Sorting form opens. Choose the property or properties from the Available for Sorting panel and click on the right arrow button. The property or properties appear in the Used for Sorting panel. Click on the Sort Ascending or Sort Descending button, as required.

12 Save the inventory output by performing Procedure 22-2 or 22-3.

13 Close the form.

Procedure 22-2 To save inventory output in HTML format

1 Define the filter properties for the inventory search, and list and sort the output as described in Procedure 22-1.

2 Right-click on a column heading of the inventory output and choose Save to File from the contextual menu. The Save form opens.

3 Save the inventory output.

i To choose a directory in which to save the listed information, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose HTML (*.htm, *.html) from the Files of Type drop-down menu.

iv Click on the Save button. The results of the inventory search are saved to the specified HTML file.

4 Close the form.

Procedure 22-3 To save inventory output in CSV format

1 Define the filter properties for the inventory search, and list and sort the output as described in Procedure 22-1.

2 Right-click on a column heading of the inventory output and choose Save to File from the contextual menu. The Save form opens.

3 Save the inventory output.

i To choose a directory in which to save the listed information, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose CSV (*.csv) from the Files of Type drop-down menu.

iv Click on the Save button. The results of the inventory search are saved to the specified CSV file.

4 Close the form.

Procedure 22-4 To save a filter

See Procedure 3-37 for more information.

Procedure 22-5 To inventory CLEI codes for managed device objects

1 You can list CLEI codes for card slots, cards, daughter card slots and daughter cards.

a To view CLEI codes for a device, perform steps 2 to 7.

b To view CLEI codes for the entire network, perform steps 8 to 13.

2 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

3 Choose a Network Element (Network) from the object drop-down list and click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab button and choose a network object from the object drop-down list. For example:

- To display the cards and daughter cards that are configured in the slots expand Slot (Physical Equipment and select one of the following:
  - Card Slot (Physical Equipment)
  - Daughter Card Slot (Physical Equipment)
- To display the IOMs that are installed on, pre-provisioned, or provisioned for the node expand Card (Physical Equipment) select IO Card (Physical Equipment)

In each instance, the list form displays the results of the inventory search for the selected device.

6 To obtain a list of CLEI codes for the network object selected in step 5, perform step 11d of Procedure 22-1 to remove all columns from the list except for the object ID or object type and the CLEI code columns.

7 Go to step 12.

8 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

9 Choose a network object from the object drop-down list.

10 Click on the Search button. The list form displays the results of the inventory search.

11 To obtain a list of CLEI codes for the network object selected in step 5, perform step 11d of Procedure 22-1 to remove all columns from the list except for the site ID, object ID, and CLEI code columns

12 Save the CLEI code inventory output.

a To save the results in HTML format, perform steps 2 and 3 of Procedure 22-2.

b To save the results in CSV format, perform steps 2 and 3 of Procedure 22-3.

13 Close the form.

Procedure 22-6 To inventory card software versions for a managed device

You can inventory card software versions for a managed device.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab button and choose Card (Physical Equipment) from the object drop-down list. The list form displays the results of the inventory search.

6 To obtain a list of card software versions for the selected device, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Slot ID
- Software Version

7 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

8 Close the form.

Procedure 22-7 To inventory port types for a managed device

Perform this procedure to generate an inventory of port types, such as physical ports, SONET channels, link aggregation groups, terminations, TDM channels, protocols, multilink bundles, and APS groups.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab button and choose Port (Physical Equipment) from the object drop-down list. The list form displays the results of the inventory search.

6 To display more detailed port inventory information expand to the following sub-objects on the object drop-down list:

- SONET Channels
- Link Aggregation Groups
- TDM Channels
- Multilink Bundles
- APS Groups

7 To sort the inventory output, perform step 11 of Procedure 22-1.

8 Save the inventory output.

- **a** To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.
- **b** To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

9 Close the form.

Procedure 22-8 To inventory shelf data for a managed device

Perform this procedure to generate an inventory of shelf manufacturer information, part numbers, serial numbers, CLEI codes, and CLLI codes for the shelves of a managed device.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab button and choose Shelf (Physical Equipment) from the object drop-down list. The list form displays the results of the inventory search.

6 Choose a shelf from the list and click on the Properties button. The Shelf (Edit) form opens with the General tab button displayed.

7 Click on the Display tab button. A picture of the selected shelf is displayed.

8 Use screen capture software to record the screen image, or otherwise copy the shelf information to a file for further processing.

Note — You can generate an inventory of shelf data for the managed network, but not for an individual managed devices. See Procedure 22-16 for more information.

9 Close the form.

Procedure 22-9 To inventory all managed cards

You can inventory all managed cards in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Card (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of card-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Manufacture Date
- Part Number
- Serial Number
- CLEI Code

6 Save the inventory output.

  a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

  b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-10 To inventory all managed fan trays

You can inventory all managed fan trays in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Fan Tray (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of fan tray-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Operational State
- Administrative State
- Device State

6 Save the inventory output.

   a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

   b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-11 To inventory all managed flash memory

You can inventory all managed flash memory in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Flash Memory (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of flash memory-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Serial Number
- Firmware Revision
- Model Number
- Capacity (sectors)
- Amount Used (sectors)

6 Save the inventory output.

   a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

   b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-12 To inventory all managed physical links

You can inventory all managed physical links in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Physical Link (Network) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of physical link-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Endpoint A Type
- Endpoint A - Port
- Endpoint B Type
- Endpoint B - Port

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-13 To inventory all managed ports

You can inventory all managed ports in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Port (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of port-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Name
- CLI Name
- MTU (bytes)
- State

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-14 To inventory all managed power supply trays

You can inventory all managed power supply trays in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Power Supply Tray (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of power supply tray-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Administrative State
- Operational State
- AC Voltage Status
- DC Voltage Status
- Assigned Type

6 Save the inventory output.

  a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

  b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-15 To inventory all managed processors

You can inventory all managed processors in a network of managed devices.

Note — The eNodeB, 9471 MME, and 5780 DSC have distinct types of control cards. See the *5620 SAM LTE RAN User Guide* for information about performing inventory tasks for the eNodeB. See the *5620 SAM LTE ePC User Guide* for information about performing inventory tasks for the 9471 MME and 5780 DSC.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Processor (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of processor-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Operational State
- Administrative State
- CLEI Code
- Manufacturer
- Manufacture Date
- Part Number
- Serial Number

6 Save the inventory output.

  a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

  b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-16 To inventory all managed shelves

You can inventory all managed shelves in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Shelf (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of shelf-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- Operational State
- Administrative State
- CLEI Code
- Manufacturer
- Manufacture Date
- CLLI Code
- Part Number
- Serial Number (Manufacturer Details)

6 Save the inventory output.

 a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

 b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the form.

Procedure 22-17 To inventory all management ports

You can inventory all management ports in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of management port-specific codes, perform step 11d of Procedure 22-1 to remove all columns from the list except for the following:

- System ID
- Management IP Address
- Location
- Chassis Type
- Sys Object ID
- Software Version
- Descriptor Version (software release)
- Resource Group ID

6 Save the inventory output.

 a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

 b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

7 Close the Manage Equipment form.

Procedure 22-18 To collect inventory data for network device SLA audits

You can create lists of inventory data to provide the specific summary information required for SLA audits. Ensure the following before you start:

- Inventory collection requirements differ based on SLA agreements. Ensure that the correct data is being collected for your SLA agreement.
- Perform inventory collection during a maintenance window, or during low network activity windows to ensure no impact to systems.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Collect the required SLA audit data.

a For card SLA audits, choose Card (equipment) from the object drop-down list.

b For shelf SLA audits, choose Shelf (equipment) from the object drop-down list.

c For power supply tray SLA audits, choose Power Supply Tray (equipment) from the object drop-down list.

3 Click on the Search button. The SLA audit data appears in the list.

4 Typically, only a subset of data is required for SLA audits. To display only the required information, perform the following:

i Left-click on the list column heading. The list contextual menu appears.

ii Ensure the information that you want displayed has a check mark. These typically include:

- Identification information, such as Site ID, Site Name, Slot ID, and Slot Name
- SLA audit and ordering information, such as Manufacture Date, Part Number, Serial Number, CLEI Code, and Card Type

iii Close the list contextual menu. Only the chosen information is displayed in the list.

iv Choose Save Table Preferences from the list contextual menu to save the refined list for future use. When a similar search from the same client GUI is performed, the refined list is shown by default.

v Confirm the action.

5 Save the inventory output.

   a To save the output in an HTML file, perform steps 2 and 3 of Procedure 22-2.

   b To save the output in a CSV file, perform steps 2 and 3 of Procedure 22-3.

6 Close the form.

23 — NE maintenance

23.1 NE maintenance overview

The 5620 SAM includes NE maintenance functionality for supported devices that allows a system administrator to:

- define the 5620 SAM deployment and local device configuration-save conditions
- perform an on-demand or scheduled NE configuration backup
- restore a previous device configuration
- perform an on-demand or scheduled NE software upgrade; scheduled software upgrades are supported for the 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7210 SAS-E, 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, and 9500 MPR.
- view the status of a deployment, backup, device configuration restore, device software upgrade, or accounting statistics retrieval operation in progress
- troubleshoot a failed deployment, backup or upgrade

A 5620 SAM operator with an administrator or network element software management scope of command role and can perform device configuration save, backup, or restore operations, and can create policies for scheduling backups and configuration saves.

A 5620 SAM operator can upgrade software or schedule a software upgrade on sites and routers that are within their span of control.

A 5620 SAM operator with lawful intercept management scope of command role can perform back up and restore operations for LI configuration on an NE. Back up data is saved only when the LI local save allowed parameter is set to True. See Procedure 13-10 for more information about configuring LI local save allowed.

Managing NE deployments

When you apply a device configuration change using the 5620 SAM—for example, by clicking on OK or Apply after changing a service parameter—the 5620 SAM deploys the configuration change to the device according to the 5620 SAM deployment policy. The 5620 SAM deployment policy also specifies when the device saves its configuration locally. The information in a deployment policy includes the following:

- the number and frequency of deployment retries that the 5620 SAM performs
- the conditions under which the 5620 SAM initiates a device configuration save, such as the frequency and level of saved configuration detail

In a lab or testing environment, it is sometimes necessary to disable 5620 SAM deployment. See the *5620 SAM XML OSS Interface Developer Guide* for information about disabling 5620 SAM deployment.

Managing NE backups and restores

A 5620 SAM backup policy specifies the conditions under which the 5620 SAM performs a device backup to ensure that the device configuration is not lost in the event of a failure. A default policy that is assigned to all managed devices is in place after 5620 SAM installation. You can create and configure multiple backup policies, and you can assign them to multiple NEs. You cannot delete a backup policy that is assigned to an NE. The information in a backup policy includes the following:

- the frequency of backups
- the files that a backup collects
- the type of file compression that the 5620 SAM uses
- the age and number of backup files that the 5620 SAM retains

The 5620 SAM stores the backed-up device configuration files in the 5620 SAM database for ease of tracking and retrieval. You can perform an on-demand export of backup files from the database to a file system, and can import NE backups from a file system to the 5620 SAM database.

You can configure the 5620 SAM to save device configuration backup files to the main-server file system, in addition to the 5620 SAM database, by editing a main-server configuration file. The saved files are synchronized between the primary and standby main servers in a redundant 5620 SAM deployment.

You can configure the 5620 SAM to do the following:

- automatically save device backups to a file system in addition to the database
- automatically delete device backup files after the associated NE is unmanaged

See chapter 6 for more information.

When a device configuration requires replacement, for example, because it becomes corrupted, you can restore a previously backed-up configuration. Unless otherwise specified, the 5620 SAM restores the most recent device configuration backup. See Procedures 23-4 and 23-5 for more information.

Managing NE software upgrades

When a new device software version is available, you can use the 5620 SAM to perform an on-demand NE software upgrade or schedule one using a software upgrade policy. You can create and configure multiple software upgrade policies and assign them to multiple NEs. You cannot delete a software upgrade policy that is assigned to an NE. The information in a software upgrade policy includes the following:

- the NE file location of the currently active device software
- the NE file location in which to store a backup copy of the current device software
- whether to activate the software after transferring it to the NE
- whether to reinitialize the NE after the upgrade
- whether the upgrade is an in-service software upgrade, or ISSU

During a software upgrade, the 5620 SAM performs checks to ensure that the new software is compatible with the device type and that the required files are present. The 5620 SAM does not initiate a device software upgrade unless the necessary conditions are in place. You can use the 5620 SAM to roll back a software upgrade to the previous version in the event of an upgrade failure.

Note — The 5620 SAM does not support a software upgrade or downgrade on a Telco, 7250 SAS, 7250 SAS-ES or 7250 SAS-ESA NE. You can use a software upgrade policy to upload a software image to the NE, but the upgrade or downgrade must be performed using a CLI. Contact your Alcatel-Lucent technical support representative for information about downgrades.

See Procedures 23-11 and 23-14 for more information.

ISSUs

An ISSU on a managed device that has dual CPMs allows the device to provide uninterrupted service during the upgrade process. A device software upgrade requires a CPM restart, which causes temporary device down time. When a device has dual CPMs, however, one CPM can remain active while the other restarts with the upgraded software. These alternate CPM restarts mean that the device remains in service during the upgrade. If an upgrade on a CPM fails, the CPM reports a failed state and raises an alarm. In-service software upgrades for devices are restricted to maintenance software releases.

You can specify that the 5620 SAM activates the new software image immediately after transferring it to an NE, or you can specify only the file transfer and manually activate the software image later. Manual software activation provides more control over an upgrade, which may be required, for example, when multiple NEs are involved.

NE file-system browsing

A 5620 SAM operator can browse the file system of a managed NE to list the contents of the compact flash devices. You can browse the file system of a 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, 7705 SAR, 7710 SR, or 7750 SR using simple FTP or a CLI session using SSH. The 5620 SAM GUI is used to browse the different types of files.

Browsing an NE file system using the 5620 SAM is a convenient way to confirm that operations such as the following occur as planned by verifying the sizes and time stamps of local NE files:

- NE configuration saves
- NE software image transfers and upgrades
- NE configuration restores
- NE accounting-statistics collection

FTP file browsing on an NE requires FTP user-account access on the NE. SSH file browsing requires console user-account access and the configuration of SSH security on the NE. See chapter 14 for information about enabling FTP or console access for an NE user account. See chapter 14 for information about configuring SSH on an NE.

Note — The 7705 SAR may become temporarily unreachable when enabling SSH and starting the SSH server on the device.

See Procedure 23-26 for information about browsing an NE file system using an FTP file browser. See Procedure 23-27 for information about browsing an NE file system using an SSH file browser.

Secure file transfers for site backups and upgrades

The 5620 SAM supports secure and non-secure file transfers for backups, restores, software upgrades, and statistics collection. The device mediation policy determines whether FTP or SCP is used to perform file transfers to and from the managed devices. See chapter 14 for information about configuring SSH2.

The following devices support the use of SSH2 for secure file transfers:

- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR
- OS 6250M
- OS 6250SME
- OS 6400
- OS 6850
- OS 6850E
- OS 6855
- OS 9600
- OS 9700
- OS 9700E
- OS 9800
- OS 9800E

Sample deployment policy configuration

The following example describes the configuration and operation of a 5620 SAM deployment policy. The example uses the default parameter values, which are appropriate for most applications. The Deployment Policy properties form contains the parameters listed in the example. See Procedure 23-1 for deployment configuration information.

Example details

The sample deployment policy specifies that after a configuration deployment failure, the 5620 SAM retries the deployment until it is successful. The policy also specifies that the 5620 SAM initiates a save of the device configuration to local storage after every configuration change. In order to conserve storage space, the device is configured to save the configuration information for only the device parameters that are not at their default values.

The deployment policy parameters and their values for the example are:

- Auto Save Scheme—Every Deployment
- Auto Save Threshold—0
- Scheduled Save Scheme—None
- Scheduled Save Interval—1 hour
- Save Details—disabled
- Retry Scheme—Retry Forever
- Retry Interval—5 minutes
- Retry Threshold—0

Sample backup/restore policy configuration

The following example describes a sample 5620 SAM backup/restore policy configuration and its operation using parameter values that are appropriate for most applications. The Backup Policy form contains the parameters listed in the example. See Procedure 23-3 for the configuration information.

Example details

The sample backup policy specifies that the 5620 SAM obtains the backup files by FTP from the device once every hour regardless of configuration activity, and after every 25 configuration changes. The policy also specifies that the 5620 SAM backs up the device configuration file and boot options file (BOF) only when a newer file is present, and uses gzip file compression. The 5620 SAM is to retain at most 30 backup versions, and purge versions that are more than 30 days old.

The backup policy parameters and their values are:

- Enable Backup—enabled
- Auto Reboot After Successful Restore—enabled
- Scheduled Backup Scheme—Every Scheduled Interval
- Scheduled Backup Interval—1 hour
- Scheduled Backup Sync Time — 00:00
- Scheduled Backup Threshold (operations)—5
- Auto Backup Scheme—Every Nth 5620 SAM Server Initiated Save
- Auto Backup Threshold (operations)—50
- CLI Config File Mode—New Version Only
- CLI Config Save Details—disabled
- CLI Debug Save Config File Mode—disabled
- Boot Option File Mode—New Version Only
- File Compression—GZIP
- Auto-Purge Scheme—By Age But Retain A Minimum Number Of Backups
- Number of Backups—30
- Maximum Backup Age (days)—30

Figure 23-1 5620 SAM backup process

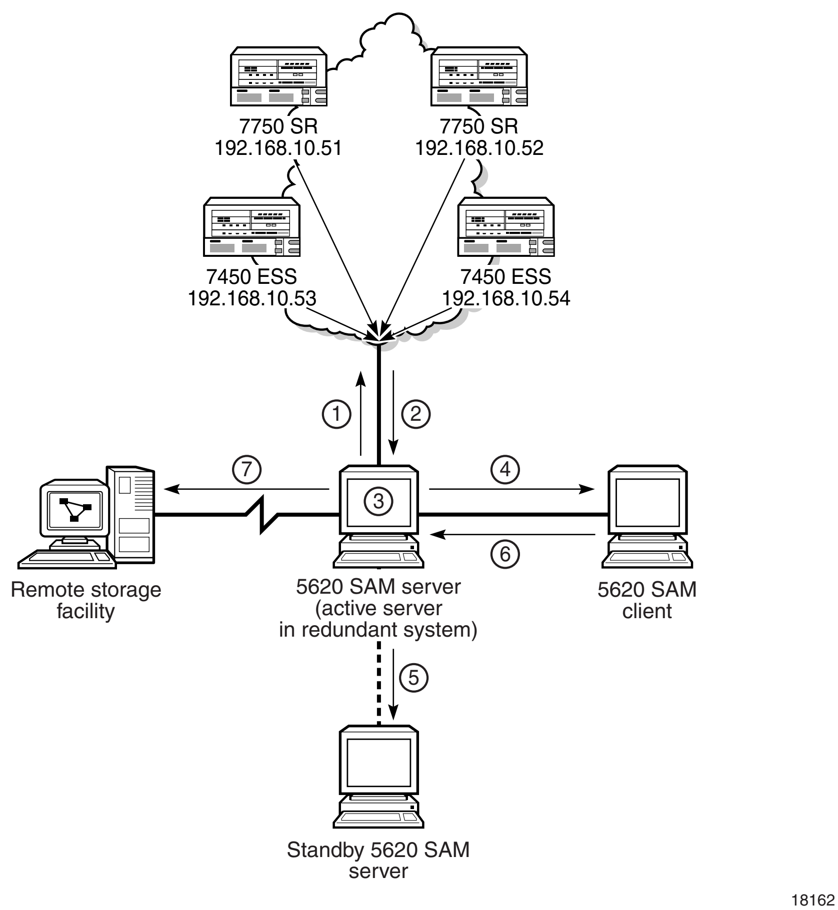


Figure 23-1 illustrates the activities of the 5620 SAM backup/restore process. The labels correspond to events in the following sequence:

1 At the interval specified—every hour in this example—the 5620 SAM issues an FTP or SCP request to all devices for a backup.

2 The devices use FTP or SCP to send the BOF and configuration files to the 5620 SAM server.

3 The 5620 SAM server stores the received files in the 5620 SAM database.

4 An operator using a 5620 SAM client uses the Backup/Restore Status tab of the Backup Policy form to view the backup status.

5 If the 5620 SAM system is a redundant configuration, the active server synchronizes the backed-up information with the standby server.

6 A 5620 SAM operator uses the Backup/Restore form to perform on-demand and scheduled device backups, restores, and configuration saves, as required.

7 A third-party application periodically sends a copy of the backup files from the 5620 SAM server to a remote storage facility for safekeeping.

23.2 Workflow for NE maintenance

1 For secure backups, restores and upgrades, verify that SSH2 is correctly configured on the device and that the 5620 SAM mediation policy for the device is configured for secure FTP or SCP. See chapter 13 for information about device commissioning. See chapter 14 for information about configuring a 5620 SAM mediation policy. Secure backups and upgrades are supported on the following devices:

- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR
- OS 6250M
- OS 6250SME
- OS 6400
- OS 6850
- OS 6850E
- OS 6855
- OS 9600
- OS 9700
- OS 9700E
- OS 9800
- OS 9800E

2 Commission the managed devices using a CLI. See chapter 13 for information about device commissioning.

3 Configure the 5620 SAM deployment policy to specify how and when the 5620 SAM tries to send configuration changes from 5620 SAM clients to the managed devices. See Procedure 23-1 for more information.

4 Use the 5620 SAM to configure device backup or restore policies. A device backup policy specifies how often the 5620 SAM backs up the device configuration. See Procedure 23-3 for more information.

As a restore policy works implicitly with a backup, there is no explicit restore policy. The user must select the imported or pre-existing backup file and click on the Restore button.

5 As required, schedule device software upgrades. Scheduled software upgrades are supported on the 7210 SAS-D 6F 4T ETR, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7210 SAS-X 24F 2XFP, 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, and 9500 MPR.

i Create a 5620 SAM schedule. See Procedure 23-18 for more information. See chapter 79 for information about creating 5620 SAM schedules.

ii Create a software upgrade policy and create a 5620 SAM scheduled task for the upgrade activity. See Procedure 23-11 for more information.

iii Review the results and status of the scheduled upgrade and, as required, take the appropriate actions based on your company policies.

iv As required, manage scheduled software upgrades. See Procedure 23-19 for more information.

6 As required, perform on-demand NE configuration saves, backups, and restores.

a Import a device backup file. See Procedure 23-6 for more information.

b Export a device backup file. See Procedure 23-7 for more information.

c Perform an OmniSwitch device backup file. See Procedure 23-8 for more information.

d Restore an OmniSwitch device configuration backup. See Procedure 23-9 for more information.

e Restore a backed up device configuration. See Procedure 23-5 for more information.

7 View the status of various maintenance activities to confirm that scheduled tasks occur as planned.

a View the deployment, backup/restore, or software upgrade status of an NE. See Procedure 23-23 for more information.

b View the accounting statistics collection status of an NE. See Procedure 23-24 for more information.

c View the trap metrics information. See Procedure 23-25 for more information.

8 View the contents of NE file systems by opening an FTP or SSH file browser from the 5620 SAM client GUI, as required. See Procedure 23-26 and Procedure 23-27 for more information.

9 As required, troubleshoot failed configuration deployments using the 5620 SAM alarm window and the Deployment form. See Procedure 23-2 for more information.

23.3 Workflow for a 7450 ESS, 7710 SR, or 7750 SR software upgrade

Caution — Before you perform an ISSU, review the appropriate device release notice for more information about the device software releases that support the ISSU. The software upgrade information in the device documentation takes precedence over this procedure.

1 Perform a preliminary check before you start the software upgrade.

i Manually verify the software image file checksums.

ii Verify that the device supports the new software.

iii Verify that there is sufficient space on the compact flash drive for the software image files.

iv For NEs with redundant CPMs, verify that the boot environments are synchronized by using the appropriate CLI command.

2 Download the software description file to a directory on a 5620 SAM client station.

3 Import the software description file. See Procedure 23-10 for more information.

4 Back up the device configuration. See Procedure 23-4 for more information.

5 Perform a software upgrade to transfer the software image files to each NE that you need to upgrade.

   a Perform a scheduled software upgrade. See Procedure 23-18 for more information.

   b Perform an immediate software upgrade. See Procedure 23-14 for more information.

6 After the upgrade, verify whether the boot environment synchronization is successful.

7 If required, reboot the NE.

Note 1 — Some device software upgrades do not require a reboot; for example, ISA-AA upgrades and ISSUs. See the device documentation for more information.

Note 2 — When you perform an ISSU, you can manually soft reset or hard reboot the IOMs after an upgrade. A soft reset results in minimal downtime, but has restricted support. See Procedure 23-12 for information about a manual soft reset. See Procedure 23-13 for information about a manual hard reboot.

Note 3 — For MDAs, CMAs, and MCMs in a 7710 SR, the device determines what needs to be reset after an ISSU and performs the required resets automatically.

Note 4 — When the IOMs are not manually soft reset or hard rebooted, the device performs a soft reset, if supported, after 2 h; otherwise, the device performs a hard reboot after 2 h.

Note 5 — The 5620 SAM does not support the Reboot Upgrade option on NEs because it is considered too invasive. Such an operation should be performed only through a direct console connection to the NE.

8 View the software upgrade status of the NE to verify whether the upgrade is successful. See Procedure 23-23 for more information.

9 Verify whether the transferred files and configurations are on the device by viewing the contents of the NE file systems through an FTP or SSH file browser, as required. See Procedure 23-26 and Procedure 23-27 for more information.

10 Remove obsolete software images from the device.

11 Fully resynchronize the NE using the 5620 SAM GUI. See chapter 14 for more information.

12 As required, perform upgrade verification tests.

23.4 Workflow for a 7250 SAS software upgrade

Caution — The software upgrade information in the device documentation takes precedence over this procedure. Before you perform a software upgrade, read the device documentation.

1 Perform a preliminary check before you start the software upgrade.

- **i** Verify that the device supports the new software.
- **ii** Verify that there is sufficient space on the compact flash drive for the software image files.

2 Download the software description file to a directory on a 5620 SAM client station.

3 Import the software description file. See Procedure 23-10 for more information.

4 Back up the device configuration using the script manager or CLI.

Note — You cannot use the 5620 SAM to back up or restore the device configuration of the 7250 SAS.

5 Start the upgrade procedure using the script manager. Perform a scheduled software upgrade or an immediate software upgrade to transfer the software image files to each NE that you need to upgrade. Procedure 23-15 for more information about performing an immediate software upgrade. See Procedure 23-18 for more information about performing a scheduled software upgrade.

6 Reboot the NE.

7 View the software upgrade status of the NE to verify whether the upgrade is successful. See Procedure 23-23 for more information.

8 Verify whether the transferred files and configurations are on the device by viewing the contents of the NE file systems through an FTP or SSH file browser, as required. See Procedure 23-26 and Procedure 23-27 for more information.

9 Remove obsolete software images from the device.

10 Fully resynchronize the NE using the 5620 SAM GUI. See chapter 14 for more information.

11 Perform upgrade verification tests, as required.

23.5 Workflow for a 9500 MPR software upgrade

1 Create a 9500 MPR software upgrade policy; see Procedure 23-11 for more information. Configure the FTP server details in the upgrade policy. The images are transferred to the FTP server location and the 9500 MPR node will pickup image files from the configured FTP server.

Note — The software upgrade policy provides the 9500 MPR NE with information about the location of the new software image files during a software upgrade.

2 Download the image package to the 5620 SAM client. Extract the package and ensure that the .DSC file is present in the same folder. When you click on the import button, the 9500 MPR image transfer is initiated, see Procedure 23-10. The image files will be copied and stored temporarily on the 5620 SAM server. When you click on the Upgrade Sites button, the stored image files are transferred to the FTP server and picked up by the 9500 MPR.

Note — The software description files have a .DSC file extension. A software description file identifies the files required to be upgraded to the 9500 MPR.

3 Perform a scheduled software upgrade or an immediate software upgrade to transfer the software image files to each 9500 MPR that you need to upgrade. See Procedure 23-17 for more information about performing an immediate software upgrade. See Procedure 23-18 for more information about performing a scheduled software upgrade.

4 Activate the new software on each upgraded 9500 MPR NE. See Procedure 19-12 for more information about activating software on a 9500 MPR NE.

23.6 NE maintenance procedures

Use the following procedures to perform NE maintenance operations.

Procedure 23-1 To configure the 5620 SAM deployment policy

1 Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Deployment form opens with the Incomplete Deployments tab displayed.

2 Click on the Deployment Policy tab button.

3 Configure the parameters:

- Auto Save Scheme
- Auto Save Threshold
- Scheduled Save Scheme
- Scheduled Save Interval
- Save Details
- Retry Scheme
- Retry Interval
- Retry Threshold

4 Click on the OK button. A dialog box appears.

5 Click on the Yes button. The Deployment form closes.

Procedure 23-2 To troubleshoot a failed configuration deployment

The 5620 SAM continues to retry deployments after a failed or incomplete deployment attempt, based on the 5620 SAM deployment policy, as configured in Procedure 23-1. When there is a deployment error, a number of problems can occur, for example:

- The 5620 SAM database may lose synchronization with the device database.
- Configuration changes requested using the client GUI may clash with configuration changes, retries, and recovery applications developed by an OSS system using the 5620 SAM-O interface or by an operator using a CLI.

When a failed or incomplete deployment or a failed SNMP configuration request occurs, a Problems Encountered error display form appears automatically. This form displays error information about the failure(s).

Note 1 — The Request Id and Task Name fields appearing on the Problems Encountered error form can be used for troubleshooting using the Task Manager application.

Note 2 — The Problems Encountered error form can appear for non-deployment generated errors also.

For example, to view more information on a failed deployment, select a failed deployment entry, then click on the Properties button, or double-click on the failed deployment entry.

An error form opens which contains a View Affected Object button and a Details button.

Click on the Details button to view detailed diagnostic information about the failure(s).

Click on the View Affected Object button. A form displaying object properties opens. This form facilitates rapid navigation to the object which caused the failure for troubleshooting purposes.

Click on the Faults tab button. Alarm information related to the failure(s) is displayed.

A failure error message is not generated when the alarm is cleared or the failure entry is deleted.

Note 1 — If a deployment failure is associated with more than one 5620 SAM GUI, the Problems Encountered form and related forms appear only on the GUI from which the deployment was issued.

Note 2 — The automatically generated Problems Encountered form and related forms, are an additional tool to the following troubleshooting procedure.

The Deployment form displays failed configuration deployments and allows you to view information about failed deployments. Using this form, you can clear the deployment, override the error to force the configuration to be downloaded to the device, or suspend or resume deployment retries to a device.

1 Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Deployment form opens with the Incomplete Deployments tab displayed.

2 Review the deployment information. The State value indicates the cause of the deployment failure.

3 Select a deployment in the list and click on the Properties button. The properties form for the deployment opens. The objects that the deployment failed to modify are displayed in the Objects list.

4 Select an entry in the Objects list and click on the Properties button. The Object Change form that describes the attempted configuration change opens.

5 Select an entry in the Attributes list and click on the Properties button. The Attribute Change form opens and displays the following object attribute information for troubleshooting:

- the NE attribute that was to be modified
- the old, unmodified attribute value
- the new attribute value that the deployment failed to assign

6 Click on the Cancel button to close the Attribute Change form.

7 Click on the Cancel button to close the Object Change form.

8 Click on the Cancel button to close the deployment properties form.

9 Perform one of the following actions, depending on the result of the investigation into the failed deployment.

a Click on the Suspend Retries button to override the deployment policy setting and prevent further retries of the deployment. A dialog box appears; click on the Yes button.

b Click on the Resume Retries button to override a previous Suspend Retries action performed on the deployment. A dialog box appears; click on the Yes button.

c Click on the Clear button to clear the deployment. A dialog box appears; click on the Yes button. The deployment is cleared.

Note — Clearing a failed deployment may result in a loss of data synchronization between the 5620 SAM database and the NE. Alcatel-Lucent recommends that you resynchronize the NE objects associated with a failed deployment after you clear a failed NE deployment.

d Click on the Force Submit button to force the 5620 SAM to immediately resend the deployment to the NE. A dialog box appears; click on the Yes button.

10 Click on the Refresh button to update the list of failed deployments.

11 Take the appropriate action described in this procedure to troubleshoot other failed deployments, as required.

12 Close the Deployment form.

Procedure 23-3 To create a device backup policy

Perform this procedure to create a device backup policy and assign it to NEs.

Note — The default backup policy is assigned automatically to all 5620 SAM-managed NEs that do not currently have an assigned backup policy.

1 Choose Administration→NE Maintenance→Backup/Restore from the 5620 SAM main menu. The Backup/Restore form opens with the Backup/Restore Policy tab displayed.

2 Click on the Create button. The Backup Policy (Create) form opens.

3 Specify whether backup functionality is enabled.

a Enable the Enable Backup parameter.

b Disable the Enable Backup parameter. The remaining parameters on the form cannot be configured. Go to step 13.

4 Configure the following parameters:

- Policy ID
- Auto-Assign ID
- Name
- Policy Type

5 If you selected AOS Based Node policy type, go to step 7.

6 Specify whether to perform a reboot after the configuration is restored to the device by specifying the Auto-Reboot After Successful Activation parameter.

Caution — When you use the 5620 SAM client GUI to restore a managed device configuration and you disable the Auto-Reboot After Successful Activation parameter, there is a risk that the bof.cfg file may be overwritten in the following situations:

- when a user performs “bof save” using CLI on the managed device
- If there is a gap between a restore and a reboot, perform a “show bof” to ensure that another user has not performed a “bof save”.

7 You can schedule backups based on a time interval or on the number of NE configurations performed from the 5620 SAM server. Configure the backup triggering parameters:

- Scheduled Backup Scheme
- Scheduled Backup Interval
- Scheduled Backup Sync Time
- Scheduled Backup Threshold (operations)
- Auto Backup Scheme
- Auto Backup Threshold (operations)

8 Perform one of the following:

a If you selected SR Based Node policy type, go to step 9.

b If you selected AOS Based Node policy type, go to step 11.

c If you selected MPR Based Node policy type, go to step 12.

Note 1 — See the *5620 SAM LTE RAN User Guide* for more information on creating a backup policy for an eNodeB.

Note 2 — See the *5620 SAM Optical User Guide* for more information on creating a backup policy for an 1830 PSS.

Note 3 — See the *5620 SAM LTE ePC User Guide* for more information on creating a backup policy for a 7750 MG.

9 Configure the Backup Settings parameters:

- CLI Config File Mode
- CLI Config Save Details
- CLI Debug Save Config File Mode
- Boot Option File Mode
- File Compression

Note — In addition to enabling the CLI Debug Save Config File Mode parameter, you must specify the location of the debug configuration files in the 5620 SAM main server configuration. See chapter 6 for information about how to specify the location of the debug configuration files in the main server configuration.

10 Go to step 12.

11 Configure the AOS Backup Settings parameters:

- Save Certified Directory
- Save Network Directory
- File Compression

Note — The 5620 SAM can only backup configuration files stored in the certified directory. If you need to backup configuration files in the working directory, you must ensure that the files in the certified and working directories are identical. See Procedure 19-13 to perform a Certify or Certify and Synchro command before you backup the OmniSwitch configuration files.

12 Configure the parameters in the Backup Purging panel. Backup purging parameters allow you to specify the number of backup files kept. These settings allow you to eliminate manual monitoring and deletion of backup files. The purge criteria can be the number of files, the age of the files, or both.

- Auto-Purge Scheme
- Number of Backups
- Maximum Backup Age (days)

13 Click on the OK button to save the backup policy. The Backup Policy (Create) form closes.

14 Assign the policy to NEs as required.

i Select the new policy in the list and click on the Properties button. The Backup Policy (Edit) form opens.

ii Click on the Backup/Restore Policy Assignment tab button. The Backup Policy (Edit) Filter form opens.

iii Configure an advanced search, if required. See Procedure 3-27 for more information.

iv Click on the OK button. The Backup Policy (Edit) Filter form closes and the filtered NEs appear in the Unassigned Sites or Assigned Sites lists.

v Select one or more NEs in the Unassigned Sites list and click on the right-pointing arrow to move them to the Assigned Sites list.

vi Click on the OK button. The Backup Policy (Edit) form closes and a dialog box appears.

vii Click on the Yes button. The policy is assigned to the NEs.

15 The 5620 SAM creates the backup based on the specified schedule.

You can optionally perform the backup immediately. See Procedure 23-4 for more information.

16 Close the Backup/Restore form.

Procedure 23-4 To perform an immediate device backup, restore, or configuration save

When you start an immediate backup, you back up the device configuration based on the backup policy associated with the NE.

A device configuration restore operation uses the most recently backed-up device configuration file unless otherwise specified. See Procedure 23-5 for more information.

The following conditions must be present before you can perform a device configuration backup, restore, or configuration save:

- You have a 5620 SAM user account with an administrator or network element software management scope of command role or a scope of command role with write access to the mediation package. See chapter 9 for more information about scope of command roles.
- FTP or secure FTP is configured in the mediation policy for the NE. See chapter 14 for more information.
- The BOF persist parameter is set on the 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7450 ESS, 7710 SR, and 7750 SR. See chapter 13 for information about device commissioning.

Depending on the operation type, the Backup State or Restore State column displays the current state of the operation. The possible values are:

- Not Attempted - the operation is unattempted
- Saving Config - the device configuration is being saved on the device
- Transferring Files - a file transfer is in progress
- Success - the operation is complete and successful
- Failure - the operation is complete but unsuccessful
- CPM Sync and Pending Reboot - the device configuration is restored and the device is synchronizing the CPMs before it reboots
- CPM Sync and Pending Reboot Standby - the 5620 SAM is waiting for the reboot of the standby CPM
- Standby Reboot and Pending Redundant Switch-over - the 5620 SAM is waiting for the switchover to the standby CPM

Note — During a backup, if a device is unresponsive to the 5620 SAM because SNMP on the device is disabled, the Backup State column entry for the device does not immediately display the correct value of Failed. This latency is caused by the inability of the 5620 SAM to communicate with the unresponsive device. In such a situation, the Backup State column displays the initial value of Saving Config until three 10-minute SNMP polling periods, or 30 minutes, have elapsed, after which the Backup State changes to Failed if SNMP remains disabled.

1 Choose Administration→NE Maintenance→Backup/Restore from the 5620 SAM main menu. The Backup/Restore form opens.

2 Click on the Backup/Restore Status tab button. The managed devices are listed.

3 Select a device from the list and click on the Backup button, the Restore button, or the Save Config button, depending on the operation that you want to perform. A dialog box appears.

4 Click on the Yes button. The backup or restore operation starts, and the current backup or restore state for the device is indicated in the Backup State or Restore State column.

5 You can resynchronize an NE with the 5620 SAM database, if required, by clicking on the Resync button. See chapter 14 for information about resynchronizing an NE.

6 Close the Backup/Restore form.

Procedure 23-5 To restore a device configuration backup other than the most recent

You can choose to restore an older version of the device configuration to meet special network requirements.

Caution 1 — Older backups do not have the most recent network information. Restoring an older device configuration may be service-affecting.

Caution 2 — Ensure that you back up the current device configuration using Procedure 23-3 before you proceed.

1 Choose Administration→NE Maintenance→Backup/Restore from the 5620 SAM menu. The Backup/Restore form opens.

2 Click on the Backup/Restore Status tab. The managed devices are listed.

3 Double-click on a device from the list. The NE Backup/Restore Status form for the selected device opens.

4 Click on the Backups tab button. A list of configuration backups for the selected device opens, ordered from the oldest to the most recent.

5 Select a backup in the list and click on the Restore button. A dialog box appears.

6 Click on the Yes button.

7 Click on the Resync button to ensure the latest network information is available, if required.

8 Close the Backup/Restore form.

Procedure 23-6 To import a device backup to the 5620 SAM database

1 Choose Administration→NE Maintenance→Backup/Restore from the 5620 SAM main menu. The Backup/Restore form opens with the Backup/Restore Policy tab displayed.

2 Click on the Backup/Restore Status tab button.

3 Select the NE in the list for which you are importing a backup and click on the Properties button. The NE Backup/Restore Status form opens.

4 Click on the More Actions button and choose Import. A file navigator form opens.

5 Use the form to specify the directory that contains the device backup and click on the OK button.

If the directory contains a backup for this NE, the 5620 SAM imports the backup files into the 5620 SAM database and the import is successful. Otherwise, a dialog box appears if the directory does not contain a backup from this NE, and the import fails. Click on the OK button to close the dialog box.

6 Close the NE Backup/Restore Status form.

7 Close the Backup/Restore form.

Procedure 23-7 To export a device backup to a file

1 Choose Administration→NE Maintenance→Backup/Restore from the 5620 SAM main menu. The Backup/Restore form opens with the Backup/Restore Policy tab displayed.

2 Click on the Backup/Restore Status tab button.

3 Select the NE in the list for which you are exporting a backup and click on the Properties button. The NE Backup/Restore Status form opens.

4 Click on the Backups tab button. A list of backups for the NE is displayed.

5 Select a backup in the list and click on the Export button. A file navigator form opens.

6 Use the form to specify the directory that is to contain the exported device backup and click on the OK button. The NE configuration backup is saved to the specified directory.

7 Close the NE Backup/Restore Status form.

8 Close the Backup/Restore form.

Procedure 23-8 To perform a device backup on an OmniSwitch

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch icon, right-click on an OmniSwitch shelf object in the equipment view and choose Properties from the contextual menu. The Shelf (Edit) form opens with the General tab displayed.

3 Click on the Software Control Module tab button. Ensure the Running Directory field value is Working.

4 Ensure the Certified Status field value is Certified. If the value is not Certified, click on the drop down menu in the Command to Apply field. Choose Certified. Click on the Apply button. A dialog box appears. Click on the Yes button. The Certified Status field value changes to Certified.

Note — It is necessary to do a Resync to make sure the "/flash/working" and "/flash/certified" directories are the same even though the Certified Status field is shown as Certified. Go to Step 5.

5 Click on the Resync button. A dialog box appears. Click on the Yes button.

6 Perform an NE backup by choosing Administration→NE Maintenance→Backup/Restore from the 5620 SAM menu. The BackupRestore form opens in the Backup/Restore Policy tab. Click on the Backup/Restore Status tab button. A list of all the backup files associated with a backup policy appears. See Procedure 23-3 for details.

7 Export a copy of the backup onto a local drive.

Procedure 23-9 To restore a configuration backup on an OmniSwitch

First, perform an OmniSwitch device backup, using Procedure 23-8.

Note — To restore an OmniSwitch NE's configuration files, by performing Procedure 23-8, a backup file located in the 5620 SAM database is created. Therefore, a Backup/ Restore Policy will already exist in the 5620 SAM database.

1 On the BackupRestore form, choose the OmniSwitch NE on which you want to perform the restore. Click on the Properties button. The NE Backup/Restore Status details form opens for that NE. Click on the Backups tab button. Choose the file you want to restore.

Note — You can import the locally available backup file for the same NE to the 5620 SAM which can be restored. Ensure the backup policy remains the same as was in place during the backup procedure. This will prevent the 5620 SAM throwing an error while importing the file.

2 A Confirm dialog box appears. Click on the Yes button.

3 With the appropriate OmniSwitch file chosen, click on the Properties button. The NE BackupRestore Status - AOS Policy form appears. The Restore Status panel indicates Restore Time, Restore State and last Successful Restore Time values.

Note 1 — The restored back-up configuration is stored on a working directory.

Note 2 — The restored back-up configuration is stored on a working directory. Success indicates that the file has been successfully transferred to the appropriate NEs. However, the file will not become active until the device(s) have been reloaded from working.

4 Right-click on an OmniSwitch shelf object in the equipment view and choose Properties from the contextual menu. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Software Control Module tab button. Click on the drop down menu in the Command to Apply field. Choose Reload from Working.

6 Click on the Apply button. A dialog box appears. Click on the Yes button.

7 If required, configure the Delayed Activation Timer parameter.

8 In order to certify the restored configurations, ensure the Certified Status field value is Certified, after validating all the data. See Step 4 of Procedure 23-8.

Procedure 23-10 To import device software image or description files to the 5620 SAM database

Perform this procedure to import a set of device software files or 9500 MPR software description files into the 5620 SAM database for use during device software upgrades.

1 Make the new device software files available to the 5620 SAM.

i If the device software files are compressed in an archive, for example, a TiMOS ZIP file, extract the files from the archive.

Note — Depending on the device type and version, the compressed files in a device software archive do not extract to a flat directory structure.

ii Copy or move the files to a directory that is accessible to the 5620 SAM.

Note 1 — The directory must contain a valid and complete set of device software files, and must not contain other files or subdirectories.

Note 2 — Alcatel-Lucent recommends that all OmniSwitch software image files, including any optional and boot files, are available in the specified directory for importing to the 5620 SAM database.

Note 3 — 9500 MPR NEs require only the software description (.DSC) files to be available for importing into the 5620 SAM database.

2 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens with the Software Upgrade Policy tab displayed.

3 Click on the Software Images tab button.

4 Click on the appropriate tab button for the type of NE that you need to upgrade.

5 Click on the Import button. The Open window appears.

6 Navigate to directory that contains the software image, select the image, and click on the Open button. The software image appears in the list.

Note — You upgrade a Release 8.0 R1 or later 7450 ESS, 7710 SR, or 7750 SR using a common software image. The Product Name field displays Alcatel-SR/ESS-7XXX to indicate that the software image is a common software image.

The 5620 SAM verifies that only the required files are present and then imports the files from the specified directory into the 5620 SAM database. An entry for the image appears in the list.

If the directory does not contain only the required files, a dialog box appears. Go to step 7. Otherwise, go to step 8.

7 Perform the following:

  i Click on the OK button.

  ii Copy or move files, as required, to ensure that the directory contains only the files required for the upgrade.

  iii Go to step 5.

8 Close the Software Upgrade form.

Procedure 23-11 To create a software upgrade policy

Perform this procedure to create a policy that can be used to perform an immediate or scheduled device software image upgrade. Contact your Alcatel-Lucent technical support representative for information about downgrades.

You cannot create a software upgrade policy on the 7210 SAS-E, 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, or 7210 SAS-M 24F 2XFP ETR.

1 Perform Procedure 23-10 to import the required device software image.

2 Ensure that the following conditions are present.

- Appropriate FTP accounts are configured and available on the devices.
- The device configuration files are backed up, as described in Procedures 23-3 and 23-4.

3 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens.

4 Click on the Create button. The Software Upgrade Policy (Create) form opens.

5 Configure the Policy Type parameter.

6 Perform one of the following.

  a If you selected SR Based Node in step 5, go to step 7.

  b If you selected AOS Based Node in step 5, go to step 10.

  c If you selected MPR Node in step 5, go to step 12.

Note 1 — See the *5620 SAM LTE ePC User Guide* for more information about 9471 MME and 7750 MG software file transfers and software upgrades.

Note 2 — See the *5620 SAM LTE RAN User Guide* for more information about eNodeB software upgrades.

7 Configure the following parameters:

- Auto-Assign ID
- Policy ID
- Name
- CFlash Image Root Path
- CFlash Backup Root Path

Note 1 — You can open an FTP or SSH file browser from this form to determine the values to use for the CFlash Image Root Path and CFlash Backup Root Path parameters. Click on the More Actions button and choose FTP File Browser or SSH File Browser, as required. See Procedures 23-26 and 23-27 for more information.

Note 2 — By default, compact flash cf3 is used to store image and backup files. Some NE types do not support a cf3, for example the 7210 SAS supports only one compact flash designated as cf1. Ensure that you specify a supported compact flash for the NE type when you configure the CFlash Image Root Path and CFlash Backup Root Path parameters.

8 Perform one of the following actions, as required.

a To specify an out-of-service upgrade that activates the new software image after the download but does not reboot the NE, enable the Auto-Activate After Successful File Transfer parameter and ensure that the Auto-Reboot After Successful Activation parameter is disabled.

Note 1 — You are not required to reboot for some NE software upgrades; for example ISA-AA upgrades. See the associated node documentation for additional information.

Note 2 — The 5620 SAM does not support the Reboot Upgrade option on NEs because it is considered too invasive. Such an operation should be performed only through a direct console connection to the NE.

b To specify an out-of-service upgrade that includes rebooting the NE after activating the software, enable the Auto-Reboot After Successful Activation parameter. When you are downloading multiple images to multiple devices, Alcatel-Lucent recommends that you disable the Auto-Reboot After Successful Upgrade option to ensure that the new software properly transfers.

When you enable the Auto-Reboot After Successful Activation parameter, you are prompted to acknowledge the action because it is potentially service-affecting. Before you proceed, ensure that you understand the implications of automatically rebooting the NE after an upgrade.

The Auto-Reboot After Successful Activation parameter is configurable when the In Service Software Upgrade parameter is disabled.

Caution — When you use the 5620 SAM client GUI to perform a managed device software upgrade and you disable the Auto-Activate After Successful File Transfer and Auto-Reboot After Successful Activation parameters, there is a risk that the bof.cfg file may be overwritten in these situations:

- if a user performs ‘bof save’ using CLI on the managed device
- if there is a gap between the software upgrade and the reboot

Perform a ‘show bof’ to verify that the BOF has not been overwritten.

c To specify an in-service upgrade, select In Service Software Upgrade to upgrade a device with dual CPMs.

Note 1 — An in-service software upgrade is not supported between every maintenance and major release. For upgrades that do not support in-service software upgrades, you must perform an out-of-service upgrade. Refer to the appropriate network element documentation for supported in-service upgrade release transitions.

Note 2 — Specifying an in-service software upgrade disables the Auto-Reboot After Successful Activation parameter.

9 Go to step 13.

10 Configure the parameters:

- Auto-Assign ID
- Policy ID
- Name
- Image Root Path
- Upgrade File Type

11 Go to step 13.

12 Configure the parameters:

- Auto-Assign ID
- Policy ID
- Name
- FTP User ID
- FTP Password
- FTP Server IP
- FTP Server Port
- Root Directory
- Forced Download
- Auto-Activate After Successful File Transfer

13 Click on the Apply button. The Software Upgrade Policy (Create) form refreshes with additional tab buttons and the form name changes to Software Upgrade Policy (Edit).

14 Assign the policy to NEs as required.

- **i** Click on the Software Upgrade Policy Assignment tab button. The Software Upgrade Policy Filter (edit) form opens.
- **ii** Configure the filter parameters, if required. Click on the OK button.
- **iii** Select one or more NEs in the Unassigned Sites list and click on the right-pointing arrow to move them to the Assigned Sites list.
- **iv** Click on the OK button. A dialog box appears.
- **v** Click on the Yes button. The policy is assigned to the NEs.

15 Close the Software Upgrade Policy (Edit) form. The new policy is displayed on the Software Upgrade form.

Procedure 23-12 To perform a soft reset of an IOM or IMM

Use this procedure to perform a manual soft reset of one of the following:

- an IOM in a 7210 SAS-M 24F, 7210 SAS-M 24F 2XFP, 7210 SAS-M 24F 2XFP ETR, 7450 ESS, or 7750 SR
- an IOM3 or IMM in a Release 8.0 R1 or later 7450 ESS or 7750 SR

Note — Soft reset is supported only under the following conditions:

- The IOM is operationally up.
- The IOM is supported.
- The MDAs are Ethernet MDAs but not HSMDAs, and are provisioned.

1 To select the IOM, choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the an NE and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the card slot level, right-click on the card slot and select Soft Reset from the contextual menu. A Warning form opens.

5 View the dependency information.

6 Select the I understand the implications of this action check box.

7 Click on the Yes button. The operational state of the IO card displays the soft reset status when the soft reset is in progress.

Procedure 23-13 To perform a hard reboot of an IOM

Use this procedure to perform a manual hard reboot of an IOM.

1 To select the IOM, choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the an NE and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the card slot level and click on the card slot. The Card Slot form opens.

5 Click on the IO Card tab button.

6 Click on the More Actions button and choose Reboot. The operational state of the IO card displays the hard reboot status when the hard reboot is in progress.

7 Close the Card Slot form.

Procedure 23-14 To perform an immediate software upgrade on a 7450 ESS, 7710 SR, or 7750 SR

The following conditions must be true before you attempt a device software upgrade:

- You have a 5620 SAM user account with an administrator or network element software management scope of command role or a scope of command role with write access to the mediation package. See chapter 9 for more information about scope of command roles.
- The FTP or secure FTP must be configured in the mediation policy for the NE. See chapter 14 for more information.

Warning — Devices, such as the 7450 ESS and 7750 SR, may require a firmware upgrade before a device software upgrade. To avoid a service outage, ensure that the device firmware version supports the software upgrade. See the device software Release Notes to obtain information about firmware and software version compatibility and about the firmware upgrade procedures.

Caution 1 — Alcatel-Lucent recommends that you establish a physical console session on the device that you need to upgrade. The console session allows you to monitor the upgrade and recover the device if the upgrade fails.

Caution 2 — Before you perform a software upgrade, read the device documentation. The software upgrade information in the device documentation takes precedence over this procedure.

Caution 3 — Before you perform an ISSU, review the appropriate device release notice for more information about the device software releases that support the ISSU. See section 23.1 for more information about the ISSU.

Note — If you downgrade a device software image, you must unmanage and delete the device before you perform the downgrade, as described in Procedure 14-13. Contact your Alcatel-Lucent technical support representative for information about downgrades.

1 Perform a preliminary check before you start the software upgrade.

- **i** Manually verify the software image file checksums.
- **ii** Verify that the device supports the new software.
- **iii** Verify that the compact flash drive has sufficient space for the software image files.
- **iv** For NEs with redundant CPMs, verify that the boot environments are synchronized by using the appropriate CLI command.

2 Back up the device configuration. See Procedure 23-4.

3 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens.

4 Choose the appropriate software upgrade policy.

Note — The 5620 SAM performs an upgrade on each NE to which the software upgrade policy is assigned and performs each upgrade according to the policy configuration.

5 Click on the Software Images tab button.

6 Choose a software image in the list and click on the Import button. The Open window appears.

7 Navigate to the directory that contains the software image, select the image, and click on the Open button.

Note — You upgrade a Release 8.0 R1 or later 7450 ESS, 7710 SR, or 7750 SR using a common software image. The Product Name field displays Alcatel-SR/ESS-7XXX to indicate that the software image is a common software image.

The 5620 SAM verifies that only the required files for the upgrade are present and then imports the files from the specified directory into the 5620 SAM database. An entry for the image appears in the list.

If the directory does not contain only the required files, a dialog box appears. Go to step 8. Otherwise, go to step 9.

8 Perform the following:

i Click on the OK button.

ii Copy or move files to ensure that the directory contains only the files required for the upgrade.

iii Go to step 6.

9 Click on the Upgrade Sites button. A list of NEs appears. The list is filtered to display only the device type that is appropriate for the specified software image.

Note — If you select a common software image in step 7, only the 7450 ESS, 7750 SR, and 7710 SR devices are listed.

10 Choose one or more NEs in the list.

11 Click on the OK button. The software upgrade starts.

12 Click on the Software Upgrade Status tab button to view the progress of the upgrade.

13 Reboot the NE if the Auto-Reboot After Successful Activation parameter is disabled in the software upgrade policy. Perform one of the following actions.

Note 1 — Some device software upgrades do not require a reboot; for example, ISA-AA upgrades and ISSUs. See the device documentation for more information.

Note 2 — When you perform an ISSU, you can manually soft reset or hard reboot the IOMs or IMMs after an upgrade. A soft reset results in minimal downtime, but has restricted support. See Procedure 23-12 to perform a manual soft reset, or Procedure 23-13 to perform a manual hard reboot.

Note 3 — For MDAs, CMAs, and MCMs in a 7710 SR, the device performs the required resets automatically after an ISSU.

Note 4 — When the IOMs are not manually soft reset or hard rebooted, the device performs a soft reset, if supported, after 2 h; otherwise, the device performs a hard reboot after 2 h.

Note 5 — The 5620 SAM does not support the Reboot Upgrade option on NEs because it is considered too invasive. Such an operation should be performed only through a direct console connection to the NE.

a Use a Telnet or SSH CLI session.

i Right-click on the NE and choose NE Session→Telnet Session or NE Session→SSH Session.

ii Enter the following at the command prompt:

`admin reboot now` ↵

The NE reboots.

b Use the 5620 SAM GUI.

i Choose Equipment from the 5620 SAM navigation tree drop-down menu.

ii Navigate to the NE shelf object. The path is Routing→NE→Shelf.

iii Right-click on the shelf object and choose Reboot. The NE reboots.

Caution — Rebooting an NE that is in service is service-affecting. Ensure that the reboot activity occurs during a scheduled maintenance window.

14 Verify whether the upgrade is successful, as described in Procedure 23-23.

15 Use the FTP or SSH file browser to verify whether the transferred files and configurations are on the managed device. See Procedure 23-26 for information about using an FTP file browser. See Procedure 23-27 for information about using an SSH file browser.

16 Fully resynchronize the NE using the 5620 SAM GUI. See chapter 14 for information about resynchronizing an NE.

17 Perform upgrade verification tests, as required.

Procedure 23-15 To perform an immediate software upgrade on a 7250 SAS

The following conditions must be true before you attempt a device software upgrade:

- You have a 5620 SAM user account with an administrator or network element software management scope of command role or a scope of command role with write access to the mediation package. See chapter 9 for more information about scope of command roles.
- The FTP or secure FTP must be configured in the mediation policy for the NE. See chapter 14 for more information.

Caution 1 — Alcatel-Lucent recommends that you establish a physical console session on the device that you need to upgrade. The console session allows you to monitor the upgrade and recover the device in the event of an upgrade failure.

Caution 2 — Before you perform a software upgrade, read the device documentation. The software upgrade information in the device documentation takes precedence over this procedure.

Note — If you downgrade a device software image, you must unmanage and delete the device before you perform the downgrade, as described in Procedure 14-13. Contact your Alcatel-Lucent technical support representative for information about downgrades.

1 Perform a preliminary check before you begin the software upgrade.

i Verify that the device supports the new software.

ii Verify that the compact flash drive has sufficient space for the software image files.

2 Download the software description file to a directory on a 5620 SAM client station.

3 Load the software description file from step 2 into the TFTP server. See Procedure 23-10 for more information.

4 Back up the device configuration using the 5620 SAM Script Manager.

5 Start the upgrade procedure using the 5620 SAM Script Manager. Code 23-1 is an example of an upgrade script.

Code 23-1: 7250 SAS upgrade script example

```

6 Reboot the NE.

7 Verify whether the upgrade is successful, as described in Procedure 23-23.

8 Use the FTP or SSH file browser to verify that the transferred files and configurations are on the device. See Procedure 23-26 for information about using an FTP file browser. See Procedure 23-27 for information about using an SSH file browser.

9 Remove obsolete software images from the device.

10 Fully resynchronize the NE using the 5620 SAM GUI. See chapter 14 for information about resynchronizing an NE.

11 Perform upgrade verification tests, as required.

Procedure 23-16 To perform an immediate software upgrade on an OmniSwitch

The directory structure that stores the image and configuration files is divided into two parts:

- The certified directory contains files that have been certified by an authorized user as the default files for the switch.
- The working directory contains files that may or may not be modified from the certified directory. The working directory is a holding place for new files. Files in the working directory must be tested before you commit them to the certified directory.

The following conditions must be present before you can perform a device software upgrade:

- You have a 5620 SAM user account with an administrator or network element software management scope of command role or a scope of command role with write access to the mediation package. See chapter 9 for more information about scope of command roles.
- FTP is configured in the mediation policy for the NE. See chapter 14 for more information.

Warning — An OmniSwitch may require a firmware upgrade before a device software upgrade. To avoid a service outage, ensure that the device firmware version supports the software upgrade. See the device software Release Notes to obtain information about firmware and software version compatibility.

Caution — Alcatel-Lucent recommends that you establish a physical console session on the device that you need to upgrade. The console session allows you to monitor the upgrade and recover the device in the event of an upgrade failure.

Perform the following procedure to perform an immediate software upgrade of an OmniSwitch. You can perform the following types of software upgrades:

- Image file
- Boot files
- FPGA files (OS 6855 only)

Note 1 — To perform an ISSU, which is supported only on the OS 9700E and OS 9800E, Release 6.4.2 R1, use the software upgrade window only.

Note 2 — The OS 9700E and OS 9800E NEs support standard software upgrades as described above, in addition to ISSU, with CMM images running on these NEs, and with minimal interruption of data traffic. Currently on OmniSwitch systems the introduction of new images necessitates a system reload which disrupts all data traffic during the reload process. As is the case for a CMM Takeover on current OS 9700E and OS 9800E based systems, data traffic loss should be limited to Layer 3 base traffic and no loss of Layer 2 data traffic should occur. Standard procedures can be used for a normal upgrade or an ISSU.

Note 3 — The operational restrictions and requirements are:

- Only OS 9700E and OS 9800E NEs CMM images have the ability to be upgraded.
- The following CMM images are ISSU capable: Jbase.img, Jsecu.img, Jadvrout.img and Jos.img.
- The OS 9700E and OS 9800E NE platforms must bet fully synchronized and certified.
- Target images must be loaded to the /flash/issu directory.
- Sufficient flash memory must be available for upgrade images.
- The CMM software build must be in the same major build tree branch, differing only in the build number (6.4.1.*.R01)
- NEs running an 'R##' build, such as 6.4.1.123.R01 do not support ISSU patches. The NE must first be upgraded to an 'S##' build such as 6.4.1.123.S01.

See Procedure 23-14 to perform an immediate software upgrade on a SR or ESS NE.

1 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens.

2 Perform one of the following:

a If you need to upgrade the image files or the image and boot files, go to step 3.

b If you need to upgrade the boot files, go to step 18.

c If you need to upgrade the FPGA files, go to step 32.

3 Choose the appropriate software upgrade policy.

Note — The 5620 SAM performs the upgrade according to the configuration in the software upgrade policy that is assigned to the NE.

4 Click on the Software Images tab button.

5 Click on the AOS Software tab button.

6 Choose a software image in the list.

7 Click on the Transfer to Sites button. A list of NEs opens. The list is filtered to display only the device type that is appropriate for the selected software image.

8 Choose one or more NEs in the list.

9 Click on the OK button. The selected software image file is uploaded to the working directory of the selected NEs.

10 Click on the Software Upgrade Status tab to view the status of the upgrade as it progresses. Wait until the files have been successfully transferred before going to step 11.

11 Click on the Reload working Sites button. A list of NEs opens.

12 Choose one or more NEs in the list.

13 Click on the OK button. The selected NEs reboots using the new software image that was uploaded to the working directory.

Caution — Rebooting an NE that is in service is service-affecting. Ensure that the reboot activity occurs during a maintenance window.

Note — Alcatel-Lucent recommends monitoring the switch to ensure that the reboot completes successfully.

14 Click on the Certify Sites button. A list of NEs opens.

Note — Only software that has been thoroughly validated as viable and reliable software should be copied to the certified directory. After you copy the software to the certified directory, you cannot recover a previous version of the image or configuration files.

15 Choose one or more NEs in the list.

16 Click on the OK button. The software image stored in the NE working directory is copied to the certified directory. The working directory and the certified directory are synchronized so that the same files are in both directories.

17 Perform one of the following:

- **a** If you need to upgrade the boot files, go to step 26.
- **b** If you need to upgrade the FPGA files, go to step 34.
- **c** If you are only upgrading the image files, go to step 39.

18 Choose the appropriate software upgrade policy.

Note — The 5620 SAM performs the upgrade according to the configuration in the software upgrade policy that is assigned to the NE.

19 Click on the Software Images tab button.

20 Click on the AOS Software tab button.

21 Choose a software image in the list.

22 Click on the Transfer to Sites button. A list of NEs opens. The list is filtered to display only the device type that is appropriate for the selected software image.

23 Choose one or more NEs in the list.

24 Click on the OK button. The boot files are uploaded to the root directory of the selected NEs.

25 Click on the Software Upgrade Status tab to view the status of the upgrade as it progresses. Wait until the files have been successfully transferred before going to step 26.

26 Click on the Upgrade Boot files button. A list of NEs opens. The list is filtered to display only the device type that is appropriate for the selected files.

27 Choose one or more NEs in the list.

28 Click on the OK button. The boot files are upgraded on the selected NEs.

29 Click on the Software Upgrade Status tab to view the status of the upgrade as it progresses. Wait until the files have been successfully transferred before going to step 30.

30 Click on the Delete boot files button.

31 Perform one of the following:

- **a** If you need to upgrade the FPGA files, go to step 34.
- **b** If you do not need to upgrade the FPGA files, go to step 39.

32 Click on the Software Images tab button.

33 Click on the AOS Software tab button.

34 Choose a software image in the list.

35 Click on the Upgrade FPGA files button. A list of NEs opens. The list is filtered to display only the device type that is appropriate for the selected file type.

36 Choose one or more NEs in the list.

37 Click on the OK button. The selected FPGA files are uploaded to the root directory of the selected NEs.

38 Click on the Software Upgrade Status tab to view the status of the upgrade as it progresses. After the FPGA files are successfully transferred, the selected NEs are rebooted.

39 Verify the upgrade success, as described in Procedure 23-23.

40 Close the Software Upgrade form.

Procedure 23-17 To perform an immediate software upgrade on a 9500 MPR

Perform the following procedure to download 9500 MPR software to one or more 9500 MPRs. After a successful software upgrade, perform Procedure 19-12 to activate the software on the 9500 MPR NE.

The 9500 MPR software is stored in two banks on a compact flash card:

- The committed bank contains the software that is currently running.
- The standby bank contains downloaded software that has not been activated or software that was active before the current committed software.

Note — A 9500 MPR that has never been upgraded only displays the committed bank. The standby bank does not appear until new software is downloaded for the first time.

You need a 5620 SAM user account with an administrator or network element software management scope of command role or a scope of command role with write access to the mediation package before you can perform a 9500 MPR software download. See chapter 9 for more information about scope of command roles.

1 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens.

2 Choose the appropriate software upgrade policy.

Note — The 5620 SAM performs the upgrade according to the configuration in the software upgrade policy that is assigned to the NE.

3 Click on the Software Images tab button.

4 Click on the MPR 9500 Software Images tab button.

5 Choose a software image file in the list. The image descriptor file has a .DSC file extension and must be present on the client system. Other software files do not need to be present on the client system.

6 Click on the Upgrade Sites button. A list of NEs opens. The list is filtered to display only the device type that is appropriate for the selected software image.

7 Choose one or more NEs in the list.

8 Click on the OK button. The software upgrade starts.

9 Click on the Software Upgrade Status tab button to view the status of the upgrade as it progresses. Verify that the files are successfully transferred before you go to step 10.

Note — If the Auto-Activate After Successful File Transfer check box is enabled, the device activates the new software image after an upgrade operation successfully completes.

10 Close the Software Upgrade form.

Procedure 23-18 To schedule a software upgrade

Perform this procedure to schedule a device software upgrade on one or more managed NEs according to a software upgrade policy and a 5620 SAM schedule. See Procedure 23-14 for information about creating a software upgrade policy. See chapter 79 for information about creating schedules.

Note — A new SAM scheduled task is shut down by default and must be turned up before it can be executed with one exception. Scheduled software upgrade tasks associated with all NE types are by default auto-enabled.

1 Perform Procedure 23-10 to import the required device software image.

2 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens with the Software Upgrade Policy tab displayed.

3 Select the appropriate software upgrade policy.

Note — The 5620 SAM performs the upgrade according to the configuration in the software upgrade policy that is assigned to the NE.

4 Click on the Software Images tab button.

5 Select a software image in the list and click on the Schedule Upgrades button. The Select Sites form opens.

6 Choose an NE in the list and click on the OK button. You can choose multiple NEs. The Select Schedule form opens.

Note 1 — If no schedules are listed, you can create one for the upgrade. You cannot proceed unless a schedule is available. See chapter 79 for information about creating 5620 SAM schedules.

Note 2 — You cannot use a schedule in which the Ongoing parameter is enabled.

7 Select a schedule in the list and click on the OK button. See Procedure 23-19 and chapter 79 for more information on how to create a schedule. A dialog box appears.

8 Click on the Yes button. The 5620 SAM schedules the upgrade.

9 Close the Software Upgrade form.

Procedure 23-19 To manage scheduled software upgrades

1 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens with the Software Upgrade Policy tab displayed.

2 Click on the Software Upgrade Status tab button.

3 Click on the Scheduled Task button. The Scheduled Task form opens.

4 Configure the filter criteria and click on the Search button. A list of scheduled tasks is displayed.

5 Choose a scheduled software upgrade entry.

6 To view the scheduled task configuration, click on the Properties button. The Software Upgrade Scheduled Task form opens.

7 Administratively enable or disable the scheduled software upgrade, if required, by configuring the Administrative State parameter.

8 Click on the Properties button in the Schedule panel to view the schedule information, if required.

9 Click on the Properties button in the Task panel to view the 5620 SAM task information, if required.

10 Close the Software Upgrade Scheduled Task form. The Scheduled Task form reappears.

11 Click on the Task Action button and choose the appropriate option to turn up, shut down, or execute the task, if required.

12 Click on the Delete button to remove the scheduled task from the 5620 SAM, if required.

Note 1 — You cannot delete a scheduled task that is operationally enabled. Click on the Task Action button and choose Shut Down from the menu to operationally disable the scheduled task before you delete it.

Note 2 — The 5620 SAM does not delete a scheduled task after it runs; you must delete it manually. You cannot reuse a completed scheduled task.

13 Close the Scheduled Task form. The Software Upgrade form reappears.

14 Close the Software Upgrade form.

Procedure 23-20 To monitor software upgrade status

1 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens.

2 Click on the Software Upgrade Status tab button.

3 Configure the filter criteria, if required, and click on the Search button. A list of NEs is displayed.

4 Select an NE from the list and click on the Properties button. The Software Upgrade Status (View) form opens.

5 Click on the Software Upgrade tab to view information on the software upgrade.

6 Close the Software Upgrade Status (View) form.

7 Close the Software Upgrade form.

Procedure 23-21 To activate a device software image

Perform this procedure to activate a previously downloaded device software image on an NE. When the 5620 SAM activates an NE software image, it does the following:

- Updates the BOF with the new software image location
- Backs up the original boot.ldr at the location specified by the CFlash Backup Root Path parameter

- Replaces the currently active boot.ldr file with the new one
- Forces a “boot env synch” and a “config synch” on NEs that have redundant CPMs

Note 1 — If the BOF update fails, then the original boot.ldr file is put in place to align with the BOF specification.

Note 2 — The 5620 SAM ensures that the software image is present on the NE and valid for the device before it updates the BOF.

1 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens with the Software Upgrade Policy tab displayed.

2 Click on the Software Upgrade Status tab button. A list of NEs is displayed.

3 Choose an NE in the list.

4 Click on the Software Images tab button. A list of software images on the selected NE is displayed.

5 Select a software image in the list and click on the Activate button. A dialog box appears.

6 Click on the Yes button. The software image is activated.

7 Verify the activation success, as described in Procedure 23-23.

8 Close the Software Upgrade form.

Procedure 23-22 To export a device software image from the 5620 SAM database to a file system

1 Choose Administration→NE Maintenance→Software Upgrade from the 5620 SAM main menu. The Software Upgrade form opens with the Software Upgrade Policy tab displayed.

2 Click on the Software Images tab button.

3 Perform one of the following:

a To export SR device software images, go to step 4

b To export OmniSwitch software images click on the AOS Software tab button. Go to step 4.

4 Choose an image from the displayed list.

5 Click on the Export button. A file navigator form opens.

6 Use the form to specify the directory that is to contain the exported software image and click on the OK button. The software image is saved to files in the specified directory.

7 Close the Software Upgrade form.

Procedure 23-23 To view the deployment, backup/restore, or software upgrade status of an NE

1 Perform one of the following actions.

a Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu to view deployment status. The Deployment form opens with the Incomplete Deployments tab displayed.

i Double-click on a deployment in the list. The deployment properties form opens.

ii View the deployment status.

b Choose Administration→NE Maintenance→Backup/Restore from the 5620 SAM main menu to view the backup or restore status. The Backup/Restore form opens with the Backup/Restore Policy tab displayed.

i Click on the Backup/Restore Status tab button. The Restore State column of the backup or restore is: Transferring Files, Pending, Reboot, CPM Sync and Reboot, Success, Not Attempted, Save Config, or Failure. The timestamp is also displayed.

ii Double-click on a row in the list to display information about the backup or restore operation. You can click on the General, Backups, Configuration Saves, and Faults tab buttons.

Note — When you click on the Backups tab button, the date and time in the Config File Version column corresponds to the date and time for the Last Boot Cfg Version on the NE.

c Choose Administration→NE Maintenance→Software Upgrade to view the software upgrade status. The Software Upgrade form opens.

i Click on the Software Upgrade Status tab button. A list of NEs displayed.

ii Double-click on an NE in the list to view information about the upgrade. The Software Upgrade Status form opens.

iii Close the Software Upgrade Status form.

2 Close the form.

Procedure 23-24 To view the accounting statistics collection status of an NE

1 Choose Tools→Statistics→Accounting Retrieval Status from the 5620 SAM menu. The Accounting Retrieval Status form opens with a list of managed NEs displayed.

2 Select an NE in the list and click on the Properties button. The Accounting Retrieval Status (View) form opens.

3 View the statistics collection information for the NE.

4 Close the Accounting Retrieval Status (View) form.

5 Close the Accounting Retrieval Status form.

Procedure 23-25 To view the trap metrics information

1 Choose Tools→Statistics→Trap Metrics Information from the 5620 SAM main menu. The Trap Metrics Information form opens and lists the NEs that generated the most traps during the last collection interval. The collection interval is indicated by the Start Collection Period and End Collection Period values at the top of the form.

Note — The number of displayed NEs is limited by the metrics configuration in the nms-server.xml file.

2 Click on the Search button to refresh the trap metrics information. The list and collection interval values are updated.

3 Close the Trap Metrics Information form.

Procedure 23-26 To view an NE file system using an FTP file browser

Perform this procedure to browse and list the files on a managed NE. You require FTP user-account privileges on the NE for access to the NE file system. See chapter 13 for information about enabling FTP access for an NE user account.

1 Initiate an FTP file browser session.

a Use the 5620 SAM main menu.

i Choose Tools→NE Sessions→FTP File Browser. The FTP File Browser form opens.

ii Enter the IP address of the NE that you want to browse in the field at the top of the form.

iii Press Enter or click on the Connect button. The Enter the Username and Password form opens.

Note — When you use the 5620 SAM main menu to open a file-browser session, you are not restricted to the original NE; you can use the same form to connect to other NEs. This is useful when several NEs are to be browsed in succession.

b Use the Software Upgrade Policy form.

i Choose Administration→NE Maintenance→Software Upgrade. The Software Upgrade form opens with the Software Policy tab displayed.

ii Select a policy in the list and click on the Properties button. The Software Upgrade Policy (Edit) form opens.

iii Click on the More Actions button and choose FTP File Browser. The FTP File Browser form opens.

iv Enter the IP address of the NE that you want to browse in the field at the top of the form.

v Press Enter or click on the Connect button. The Enter the Username and Password form opens.

c Use the contextual menu for an NE.

i Select an NE icon in the 5620 SAM network navigation tree or topology map.

ii Right-click on the NE icon and choose NE Sessions→File Browser from the contextual menu. The FTP File Browser form opens, then displays the Enter the Username and Password form.

d Use the properties form of an NE.

i Select an NE icon in the 5620 SAM network navigation tree or topology map.

ii Right-click on the NE icon and choose Properties from the contextual menu. The Network Element (Edit) form opens.

iii Click on the More Actions button and choose File Browser. The FTP File Browser form opens, then displays the Enter the Username and Password form.

e Use the topology view of a service.

i Choose one of the following from the 5620 SAM main menu:

- Manage→Service→Services
- Manage→Service→Composite Services
- Manage→Service→Mirror Services

ii Configure the filter criteria.

iii Choose a service from the list.

iv Click on the Topology View button. A Topology View dialog box appears.

v Click on the Yes button. The Service Topology map opens.

vi Right-click on a managed device and choose NE Sessions→File Browser from the contextual menu. The FTP File Browser form opens to display the Enter the Username and Password form.

Note — You can open a file browser session on only one managed device at a time.

f Use the navigation tree of a service management form.

i Choose one of the following from the 5620 SAM main menu:

- Manage→Service→Services
- Manage→Service→Composite Services
- Manage→Service→Mirror Services

ii Configure the filter criteria.

iii Choose a service from the list.

iv Click on the Properties button.

v The *Service* (Edit) form opens.

where *Service* is the type of service selected

vi On the navigation tree, right-click on a service site and choose NE Sessions→File Browser from the contextual menu. The FTP File Browser form opens to display the Enter the Username and Password form.

Note — You can open a file browser session on only one service site at a time.

g Use the Sites tab of a service.

i Choose one of the following from the 5620 SAM main menu:

- Manage→Service→Services
- Manage→Service→Composite Services
- Manage→Service→Mirror Services

ii Configure the filter criteria.

iii Choose a service from the list.

iv Click on the Properties button.

v The *Service* (Edit) form opens.

where *Service* is the type of service selected

vi Click on the Sites tab button.

vii Choose a site from the list.

viii Click on the NE Sessions button and choose File Browser from the contextual menu. The FTP File Browser form opens to display the Enter the Username and Password form.

Note — You can open a file browser session to only one service site at a time.

h Use the NE alarm contextual menu.

i Select an NE alarm in the 5620 SAM alarm window.

ii Right-click on the alarm and choose NE Sessions→File Browser. The FTP File Browser form opens, then displays the Enter the Username and Password form.

Note — When you use the 5620 SAM main menu or the Software Upgrade form to open a file-browser session, you are not restricted to the original NE; you can use the same form to connect to other NEs. This is useful when several NEs are to be browsed in succession.

2 Enter the user name and password of a user account with FTP access privileges on the NE and click on the OK button or press Enter. If the NE accepts the credentials, the form lists the contents of the NE.

<DIR> in the Type column indicates a directory. The file path to the current directory is displayed in the Path field.

> **Note —** On an NE with redundant CPMs, the form lists the contents of the cf3 device on the active CPM.
>
> You can browse the cf3 device on the standby CPM by specifying cf3-B:\ in the Path field.

3 If the login attempt fails with the supplied credentials, a dialog box appears. Click on the OK button to close the dialog box, check the credentials and repeat step 2.

4 Sort the list entries by a specific attribute, if required, by clicking on the column heading for the attribute. Clicking again on the column heading reverses the sort order.

5 Reorder the columns, if required, by clicking on a column heading and dragging the column to a new position.

6 Navigate the file system as required. Perform one of the following actions to open a directory and list the contents.

- **a** Double-click on the directory row in the list.
- **b** Select the directory row and press <CTRL>O.
- **c** Type the path to the directory in the Path field and click on the Go button or press Enter.

7 If you opened the browser using the 5620 SAM main menu, you can browse another NE file system using the same form, if required.

- **i** Click on the Disconnect button to end the browsing session.
- **ii** Go to step 1 a ii.

8 Close the FTP File Browser form.

Procedure 23-27 To view an NE file system using an SSH file browser

Perform this procedure to browse and list the contents of a managed NE using a secure file browser. You require console and SSH user-account privileges on the NE for access to the NE file system, and an SSH server must be configured on the NE. See chapter 13 for information about enabling console or SSH access for an NE user account. See chapter 14 for information about configuring an SSH server for an NE.

1 Initiate an SSH file browser session.

a Use the 5620 SAM main menu.

i Choose Tools→NE Sessions→SSH File Browser. The SSH File Browser form opens.

ii Enter the IP address of the NE that you want to browse in the field at the top of the form.

iii Press Enter or click on the Connect button. The Enter the Username and Password form opens.

b Use the Software Upgrade Policy form.

i Choose Administration→NE Maintenance→Software Upgrade. The Software Upgrade form opens with the Software Policy tab displayed.

ii Select a policy in the list and click on the Properties button. The Software Upgrade Policy (Edit) form opens.

iii Click on the More Actions button and choose SSH File Browser. The SSH File Browser form opens.

iv Enter the IP address of the NE that you want to browse in the field at the top of the form.

v Press Enter or click on the Connect button. The Enter the Username and Password form opens.

c Use the contextual menu for an NE.

i Select an NE icon in the 5620 SAM network navigation tree or topology map.

ii Right-click on the NE icon and choose NE Sessions→File Browser from the contextual menu. The SSH File Browser form opens, then displays the Enter the Username and Password form.

d Use the properties form of an NE.

i Select an NE icon in the 5620 SAM network navigation tree or topology map.

ii Right-click on the NE icon and choose Properties from the contextual menu. The Network Element (Edit) form opens.

iii Click on the More Actions button and choose File Browser. The SSH File Browser form opens, then displays the Enter the Username and Password form.

e Use the NE alarm contextual menu.

i Select an NE alarm in the 5620 SAM alarm window.

ii Right-click on the alarm and choose NE Sessions→File Browser. The SSH File Browser form opens, then displays the Enter the Username and Password form.

Note — When you use the 5620 SAM main menu or the Software Upgrade form to open a file-browser session, you are not restricted to the original NE; you can use the same form to connect to other NEs. This is useful when several NEs are to be browsed in succession.

2 Enter the user name and password of a user account with FTP and SSH access privileges on the NE and click on the OK button or press Enter. If the NE accepts the credentials, the form lists the contents of the NE.

<DIR> in the Type column indicates a directory. The file path to the current directory is displayed in the Path field.

Note — On an NE with redundant CPMs, the form lists the contents of the cf3 device on the active CPM.

You can browse the cf3 device on the standby CPM by specifying cf3-B:\ in the Path field.

3 If the login attempt fails with the supplied credentials, a dialog box appears. Click on the OK button to close the dialog box, check the credentials and repeat step 2.

4 Sort the list entries by a specific attribute, if required, by clicking on the column heading for the attribute. Clicking again on the column heading reverses the sort order.

5 Reorder the columns, if required, by clicking on a column heading and dragging the column to a new position.

6 Navigate the file system as required. Perform one of the following actions to open a directory and list the contents.

a Double-click on the directory row in the list.

b Select the directory row and press <CTRL>O.

c Type the path to the directory in the Path field and click on the Go button or press Enter.

7 If you opened the browser using the 5620 SAM main menu or from the Software Upgrade form, you can browse another NE file system using the same form, if required.

- **i** Click on the Disconnect button to end the browsing session.
- **ii** Go to step 1 a ii.

8 Close the SSH File Browser form.

24 — TCP enhanced authentication

24.1 TCP enhanced authentication overview

This chapter describes the 5620 SAM support of TCP enhanced authentication for NEs based on the MD5 encryption mechanism described in RFC2385. 5620 SAM TCP enhanced authentication allows the use of powerful algorithms for authenticating routing messages.

The 5620 SAM uses a TCP extension to enhance BGP and LDP security. TCP enhanced authentication is used for applications that require secure administrative access at both ends of a TCP connection. TCP peers update authentication keys during the lifetime of a connection.

A 5620 SAM operator with administrative privileges can create, delete, modify, and distribute TCP enhanced authentication components, and can perform an audit of a local key chain to compare it with the associated global key chain or other local key chains. The 5620 SAM TCP enhanced authentication components are called keys and key chains.

Global key chains are created in draft mode. This allows operators to verify that the key chain is correctly configured before they distribute it to the network elements. When the key chain is approved for distribution, you can change the global key chain to released mode, which also distributes the key chain to existing local definitions. The 5620 SAM saves the latest released version of the global key chain.

Caution — Alcatel-Lucent recommends that you use only the 5620 SAM to create keys and key chains. Do not create a key or key chain directly on a managed NE using another interface, for example, a CLI. The 5620 SAM cannot obtain a TCP key secret value from an NE during resynchronization, so it cannot specify the key for use on another NE.

If a local NE key chain and the associated global 5620 SAM key chain differ after a resynchronization, the 5620 SAM raises an alarm.

TCP keys and key chains

A key is a data structure that is used to authenticate TCP segments. One or more keys can be associated with a TCP connection. Each key contains an identifier, a shared secret, an algorithm identifier, and information that specifies when the key is valid for authenticating the inbound and outbound segments.

A key chain is a list of up to 64 keys that is associated with a TCP connection. Each key within a key chain contains an identifier that is unique within the key chain. You can use the 5620 SAM to distribute a global key chain to multiple NEs and assign a key to multiple BGP or LDP instances.

The 5620 SAM treats global and local key chain management as it does policy management; depending on the distribution mode configuration of a local key chain, when you modify a global key chain using the 5620 SAM, all local instances can be updated to ensure that all instances of the key chain in the network are synchronized. See chapter 46 for information about global and local policy instances, policy distribution and distribution modes, and local policy audits.

When the 5620 SAM attempts to synchronize the keys in a global key chain with the keys on an NE, the NE does not return the secret key value. After a key chain is deployed to an NE, the shared secret and the encryption algorithm cannot be modified. You can delete a key chain or key only when it is not in use by a protocol.

You can specify whether an NE uses a TCP key for sending packets, receiving packets, or both. Using keys that are configured for both, or send-receive, is general good practice because communication between NEs cannot be affected by assigning the wrong key type.

There are two classes of TCP keys:

- Active
- Eligible

Active keys

A key set contains one active key. An active key is a key that TCP uses to generate authentication information for outbound segments. You cannot delete the active key in a keychain.

Eligible keys

Each set of keys, called a key chain, contains zero or more eligible keys. An eligible key is a key that TCP uses to authenticate inbound segments.

24.2 Workflow to create a global key chain and local key

1. Create a global key chain that contains at least one key. See Procedure 24-1 for more information.
2. Distribute the key chain to NEs. See Procedure 24-2 for more information.
3. Assign the key chain to a routing protocol, such as BGP or LDP. See chapter 31 for more information.

24.3 TCP enhanced authentication menu

Table 24-1 lists the TCP enhanced authentication menu and the associated functions.

Table 24-1 5620 SAM TCP KeyChains menu

Menu option	Function
Administration→Security→TCP KeyChains	Create and manage TCP keys and key chains.

24.4 TCP enhanced authentication procedures

Use the following procedures to perform TCP enhanced authentication management functions.

Procedure 24-1 To create a global key chain

Perform the following procedure to create a global TCP key chain for distribution to NEs.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Click on the Create button. The KeyChain (Create) form opens.

3 Configure the parameters.

- Displayed Name
- Description
- Send Option
- Receive Option
- Admin State

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click the KeyChain Key tab button.

5 Click the Create button. The KeyChain Key (Create) form opens.

6 Configure the parameters:

- Key ID
- Auto-Assign ID
- Secret Key Algorithm
- Key
- Key Direction
- Admin State
- Begin Time
- End Time
- Tolerance (seconds)

Caution — Alcatel recommends that you choose the Send-receive option for the Key Direction parameter to ensure bidirectional communication between NEs.

Note — The 5620 SAM generates a random default value for the Key parameter. For greater security, Alcatel-Lucent recommends that you accept this value rather than manually enter a value.

7 Click on the OK button. A dialog box appears.

8 Click the OK button. The key is added to the keychain and displayed on the KeyChain (Edit) form.

9 Click the OK button. The KeyChain (Edit) form closes.

10 Close the TCP KeyChains form.

Procedure 24-2 To distribute global key chains to NEs

Perform the following procedure to distribute one or more global TCP key chains to one or more NEs. When you distribute a global key chain, local key chain using the Sync With Global distribution mode allow the NE to receive the key chain.

Note — Local key chains using the Local Edit Only distribution mode do not allow the NE to receive the distribution of a global key chain. You must ensure that the distribution mode for the local key chain is set to Sync With Global if you want the NE to receive the distribution of a global key chain.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Configure the filter criteria and click on the Search button. A list of key chains is displayed.

3 Select one or more key chains in the list.

4 When the key chain is in draft configuration mode, the Distribution option, located under the More Actions button, is disabled and the key chain cannot be distributed to the network elements. You must first release the key chain for distribution by performing the following steps. Releasing the global key chain also distributes the key chain to existing local definitions. Otherwise, go to step 5.

i Click on the Properties button. The Key Chain (Edit) form opens.

ii Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears.

iii Click on the Yes button. The configuration mode of the key chain is changed to Released.

Warning — When you switch the configuration mode of the global key chain to released, the key chain is distributed to existing local definitions.

iv View the local key chain, if necessary, by clicking on the Local Definitions tab button and double-clicking on the local key chain in the list.

v Close the Key Chain (Edit) form. The TCP KeyChains form reappears.

5 Click the More Actions button and choose Distribute. The Distribute - KeyChain form opens.

6 Select one or more NEs in the Available Nodes list.

7 Click on the right-arrow button. The selected NEs move to the Selected Nodes list.

8 Click on the More Actions button and choose Distribute. The 5620 SAM distributes the key chains to the NEs.

9 Close the Distribute - KeyChain form. The TCP KeyChains form reappears.

10 Configure the distribution mode of the local definitions by performing the following steps.

i Click on the More Actions button and choose Distribution Mode. The Distribution Mode form opens.

ii Choose Sync With Global, Local Edit Only, or All from the Distribution Mode parameter drop-down menu. The sites that are configured with the selected distribution mode are listed.

iii Choose one ore more rows from the Available Nodes list.

iv Click on the right arrow button. The chosen site or sites move to the Selected Nodes panel on the right side of the form.

v Depending on the distribution mode of the chosen site or sites, perform one of the following steps:

- Click on the Sync With Global button.
- Click on the Local Edit Only button.

vi Close the Distribution Mode form. The TCP KeyChains form reappears.

11 Close the TCP KeyChains form.

Procedure 24-3 To verify the distribution of a global key chain to NEs

Perform the following procedure to view a list of the NEs to which the 5620 SAM has successfully distributed a specific TCP key chain.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Configure the filter criteria and click on the Search button. A list of key chains is displayed.

3 Select a key chain in the list.

4 Click on the Properties button. The KeyChain (Edit) form opens.

5 Click on the Local Definitions tab button. The NEs that have a local instance of the key chain are displayed in a list.

6 View the list of NEs to confirm that the key chain is distributed to the required NEs.

7 Close the KeyChain (Edit) form.

8 Close the TCP KeyChains form.

Procedure 24-4 To modify a key chain or key

Perform the following procedure to modify global or local TCP key chain or key parameters, or to add a key to an existing global or local key chain.

Note — When you modify a key chain or key, the modified object is automatically distributed to the NEs that have a local instance of the key chain.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Perform one of the following actions.

a Modify a global key chain.

i Select Global from the Policy scope drop-down menu.

ii Configure the filter criteria and click on the Search button. A list of global key chains is displayed on the form.

b Modify a local key chain.

i Select Local from the Policy scope drop-down menu.

ii Click on the Select button to choose an NE. The Select a Network Element form opens.

iii Select an NE in the list and click on the OK button. The NE IP address is displayed in the Local Node IP Address field.

iv Click on the Search button. A list of key chains on the NE is displayed.

3 Select a key chain in the list and click on the Properties button. The KeyChain (Edit) form opens with the General tab displayed.

4 Configure the parameters, if required.

- Description
- Send Option
- Receive Option
- Admin State

5 Click the KeyChain Key tab button. The key chain keys are listed.

6 Modify a key, if required.

i Select a key in the list and click on the Properties button. The KeyChain Key (Edit) form opens.

ii Perform steps 6 to 8 of Procedure 24-1.

7 To add a new key to the key chain, perform steps 4 to 8 of Procedure 24-1.

8 Click the OK button. The KeyChain (Edit) form closes.

9 Close the TCP KeyChains form.

Procedure 24-5 To delete a key chain

Perform the following procedure to permanently remove a local or global TCP key chain.

Caution — Deleting a TCP key chain can be service-affecting. Ensure that you understand the implications of deleting the key chain before you proceed.

Note — You cannot delete a TCP key chain when the Admin State parameter for the key chain is set to In Service.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Perform one of the following actions.

a Delete a global key chain.

i Select Global from the Policy scope drop-down menu.

ii Configure the filter criteria and click on the Search button. A list of global key chains is displayed on the form.

b Delete a local key chain.

i Select Local from the Policy scope drop-down menu.

ii Click on the Select button to choose an NE. The Select a Network Element form opens.

iii Select an NE in the list and click on the OK button. The NE IP address is displayed in the Local Node IP Address field.

iv Click on the Search button. A list of key chains on the NE is displayed.

3 Select a key chain in the list and click on the Delete button. A dialog box appears.

4 Click on the OK button. A dialog box appears.

5 Click on the OK button. The 5620 SAM deletes the key chain and removes it from the list.

6 Close the TCP KeyChains form.

Procedure 24-6 To delete a key

Perform the following procedure to permanently remove a key from a local or global TCP key chain.

Caution — Deleting a TCP key can be service-affecting. Ensure that you understand the implications of deleting the key before you proceed.

Note — You cannot delete a TCP key when the Admin State parameter for the key is set to In Service.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Perform one of the following actions.

  a Delete a key from a global key chain.

    i Select Global from the Policy scope drop-down menu.

    ii Configure the filter criteria and click on the Search button. A list of global key chains is displayed on the form.

  b Delete a key from a local key chain.

    i Select Local from the Policy scope drop-down menu.

    ii Click on the Select button to choose an NE. The Select a Network Element form opens.

    iii Select an NE in the list and click on the OK button. The NE IP address is displayed in the Local Node IP Address field.

    iv Click on the Search button. A list of key chains on the NE is displayed.

3 Select a key chain in the list and click on the Properties button. The KeyChain (Edit) form opens with the General tab displayed.

4 Click the KeyChain Key tab button. The key chain keys are listed.

5 Select a key in the list and click on the Delete button. A dialog box appears.

6 Click on the OK button. The 5620 SAM deletes the key and removes it from the list.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The KeyChain (Edit) form closes.

9 Close the TCP KeyChains form.

Procedure 24-7 To identify differences between a global and local policy or two local key chains

Note 1 — You can cancel the local audit at any time by clicking on the Local Audit Off button on the KeyChain (Edit) form.

Note 2 — The 5620 SAM does not identify differences between the Begin Time and End Time properties of key chains.

1 Choose Administration→Security→TCP KeyChains from the 5620 SAM main menu. The TCP KeyChains form opens.

2 Choose Local from the Policy scope drop-down menu.

3 Click on the Select button beside the Local Node IP Address parameter. The Select a Network Element form opens.

4 Choose a device from the list and click on the OK button. The Select a Network Element form closes and the TCP KeyChains form is updated with the network element IP address.

5 Click on the Search button. A list of local key chains is displayed.

6 Choose the local key chain that you want to compare with another key chain.

7 Click on the Properties button. The KeyChain (Edit) form opens.

8 Click on the Local Audit On button. The Local Audit form opens.

9 From the Policy scope drop-down menu:

- a Choose Global and go to step 10.
- b Choose Local and configure the Local Node IP Address parameter by using the Select button to choose a network element. The Select a Network Element form opens.
  - i Choose a network element and click on the OK button. The Select a Network Element form disappears, and the policy manager form reappears with a list of the local policies for the chosen network element in the bottom panel.
  - ii Go to step 10.

10 Click on the OK button. The Local Audit form closes.

11 View the differences between the key chains by clicking on the tab buttons that are highlighted with an arrow icon to indicate that differences exist on the forms. An arrow icon beside a property indicates that the property is modified. In lists, new entries are highlighted in pink and modified entries are highlighted in purple.

12 Close the local and global key chain (Edit) forms.

25 — Card migration

25.1 Card migration management overview

You can use a 5620 SAM GUI utility called the Card Migration Event Manager to facilitate the transition to an IOM 3 on one or more 7450 ESS or 7750 SR NEs. The Card Migration Event Manager transfers the existing IOM and MDA configurations to new modules with minimal service interruption.

The 5620 SAM Card Migration Event Manager can do the following:

- Upgrade from an IOM 1 or IOM 2 to an IOM3 while retaining the same MDAs.
- Upgrade from one MDA type to a newer MDA type that has compatible features.
- Upgrade an IOM and the associated MDAs in one operation.

You can perform an immediate migration, or preconfigure one or more migration events for later execution. A migration event can include an NE reboot to put the new hardware configuration into effect immediately after the migration. You can upgrade multiple IOMs and MDAs in one operation to limit the number of required NE reboots to one.

During a migration event, the 5620 SAM identifies the configured objects that are bound to the IOM or MDA, deletes the objects, and then creates the objects on the new IOM or MDA. The old and new configurations are saved in the 5620 SAM database until the migration completes successfully. The 5620 SAM preserves the statistics data and alarm information that is associated with each object.

Restrictions

The following restrictions apply to 5620 SAM card migration event management:

- **General**
  - Only the 5620 SAM admin user, or a user with an assigned administrator scope of command role, can create, modify, or execute a migration event.
  - The migration functions are not available to 5620 SAM OSS clients.
  - You may need to re-enable SNMP on an NE after the NE reboots following a migration event.
  - You can only perform a card migration if the description associated with the cards being migrated do not contain any numerical values.
- **IOM-specific**
  - An IOM downgrade, for example, a migration from an IOM 3 to an IOM 2, is not supported.
- **MDA-specific:**
  - You cannot migrate an empty MDA slot to an MDA.
  - MDA migration is limited to MDAs of the same physical transmission type; for example, migration from a SONET MDA to an Ethernet MDA is not supported.
  - You cannot upgrade an MDA that is integrated with an IOM, for example, an IMM.
  - For MDAs, you can migrate only to an MDA of similar capacity that has the same or a greater number of ports.

The 5620 SAM raises an alarm during a migration event if a target NE is unreachable. After a migration event, the 5620 SAM raises an alarm to indicate migration success or failure.

Table 25-1 lists the supported MDA migration types.

Table 25-1 Supported MDA migration types

Current MDA	MDAs supported by migration
10 x 1-Gig Ethernet SFP	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
5 x 1-Gig Ethernet SFP	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
1 x 10-Gig Ethernet	4 x 10Gig Extended Performance XFP 2 x 10Gig Extended Performance XFP 1 x 10Gig Extended Performance SFP
20 x 100 Ethernet Fx	20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
20 x 10/100/1000 Ethernet Tx	20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
2 x 10-Gig Ethernet XFP	2 x 10Gig Extended Performance XFP 4 x 10Gig Extended Performance XFP
20 x 10/100/1000 Ethernet SFP	20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
1 x 10-gig Ethernet XFP	4 x 10GigExtended Performance XFP 2 x 10Gig Extended Performance XFP 1 x 10Gig Extended Performance XFP
5 x 10/100/1000	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
10 x 10/100/1000 Ethernet SFP	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
60 x 10/100 Ethernet	48 x 10/100/1000 Ethernet Extended Performance TX

25.2 Workflow to manage card migration

The following is the sequence of high-level actions required to manage card migration.

1 Use the 5620 SAM to back up the device configuration of each target NE.

> **Note —** When you attempt a migration on an NE that does not have a recent configuration backup in the 5620 SAM database, the 5620 SAM raises an alarm and the migration fails.
>
> A recent configuration backup is a backup that occurs after the latest configuration save on the NE.

See chapter 23 for information about performing NE backups.

2 Create a card migration event and execute or save it, as required. See Procedure 25-1 for more information.

3 Execute a saved card migration event, as required. See Procedure 25-2 for more information.

25.3 Card migration management procedures

Use the following procedures to perform card migration event management tasks.

Procedure 25-1 To create a card migration event

1 Choose Tools→Card Migration Event Manager from the 5620 SAM main menu. The Card Migration Event Manager form opens.

2 Click on the Create button. The Card Migration Event (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Description
- Additional Information
- Auto Reboot

4 Click on the NE Migration Candidates tab button.

5 Click on the Add button. The Select Network Elements - Card Migration Event form opens.

6 Select one or more NEs in the list and click on the OK button. The Select Network Elements - Card Migration Event form closes and the NEs are listed on the Card Migration Event (Create) form.

7 Select one or more NEs in the list and click on the Properties button. The Network Element Migration Candidates form opens.

8 Configure the Auto Reboot parameter.

9 Click on the Ok button. The Network Element Migration Candidates form closes, and a dialog box appears.

10 Click on the OK button.

11 Click on the Card Migration Candidates tab button.

12 Click on the Add button. The Select Cards - Card Migration Event form opens.

13 Select one or more cards in the list and click on the OK button. The Select Cards - Card Migration Event form closes and the cards are listed on the Card Migration Event (Create) form.

14 Select one or more cards in the list and click on the Properties button. The Migration Details (Create) form opens.

15 Configure the New Type parameter in the IOM panel, if required.

16 Configure the New Type parameter in the MDA 1 panel, if required.

17 Configure the New Type parameter in the MDA 2 panel, if required.

18 Click on the OK button. The Migration Details (Create) form closes, and a dialog box appears.

19 Click on the OK button.

20 To execute the migration event immediately, perform the following steps. Otherwise, you can execute the migration later by performing Procedure 25-2.

i Use the 5620 SAM to back up the device configuration of each target NE.

Note — When you attempt a migration on an NE that does not have a recent configuration backup in the 5620 SAM database, the 5620 SAM raises an alarm and the migration fails.

A recent configuration backup is a backup that occurs after the latest configuration save on the NE.

See chapter 23 for information about performing NE backups.

ii Click on the Apply button. The 5620 SAM saves the card migration event configuration.

iii Click on the General tab to display the Status indicator.

iv Click on the Initiate Migration button. A dialog box appears.

v Click on the Yes button. The 5620 SAM starts to migrate the specified cards.

vi Monitor the card migration as it progresses by viewing the Status indicator on the form. The status can be one of the following:

- Awaiting manual reboot to complete migration
- Failed - Latest configuration not available
- Failed - Unable to migrate configuration
- Failed - Unable to reboot network element
- Failed - Unable to transfer migrated configuration
- Migration completed
- Not Started
- Rebooted network element
- Started
- Swap failed
- Swap failed on some network elements

21 Click on the OK button. The Card Migration Event (Create) form closes.

22 Close the Card Migration Event Manager form.

Procedure 25-2 To execute a saved card migration event

1 Use the 5620 SAM to back up the device configuration of each target NE.

> **Note —** When you attempt a migration on an NE that does not have a recent configuration backup in the 5620 SAM database, the 5620 SAM raises an alarm and the migration fails.
>
> A recent configuration backup is a backup that occurs after the latest configuration save on the NE.

See chapter 23 for information about performing NE backups.

2 Choose Tools→Card Migration Event Manager from the 5620 SAM main menu. The Card Migration Event Manager form opens.

3 Configure the filter criteria and click on the Search button. A list of card migration events is displayed.

4 Select a card migration event and click on the Properties button. The Card Migration Event (Edit) form opens with the General tab displayed.

5 Click on the Initiate Migration button. A dialog box appears.

6 Click on the Yes button. The 5620 SAM starts to migrate the specified cards.

7 Monitor the card migration as it progresses by viewing the Status indicator on the form. The status can be one of the following:

- Awaiting manual reboot to complete migration
- Failed - Latest configuration not available
- Failed - Unable to migrate configuration
- Failed - Unable to reboot network element
- Failed - Unable to transfer migrated configuration
- Migration completed
- Not Started
- Rebooted network element
- Started
- Swap failed
- Swap failed on some network elements

8 Click on the OK button. The Card Migration Event (Create) form closes.

9 Close the Card Migration Event Manager form.

Procedure 25-3 To delete a card migration event

1 Choose Tools→Card Migration Event Manager from the 5620 SAM main menu. The Card Migration Event Manager form opens.

2 Configure the filter criteria and click on the Search button. A list of card migration events is displayed.

3 Select a card migration event and click on the Delete button. A dialog box appears.

4 Click on the Yes button. The 5620 SAM deletes the card migration event.

5 Close the Card Migration Event Manager form.

26 — TCA

26.1 TCA overview

You can create policies to raise 5620 SAM alarms based on managed-object statistics. When a statistic counter of an object such as an interface reaches a specified threshold, the 5620 SAM alerts GUI operators using a threshold-crossing alarm, or TCA, based on policy specifications.

A TCA policy includes the following:

- the direction of traffic flow to monitor
- the objects that are associated with the policy
- rules that define properties such as the rising and falling thresholds, and the alarm severity
- custom statistics counters that can be used to monitor statistics based on specified formulas

Note — A TCA is not self-clearing. The 5620 SAM clears a TCA only when the TCA policy contains a falling-threshold rule in addition to a rising-threshold rule, and the alarm severity in the falling-threshold rule is set to cleared.

To enable TCA on an object, you must enable collection of performance statistics on the object. To determine whether a specified statistic exceeds a TCA policy threshold, the 5620 SAM compares the utilization value at each statistics collection to the threshold values in the associated TCA policy.

The 5620 SAM TCA function raises an alarm when a statistic threshold is initially crossed. Rather than raise a new alarm for each successive threshold-crossing event associated with a TCA policy, the 5620 SAM changes the severity of the initial alarm based on the rules defined in the policy.

In the 5620 SAM client GUI, you can associate a TCA policy with a managed object from the TCA policy configuration form, or from the object properties form. You can associate one TCA policy with multiple objects.

Statistics counters

Depending on the monitored object, you can create rules to monitor utilization, packets in error, and packets dropped.

The 5620 SAM allows you to monitor custom TCA statistics. You can create a custom TCA profile and build a formula using statistics counters and constant values. See the *5620 SAM Statistics Management Guide* for more information on statistics counters.

For all statistics counters, you can choose to apply the rule to the delta value, rather than the absolute value. The delta value is the difference between the current value and most recent previous value of the statistic counter.

TCA configuration example

The following example describes the 5620 SAM configuration required to raise a TCA, adjust the alarm severity, and clear the alarm, based on the following utilization specifications:

- Raise a minor alarm if utilization is between 60% and 69%.
- Change the alarm severity to major if utilization rises to between 70% and 79%.
- Change the alarm severity to critical if utilization rises to 80% or higher.
- Change the alarm severity to major if utilization falls below 80%.
- Change the alarm severity to minor if utilization falls below 70%.
- Clear the alarm if utilization falls below 60%.

The following are the TCA rules and associated parameter values required to implement the example alarm behavior:

Rule to raise minor alarm for 60% or higher utilization:

- Alarm Severity—minor
- Threshold (%)—60
- Threshold Direction—Rising Above

Rule to change alarm severity to major for 70% or higher utilization:

- Alarm Severity—major
- Threshold (%)—70
- Threshold Direction—Rising Above

Rule to change alarm severity to critical for 80% or higher utilization:

- Alarm Severity—critical
- Threshold (%)—80
- Threshold Direction—Rising Above

Rule to change alarm severity to major if utilization falls below 80%:

- Alarm Severity—major
- Threshold (%)—80
- Threshold Direction—Falling Below

Rule to change alarm severity to minor if utilization falls below 70%:

- Alarm Severity—minor
- Threshold (%)—70
- Threshold Direction—Falling Below

Rule to clear alarm if utilization falls below 60%:

- Alarm Severity—cleared
- Threshold (%)—60
- Threshold Direction—Falling Below

26.2 Workflow to configure TCA

Perform these steps to configure a TCA policy on a monitored object.

1 Enable performance statistics collection on the object that is to be monitored. For example, Table 26-1 lists the port statistics policy objects required to enable TCA on a network interface or physical link.

Table 26-1 Port statistics policy objects for TCA

Statistics policy type	MIB	MIB entry	Monitored class
NE MIB	IF-MIB	ifEntry	—
Specific MIB	IF-MIB	ifEntry	equipment.PhysicalPort

See the *5620 SAM Statistics Management Guide* for more information about collecting performance statistics.

2 If you are creating custom TCA rules, configure a custom TCA profile. See Procedure 26-1 for more information.

3 Configure a TCA policy. See Procedure 26-2 for more information.

i Configure a TCA policy.

ii Configure utilization, error, and drop TCA rules.

iii If required, configure custom TCA rules using custom TCA profiles.

4 Apply a TCA policy to an object. See Procedure 26-3 for more information.

5 Configure TCA system preferences, as required. See Procedure 26-5 for more information.

26.3 TCA management procedures

The following procedures describe how to manage TCA policies.

Procedure 26-1 To configure a custom TCA profile

Perform this procedure to create a custom TCA profile to apply to a TCA policy.

1 Choose Tools→TCA Policies from the 5620 SAM main menu. The TCA Policies form opens.

2 Choose CustomProfileTCA (TCA Policy) from the object type drop-down menu.

3 Click on the Create button. The CustomProfileTCA (Create) form opens.

4 Configure the parameters:

- Profile ID
- Auto-Assign ID
- Profile Name
- Description

5 Click on the Select button. The Custom Profile TCA (Create) form opens.

6 Configure the filter criteria, if required, and click on the Search button.

7 Select a monitored object from the list and click on the OK button. The Custom Profile TCA (Create) form closes.

8 Configure the Stats Type parameter.

9 Click on the Build Formula button. The Build Formula form opens.

10 Choose a statistic counter from the Counter Field drop-down menu.

11 Click on the Add button.

12 Add as many expressions to the formula as required.

a Add a statistic counter to the formula.

i Click on one of the mathematical operator buttons.

ii Choose a counter from the Counter Field drop-down menu.

iii Click on the Add button.

b Add a constant value to the formula.

i Click on one of the mathematical operator buttons.

ii Enter a number in the Constant Value field.

iii Click on the Add button.

13 Click on the OK button. The Build Formula form closes.

14 Click on the OK button. The CustomProfileTCA (Create) form closes.

15 Close the TCA Policies form.

Procedure 26-2 To configure a TCA policy

Perform this procedure to configure a TCA policy for monitoring object utilization.

1 Choose Tools→TCA Policies from the 5620 SAM main menu. The TCA Policies form opens.

2 Choose TCAPolicy (TCA Policy) from the object type drop-down menu.

3 Click on the Create button. The TCAPolicy (Create) form opens.

4 Configure the parameters:

- Policy ID
- Auto-Assign ID
- Displayed Name
- Description
- TCA Admin State

5 Click on the Select button. The TCAPolicy form opens.

6 Configure the filter criteria, if required, and click on the Search button.

7 Select a monitored object from the list and click on the OK button. The TCAPolicy form closes.

8 Click on the Apply button. The TCAPolicy (Create) form closes and the TCAPolicy (Edit) form opens with the General tab displayed.

Note — The panels that appear on the General tab depend on which object type you are creating a TCA policy for.

9 If applicable, configure utilization TCA rules.

i In the Utilization panel, configure the parameters:

- Disable TCA
- Flow Direction
- Delta Tolerance

ii Click on the Create button in the Rules subpanel. The PercentageTCARule, tca.UtilizationTCA-0 (Create) form opens.

iii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold (%)
- Threshold Direction
- Use for Delta TCA

iv Click on the OK button. The PercentageTCARule, tca.UtilizationTCA-0 (Create) form closes.

v Repeat steps ii to iv to create additional rules, as required.

Note — You cannot create two rules that have the same Threshold (%) and Threshold Direction values.

10 If applicable, configure error TCA rules.

i In the Error panel, configure the parameters:

- Disable TCA
- Flow Direction
- Delta Tolerance

ii Click on the Create button in the Rules subpanel. The PercentageTCARule, tca.ErrorTCA-0 (Create) form opens.

iii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold (%)
- Threshold Direction
- Use for Delta TCA

iv Click on the OK button. The PercentageTCARule, tca.ErrorTCA-0 (Create) form closes.

v Repeat steps ii to iv to create additional rules, as required.

Note — You cannot create two rules that have the same Threshold (%) and Threshold Direction values.

11 If applicable, configure drop TCA rules.

i In the Drop panel, configure the parameters:

- Disable TCA
- Flow Direction
- Delta Tolerance

ii Click on the Create button in the Rules subpanel. The PercentageTCARule, tca.DropTCA-0 (Create) form opens.

iii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold (%)
- Threshold Direction
- Use for Delta TCA

iv Click on the OK button. The PercentageTCARule, tca.DropTCA-0 (Create) form closes.

v Repeat steps ii to iv to create additional rules, as required.

Note — You cannot create two rules that have the same Threshold (%) and Threshold Direction values.

12 If applicable, configure custom TCA rules.

i In the Custom panel, click on the Create button. The CustomTCA (Create) form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID
- Disable TCA
- Displayed Name
- Delta Tolerance

iii Click on the Select button. The Select Custom Profile TCA - CustomTCA form opens.

iv Configure the filter criteria, if required, and click on the Search button.

v Select a Custom TCA Profile from the list and click on the OK button. The Select Custom TCA Profile - CustomTCA form closes.

vi Click on the Create button in the Rules panel. The CustomTCARule, tca.CustomTCA-0 (Create) form opens.

vii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold
- Delta Threshold (%)
- Threshold Direction
- Use for Delta TCA

- **viii** Click on the OK button. The CustomTCARule, tca.CustomTCA-0 (Create) form closes.
- **ix** Click on the OK button. The CustomTCA (Create) form closes and a dialog box opens.
- **x** Click on the OK button.

13 Apply the TCA Policy to monitored objects, as required.

- **i** Click on the Monitored Objects tab button.
- **ii** Click on the Add button. The Select form opens.
- **iii** Configure the filter criteria, if required, and click on the Search button.
- **iv** Select one or more objects from the list and click on the OK button. The Select form closes.

14 Click on the OK button. A dialog box opens.

15 Click on the OK button to confirm the changes. The TCAPolicy (Edit) form closes.

16 Close the TCA Policies form.

Procedure 26-3 To apply a TCA policy to objects using the object properties forms

Perform this procedure to apply an existing TCA policy to an object from the object properties form.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Select an object from the Select Object Type drop-down menu.

3 Configure the filter criteria, if required, and click on the Search button.

4 Select an object from the list and click on the Properties button. The properties form for the object opens.

5 If the object is a Physical Link, perform the following steps.

- **i** Click on the End Point A TCA tab button.
- **ii** Click on the Assign button. The Select TCA Policy form opens.
- **iii** Configure the filter criteria, if required, and click on the Search button.
- **iv** Select a TCA policy in the list and click on the OK button. The Select TCA Policy form closes and the TCA policy is listed on the object properties form.
- **v** Click on the End Point B TCA tab button.
- **vi** Click on the Assign button. The Select TCAPolicy form opens.

vii Configure the filter criteria, if required, and click on the Search button.

viii Select a TCA policy in the list and click on the OK button. The Select TCA Policy form closes and the TCA policy is listed on the object properties form.

ix Go to step 10.

6 Click on the TCA tab button.

7 Click on the Assign button. The Select TCAPolicy form opens.

8 Configure the filter criteria, if required, and click on the Search button.

9 Select a TCA policy in the list and click on the OK button. The TCA policy is listed on the object properties form.

10 Close the object properties form.

11 Close the Manage Equipment form.

Procedure 26-4 To delete a TCA policy

Perform this procedure to delete a TCA policy.

1 Choose Tools→TCA Policies from the 5620 SAM main menu. The TCA Policies form opens.

2 Configure the filter criteria, if required, and click on the Search button.

3 Select one or more TCA policies in the list and click on the Delete button. The 5620 SAM deletes the TCA policies.

4 Close the TCA Policies form.

Procedure 26-5 To configure the TCA system preferences

1 Choose Administration→System Preferences from the 5620 SAM main menu. The System Preferences form opens.

2 Click on the TCA tab button.

3 Configure the parameters:

- Max TCA Alarm Limit
- Max TCA Alarm Reset Synchronization Time
- Max TCA Alarm Reset Interval
- Alarm Severity

4 Click on the OK button. A dialog box opens.

5 Click on the OK button to confirm the action. The System Preferences form closes.

27 — Bulk operations

27.1 Bulk operations overview

The 5620 SAM bulk operations function allows you to create bulk changes to modify a large amount of information. Bulk changes may be deployed to NEs or restricted to the 5620 SAM.

A bulk change can contain thousands of target objects. These objects, referred to as batch items, are grouped into batches for efficient bulk change execution. An operator can execute an entire bulk change or individual batches.

You should regenerate batches each time you execute a bulk change to ensure that each target object that matches the bulk change filter is modified.

If one or more of the batch items fail to change during a bulk change operation, the Batch Status and the Batch Status Summary parameters help identify the items. You can also use the Task Manager to view information about a batch.

27.2 Workflow to manage bulk operations

1. Create a bulk change. See Procedure 27-1 for more information.
2. Generate batches for a bulk change. See Procedure 27-3 for more information.
3. Execute one or more batches in a bulk change. See Procedure 27-3 for more information.
4. As required, stop a bulk change. See Procedure 27-6 for more information.
5. View the bulk change execution results to verify that the bulk change was successful and to identify any items which failed to change. See Procedure 27-5 for more information.

27.3 Bulk operations procedures

Use the following procedures to manage 5620 SAM bulk operations.

Procedure 27-1 To create a bulk change

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Open the Create Bulk Change form by performing one of the following steps.

a Click on the Create button.

b To create a bulk change by copying values from an existing bulk change, perform the following steps.

i Configure the filter criteria and click on the Search button. A list of bulk operations appears.

ii Choose the bulk change from the list and click on the Properties button. The Bulk Change configuration form opens.

iii Click on the Copy button.

3 Configure the parameters, if required:

- Operation ID
- Auto-Assign ID
- Name
- Description
- Admin State
- Object Type

The Operation ID parameter is configurable when the Auto-Assign ID parameter is disabled.

4 Click on the Next button. The Specify the filter form opens.

5 Configure the filter criteria, as required and perform the following steps. Creating a filter that contains the attributes that you want to change can limit the number of objects generated for the bulk change.

i Click on the Attribute drop down and select an option.

ii Click on the Function drop down and select an option.

iii Click on the Value drop down and select or enter an option.

iv Click on the Add to filter icon. The options are displayed on the filter panel.

v Select AND or OR from the Operators drop down option. Repeat steps i to iv to add more options.

vi Click on Save, the Save Filter form opens.

vii Configure the parameters:

- Filter Name
- Description
- Public

viii Click on the Save button. The Save Filter form closes.

6 Click on the Count button to determine the number of network objects that are affected based on the filter.

7 Click on the View button to list the target objects. The Filtered List form opens.

8 Click on the Search button. A list of target objects is displayed.

9 Click on the Next button. The Specify the attributes form opens.

10 Double-click on the attribute or attribute group in the attribute tree panel that you want to include in the bulk change. The attribute or attribute group appears in the display panel.

11 If you included an attribute or attribute group that you want to exclude from the bulk change, you can remove it by clicking on the Remove icon in the display panel.

12 Perform one of the following on each listed attribute, as required.

a Enter a value in the attribute field. The drop-down menu changes from Unchanged to Set, which means that the attribute changes to the new value when you execute the bulk change.

b Choose Default from the drop-down menu to specify that the attribute is to change to the default value when you execute the bulk change.

c Choose Clear from the drop-down menu. Depending on the object type, the attribute value is cleared or set to the default value when you execute the bulk change.

13 Click on the Next button. The Change review form opens.

14 Configure the parameters, if required:

- Batch Size
- Continue on Failure
- Admin State

15 Click on the Finish button.

16 Click on the Close button. The Create Bulk Change form closes.

17 To create more Bulk Changes, repeat steps 2 to 16.

Procedure 27-2 To modify a bulk change

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change from the list and click on the Properties button. The Bulk Change configuration form opens with the Batch Control tab displayed.

4 Click on the Summary tab button.

5 Modify the parameters, if required:

- Description
- Batch Size
- Admin State
- Continue on Failure

6 Click on the Spans tab button and specify a span, if required.

7 Click on the OK button. The Bulk Change configuration form closes.

8 Close the Bulk Operations form.

Procedure 27-3 To execute a bulk change

Note 1 — You can only execute one bulk change at a time. All other bulk changes are queued.

Note 2 — You can only generate batches for one bulk change at a time.

Note 3 — You cannot generate batches when a bulk change is executing.

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change from the list and perform one of the following.

a If the bulk change contains batches, click on the Execute button to execute all of the batches.

> **Note —** Changes made to the network after the batches were generated are not affected by the bulk change batches.

b If the bulk change does not contain batches, or you want to regenerate the batches, perform the following.

i Click on the Properties button. The Bulk Change configuration form opens.

ii If the Generate Batches button is dimmed, perform the following:

- Click on the Summary tab button.
- Set the Admin State parameter to Enable.
- Click on the Batch Summary tab.

iii Click on the Generate Batches button. The batches are generated and listed on the form.

iv To execute only specific batches, choose one or more batches from the list and click on the Execute Selected button.

v To execute all of the batches, click on the Execute All button.

A dialog box appears. You can modify the bulk change confirmation message behavior from the User Preferences form.

4 Click on the Yes button. The 5620 SAM executes the bulk change.

Procedure 27-4 To enable or disable the display of bulk change confirmation messages

Perform this procedure to specify whether the 5620 SAM displays a confirmation message when an operator initiates a bulk change operation.

1 Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.

2 Configure the Enable Confirmation for Bulk Change Actions parameter.

3 Click on the OK button. The User Preferences form closes.

Procedure 27-5 To view executed batch information

Note — You can also use the 5620 SAM Task Manager to view information about a batch.

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change from the list and click on the Properties button. The Bulk Change configuration form opens with the Batch Control tab displayed.

4 Choose a batch from the list.

5 Click on the Properties button. The Bulk Change Batch configuration form opens with the General tab displayed. View general information about the executed batch.

6 Click on the Batch Items tab button.

7 Click on the Search button. A list of items that were changed in the batch appears with the status of each batch item.

8 To view the parameters for each batch item, choose a batch item from the list and click on the Properties button.

9 Close all of the forms.

Procedure 27-6 To stop one or more bulk changes

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Perform one of the following:

- **a** Choose one or more bulk change to stop from the list.
- **b** Choose one or more batches to stop by performing the following:
  - **i** Choose a bulk change from the list.
  - **ii** Click on the Properties button. A Bulk Change configuration form opens with the Batch Control tab displayed.
  - **iii** Choose one or more batches from the list.

4 Click on the Stop button. A dialog box appears.

5 Click on the Yes button. The bulk change execution stops.

6 Close the forms.

Procedure 27-7 To delete a bulk change

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change that you want to delete from the list and click on the Delete button. A dialog box appears.

4 Click on the Yes button. The bulk changes is removed from the 5620 SAM.

28 — Object life cycle

28.1 Object life cycle overview

The OLC state specifies whether an object is in maintenance or in-service mode to filter alarms in the Alarms Window. Alarms are generated for objects and services regardless of the OLC State parameter setting. The parameter setting is not sent to the objects or services.

You can set the OLC state for the following objects and services:

- network element
- card slot
- daughter card
- port
- LAG
- composite service
- service
- site
- SAPs (L2 access interfaces and L3 access interfaces)

Caution — Changing the OLC state on an object will also change the OLC state on all of its child objects. The operation could take several minutes to complete, depending on the number of objects affected.

Setting the OLC state

The default value of the OLC state for network elements can be specified in the discovery rules. See chapter 14 for more information about configuring the default OLC state for network elements. The OLC state default value of a child object is inherited from the parent object. The default value of the OLC state for composite services and services can be specified using the nms-server.xml file.

Caution — Unauthorized modification of the nms-server.xml file can seriously affect network management and 5620 SAM performance. Contact your Alcatel-Lucent representative for information about file modification.

When the OLC state of an NE is set to the maintenance mode, all children equipment such as access interfaces, card slots, daughter cards, and ports are set to maintenance mode. The sites on the NE are set to the maintenance mode.

When the OLC state of a composite service or service is set to the maintenance mode, the following related objects are changed:

- sites on which the services reside
- access interfaces (SAPs, L2 and L3 access interfaces)
- SDP Bindings (mesh, mirror and spoke bindings)

When the OLC state of a composite service or services is changed to in service, access interfaces and sites may not change to in service if they belong to equipment objects that are set to maintenance.

See chapter 19 for information about setting the OLC state for network and equipment objects. See chapters 70, 71, 73, 74, 69, 72 and 76 for more information about setting the OLC state for specific services and sites. See the *5620 SAM Parameter Guide* for information about how to configure the OLC State parameter.

The OLC state for a child object is inherited from the parent object. The OLC state of the parent object must be in service to change the OLC State parameter of the child object. You can change the OLC state parameter of the parent object regardless of the OLC state of the child object. However, when a child object has more than one parent object and the OLC state of one parent is set to maintenance, the child object is set to maintenance. The OLC state for a child object cannot be changed if one of the parent OLC states is set to maintenance.

Discovery rules allow the operator to set the default OLC state for the node during discovery. See chapter 14 for information about setting the OLC state during discovery.

You must add the OLC state property to manually created service templates, as described in Procedure 28-5.

28.2 Workflow to set OLC states

1 If required, configure the default OLC state for network elements in the discovery rules. See chapter 14 for more information on configuring discovery rules.

2 As required, configure the OLC state for specific nodes, cards, ports, LAGs, services and alarms, as required.

  i Configure the OLC state from the 5620 SAM main menu. See Procedure 28-3 for more information.

  ii Configure the OLC state from an object configuration form. See Procedure 28-6 for more information.

  iii Configure the OLC state from the Alarm window. See Procedure 28-4 and Procedure 28-1 for more information.

3 If required, configure the OLC state on a service template using the GUI builder. See Procedure 28-5 for more information.

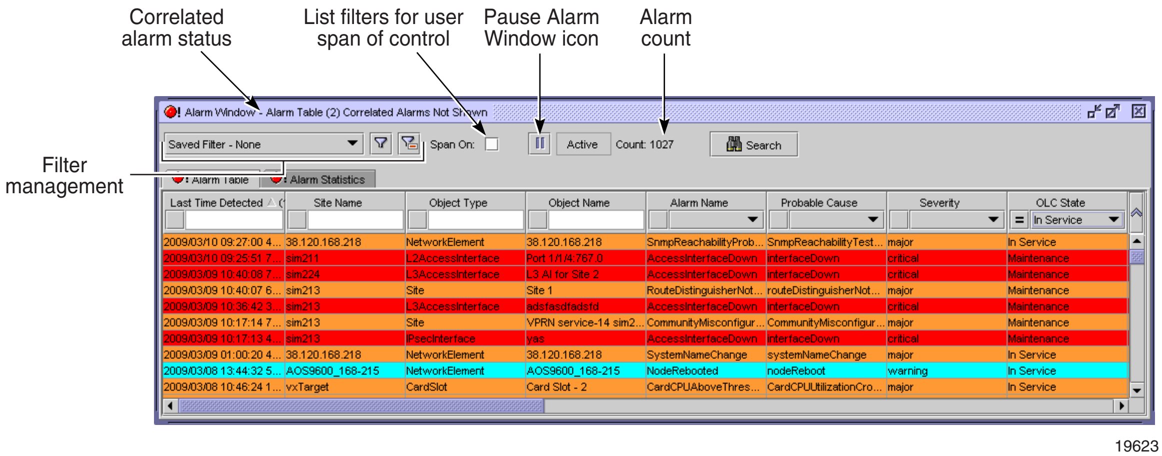
28.3 Setting the OLC state procedures

Use the following procedures to perform OLC management tasks.

Procedure 28-1 To view the OLC state of all network alarms using the dynamic alarm list

The dynamic alarm list Alarm Window allows you to monitor incoming faults from the devices and 5620 SAM software. This feature is most useful when monitoring the network. Figure 28-1 shows the dynamic alarm list Alarm Window.

Figure 28-1 Dynamic alarm list Alarm Window - Alarm Table



1 Click on the filter icon in the Alarm Window. A filter window opens.

Note — You can open and view up to six Alarm Windows. This is useful when you need to view multiple filtered incoming network alarms.

2 Choose OLC State from the Attribute drop-down menu.

3 Configure the filter form to search for alarms. See chapter 3 for more information about creating search filters.

4 To assign the OLC State to the alarm. See Procedure 28-4 for more information.

5 Handle the alarms according to your fault management policies. See the *5620 SAM Troubleshooting Guide* for information about troubleshooting using alarm information guidelines.

Procedure 28-2 To view the OLC state of network equipment or a service

1 Choose Administration→OLC from the 5620 SAM main menu. An OLC form appears.

2 Choose a type of service or object from the object drop-down menu:

- Network Element (network) to view a list of NEs
- Card Slot (physical equipment) to view a list of cards
- Daughter Card Slot (physical equipment) to view a list of daughter cards
- Physical Port (physical equipment) to view a list ports
- LAG (LAG) to view a list of LAG ports
- Composite Service (Service Management) to view a list of composite services
- Service (Service Management) to view a list of services
- Site (Service Management) to view a list of sites

3 Choose In Service or Maintenance in the OLC State filter properties using the drop-down menu.

4 Click on the Search button. A list of objects or services appears based on the search filter.

Procedure 28-3 To change the OLC state of equipment or a service

Caution — Changing the OLC state can affect 5620 SAM performance and can take up to ten or more minutes to complete. Changing the OLC state of a parent object changes the OLC state of the child objects.

Note — One JMS message is sent to identify that the OLC state of a parent object has changed.

1 Choose Administration→OLC from the 5620 SAM main menu. An OLC form appears.

2 Choose a type of service or object from the object drop-down menu:

- Network Element (Network) to view a list of NEs
- Card Slot (Physical Equipment) to view a list of cards
- Daughter Card Slot (Physical Equipment) to view a list of daughter cards
- Physical Port (Physical Equipment) to view a list ports
- LAG (LAG) to view a list of LAG ports
- Composite Service (Service Management) to view a list of composite services
- Service (Service Management) to view a list of services
- Site (Service Management) to view a list of sites

3 Configure the filter criteria.

4 Click on the Search button. A list of equipment objects or services appears based on the search filter.

5 Select an object in the list. You can select multiple objects.

6 Click on the OLC State button, a drop-down menu appears.

7 Choose Maintenance or In Service from the drop-down menu. The OLC state of the object changes in the filtered list panel.

8 Close the OLC form.

Procedure 28-4 To change the OLC state from the Alarm Window

1. Click on the Alarm Table tab button in the Alarm Window. The dynamic list of incoming network alarms appears.
2. If required, click on the filter icon to create a filtered list of alarms. See chapter 3 for more information about creating search filters.
3. Select an alarm in the list. You can select multiple alarms.
4. Right-click on the alarm, a drop-down menu appears.
5. Choose Assign OLC State. An OLC State Assignment window opens.
6. Choose Maintenance or In service from the drop-down menu.
7. Click on the OK button. A dialog box appears.
8. Click on the Yes button. The OLC State Assignment window closes.

Procedure 28-5 To add the OLC state to a template using the GUI builder

Some service objects have an OLC state property. You cannot configure the OLC state property during the configuration of the service object. For 5620 SAM-created service templates, the OLC state property is automatically added to the template. For manually created service templates, the OLC state property is not added to the template. Perform the following procedure to add the OLC state property to a manually created template.

1. Perform steps 1 to 5 in Procedure 4-6 to open the GUI builder.
2. Perform step 15 in Procedure 4-6 to create a combo box component and enter olcState for the Name combo box component attribute.
3. Enter the value “maintenance” for the List combo box component attribute.
4. Enter the value “inService” for the List combo box component attribute.
5. Enter the value “maintenance” or “inService” for the Default combo box component attribute.
6. Save and close the GUI builder and Script editor windows.

Procedure 28-6 To change the OLC state of an L2 or L3 access interface

Use this procedure to configure the OLC for SAPs on VLL, VPLS, VPRN, MVPLS, and IES services.

Note — The OLC State parameter is configurable on the access interface only when the service OLC State is set to In Service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Select a service and click on the Properties button. The service configuration form opens with the General tab displayed.

4 Perform one of the following actions.

- **a** To choose an L2 access interface
  - **i** Click on the L2 Access Interface tab button.
  - **ii** Choose an L2 access interface and click on the Properties button. The L2 Access Interface (Edit) form opens.
- **b** To choose an L3 access interface
  - **i** Click on the L3 Access Interface tab button.
  - **ii** Choose an L3 access interface and click on the Properties button. The L3 Access Interface (Edit) form opens.

5 Click on the OLC State button, a drop-down menu appears.

6 Choose Maintenance or In Service from the drop-down menu. The OLC state of the object changes in the filtered list panel.

7 Click on the OK button. The service configuration form appears.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button to confirm the action. The service configuration form closes and the Manage Services form reappears.

10 Click on the Close button to close the Manage Services form.

29 — Auto-provision

29.1 Auto-provision overview

Auto-provision provides a way to reuse a proven configuration and apply the configuration to multiple NEs of the same type. This functionality is useful when a large number of similar NEs must be configured. Auto-provision reduces configuration errors and the time to configure each NE. Auto-provision takes advantage of the validations that are executed for every 5620 SAM configuration. When you configure a source NE from a 5620 SAM, the need to troubleshoot configuration problems is reduced.

After a source NE is configured and backed up, an operator can import the source script to the source profile. Alternatively, an operator can add the source script manually to the source profile. From the source profile, a target template can be generated. An operator can import the target template, enter any required changes and deploy the configuration template on a target NE. To ensure that the CLI syntax remains intact, the target NE must be the same type of NE, version, and chassis type as the source NE. For example, a source configuration from a 7705 SAR, version 2.0 device can only be deployed to a 7705 SAR, version 2.0 device.

Auto-provision extends configuration to an adjacent 7750 SR to ensure a prompt and reliable exchange of traffic between the devices. When the configuration profile is successfully deployed to a 7705 SAR target device, the operator can generate configuration modules to configure interactions between the target device and the adjacent devices. An operator can make minor changes to some of the attributes on the configuration modules and deploy the configuration modules to create objects on the selected 7750 SR. When modules are configured, the operator can deploy the modules to configure the connection. A VLL service site is created on the 7705 SAR and the adjacent 7750 SR. The 5620 SAM automatically creates SAPs and SDP bindings.

The 5620 SAM supports the generation of SAP and SDP configuration modules. Configuration between the 7705 SAR and the adjacent 7750 SR requires the following:

- Base configuration of the 7750 SR is complete and the 7705 SAR is auto-provisioned.
- Interface-level configuration is sent to the adjacent 7750 SR.
- The uplink port of the auto-provisioned 7705 SAR is configured to communicate with the network interface of the 7750 SR. Only Ethernet network interfaces are supported.
- The 7750 SR must be able to communicate with the adjacent 7705 SAR.
- A LDP interface is created on the same interface.
- A MPLS interface is created when MPLS is enabled. Choose either RSVP hop by hop or TE.
- MLPPP is configured on the 7750 SR when MLPPP is configured on the adjacent 7705 SAR.
- A LSP is configured between the 7750 SR and the 7705 SAR.
- An Ethernet, TDM or ATM endpoint is created on the 7750 SR that corresponds to the SAP on the 7705 SAR.

The velocity script generator parses a validated source NE configuration so that the NE is compatible with the velocity script management tool that is available in the 5620 SAM. After the layers are identified, the velocity script generator identifies attributes that require configuration before they can be applied to a target NE. Table 29-1 lists the layers that are identified by the velocity script generator. An operator can add, remove, modify, or hide any of the attributes that are listed. The layers must be configured to deploy together.

Table 29-1 Layers and attributes identified by the velocity script generator

Layer	Attributes
Base Equipment layer	SNMP packet size and daughter cards
Channelization layer	SONET SDH paths and channel groups
Policies layer	QoS and ACL related policies
Routing layer	Routing interface configurations and static routes
Routing Protocols layer	Routing Protocol configurations
MPLS layer	Targeted LDP, MPLS interfaces, and LSPs
Service layer	VLL services including Apipe, Cpipe, Epipe, Ipipe, VPRN, SAP, and SDP bindings

Warning — Scripts that are modified and saved must be applied to devices with the same vendor and version.

Access to the script management is controlled by the administration, script management and script execution scope of command roles. Access to auto-provision is controlled by the auto config permissions that are defined in the scope of command roles. Users that are assigned the administration or script management role can create, modify, delete, and execute scripts. Users that are assigned the script execution role can view and run scripts, view and save results, configure script targets and sources, and view historical results.

In addition to the scope of command access roles and profiles, access to the script manager is further defined by span of control. Span of control profiles determine where a user can apply scope of command access roles and profiles. For example, a user may have privileges to execute scripts. However, a span of control profile defines the scripts that the user can execute.

Auto-provision requires a Mobile Services Package license key to operate. See chapter 3 for more information about obtaining and installing software license keys.

29.2 Workflow to configure network devices using auto-provision

1 Configure the source template. See Procedure 29-1 for more information.

- **i** Determine the NE configuration that you need to use for the source.
- **ii** Import a source configuration file from the router, or create a source file by performing a backup of the source configuration and naming the backup file a unique name.
- **iii** Generate a template from the source script.

2 Configure the target template. See Procedure 29-2 for more information.

- **i** Import the template file to the auto-provision profiles manager tool.
- **ii** As required, configure the source script.
- **iii** Use the GUI builder to customize attributes in the source template. Refer to the *5620 SAM Scripts and Templates Developer Guide* for more information.

3 Apply a target template to an unprovisioned NE. See Procedure 29-3 for more information

Note — Typically, step 1 is performed on one 5620 SAM, and steps 2 and 3 are performed on another 5620 SAM. Step 1 is typically performed in a lab or testing environment.

29.3 Auto-provision procedures

Use the following procedures to perform auto-provision.

Procedure 29-1 To configure a source template

1 Choose Tools→Auto-Provision Profiles from the 5620 SAM main menu. The Auto-Provision Profile Manager form opens.

2 Choose Auto-Config Source Node Profile (Automatic Configuration) from the drop-down menu.

3 Click on the Create button. The Auto-Config Source Node Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Script ID
- Name
- Description
- Network Element Type
- Network Element Version Information

5 Click on the Select button beside the Source Node Name parameter. The Select Source Node Auto-Config Source Node Profile form opens.

6 Choose a source NE from the list and click on the OK button. The Select Source Node Auto-Config Source Node Profile form closes. The following source NE information is displayed:

- Name
- Management IP Address
- System ID (Loopback IP Address)
- Chassis Type
- Software Version

7 Click on the Apply button. The Backup State parameter displays the status of the last backup operation on the NE, and the Script tab is available.

8 Create a backup file of the source NE and import the configuration script by performing one of the following:

a Back up and import from the router.

i Click on the More Actions button and choose Backup. The Backup State parameter displays the status of the backup. When the status is Success, go to step ii.

ii Click on the More Actions button and choose Attach Source Node Config . The backed-up script is attached to the source profile and can be viewed from the Script tab button.

b Back up and import the device configuration to a file.

i See Procedure 23-4 for information about saving a 7705 SAR configuration to a backup file.

ii Click on the Script tab button and click on the Create button. A Script Editor window opens.

iii Choose File→Import from the Editor menu. The Import dialog box appears.

iv Scroll to the location of the backup file that you previously created and saved.

v Click on the Import button. The script appears in the Script Editor workspace.

vi Choose File→Save and Close from the Editor menu. The Script Editor form closes.

Warning 1 — Scripts that are not correctly applied or created can cause serious damage to the network. Alcatel-Lucent recommends that system administrators clearly define the user responsibilities for script usage, and ensure that scripts are verified before they are executed on devices in a live network.

Warning 2 — Before you run a script, you need read, write, and execute permissions for the following directories:

- *install_dir*/client/nms/bin, in Solaris
- *install_dir*\client\nms\bin\clientCache, in Windows

where *install_directory* is the 5620 SAM client installation location, typically /opt/5620sam/client on Solaris, and C:\5620sam\client on Windows.

vii Choose File→Save and Close from the Editor menu. The Script Editor form closes and the Auto-Config Source Node Profile (Edit) form reappears. The script appears in the list.

9 Click on the More Actions button and choose Generate Template.

Template generation can take several minutes to complete depending on the size of the source configuration file and server resource usage. After the process is complete, the Template tab is available.

10 Click on the Template tab. The newly created template appears in the list.

11 Choose a template and click on the Properties button. The script appears in the Script Editor workspace.

12 See Procedure 4-6 for more information about using the GUI builder tool to generate and customize a UI.

13 Choose File→Save from the Editor menu and close the GUI Builder window. The Script Editor window reappears.

14 Choose File→Export from the Editor menu. The Export dialog box appears.

15 Scroll to the location where you need to save the text file and enter a file name.

16 Click on the Export button. The Script Editor window reappears.

17 Close the Script Editor window. A dialog box appears if you entered any changes to the script.

18 Click on the OK button to save the changes to the script.

19 Close the Auto-Config Source Node Profile (Edit) window.

Procedure 29-2 To configure a target template

1 Choose Tools→Auto-Provision Profiles from the 5620 SAM main menu. The Auto-Provision Profile Manager form opens.

Note — Before you can apply a source configuration to a target NE, you must configure and export the source configuration. See Procedure 29-1 for more information about configuring and exporting a source template.

2 Choose Auto-Config Target Node Profile (Automatic Configuration) from the drop-down menu.

3 Click on the Create button. The Auto-Config Target Node Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Script ID
- Name
- Description
- Network Element Type
- Network Element Version Information

5 Click on the Apply button. The Template and Targeted Nodes tabs are available.

6 Click on the Template tab button and click on the Add button. A Script Editor window opens.

7 Choose File→Import from the Editor menu. The Import dialog box appears.

8 Scroll to the location of the file that you exported in Procedure 29-1.

9 Click on the Import button. The script appears in the Script Manager Editor workspace.

10 See Procedure 4-6 for more information about using the GUI builder tool to generate and customize a UI.

11 Choose File→Save from the Editor menu and close the GUI builder window.

12 Choose File→Save and Close from the Editor menu. The Script Editor form closes and the Auto-Config Target Node Profile (Edit) form reappears displaying the template.

13 Close the Auto-Provision Target Node Profile (Edit) window. To apply the source template to a target NE; go to Procedure 29-3.

Procedure 29-3 To apply a target template to an unprovisioned NE

1 Choose Equipment from the drop-down menu on the navigation tree.

Note — You can also access the Auto-Provision Managed Node Wizard from the equipment properties configuration form.

2 Right-click on the target device in the navigation tree and choose Auto-Provision from the drop-down menu. The Auto-Provision Managed Node Wizard form appears with the Profile step displayed.

Note — When a device has been previously configured, the Auto-Provision option is greyed out for the device.

3 Click on the Select button beside the Script ID parameter. A Select Template Name (Profile) - Auto-Provisioning window opens displaying a list of templates.

4 Choose the target template that you configured in Procedure 29-2.

5 Click on the OK button. The Auto-Provision Managed Node Wizard reappears.

6 Perform one of the following:

- **a** Enable the Adjacent NE Managed parameter when the adjacent node is managed by the 5620 SAM. Go to step 9.
- **b** Disable the Adjacent NE Managed parameter when the adjacent node is not managed by the 5620 SAM.

7 Click on the Next button. The Adjacent Node step is displayed.

8 Configure the Adjacent Site ID parameter. Go to step 13.

9 Click on the Next button. The Adjacent 7750 Node step is displayed.

10 Click on the Select button beside the Name parameter. A Select Adjacent NE - Auto-Provision Site window opens with a list of NEs.

11 Choose an NE from the list.

12 Click on the OK button. The Auto-Provision Managed Node Wizard reappears with the information about the displayed NE.

13 Click on the Finish button. A dialog box appears prompting you to deploy the script and generate configuration modules for the adjacent device.

14 Click on the OK button. The 5620 SAM prompts you to view the newly created auto-provision configuration.

15 Enable the View the newly created Auto-Provisioning parameter to display the auto-provision configuration after you close the form, if required.

16 Click on the Close button. The Auto-Provision-Site (Edit) window opens displaying the provisioning for the adjacent device.

17 Click on the Deploy Profile button. A Target Configuration window opens displaying the target NE, and the configurable parameters.

18 Configure the parameters, as required.

19 Click on the NE to which you need to deploy the configuration profile.

20 Click on the Execute button. View the status of the auto-provisioning in the Detailed Status/Error panel. After the NE is configured using the configuration profile, the status of the NE changes to configured.

21 Click on the Modules tab button.

> **Note —** You must deploy the 7750 SR configuration modules after the 7705 SAR auto-provisioning is successfully deployed and resynchronized.

22 Click on the Generate Modules button to prompt the 5620 SAM to display the interactions between the target device and the adjacent device.

23 Click on the Properties button of a generated module to configure all of the modules that were created. The default values for some of the modules are usable. However, for other modules such as SAP modules, the operator must select a port on the 7750 SR before performing step 24.

24 Click on the Deploy Modules button to configure the connection.

25 Click on the Service Associations tab button to view the modified services.

26 Close the Target Configuration window.

Network management

30 — NE routing and forwarding

30.1 NE routing and forwarding overview

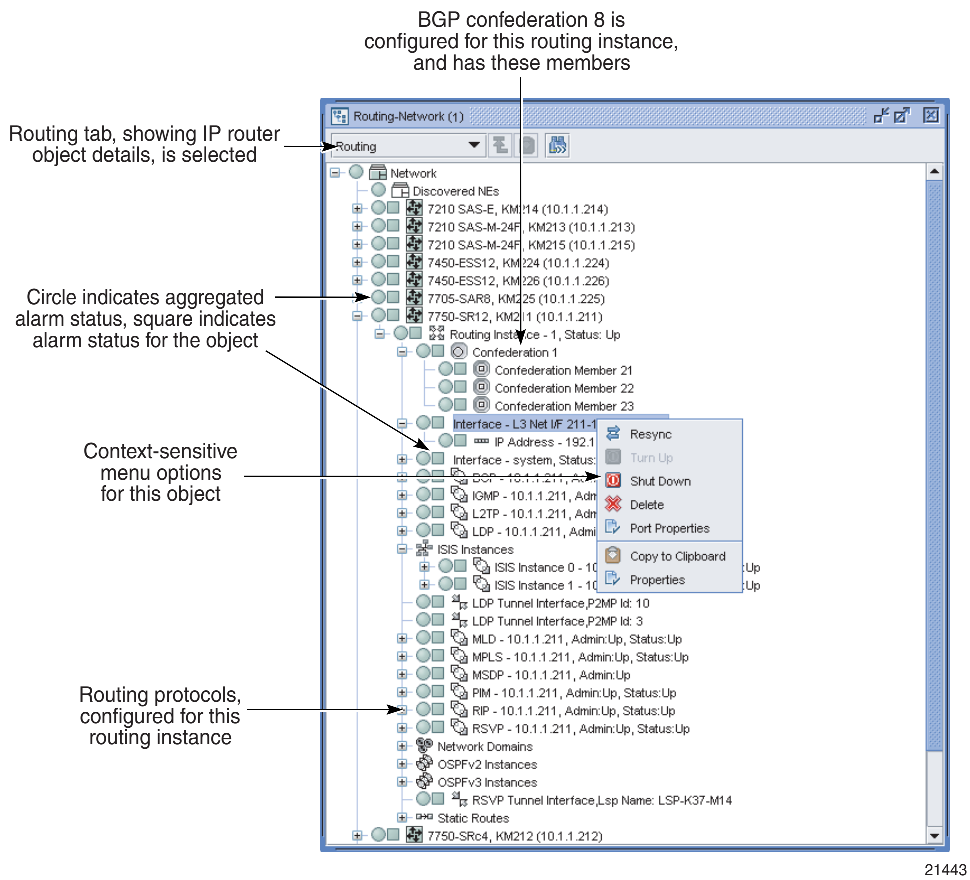
The 5620 SAM allows you to view and configure the routing and forwarding parameters on NEs. You can use the Routing view in the 5620 SAM GUI navigation tree to manage these functions on each managed NE.

Note 1 — For the 7250 SAS-ES and 7250 SAS-ESA, the 5620 SAM supports only the viewing, not the configuration, of routing instances and L3 interfaces. The 7250 SAS-ES and 7250 SAS-ESA must be configured using the CLI before they can be managed by the 5620 SAM.

Note 2 — For an OmniSwitch, the 5620 SAM supports viewing the status of routing protocols that are enabled using the CLI. The 5620 SAM also supports the configuration and management of routing instances, L3 interfaces, and static routes.

Figure 30-1 shows the routing objects in the network view of the navigation tree.

Figure 30-1 Routing objects



L3 network interfaces

An L3 network interface is a logical IP object that is defined on a physical port, such as an Ethernet port. An L3 interface:

- associates an IP address and subnet mask with a physical port or channel
- has a physical port or channel cabled to another device
- requires QoS policy configuration
- requires routing protocol configuration

The physical connection of one device to another device is through a port or channel. However, the L3 interface determines its IP connectivity. The L3 interface passes both routing information and IP traffic.

The system interface is associated with a network entity, such as a specific device, not a specific interface. The system interface is also referred to as the loopback interface. The system interface is associated during the configuration of the following entities:

- the termination point of service tunnels
- the hops when configuring MPLS paths and LSPs
- the addresses on a target device for BGP and LDP peering

The system interface is used to preserve connectivity when an interface fails or is removed. A system interface must have an IP address and a 32-bit subnet mask. The system interface is used as the device identifier by higher-level protocols such as OSPF and BGP. See chapter 31 for more information about routing protocols.

DoS protection

The 7750 SR-7, 7750 SR-12, 7450 ESS-7, and 7450 ESS-12 support the use of DoS protection on network interfaces.

In a subscriber aggregation network, an NE typically receives few control-plane packets from a specific subscriber. If one or more subscribers generate excessive control-plane traffic, DoS protection policies can help to ensure that NEs do not become overburdened by these unwanted packets.

You can use the 5620 SAM to create DoS protection policies and apply them to L3 network interfaces. A DoS protection policy limits the number of control-plane protocol packets that are received each second from a subscriber host, and optionally logs a violation notification if a policy limit is exceeded. The interface drops the excessive packets before they are queued or processed by the NE. You can use the NE System Security form to view the violations for a specific NE.

You can apply DoS protection policies to control the following on L3 network interfaces:

- the control-plane packet arrival rate per subscriber host
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

An NE that supports DoS protection automatically assigns a default DoS protection policy to each L3 network interface. The default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified.

You can also apply DoS protection policies to certain L2 and L3 access interfaces. See the appropriate service chapter for information about applying DoS protection policies to access interfaces.

You can configure global DoS protection on an NE using the NE System Security form. Global DoS protection controls the arrival rate for unprovisioned link-layer protocol packets from CE devices. See Procedure 21-10 for more information.

See Procedure 21-3 for information about configuring NE DoS protection policies. See Procedure 30-9 for information about applying an NE DoS protection policy to an L3 network interface.

Routing protocols

When you configure a device, you configure the routing protocols used and the topology of packet handling between different devices in the network.

Networks can be grouped into areas. An area is a collection of network segments within an AS that have been administratively assigned to the same group. Area topology is concealed from the rest of the AS. This means a significant reduction in routing traffic. Routing in the AS takes place on two levels, depending on whether the source and destination of a packet reside in:

- the same area, known as intra-area routing
- different areas, knows as inter-area routing

In intra-area routing, the packet is routed based on information found within the area; no routing information from outside the area is used. This protects intra-area routing from the injection of bad routing information. Two devices, which are not area border routers, and belonging to the same area, have identical topological databases.

Devices that are aware of more than one area are called area border routers. In this case, all devices in an AS do not have an identical topological database. An area border router has a separate topological database for each area it is connected to. ASs share routing information, such as routes to each destination and information about the route or AS path, with other ASs using BGP.

Routing tables contain lists of next hops, reachable addresses, and associated path cost metrics to each device. Routing protocols use the information and path parameters to compile a network topology. The information about routes that is used to update routing tables can be modified using routing policies.

LLDP

Link Layer Discovery Protocol is a not a routing protocol, but instead, a neighbor-discovery protocol. As such, it is configured in a different manner than the standard routing protocols. LLDP allows a network access device to advertise its identity and capabilities to other stations attached to the same physical IEEE 801 LAN. It also permits information that the devices discover about peer devices to be stored. LLDP is only applicable for devices using Ethernet connectivity.

When LLDP is enabled on a device, it sends and receives LLDP messages on all of the physical interfaces that are enabled for LLDP transmission. These messages are sent periodically to ensure that information is accurate. These messages are stored on the local device for a configurable amount of time, and after this time has expired, the information is discarded.

5620 SAM uses the information stored in the applicable LLDP tables on the node to automatically discover the physical topology in the network. You can use this information to examine the L1/L2 topology and perform appropriate diagnostics and troubleshooting.

In LLDP, a single LLDP Protocol Data Unit is transmitted in a single Ethernet frame. The basic LLDP PDU consists of a header, followed by a variable number of information elements known as TLVs that each include fields for Type, Length, and Value. Type identifies what kind of information is being sent. Length indicates the length of the information string. Value is the actual information sent. Each LLDP PDU includes three mandatory TLVs followed by optional TLVs.

Mandatory TLVs include:

- Chassis ID: this represent the chassis identification of the device transmitting the LLDP frame
- Port ID: this represents the identification of the specific port transmitting the LLDP frame
- TTL: this represents the length of time the receive frame shall be valid

Optional TLVs include:

- Port Description: this represents the description of the port
- System Name: this is the administratively-assigned name of the device
- System Description: this is a textual description of the device
- System Capabilities: this identifies the capabilities of the device and its function (such as router, switch, repeater, etc.)

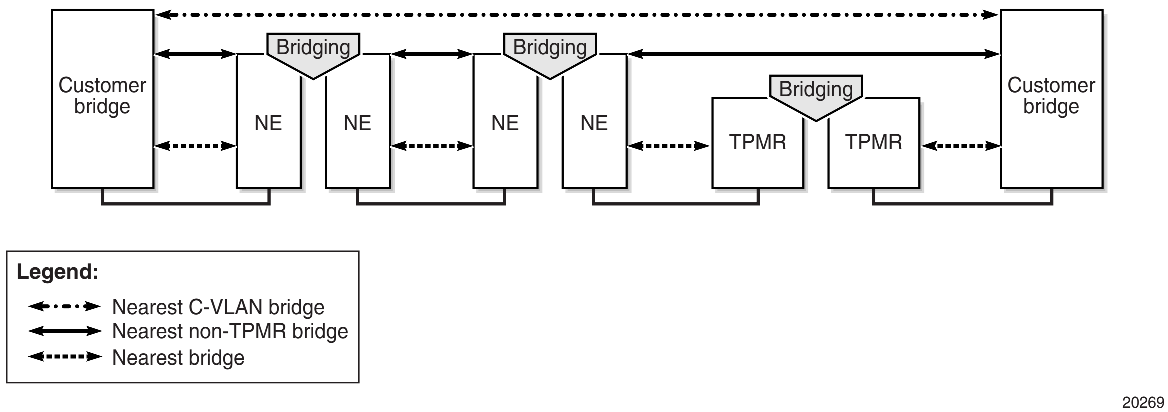
LLDP also supports multiple transmission scopes. The destination MAC address in the LLDP PDU determines how a frame is propagated through the network, thereby determining the LLDP message scope. Table 30-1 identifies a set of destination MAC address and describes the different transmission scopes associated with each address.

Table 30-1 MAC Addresses and transmission scopes

Name	Value	Purpose
Nearest Bridge	01-80-C2-00-00-0E	Propagation constrained to a single physical link
Nearest non-TPMR bridge	01-80-C2-00-00-03	Propagation constrained by all bridges other than TPMR; intended for use within provider bridged networks
Nearest Customer Bridge	01-80-C2-00-00-00	Propagation constrained by customer bridges

This information is also presented graphically in Figure 30-2.

Figure 30-2 LLDP Multiple Transmission Scopes



To enable LLDP, you must configure the protocol at both the system level and at the port level. This is best done using the equipment navigation tree. Table 30-2 lists the procedures required to implement LLDP.

Table 30-2 LLDP configuration procedures list

Procedure	See
To enable LLDP on a router	LLDP in section 30.1 and perform Procedure 17-9
To configure Ethernet ports	Procedure 20-1
To configure OmniSwitch Ethernet ports	Procedure 20-34

You can also use the physical topology map to view and edit various LLDP parameters and interconnections. By default, the physical map displays the topology based on the nearest-bridge LLDP scope. In addition, after the physical topology of a network has been discovered, you can create a reference checkpoint which is basically a snapshot of the topology at a specific time. Any subsequent deviations from this checkpoint can then be displayed. See “Physical topology map” in section 5.1 for more information.

Routing policies

Routing policies, also known as route redistribution policies, control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination.

The 5620 SAM supports routing-policy distribution to the following devices:

- 7210 SAS-M24F
- 7210 SAS-M24F2XFP
- 7210 SAS-M24F2XFP [ETR]
- 7210 SAS-X24F2XFP
- 7250 SAS and 7250 SAS-ES, at releases earlier than 2.0
- 7450 ESS
- 7705 SAR, Release 1.0 or later
- 7710 SR
- 7750 SR
- Telco, Release 6.0 or earlier

There are no default routing policies. Each policy must be created and applied to an object, a routing protocol, or the forwarding table. Each set of rules that is associated with controlling routes are called routing policy statement entries on the client GUI.

Use routing policies:

- to control routing protocols, such as BGP, to allow routes from another protocol, such as OSPF, into the routing table, which allows the routing table to redistribute packets into other protocols
- to control the import and export of learned active routes of a protocol
- to modify the characteristics of a route, for example, to change the community values of BGP AS path attributes
- to prevent the routes for specific customers from being added to routing tables
- to control BGP route flapping

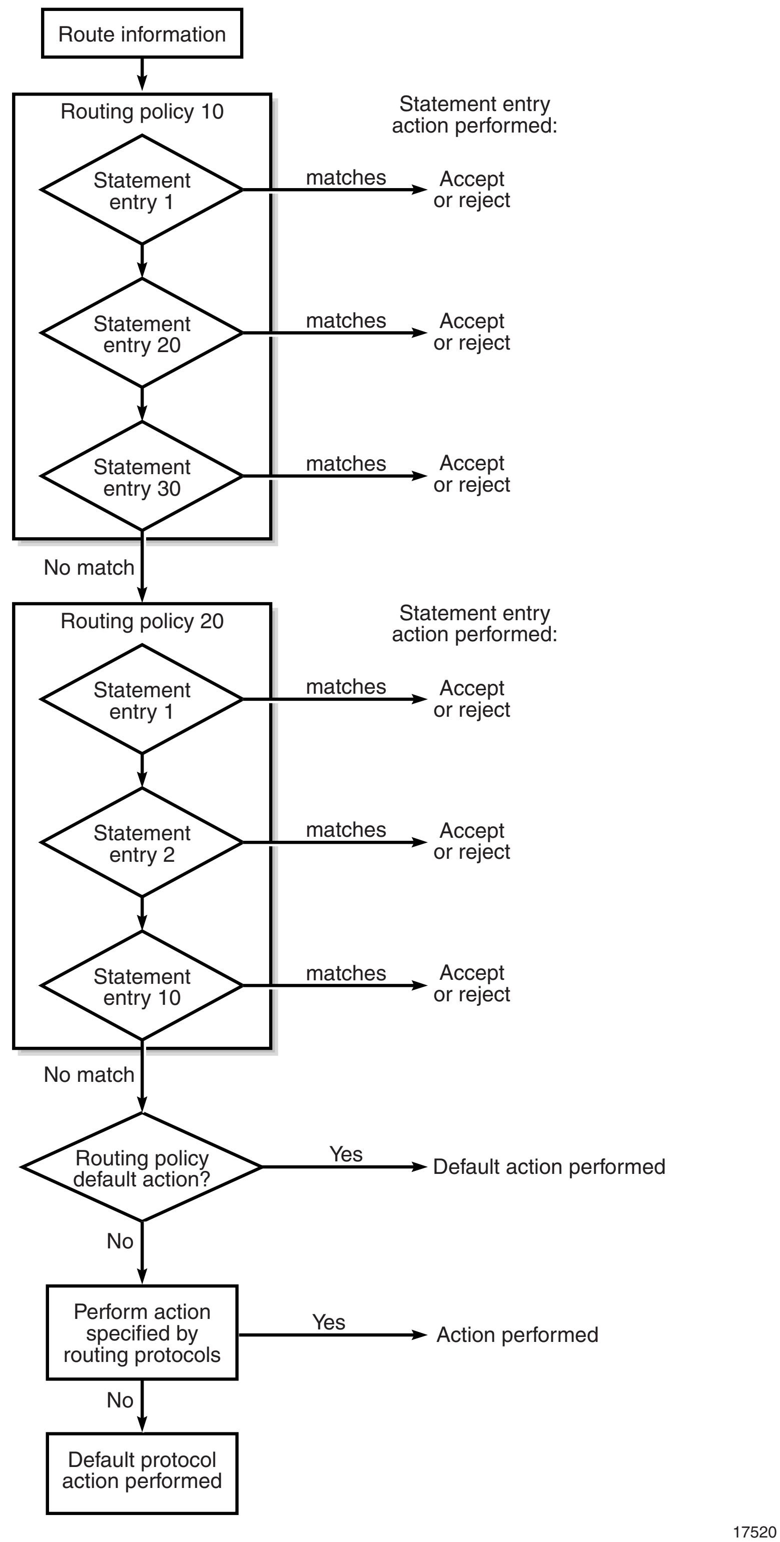
Routing policy statements and routing policy statement entries are compared against incoming route packets in the following sequence.

1. The routing packets arrive.
2. The first routing policy is analyzed.
3. Each entry in the routing policy statement is analyzed.

   If a match is found based on the first routing policy statement entry, the specified action is performed. You can use the Action parameter to specify the continued evaluation of route policy entries, or additional policy statements.
4. If no match is found, the packet is compared against the second routing policy statement entry. If a match is found based on the second routing policy statement entry, the specified action is performed.
5. If no match is found, the packet is compared sequentially against all remaining routing policy statements and routing policy statement entries. If a match is found, the specified action is performed.
6. If the packet does not match any routing policy statements or entries, the default action is performed.

Figure 30-3 shows how routes are analyzed using routing policies.

Figure 30-3 Routing policy analysis workflow



To ensure routing configuration flexibility, the following routing policies can be configured as separate policies or can be cross-referenced to form a framework of policies depending on the network requirements:

- Policy Statement
- Prefix List
- Community
- Damping
- AS Path

Policies that are cross-referenced are distributed together. For example a Policy Statement can reference the Prefix List policy by matching the From Criteria and the To Criteria for each policy type.

Careful planning is essential to implement route policies that can affect the flow of routing information or packets traversing managed devices. Before configuring and applying a route policy, consider the following:

- Develop an overall plan and strategy to accomplish your intended routing actions
- Analyze the effect of what happens to a packet that meets the specified criteria in a routing policy statement entry to ensure the proper action is executed and that no routing loops are created
- when possible, redistribute from a less router protocol to a greater routing protocol, for example from RIP to OSPF
- redistribute exported routes at a single device, when possible

When no action or default action in a routing policy is matched on a packet, then the routing protocols determine the default action for the packet. The action can be specified for the protocol. If the action is not specified, there are default routing protocol import and export actions performed, as described in Table 30-3.

Table 30-3 Default routing protocol actions

Protocol	Default import route action	Default export route options
BGP	All routes from BGP peers are accepted and forwarded to the BGP route selection process.	All active internal BGP routes are advertised to BGP peers. All non-BGP learned routes are not advertised to BGP peers.
IS-IS	IS-IS route acceptance cannot be configured. All IS-IS routes are accepted from IS-IS neighbors.	All internal IS-IS routes are advertised to all IS-IS neighbors. All non-IS-IS learned routes are not advertised to IS-IS neighbors.
OSPF	OSPF route acceptance cannot be configured. All OSPF routes are accepted from OSPF neighbors.	All OSPF routes are advertised to all OSPF neighbors. All non-OSPF learned routes are not advertised to OSPF neighbors.
RIP	All RIP-learned routes are accepted from RIP peers.	All non-RIP learned routes are not advertised to RIP peers.

For importing routing, RIP and BGP learned routes can be altered using routing protocols. For example, for devices learning about routes from BGP, you can create an import route policy that can limit the number and types of routes accepted and added to the routing tables.

For exporting routes, some default behaviors exist:

- internally learned routes are redistributed using the same protocol
- externally learned routes are not automatically advertised to all neighbors or peers

In the case of externally learned routes, you can create an export policy to determine how the routes are advertised, for example, configuring something learned by BGP to be redistributed using OSPF. This is useful in cases:

- where legacy equipment does not support a specific protocol
- when companies merge and they use different routing protocols on the devices

Network Address Translation

Network Address Translation, or NAT, is function that rewrites address information in IP packets that travel between private and public networks. NAT is a widely accepted method of effectively extending the available public IPv4 address space, because multiple end users can share one IP address. NAT can also provide security by preventing an internal IP address, such as an end-user address, from entering a public network.

NAT translates internal, or private, host IP address and TCP port values to external, or public, values. When NAT receives a packet from an internal host, it replaces the source address information in the packet with public address information, and forwards the packet to the destination. NAT assigns private IP addresses and ports dynamically using values from an allocated pool, but can also use values that are statically assigned to internal hosts, depending on the type of NAT depl.oyment.

You can use the 5620 SAM to configure NAT on a Release 8.0 or later 7750 SR-7 or 7750 SR-12, in chassis mode B or higher. 5620 SAM NAT support includes the following:

- policy-based management
- subscriber-specific implementation
- configurable port usage limits per subscriber, address range, or policy
- reserved port ranges for specified forwarding classes that are exempt from port usage limits
- configurable protocol timeout periods for efficient resource management

The 5620 SAM supports the following NAT deployment types:

- L2-aware—Hosts of the same subscriber can share a private address, and are assigned public addresses from a pool in a base routing instance.
- large-scale—Each host can have a unique static or dynamic private address, and is assigned a public address from a pool in a VPRN routing instance.

The NAT configuration on a routing instance includes the following:

- one or more NAT address pools that are associated with local ISA-NAT groups
- a NAT policy, which specifies port ranges and operational parameters
- host address match criteria
- one or more NAT destinations

An ISA-NAT group is a logical group of redundant MDAs that forward NAT packets. A NAT policy associates an address pool with an ISA-NAT group and defines general NAT properties. See chapter 18 for an ISA-NAT group overview and configuration information. See chapter 46 for information about creating and configuring NAT policies.

A 5620 SAM operator assigns port ranges in an address pool configuration. Port ranges specify the number of ports allocated to a subscriber for mapping to host sessions. When all ports for a subscriber are consumed, further port assignments do not occur and host sessions are refused. This helps to prevent the swamping of NAT by an event such as a virus attack or multiple peer-to-peer file transfers. You can override a port-range limit by configuring a range of reserved ports that are assigned based on the traffic forwarding class.

Note — The 5620 SAM does not allow the use of ports 0 to 1023, which are called the well-known ports or privileged ports, in a NAT configuration.

To ensure fair and timely NAT resource allocation to hosts, you can specify timeout values in a NAT policy for protocols such as ICMP, TCP, and UDP. NAT ends a host session after the timeout period, for example, when TCP handshaking takes an unreasonable amount of time.

The NAT drain function is a mechanism that is used to gracefully remove the host sessions associated with an address range in a NAT address pool. When an address range is in the draining state, NAT drops new session requests for the address range. After an existing session associated with a draining address range closes, a new session for the same host is created using a different address range. The drain function removes an address range only when there are no sessions associated with the address range. See chapter 18 for information about using the NAT drain function.

You can view general NAT statistics, for example, address-pool allocation and session counts for different protocols on the Statistics tab of an ISA-NAT group member properties form.

Note — The 5620 SAM does not record detailed NAT session information such as duration or packet counts. You can obtain this information only by directly requesting it from a participating NE.

L2-aware NAT

In L2-aware NAT, a NAT policy is associated with a subscriber profile that is applied to an IES SAP. The NAT policy specifies an address pool on the base routing instance. When DHCP assigns a private IP address that is in an L2-aware NAT address range, NAT assigns a public IP address to the host packets. See chapter 73 for information about configuring NAT in an IES.

Note 1 — A NAT configuration on a base routing instance applies to each IES site on the NE.

Note 2 — A NAT policy that is specified in a subscriber profile redirects all IPv4 traffic for the subscriber to NAT.

Large-scale NAT

Large-scale NAT is used when each host in a customer VPRN service has a unique private IP address and requires a unique public IP address, for example, in mobile network deployments. Large-scale NAT is used between routing instances. A customer VPRN routing instance provides host access and forwards packets through NAT to a VPRN or through an IES to an NE routing instance, which provides public network access.

A VPRN routing instance requires an ACL IP filter or static route to direct host traffic through the NAT function, and uses an address pool in the VPRN routing instance. You can configure large-scale NAT to statically and dynamically assign private addresses. See chapter 74 for information about configuring NAT in a VPRN service. See "Static port forwarding" in this section for more information about configuring NAT to use static private addresses.

Static port forwarding

In a large-scale NAT deployment, you can configure NAT to assign static private addresses to subscriber hosts using static port forwarding. Static port forwarding ensures that an internal host uses the same private IP address and port each time they connect to the network. You can use the 5620 SAM to configure static port forwarding for TCP and UDP independently.

See chapter 74 for information about configuring static port forwarding in a VPRN service. See chapter 68 for information about configuring L2Aware static port forwarding on a residential subscriber instance.

Cflowd

The 5620 SAM supports the configuration of Cflowd on Release 8.0 and later of the 7710 SR, 7750 SR-7 and 7750 SR-12, and on the 7450 ESS in mixed mode. Cflowd is a traffic-sampling function that collects statistical data based on traffic flows. A flow is a series of packets in a user session. Cflowd data is typically used to monitor network-usage trends and detect security threats. You can use the 5620 SAM to configure Cflowd for the following:

- traffic that passes through an L3 network interface
- traffic that is redirected to Cflowd using an ACL IP filter
- AA traffic

You must enable Cflowd globally on an NE before you can configure Cflowd collectors. You can create multiple Cflowd collectors on an NE. Each collector is deleted when Cflowd is disabled.

AA Cflowd is configurable on an ISA-AA group, and supports basic Cflowd sampling as well as TCP performance data collection for AA applications and application groups. Each ISA-AA group supports one Cflowd instance.

See chapter 17 for information about enabling and configuring global Cflowd on an NE, and see chapter 18 for information about enabling and configuring AA Cflowd on an ISA-AA group.

Shared Risk Link Group policies

Shared Risk Link Groups, or SRLGs, are constructs which allow you to perform two operations that enhance overall system reliability. You can use SRLGs to establish a FRR LSP path. You can also use SRLGs to establish a secondary LSP path which is disjointed from the primary LSP path. Links that are members of the same SRLG represent resources which share the same risk. For example, fiber links sharing the same conduit, or multiple wavelengths sharing the same fiber.

An SRLG is modeled as a policy object. It therefore follows the normal policy behavior for creation, listing, updating, deletion, distribution, and re synchronization.

Configured SRLGs are associated with MPLS interfaces. The SRLGs are used by the CSPF when computing a FRR detour/bypass path, or a secondary LSP path. SRLGs indicate to the CSPF which interfaces to avoid in the path's computation.

30.2 Network domain overview

The 5620 SAM allows you to create, delete, associate and edit network domains. You can use the network domains view in the 5620 SAM GUI navigation tree to manage these functions. Network domains help determine which network ports are eligible to transport traffic of individual SDPs. This information is used for the SAP-ingress queue allocation which is applied to VPLS SAPs. No SAP-ingress queues are allocated if a given port does not belong to the network domain used in a VPLS.

Note 1 — A maximum of four network domains are supported in any VPLS.

Note 2 — If an SDP is used for E-PIPE, I-PIPE or A-PIPE bindings, the network domain configuration is not considered.

Note 3 — Network domains are not applicable to loopback and system interfaces.

By default, all network interfaces in a routing instance belong to the default network domain. You can associate an interface to any user defined network domain. The loopback and system interfaces cannot be associated with user defined network domains.

An SDP can be assigned to only one network domain. If no user defined network domain is created, an SDP will be assigned to the default network domain. All SAPs in VPLS will have a queue reaching all fwd complexes serving interfaces belonging to the same network domains as the SDPs. You can assign or remove a network domain association of the interface or SDP without deleting the respective object.

30.3 Workflow to configure NE routing and forwarding

1 Use the CLI to configure or verify the following parameters:

- system address (system ID)
- router ID

See the *7750 SR OS Router Guide* for more information about these parameters.

2 Configure a routing instance.

a If you want to configure a routing instance on the OmniSwitch 6xxx or 9xxx, perform the following:

i Configure a routing instance on the OmniSwitch 6xxx or 9xxx. See Procedure 30-3 for more information.

ii If required, configure UDP relay/DHCP snooping on an OmniSwitch. See Procedure 30-6 for more information.

iii If you configured UDP relay/DHCP snooping, then configure all ports within the network connected to DHCP servers to trusted. See Procedure 20-34 for more information.

b If you want to configure a routing instance on any other NE, see Procedure 30-2 for more information.

3 Create or configure network or system L3 interfaces.

a If you want to configure network or system L3 interfaces on an OmniSwitch, see Procedure 30-8 for more information.

b If you want to configure network or system L3 interfaces on any other NE, see Procedure 30-7 and Procedure 30-9 for more information.

i Associate a network port with the L3 interface.

ii Configure the appropriate routing protocols on the interfaces, as required. The supported protocols are BGP, MPLS, RIP, LDP, OSPFv2, OSPFv3, IS-IS, and RSVP.

See chapter 31 for more information about routing protocol configuration and parameters.

iii Enable the multicast routing types on the interfaces as required. The supported types are PIM, IGMP, and MLD.

See chapter 31 for more information about multicast configuration and parameters.

iv Enable bridging on the interfaces as required. The 5620 SAM supports bridging on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco and OmniSwitch devices.

See chapter 31 for more information about bridging configuration and parameters.

v Assign a DoS protection policy to the interface, if required.

vi Assign an IES or network interface to a virtual router as a VRRP instance.

See chapter 39 for more information about VRRP configuration and parameters.

4 Cable the network ports on the devices to the network ports on other devices.

5 Configure these key device parameters using the 5620 SAM:

- BGP, MPLS, RIP, LDP, OSPF, IS-IS, and RSVP
  Enable routing protocols on the device, as required. If you plan to create signaled LSPs, then you must enable MPLS, and RSVP or LDP.
- IP address ranges for use by services, such as IES and VPLS
  Reserve IP addresses to provide a mechanism to reserve one or more address ranges for services. When services are defined, the address must be in the range specified as a service prefix. Addresses in the range of a service prefix can be allocated to a network port unless set to exclusive. Then, the address range is exclusively reserved for services.
- device-wide AS settings

6 Create static routes, as required. See Procedure 30-20

7 Use the 5620 SAM to configure a routing policy.

i Configure AS path expressions, as required. See Procedure 30-15 for more information.

ii Configure routing policy statements, as required. See Procedure 30-11 for more information.

iii Configure community lists, as required. See Procedure 30-13 for more information.

iv Configure damping parameters to control BGP route flapping, as required. See Procedure 30-14 for more information.

v Configure prefix lists, as required. See Procedure 30-12 for more information.

8 If required, configure an AS and confederations for BGP.

Configuring confederations is optional and should only be implemented to reduce the IBGP mesh inside an AS. An AS can be logically divided into smaller groupings called sub-confederations. See chapter 31 for more information about BGP configuration.

9 Use the 5620 SAM to create MPLS administrative groups and assign the groups to MPLS interfaces and LSPs paths, as required. See Procedure 30-17 for more information.

10 If required, configure NAT on the base routing instance. See Procedure 30-22 for more information.

30.4 Workflow to configure network domains

1 Create a network domain. See Procedure 30-23 for more information.

2 Associate a network interface with a network domain. See Procedure 30-25 for more information.

3 If required, associate a service tunnel with a network domain. See Procedure 30-27 for more information.

30.5 NE routing and forwarding configuration procedures

The following procedures describe how to configure routing.

Procedure 30-1 To query network resources

This procedure describes how to view current network resources such as IP addresses, RDs and RTs, and MAC addresses.

1 Choose Network Resources from the Tools menu. The Network resources form opens with the IP Addresses tab displayed.

2 Select the tab for the particular network resource type you want to query. The choices are:

- IP Addresses
- Route Distinguishers and Route Targets
- MAC Addresses

The form list is refreshed to display the chosen resources.

3 Customize the search as required. Apply a Boolean operator for any of the items in the list header and then do one of the following:

a Choose a specific item type from the adjacent drop down menu (indicated by a downward-pointing arrow).

b Enter a specific string in the adjacent blank text field.

4 Click on the Search button.

The results of your customized search are displayed.

5 Close the Network Resources form.

Procedure 30-2 To configure a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→Router→Routing Instance.

3 If you are configuring a VRF routing instance on an OS 9700E or OS 9800E, go to step 4, otherwise go to step 6.

4 Right-click on the OS 9700E or OS 9800E, and choose Create VRF Instance. The Routing Instance (Create) form opens.

5 Configure the VRF Name parameter. Click on the Apply button. The Routing Instance (Edit) form opens. Go to step 8.

6 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

7 Configure the Administrative State parameter.

8 Click on the Protocols tab button.

9 Configure the applicable parameters:

- BGP Enabled
- MPLS Enabled
- OSPFv2 Enabled
- RIP Enabled
- L2TP Enabled
- LDP Enabled
- OSPFv3 Enabled
- IS-IS Enabled

The supported protocols are displayed in the navigation tree as sub-items in the routing instance. Click on the Properties button to configure the routing protocols. See chapter 31 for more information about routing protocol configuration using the GUI.

Note — SNMPv3 must be used to manage OS 9700E and OS 9800E NEs, when configuring a VRF routing instance.

10 Click on the More Actions button and choose Edit Routing Policies. A Routing Policy Manager (Edit) window opens.

11 Click on the More Actions button and choose Show Policy. A Routing Policy Show Policy window opens with the General tab displayed.

12 Click on the Ok button. A CLI display is initiated.

13 View the policy.

14 Click on the Close button. The Routing Policy Show Policy window closes.

15 Click on the Multicast tab button.

Multicast is not configurable for the 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], and 7450 ESS.

16 Configure the parameters:

- PIM Enabled
- IGMP Enabled
- MLD Enabled
- MSDP Enabled

The supported multicast protocols are displayed in the navigation tree as sub-items in the routing instance. Click on the Properties button to configure the routing protocols. See chapter 31 for more information about multicast protocol configuration using the GUI.

17 Click on the Routing tab button.

18 Configure the parameters:

- Router ID
- Maximum Number of Equal Cost Routes
- Autonomous System
- Confederation Autonomous System
- LDP Shortcut Enabled
- Enforce Maximum Number Of Multicast Routes

Autonomous System, Confederation Autonomous System and Enforce Maximum Number Of Multicast Routes parameters are not configurable in the 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], and 7450 ESS.

When you select the Enforce Maximum Number Of Multicast Routes parameter, the following configurable parameters appear:

- Maximum Number Of Multicast Routes
- Log Only
- Threshold (%)

See chapter 31 for more information about AS and confederation parameters for BGP using the GUI.

19 Configure the parameters:

- Single SFM Overload Admin State
- Hold-Off Time (seconds)

The Hold-Off Time (seconds) parameter and read-only attributes Overload State, Overload Start, and Overload Duration are only displayed when the Single SFM Overload Admin State parameter is set to Up.

20 Configure a Multicast Path Management Info Policy, if required.

i Click on the Select button beside the Name parameter. The Select Ingress Info Policy form is displayed.

ii Choose the required policy from the list and click OK. The Select Ingress Info Policy form closes and the policy name is displayed in the Name field.

Note — The Mcast Path Mgmt Channels tab displays data on the operational channels after actual traffic from a specific multicast source for a specific multicast group passes through the virtual router. You must click on the Search button to refresh the data. See chapter 46 for a listing of the displayed operational channel parameters.

21 Click on the Interfaces tab button. See Procedure 30-7 for more information about creating additional L3 interfaces.

22 Click on the Address tab button.

23 Configure IP address parameters for L3 interfaces.

i Choose an address in the list.

ii Click on the Properties button.

The IP Address form opens.

iii Configure the parameters:

- IP Address
- Prefix Length
- Broadcast Address Format

iv Click on the OK button. The IP Address form closes and the Routing Instance form reappears.

Note — The IP Address, Prefix Length, and Broadcast Address Format cannot be changed for the System interface.

24 Click on the Static Routes tab button to view a list of static routes and to add static routes. See Procedure 30-20 for more information.

25 Click on the NAT Configuration tab button to configure NAT on the routing instance. See Procedure 30-22 for more information.

Note — NAT configuration is supported only on a Release 8.0 or later 7750 SR-7 or 7750 SR-12 in chassis mode B or higher.

26 Click on the RSVP Tunnel Interfaces tab button to create an RSVP tunnel interface entry, if required.

i Click on the Create button. The RSVP Tunnel Interface (Create) form opens.

ii Click on the Select button beside the Lsp Name parameter. The Select - RSVP Tunnel Interface form opens.

iii Select an RSVP tunnel interface and click on the OK button. The Select - RSVP Tunnel Interface form closes and the RSVP Tunnel Interface (Create) form reappears.

iv Configure the Sender Address parameter.

v Click on the OK button. The RSVP Tunnel Interface (Create) form closes.

27 Click on the LDP Tunnel Interfaces tab button to create an LDP tunnel interface entry, if required.

i Click on the Create button. The LDP Tunnel Interface (Create) form opens.

ii Configure the parameters:

- Description
- P2MP ID
- Root Node
- Sender Address

iii Click on the OK button. The LDP Tunnel Interface (Create) form closes.

28 Click on the Multi-Homing Interface tab button to create a multi-homing interface entry, if required. the Multi-Homing Interface (Create) form opens with the General tab displayed.

Note 1 — The Multi-Homing Interface is a loopback interface used in multi-homing resiliency for a pair of protected routers. When it is active, the Primary interface can be used to advertise reachability information of the alternate router to the rest of the network. The Secondary interface is used to resolve routes advertised by the alternate router in the event that router becomes unavailable. This mechanism applies to both IP and VPN traffic.

Note 2 — Only one Primary and one Secondary multi-homing interface may be created for a router.

Note 3 — You can configure a multi-homing interface on the 7750 SR, 7710 SR, and 7450 ESS (in mixed mode) network elements. Chassis mode “D” must be enabled.

i Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Type
- Hold Time (seconds)
- Administrative State

The Hold Time (seconds) parameter only appears if you specify Secondary as the Interface Type.

ii Click on the Addresses tab button. The Multi-Homing Interface Addresses list is displayed.

iii Click on the Create button. The IP Address (Create) form opens.

iv Configure the IP Address parameter.

Note — Only IPv4 addresses are supported when creating the multi-homing interface.

v Click on the OK button. The IP Address (Create) form closes and the new address appears selected in the list.

vi Click on the OK button. The Multi-Homing Interface (Create) form closes.

29 Click on the Route Aggregation tab button to configure route aggregates that can be generated into the virtual router.

i Click on the Create button. The Aggregation (Create) form opens.

ii Configure the parameters, if present:

- IP Address Prefix
- Mask
- Summary Only
- As Set
- Aggregator
- Aggregator AS
- Aggregator IP Address

The Aggregator AS and Aggregator IP Address parameters are configurable when the Aggregator parameter value is set to True.

The 7705 SAR-8 supports Summary Only route aggregation only.

30 Click on the BGP Confederations tab button, if present, to view and create BGP confederations. See chapter 31 for more information about BGP confederation configuration.

31 Click on the Service Address Ranges tab button, if present, to provide a mechanism to reserve one or more IP address ranges for use by services, such as IES.

i Click on the Create button. The Service Address Range form opens.

ii Configure the parameters:

- IP Address
- Prefix Length
- Exclusive

iii Click on the OK button. The Service Address Range form closes and the Routing Instance form reappears.

32 Configure an override source IP address or L3 interface for use by a selected IP application, if required.

i Click on the Source Address tab button.

ii Click on the Create button. The Source Address form opens.

33 Choose an IP application from the Source IP Application drop-down menu.

34 Perform one of the following:

Note — If you choose the interface index option, the router must already have a network interface or an IES L3 access interface created on the routing instance.

a Choose IP Address in Source Address Termination to specify a source IP address on the node for use by the IP application.

i Enter an IP address in the Source IP Address field.

ii Go to step 35.

b Choose Interface Index in Source Address Termination to use the primary address on the L3 network interface as the source address on the node for the IP application.

i Click on the Select button to choose an interface. The Select Source Address Network Interface form opens. Select an interface in the list and click on the OK button. The IP address and Interface ID of the L3 interface appears on the form.

ii Go to step 35.

Note — You must select an IPv6 Source IP Address to select an IPv6 Source IP Application.

35 Click on the OK button. The Source Address form closes and the Routing Instance form reappears. The IP application source address and parameters appear on the form.

36 Click on the Local DHCP Servers tab button and perform one of the following steps to configure a local DHCP server on the routing instance, if required or applicable.

Note — DHCPv6 server configuration is supported only on a Release 9.0 or later 7450 ESS in mixed mode, or a Release 9.0 or later 7750 SR.

a To configure a local DHCPv4 server on the routing instance go to step 37.

b To configure a local DHCPv6 server on the routing instance go to step 38.

37 Perform the following steps to configure a local DHCPv4 server on the routing instance, if required or applicable.

i Click on the Local DHCP V4 tab button.

ii Click on the Create button. The Local DHCP Server (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Server Name
- Description
- Administrative State
- Use GI Address

iv Click on the Select button. The Select Local User Database form opens.

v Select a local user database in the list and click on the OK button. The Select Local User Database form closes and the local user database information is displayed on the Local DHCP Servers (Create) form.

vi Configure the following parameters:

- Allow Send Force Renews
- Use Pool From Client

vii Click on the IP Address Pools tab button to assign one or more IP addresses to the local DHCP server.

viii Click on the Create button. The IP Address Pool (Create) form opens with the General tab displayed.

ix Configure the following parameters:

- Pool Name
- Description

x Configure the parameters in the Minimum Lease Time panel:

- Days
- Hours
- Minutes
- Seconds

xi Configure the parameters in the Maximum Lease Time panel:

- Days
- Hours
- Minutes
- Seconds

xii Configure the parameters in the Offer Time panel:

- Minutes
- Seconds

xiii Configure the parameters in the Pool Minimum Free panel:

- Type
- Threshold

xiv Click on the Subnets tab button to add subnets to the DHCP server pool.

xv Click on the Create button. The Subnet (Create) form opens with the General tab displayed.

xvi Configure the parameters:

- IP Address
- Prefix Length
- Free Addresses Minimum Type
- Free Addresses Minimum Threshold
- Maximum Declined Addresses Stored

xvii Click on the Address Ranges tab button.

xviii Click on the Create button. The Subnet Address Range (Create) form opens.

xix Configure the parameters:

- Action
- Start Address
- End Address

Note — You must exclude static IP addresses from the subnet address range because static IP addresses are dedicated.

xx Click on the OK button. The Subnet Address Range (Create) form closes and a dialog box appears.

xxi Click on the OK button. The Subnet (Create) form reappears.

xxii Click on the Options tab button.

xxiii Click on the Create button. The Subnet Option (Create) form opens.

xxiv Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xxv Click on the OK button. The Subnet Option (Create) form closes and a dialog box appears.

xxvi Click on the OK button. The Subnet (Create) form reappears.

xxvii Click on the OK button. The Subnet (Create) form closes and a dialog box appears.

xxviii Click on the OK button. The IP Address Pool (Create) form reappears.

xxix Click on the Options tab button.

xxx Click on the Create button. The IP Address Pool Option (Create) form opens.

xxxi Configure the Option parameter.

xxxii If you set the Option parameter to Custom Option, configure the following parameters:

- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xxxiii If you set the Option parameter to DNS Name Servers or Netbios Name Server, configure the following parameters:

- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

xxxiv If you set the Option parameter to Domain Name, configure the Value parameter.

xxxv If you set the Option parameter to Lease Time, Lease Renew Time, or Lease Rebind Time, configure the following parameters:

- Days
- Hours
- Minutes
- Seconds

xxxvi If you set the Option parameter to Netbios Node Type, configure the Netbios Node Type parameter.

xxxvii Click on the OK button. The IP Address Pool Option (Create) form closes and a dialog box appears.

xxxviii Click on the OK button. The IP Address Pool (Create) form reappears.

xxxix Click on the OK button. The IP Address Pool (Create) form closes and a dialog box appears.

xl Click on the OK button. The Local DHCP Server (Create) form reappears.

xli Click on the OK button. The Local DHCP Server (Create) form closes and a dialog box appears.

xlii Click on the OK button. The VPRN Site (Create) form reappears.

38 Perform the following steps to configure a local DHCP v6 server on the routing instance, if required or applicable.

Note — DHCPv6 server configuration is supported only on a Release 9.0 or later 7450 ESS in mixed mode, or a Release 9.0 or later 7750 SR.

i Click on the DHCP V6 tab button.

ii Click on the Create button. The Local DHCPv6 Server (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Server Name
- Description
- Administrative State
- Use Pool From Client

iv Configure the parameters in the Lease Hold Time panel:

- Days
- Hours
- Minutes
- Seconds

v Click on the IPv6 Address Pools tab button to assign one or more pools to the local DHCPv6 server.

vi Click on the Create button. The IPv6 Address Pool (Create) form opens with the General tab displayed.

vii Configure the following parameters:

- Pool Name
- Description

viii Click on the Prefixes tab button to add prefixes to the DHCPv6 server pool.

ix Click on the Create button. The Prefix (Create) form appears with the General tab displayed.

x Configure the following parameters:

- IPv6 Address
- Prefix Length

xi Configure the parameters in the Preferred Life Time panel:

- Days
- Hours
- Minutes
- Seconds

xii Configure the parameters in the Valid Life Time panel:

- Days
- Hours
- Minutes
- Seconds

xiii Configure the parameters in the Renew Timer panel:

- Days
- Hours
- Minutes
- Seconds

xiv Configure the parameters in the Rebind Timer panel:

- Days
- Hours
- Minutes
- Seconds

xv Click on the Apply button. A dialog box appears.

xvi Click on the OK button.

xvii Click on the Options tab button.

xviii Click on the Create button. The Prefix Option (Create) form appears.

xix Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String, Hex String, or Domain.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xx Click on the OK button. The Prefix Option (Create) form closes and a dialog box appears.

xxi Click on the OK button. The Prefix (Create) form reappears with Options tab displayed.

xxii Click on the OK button. The Prefix (Create) form closes and a dialog box appears.

xxiii Click on the OK button. The IPv6 Address Pool (Create) form reappears with Prefix tab displayed.

xxiv Click on the Options tab button.

xxv Click on the Create button. The IPv6 Address Pool Option (Create) form appears.

xxvi Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String, Hex String, or Domain.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xxvii Click on the OK button. The IPv6 Address Pool Option (Create) form closes and a dialog box appears.

xxviii Click on the OK button. The IPv6 Address Pool (Create) form reappears with Options tab displayed.

xxix Click on the OK button. The IPv6 Address Pool (Create) form closes and a dialog box appears.

xxx Click on the OK button. The DHCP V6 Server (Create) form reappears with IPv6 Address Pool tab displayed.

xxxi Click on the OK button. The DHCP V6 Server (Create) form closes and a dialog box appears.

xxxii Click on the OK button. The Routing Instance (Edit) form reappears.

39 Click on the Self Generated Traffic tab button. The DSCP Marking tab is displayed with a list of all the applications for which the DSCP can be set.

40 Choose an application to view or edit the DSCP setting.

41 Click on the Properties button. An Application DCSP Marking form opens.

42 Configure the DSCP parameter.

43 Click on the OK button. A dialog box appears.

44 Click on the Yes button.

45 Click on the DSCP Mapping tab button.

46 Select a DSCP mapping in the list and click on the Properties button. The Application DCSP Mapping form opens.

47 Configure the Forwarding Class parameter.

48 Click on the OK button. A dialog box appears.

49 Click on the Yes button.

50 Click on the Dot1p Marking tab button.

51 Select a Dot1p marking entry in the list and click on the Properties button. The Application Dot1p Marking form opens.

52 Configure the Dot1p parameter.

53 Click on the OK button. A dialog box appears.

54 Click on the Yes button. The Routing Instance (Edit) form reappears.

55 Close the Routing Instance (Edit) form.

Procedure 30-3 To configure an OmniSwitch 6xxx or 9xxx routing instance

To configure an OS 9700E or OS 9800E routing instance, see Procedure 30-2.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an OmniSwitch routing instance by choosing Network→OmniSwitch 6xxx or OmniSwitch 9xxx→ Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Routing tab button.

5 Configure the Router ID parameter, if required.

6 Click on the Interfaces tab button. See Procedure 30-8 for information about creating additional OmniSwitch L3 interfaces.

7 Click on the Address tab button.

8 Configure IP address parameters for L3 interfaces.

i Choose an address in the list.

ii Click on the Properties button. The IP Address (Edit) form opens.

iii Configure the parameters, if required:

- IP Address
- Prefix Length

iv Click on the OK button to save the changes. A dialog box appears.

v Select the check box to indicate that you understand the implications of making the change or click on the No button and go to step ix.

vi Click on the Yes button. A dialog box appears.

vii Click on the Yes button. The Routing Instance (Edit) form reappears.

viii Go to step 9.

ix Close the IP Address (Edit) form.

9 Click on the Static Routes tab button to view a list of static routes and to add static routes. See Procedure 30-21 for more information.

10 Click on the OK button to save the configuration. A dialog box appears.

11 Click on the Yes button to verify the action.

12 Close the form.

Procedure 30-4 To view DHCPv6 leases

This procedure describes how to view the DHCPv6 prefixes that the server has given out.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab button.

5 Click on the Local DHCPv6 tab button. The list of associated DHCPv6 servers is displayed.

6 Select a DHCPv6 server from the list and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

7 Click on the More Actions button and choose Show Leases. The Local DHCPv6 Server Show Leases form opens.

8 Perform one of the following:

a To view the entire list of leases that are active on the DHCPv6 server, click OK.

b To view the lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server and click OK.

Note — If the prefix does not exist in the list of leases, a message displays.

c To view the detailed lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server, select the Detail check box, and click OK. The form displays the CLI details for the specific prefix.

9 Close the Local DHCPv6 Server Show Leases form.

10 Close the Local DHCPv6 Server (Edit) form.

11 Close the Routing Instance (Edit) form.

Procedure 30-5 To view DHCPv6 log events

This procedure describes how to view lease not owner and pool unknown log events for local DHCPv6 servers.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab button.

5 Click on the Local DHCPv6 tab button. The list of associated DHCPv6 servers is displayed.

6 Select a DHCPv6 server from the list and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

7 Click on the Logs tab button. The Lease Not Owner Log and Pool Unknown Log tabs display.

8 Click on the tab button for the type of log that you wish to display. Configure the filter criteria and click on the Search button. A list of NE SHCV event logs appears.

9 Configure the filter criteria and click on the Search button. A list of event logs appears.

10 Select a log entry and click on the Properties button. The Log form opens.

11 View the log entry.

12 Close the Log form.

13 Close the Local DHCPv6 Server (Edit) form.

14 Close the Routing Instance (Edit) form.

Omniswitch DHCP relay and snooping

A DHCP relay agent is a BOOTP relay agent that relays DHCP messages between DHCP clients and DHCP servers on different IP networks. The Omniswitch supports global or per-VLAN BOOTP/DHCP relay service and per-VLAN UDP port relay services.

DHCP Option-82 and DHCP snooping provide security for a DHCP relay service. The DHCP Option-82 switch-level feature allows the relay agent to insert identifying information into client-originated DHCP packets before the packets are forwarded to the DHCP server. DHCP Snooping, at the switch or VLAN level, improves network security by filtering DHCP messages received from devices outside the network and building and maintaining a binding table to track access information for each device. DHCP relay Option-82 and snooping cannot be run on the switch at the same time.

DHCP relay and snooping is configured at the default routing instance level, see Procedure 30-6. In addition, per-VLAN DHCP snooping can be enabled on a VLAN site. See procedures 69-1, 69-4, and 69-6 for more information.

It is necessary to configure ports connected to DHCP servers within the network and/or firewall as trusted ports so that necessary DHCP traffic to/from the server is not blocked. Configuring the port mode as trusted also identifies the device connected to that port as a trusted device within the network. See Procedure 20-34 for more information.

Procedure 30-6 To configure UDP relay/DHCP snooping on an OmniSwitch in routing instances

This procedure describes how to configure UDP Relay and DHCP Option-82 and snooping on default routing instances for all OmniSwitch NEs.

Note — For VRF instances on the OS 9700E and OS 9800E NEs, only UDP Relay service is supported.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an OmniSwitch routing instance by choosing Network→OmniSwitch → Routing Instance.

Warning 1 — The routing instance must be the default routing instance.

Warning 2 — UDP Server Statistics/UDP Service Statistics will be lost as part of the parent change from Bridge Instance to Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the UDP Relay tab button to configure UDP relay. The UDP Relay General Configuration tab is displayed.

5 Configure the following parameters in the UDP BOOTP/DHCP Relay General Configuration panel.

- Forwarding Delay (seconds)
- Maximum Hops
- Forwarding Option

6 If you need to use the DHCP Option-82 functionality, configure the following parameters in the Relay Information Configuration panel.

- Relay Agent Information Mode
- Relay Agent Information Policy

7 If you need support for PXE devices, configure the PXE Support parameter.

Note — For VRF instances on the OS 9700E and OS 9800E NEs, the following parameters are read only:

- Forwarding Delay (seconds)
- Maximum Hops
- Relay Agent Information Mode
- Relay Agent Information Policy
- PXE Support

The values of these parameters are updated automatically if the corresponding value is modified under the default VRF instance.

8 Click on the DHCP Snooping tab button to configure DHCP snooping.

9 Configure the following parameters:

- DHCP Snooping Mode
- Bypass Option-82 Check
- Option-82 Format Type
- MAC Address Verification
- Option-82 Data Insertion
- Binding Database Mode
- Synchronization Timeout (seconds)
- Action
- Binding Persistency

If you selected the User String option for the Option-82 Format Type parameter, configure the Option-82 User String parameter.

10 Configure UDP port relay services, if required. Click on the Relay Services tab button.

11 Click on the Create button.

12 Configure the UDP Relay Service parameter.

If you selected the Other option, configure the Relay Service Port and Relay Service Description parameters.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button.

15 Click on the Relay Destinations tab button.

16 Click on the Create button. The Create UDP Service Destinations form opens with the Select Relay Service step displayed.

17 Click on the Select button. The Select UDP Service-UDP Relay Service Destination form opens.

18 Choose a UDP relay service from the list. Click on the OK button.

19 If you selected BOOTP/DHCP (67/68) in step 18 and the parameter Forwarding Option is set to Standard, click on the Next button. Otherwise, go to step 22.

20 The Forwarding Address step is displayed.

21 Configure the Forwarding Address parameter, if required.

22 Click on the Next button. The Select VLANs step is displayed.

23 Configure the search filter and click on the Search button. The Select VLANs form displays the VLANs that match the search criteria.

24 Choose one or more VLANs to be used to forward the UDP traffic.

25 Click on the Finish button. The Create UDP Service Destinations form closes and the selected VLANs appear in the relay destinations list.

Procedure 30-7 To create an L3 interface

This procedure describes how to create L3 interfaces. The interfaces you can configure include the following:

- L3 network interface
- ICMP interface
- system interface
- management interface
- VRRP instance
- IGMP interface
- PIM interface
- MLD interface

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→Router→Routing Instance.

3 Create a new L3 interface by right-clicking on the routing instance icon and choose Create Interface. The Create Network Interface form opens.

Note — The steps that appear on the Create Network Interface form vary, depending on the device type, device version, and the options that are selected during configuration.

4 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- IPv6 Allowed
- MAC Address
- Allow Directed Broadcasts
- Class
- Loopback Enabled
- PIM RP Delayed Up Period
- Cflowd Type
- Trusted
- Admin Link Local Address
- Admin Link Local Address Preferred
- Strip Label
- LDP Synchronization Timer
- FlowSpec Validate Enabled
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6

5 Click on the Next button and perform one of the following:

a If you chose Numbered in the Class parameter in step 4, the Configure IP Address form opens. Specify the IP address information for the L3 interface:

i Click on the Create button. The IP Address (Create) form opens.

ii Configure the parameters:

- IP Address
- Prefix Length
- IGP Inhibit
- Broadcast Address Format
- EUI-64
- IP Address Preferred

The Broadcast Address Format parameter only appears if the IP Address parameter is set to an IPv4 address.

The EUI-64 and IP Address Preferred parameters only appear if the IP Address parameter is set to an IPv6 address.

iii Click on the OK button to save the changes. A dialog appears.

iv Click on the OK button. The IP Address (Create) form closes and the Configure IP Address form reappears.

b If you chose Unnumbered for the Class parameter in step 4, the Configure Unnumbered Interface form opens. Configure the parameters:

- Unnumbered Type
- Unnumbered Reference

6 Click on the Next button. The Select Port form opens.

Note — If the Loopback Enabled parameter is selected on the Define General Properties form, The Select Port step does not appear in the step menu for the 7450 ESS, 7750 SR, 7705 SAR, and 7710 SR.

7 Associate the L3 interface with a physical port.

i Click on the Select button. The Select Port form opens.

ii Choose a port from the list.

iii Click on the OK button. The port is associated with the L3 interface.

8 Click on the Next button. The Select Network Policy form opens.

9 Click on the Select button in the Network Policy panel to list and choose a network policy for the interface. Network policies are used to determine QoS settings based on the packet DSCP bits on the ingress and egress of the network.

Note — If you select a network policy with a forwarding class mapped to a queue group queue ID, you must ensure that the mapping queue group queue ID is in the selected Queue Group Template Policy.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

10 Click on the Select button beside the Queue Group Template Policy to list and choose a network egress queue group template policy for the interface. Queue group template policies allow SAP or IP interface forwarding classes to be redirected from the typical queue mapping to a shared queue.

Note 1 — You must ensure that the port you selected in step 7 has a network egress queue group with the same name as the Queue Group Template policy created on it.

See Procedure 20-1 in chapter 20 for more information about how to configure Ethernet ports. See chapter 46 for more information about queue group template policies.

Note 2 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

11 Click on the Next button. The Select ACL Filters form opens.

12 Click on the Select buttons to list and choose Ingress and Egress IPv4 and IPv6 ACL filters for the interface. ACL filters are used to filter out IP traffic that matches user-defined criteria.

13 Click on the Next button. The Configure ICMP form opens.

Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

14 Click on the Next button. If the IPv6 Allowed parameter in step 4 is enabled, the Configure ICMPv6 form opens. Otherwise, go to step 15.

Configure the parameters:

- Redirects
- Unreachables
- Packet Too Big
- Param Problem
- Time Exceeded
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of Packet Too Big
- Packet Too Big Time (seconds)
- Number of Param Problem
- Param Problem Time (seconds)
- Number of Time Exceeded
- Time Exceeded Time (seconds)

15 Click on the Next button. The Configure ARP form opens.

i Configure the Timeout (seconds) parameter.

ii Click on the Create button to statically associate an IP or MAC address to the interface. The Static ARP (Create) form opens.

Configure the parameters:

- IP Address
- Physical Address

iii Click on the OK button. The Static ARP (Create) form closes.

16 Click on the Next button. The Configure Proxy ARP form opens.

Proxy ARP allows a device, such as a router, to answer ARP requests that are intended for another device. This allows a device to reach a remote subnet without configuring routes to the subnet or a default gateway device.

17 Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP

18 Click on the Next button. The Configure Proxy ARP Policies form opens.

19 Configure the parameters:

- Proxy Arp Policy 1
- Proxy Arp Policy 2
- Proxy Arp Policy 3
- Proxy Arp Policy 4
- Proxy Arp Policy 5

20 Click on the Next button. If the IPv6 Allowed parameter in step 4 is enabled, the Configure Neighbor Discovery form opens. Otherwise, go to step 26.

21 Click on the Create button to configure a neighbor. The Neighbor Discovery (Create) form opens.

22 Configure the parameters:

- IP Address
- Physical Address

23 Click on the OK button. The Neighbor Discovery (Create) form closes and the Configure Neighbor Discovery form reappears.

24 Click on the Next button. The Configure Proxy Neighbor Discovery form opens.

25 Configure the parameters:

- Enable Local Proxy
- Policy 1
- Policy 1
- Policy 1
- Policy 1
- Policy 1

Note — You must not leave an empty policy parameter between two configured policy parameters. For example, do not configure the Policy 1 and Policy 3 parameters and leave the Policy 2 parameter unconfigured. The 5620 SAM reorders the policies and moves the policy entered for the Policy 3 parameter to the Policy 2 parameter.

26 Click on the Next button. The Configure NTP form opens.

27 Configure the Broadcast parameter.

Note — When the Broadcast parameter is enabled, a time protocol such as NTP or SNTP must be enabled and configured on the device, or the device ignores broadcast time packets received on the interface. See chapter 13 for information about configuring NTP or SNTP on a device.

28 Click on the Next button. The Configure DHCP - General form opens.

29 Configure IPv4 DHCP for the interface, if required.

i Configure the parameters:

- Enable DHCP Relay
- Description
- Action
- Circuit ID
- Remote ID
- Remote ID String
- Copy To Option 43

Note — The Remote ID String parameter is configurable when the Remote ID parameter is set to Remote IDString.

ii Click on the Next button. The Configure DHCP - Server form opens.

iii Configure the Server 1 through Server 8 parameters.

30 Click on the Next button. The Configure VRRP form opens.

VRRP instances are members of a virtual router that provides backup if a router fails in a statically configured LAN. VRRP instances are created from network interfaces on a router, either as a master owner through which IP packets are routed before a failover or as a backup non-owner that assumes the packet-forwarding (master) role after a failover. Before you create or add a VRRP instance to a virtual router, ensure that the master and backup interfaces have the same VRID and occupy the same subnet.

31 Perform one of the following:

- **a** If a VRRP instance is not required, click on the Next button until the Unicast RPF form opens in step 40.
- **b** If an IPv4 VRRP instance is required, click on the Create button. The VRRP Instance (Create) form opens with the General tab displayed. See chapter 39 for information about VRRP instances and virtual routers.
- **c** If an IPv6 VRRP instance is required, click on the Next button. The Configure IPv6 VRRP form is displayed. Click on the Create button and the VRRP IPv6 Instance (Create) form opens with the General tab displayed. See chapter 39 for information about VRRP instances and virtual routers.

32 Click on the Next button. The Configure Router Advertisement form opens.

33 Click on the Create button to add a router advertisement entry. The Router Advertisement (Create) form opens with the General tab displayed.

34 Configure the parameters:

- Send Advertisement
- Min Interval (seconds)
- Reachable Time (milliseconds)
- Managed Address Config
- MTU
- Use Virtual MAC Address
- Max Interval (seconds)
- Retransmit Time (milliseconds)
- Other Stateful Config
- Current Hop Limit
- Lifetime (seconds)

If you are configuring the L3 interface for an IPv6 VRRP instance, then the Send Advertisement and Use Virtual MAC Address parameters must both be enabled.

35 Click on the Prefix tab button.

36 Click on the Create button. The Router Advertisement Prefix (Create) form opens.

37 Configure the parameters:

- IPv6 Prefix
- Prefix Length
- On-Link Determination
- Autonomous Address Configuration
- Lifetime (seconds)
- No Expiry
- Lifetime (seconds)
- No Expiry

Note — Each Lifetime (seconds) parameter is configurable when the associated No Expiry parameter is disabled.

38 Click on the OK button. A dialog box appears.

39 Click on the OK button. The Router Advertisement Prefix (Create) form closes.

40 Click on the Next button. The Unicast RPF form opens.

41 Configure the parameters:

- URPF Check State
- URPF Check Mode

42 Click on the Next button. The Configure Network Domain form opens.

43 Configure the parameters. You can Add Network Domain or Remove Network Domain.

44 Click on the Next button. The Configure BFD form opens.

45 Configure Bi-directional Forwarding Detection for the interface, if required.

i Set the Administration Status parameter to Up. The configuration form is refreshed with additional parameters.

ii Configure the parameters:

- Administration Status
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier

iii To view local and remote session peers, click on the BFD Session tab button. 5620 SAM retrieves information from local and remote nodes and displays a list of BFD current sessions on router interfaces or L3 interfaces.

iv Click on a session. A properties window opens for the session. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

The BFD Status field indicates one of the following:

- "no service", when BFD is disabled
- "in service", when BFD is running
- "out of service", when BFD has failed

v Click on the OK button.

Note — You cannot enable BFD on an interface, if BFD is not configured on the interface. You cannot set the administration status of an interface to disabled, when protocols using the interface have BFD enabled. See chapter 31 for information about enabling and disabling BFD for routing protocols.

46 Click on the Next button. If the IPv6 Allowed parameter in step 4 is enabled, the Configure IPv6 BFD form opens and you can configure IPv6 BFD parameters for the interface as in step 51.

47 Click on the Finish button. The Summary form opens.

48 Enable the View the newly created Network Interface parameter to view the interface configuration after closing the form, if required.

49 Click on the Close button. The Create Network Interface form closes.

50 If the View the newly created tunnel parameter in step 48 is enabled, the Network Interface (Edit) form opens with the newly created interface configuration displayed. To configure BFD on the network interface, go to step 51.

51 Configure Bi-directional Forwarding Detection for the interface, if required.

i Click on the BFD tab button. A configuration form opens.

ii Set the Administration Status parameter to Up. The configuration form is refreshed with additional parameters.

iii Configure the parameters:

- Administration Status
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier

iv To view local and remote session peers, click on the BFD Session tab button. 5620 SAM retrieves information from local and remote nodes and displays a list of BFD current sessions on router interfaces or L3 interfaces.

v Click on a session. A properties window opens for the session. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

The BFD Status field indicates one of the following:

- "no service", when BFD is disabled
- "in service", when BFD is running
- "out of service", when BFD has failed

vi Click on the OK button.

Note — You cannot enable BFD on an interface, if BFD is not configured on the interface. You cannot set the administration status of an interface to disabled, when protocols using the interface have BFD enabled. See chapter 31 for information about enabling and disabling BFD for routing protocols.

Procedure 30-8 To create an OmniSwitch L3 interface

An L3 interface enables IP routing on a VLAN. Without an L3 interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an OmniSwitch routing instance by choosing Network→OmniSwitch →Routing Instance.

3 Right-click on the routing instance icon and choose Create Interface from the contextual menu. The Create Network Interface form opens with the Define General Properties form displayed.

4 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Configured Primary Status
- Enable Forwarding

5 Click on the Next button. The Configure IP Address form opens.

6 Click on the Create button. The IP Address (Create) form opens.

7 Configure the parameters:

- IP Address
- Prefix Length

8 Click on the OK button. The IP Address (Create) form closes and a dialog box appears.

9 Click on the OK button.

10 Click on the Next button. The Configure Proxy ARP form opens.

11 Configure the Enable Local Proxy ARP parameter.

12 Click on the Next button. The Select VLAN form opens.

13 Click on the Select button. The Select VLAN - Network Interface form opens.

14 Choose a VLAN to which you want to add the interface.

15 Click on the OK button. The Select VLAN - Network Interface form closes.

16 Click on the Finish button. The Summary form opens.

17 Select the View the newly created Network Interface parameter to view the interface configuration after you close the Summary form, if required.

18 Click on the Close button. The Create Network Interface form closes.

Procedure 30-9 To configure an L3 interface

This procedure describes how to configure L3 interface parameters. The interfaces you can modify include the following:

- L3 network interface
- ICMP interface
- system interface
- management interface
- VRRP instance
- IGMP interface
- PIM interface
- MLD interface

1 Choose Routing from the navigation tree view selector.

2 Navigate to a network interface. The path is Routing→Router→Routing Instance→Interface.

3 Select an interface and choose Properties from the right-click contextual menu. The Network Interface (Edit) form opens.

4 Click on the appropriate tab button and configure the parameters, if required. Table 30-4 describes the tabs to choose, as shown when you modify an existing routing interface.

Table 30-4 Description of Network Interface configuration form tabs

Tab	Description
General	Configure the parameters: • Description • Administrative State • IPv6 Allowed • MAC Address • Allow Directed Broadcasts • Class • PIM RP Delayed Up Period • Cflowd Type • LDP Synchronization Timer • FlowSpec Validate Enabled • Loopback Enabled • Trusted
Port	To create an association between the L3 interface and a physical port or channel. The system interface is not associated with a port.
Policies	To associate network policies and ingress or egress IP ACL filter policies with the network interface.
Protocols	To view a list of protocols that are enabled on the interface, and to apply protocols. The protocols are: • MPLS • OSPFv2 • OSPFv3 • LDP • IS-IS • RIP
Multicast	To view a list of multicast protocols that are enabled on the interface, and to apply protocols. The protocols are: • PIM • IGMP • MLD
Local DHCP Servers	To assign local DHCP servers. Local DHCP servers are configured on the routing instance and VPRN service. They must be assigned to a network or an L3 interface. To assign local DHCPv6 servers the IPv6 Allowed parameter must be enabled.
Security	To assign a DoS protection policy to a network interface.
RCA Result	To view the results of RCA activities on the network interface
Address	To assign an IP address, subnet and broadcast address format to a network interface. Only one primary IP address can be associated with a network interface.
BFD	To configure BFD parameters

(1 of 2)

Tab	Description
ARP	To configure or view ARP and proxy ARP parameters. Click on the General tab button to configure the minimum time, in seconds, that an ARP entry is stored in the ARP table. Click on the Create button to configure static ARP IP and MAC address parameters. Click on the Proxy ARP tab button to view parameter information.
ICMP	To configure ICMP parameters
ICMPv6	If IPv6 is enabled on the interface, to configure ICMPv6 parameters
Neighbor Discovery	To configure neighbor discovery and proxy neighbor discovery for static routes. Click on the General tab button and Create button to configure neighbor discovery IP and MAC address parameters. Click on the Proxy ND tab button to configure proxy neighbor discovery parameters. [1]
VRRP	To add a VRRP instances to an existing virtual router that assumes routing responsibilities from a failed router in a statically configured LAN
MEPs	To add network interface facility MEPs. Each network interface can support one facility MEP.
Advertisement	To configure router advertisement
DHCP	To configure DHCP Relay parameters
NTP	To enable SNTP broadcasts on the network interface
Statistics	To view L3 network interface statistics
Faults	To view alarms that are raised against the network interface, or related alarms that affect the network interface

(2 of 2)

Note

(1) The Proxy ND tab is available only on the 7750 SR.

5 Click on the Apply button to save the changes.

6 Close the form.

7 Cable the network ports or channels of the device, with L3 interfaces enabled, to other devices configured the same way.

8 Configure routing protocols, as described in chapter 31.

Procedure 30-10 To configure an OmniSwitch L3 interface

1 Choose Routing from the navigation tree view selector.

2 Navigate to a network interface by choosing Network→ OmniSwitch →Routing Instance→Interface.

3 Choose an interface and choose Properties from the contextual menu. The Network Interface (Edit) form opens.

4 Click on the appropriate tab button and modify the parameters, if required. Table 30-5 describes the tabs.

Table 30-5 Description of OmniSwitch network interface configuration form tabs

Tab	Description
General	Configure the parameters: • Description • Administrative State • Configured Primary Status • Enable Forwarding • Encap Type
VLAN	View properties of the VLAN to which the interface is assigned or assign a VLAN to the interface.
Address	Assign an IP address to a network interface or view properties of an assigned address. Only one primary IP address can be associated with a network interface.
ARP	Configure the Enable Local Proxy ARP parameter.
Faults	View alarms that are raised against the network interface, or related alarms that affect the network interface.

5 Click on the Apply button to save the changes.

6 Close the form.

Procedure 30-11 To configure a routing policy statement

See "Routing policies" in section 30.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Statement from the 5620 SAM main menu. A Routing Policy Statement Manager window opens.

2 Click on the Create button.

3 Configure the parameters:

- Policy Statement Name
- Description
- Default Action
- Check Dependencies

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Perform one of the following:

a Click on the Components tab button. Select and right-click on Policy Statement Entry and choose Create Policy Statement Entry. The Policy Statement Entry (Create) form opens with the General tab displayed. Go to step 6.

b Click on the Policy Statement Entries tab button.

5 Click on the Create button. The Policy Statement Entry (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Entry ID
- Description
- Action

7 Perform one of the following:

a If you choose Accept, Next Entry, or Next Policy for the Action parameter, go to step 8.

b If you choose None or Reject for the Action parameter, go to step 14.

8 Click on the Action tab button.

9 Configure the parameters:

- Route Origin
- Route Preference
- BGP Local Preference
- Local Preference Set
- Use Next Hop
- Metric Action
- Interface
- Metric Value
- OSPF, RIP, or ISIS Tag (Hex)
- Next Hop Type
- OSPF Route Type
- Advertise Next Hop Self
- Forwarding Class Name
- Forwarding Class Priority
- Damping Profile Name

10 Click on the Path tab button.

11 Configure the parameters:

- AS Path Name
- BGP AS Path Action
- BGP AS Prepend number
- Prepend Count

12 Click on the BGP Community tab button.

13 Configure the parameters:

- Community Name 1
- Community Action 1
- Community Name 2
- Community Action 2

14 Click on the From Criteria tab button. The Policy Statement Entry (Create) form appears with the General tab displayed.

15 Click on the Select button beside the AS Path Name parameter. A Select Policy Statement Entry - Site form opens.

16 Choose an AS path from the list.

17 Click on the Ok button. The AS Path Name is refreshed with the selected AS Path.

18 Click on the Select button beside the Community List Name parameter. A Select Policy Statement Entry - Site from opens.

19 Choose a community from the list.

20 Click on the OK button. The Community List Name is refreshed with the selected community.

21 Configure the parameters.

- Protocol
- Origin
- State
- Interface Name
- Static Route Tag
- No Route Tag
- Family
- Level
- IS-IS External Route
- OSPF Route Type
- OSPF Area
- OSPF Area Set
- Multicast Source IP Address
- Neighbor IP Address

22 Click on the Select button beside the Multicast Group Prefix List Name parameter. A Select Policy Statement Entry window opens.

23 Choose a policy from the list.

24 Click on the Ok button. The Multicast Group Prefix List Name parameter is refreshed with the selected policy.

25 Click on the Select button beside the IGMP Host Prefix List Name parameter. A Select Policy Statement Entry window opens.

26 Choose a policy from the list.

27 Click on the Ok button. The IGMP Host Prefix List Name parameter is refreshed with the selected policy.

28 Click on the Select button beside the Interface Name parameter. A Select Zone Index From Criteria Site window opens.

29 Choose a site from the list.

30 Click on the Ok button. The Interface Name parameter is refreshed with the selected site.

31 Click on the Select button beside the Neighbor Prefix List Name parameter. A Select Policy Statement Entry window opens.

32 Choose a policy statement from the list.

33 Click on the Ok button. The Neighbor Prefix List Name parameter is refreshed with the selected policy.

34 Click on the Prefix List tab button.

35 Configure the parameters.

- Prefix List 1
- Prefix List 2
- Prefix List 3
- Prefix List 4
- Prefix List 5

36 Click on the To Criteria tab button. The Policy Statement Entry (Create) form appears with the General tab displayed.

37 Configure the parameters.

- Protocol
- Instance ID
- All Instances
- Level
- Neighbor IP Address

38 Click on the Select button beside the Neighbor Prefix List Name parameter. A Select Policy Statement Entry window opens.

39 Choose a policy from the list.

40 Click on the Ok button. The Neighbor Prefix List parameter is refreshed with the selected policy.

41 Click on the Select button beside the Interface Name parameter. A Select Zone Index To Criteria Site window opens.

42 Choose an interface from the list.

43 Click on the Ok button. The Interface Name parameter is refreshed with the selected site.

44 Click on the Prefix Lists tab button.

45 Configure the parameters.

- Prefix List 1
- Prefix List 2
- Prefix List 3
- Prefix List 4
- Prefix List 5

46 Click on the OK button. A dialog box appears.

47 Click on the OK button.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 46-1.

48 Configure the following routing-related policies, if required:

a To configure a prefix list policy, see Procedure 30-12.

b To configure a community policy, see Procedure 30-13.

c To configure a damping policy, see Procedure 30-14.

d To configure an AS path policy, see Procedure 30-15.

e To view a routing policy from a CLI session, see Procedure 30-16.

Procedure 30-12 To configure a prefix list policy

See “Routing policies” in section 30.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Prefix List from the 5620 SAM main menu. A Routing Policy Prefix List Manager window opens.

2 Click on the Create button. The Routing Policy Prefix List (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Prefix List Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Prefix List Members tab button.

5 Click on the Create button. The Prefix List Member (Create) form opens.

6 Configure the parameters:

- Prefix
- Mask
- Type
- Begin Length
- Through Length

The Begin Length and Through Length parameters are configurable when the Type parameter value is set to Range or Through.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Routing Policy Prefix List, Global Policy (Create) window appears with the newly created prefix member.

9 Close the Routing Policy Prefix List, (Create) window.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 46-1.

10 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 30-11.

b To configure a community policy, see Procedure 30-13.

c To configure a damping policy, see Procedure 30-14.

d To configure an AS path policy, see Procedure 30-15.

e To view a routing policy from a CLI session, see Procedure 30-16.

Procedure 30-13 To configure a community policy

See “Routing policies” in section 30.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Community from the 5620 SAM main menu. A Manage Routing Policy - Community window opens.

2 Click on the Create button. A Routing Policy - Community, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Community Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Community Members tab button.

5 Click on the Create button. A Community Member Site (Create) window opens.

6 Configure the Community Member parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Routing Policy Community (Create) window is updated with the newly created site.

9 Close the Routing Policy - Community, Global Policy (Create) window.

10 Close the Manage Routing Policy - Community window.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 46-1.

11 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 30-11.

b To configure a prefix list policy, see Procedure 30-12.

c To configure a damping policy, see Procedure 30-14.

d To configure an AS path policy, see Procedure 30-15.

e To view a routing policy from a CLI session, see Procedure 30-16.

Procedure 30-14 To configure a damping policy

See “Routing policies” in section 30.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Damping from the 5620 SAM main menu. A Manage Routing Policy - Damping window opens.

2 Click on the Create button. A Routing Policy - Damping, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Damping Name
- Half Life
- Reuse
- Suppress
- Max Suppression

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button.

5 Close the Routing Policy - Damping, Global Policy (Create) window.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 46-1.

6 Configure the following routing-related policies, if required:

  a To configure a policy statement, see Procedure 30-11.

  b To configure a prefix list policy, see Procedure 30-12.

  c To configure a community policy, see Procedure 30-13.

  d To configure an AS path policy, see Procedure 30-15.

  e To view a routing policy from a CLI session, see Procedure 30-16.

Procedure 30-15 To configure an AS path policy

See "Routing policies" in section 30.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→AS Path from the 5620 SAM main menu. A Manage Routing Policy - AS Path window opens.

2 Click on the Create button. An Routing Policy - AS Path, Global Policy (Create) window opens with the General tab displayed.

3 Configure the parameters:

- Path Name
- Description
- Regular Expression

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 46-1.

5 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 30-11.

b To configure a prefix list policy, see Procedure 30-12.

c To configure a community policy, see Procedure 30-13.

d To configure a damping policy, see Procedure 30-14.

e To view a routing policy from a CLI session, see Procedure 30-16.

Procedure 30-16 To view a routing policy from a CLI session

To view a routing policy from a CLI session, navigate to the previously distributed local routing policy or view navigate to a routing instance by choosing Network→Router→Routing Instance. See Procedure 30-2 for more information.

1 Perform one of the following depending on which routing policy you want to view from a CLI session.

a Choose Policies→Routing→Policy from the 5620 SAM main menu. A Routing Policy Statement Manager window opens.

b Choose Policies→Routing→Prefix List from the 5620 SAM main menu. A Routing Policy Statement Manager window opens.

c Choose Policies→Routing→Community from the 5620 SAM main menu. A Routing Policy Community Manager window opens.

d Choose Policies→Routing→Damping from the 5620 SAM main menu. A Routing Policy Damping Manager window opens.

2 Click on the Search button. A list of policies appears.

3 Choose a policy from the list.

4 Click on the Properties button. A *Policy_type* (Edit) form opens.

5 Click on the Local Definitions tab button. A window appears displaying a list NEs to where the policy was distributed.

6 Choose a site from the list.

7 Click on the Properties button. A *Policy_type* Local Policy (Edit) form opens.

8 Click on the More Actions button and choose Show Policy. A Routing Policy Show Policy window opens with the General tab displayed.

9 Click on the Ok button. A CLI display is initiated.

10 View the policy.

11 Click on the close button.

12 Close the A *Policy_type* Local Policy (Edit) form.

Procedure 30-17 To configure an MPLS administrative group policy

MPLS administrative group policies define administrative groups that can be assigned to MPLS interfaces, LSPs, and LSP paths. After you configure MPLS administrative groups, the administrative groups can be assigned to MPLS interfaces, LSPs, and LSP paths on their respective properties forms. Multiple administrative groups can be assigned to each of these objects.

When establishing LSP and LSP paths, devices are only consider MPLS interfaces which are associated with the same administrative group as the LSP or LSP path. MPLS interfaces advertise administrative group associations using CSPF. This is done using the 32 bit mask which you configure using the Value parameter on the MPLS administrative group policy form.

An administrative group can also be assigned to be explicitly excluded from LSPs and LSP paths. The device cannot use MPLS interfaces in the administrative group to establish LSPs or LSP paths. Administrative group exclusion takes priority over administrative group inclusion.

CSPF must be enabled on LSPs for administrative groups to be relevant. You can enable and configure CSPF on the LSP properties form. When CSPF is enabled on an LSP, it is automatically enabled on associated LSP paths. LSP paths can be configured on the LSP path properties form to inherit additional CSPF, administrative group, and other parameters from LSPs.

This procedure describes how to create MPLS administrative groups. Table 30-6 describes where to find information about assigning MPLS administrative groups to MPLS interfaces, LSPs, and LSP paths.

Table 30-6 MPLS administrative group assignments

To assign groups to	See Procedure
MPLS interfaces	"To create an MPLS interface" in chapter 32
LSPs	"To create a static LSP" in chapter 32
LSP paths	"To configure an LSP path" in chapter 32
	"To configure an LSP on a 7250 SAS device" in chapter 32

1 Choose Policies→MPLS→Administrative Group from the 5620 SAM main menu. The Manage MPLS Administration Groups form opens.

2 Click on the Create button. The Admin Group (MPLS) Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Value

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button to save the policy.

The Admin Group (MPLS) Policy (Edit) form is refreshed and the tabs are selectable. Table 30-7 describes the tabs that you can choose to configure the parameters.

Table 30-7 Description of MPLS administrative group form tabs

Tab	Description
Local Definitions	Lists MPLS administrative group policies and allows you to manage administrative group policy distribution.
LSPs	Lists and allows you to manage LSPs to which the administrative group has been assigned.
LSP-Path Bindings	Lists and allows you to manage LSP paths to which the administrative group has been assigned.
Interfaces	Lists and allows you to manage MPLS interfaces to which the administrative group has been assigned.
Faults	List and manage alarms related to the administrative group.

5 Click on the More Actions button and choose Distribute to manually distribute the administrative group policy locally to managed devices. Policies are also automatically distributed to managed devices when they are used by resources on the device.

Procedure 30-18 To configure a Shared Risk Link Group policy

This procedure describes how to create SRLG policies. Table 30-8 describes where to find information about related MPLS and LSP procedures.

Table 30-8 Related MPLS and LSP procedures

To:	See Procedure:
Configure an MPLS instance	"To configure an MPLS instance" in chapter 32
Create an MPLS interface	"To create an MPLS interface" in chapter 32
Configure LSP paths	"To configure an LSP path" in chapter 32

1 Choose Policies→MPLS→Shared Risk Link Group from the 5620 SAM main menu. The Manage Shared Risk Link Group Policies form opens.

2 Click on the Create button.

The Shared Risk Link Group, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Value

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button to save the policy.

The Shared Risk Link Group Policy (Edit) form is refreshed and the tabs are selectable. Table 30-9 describes the tabs that you can choose to configure the parameters.

Table 30-9 Description of Shared Risk Link Group Policy form tabs

Tab	Description
General	Displays information on the policy and allows you to prepare the policy for release and distribution.
Local Definitions	Lists Shared Risk Link Group policies and allows you to manage policy distribution.
Interfaces	Lists and allows you to manage MPLS interfaces to which the SRLG policy has been assigned.
Faults	List and manage alarms related to the SRLG.

5 Click on the More Actions button and choose Distribute to manually distribute the SRLG policy locally to managed devices. Policies are also automatically distributed to managed devices when they are used by resources on the device. See chapter 46 for more information about policies and policy distribution.

Procedure 30-19 To create a static configuration for a SRLG Policy

This procedure describes how to create a static configuration for a SRLG policy. This differs from the standard SRLG policy described in Procedure 30-18 in that it allows you to manually enter into the SRLG database the SRLG membership for links in the entire network. This is typically done at the 7x50 head-end node and is mutually exclusive with the reading of this information from the traffic engineering database.

There are deployments where the 7x50 head-end node interoperates with routers that do not implement the SRLG membership advertisement using IGP SRLG Type-Length Value (TLV) or sub-TLV. In these situations, you can manually enter the link members of SRLG groups for the entire network at any 7x50 node which needs to signal LSP paths, such as a head-end node.

1 Choose Policies→MPLS→Shared Risk Link Group Static Configuration from the 5620 SAM main menu. The Manage Shared Risk Link Group Static Configuration form opens.

2 Click on the Create button.

The Static Configuration for SRLGs Policy (Create) form opens with the General tab displayed.

3 Configure the Displayed Name parameter.

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button to save the policy.

The Static Configuration for SRLGs Policy (Edit) form is refreshed and the tabs become selectable. Table 30-10 describes the tabs that you can choose to configure parameters or view fault information.

Table 30-10 Description of Static Configuration for SRLG Policy form tabs

Tab	Description
General	Displays information on the policy and allows you to prepare the policy for release and distribution.
Local Definitions	Lists Static Configuration for SRLG policies and allows you to manage policy distribution.
Routers	Lists and allows you to manage existing static configuration entries or add new ones.
Faults	List and manage alarms related to the static configuration for SRLGs.

5 Click on the Routers tab button.

6 Click on the Create button. The Router for Static Config for SRLG policy (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Router ID
- Administrative State

8 Click on the OK button, and then click OK in the confirmation box that appears. The router(s) you added appears in the list on the Routers tab.

9 If you want to add other routers, repeat steps 6 and 7, otherwise, go to step 10.

10 Select one of the routers from the list and click on the Properties button. The Router for Static Config for SRLG policy (Create) window opens with the General tab displayed.

11 Configure the Administrative State parameter.

12 Click on the Interfaces tab.

13 Configure the Interface Ip Address parameter. You can enter this manually or use the Select button to choose from a list.

14 Configure the Displayed Name parameter.

Note — You can associate the same Interface Ip Address parameter with more than one SRLG.

15 Click on the Apply button and repeat steps 10 to 14 to add other entries, or click OK to close the Static Configuration for SRLGs policy (Create) window.

16 If you clicked on Apply in the previous step, you can click on the More Actions button and choose Distribute to manually distribute the Static Configuration for SRLGs policy locally to managed devices. Policies are also automatically distributed to managed devices when they are used by resources on the device. See chapter 46 for more information about policies and policy distribution.

Procedure 30-20 To create a static route

1 Choose Routing from the navigation tree view selector.

2 Navigate to the static routes icon. The navigation path is Routing→Router→Routing Instance→Static Routes.

3 Right-click on the static routes icon and choose Create Static Route from the contextual menu. The Static Route (Create) form opens.

4 Configure the parameters:

- Auto-Assign ID
- Static Route ID
- BFD Enabled
- Forwarding Class Name
- Forwarding Class Priority
- Destination
- Prefix Length
- Multicast Capable Peers
- Type
- IP Address
- Interface Name
- Unnumbered Interface
- Preference
- Metric
- Administrative State
- Tag
- LDP
- Disallow IGP
- Enable CPE Check
- Target IP Address
- Interval (seconds)
- Drop Count
- Log
- Prefix List Name
- Prefix List Flag

The IP Address parameter is configurable when the Type parameter is set to an option other than Black Hole.

The Target IP Address, Interval (seconds), Drop Count, and Log parameters are only displayed when Enable CPE Check is enabled.

You cannot specify a Prefix List if either BFD Enabled or Enable CPE Check parameters are enabled for the static route.

The Prefix List Flag Prefix List Name parameter is configured.

5 If IPv6 is enabled on the routing instance, click on the Select button beside the Interface Name parameter to choose an IPv6 zone index for the static route. The Select Zone Index - Static Route form opens. Otherwise, go to step 7.

6 Select a zone index in the list and click on the OK button. The Select Zone Index - Static Route form closes and the zone index is displayed in the Static Route (Create) window.

7 Click on the OK button. The Static Route (Create) form closes.

Procedure 30-21 To configure an OmniSwitch static route

1 Choose Routing from the navigation tree view selector.

2 Navigate to the static routes icon by choosing Network→OmniSwitch or→Routing Instance→Static Routes.

3 Right-click on the static routes icon and choose Create Static Route from the contextual menu. The Static Route (Create) form opens.

4 Configure the parameters:

- Auto-Assign ID
- Static Route ID
- Destination
- Prefix Length
- Type
- IP Address
- Metric

Note — If the address entered for the IP Address parameter is unreachable by the node, the static route is not created on the node. Use the 5620 SAM to verify that all configured static routes are created successfully on the node by checking the list of static routes for the OmniSwitch routing instance.

5 Click on the OK button to save the configuration. The Static Route (Create) form closes.

Procedure 30-22 To configure NAT on a routing instance

NAT configuration is supported only on a Release 8.0 or later 7750 SR-7 or 7750 SR-12 in chassis mode B or higher.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the NAT Configuration tab button.

5 Click on the Create button. The NAT Configuration (Create) form opens with the General tab displayed.

6 Click on the Select button to choose a NAT policy. The Select NAT policy form opens.

7 Select a policy in the list and click on the OK button. The Select NAT policy form closes, and the policy name is displayed on the NAT Configuration (Create) form.

8 Click on the Apply button. A dialog box appears.

9 Click on the Yes button.

10 Configure the parameters as required:

- Peer Address
- Steering Route Address Prefix
- Prefix Length
- DS Lite
- Subscriber Prefix Length

11 Perform the following steps to add a DS Lite address.

i Click on the DS Lite Address tab button.

ii Click on the Create button. The Dual Stack Lite Address (Create) form opens.

iii Configure the Address and Tunnel; MTU (bytes) parameters.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Dual Stack Lite Address (Create) from closes and the NAT Configuration (Create) form lists the DS Lite address.

12 Perform the following steps to configure static port forwarding, if required.

i Click on the NAT Static Port Forwarding tab button.

ii Click on the Create button. The NAT Static Port Forwarding Display (Create) form opens.

iii Configure the parameters:

- Type
- Inside IP Address
- Outside IP Address
- Inside Port
- Protocol
- Outside Port
- Lifetime (seconds)
- B4 Address
- AFTR Address

Note — You cannot specify the same set of Inside Port and Protocol values in more than one static port mapping to an Inside IP Address.

You can specify the same Outside Port value in multiple mappings to an Inside IP Address.

iv Click on the OK button. The NAT Static Port Forwarding (Create) form closes, and the NAT Configuration (Create) form lists the new entry.

v Repeat steps ii to iv to assign large scale NAT Static Port Forwards, if required.

13 Perform the following steps to syncronize NAT static port forwards, if required.

i Choose a static port forward from the list and click on the Sync button. The NAT Static Port Forwarding Sync form opens.

ii Click on the Select button in the Targeted Router Instance panel. The Select Targeted Router Instance form opens.

iii Select a router instance from the list and click on the OK button. The Select Targeted Router Instance form closes and the NAT Static Port Forwarding Sync form reappears with the router instance information displayed.

iv Configure the Lifetime (seconds) parameter and click on the OK button. A dialog box appears.

v Click on the OK button.

14 Perform the following steps to configure a NAT pool.

i Click on the NAT Pools tab button.

ii Click on the Create button. The NAT Pool (Create) form opens.

iii Configure the parameters:

- Displayed Name
- Description
- Subscriber Limit
- Exported Address Prefix
- Prefix Length
- Monitored Address Prefix
- Prefix Length
- NAT Pool Type
- Administrative State
- Port Mode
- Port Reservation Type
- Port Reservation Value
- Port Forward Range End
- High Watermark
- Low Watermark

iv Click on the Select button to choose an ISA-NAT group. The Select ISA-NAT group form opens.

v Select an ISA-NAT group in the list and click on the OK button. The Select ISA-NAT group form closes, and the NAT Pool (Create) form displays the ISA-NAT group name.

vi Click on the NAT Pool Ranges tab button.

vii Click on the Create button. The NAT Pool Range (Create) form opens.

viii Configure the parameters:

- Description
- Range Start
- Range End

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The NAT Pool Range (Create) form closes, and the NAT Pool (Create) form lists the pool range.

xi Click on the OK button. A dialog box appears.

xii Click on the OK button. The NAT Pool (Create) form closes, and the NAT Configuration (Create) form lists the NAT pool.

xiii Repeat steps vii to xii to add another pool, if required.

15 Perform the following steps to add an IP address for L2-aware NAT forwarding, if required.

i Click on the L2 Aware IP Addresses tab button.

ii Click on the Create button. The L2 Aware IP (Create) form opens.

iii Configure the parameters:

- Inside IP Address
- Prefix Length

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The L2 Aware IP (Create) form closes, and the NAT Configuration (Create) form lists the IP address.

vi Repeat steps ii to v to add another IP address, if required.

16 Perform the following steps to add a NAT destination address.

i Click on the NAT Destinations tab button.

ii Click on the Create button. The NAT Destination (Create) form opens.

iii Configure the parameters:

- Inside IP Address
- Prefix Length

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The NAT Destination (Create) form closes, and the NAT Configuration (Create) form lists the destination.

vi Repeat steps ii to v to add another destination, if required.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The NAT Configuration (Create) form closes, and the NAT configuration is listed on the Routing Instance form.

30.6 Network domain configuration procedures

Perform these procedures to configure a network domain.

Procedure 30-23 To create a network domain

1 Choose Routing from the navigation tree view selector.

2 Navigate to the network domains icon by choosing Network→NE→Routing Instance→Network Domains.

3 Right-click on the network domains icon and choose Create Network Domain from the contextual menu. The Network Domain (Create) form opens.

4 Enter:

- Domain Name
- Description

5 Click on the OK button. The Domain Network (Create) form closes and a network domain is created in the navigation tree.

Procedure 30-24 To delete a network domain

1 Choose Routing from the navigation tree view selector.

2 Navigate to the network domains icon by choosing Network→NE→Routing Instance→Network Domains.

3 Right-click on the network domains icon and choose Delete from the contextual menu. A Confirm dialog box opens.

Caution 1 — The default network domain cannot be deleted.

Caution 2 — The network domain related to the Interface and SDP cannot be deleted.

4 Perform one of the following:

a Click on the No button to avoid deleting the network domain. The Confirm dialog box closes.

b Click on the Yes button. The network domain is deleted from the navigation tree.

Procedure 30-25 To associate a network interface with a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Network Interfaces tab and click on Add Network Interface. The Add Network Interface window opens.

4 Click on Search to display all the Network Interfaces. Select a Network Interface and click on OK the selected Network Interface is displayed on the Network Domain window.

Procedure 30-26 To remove a network interface from a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Network Interfaces tab and select the Network Interface that has to be removed from the domain.

4 Click on Remove Network Interface.

5 A Confirm dialog box opens.

Perform one of the following:

a Click on the No button to avoid removing the network interface. The Confirm dialog box closes.

b Click on the Yes button. The network interface is removed from the network domain.

Procedure 30-27 To associate a service tunnel with a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Service Tunnels tab and click on Add Tunnel. The Add Tunnel window opens.

4 Click on Search to display all the service tunnels. Select a service tunnel and click on OK the selected service tunnel is displayed on the Network Domain window.

Procedure 30-28 To remove a service tunnel from a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Service Tunnels tab and select the service tunnel that has to be removed from the domain.

4 Click on Remove Tunnel.

5 A Confirm dialog box opens.

Perform one of the following:

a Click on the No button to avoid removing the service tunnel. The Confirm dialog box closes.

b Click on the Yes button. The service tunnel is removed from the network domain.

Procedure 30-29 To edit a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance

3 Choose the newly created interface and right-click on the Interface and select Properties. The Network Interface form opens. See Procedure 30-7, steps 42 and 43 to associate a network interface to a network domain.

4 Select the Network Domain tab. The Network Domain form opens. See Procedure 30-7, steps 42 and 43 to edit a network domain.

---

31 — Protocol configuration

31.1 Protocol configuration overview

The 5620 SAM allows you to configure routing protocols and navigate to the device parameters. One device can support multiple routing protocols.

You use the network, IS-IS, and OSPF views in the 5620 SAM GUI navigation tree to view and configure parameters that set and manage the device routing protocol support. The routing protocols are enabled on the devices when you configure the devices. You configure the Layer 3 interfaces when you configure the routing instance on the device. You can then configure the routing protocols for specific Layer 3 interfaces.

Supported routing protocols include:

- BGP
- RIP
- LDP
- IS-IS
- OSPF
- RSVP
- L2TP

Routing protocols can be configured to import or export routes from other routing protocols using routing policies. See "Routing policies" in section 30.1 for more information.

In addition to routing protocols, the 5620 SAM supports the following router configurations:

- multicast protocols
    - PIM; see section 31.22 for more information
    - IGMP; see section 31.23 for more information
    - MSDP; see section 31.24 for more information
    - MLD; see section 31.25 for more information
- bridging on 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, Telco, and OmniSwitch devices; see section 31.26 for more information

Note — You cannot use the 5620 SAM to configure routing protocols on the 7250 SAS.

IPv6 support

The 5620 SAM supports IPv6 for control-plane addressing on the 7750 SR in chassis mode B (in mixed mode, for 7750 SR-7 and 7750 SR-12 only), C and D, on the 7710 SR, and on the 7450 ESS in mixed mode. See chapter 19 for information about chassis modes.

Although the implementation of IPv6 is driven by the diminishing IPv4 address space, it is increasingly necessary to use a protocol that is designed to handle more complex network applications, such as broadband voice and video transmission, IP transit, Internet exchange peering, and other large enterprise applications.

Transition from IPv4 to IPv6

The transition from IPv4 to IPv6 is occurring in stages as network providers, service providers, and end users migrate existing applications and equipment to the new version. Control-plane forwarding of IPv6 packets is an important part of this transition; it allows isolated IPv6 hosts and smaller IPv6 networks to peer across an IPv4 network, using a mechanism such as 6over4 tunneling.

With 6over4 tunneling, a host encapsulates IPv6 packets in IPv4 packets for transport across an IPv4 network. Routers that identify 6over4 encapsulation remove the IPv4 encapsulation before they forward the packets to other native IPv6 hosts. The 6over4 mechanism uses the IPv4 multicast infrastructure for neighbor discovery.

IPv6 benefits

The general benefits of IPv6 include:

- **simplified header format and fixed header length**

  An IPv6 header contains fewer fields than an IPv4 header. IPv6 excludes obsolete IPv4 header fields and processes option fields only when they contain values. IPv6 also standardizes the size of the packet header to 40 bytes to streamline packet processing. These features reduce packet-processing overhead and make routing more efficient.
- **addressing enhancements**

  IPv6 increases the IP address size from 32 bits to 128 bits to support a greater number of nodes and to provide a more versatile addressing hierarchy. IPv6 also supports address autoconfiguration.

  The scalability of multicast routing is improved by the presence of a Scope field. IPv6 introduces anycast addressing, which designates a group of disparate nodes as the recipient of a specific data stream.
- **improved scalability and extensibility**

  Built-in traffic optimization makes IPv6 highly scalable, and IPv6 supports future routing technology enhancements using protocol extensions.
- **flow-labeling capability**

  IPv6 features packet prioritization which allows the labeling of packets that require special handling, such as real-time service for VoIP conferences.
- **improved privacy and security**

  Authentication, encryption, and data integrity features are mandatory components for which IPv6 supports standardized extensions.

The 5620 SAM and IPv6

The 5620 SAM entities that support IPv6 configuration include the following:

- BGP for base routing instances and VPRN services
- IS-IS adjacencies
- multicast routing
- static routes
- ICMP
- routing policies
- access ingress and egress policies
- CPM filter policies
- PPP
- IES and VPRN SAPs
- IES and VPRN bi-directional forwarding detection
- VLL Ipipe
- PIM-SSM

A 5620 SAM operator enables IPv6 on an interface during interface creation.

The benefits of the 5620 SAM IPv6 implementation include:

- integration with existing IPv4 configurations on many property and configuration forms
- automatic validation of IP addresses on the client GUI, regardless of the IP version
- support of compressed IPv6 addresses when repeated address octets are present
- support for IPv6 statistics
- simultaneous IPv4 and IPv6 support by routing protocols
- separate IPv4 and IPv6 administrative and operational states on an interface

Accepted IPv6 address formats

The 5620 SAM accepts IPv6 addresses in the following formats:

- colon-hexadecimal, or *x:x:x:x:x:x:x:x*
  where *x* is a 16-bit hexadecimal number from 0 to FFFF
- a combination of colon-hexadecimal and dotted-decimal, or *x:x:x:x:x:x:d.d.d.d*
  where
  x is a 16-bit hexadecimal number from 0 to FFFF
  d is an 8-bit decimal number from 0 to 255

Using a combination of colon-hexadecimal and dotted-decimal formats may be convenient in an environment that supports the use of IPv4 and IPv6 addresses.

The 5620 SAM allows IPv6 address compression for an address that contains repeated zero values. You can use two adjacent colons to represent any group of repeated zero values in an IPv6 address. For example:

2001:DB8::

expands to

2001:0DB8:0000:0000:0000:0000:0000:0000

It is not necessary to supply the leading zeros for a number in an IPv6 address. For example, 2001:DB8::3C:5 is a valid IPv6 address.

BGP

BGP is an inter-AS routing protocol. An AS is a network or a group of devices logically organized and controlled by a common network administration. BGP enables devices to exchange network reachability information. AS paths are the routes to each destination. There are two types of BGP: IBGP and EBGP.

- IBGP is used to communicate with peer devices in the same AS. Routes received from a device in the same AS are not advertised to other devices in the same AS but can be advertised to an EBGP peer.
- EBGP is used to communicate with peers in different ASs. Routes received from a device in a different AS can be advertised to both EBGP and IBGP peers.

See “Inter-AS connections” in section 74.1 for more information about connecting ASs in a VPRN.

You can use the 5620 SAM to enable BGP on the device and perform the following functions:

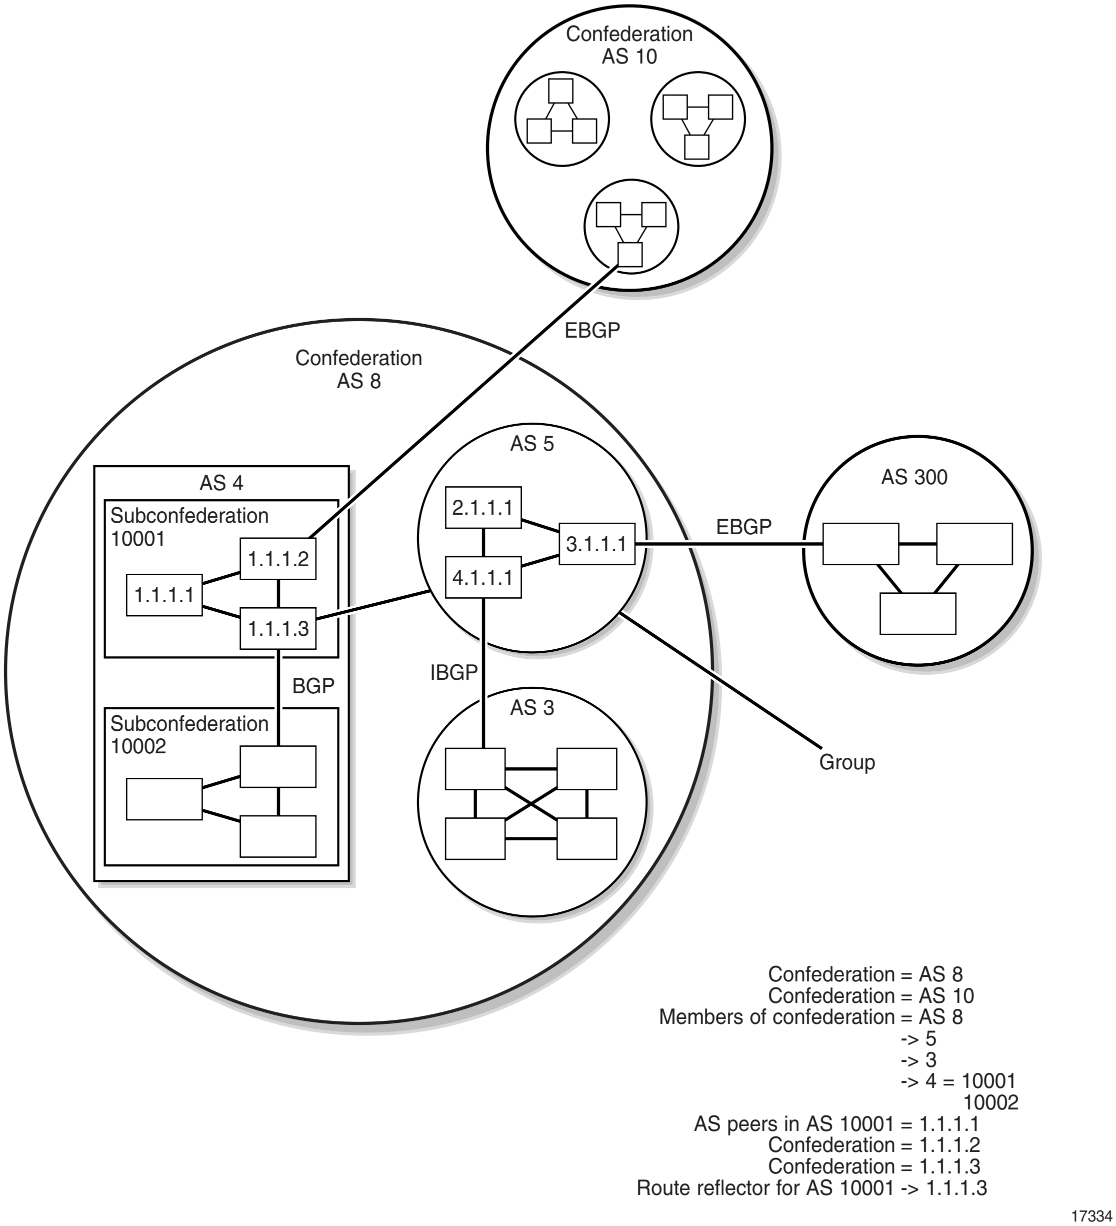
- set the AS values for the routing instance
- create confederations of group-managed devices
- create BGP peer groups
- create neighbors (peers) within the BGP peer groups

The 5620 SAM supports the configuration of IPv6 addresses for BGP peering on the base routing instance of the 7750 SR (chassis modes C and D, and chassis modes A and B with mixed mode enabled), and the 7450 ESS in mixed mode.

A device can only belong to one AS. After the neighbor relationship is established between devices, they exchange BGP open messages, which contain information such as AS numbers, BGP versions, router IDs, hold-time values, and keepalive messages. This information determines the status of the BGP session. Peer relationships are defined by configuring the IP addresses of the devices that are peers of the local BGP system.

Figure 31-1 shows a simple BGP example using groups, subconfederations, and confederations.

Figure 31-1 BGP example



In a standard BGP configuration, all BGP-enabled devices within an AS have a full mesh of BGP peerings to ensure all externally learned routes are redistributed through the entire AS. This is needed because IBGP does not re-advertise routes learned from one IBGP peer to another IBGP peer. However, as more devices are added, scaling the IBGP mesh can become an issue. To solve this scaling issue, you can use:

- confederations
- subconfederations

Confederations are a way to subdivide a large AS into smaller ASs. Subconfederations further subdivide ASs. Within each smaller AS, or confederation, IBGP is still used, however EBGP is used between subconfederations. This means less meshing between peers is required.

Another method of subdividing an AS is route reflection. For route reflection, an AS is divided into groups called clusters. Each cluster contains at least one route reflector. The route reflector redistributes routing updates to all devices in its cluster. Because the route reflector provides all the routing updates, the other devices in the cluster do not maintain a BGP mesh.

By default, BGP routers will advertise only the best path to other BGP peers. When the best path fails or a better path is discovered, the old routing information is overwritten. If BGP Add-Path is enabled, peers will advertise multiple paths for the same destination, all of which will be retained in their routing tables. In the event of a failure or path withdrawal message, the router is able to update its forwarding entry for that destination without having to receive new path advertisements. This results in faster convergence after path failure.

MP-BGP

BGP distributes IP routing information between networks. The distribution of IP routing information between VPRNs requires MP-BGP. MP-BGP addressing uses an 8-byte RD with a 4-byte or 16-byte IP address, depending on whether IPv4 or IPv6 is used. The requirements for MP-BGP configuration are the following.

- MP-BGP must be enabled on the participating PE devices.
- All PE devices must be configured as BGP peers.

When PE devices learn routing information from the CE devices in a VPRN configuration, the routing information is shared using MP-BGP. The RD is used to associate the new routing information with a VPRN instance.

The PE devices distribute the route information to the other CE devices in the VPRN. Each learned route is assigned an MPLS label that is distributed to the devices.

When customer packets arrive at a PE device, the packets are encapsulated with the MPLS label that corresponds to the learned route for the packet destination.

The MP-BGP multicast extension can be applied to build separate routing tables for multicast paths. IGPs such as OSPF and IS-IS can import multicast and unicast routing information to the multicast and unicast routing tables. The multicast routing information can subsequently be used by PIM to perform RPF lookups.

RIP

RIP is an IGP that uses a distance-vector algorithm to determine the best route to a destination, using hop count as the deciding factor. In order for the protocol to provide complete information about routing, every device in the domain must participate in the protocol. RIP, a UDP-based protocol, updates its neighbors, and the neighbors update their neighbors.

Unlike OSPF and other link-state protocols, RIP directly advertises reachability information to its neighbors. RIP advertises reachability information by sending prefix, mask, and either hop count or cost metric data. Each device running the RIP protocol advertises all RIP devices periodically by sending RIP update PDUs. The route with the lowest metric is advertised as the best route.

The 5620 SAM supports the configuration of RIPv1 and RIPv2 on network and access interfaces.

The 5620 SAM supports the configuration of IPv6 addresses for RIP on the base routing instance of the 7750 SR (chassis modes C and D, and chassis modes A and B with mixed mode enabled).

LDP

LDP is used to distribute labels in non-traffic-engineered MPLS applications. Routers can establish LSPs across a network by mapping network-layer routing information directly to the data link layer switched paths. After the LDP distributes the labels to the LSR, the LSR assigns the label to a FEC, and then informs all other LSRs in the path about the label and how the label switches data accordingly.

A FEC is a collection of common actions associated with a class of packets. LDP helps establish the LSP by providing a set of procedures that LSRs can use to distribute labels.

When a service tunnel is configured on managed routers using LDP signaling in an MPLS environment, LDP sessions are set up based on the configured hello and other PDU values. If another service tunnel is created to the same destination, the LDP session is reused.

The LDP sessions between LSRs:

- find and establish LDP peers in the managed network
- exchange label mappings for each LSR
- exchange label bindings

After all the LSRs are LDP-aware and the LSP is created, forwarding can occur as follows:

1 A FEC is associated with the LSP.

2 The FEC maps the packets to the LSP.

3 The next LSR that is part of the LSP splices incoming FEC labels to the outgoing FEC label of the next hop.

There are two types of LDP:

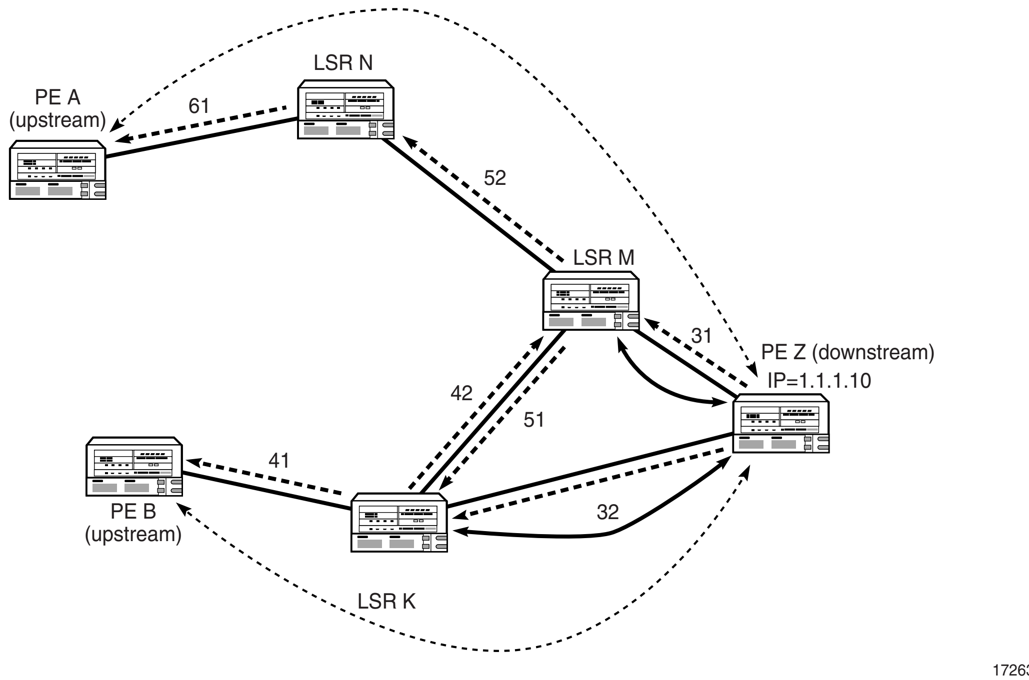
- T-LDP
- DU-LDP

T-LDP is used to distribute labels for VLL and VPLS. T-LDP allows the targeting of remote devices that are not directly connected as targeted peers.

DU-LDP can be used to create tunnels between PEs for IP-VPN services.

Figure 31-2 shows an example of LDPs that are used in a simple Layer 2 and Layer 3 service provider network.

Figure 31-2 LDP sample network



- The solid straight lines between the devices indicate IP connectivity. These are directly connected peers.
- The dotted bidirectional curved lines indicate T-LDP sessions. These are targeted peers that are not directly connected.
- The solid bidirectional curved lines indicate DU-LDP sessions. This example only shows two instances, between M and Z, and Z and K. If there is IP connectivity between all the devices, then all of the devices have DU-LDP sessions.

Provider edge router Z advertises the labels for its address 1.1.1.10 to adjacent link state devices M and K. Routers M and K distribute the labels for that address to the rest of the network.

If provider edge router A wants to send a VPN-labeled packet to router Z, it uses label 61 as the outer label. When the packet reaches router N, outer label 61 is swapped for outer label 52 and the packet continues downstream to router M. Router M then swaps out label 52 for either outer label 31 or 42, depending on router M's label selection algorithm. If outer label 31 is selected, the packet reaches router Z directly, which then continues to route the packet to the customer site based on the VPN label.

If a router receives more than one request for an IP address, and the router does not support ECMP, it selects the first label it receives. If the router supports ECMP, it selects the label with the lowest cost path, or selects both labels if the cost paths are identical.

When a router supports ECMP protocol, LSRs can have multiple equal cost paths to an IP address. ECMP LDP retains all labels it receives from multiple next hop peers. The forwarding plane contains multiple next hops for a FEC and as a result, provides load balancing for LDP-based LSPs.

When a router supports ECMP LDP and a device configured as the next hop is no longer valid, for example a session between peers is lost or the peer withdraws its label, a new valid LDP next hop peer is selected and the forwarding plane is updated.

Load balancing across LSPs for LDP over RSVP is also supported. When ECMP is enabled, all equal cost LSP endpoints are installed in the routing table by the IGP for consideration by LDP. LDP selects the LSP with the lowest LSP metric to determine the next hop. If multiple LSPs are available with equal cost, then ECMP is utilized until the ECMP count is exhausted. An LDP tree is created by sending LSP Trace messages along an ECMP path to downstream LSR nodes.

LDP for P2MP

LDP support for P2MP can be enabled on an LDP interface. You can configure an LDP interface for multicast traffic forwarding towards a downstream node. LDP configuration allows an exchange of P2MP FEC via an established session to a peer, and the use of next hops over an interface.

LDP configuration is supported on a tunnel interface under a base routing instance and under protocols such as PIM and IGMP. A P2MP ID is used as an index for LDP-based tunneling instead of an LSP ID.

Note — BFD and source redundancy are only supported on an RSVP tunnel interface.

IS-IS

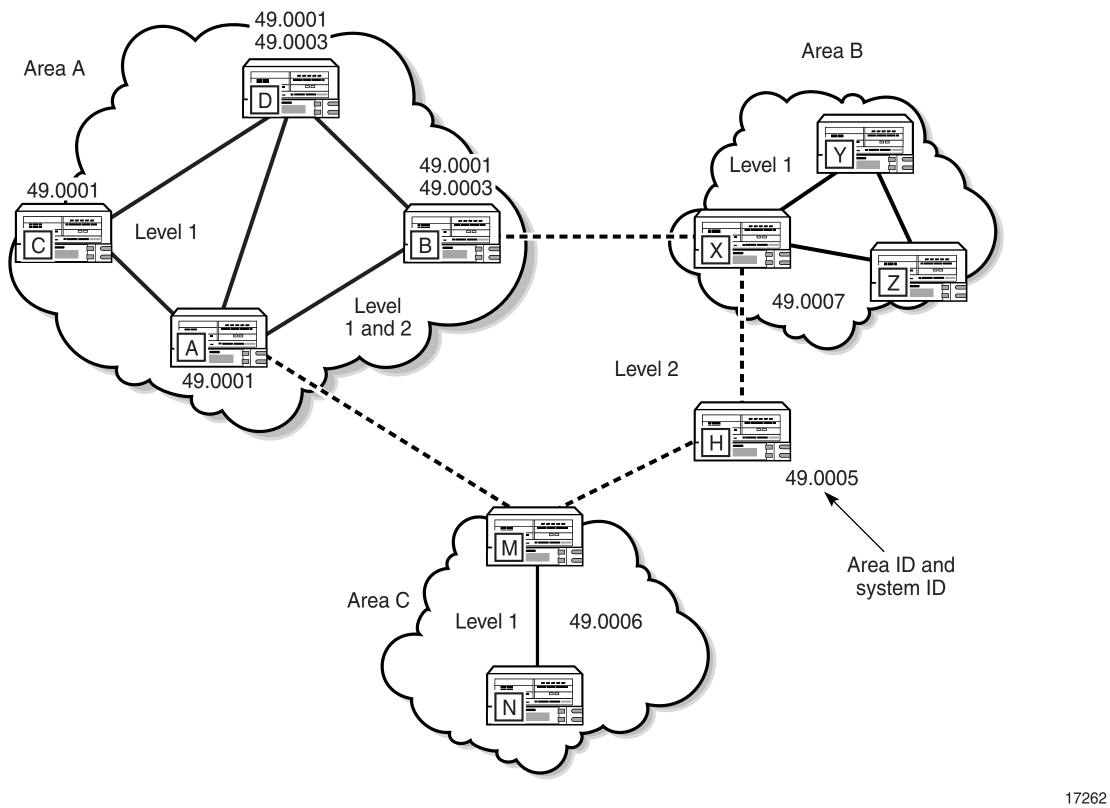
IS-IS is a link-state interior gateway protocol that uses the shortest path first algorithm to determine a route. Routing decisions are made using the link-state information. IS-IS entities include:

- networks, which are autonomous system routing domains
- intermediate systems, which are routers
- end systems, which are network devices that send and receive PDUs

End systems and intermediate system protocols allow devices and nodes to identify each other. The IS-IS protocol sends link state updates periodically through the network, so each device can maintain current network topology information.

Large networks, or autonomous systems, are supported by the IS-IS using a two-level hierarchy. This divides a large area into more manageable, smaller areas. The first level (level 1) of routing is performed within an area. The second level (level 2) of routing is performed between areas, as shown in Figure 31-3.

Figure 31-3 IS-IS routing domains example



Level 2 areas are also called backbones, similar to an OSPF backbone area. All traffic traversing different areas must traverse the backbone.A device can be configured as level 1, level 2, or both level 1 and 2. In this example, routers A, B, M, H, and X form the level 2 IS-IS backbone. The connection between routers A and B carries both level 1 and level 2 link-state PDUs. However, level 1 devices are only aware of their own area's topology, and must forward traffic to a layer 1/2 device to forward the data to another area.

Two devices are in the same level 1 area when they have level 1 adjacency. Level 1 adjacency occurs when the area IDs are common and there is a level 1 connection between the devices. Level 2 adjacency occurs when it has at least one level 1 or 2, or one level 2 interface configured.

The 5620 SAM supports the configuration of IPv6 addresses for IS-IS adjacencies.

Note — If two neighboring devices in the same level 1 area run both level 1 and 2, they establish both a level 1 and level 2 adjacency.

When LDP over RSVP is enabled for IS-IS, LSP can be used by the IGP to calculate its SPF tree. The IGP then provides LDP with all of the ECMP IDP next-hops and tunnel endpoints that the IGP identifies as the lowest cost path to the destination. If an IGP calculation and an LDP over RSVP have the same cost, LDP chooses an LDP over RSVP tunnel over an IGP route and ECMP between the two types is not considered. The type and number of tunnels that are to be considered by LDP depend on the IGP costs, where the lowest cost between the tunnel endpoint and the target is selected.

After the IS-IS is configured, routing occurs as follows:

1 Hello PDUs are sent to IS-IS-enabled interfaces to discover neighbors and establish adjacencies.
2 IS-IS neighbor relationships are formed.
3 Link-state PDUs are created based on local interfaces and prefixes that are learned from adjacent devices.
4 The devices flood LSPs to adjacent neighbors, and build a link-state database.
5 A shortest path tree is calculated by the IS-IS and the routing table is built.

OSPF

OSPF is a hierarchical link-state interior gateway protocol that operates within ASs and is used in IP networks. OSPF packets are routed based on the destination IP address of the IP packets. Each OSPF router collects link-state information to build a network topology based on OSPF areas. This topology is used to apply the Dijkstra algorithm to calculate the shortest path to each destination in the network. See the appropriate device documentation for more information about OSPF.

When LDP over RSVP is enabled for OSPF, LSP can be used by the IGP to calculate its SPF tree. The IGP then provides LDP with all of the ECMP IDP next-hops and tunnel endpoints that the IGP identifies as the lowest cost path to the destination. If an IGP calculation and an LDP over RSVP have the same cost, LDP chooses an LDP over RSVP tunnel over an IGP route and ECMP between the two types is not considered. The type and number of tunnels that are to be considered by LDP depend on the IGP costs, where the lowest cost between the tunnel endpoint and the target is selected.

OSPF areas

The hierarchical design of OSPF allows a collection of networks to be grouped into a logical OSPF area. The topology of the area is hidden from the rest of the AS, which significantly reduces OSPF protocol traffic. Routing in the AS takes place on two levels, depending on whether the source and destination of a packet reside in the same area (intra-area routing) or different areas (inter-area routing). In intra-area routing, the packet is routed solely on information obtained within the area; routing information obtained from outside the area is not used. Routers that belong to more than one area called an ABR. An ABR maintains a separate topological database for each area it is connected to. Every router that belongs to the same area has an identical topological database for that area.

OSPF super-backbone

The OSPF super-backbone provides an additional layer of hierarchy in OSPF. The OSPF super-backbone functions include:

- loop prevention
- handling LSAs received from the CE
- managing VPN IPv4 routes received by BGP

The PE routers that connect OSPF areas to the super-backbone function as ABRs in the OSPF areas to which they are attached. To achieve full compatibility, the PE routers can also serve as ASBRs in non-stub areas.

PE routers insert inter-area routes from other areas into the area in which the CE router is present. The CE routers are not involved at any level and are not aware of the super-backbone or other OSPF areas that exist outside of the super-backbone.

When you configure the super-backbone, all destinations that are learned by PEs with matching domain IDs become inter-area routes.

See the appropriate device documentation for more information about the OSPF super-backbone.

RSVP

RSVP is a network control protocol that hosts use to request specific qualities of service from the network for specific data streams. RSVP is also used to deliver QoS requests to all devices in a data path and to establish and maintain the state information required to provide the requested service quality.

RSVP is not a routing protocol. RSVP operates using unicast and multicast routing protocols. RSVP consults local routing tables to relay RSVP messages. By default, RSVP is enabled on all devices that support it.

RSVP requests typically result in the reservation of resources on each device in the data path. MPLS uses this RSVP mechanism to set up traffic-engineered LSPs. RSVP requests resources for unidirectional flows only. RSVP treats a sender as logically distinct from a receiver, although the same application process may act as both a sender and a receiver.

The RSVP hello protocol detects the loss of a neighbor node or the reset of a neighbor RSVP state information. In standard RSVP, neighbor monitoring occurs as part of the RSVP soft-state model. The reservation state is maintained as cached information that is first installed and then periodically refreshed by the ingress and egress LSRs.

If the state is not refreshed within a specified time interval, the LSR discards the state because it assumes that either the neighbor node has been lost or its RSVP state information has been reset.

Diff-Serv Traffic Engineering support

The 5620 SAM supports Diff-Serv Traffic Engineering, or TE, extensions for RSVP. Diff-Serv TE extensions provide the ability to manage bandwidth in an MPLS network on a per-TE-class basis. With Diff-Serv TE, an LER can perform this on a per-class basis. Therefore, you can set different limits for admission control of LSPs in each TE class over each link in the network.

You do this by setting a bandwidth constraint, which configures the percentage of the RSVP interface bandwidth that each CT shares. The absolute value of the CT share of the interface bandwidth is derived as the percentage of the bandwidth advertised by IGP in the Maximum Reservable link bandwidth TE parameter, that is, the link bandwidth multiplied by the RSVP interface subscription parameter.

This configuration also exists at the RSVP interface level and the value specifically configured for the interface overrides the globally-configured value. The bandwidth constraint value can be changed on the fly. You are also allowed to specify the bandwidth constraint for a CT which is not used in any of the TE class definitions and which is not used by any LSP originating or transiting this node.

To enable this feature, in summary, you must:

- configure Diff-Serv Classes on the router RSVP Routing Instances
- configure protocol properties to allow Diff-Serv Classes on the required router RSVP Interfaces
- configure traffic engineering and specify the Class Type that the required dynamic LSPs belongs to
- configure the Diff-Serv Class Type that the required LSP Paths belongs to. This overrides the value set at the LSP level.
- configure Diff-Serv to LSP FC mappings on the required service tunnels (SDPs). User-entered mappings of FC to LSP name are validated automatically (to avoid configuration conflicts) by checking with the RSVP module.

L2TP

L2TP is a session-layer protocol that extends the PPP model by allowing L2 and PPP endpoints to reside on different devices that are interconnected by a PSN. L2TP extends the PPP sessions between the CPE and PPP/L2TP termination point on the L2TP network server (LNS), via an intermediate L2TP access concentrator (LAC). The LAC is the initiator of session-generated L2TP tunnels; the LNS is the server that waits for new tunnels. Manually configured and initiated L2TP tunnels can be initiated and stopped from either the LNS or LAC.

After an L2TP tunnel is established, the network traffic between the peers is bidirectional. If a tunnel carrying a session fails, another tunnel from the same tunnel group re-establishes the session. Within each L2TP tunnel, one or more L2TP sessions can exist. Each L2TP session transports PPP packets.

The 5620 SAM supports the configuration and management of the following:

- ISA-LNS groups
- L2TP sites
- L2TP tunnel group profiles
- L2TP tunnel profiles

ISA-LNS groups

The 5620 SAM supports the creation and configuration of ISA-LNS groups on the 7750 SR. ISA-LNS groups provide LNS PPP session termination. An ISA-LNS group is associated with specific L2TP inbound peers and groups. Session traffic is automatically balanced across the available active ISA broadband application MDAs in the group.

The following operations can be performed on an ISA-LNS group member:

- drain MDA—prevents new sessions from being accepted
- stop drain—allows new sessions to be established
- stop MDA sessions—terminates the active sessions

See Procedure 18-7 for information about creating and configuring an ISA-LNS group.

L2TP sites

By default, L2TP is enabled on a base routing instance, and an L2TP site is created. An L2TP icon appears in the routing view of the navigation tree. An L2TP site does not exist by default on the base routing instance of a 7450 ESS in non-mixed mode.

L2TP is not enabled by default on a VPRN site. To enable L2TP on a VPRN site, see Procedure 74-1.

L2TP tunnel group profiles

An L2TP tunnel group profile represents the configuration for a group of L2TP tunnels. L2TP tunnel group profiles must be configured on the LNS NE. If a local user database is used on the LAC for session authentication, an L2TP tunnel group profile must be configured on the LAC. When you create an L2TP tunnel group profile, the profile can be used by its child L2TP tunnel profile to inherit certain parameter values. The inherited parameter values are used as the default values during L2TP tunnel profile configuration.

The following operations can be performed on an L2TP tunnel group profile that has a configured L2TP tunnel profile:

- drain—prevents new sessions from being accepted
- stop drain—allows new sessions to be established
- stop—closes tunnel instances and terminates the active sessions

See Procedure 31-30 for information about managing L2TP tunnel group profiles.

L2TP tunnel profiles

You can create and manage L2TP tunnel profiles from the Tunnel Group Profile properties form.

The following operations can be performed on an L2TP tunnel profile:

- start instance—attempts to create new tunnels
- stop instance—attempts to close the tunnels
- drain—prevents new sessions from being accepted
- stop drain—accepts new sessions

See Procedure 31-30 for information about managing L2TP tunnel profiles.

L2TP tunnel instance endpoints

The endpoints of an operational L2TP tunnel are represented by tunnel instance endpoints. You can view tunnel instance endpoints from the Tunnel Instance Endpoints tab on the L2TP Site (Edit) form, and from the Tunnel Group Profile or Tunnel Profile properties form if the endpoint is created using the profile configuration.

An L2TP tunnel instance endpoint is automatically created when:

- a start operation is performed on an L2TP tunnel profile
- an incoming L2TP session is established using group and tunnel profiles
- RADIUS authentication returns a configuration for the tunnel when an incoming L2TP session is authenticated and PPP session authentication determines that L2TP is used, at which point an L2TP session is established.

The following operations can be performed on an L2TP tunnel instance endpoint:

- drain—prevents new sessions from being accepted
- stop drain—allows new sessions to be established
- stop—closes the tunnel instances and terminates the active sessions

L2TP peers

An L2TP site can have none or multiple L2TP peers. L2TP peer information is available on the Peers tab of the L2TP Site form. Information about L2TP tunnels for a specific L2TP peer is available on the Tunnels tab of the L2TP Peer properties form.

The following operations can be performed on an L2TP peer:

- drain—prevents new sessions from being accepted
- stop drain—accepts new sessions

L2TP tunnels and tunnel endpoints

You can view information about L2TP tunnels and tunnel endpoints from the L2TP Tunnel - Endpoint A - Endpoint B form. See Procedure 31-31 for information about viewing L2TP tunnels and tunnel endpoints.

PIM

PIM is a component of multicast routing that defines the one-to-many or many-to-many transmission of information. You can use the following variations for PIM configurations:

- sparse mode
- dense mode
- source-specific multicast
- bidirectional

Sparse mode is the most common PIM configuration. Sparse mode is used for data transmission to nodes in multiple Internet domains that contain a small ratio of nodes that subscribe to the multicast traffic. Dense mode is used when a large ratio of the potential nodes subscribe to the multicast traffic. In source-specific multicast, paths originate at a single, defined source. Bidirectional PIM is not source-specific.

Anycast RP

Anycast RP for PIM-SM enables fast convergence when a PIM RP router fails. The receivers and sources rendezvous at the closest RP after the router failure. Anycast RP allows an arbitrary number of RPs for each group in a single, shared-tree PIM-SM domain. Triple play configurations that distribute multicast traffic using PIM-SM realize the benefits of fast RP convergence, which helps to avoid the loss of multicast data streams or IPTV delivery to the end user.

Anycast RP for PIM-SM environments is supported in the base routing PIM-SM instance of the service router. The 7750 SR, 7710 SR, and the 7450 ESS in mixed mode support Anycast RP in VPRN instances that are configured with PIM.

Anycast RP for PIM requires the completion of the following configuration information:

- An IP address specified as the RP address. This address is statically configured, or distributed using a dynamic protocol, to all PIM routers in the domain.
- A set of routers in the domain designated as RPs for the RP address. These routers form an anycast RP.
- Each of these routers is configured with a loopback interface that uses the RP address. The RP address, or a prefix that includes the RP address, is injected into the unicast routing system inside the domain.
- Each router in the anycast RP also needs a separate IP address, to be used for communication between the RPs.
- Each router in the anycast RP is configured with the addresses of all other routers in the anycast RP. The addresses must be consistently configured in all RPs in the set.

Figure 31-4 shows a sample implementation of anycast RP for PIM-SM.

Figure 31-4 Sample implementation of anycast RP for PIM-SM

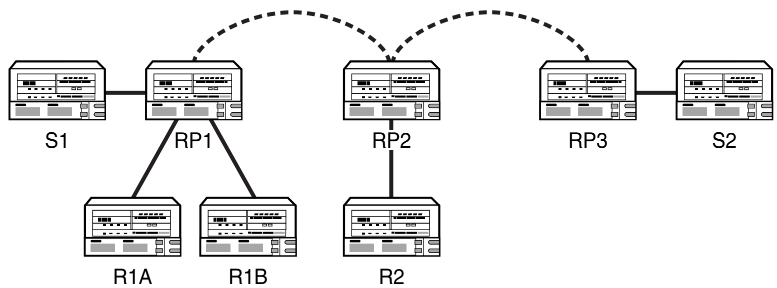


Table 31-1 summarizes the sequence of events for the Anycast RP implementation shown in Figure 31-4.

Table 31-1 Sequence of events for Anycast RP fast convergence

Sequence	Event description
1	S1 sends a multicast packet.
2	The router connected to S1 forms a PIM registration message to send to the Anycast RP address. The unicast routing system delivers the PIM registration message to the nearest RP, in this case RP1.
3	RP1 receives the PIM registration message, decapsulates the message, and sends the packet down the shared tree to the R1A and R1B receivers.
4	RP1 is configured with the IP address for RP2 and RP3. Since the registration message did not come from one of the RPs in the anycast RP set, RP1 assumes that the packet came from a designated router.
5	RP1 sends a copy of the registration message from the S1 designated router to RP2 and RP3. RP1 uses its own IP address as the source address for the PIM registration message.
6	RP1 can join the source tree by sending a join message to S1. However, RP1 must create a source-specific state.
7	RP2 receives the registration message from RP1, decapsulates the message, and send the packet down the share tree to the R2 receiver.
8	RP2 sends a registration-stop message back to RP1. RP2 can wait to send the registration-stop message if it decides to join the source tree. RP2 should wait until it receives data from the source tree before it sends the registration-stop message. If RP2 does wait for the data, the registration-stop message is sent to RP1 when it receives the next registration message. If RP2 does not wait for the data, the registration-stop message is immediately sent to RP1.
9	RP2 can join the source tree by sending a join message to S1. However, RP2 must create a source-specific state.
10	RP3 receives the registration message from RP1 and decapsulates the message. No receivers joined for the group, so RP3 discards the packet.
11	RP3 sends a registration-stop message back to RP1.

(1 of 2)

Sequence	Event description
12	RP3 creates a source-specific state, so when a receiver joins after S1 starts sending traffic, RP3 can quickly join the source tree for S1.
13	RP1 processes the registration-stop message from RP2 and RP3. RP1 can cache the receipt of registration-stop messages from the RPs in the anycast RP set. (The cache of messages is completed on a per-RP or per-source-specific basis.) The cache of messages increases the reliability of the delivery of registration messages to each RP. Subsequent registration messages received by RP1 are sent only to the RPs in the anycast RP set that have not previously sent registration-stop messages from the source-specific entry.
14	RP1 sends a registration-stop message to the DR under the following conditions: • after receiving a registration message from the DR • if all RPs in the anycast RP set have returned registration-stop messages for a specific source-specific route

(2 of 2)

SPT switchover thresholds

SPT switchover thresholds allow you to configure the switchover threshold, in Kbps, for the group prefixes. The threshold value determines when the router switches from the shared tree to the source-specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

L3 Multicast Load Balancing for ECMP

The 5620 SAM distributes multicast traffic by balancing the load based on the total available multicast bandwidth on all ECMP paths. You can configure ECMP rebalancing on the VPRN and base PIM Routing Instance configuration forms.

5620 SAM ECMP rebalancing has the following important characteristics:

- Multicast load balancing over ECMP links is enabled, by default.
- The rebalancing timer is set to 30 minutes, by default.
- Distribution of the multicast groups over the available links is processed based on the bandwidth configured for the specified group address. If the bandwidth is not configured for the multicast stream, then the configured default value is used.
- If a link failure occurs, the load on the failed channel is distributed to the remaining channels. The bandwidth required to accommodate the load from the failed link is evenly distributed over the remaining links.
- If an additional link becomes available for a specific multicast channel, it is then treated in an equivalent manner to the other links of the interface.
- A manual (operator-initiated) rebalance command is typically used to re-evaluate the current balance, with regard to bandwidth utilization. If necessary, multicast streams can subsequently be moved to different links to achieve a balance.
- In an automatic timed rebalance, the system rebalances multicast streams over the available links, based on the configured bandwidth and interval. If no links have been added or removed, or it is determined that no multicast streams will benefit from a rebalance, then it is not be implemented.

- When multicast load rebalancing is not enabled, any ECMP changes are not optimized. However, whenever a link is added, an attempt is made to balance the number of multicast streams on all the available ECMP links. This may however, not result in balanced bandwidth utilization of all the ECMP links.
- Only a single rebalance command can be executed at any specific time. If a rebalance is in progress and a manual rebalance command is entered, it is rejected and a message is displayed informing the user that a rebalance is already in progress.

IGMP

IGMP is a multicast protocol which service providers can use to establish multicast group memberships on a LAN. Within the LAN, end users use IGMP to communicate with a local multicast router, which then uses PIM to distribute the IGMP messages to other local and remote multicast routers. Multicast routers send regular membership queries to IGMP hosts which respond with membership reports. Multicast routers can use these reports to determine which hosts are interested in receiving particular multicast messages.

IGMP operates above the network layer on IPv4 networks.

MSDP

MSDP is a protocol that enables multiple PIM-SM domains to communicate with each other using their own RPs. MSDP also enables multiple RPs in a single PIM-SM domain to establish MSDP mesh-groups and to synchronize information between anycast RPs about the active sources being served by each anycast RP peer. The 7750 SR, 7710 SR, and the 7450 ESS in mixed mode support MSDP.

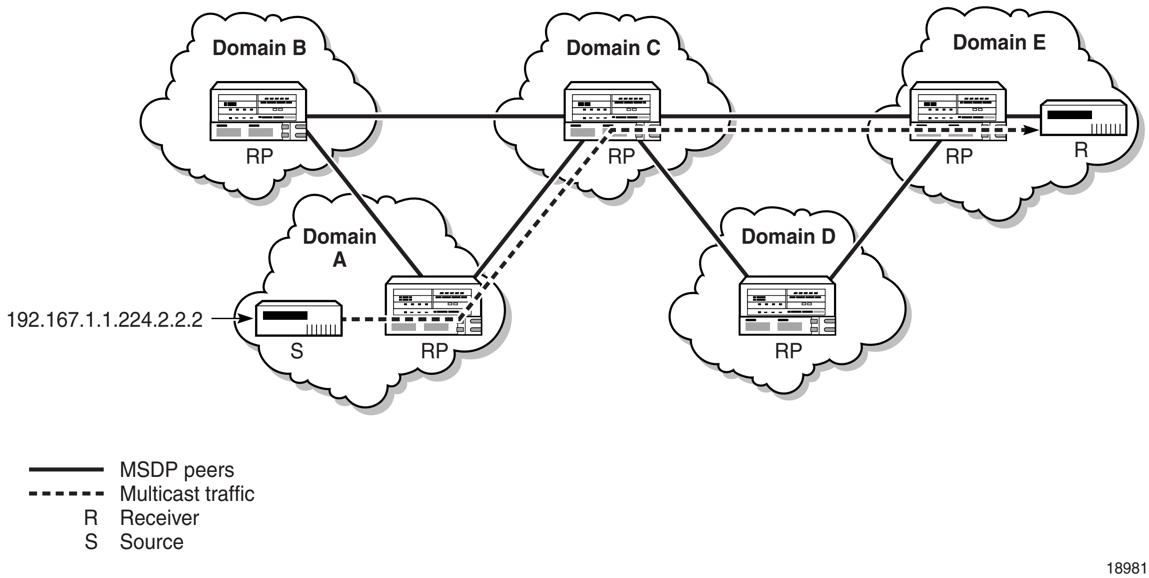
Each PIM-SM domain has its own RPs and MSDP enables these RPs to inform each other about active sources. When an active source is detected, the RPs send PIM-SM explicit join messages to the active source. When RPs in remote domains know about active sources, they can pass on this information to their local receivers and multicast data can be forwarded between the domains.

The RP learns about a new multicast source within its own domain through the PIM register mechanism and encapsulates the first data packet in a source active message. After an RPF check, the MSDP source active message is flooded by each peer to its MSDP peers until it reaches every MSDP router in the interconnected networks. If the receiving MSDP peer is an RP, and the RP has a (*,G) entry for the group in the source active message, the message is accepted. The RP creates an (S,G) state for the source and join to the shortest path tree for the state of the source.

The encapsulated data is forwarded down the RP's shared tree. When the packet is received by a receiver's last hop router, the last-hop may also join the shortest path tree to the source.

Figure 31-5 shows a sample of how data flows from a source in Domain A to a receiver in Domain E in an MSDP implementation for PIM-SM.

Figure 31-5 Sample implementation of MSDP for PIM-SM



MLD

MLD is an asymmetric protocol used by IPv6 routers to discover the presence of multicast listeners, that is, nodes that wish to receive multicast packets. MLD specifies separate behaviors for multicast address listeners and multicast routers.

The purpose of MLD is to enable each multicast router to discover, for each of its directly attached links, which multicast addresses and which sources have interested listeners on that link. The information gathered by MLD is provided to whichever multicast routing protocol is used by the router, such as PIM, to ensure that multicast packets are delivered to all links where there are listeners interested in such packets.

MLD is supported on a chassis mode C or D, and on the 7750 SR in chassis mode A or B with mixed mode enabled.

Bridging

Bridging is used between a 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device and a 7450 ESS to create a fast ring that bridges the end-user devices, such as BTV set-top boxes, and Layer 2 services, such as VPLS, that distribute multicast traffic. If required, you can configure the devices with MSTP or another STP.

STP is active by default on an OmniSwitch. The default mode of operation is 1x1 mode using RSTP. A loop-free network topology is automatically calculated based on default STP switch, bridge, and port parameter values.

Additional OmniSwitch configuration such as enabling and configuring OmniSwitch learned port security parameters for VLAN ports, DHCP relay, and DHCP snooping can be done while configuring other bridge parameters.

You can configure Multiple VLAN Registration Protocol (MVRP) as part of the bridging configuration on some versions of the OmniSwitch. MVRP provides a mechanism to maintain the contents of dynamic VLAN registration entries for each VLAN, and to propagate that information to other bridges.

In the 5620 SAM, a bridge is represented in the network view below a device, similar to the routing instance of a device.

31.2 Workflow to configure protocols

This workflow assumes the following:

- You know the 32-bit unique router ID prior to configuring OSPF or BGP.
- An AS number is assigned to the device prior to configuring BGP.

1 Enable the routing protocols to be supported on the devices. See the appropriate device documentation for more information. The options are:

- LDP
- IS-IS
- MPLS
- RSVP (enabled by default)
- BGP
- RIP
- L2TP (enabled by default)
- OSPFv2
- OSPFv3
- PIM
- IGMP
- MSDP
- MLD

Note — L2TP is enabled by default on a base routing instance, but not on a VPRN routing instance.

2 Ensure the parameters to implement routing protocols on the Layer 3 interfaces are configured. See chapter 30 for more information.

3 As required on the selected routing protocol, configure routing policies. See chapter 30 for more information.

4 Review the appropriate workflow to configure a routing protocol:

a BGP; see section 31.3 for more information

b RIP; see section 31.4 for more information

c LDP; see section 31.5 for more information

d IS-IS; see section 31.6 for more information

e OSPFv2 or OSPFv3; see section 31.7 for more information

f RSVP; see section 31.8 for more information

g L2TP; see section 31.9 for more information

h PIM; see section 31.10 for more information

- **i** IGMP; see section 31.11 for more information
- **j** MSDP; ee section 31.12 for more information
- **k** MLD; see section 31.13 for more information
- **l** bridging; see section 31.14 for more information

5 As required, configure the protocol for the remote device.

31.3 Workflow to configure BGP

1 Enable BGP on the routing instance. See Procedure 31-1 for more information.

2 Determine whether BGP confederations are necessary. If BGP confederations are necessary:

- **a** Configure the Confederation Autonomous System number on the Routing tab of the Routing Instance configuration form.
- **b** Configure BGP confederation members from the BGP Confederations tab of the Routing Instance configuration form. See Procedure 31-3 for more information.

3 If you are configuring MP-BGP, perform the following on the base routing instance of each NE that is to participate in a VPRN:

- **a** As required, enable VPN IPv4 and VPN IPv6.
- **b** As required, enable multicast IPv4 to apply the multicast extension. See Procedure 31-2 and chapter 74 for more information.

4 Create at least one BGP peer group. See Procedure 31-4 for more information.

5 As required, create BGP neighbors with which to peer. See Procedure 31-5 for more information.

6 As required, enable or disable BGP peering. See Procedure 31-6 for more information.

31.4 Workflow to configure RIP

1 Enable RIP on the routing instance. See Procedure 31-7 for more information.

2 Configure global-level RIP. See Procedure 31-8 for more information.

3 Configure group-level RIP. See Procedure 31-9 for more information.

4 Configure neighbor-level (also known as interface) RIP. See Procedure 31-10 for more information.

31.5 Workflow to configure LDP

1. Enable LDP on the routing instance. See Procedure 31-11 for more information.
2. Configure global-level LDP. See Procedure 31-12 for more information.
3. Configure one of the following options.
   a. If two LDP peers are adjacent devices, create an LDP interface. See Procedure 31-13 for more information.
   b. If two LDP peers are non-adjacent devices, create an LDP targeted peer. See Procedure 31-14 for more information.
4. As required, configure ECMP on an LDP routing interface. See Procedure 31-16 for more information.
5. Create an LDP keychain. See Procedure 31-15 for more information.

31.6 Workflow to configure IS-IS

1. Enable IS-IS on the routing instance. See Procedure 31-17 for more information.
2. Configure global-level IS-IS. See Procedure 31-18 for more information.
3. Configure at least one NET address. See Procedure 31-19 for more information.
4. Configure at least one IS-IS interface. See Procedure 31-20 for more information.
5. As required, if LDP over RSVP is enabled for IS-IS, configure an operational LSP between routers. See chapter 32 for more information.

31.7 Workflow to configure OSPFv2 and OSPFv3

1. Enable OSPF on the routing instance. See Procedure 31-21 for more information.
2. Configure OSPF on the routing instance. See Procedure 31-22 for more information.
3. Create at least one OSPFv2 or OSPFv3 area. See Procedure 31-23 for more information.
4. Assign routers to the OSPFv2 or OSPFv3 area. See Procedure 31-24 for more information.
5. Assign Layer 3 interfaces to the routers in the OSPFv2 or OSPFv3 area. See Procedure 31-25 for more information.
6. As required, create an OSPF area range. See Procedure 31-26 for more information.
7. As required, create a virtual link between the backbone OSPF area and a remote OSPF area that does not advertise the OSPF topology. See Procedure 31-27 for more information.

31.8 Workflow to configure RSVP

1. As required, configure MPLS, LSP, MPLS path, and LSP path parameters. See chapter 32 for more information.
2. Configure the RSVP on the routing interface. See Procedure 31-28 for more information.
3. Configure the RSVP interface. See Procedure 31-29 for more information.
4. As required, enable LDP. See Procedure 31-11 for more information.

31.9 Workflow to configure L2TP

1. Configure L2TP on a routing instance. See Procedure 31-30 for more information.
2. Create and configure an LNS group and group member for an LNS site. If the site is a LAC, this configuration is not required. See Procedure 18-7 for more information.
3. As required, configure the ESM profiles for LNS L2TP termination:
   - **a** VPRN; see Procedure 74-13 for more information
   - **b** IES; see Procedure 73-8 for more information
4. As required, configure L2TP on each local user database PPPoE host to be forwarded to the LNS (applicable for the LAC and the LNS, where RADIUS is not used). See Procedure 68-32 for more information.
5. As required, view L2TP tunnels and endpoints. See Procedure 31-31 for more information.

31.10 Workflow to configure PIM

1. Enable PIM on a routing instance. See Procedure 31-32 for more information.
2. Configure PIM on a routing instance. See Procedure 31-33 for more information.
3. As required, configure Anycast RP for PIM on a router. See Procedure 31-34 for more information.
4. Configure a PIM interface. See Procedure 31-35 for more information.

31.11 Workflow to configure IGMP

1. Enable IGMP on the routing interface. See Procedure 31-36 for more information.
2. Configure IGMP on the routing instance.See Procedure 31-37 for more information.
3. As required, configure IGMP on an OmniSwitch. See Procedure 31-38 for more information.

4 Configure an IGMP interface. See Procedure 31-39 for more information.

5 As required, turn up or shut down an IGMP interface. See Procedure 31-40 for more information.

6 As required, view IGMP statistics, as follows:

  a IGMP multicast reporting statistics; see Procedure 31-41 for more information

  b IGMP source statistics; see Procedure 31-42 for more information

31.12 Workflow to configure MSDP

1 Enable MSDP on the routing instance. See Procedure 31-43 for more information.

2 Configure global MSDP on the routing instance. See Procedure 31-44 for more information.

3 Create at least one MSDP peer or group-peer.

  a As required, configure group-level MSDP. See Procedure 31-45 for more information.

  b As required, configure peer-level MSDP. See Procedure 31-46 for more information.

4 As required, configure group-peer-level MSDP. See Procedure 31-48 for more information.

5 As required, configure an MSDP source. See Procedure 31-47 for more information.

6 As required, enable or disable MSDP peering. See Procedure 31-49 for more information.

31.13 Workflow to configure MLD

1 Enable MLD on the routing instance. See Procedure 31-50 for more information.

2 Configure MLD on the routing instance. See Procedure 31-51 for more information.

3 Create an MLD interface. See Procedure 31-52 for more information.

31.14 Workflow to configure bridging on a 7250 SAS or Telco device

1. As required, configure bridging on a 7250 SAS or Telco device. See Procedure 31-53 for more information.
2. As required, configure bridging on an OmniSwitch. See Procedure 31-54 for more information.
3. As required, release a violated OmniSwitch LSP port. See Procedure 31-55 for more information.

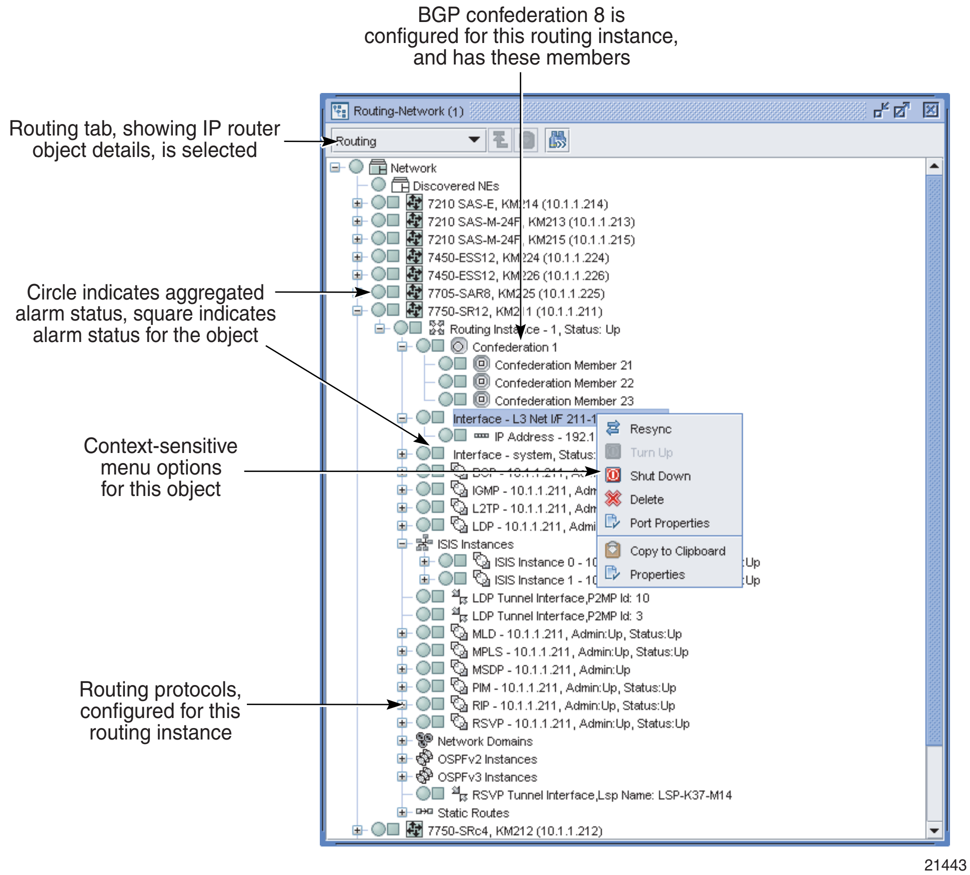
31.15 BGP configuration procedures

The BGP command hierarchy consists of three levels:

- global
- peer group
- peer (also known as neighbor)

Figure 31-6 shows the network view open to show Confederations and BGP settings.

Figure 31-6 BGP in the navigation tree network view



BGP parameters are initially applied at the global level. These parameters are inherited by the group and peer levels. Parameters can be modified and overridden on a level-specific basis.

Many of the hierarchical BGP commands can be modified at different levels. BGP group-level parameters take precedence over BGP global-level parameters. BGP peer-level parameters take precedence over group- and global-level parameters.

The following procedures describe how to configure BGP.

Procedure 31-1 To enable BGP on a routing instance

1. From the 5620 SAM GUI, choose Routing from the navigation tree view selector.
2. Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.
3. Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens with the General tab displayed.

4 Enable BGP.

i Click on the Protocols tab button.

ii Choose the BGP Enabled parameter.

Note 1 — You must configure an AS number before enabling BGP. Configure the Autonomous System parameter on the Routing tab of the Routing Instance (Edit) form.

Note 2 — If a confederation is required, configure the Confederation Autonomous System parameter on the Routing tab on the Routing Instance (Edit) form.

5 Click on the OK button. The Routing Instance (Edit) form closes, a BGP entry appears in the list of enabled protocols, and a BGP icon appears in the network view of the navigation tree.

Procedure 31-2 To configure global-level BGP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the BGP icon. The path is Routing→Router→Routing Instance→BGP.

3 Right-click on the BGP icon and choose Properties. The BGP (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Router ID
- Administrative State
- Cluster ID

5 Configure the parameters in the MED block:

- MED Compare
- MED Source
- MED Value

These parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

6 Configure the parameters in the MultiPath block:

- Multi Path
  Set to 1 to disable. When set from 2 to 16, multipath is enabled and BGP load shares traffic across the number of links specified. If the equal cost routes available are greater than the configured value, then routes with the lowest next hop IP address are chosen.
- IBGP MultiPath
- EIBGP LoadBalance

7 Configure the Backup Path parameter in the Backup Path block.

8 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the Select button in the KeyChain block. The Select BGP Site Keychain - BGP form opens.

ii Select a key chain in the list and click on the OK button. The Select BGP Site Keychain - BGP form closes. The 5620 SAM assigns the key chain to the BGP instance.

9 If you are configuring BGP for a VPRN routing instance, go to step 12.

10 Configure the parameters in the Graceful Restart block:

- Graceful Restart
- Stale Routes Time (seconds)

The Stale Routes Time (seconds) parameter is configurable when the Graceful Restart parameter is enabled.

The Graceful Restart parameter is not configurable on 7210 SAS-M and 7210 SAS-X devices.

11 Configure the parameters in the IGP Shortcut block:

- IGP Shortcut
- Disallow IGP

The Disallow IGP parameter is only displayed if you enable one of the IGP Shortcut options.

12 Click on the Behavior tab button.

13 Configure the parameters:

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- FlowSpec Validate Enabled
- Disable Fast External Failover
- Advertise Inactive Routes
- Enable Inter AS VPRN
- Enable Rapid Withdrawal
- Enable Peer Tracking
- BFD Enabled
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Purge Time (minutes)
- Transport Tunnel
- Path MTU Discovery Enabled
- Hold Time (seconds)
- Enable Add-Path Send
- Add-Path Receive
- IPv4 Add-Path Limit
- VPN IPv4 Add-Path Limit
- IPv6 Add-Path Limit
- VPN IPv6 Add-Path Limit

The Enable Inter AS VPRN parameter is not configurable on a VPRN routing instance.

14 Click on the AS Properties tab button.

15 Configure the parameters:

- Min AS Origination (seconds)
- Disable 4Byte ASN
- Local AS
- Private
- Remove Private AS
- Limited

The Local AS parameters are used to configure a virtual AS. A virtual AS is used when a router (RTA) is moved from one AS (AS1) to another AS (AS2). However, the customer router (CR1) is configured to belong to the AS1. To avoid reconfiguring CR1 to belong to AS2, CR1 can continue to belong to AS1, but RTA has its local AS value set to AS1. RTA can advertise AS1 for routes advertised to CR1.

16 Click on the VPN tab button.

17 Configure the parameters:

- Family
- Apply Import Route Policies
- Apply Export Route Policies
- AS Override
- AS Path Ignore Family

If you are configuring global-level BGP for BGP AD in VPLS or for BGP VPLS, then you must enable L2 VPN in the Family block.

The Apply Import Route Policies and Apply Export Route Policies parameters are not configurable on a VPRN routing instance.

The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

18 Configure the Address Family parameter in the Rapid Update block.

19 Configure the Address Family parameter in the Advertise External block.

20 Perform the following steps to add a peer group, if required.

i Click on the Group tab button.

ii Click on the Create button.The Peer Group (Create) form opens.

iii Perform steps 4 to 20 of Procedure 31-4.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Peer Group (Create) form closes.

21 Perform the following steps to add a peer, if required.

i Click on the Peer tab button.

ii Click on the Create button. The Peer (Create) form opens.

iii Perform steps 4 to 21 of Procedure 31-5.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Peer (Create) form closes.

22 Click on the Import Policies tab button.

23 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policies to determine which routes are accepted from peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

24 Click on the Export Policies tab button.

25 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policies to determine which routes are advertised to peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 30. A router performs no validation to ensure the policies match.

26 Click on the Authentication tab button.

27 Configure the parameters:

- Type
- Key

28 Click on the following tab buttons to view information:

- Statistics
- Faults

29 Click on the OK button. The BGP (Edit) form closes.

Procedure 31-3 To configure a BGP confederation

For BGP confederations, the following rules apply:

- A device can only belong to one confederation.
- Multiple devices can belong to one BGP confederation.

You must configure BGP on the device and configure global-level BGP parameters before you configure BGP confederations, as described in Procedures 31-1 and 31-2.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the Routing Instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Click on the Routing tab button.

5 Enter the confederation number for the Confederation Autonomous System parameter and click on the Apply button.

6 Click on the BGP Confederations tab button.

7 Click on the Create button to add a BGP confederation, or select a BGP confederation from the list and click on the Properties button to configure an existing BGP confederation. The Confederation (Edit) form opens with the General tab displayed.

Note — You can only have one BGP confederation per device.

8 To add a new member to the confederation:

i Click on the Members tab button.

ii Click on the Create button. The Confederation Member (Create) form opens.

iii Configure the Member AS parameter as the number of ASs for the confederation. The member AS number represents the BGP instance of the device.

iv Click on the OK button. The Confederation Member (Create) form closes, and an entry for the new confederation member AS appears in the Confederation (Edit) form.

9 Click on the OK button. The Confederation (Edit) form closes and the Routing Instance (Edit) reappears. A Confederation icon appears in the Navigation Tree below the Routing Instance icon.

You can verify the confederation membership by opening the Confederation icon to view icons that represent the members of the confederation as specified in step 8.

10 Close the Routing Instance (Edit) form.

Procedure 31-4 To configure peer-group-level BGP

Note 1 — For most parameters in this procedure, you can specify that the parameter value is inherited from the parent BGP configuration using the Inherit Value parameter.

If you disable value inheritance for a parameter, the available options are restricted, based on the parent parameter value and the protocol functionality. For example, if a parameter in the global-level BGP configuration is set to True, the only available option for the same parameter in the peer-group-level BGP configuration is False, unless a value of False violates a protocol rule, in which case the only available option is True.

Note 2 — The parameters that you configure for a BGP peer group take precedence over the parameters that are configured for global-level BGP.

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Navigate to the BGP icon by choosing Routing→Router→Routing Instance→BGP.

3 Right-click on the BGP icon and choose Create Group. The Peer Group (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Description
- Administrative State
- Cluster ID
- Local Address
- Inherit Value
- Dynamic Peer

5 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the Select button in the KeyChain block. The Select BGP Group Keychain - Peer Group form opens.

ii Select a key chain in the list and click on the OK button. The Select BGP Group Keychain - Peer Group form closes. The 5620 SAM assigns the key chain to the BGP peer group.

6 Configure the parameters in the Graceful Restart block:

- Graceful Restart
- Stale Routes Time (seconds)
- Inherit Value

The Stale Routes Time (seconds) parameter is configurable when the Graceful Restart parameter is enabled.

The Graceful Restart parameter is not configurable on 7210 SAS-M and 7210 SAS-X devices.

7 Configure the parameters in the MED block:

- MED Source
- MED Value
- Inherit Value

These parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

8 Click on the Behavior tab button.

9 Configure the parameters:

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- Disable Fast External Failover
- Advertise Inactive Routes
- Enable Peer Tracking
- BFD Enabled
- FlowSpec Validate Enabled
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Peer Type
- Passive
- Next Hop Self
- Minimum TTL Value
- Path MTU Discovery Enabled
- Hold Time (seconds)
- Prefix Limit
- Prefix Limit Log Only
- Prefix Limit Threshold
- Enable Add-Path Send
- Add-Path Receive
- IPv4 Add-Path Limit
- VPN IPv4 Add-Path Limit
- IPv6 Add-Path Limit
- VPN IPv6 Add-Path Limit
- Inherit Value

10 Click on the AS Properties tab button.

11 Configure the parameters:

- Peer AS
  The parameter specifies the peer AS for this specific group, and the behavior, either internal or external. Multipath configurations are not supported at the BGP peer level.
- Min AS Origination (seconds)
- Disable 4Byte ASN
- AS Override
- Local AS
- Private
- Remove Private AS
- Limited
- Inherit Value

12 Click on the VPN tab button.

13 Configure the parameters:

- Family
- Advertise Label
- Apply Import Route Policies
- Apply Export Route Policies
- Inherit Value

Note 1 — The Advertise Label, Apply Import Route Policies, and Apply Export Route Policies parameters are not configurable for a VPRN routing instance.

Note 2 — The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

14 Perform the following steps to add a peer, if required.

i Click on the Peer tab button.

ii Click on the Create button. The Peer (Create) form opens.

iii Perform steps 4 to 21 of Procedure 31-5.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Peer (Create) form closes.

15 Click on the Import Policies tab button.

16 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Inherit Value

Configure the import route policies to determine which routes are accepted from peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

17 Click on the Export Policies tab button.

18 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Inherit Value

Note — Configure the export route policies to determine which routes are advertised to peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 30. A router performs no validation to ensure the policies match.

19 Click on the Authentication tab button.

20 Configure the parameters:

- Type
- Key
- Inherit Value

21 Click on the following tab buttons to view information.

- Statistics
- Faults

22 Click on the OK button. The Peer Group (Create) form closes, and the 5620 SAM displays an icon for the new peer group under the BGP icon in the navigation tree.

Procedure 31-5 To configure peer-level BGP

Note 1 — For most parameters in this procedure, you can specify that the parameter value is inherited from the parent BGP configuration using the Inherit Value parameter.

If you disable value inheritance for a parameter, the available options are restricted, based on the parent parameter value and the protocol functionality. For example, if a parameter in the peer-group-level BGP configuration is set to True, the only available option for the same parameter in the peer-level BGP configuration is False, unless a value of False violates a protocol rule, in which case the only available option is True.

Note 2 — The parameters that you configure for a BGP peer take precedence over the parameters that are configured for group-level BGP.

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Navigate to a peer group by choosing Routing→Router→Routing Instance→BGP→Peer Group.

3 Right-click on the peer group icon and choose Create Peer. The Peer (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- Description
- Administrative State
- Cluster ID
- Local Address
- Inherit Value

5 Click on the Behavior tab button.

6 Configure the parameters:

7 Click on the AS Properties tab button.

8 Configure the parameters:

- Peer AS
  The parameter specifies the peer AS for the group to which the peer belongs, and the behavior, either internal or external. Multipath configurations are not supported at the BGP peer level.
- Local AS
- Private
- Remove Private AS
- Limited
- Min AS Origination (seconds)
- Disable 4Byte ASN
- Inherit Value

9 Click on the MED tab button.

10 Configure the parameters:

- MED Source
- MED Value
- Inherit Value

These parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

11 Click on the VPN tab button.

12 Configure the parameters:

- Family
- Advertise Label
- Advertise LDP Prefix
- Apply Import Route Policies
- Apply Export Route Policies
- Inherit Value

The Advertise LDP Prefix is only displayed when the Advertise Label parameter is enabled for IPv4 routes.

The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

13 Click on the Graceful Restart tab button.

14 Configure the parameters:

- Graceful Restart
- Stale Routes Time (seconds)
- Inherit Value

15 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the KeyChain tab button.

ii Click on the Select button. The Select BGP Peer Keychain - Peer form opens.

iii Select a key chain in the list and click on the OK button. The Select BGP Peer Keychain - Peer form closes and the 5620 SAM assigns the key chain to the BGP peer.

16 Click on the Import Policies tab button.

17 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Inherit Value

Configure the import route policies to determine which routes are accepted from peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

18 Click on the Export Policies tab button.

19 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Inherit Value

Configure the export route policies to determine which routes are advertised to peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 30. A router performs no validation to ensure the policies match.

20 Click on the Authentication tab button.

21 Configure the parameters:

- Type
- Key
- Inherit Value

22 Click on the OK button. The Peer (Create) form closes and a Peer icon appears below the Peer Group icon in the Navigation Tree of the network view.

23 Configure the protocol for the far-end device, if applicable. Use CLI for devices that are managed outside the scope of the 5620 SAM.

Procedure 31-6 To enable or disable BGP peering

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Navigate to a peer group by choosing Routing→Router→Routing Instance→BGP→Peer Group.

3 Click on the Peer Group icon to display the peers in the peer group.

4 Right-click on a peer and choose one of the following menu items:

   a Turn Up to activate a peer

   b Shut Down to deactivate a peer

5 A dialog box appears. Click on the Yes button. The state information beside the Peer icon changes accordingly.

31.16 RIP configuration procedures

The RIP command hierarchy consists of three levels:

- global
- group
- interface (also known as neighbor)

For RIP configuration, you must define at least one group and one interface. The parameters that are configured on the global level are inherited by the group and interface levels. Parameters can be modified and overridden on a level-specific basis.

Many of the hierarchical RIP commands can be modified on different levels. RIP group-level parameters take precedence over BGP global-level parameters. RIP interface-level parameters take precedence over peer-group and global-level parameters.

The following procedures describe how to configure RIP.

Procedure 31-7 To enable RIP on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable RIP.

   i Click on the Protocols tab button.

   ii Select the RIP Enabled parameter.

5 Click on the OK button to save the changes. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and a RIP icon appears under the routing instance in the navigation tree.

Procedure 31-8 To configure global-level RIP

1. Choose Routing from the navigation tree view selector from the 5620 SAM GUI.
2. Navigate to the RIP icon by choosing Routing→Router→Routing Instance→RIP.
3. Right-click on the RIP icon and choose Properties. The RIP Site (Edit) form opens with the General tab displayed.
4. Configure the parameters:
   - Description
   - Administrative State
5. Click on the Behavior tab button.
6. Configure the parameters:
   - Check Zero
   - Message Size
   - Metric In
   - Metric Out
   - Preference
   - Receive
   - Send
     The parameter specifies the type of messages received based on the RIP version, and the variation of RIPv2 messages sent, either broadcast or multicast.
   - Split Horizon
   - Propagate RIP Metric
     This parameter is configurable only when configuring RIP on a VPRN routing instance.
   - Flush
   - Timeout
   - Update
7. Click on the Authentication tab button.
8. Configure the parameters:
   - Type
   - Key
9. Click on the Import Policies tab button.
10. Configure the parameters:
    - Policy 1
    - Policy 2
    - Policy 3
    - Policy 4
    - Policy 5

Specify routing policies that determine the routes that RIP interfaces import. You can specify up to five routing policies. The routing policies are enforced in order, from one to five.

11 Click on the Export Policies tab button.

12 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Specify routing policies that determine the routes that RIP interfaces export. You can specify up to five routing policies. The routing policies are enforced in order, from one to five.

13 To create a RIP group, click on the Group tab button.

i Click on the Create button. The RIP Group (Create) form opens.

ii Configure the parameters. See Procedure 31-9 for more information.

14 Click on the Interface tab button. To configure interface-level (also known as neighbor) RIP parameters:

i Click on the Create button. The RIP Interface (Create) form opens.

ii Configure the parameters. See Procedure 31-10 for more information.

15 Click on the following tab buttons to view statistics and alarm information.

- Statistics
- Faults

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The RIP Site (Edit) form closes.

Procedure 31-9 To configure group-level RIP

Note 1 — You can choose to inherit values from the global-level RIP configuration by selecting the Inherit Value parameter. If you choose not to inherit a parameter value from the global-level RIP configuration, only the parameter options that are not set in the parent configuration are available. For example, if the Check Zero parameter is set to false in the global-level RIP configuration, you can only set the parameter to true in the group-level RIP configuration.

Note 2 — The parameters that you configure for a RIP group take precedence over the parameters that are configured for the global-level RIP configuration.

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Navigate to the RIP icon. The path is Routing→Router→Routing Instance→RIP.

3 Right-click on the RIP icon and choose Create Group. The RIP Site Group (Create) form opens with the General tab displayed.

4 Configure the Name parameter.

5 Perform steps 4 to 12 of Procedure 31-8.

6 Click on the OK button. The RIP Group (Create) form closes, and the 5620 SAM displays an icon for the new RIP group in the navigation tree below the RIP icon.

Procedure 31-10 To configure interface-level RIP

Note 1 — You can choose to inherit values from the global-level RIP configuration by selecting the Inherit Value parameter. If you choose not to inherit a parameter value from the global-level RIP configuration, only the parameter options that are not set in the parent configuration are available. For example, if the Check Zero parameter is set to false in the global-level RIP configuration, you can only set the parameter to true in the interface-level RIP configuration.

Note 2 — The parameters that you configure for a RIP interface, also known as a RIP neighbor, take precedence over the parameters that are configured for the group- and global-level RIP configuration.

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Navigate to a RIP group. The path is Routing→Router→Routing Instance→RIP→RIP Group.

3 Right-click on the RIP group icon and choose Create Interface. The RIP Interface (Create) form opens with the General tab displayed.

4 Perform steps 4 to 12 of Procedure 31-8.

5 Click on the OK button. The RIP Interface (Create) form closes, and the 5620 SAM displays an icon for the new RIP interface below the RIP group icon in the navigation tree.

31.17 LDP configuration procedures

An LDP instance in the 5620 SAM network navigation tree has the following child objects:

- Interfaces–The interfaces object contains the configured LDP interfaces for directly connected peers. The 7210 SAS-M does not support configuration of LDP interfaces.
- Targeted Peers–The targeted peers object contains the indirectly connected peers.

T-LDP is supported on the 7750 SR, 7710 SR, 7450 ESS, 7210 SAS-M, 7210 SAS-X, 7250 SAS-ES, 7705 SAR, and 7250 SAS-ESA. DU-LDP is supported only on the 7750 SR.

The following procedures describe how to configure LDP.

Procedure 31-11 To enable LDP on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable LDP.

  i Click on the Protocols tab button.

  ii Select the LDP Enabled parameter.

5 Click on the OK button to save the changes. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and an LDP icon appears under the routing instance in the navigation tree.

Procedure 31-12 To configure global-level LDP

1 Enable LDP on the router, as described in Procedure 31-11.

2 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

3 Navigate to the LDP instance icon. The path is Routing→Router→Routing Instance→LDP.

4 Right-click on the LDP icon and choose Properties. The LDP - Routing Instance (Edit) form appears, with the General tab displayed.

5 Configure the Administrative State parameter.

6 Click on the Common tab button.

7 Configure the parameters:

- Targeted Sessions Allowed
- Prefer Tunnel-in-Tunnel
- Tunnel Down Damp Time (seconds)
- Enable Implicit Null Label
- Enforce Graceful Restart
- Multi Path Make Before Break Time (seconds)
- Neighbor Liveness Time (seconds)
- Maximum Recovery Time (seconds)
- Forward State Holding Time (seconds)
- Reconnect Time (seconds)
- Shortcut Local TTL Propagate
- Shortcut Transit TTL Propagate
- Enable Fast Re-route

Configure the Targeted Sessions Allowed parameter to true to configure the router for T-LDP. Targeted sessions are LDP sessions that distribute labels between indirectly connected peers.

The Neighbor Liveness Time (seconds) and Maximum Recovery Time (seconds) parameters are configurable when the Enforce Graceful Restart parameter is enabled.

8 Click on the Interface Properties tab button.

9 Configure the parameters:

- Address Type
  - Choose system to have the system IP address set up LDP sessions.
  - Choose interface to have the IP interface address set up LDP sessions only if there are not multiple interfaces between the two neighbors.
- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)

By default, these parameter values are inherited by all LDP interfaces.

10 Click on the Targeted Peer Properties tab button.

i Configure the parameters:

- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)

  By default, these parameter values are inherited by all LDP targeted peers.

ii Click on the Route Import Policy tab.

iii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

iv Click on the Route Export Policy tab.

v Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

11 Click on the Ecmp OAM tab button. The General tab displayed. See Procedure 31-16 for more information about configuring ECMP for LDP interfaces.

12 Click on the Interfaces tab button. A list of interfaces you can view or configure opens. See Procedure 31-13 for more information about configuring LDP interfaces.

13 Click on the Peers tab button. A list of peers you can view or configure opens. See Procedure 31-16 for more information about creating peers.

14 Click on the Targeted Peers tab button. A list of targeted peers you can view or configure opens. See Procedure 31-14 for more information about creating and configuring targeted peers.

15 Click on the Import Policies tab button.

16 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

17 Click on the Export Policies tab button.

18 Configure the parameters on the General tab:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

19 Click on the Tunnel Table tab button.

20 Configure the parameters on the Tunnel Table tab:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

The tunnel table policies are used to allow LDP-capable PE devices to offer services to PE routers in areas or domains where BGP-labeled routes are not supported. They are used to determine which routes are advertised to LDP. Only policy entries supporting the LDP protocol are considered; all other policies are ignored. See also Procedure 31-5 for information on enabling the advertisement of LDP prefixes to BGP peers.

21 Click on the Sessions tab button. A list of LDP sessions opens, showing information of the active LDP communication sessions between interfaces and targeted peers between the routers running LDP.

22 Click on the Static Prefix FECs tab button.

i Click on the Create button. The StaticFec (Create) form opens.

ii Configure the parameters:

- IP Prefix
- Probe Interval (Minutes)
- Advertised Label
- Next Hop Type
- Next Hop
- Swap Label

Next Hop Address and Swap Label parameters appear when IP Address is selected for the Next Hop Address value.

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The static FEC form closes and the static FEC entry appears in the list.

23 Click on the Aggregate Prefix Match tab button.

24 Configure the parameters:

- Aggregate Prefix Match Enabled
- Administrative State

When the Aggregate Prefix Match Enabled parameter is enabled, the LDP installs a prefix binding in the LDP FIB by performing a longest match against an aggregate prefix in the routing table, as opposed to requiring an exact match of the prefix. The LDP prefix binding continues to be advertised on a per individual /32 prefix basis.

The Administrative State parameter can only be configured if the Aggregate Prefix Match Enabled parameter is enabled.

25 Configure the following parameters in the Prefix Exclude Policies block:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

The Prefix Exclude Policies can only be configured if the Aggregate Prefix Match Enabled parameter is enabled.

When routing policy statements are specified in the Prefix Exclude Policies block, any prefixes defined in the routing policies are excluded from the aggregate prefix matching procedure. In this case, when LDP receives a FEC-label binding for this prefix, it performs an exact match of a specific FEC element prefix, as opposed to a longest match of one or more LDP FEC element prefixes.

26 Click on the Accounting tab button.

27 Click on the Create button. The AccountingFecPrefix (Create) form opens.

28 Configure the FEC Prefix parameter.

29 Configure the parameters in the Egress Accounting Statistics panel:

- Click on the Select button. The Select Accounting Policy - AccountingFecPrefix form opens. Choose the required accounting policy and click on the OK button. Only accounting policies with the CombinedLdpLspEgressStats stats type are available for selection.
- Collect Accounting Statistics
- Administrative State

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

30 Click on the following tab buttons to view LDP statistics and alarm information.

- Statistics
- Faults

31 Click on the OK button. The LDP (Edit) form closes.

Procedure 31-13 To configure an LDP interface

Note — You can choose to inherit values from the global-level LDP configuration by selecting the Inherit Value parameter.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to an LDP instance. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP instance and choose Create Interface. The LDP Interface configuration form opens with the General tab displayed.

4 Click on the Select button to choose a Layer 3 interface. The Select Interface - LDP Interface form opens.

5 Configure the filter criteria. A list of the available interfaces appears.

6 Select an interface in the list and click on the OK button.

7 Configure the parameters:

- Description
- Administrative State

8 Click on the Protocol Properties tab button.

9 Configure the parameters:

- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)
- Address Type
    - Choose system to have the system IP address set up LDP sessions.
    - Choose interface to have the IP interface address set up LDP sessions only if there are not multiple interfaces between the two neighbors.

  By default, these parameter values are inherited by all LDP interfaces.
- Local LSR ID
- Enable BFD Tracking
- Multicast Forwarding

10 Click on the OK button. The LPD Interface (Create) form closes, and an icon for the new LDP interface appears in the navigation tree list of interfaces below the LDP icon.

11 Click on the OK button. An icon for the new LDP interface appears in the navigation tree below the LDP icon.

12 Configure the protocol for the far-end device, if applicable. Use CLI for devices that are managed outside the scope of the 5620 SAM.

Procedure 31-14 To configure an LDP targeted peer

Note 1 — You can choose to inherit values from the global-level LDP configuration by selecting the Inherit Value parameter.

Note 2 — The parameters that you configure for a targeted peer take precedence over the parameters that are configured for the global-level LDP configuration.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to an LDP interface. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP icon and choose Create Targeted Peer. The TargetedPeer (Create) configuration form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- Description
- Administrative State

5 Click on the Protocol Properties tab button.

i Configure the parameters:

- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)
  By default, these parameter values are inherited from the global-level LDP instance.
- Tunneling Enabled
- BFD Enabled

ii Configure the Local LSR ID Name parameter by clicking on its associated Select button. The Select Local LSR ID window opens.

iii Select the desired Local LSR ID from the list and then click OK. The Select Local LSR ID window closes and the name of the Local LSR ID you chose appears in the Name field.

6 Click on the LSPs tab button. View, add, or configure associated LSPs, as required.

Refer to Chapter 32 for information on creating and configuring LSPs.

7 Click on the OK button. The TargetedPeer (Create) form closes, and an icon for the new LDP targeted peer appears in the navigation tree list of targeted peers below the LDP icon.

8 Configure the protocol for the far-end device, if applicable. Use CLI for devices that are managed outside the scope of the 5620 SAM.

Procedure 31-15 To configure an LDP peer

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to an LDP interface. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP icon and choose Properties. The LDP (Edit) form opens.

4 Click on the Peers tab button.

5 Click on the Create button. The Peer (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Peer Address
- Minimum TTL Value
- DoD Label Distribution
- Path MTU Discovery Enabled

7 Assign a TCP key chain to the LDP peer, if required.

i Click on the KeyChain tab button.

ii Click on the Select button. The Select LDP Peer Keychain - Peer form opens with a list of local key chains displayed.

iii Select a key chain in the list and click on the OK button. The Select LDP Peer Keychain - Peer form closes. The 5620 SAM assigns the key chain to the LDP peer.

8 Select the Authentication tab button.

9 Configure the parameters:

- Type
- Key

10 Click on the Import Policies tab button.

The FEC prefix Import Policy provides a mean of controlling which FEC prefixes received from other LDP and T-LDP peers should be re-distributed to this LDP peer. If no policy name is specified, the NE will import all FEC prefixes it learns from other LDP and T-LDP peers to this LDP peer.

11 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

12 Click on the Export Policies tab button.

The FEC prefix Export Policy provides a mean of controlling which FEC prefixes from this peer should be re-distributed to all other LDP and T-LDP peers. If no policy name is specified, the NE will export all FEC prefixes it learns from this LDP peer to all other LDP and T-LDP peers.

13 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The new peer appears in the list.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The LDP (Edit) form closes.

Procedure 31-16 To configure ECMP for LDP routing

Note — 5620 SAM supports LDP ECMP when LDP routing is configured on the 7750 SR, 7450 ESS, and 7710 SR.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to an LDP interface. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP icon and choose Properties. The LDP Routing Instance (Edit) form opens.

4 Click on the ECMP OAM tab button.

5 Perform one of the following steps:

   a If the Tree Trace parameter is not configured, go to step 6.

   b If the Tree Trace parameter is configured, go to step 7.

6 Select Configured from the Tree Trace drop-down menu. The LDP Routing Instance (Edit) form re-opens with all parameters displayed.

7 Configure the tree discovery configuration parameters:

- Tree Trace
- Administrative State
- Discovery Interval (Minutes)
- Discovery Timeout (Seconds)
- Retry Count
- Maximum Paths
- Forwarding Class
- Profile
- Maximum TTL
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Probe Interval (Minutes)
- Probe Timeout (Minutes)
- Retry Count

8 Click on the Discovered FECs tab. A list of discovered FECs appears.

9 Select a FEC from the list and click on the Properties button. An Autodiscovered FEC (Edit) form opens with the General tab displayed.

10 Perform one of the following:

   a Click on the More Actions button and choose Create LDP Tree Trace to configure and execute an LSP trace test; see chapter 38 for information about configuring this test.

   b Click on the More Actions button and choose Create LSP Ping to configure and execute a LSP ping test; see chapter 38 for information about configuring this test.

   c Click on the More Actions button and choose Create LSP Trace to configure and execute a LDP tree trace; see chapter 38 for information about configuring this test.

11 Click on the Discovered ECMP tab. A list of ECMP paths associated with the FEC appears.

12 Select an ECMP path from the list.

13 Click on the Properties button. An Autodiscovered Path (Edit) form opens.

14 Click on the More Actions button and choose Create LSP. To configure and execute an LSP trace test; see chapter 38.

15 Click on the More Actions button and choose Create LSP Ping. To configure and execute an LSP ping test; see chapter 38.

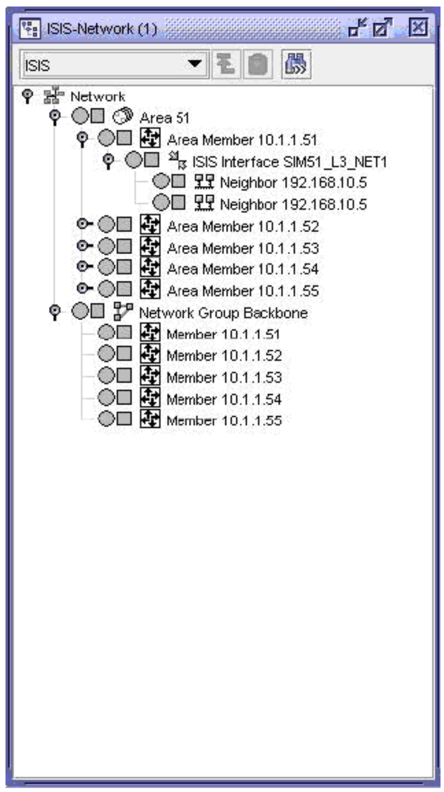
16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Autodiscovered FEC (Edit) form closes.

31.18 IS-IS configuration procedures

Configuration planning is essential to organize devices in level 1, level 2 and level 1 and 2 areas. IS-IS provides defaults for basic protocol operability. Use the 5620 SAM to configure the IS-IS parameters. Figure 31-7 shows the IS-IS view in the navigation tree

Figure 31-7 IS-IS view



The IS-IS information that is displayed includes:

- backbone area and backbone-area devices
- a list of areas and the participating routers in each area
- a list of devices and associated interfaces that shows the IP address and the configured level (1, 2, or 1 and 2) of each interface
- the IS-IS adjacencies for each interface

The following procedures describe how to configure IS-IS.

Procedure 31-17 To enable IS-IS on a routing instance

1. From the 5620 SAM GUI, choose Routing from the navigation tree view selector.
2. Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.
3. Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.
4. Enable the IS-IS protocol.
   i. Click on the Protocols tab.
   ii. Select the IS-IS Enabled parameter.
5. Click on the OK button. A dialog box appears.
6. Click on the Yes button. IS-IS is listed in the configuration form of configured protocols.
7. Click on the OK button. A dialog box appears.
8. Click on the Yes button. The Routing Instance (Edit) form closes, and an ISIS icon appears in the navigation tree below the routing instance.

Procedure 31-18 To configure IS-IS on a routing instance

Router-wide IS-IS parameter values can differ from the interface IS-IS parameter values that are configured in Procedure 31-20. Interface capabilities are compared to the outer-wide capabilities to determine the type of level 1, level 2, and level 1 and 2 adjacencies that are set up between routers to exchange IS-IS routing information.

1. Enable the IS-IS protocol on a router, as described in Procedure 31-17.
2. Navigate to an ISIS icon. The path is Routing→Router→Routing Instance→ISIS.
3. Right-click on the ISIS icon and choose Properties. The IS-IS Interface (Edit) form opens with the General tab displayed.
4. Configure the parameters:
   - Administrative State
   - Level Capability

   A level 1 adjacency can be established when there is at least one area address shared by this router and a neighboring router. A level 2 adjacency is established when another router is configured as a level 2 or a level 1 and 2 router with interfaces configured as level 2 or level 1 and 2. A level 1 and 2 adjacency is created when the neighboring router is also configured as a level 1 and 2 router and the routers have at least one area address in common.
5. Click on the Behavior tab button.

6 Configure the parameters:

- Reference Bandwidth
- Traffic Engineering
- Unicast Import
- Multicast Import
- Hello Authentication
- CSNP Authentication
- PSNP Authentication
- Multi-Topology
- IPv6 Unicast Multi-Topology
- Enable LDP Synchronization
- LDP over RSVP Include
- Isis Default Route Tag
- Advertise Only Passive Interfaces
- RSVP Shortcut Enabled
- Advertise Tunnel Links Enabled
- Enable Loop-free Alternate
- Overload On Boot
- Overload On Boot Timeout (seconds)
- Overload
- Overload Timeout (seconds)
- LSP Lifetime (seconds)
- LSP Max Wait (seconds)
- LSP Initial Wait (seconds)
- LSP Second Wait (seconds)
- SPF Max Wait (seconds)
- SPF Initial Wait (milliseconds)
- SPF Second Wait (milliseconds)

7 Click on the Graceful Restart tab button.

8 Configure the parameters:

- Graceful Restart
- Helper Mode

9 Depending on the device type and configuration, the IP Versions tab is configurable. Click on the IP Versions tab button to specify the allowed IP versions for the IS-IS instance.

10 Configure the parameters:

- Enable IPv6
- IPv6 Routing TLV type
- Enable IPv4
- Strict Adjacency Check

11 Click on the Authentication tab button.

12 Configure the parameters:

- Enable Authentication
- Type
- Key

13 Click on the Level 1 tab button. The General tab is displayed.

14 Configure the parameters:

- Preference
- Preference
- Wide Metrics Only
- Hello Authentication
- CSNP Authentication
- PSNP Authentication

15 Click on the Authentication tab button to configure level 1 authentication.

16 Configure the parameters:

- Type
- Key

Configure the authentication parameters to specify the MD5 key or password to verify PDUs from neighboring routers on the interface.

17 Click on the Level 2 tab button.

18 Repeat steps 14 to 16.

19 Click on the Export Policies tab button.

20 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

You can specify up to five routing policies, in order of preference, to determine the routes that are exported from the routing table to IS-IS. When multiple policies are specified, the policies are evaluated in order, from one to five.

21 Click on the NET addresses tab button. Perform step 4 of Procedure 31-19.

22 Click on the OK button. A dialog box appears.

23 Click on the OK button. The new NET address appears on the NET Addresses tab.

24 Click on the Route Summarizations tab button. IS-IS route summaries allow users to create aggregate IPv4 or IPv6 addresses that include multiple groups of IPv4 or IPv6 addresses for a specific IS-IS summary level. This can help reduce the size of the link state database and the routing table.

25 Click on the Create button. The Route Summarization (Create) form opens.

26 Configure the parameters:

- Network
- Mask
- Summary Level
- Summary Route Tag

27 Click on the OK button. A dialog box appears.

28 Click on the OK button. The new route summary appears on the form.

29 Click on the Interfaces tab button to add an IS-IS interface, if required.

- **i** Click on the Create button.
- **ii** Perform steps 4 to 17 of Procedure 31-20.
- **iii** Click on the OK button. A dialog box appears.
- **iv** Click on the OK button. The new interface appears on the form.

30 Click on the following tab buttons to view information.

- Adjacencies
  - An adjacency represents a connection between two IS-IS interfaces. The information listed for an adjacency includes the state of the adjacent interface, the interface ID, and the neighbor ID.
- SPF Logs
- Statistics
- Faults

31 Click on the OK button. A dialog box appears.

32 Click on the Yes button. The IS-IS (Edit) form closes.

Procedure 31-19 To configure an IS-IS NET address

1 Enable the IS-IS protocol on a device, as described in Procedure 31-17.

2 Navigate to an ISIS icon. The path is Routing→Router→Routing Instance→ISIS.

3 Right-click on the ISIS icon and choose Add NET Address. The Area ID (Create) form opens.

4 Configure the NET address for IS-IS using the Area ID parameter. The NET address is exchanged in hello and LSP PDUs. Level 1 interfaces must have at least one area ID in common. Level 2 interfaces can have different area IDs. If all of the interfaces have different area IDs, they are considered level 2 interfaces only.

NET addresses are built from some non-configurable elements, including the device system ID, the network SAP, and the network entity title.

5 Click on the OK button. The Area ID (Create) form closes, and an icon for the new area appears in the navigation tree below the ISIS icon.

Procedure 31-20 To configure an IS-IS interface

Interface IS-IS parameters can differ from the global policies set in Procedure 31-18. Interface-level parameters specify the interface routing levels. Interface level capabilities are compared to the router-wide capabilities to determine the type of level 1, level 2, and level 1 and 2 adjacencies that can be created between devices to exchange IS-IS routing information.

1 Enable the IS-IS protocol on a router, as described in Procedure 31-17.

2 Navigate to an ISIS icon. The path is Routing→Router→Routing Instance→ISIS.

3 Right-click on the ISIS icon and choose Create Interface. The IS-IS Interface (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Administrative State
- Level Capability
- Type
- BFD Enabled
- IPv6 BFD Enabled

5 Click on the Select button to choose a Layer 3 interface. The Select Interface - IS-IS Interface form opens.

6 Configure the filter criteria. A list of the available interfaces appears.

7 Select an interface in the list and click on the OK button.

8 Click on the Behavior tab button.

9 Configure the parameters:

- CSNP Interval (seconds)
- LSP Pacing Interval (seconds)
- Retransmit Interval (seconds)
- Mesh Group Status

  To create a mesh group, set the Mesh Group Status parameter to Enabled and specify the same mesh group number for all interfaces. The mesh group parameters specify the assigned mesh group for the interface. Mesh groups limit the amount of flooding when a new or changed LSP is advertised in an area.
- Mesh Group
- Passive
- Route Tag

The TE Metric check box is a read-only field that indicates whether the TE Metric parameter is being configured in the interface for LSP path computation by CSPF.

10 Click on the Authentication tab button.

11 Configure the parameters:

- Type
- Key

You can enable authentication for any IS-IS PDUs sent by the interface. Configure the authentication parameters to specify the MD5 key or password to verify PDUs that are sent by neighboring routers on the interface.

12 Click on the Level 1 tab button.

13 Configure the parameters on the General tab:

- Hello Interval (seconds)
- Hello Multiplier
- Metric
- Passive
- Priority

14 Click on the Authentication tab button.

15 Configure the parameters:

- Type
- Key

16 Click on the Level 2 tab button.

17 Repeat steps 13 to 15.

18 Click on the following tab buttons to view information.

- Adjacencies
  - An adjacency represents a connection between two IS-IS interfaces. The information listed for an adjacency includes the state of the adjacent interface, the interface ID, and the neighbor ID.
- Statistics

19 Click on the OK button. The IS-IS Interface (Create) form closes, and the new interface appears in the navigation tree below the ISIS icon.

31.19 OSPF configuration procedures

The 5620 SAM supports the configuration of OSPFv2 and OSPFv3.

Note 1 — OSPFv3 configuration is supported on the 7750 SR (chassis modes C and D, and also chassis modes A and B with mixed mode enabled), 7710 SR, 7450 ESS (mixed mode), and 7705 SAR, Release 4.0 and later.

Note 2 — OSPFv2 configuration is supported on the 7705 SAR Release 2.0 and later.

Note 3 — The 7750 SR, 7450 ESS, 7710 SR, OS 9700E, and OS 9800E support multiple instances of OSPFv2 on the base routing instance.

Note 4 — The 7450 ESS in mixed mode, the 7710 SR, and the 7750 SR in chassis mode C or D support multiple OSPF instances in VPRN services.

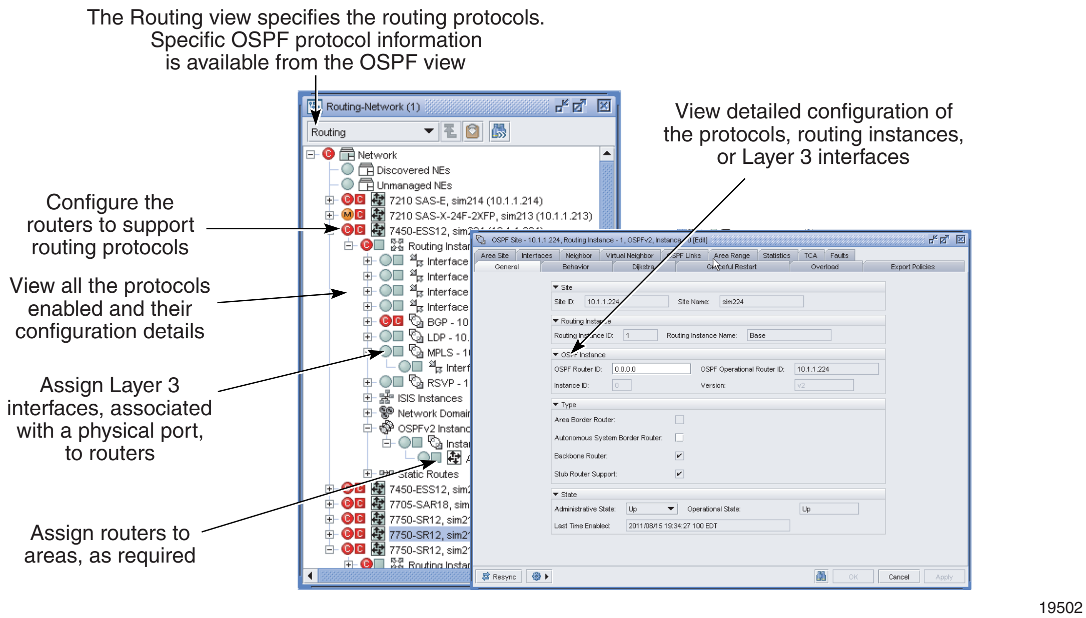
Note 5 — The 7210 SAS-M supports only one OSPF instance.

Configuration planning is essential to organize OSPF areas, interfaces, and virtual links. OSPF provides defaults for basic protocol operability. OSPF configuration requires, as a minimum, that:

- you create a single OSPF backbone area that contains the area border routers.
- for larger networks, you create several areas that contain the other routers.
- for smaller networks, you place all routers in the OSPF backbone area.

Use the 5620 SAM navigation tree to configure the OSPF parameters. Figure 31-8 shows the OSPF view in the navigation tree.

Figure 31-8 OSPF view



The OSPF parameters that are required for OSPF deployment are:

- Router ID — Each device that runs OSPF must be configured with a unique router ID. The router ID is used by the OSPF and BGP routing protocols in the routing table manager. When you configure a new router ID, protocols are not automatically restarted with the new router ID. You must shut down and restart the protocol to initialize the new router ID.
- An area — At least one OSPF area must be created. An interface must be assigned to each OSPF area. The types of OSPF areas include a backbone area, stub area, and NSSA.
- Layer 3 interfaces — A Layer 3 interface is the logical IP connection between a router and one of its attached networks. A physical interface is associated with the Layer 3 interface to provide the cabled connected to another device. A Layer 3 interface has state information from the underlying lower-level protocols and the routing protocol. A network interface has an associated IP address and mask that combine to create an IP prefix, unless the interface is in an unnumbered, point-to-point network.

The following procedures describe how to configure OSPF.

Procedure 31-21 To enable OSPF on a routing instance

1. Choose Routing from the navigation tree view selector from the 5620 SAM GUI.
2. Navigate to the routing instance icon by choosing Routing→Router→Routing Instance.
3. Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Click on the Protocols tab button.

5 Select the OSPFv2 Enabled parameter to enable OSPFv2, if required.

6 Select the OSPFv3 Enabled parameter to enable OSPFv3, if required.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Routing Instance (Edit) form closes, and an icon for each newly enabled protocol appears under the routing instance in the navigation tree.

Procedure 31-22 To configure OSPF on a routing instance

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Navigate to the OSPF area that you need to add a router by choosing one of the following:

   a 7750 SR, 7450 ESS, and 7710 SR, Network→Router→Routing Instance→OSPFv*N* Instances.

   b For all other devices, Routing→Router→Routing Instance→OSPFv*N*, where *N* is the OSPF version number; for example, 2 or 3

3 Perform one of the following, when OSPFv2 is required:

   a For the 7705 SAR, right-click on the appropriate OSPFv2 Instances icon and choose Properties. The OSPF Site, Routing instance, OSPFv2 instance (Edit) form appears. Go to step 5.

   b For the 7750 SR, 7450 ESS, or 7710 SR, right-click on the appropriate OSPFv2 Instances icon and choose Create OSPFv2 Instance. The OSPF (Create) form opens with the General tab displayed. Go to step 5.

4 For OSPFv3:

   i Right-click on the appropriate routing instance and choose Properties. The Routing Instance (Edit) form opens with the General tab displayed.

   ii Click on the Protocols tab button and ensure the OSPFv3 Enabled parameter is configured to create the OSPFv3 routing instance. Click on the appropriate OSPFv3 Instances icon.

   iii Select the appropriate Instance icon below the OSPFv3 Instances icon, and select Properties. The OSPF Routing Instance OSPFv3 (Edit) form opens.

5 Configure the parameters:

- OSPF Router ID
- Instance ID
- Autonomous System Border Router
- Domain ID
- Administrative State

6 Click on the Behavior tab button.

7 Configure the parameters:

- Traffic Engineering Support
- Interface Base Reference Cost (kbps)
- Overload Stubs
- Unicast Import
- Multicast Import
- Enable LDP Synchronization
- Ignore DN Bit
- Suppress DN Bit
- RFC1583 Compatible
- LDP over RSVP Include
- Advertise Tunnel Links Enabled
- Exit Overflow Interval
- External LSA Limit
- Preference
- Preference

The Traffic Engineering Support, RFC1583 Compatible, LDP over RSVP Include, Multicast Import, and Unicast Import parameters are configurable for OSPFv2 only.

The Unicast Import and Multicast Import parameters are not configurable for OSPF in VPRN.

8 Click on the Dijkstra tab button.

9 Configure the following parameters:

For SPF:

- SPF Max Wait (milliseconds)
- Initial Wait (milliseconds)
- Second Wait (milliseconds)

For LSA:

- LSA Generate Max Wait (milliseconds)
- LSA Arrival Wait (milliseconds)
- Initial Wait (milliseconds)
- Second Wait (milliseconds)

10 Depending on the OSPF version, the Graceful Restart tab is configurable. Configure graceful restart, if required.

i Click on the Graceful Restart tab button.

ii Configure the parameters:

- Graceful Restart
- Helper Mode

The Helper Mode parameter is configurable when the Graceful Restart parameter is set to true.

11 Depending on the OSPF version, the Overload tab is configurable. Configure overload, if required.

i Click on the Overload tab button.

ii Configure the parameters:

- Overload Enabled
- Boot Overload Enabled
- Overload Interval (seconds)
- Boot Overload Interval (seconds)

The Overload Interval (seconds) parameter is configurable when the Overload Enabled parameter is selected.

The Boot Overload Interval (seconds) parameter is configurable when the Boot Overload Enabled parameter is enabled.

12 If the OSPF version is OSPFv2, the OSPF Super-Backbone tab is configurable. Configure the OSPF super-backbone, if required.

i Click on the OSPF Super-Backbone tab button.

ii Configure the parameters:

Note — These parameters apply only to VPRN instances of OSPF.

- VPN Domain Type
- VPN Domain ID (hex)
- VPN Tag
- Super-Backbone

13 Click on the Export Policies tab button to specify the export routing policies that determine the routes that are advertised to peers.

14 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

15 Click on the Area Site tab button to add a routing instance for the router to an OSPF area, if required. Otherwise, go to step 17.

- **i** Click on the Create button. The AreaSite (Create) form opens.
- **ii** Configure the parameters:
  - Area ID
  - Type
  - Blackhole Range
- **iii** Click on the OK button. The AreaSite (Create) form closes, and the OSPF (Edit) form reappears.

16 Perform steps 4 to 13 of Procedure 31-25.

17 Click on the following tab buttons to view OSPF configuration information:

- Interfaces
- Neighbor
- Virtual Neighbor
- Virtual Link (configurable only in a backbone area)
- Area Range
- Statistics
- Faults

The Statistics and Faults tabs are unavailable for OSPF in VPRN.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button to close the OSPF Site (Edit) form.

Procedure 31-23 To create an OSPF area

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Right-click on the Network icon and choose Create Area. The Area (Create) form opens.

3 Configure the parameters:

- Version
- Area ID
- Name
- Type
- Description

4 Click on the Apply button. Additional configurable tab buttons appear.

5 Click on the Area Site tab button.

6 Click on the Create button to add a routing instance to the area. The Area Site (Create) form opens.

7 Click on the Select button to choose a routing instance. The Select OSPF Instance - Area Site form opens.

8 Select an OSPF instance and click on the OK button. The Select OSPF Instance form closes, and the OSPF instance appears in the Routing Instance panel.

9 Configure the parameters:

- Type
- Blackhole Range

Configure the area as a blackhole range to avoid routing loops.

The Type parameter is not configurable for a backbone-area routing instance.

10 Click on the Apply button. Additional configurable tab buttons appear, and an icon for the new area appears in the navigation tree.

11 Depending on the Type parameter value, the Stub/NSSA tab is configurable. Configure stub or NSSA functionality, if required.

The Default Cost parameter is configurable only when the Type parameter value from step 9 is Stub (No Type 5 External) or Totally Stub (No Summaries).

i Click on the Stub/NSSA tab button.

ii Configure the parameters:

- Default Cost
- Redistribute External Routes
- Originate Default Route

The Redistribute External Routes and Originate Default Route parameters are configurable only when the Type parameter value from step 9 is NSSA (No Type 5 External) or NSSA (No Summaries).

12 If the area is a backbone area that requires links to remote areas that do not advertise OSPF topology, configure a virtual link.

i Click on the Virtual Link tab button.

ii Perform steps 4 to 8 of Procedure 31-27.

iii Click on the OK button. The new virtual link entry appears in the list.

13 Create an area range, if required.

i Click on the Area Range tab button.

ii Click on the Create button. The Area Range (Create) form opens.

iii Perform steps 4 and 5 of Procedure 31-26.

iv Click on the OK button. The new area range entry appears in the list.

14 Click on the OK button. The Area Site (Create) form closes, and a dialog box appears.

15 Click on the Yes button to confirm the action.

Procedure 31-24 To add a router to an OSPF area

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Navigate to the OSPF area to which you want to add a router. The path is Routing→Area.

3 Right-click on the area icon and choose Add OSPF Instance. The Area Site (Create) form opens.

4 Configure the parameters:

- Type
- Blackhole Range

Configure the area as a blackhole range to avoid routing loops.

5 Click on the Select button below the Routing Instance panel to choose a routing instance. The Select OSPF Instance - Area Site form opens.

6 Select a routing instance and click on the OK button. The routing instance appears in the Routing Instance panel.

7 Depending on the Type parameter value from step 4, the Stub/NSSA tab is configurable. Configure stub or NSSA functionality, if required.

i Click on the Stub/NSSA tab button.

ii Configure the parameters:

- Default Cost
- Redistribute External Routes
- Originate Default Route

The Default Cost parameter is configurable only when the Type parameter value from step 4 is Stub (No Type 5 External) or Totally Stub (No Summaries).

The Redistribute External Routes and Originate Default Route parameters are configurable only when the Type parameter value from step 4 is NSSA (No Type 5 External) or NSSA (No Summaries).

8 Click on the OK button. The Area Site (Create) form closes, and an icon for the router appears in the navigation tree under the Area icon.

Procedure 31-25 To add a Layer 3 interface to an OSPF router

Perform this procedure to allow an OSPF-enabled router to participate in area discovery and share routing information with other area members.

Note — This action assigns an existing Layer 3 interface to the router in the OSPF area rather than creating a new Layer 3 interface.

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Click on an Area icon to display the area routers.

3 Right-click on a router instance icon and choose Create Interface. The OSPF Interface (Create) configuration form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Administrative State
- Configured MTU (bytes)

5 Click on the Select button beside the Interface Name parameter to choose an interface. The Select Interface - OSPF Interface form opens.

6 Configure the filter criteria. A list of available Layer 3 interfaces appears.

7 Choose a Layer 3 interface and click on the OK button. The Select Interface - OSPF Interface form closes, and the interface entry appears in the Interface panel.

8 Click on the Protocol Properties tab button.

9 Configure the parameters:

- Type
- Priority
- Metric
- Advertise Subnet
- BFD Enabled
- Passive
- Hello Interval (seconds)
- Router Dead Interval (seconds)
- Retransmission Interval (seconds)
- Transit Delay (seconds)

The Advertise Subnet parameter is configurable for OSPFv2 only.

The TE Metric check box is a read-only field that indicates whether the TE Metric parameter is being configured in the interface for LSP path computation by CSPF.

10 Perform one of the following steps to configure authentication for the interface, if required. Otherwise, go to step 13.

a Click on the Authentication tab button, and go to step 11.

b For OSPFv3 interfaces, click on the IPsec Static SA tab button, and go to step 12.

11 Configure the Authentication Type parameter.

a Choose MD5-based Authentication.

i Click on the Create button to create an MD5 authentication key. The Md5Key (Create) form opens.

ii Configure the parameters:

- Key Index
- Key
- Re-enter Key

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Md5Key (Create) form closes, and the new authentication key appears in the list.

b Choose Simple Password.

i Click on the Change Password button to enter a password. The Password (Create) form opens.

ii Configure the parameters:

- Password
- Re-enter Password

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Password (Create) form closes.

12 Configure the parameters:

- IPsec Security Association Name
- IPsec In Static Security Association
- IPsec Out Static Security Association

13 Click on the OK button to close the OSPF Interface (Create) form. The 5620 SAM displays an icon for the new OSPF interface in the navigation tree below the area router.

Procedure 31-26 To create an OSPF area range

An area range summarizes a range of IP addresses in an LSA to minimize the number of flooded advertisements in the LSA.

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Click on an Area icon in the navigation tree to display the area routers.

3 Right-click on a router instance icon and choose Create Area Range. The Area Range (Create) form opens.

4 Configure the parameters:

- Network
- Prefix Length
- Link State DB Type
- Effect

5 Click on the OK button. The Area Range (Create) form closes, and an icon for the new area range appears in the navigation tree below the OSPF area.

Procedure 31-27 To create a virtual link

Perform this procedure to create a link between the backbone OSPF area and a remote OSPF area that does not advertise the OSPF topology.

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Click on the backbone area icon in the navigation tree to display the area routers. The backbone area ID is 0.0.0.0.

3 Right-click on a backbone-area router instance icon and choose Create Virtual Link. The Virtual Link (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Virtual Neighbor Router (Site) ID
- Transit Area
- Administrative State

5 Click on the Protocol Properties tab button.

6 Configure the parameters:

- Hello Interval (seconds)
- Router Dead Interval (seconds)
- Retransmission Interval (seconds)
- Transit Delay (seconds)

7 Perform one of the following steps to configure authentication for the virtual link, if required. Otherwise, go to step 10.

a Click on the Authentication tab button, and go to step 8.

b For OSPFv3 interfaces, click on the IPsec Static SA tab button, and go to step 9.

8 Configure the Authentication Type parameter.

a Choose MD5-based Authentication.

i Click on the Create button to create an MD5 authentication key. The Md5Key (Create) form opens.

ii Configure the parameters:

- Key Index
- Key
- Re-enter Key

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Md5Key (Create) form closes, and the new authentication key appears in the list.

v Go to step 10.

b Choose Simple Password.

i Click on the Change Password button to enter a password. The Password (Create) form opens.

ii Configure the parameters:

- Password
- Re-enter Password

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Password (Create) form closes.

v Go to step 10.

9 Configure the parameters:

- IPsec Security Association Name
- IPsec In Static Security Association
- IPsec Out Static Security Association

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The VirtualLink (Create) form closes, and the 5620 SAM displays an icon for the new virtual link in the navigation tree.

31.20 RSVP configuration procedures

The following procedures describe how to configure RSVP.

Procedure 31-28 To configure RSVP on a routing instance

1 Navigate to an RSVP icon. The path is Routing→Router→Routing Instance→RSVP.

2 Right-click on the RSVP icon and choose Properties. The RSVP form opens with the General tab displayed.

3 Configure the parameters:

- Administrative State
- Keep Multiplier
- Refresh Time
- Message Pacing
- Enable Graceful Shutdown
- Enable Implicit Null Label
- Max Burst
- Period (milliseconds)
- Rapid Retransmit Time (hundred-milliseconds)
- Rapid Retry Limit

4 If you are going to configure Diff-Serv TE, then MPLS must be shutdown first. Otherwise, go to step 16.

5 Configure the parameters:

Note 1 — Enabling a Diff Serv Model only takes effect if you have already enabled traffic engineering at one or both of the following routing protocol levels:

- IS-IS, as described in Procedure 31-18
- OSPF, as described in Procedure 31-22

A dialog box appears if IS-IS and/or OSPF TE is not enabled, but you can save your configuration if IS-IS and/or OSPF TE is not enabled.

Note 2 — The Class Type BW Percent parameters are configured globally and the parameters are applied to all RSVP interfaces in the system. After the parameters are configured, the parameters can only be changed after you shut down the MPLS protocol. The total bandwidth specified for the eight classes should not exceed 100%.

- Diff Serv Model
- TE Threshold Update Enabled
- Class Type 0 BW Percent
- Class Type 1 BW Percent
- Class Type 2 BW Percent
- Class Type 3 BW Percent
- Class Type 4 BW Percent
- Class Type 5 BW Percent
- Class Type 6 BW Percent
- Class Type 7 BW Percent
- Update On CAC Failure Enabled
- Update Timer (seconds)

6 Configure the Include Node in RRO parameter.

7 Click on the TE Classes tab.

8 Select one of the TE classes in the table and click on the Properties button. The TE Class (Create) form opens.

Note — The TE Class Definition is used to map all TE Classes (up to a maximum of 8) to Class Type and LSP setup priority. There is no default TE Class after Diff-Serv is enabled. You must explicitly define each TE Class. If Diff-Serv is disabled, the default CT (CT0) and eight pre-emption priorities are used internally.

9 Configure the parameters:

- Priority
- TE Class Type

10 Click on the ForwardingClassMaps tab.

11 Click on the Create button. The Forwarding Class Map (Create) form opens.

12 Configure the parameters:

- FC Name
- TE Class Type

13 Repeat steps 8 to 12 for the remaining TE classes, as required.

14 Click on the TE Thresholds tab.

15 Configure the parameters:

- Up Threshold (%) (1 through 16)
- Down Threshold (%) (1 through 16)

You can also click the Reset TE Up/Down Thresholds to Default buttons to set either the Up or Down Thresholds to their default values, respectively.

16 Click on the following tab buttons to view information.

- Interfaces
- Sessions
- Neighbors
- Statistics
- Faults

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The RSVP form closes.

Procedure 31-29 To configure an RSVP interface

1 Navigate to an RSVP interface icon. The path is Routing→Router→Routing Instance→RSVP→Interfaces→Interface.

2 Right-click on the RSVP interface and choose Properties. The RSVP Interface (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Administrative State

4 Click on the Protocol Properties tab button.

5 Configure the parameters:

- Enable Refresh Reduction
- Enable Reliable Delivery
- Enable Graceful Shutdown
- Enable Implicit Null Label
- Hello Interval (milliseconds)
- Subscription Ratio
- BFD Enabled
- Inherit SAM Class Type BW
- Class Type 0 BW Percent
- Class Type 1 BW Percent
- Class Type 2 BW Percent
- Class Type 3 BW Percent
- Class Type 4 BW Percent
- Class Type 5 BW Percent
- Class Type 6 BW Percent
- Class Type 7 BW Percent

The Class Type BW Percent parameters can only be configured if the Inherit SAM Class Type BW parameter is disabled. If you enter values at the RSVP interface level, they override the global values configured in Procedure 31-28 for the node RSVP routing instance.

6 Click on the Authentication tab button.

7 Configure the Key parameter.

8 Click on the TE Thresholds tab.

9 Configure the parameters:

- Inherit TE Up Thresholds
- Inherit TE Down Thresholds
- Up Threshold (%) (1 through 16)
- Down Threshold (%) (1 through 16)

You can only configure the Up Threshold (%) and Down Threshold (%) parameters if the Inherit TE Up Thresholds and Inherit TE Down Thresholds parameters are disabled, respectively.

10 Click on the following tab buttons to view information.

- Neighbors
- Statistics
- Faults

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The RSVP Interface (Edit) form closes.

31.21 L2TP configuration procedures

The 5620 SAM supports the configuration and management of L2TP sites, tunnel group profiles, and tunnel profiles.

A typical L2TP configuration is applied to two NEs; one NE performs the LAC role and the other NE performs the LNS role. An NE can perform both LAC and LNS roles. At least one ISA-LNS group must be configured for the LNS NE. See section 18.5 for information about ISA-LNS groups. See Procedure 18-7 for information about creating and configuring an ISA-LNS group member.

Note 1 — To enable L2TP, the NE must be in chassis mode B or higher.

Note 2 — The 7750 SR, Release 7.0, does not support L2TP in chassis mode B.

Note 3 — The 5620 SAM supports L2TP configuration and management on a Release 7.0 or 8.0 7750 SR, or a 7450 ESS in mixed mode, for LAC only.

Note 4 — L2TP can also be enabled on a VPRN site. See chapter 74 for more information.

The following procedures describe how to configure L2TP.

Procedure 31-30 To configure L2TP on a routing instance

Note 1 — Only a Release 8.0 or later 7750 SR-7 or 7750 SR-12 can function as an LNS.

Note 2 — L2TP functionality is supported only by Ethernet MDAs. An IOM 2 or IOM 3 is required to configure an L2TP access interface, and an IOM 3 is required for an L2TP network interface. An IOM3-XP is required for configuration of a broadband ISA MDA.

1 Navigate to an L2TP icon. The path is Routing→Router→Routing Instance→L2TP.

2 Right-click on the L2TP icon and choose Properties. The L2TP Site (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Administrative State
- Session Limit
- Receive Window Size
- Peer Address Change Policy
- Excluded AVPs
- Calling Number Format

4 Click on the Tunnel Group Profiles tab button.

i Click on the Create button. The L2TP Tunnel Group Profile (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Group Name
- Description
- Administrative State
- Local IP Address
- Local Name
- LNS Group ID
- Password
- Challenge
- AVP Hiding
- Session Limit
- Session Assign Method
- Max Retries Established
- Max Retries Not Established
- Receive Window Size
- Hello Interval (seconds)
- Idle Timeout (seconds)
- Destruct Timeout (seconds)

Note 1 — You must configure the LNS Group ID parameter for the tunnel group profile or tunnel profile of the site acting as the LNS.

Note 2 — On the LAC NE, each L2TP tunnel must have the local IP address set to the system interface IP address. This restriction applies only to the 7750 SR, Release 7.0.

Note 3 — To generate operational L2TP tunnels, a start operation must be performed on the L2TP tunnel on the LAC NE. You can also perform a start operation from a tunnel profile on the LNS.

5 Click on the PPP tab button.

Note — You only configure PPP for LNS L2TP tunnel group profiles and L2TP tunnel profiles.

6 Configure the Authentication Protocol parameter.

7 Click on the Select button in the Authentication Policy panel. The Select Authentication Policy (PPPGroupProfile) form opens.

8 Select an authentication policy from the list and click on the OK button. The Select Authentication Policy form closes and the L2TP Tunnel Group Profile (Create) form displays the new PPP authentication policy.

9 If you did not select an authentication policy in step 8, click on the Select button in the User Database panel. The Select User Database (PPPGroupProfile) form opens.

10 Select a user database from the list and click on the OK button. The Select User Database form closes and the L2TP Tunnel Group Profile (Create) form displays the user database.

11 Click on the Select button in the Default Service ID panel. The Select Default Service ID (PPPGroupProfile) form opens.

12 Select a default service ID from the list and click on the OK button. The Select Default Service ID form closes and the L2TP Tunnel Group Profile (Create) form displays the default service ID.

13 Click on the Select button in the Default Group Interface panel. The Select Default Group Interface (PPPGroupProfile) form opens.

14 Select a default group interface from the list and click on the OK button. The Select Default Group Interface form closes and the L2TP Tunnel Group Profile (Create) form displays the default group interface.

15 Configure the parameters:

- Proxy LCP
- Proxy Authentication
- MTU (bytes)
- Keep-Alive Interval (seconds)
- Keep-Alive Multiplier
- IPCP Subnet Negotiation

16 Click on the Tunnel Profiles tab button.

i Click on the Create button. The L2TP Tunnel Profile (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Tunnel Name
- Description
- Administrative State
- Local IP Address
- Local Name
- Peer IP Address
- Remote Name
- LNS Group ID
- Password
- Auto Established
- Preference
- Challenge
- AVP Hiding
- Session Limit
- Max Retries Established
- Max Retries Not Established
- Receive Window Size
- Hello Interval (seconds)
- Idle Timeout (seconds)
- Destruct Timeout (seconds)

Note — When you configure parameters with the same name in a tunnel group profile and a tunnel profile, a non-default value in the tunnel group profile overrides the value specified for the L2TP site. Also, a non-default value in a tunnel profile overrides the value defined in the associated tunnel group profile and L2TP site.

17 Click on the PPP tab button.

Note — You only configure PPP for LNS L2TP tunnel group profiles and L2TP tunnel profiles.

18 Repeat steps 6 to 15 to configure PPP for an LNS L2TP tunnel profile.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The L2TP Tunnel Profile (Create) form closes.

21 Click on the following tab buttons to view information.

- Tunnel Instance Endpoints
- Peers
- Statistics
- Faults

Procedure 31-31 To view L2TP tunnels and tunnel endpoints

1 Choose Manage→ISA Functions→ISA-L2TP from the 5620 SAM main menu. The Manage ISA-L2TP form opens.

2 Choose L2TP tunnel (L2TP) from the object drop-down list.

3 Click on the Search button. A list of L2TP tunnels is displayed.

4 Select an entry in the list and click on the Properties button. The L2TP Tunnel - Endpoint A - Endpoint B form opens with the General tab displayed.

5 View the information for Tunnel Endpoint A and Tunnel Endpoint B.

6 Click on the L2TP Tunnel Endpoints tab button. The two L2TP tunnel endpoints are displayed.

7 Select an entry in the list and click on the Properties button. The L2TP Tunnel Endpoint (View) form opens.

8 View the information. You can also click on the Properties button to view additional information for the following:

- Site ID
- Tunnel Instance Endpoint
- Tunnel Profile
- Tunnel Group Profile
- Peer

9 Close the L2TP Tunnel Endpoint (View) form.

10 Close the L2TP Tunnel - Endpoint A - Endpoint B form.

31.22 PIM configuration procedures

The following procedures describe how to configure PIM.

Procedure 31-32 To enable PIM on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable PIM:

i Click on the Multicast tab button.

ii Select the PIM Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and a PIM icon appears in the navigation tree below the routing instance.

Procedure 31-33 To configure PIM on a routing instance

1. From the 5620 SAM GUI, choose Routing from the navigation tree view selector.
2. Navigate to a PIM icon. The path is Routing→Router→Routing Instance→PIM.
3. Right-click on the PIM icon and choose Properties. The PIM (Edit) form opens with the General tab displayed.
4. Configure the Administrative State parameter in the States panel.
5. In the PIM General Configurations panel, configure the following parameters:
   - Apply To
   - Non DR Attract Traffic
6. In the ECMP Balancing panel, configure the following parameters:
   - ECMP Balancing Enabled
   - Hold Time (minutes)
   - ECMP Hashing Enabled
7. In the Lag Usage panel, configure the Lag Usage Optimization parameter.
8. Click on the RP Behavior tab button.
9. If you are configuring for IPv4 then click on the IPv4 sub-tab and go to step 10. Otherwise click on the IPv6 sub-tab and go to step 15.
10. Configure the IPv4 Administrative State parameter in the States panel.
11. Configure the following parameters in the PIM General Configurations panel:
    - IPv4 RPF Lookup Sequence
12. Configure the following parameters in the Candidate Bootstrap Router panel:
    - CBSR Address
    - CBSR Priority
    - CBSR Hash Mask Length
    - CBSR Admin State
13. Configure the following parameters in the Candidate Rendezvous Point panel:
    - Administrative State
    - C-RP Address
    - C-RP Priority
    - C-RP Hold Time (seconds)
14. Go to step 20.
15. Configure the IPv6 Administrative State parameter in the States panel.
16. Configure the IPv6 RPF Lookup Sequence parameter in the PIM General Configurations panel.

17 Configure the following parameters in the Candidate Bootstrap Router panel:

- CBSR Address
- CBSR Priority
- CBSR Hash Mask Length
- CBSR Admin State

18 Configure the following parameters in the Candidate Rendezvous Point panel:

- Administrative State
- C-RP Address
- C-RP Priority
- C-RP Hold Time (seconds)

19 Configure the following parameters in the Embedded-RP panel:

- Enable Embedded-RP
- Embedded-RP Administrative State

20 Click on the Candidate-RP Groups tab.

21 Click on the Create button to add a new entry, if required. The C-RP Group Prefix (Create) form opens.

22 Configure the parameters:

- Group IP Address
- Mask

23 Click on the OK button. A dialog box appears.

24 Click on the OK button. The C-RP Group Prefix (Create) form closes and the new Candidate-RP entry appears in the table.

25 Click on the Embedded-RP Groups tab button.

Note — The Embedded-RP Groups tab is only selectable if you enabled the Enable Embedded-RP parameter in step 19.

26 Click on the Create button to add a new entry, if required. The E-RP Group Range (Create) form opens.

27 Configure the parameters:

- Group IP Address
- Prefix

28 Click on the OK button. The E-RP Group Range (Create) form closes and the new Embedded-RP entry appears in the table.

29 Click on the Group To RP tab button.

30 In the Static RP tab, click on the Create button to add a new entry, if required. The Static RP (Create) form opens.

31 Configure the parameters:

- Static RP IP Address
- RP Override

32 Click on the Static Group-To-RP tab button.

33 Click on the Create button to add a new entry, if required. The Static Group To RP (Create) form opens.

34 Configure the parameters:

- Static Group IP Address
- Static Group Mask

35 Click on the OK button. A dialog box appears.

36 Click on the OK button. The new Static Group-To-RP entry appears on the form.

37 Click on the OK button. A dialog box appears.

38 Click on the OK button. The new Static RP entry appears on the form.

39 If you are performing this procedure to create a PIM site on a VPRN routing instance (referenced from Procedure 74-5), the MVPN tab button appears. Click on the MVPN tab button. Otherwise, go to step 49.

40 Configure the parameters on the General sub-tab:

- Auto-Discovery
- MCast Signaling
- Inclusive Tunnel Type
- US Multicast Hop Selection
- Inter-Site Shared

Note — You must set the Inclusive Tunnel Type parameter to PIM, RSVP, or MLDP if you are creating an inclusive tunnel in step 45.

41 Click on the UMH PE Backup sub-tab to configure primary and standby UMH addresses, if required.

42 Click on the Create button. The MVPN UMH PE Backup (Create) form opens.

43 Configure the parameters:

- UMH Primary PE Address
- UMH Standby PE Address

44 Click on the OK button. The MVPN UMH PE Backup (Create) form closes and the new entry appears in the list.

45 Click on the MVPN Inclusive Tunnel tab button.

Note — Only one sub-tab will be active under the MVPN Inclusive Tunnel tab, depending on the selection you made for the Inclusive Tunnel Type parameter in step 40.

Perform one of the following:

a Create a PIM inclusive tunnel, if required.

i Configure the parameters on the PIM tab button:

- Provider Tunnel Inclusive PIM Mode
- Group Address

  The Group Address parameter is only configurable if the Provider Tunnel Inclusive PIM Mode parameter is set to ASM or SSM.

ii Go to step 46.

b Create an RSVP inclusive tunnel, if required.

i Configure the P2MP Administrative State parameter on the RSVP tab button. Until you have selected an MVPN LSP template, you cannot set the P2MP Administrative State parameter to Up. To create an MVPN LSP template, see Procedure 32-23.

ii Click on the Select button. The Select MVPN Lsp Template form opens.

iii Choose an MVPN LSP template from the list and click on the OK button. The MVPN LSP template is displayed.

iv Configure the parameters:

- Tunnel Root Enable BFD
- Tunnel Root BFD Transmit Interval
- Tunnel Root BFD Multiplier
- Tunnel Leaf Enable BFD

v Go to step 46.

c Create an MLDP inclusive tunnel, if required.

i Configure the P2MP Administrative State parameter on the MLDP tab button.

ii Go to step 46.

46 Click on the MVPN Selective Tunnel tab button. The Data MVPN Threshold tab is displayed.

47 Configure the parameters:

- PIM SSM Prefix
- PIM SSM Prefix Length
- PIM Group Address Mode
- Delay Interval (seconds)
- Pack Data Join TLV
- Auto-Discovery
- Enable ASM Data MDT

The Delay Interval (seconds) parameter can only be configured if the Include Data parameter is enabled.

48 Perform one of the following:

a Click on the Search button in the Data MVPN Threshold tab.

i Select a Data MVPN Threshold entry from the displayed list.

ii Click on the Apply button.

iii Go to step 49.

b Click on the Create button in the Data MVPN Threshold tab. The Data MVPN Threshold (Create) form is displayed.

i Configure the parameters:

- Group IP Address
- Group Prefix Length
- Threshold (kbps)

ii Click on the OK button. The Data MVPN Threshold (Create) form closes and the new entry is displayed in the list.

iii Select the new Data MVPN Threshold entry.

iv Click on the Apply button.

49 Perform one of the following, if required:

Note — A Data Multicast Tunnel (MT) can be thought of as a connector between a set of PE routers forming a multicast domain. From the perspective of a VPN-specific PIM instance, a multicast tunnel is a single multi-access interface. The Data MT Interface can only be created or selected when the PIM address is configured as other than null (0.0.0.0).

a Click on the Search button in the Data MT Interface tab.

- **i** Choose a Data MT Interface entry from the list.
- **ii** Click on the Apply button.
- **iii** Go to step 50.

b Click on the Create button in the Data MT Interface tab. The Data MT Interface (Create) form is displayed.

- **i** Configure the parameters:
    - Administrative State
    - Hello Interval (seconds)
    - Hello Multiplier
    - Improved assert
    - Three Way Hello
    - Tracking Support
- **ii** Click on the OK button. The Data MT Interface (Create) form closes and the new entry is displayed in the list.
- **iii** Select the new Data MT Interface entry.
- **iv** Click on the Apply button.

50 Click on the Import Policies tab button.

51 Click on the BootStrap Import Policies tab button.

52 Configure the parameters to filter bootstrap messages and to control the flow of bootstrap messages to the routing instance.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

53 Click on the Join/Prune Import Policies tab button.

54 Configure the parameters to filter join/prune messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

55 Click on the Register Import Policies tab button.

56 Configure the parameters to filter PIM register messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

57 Click on the Export Policies tab button.

58 Click on the BootStrap Export Policies tab button.

59 Configure the parameters to filter PIM-related export messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

60 Depending on the device version, the Anycast RP tab is configurable. Click on the Anycast RP tab button to configure Anycast RP, if required.

Note — You can use the PIM configuration form to add peers to an anycast RP. The complete configuration of anycast RP for PIM requires additional supporting components, such as the configuration of loopback interfaces and static RPs. Due to the complex configuration dependencies, Alcatel-Lucent recommends that you use the Virtual Anycast manager. The Virtual Anycast manager automatically configures many of the supporting requirements for the protocol, which reduces operator configuration errors and assists in troubleshooting activities. See Procedure 31-34 for more information about using the Virtual Anycast manager.

61 Click on the General tab button.

62 Configure the RP IP Address parameter.

63 Click on the Anycast Peer tab button.

64 Click on the Create button to create a new entry, if required. The Anycast Peer (Create) form opens.

65 Configure the Peer IP Address parameter.

66 Click on the OK button. A dialog box appears.

67 Click on the OK button. The new anycast peer entry appears on the form.

68 Click on the OK button. A dialog box appears.

69 Click on the OK button. The new anycast RP entry appears on the form.

70 Click on the SSM Groups tab button.

71 Click on the Create button to create a new entry, if required.

72 Configure the parameters:

- SSM Group IP Address
- SSM Group Mask

  These parameters are applicable to both IPv4 and IPv6.

73 Click on the OK button. A dialog box appears.

74 Click on the OK button. The new SSM group entry appears on the form.

75 Click on the Interfaces tab button to create an interface, if required.

i Click on the Create button to add a new entry.

ii Perform steps 4 to 10 of Procedure 31-35.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new interface entry appears on the form.

76 Click on the SPT Switch Threshold tab button to configure SPT switchover, if required.

77 Click on the Create button to create a new entry, if required. The Spt Switch Over Threshold (Create) form opens.

78 Configure the parameters:

- Group IP Address
- Group Prefix Length
- Infinity For Threshold
- Threshold (kbps)

79 Click on the OK button. A dialog box appears.

80 Click on the OK button. The new SPT switch threshold entry appears on the form.

81 Click on the following tab buttons to view and edit information.

- Groups
- Neighbor
- Statistics
- Faults

The Statistics and Faults tabs are unavailable for PIM in VPRN.

82 Click on the OK button. A dialog box appears.

83 Click on the Yes button. The PIM (Edit) form closes.

Procedure 31-34 To configure Anycast PIM on a router

This procedure describes how to use the Virtual Anycast Manager to configure anycast PIM on a router. The Virtual Anycast Manager automatically configures many of the supporting requirements for the protocol, which reduces operator configuration errors and assists in troubleshooting activities.

Note — The 5620 SAM does not automatically delete the supporting requirements for the protocol when you delete an anycast RP member.

You can also manually add peers to an anycast RP by navigating to the Anycast RP tab of the PIM configuration form. Ensure that PIM is enabled on the router. See Procedure 31-33 for more information.

The 5620 SAM raises an alarm when VRFs from different VPRNs are added to a single anycast RP set. You can only mismatch VRFs using methods that are not associated with the Virtual Anycast Manager; for example, by using the CLI or the PIM configuration form.

1 Choose Manage→Networking→Virtual Anycast RP from the 5620 SAM main menu. The Manage Virtual Anycast RP form opens.

2 Click on the Create button. The Virtual Anycast RP form opens with the General tab displayed.

3 Configure the parameters:

- Anycast RP Type
- Anycast RP Address
- Name
- Description
- Auto Created Interface Name

4 If the Anycast RP Type parameter value is VPRN, choose a VPRN service for the anycast RP.

i Click on the Select button. The Select Service form opens.

ii Select a VPRN service in the list and click on the OK button. The Select Service form closes, and the service is displayed in the Service panel.

5 Click on the Apply button. The Status panel appears. The Status panel is used in step 9 of this procedure to identify configuration problems.

6 Click on the Components tab button.

7 Add virtual Anycast RP members to the PIM configuration.

i Right-click on the Virtual Anycast RP Members icon and choose Add Anycast RP Member. The Enter Interface Name form opens.

ii Enter the interface name for the loopback interface. The Auto Created Interface Name parameter value appears, if configured.

iii Click on the OK button. The Enter Interface Name form closes, and the Select Local Address form opens.

iv Configure the filter criteria.

v Select the local IP address that is used to communicate with the other RP members in the virtual anycast set and click on the OK button. The new local address entry appears on the Components tab under the Virtual Anycast RP Members icon. The new local address entry also appears under the Static RP icon.

Note — The local address is typically the system address.

The 5620 SAM automatically performs the following virtual anycast RP required configuration tasks.

- It creates a PIM-enabled loopback interface, if not present, with the RP address.
- It adds a local address to the anycast RP peer set.
- It updates the peer sets that participate in the anycast RP so that all peer sets contain the same members.
- It enables PIM on the interface that contains the local IP address.
- It creates a static RP that uses the anycast RP address. Groups must be manually created using the Components tab.

vi Repeat steps 7 i to v for each member in the virtual anycast RP.

8 Add a static group-to-RP mapping for the anycast configuration.

i Right-click on a member in the Static RP list and choose Create Static RP. The Static RP (Create) form opens.

ii Configure the parameters:

- Static Group IP Address
- Static Group Mask

iii Click on the OK button. The Static Group To RP (Create) form closes.

iv Repeat steps 8 i to iii for each static group-to-RP mapping that you want to add to the virtual anycast RP configuration. Each member needs a static RP and at least one static group-to-RP mapping. The mappings typically use the same configuration values for each member in the group.

9 Verify the status of the anycast RP for PIM configuration.

i Click on the General tab button. The Status panel displays the status of the anycast RP configuration. The 5620 SAM updates the status when you add a member to or delete a member from the virtual anycast RP. You can also use the Update Status button to manually update the Status panel.

Table 31-2 lists the status check boxes that identify potential configuration problems.

Table 31-2 Anycast RP status fields

Check box	Description
Missing Group Range(s) Configurations	At least one anycast RP member does not have a group range for the anycast RP address.
Inconsistent Peer Sets	Peer sets of all the anycast RP members are not equal.
PIM not enabled on loopback interface(s)	PIM is not enabled on all loopback interfaces that are configured in the virtual anycast RP.
Only one peer configured	Only one peer is configured for anycast RP. The configuration requires two or more peers for correct functionality.
Loopback interface(s) not properly configured	At least one anycast RP member does not have a loopback interface configured with the anycast RP address.
Missing Static RP configuration(s)	A member of the virtual anycast RP does not have a static RP. Each member requires a static RP.

ii Click on the OK button. The Manage Virtual Anycast RP form reappears, and the new virtual anycast RP entry appears on the form.

iii Close the Manage Virtual Anycast RP form.

Procedure 31-35 To create a PIM interface

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to a PIM icon. The path is Routing→Router→Routing Instance→PIM.

3 Right-click on the PIM icon and choose Create Interface. The PIM Interface (Create) form opens with the General tab displayed.

4 Click on the Select button to choose a Layer 3 interface. The Select Interface - PIM Interface form opens.

5 Configure the filter criteria.

6 Select an interface in the list and click on the OK button. The Select Interface - PIM Interface form closes, and the interface name appears in the Interface panel.

7 Configure the parameters:

- Description
- Administrative State
- BFD Enabled
- IPv6 BFD Enabled

8 Click on the Behavior tab button.

9 Click on the General sub-tab.

10 Configure the parameters:

- Hello Interval (seconds)
- Hello Multiplier
- Tracking Support
- Multicast Senders
- BSM Check Router Alert
- Improved assert
- Assert Period
- Max Groups
- Three Way Hello
- Sticky DR
- DR Priority
- Sticky DR Priority

The Sticky DR Priority parameter is configurable when the Sticky DR parameter is enabled.

11 Click on the Neighbor tab button, if configurable, to view and edit information. The Neighbor tab is configurable only when a neighbor PIM interface exists.

12 Click on either the IPv4 or IPv6 sub-tab, as required.

13 Configure either the IPv4 Administrative State or IPv6 Administrative State parameter in the States panel, as required.

14 Click on the Multicast CAC tab button to add a multicast CAC policy, if required.

i Click on the Select button to choose a multicast CAC policy. The Select Multicast CAC Policy - PIM Interface form opens.

ii Select a multicast CAC policy from the list and click on the OK button. The Multicast CAC Policy - PIM Interface form closes, and the multicast CAC policy name appears in the Multicast CAC Policy panel.

iii Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)

iv Click on the Levels tab.

v Click on the Create button. The PIM Interface Multicast CAC level form opens.

vi Configure the parameters:

- Level ID
- Bandwidth (kbps)

vii Click on the LAG Port Down tab.

viii Click on the Create button. The PIM Interface Multicast CAC LAG Port Down form opens.

ix Configure the parameters:

- Number of Ports Down
- Level

15 Click on the OK button. The PIM Interface (Create) form closes, and an icon for the new PIM interface appears in the navigation tree below the PIM icon.

31.23 IGMP configuration procedures

The 5620 SAM supports IGMP configuration for core router functionality and IP services.

The following procedures describe how to configure IGMP.

Procedure 31-36 To enable IGMP on a router

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) configuration form opens.

4 Enable IGMP.

i Click on the Multicast tab button.

ii Select the IGMP Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and an IGMP icon appears in the navigation tree below the routing instance icon.

Procedure 31-37 To configure IGMP on a router

1. From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2. Navigate to the IGMP icon. The path is Routing→Router→Routing Instance→IGMP.

3. Right-click on the IGMP icon and choose Properties. The IGMP Site (Edit) form opens with the General tab displayed.

4. Configure the parameters:

   - Administrative State
   - Query Interval (seconds)
   - Last Member Query Interval (seconds)
   - Query Response Interval (seconds)
   - Robust Count

5. Click on the SSM Translation tab button to configure SSM, if required.

   i. Click on the Create button to create a new entry. The SSM Translation (Create) form opens.

   ii. Configure the parameters:

      - Start Mcast Address
      - End Mcast Address
      - Configured Source

   iii. Click on the OK button. A dialog box appears.

   iv. Click on the OK button. The new SSM entry appears on the form.

6. Click on the Interfaces tab button to add an interface, if required.

   i. Click on the Create button.

   ii. Perform steps 4 to 15 of Procedure 31-39.

   iii. Click on the OK button. The new interface entry appears on the form.

7. Click on the Group Interfaces tab button to view IES group interfaces added to IGMP, if required.

8. Click on the LDP Tunnel Interfaces tab button to create an LDP tunnel interface entry, if required.

   i. Click on the Create button. The LDP IGMP Tunnel Interface (Create) form opens with the General tab button displayed.

   ii. Click on the Select button next to the P2MP ID parameter. The Select - LDP IGMP Tunnel Interface form opens.

   iii. Select an LDP tunnel interface and click on the OK button. The LDP IGMP Tunnel Interface form reappears with the information displayed.

   iv. Click on the Static Group/Source tab button to create a static multicast entry, if required.

v Click on the Create button. The StaticGrpSrc (Create) form opens.

vi Configure the parameters:

- Static Multicast Group
- Static Source

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The new static multicast entry appears on the LDP IGMP Tunnel Interface (Create) form.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The LDP IGMP Tunnel Interface (Create) form closes.

9 Click on the RSVP Tunnel Interfaces tab button to create an RSVP tunnel interface entry, if required.

i Click on the Create button. The RSVP IGMP Tunnel Interface (Create) form opens with the General tab button displayed.

ii Click on the Select button next to the Lsp Name parameter. The Select - RSVP IGMP Tunnel Interface form opens.

iii Select an RSVP IGMP tunnel interface and click on the OK button. The Select - RSVP IGMP Tunnel Interface form closes and the RSVP IGMP Tunnel Interface (Create) form reappears with the information displayed.

iv Click on the Static Group/Source tab button to create a static multicast entry, if required.

v Click on the Create button. The StaticGrpSrc (Create) form opens.

vi Configure the parameters:

- Static Multicast Group
- Static Source

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The new static multicast entry appears on the form.

ix Click on the OK button. A dialog box appears. The RSVP IGMP Tunnel Interface (Create) form closes and the new tunnel entry is displayed.

x Click on the OK button. The RSVP IGMP Tunnel Interface (Create) form closes.

10 Click on the following tab buttons to view and edit information.

- Multicast Group/Source
- Statistics
- Faults

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The Routing Instance (Edit) form closes.

Procedure 31-38 To configure IGMP on an OmniSwitch

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→ Routing Instance→IGMP.

3 Right-click on the IGMP icon and choose Properties. The IGMP (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Administrative State
- Querying
- Spoofing
- Proxying
- Querier Forwarding
- Zapping
- Max Group Action
- Query Interval (seconds)
- Last Member Query Interval (tenths of seconds)
- Query Response Interval (tenths of seconds)
- Robust Count
- Max Group
- Protocol Version
- Router Timeout (seconds)
- Source Timeout (seconds)
- Unsolicited Report Interval (seconds)

Note — When the Administrative State parameter is Up, IP multicast switching is enabled on the OmniSwitch.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes.

Note — IGMP parameters can also be configured for each VLAN site. The VLAN site IGMP configuration overrides the routing instance IGMP settings. You can only configure VLAN site IGMP parameters after the VLAN is created. See Procedure 69-15 for information about configuring IGMP on an OmniSwitch.

Procedure 31-39 To create an IGMP interface

Note — IGMP IPv6 interfaces are supported on the 7750 SR in chassis mode A or B with mixed mode enabled, and on the 7750 SR in chassis mode C or D.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→Router→Routing Instance→IGMP.

3 Right-click on the IGMP icon and choose Create Interface. The IGMP Interface (Create) form opens with the General tab displayed.

4 Click on the Select button to choose a Layer 3 interface. The Select Interface - IGMP Interface form opens.

5 Configure the filter criteria.

6 Select an interface in the list and click on the OK button. The Select Interface - IGMP Interface form closes, and the interface name appears in the Interface panel.

7 Configure the parameters:

- Description
- Administrative State
- Administrative Version
- Maximum Number of Groups
- Subnet Check

8 Click on the Behavior tab button.

9 Configure the Import Policy parameter.

10 Configure the Disable Router Alert Check parameter, if required.

11 Click on the Multicast CAC tab button to add a multicast CAC policy, if required.

i Click on the Select button to choose a multicast CAC policy. The Select Multicast CAC Policy - IGMP Interface form opens.

ii Select a multicast CAC policy from the list and click on the OK button. The Multicast CAC Policy - IGMP Interface form closes, and the multicast CAC policy name appears in the Multicast CAC Policy panel.

iii Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

12 Click on the SSM Translation tab button, if required.

i Click on the Create button.

ii Configure the parameters:

- Start Mcast Address
- End Mcast Address
- Configured Source
- Start Mcast Address Type
- End Mcast Address Type
- Configured Source Type

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new SSM translation entry appears on the form.

13 Click on the Static Group/Source tab button to create a static multicast entry, if required.

i Click on the Create button.

ii Configure the parameters:

- Static Multicast Group
- Static Source

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new static multicast entry appears on the form.

14 Click on the following tab buttons to view and edit information.

- Multicast Group
- Multicast Group/Source

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The IGMP Interface (Create) form closes, and an icon for the new interface appears in the navigation tree below the IGMP icon.

Procedure 31-40 To turn up or shut down an IGMP interface

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→Router→Routing Instance→IGMP.

3 Right-click on the interface icon and choose Properties. The IGMP Site (Edit) form opens.

4 Click on the Interfaces tab button.

5 Turn up or shut down the IGMP interface.

a Click on the Turn Up button to activate the interface. A dialog box appears.

b Click on the Shut Down button to deactivate the interface. A dialog box appears.

6 Click on the Yes button to confirm the action and close the dialog box.

7 Close the IGMP Site (Edit) form.

Procedure 31-41 To view IGMP multicast reporting statistics for an IGMP site

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Manage→Networking→Routing Instances from the 5620 SAM main menu. The Manage Routing Instances form opens.

2 Choose IGMP Site (IGMP) from the Select Object Type drop-down menu.

3 Click on the Search button to display the IGMP sites.

4 Choose a site from the list and click on the Properties button. The IGMP Site form opens with the General tab displayed.

5 Click on the More Actions button and choose Show IGMP Multicast Reporting Statistics. The IGMP IGMP Stats Show IGMP Multicast Reporting Statistics form opens.

6 Configure the IP address, if required.

7 Click on the OK button. The contents of the IGMP multicast report are displayed.

8 Close the IGMP IGMP Stats Show IGMP Multicast Reporting Statistics form.

Procedure 31-42 To view IGMP source statistics

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Click on the Search button to display a list of services.

3 Choose a service from the list and click on the Properties button. The Service (Edit) form opens with the General tab displayed.

4 Click on the Sites tab button to display a list of sites.

5 Choose a site from the list and click on the Properties button. The Site (Edit) form opens with the General tab displayed.

6 Click on the Multicast tab button.

7 Click on the Group Interfaces tab button to display a list of group interfaces.

8 Choose a group interface from the list and click on the Properties button. The IGMP Group Interface (Edit) form opens with the General tab displayed.

9 Click on the Group Interface SAP tab button.

10 Choose a group interface SAP from the list and click on the Properties button. The Group Interface SAP (Edit) form opens with the General tab displayed.

11 Click on the Group tab button.

12 Click on the Search button to display a list of groups.

13 Choose a group from the list and click on the Properties button. The Group Interface SAP Group (View) form opens with the General tab displayed.

14 Click on the Source tab button.

15 Click on the Search button to diplay a list of sources.

16 Close the Group Interface SAP Group (View) form.

17 Click on the Statistics tab button.

18 Click on the Collect button to collect additional statistics.

19 Choose a statistics record from the list and click on the Properties button. The Statistics Record - Group Interfact SAP Stats form opens.

20 Review the statistics and close the Statistics Record - Group Interface SAP Stats form.

21 Close the IGMP Group Interface SAP (Edit) form.

22 Close the IGMP Group Interface (Edit) form.

23 Close the Site (Edit) form.

24 Close the Service (Edit) form.

25 Close the Manage Services form.

31.24 MSDP configuration procedures

The MSDP command hierarchy consists of three levels:

- global level
- peer level and group level
- group peer level

MSDP parameters are initially applied at the global level. These parameters are inherited by the group and peer levels. Parameters can be modified and overridden on a level-specific basis.

The following procedures describe how to configure MSDP.

Procedure 31-43 To enable MSDP on a router

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable MSDP by performing the following steps.

   i Click on the Multicast tab button.

   ii Select the MSDP Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Confirm the action. The Routing Instance (Edit) form closes, and an MSDP icon appears in the navigation tree below the routing instance icon.

Procedure 31-44 To configure global-level MSDP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MSDP icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Properties. The MSDP (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- SA Limit
- Data Encapsulation
- Local IP Address
- RPF Lookup Sequence
- SA Cache Lifetime (seconds)
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Click on the Group tab button to add a group, if required. See Procedure 31-45 for more information about how to configure a group-level MSDP.

6 Click on the Peer tab button to add a peer, if required. See Procedure 31-46 for more information about how to configure a peer-level MSDP.

7 Click on the Source tab button to add a source, if required. See Procedure 31-47 for more information about how to configure an MSDP source.

8 Click on the Import Policies tab button.

9 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

10 Click on the Export Policies tab button.

11 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. A router performs no validation to ensure the policies match.

12 Click on the following tab buttons to view information.

- Data Source Active
- Statistics
- Faults

13 Click on the OK button. A dialog box appears.

14 Confirm the action. The MSDP (Edit) form closes.

Procedure 31-45 To configure group-level MSDP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Create Group. The MSDP Peer Group (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Mode
- SA Limit
- Local IP Address
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Click on the Peer tab button to add a peer, if required.

6 Click on the Create button. The MSDP Peer Group (Create) form opens.

7 Configure the parameters:

- Peer Address
- SA Limit
- Local IP Address
- Default Peer
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

8 Configure the import and export policies for the MSDP peer by performing the following steps.

i Click on the Import Policies tab button.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab button.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

9 Click on the Authentication tab button.

10 Configure the parameters:

- Type
- Key

11 Click on the OK button. The MSDP Peer Group (Create) form closes and a dialog box appears.

12 Confirm the action. The peer is listed on the MSDP Peer Group (Create) form.

13 Configure the import and export policies for the MSDP group by performing the following steps.

i Click on the Import Policies tab button.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab button.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

14 Click on the OK button. The MSDP Peer Group (Create) form closes, and an MSDP Peer Group icon appears in the navigation tree below the MSDP Routing Instance icon.

Procedure 31-46 To configure peer-level MSDP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MSDP icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Create Peer. The MSDP Peer (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- SA Limit
- Local IP Address
- Default Peer
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Configure the import and export policies by performing the following steps.

i Click on the Import Policies tab button.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab button.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

6 Click on the Authentication tab button.

7 Configure the parameters.

- Type
- Key

8 Click on the OK button. The MSDP Peer (Create) form closes, and an MSDP Peer icon appears in the navigation tree below the MSDP Routing instance icon.

Procedure 31-47 To configure an MSDP source

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MSDP icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Properties. The MSDP (Edit) form opens with the General tab displayed.

4 Click on the Source tab button.

5 Click on the Create button. The MSDP Source (Create) form opens.

6 Configure the parameters:

- IP Prefix
- Mask
- SA Limit

7 Click on the OK button. The MSDP Source (Create) form closes and a dialog box appears.

8 Confirm the action. The source is listed on the MSDP (Edit) form.

9 Click on the OK button. A dialog box appears.

10 Confirm the action. The MSDP (Edit) form closes.

Procedure 31-48 To configure group-peer-level MSDP

Note — The parameters that you configure for a MSDP peer take precedence over the parameters that are configured for the MSDP peer group.

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Navigate to a peer group. The path is Routing→Router→Routing Instance→MSDP→MSDP Peer Group.

3 Right-click on the peer group icon and choose Create Peer. The MSDP Group Peer, MSDP Peer Group (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- SA Limit
- Local IP Address
- Default Peer
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Configure the import and export policies by performing the following steps.

i Click on the Import Policies tab button.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab button.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. These policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 30. There is no validation performed by the router to ensure the policies match.

6 Click on the Authentication tab button.

7 Configure the parameters:

- Type
- Key

8 Click on the OK button. The MSDP Group Peer, MSDP Peer Group (Create) form closes, and an MSDP Group Peer icon appears in the Navigation Tree below the MSDP Peer Group icon.

Procedure 31-49 To enable or disable MSDP peering

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Perform one of the following:

a Enable or disable MSDP peering in a peer group.

i Navigate to an MSDP peer group. The path is Routing→Router→Routing Instance→MSDP→MSDP Peer Group.

ii Right-click on an MSDP Peer Group icon.

b Enable or disable MSDP peering in a group peer.

i Navigate to an MSDP peer group. The path is Routing→Router→Routing Instance→MSDP→MSDP Peer Group→MSDP Group Peer.

ii Right-click on an MSDP Group Peer icon.

3 Choose one of the following menu items:

a Turn Up to activate

b Shut Down to deactivate

A dialog box appears.

4 Click on the Yes button. The state information beside the appropriate MSDP icon changes accordingly.

31.25 MLD configuration procedures

MLD is supported on a chassis mode C or D, and on the 7750 SR in chassis mode A or B with mixed mode enabled.

The following procedures describe how to configure MLD.

Procedure 31-50 To enable MLD on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→Router→Routing Instance.

3 Right-click on the Routing Instance and choose Properties. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Multicast tab and enable the MLD Enabled check box.

5 Click on the OK button. The Routing Instance (Edit) form closes, and an MLD icon appears in the navigation tree below the routing instance.

Procedure 31-51 To configure MLD on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MLD icon by choosing Network→Router→Routing Instance→MLD.

3 Right-click on the MLD icon and choose Properties. The MLD, Routing Instance (Edit) form opens with the General tab displayed.

4 Configure the optional parameters:

- Query Interval (seconds)
- Last Member Query Interval (seconds)
- Query Response Interval (seconds)
- Robust Count

5 Click on the Apply button to save the changes.

6 Click on the SSM Translation tab button, and click on the Add icon. The SSM Translation, Routing Instance window opens.

7 Configure the mandatory parameters:

- Start Multicast Address
- End Multicast Address
- Configured Source

8 Click on the Apply button to save the changes.

If you wish to create an MLD interface from this window:

a Click on the Interface tab button and click on the Add icon. Go to step 4 of Procedure 31-52.

b Click on the OK button. The MLD, Routing Instance (Edit) form closes.

Procedure 31-52 To create an MLD interface on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MLD icon by choosing Network→Router→Routing Instance→MLD.

3 Right-click on the MLD icon and choose Create Interface. The MLD Interface, Routing Instance (Create) form opens with the General tab displayed.

4 Configure the optional parameter Description.

5 Click on the Select button. The Select Interface - MLD Interface - Routing Instance window opens.

6 Select an existing network interlace that has IPv6 enabled and click the OK button to save the entry. The Select Interface - MLD Interface - Routing Instance window closes and the MLD interface name appears in the navigation tree below the MLD icon.

7 Click on the Behavior tab button and configure the optional parameters:

- Disable Router Alert Check
- Maximum Number of Groups
- Query Interval (seconds)
- Maximum Response Time between Group Messages (seconds)
- Maximum Response Time For MLDv2 (seconds)

8 Click on the Apply button to save the changes.

9 Click on the Import Policy tab button.

10 Click on the Select icon to select an optional routing policy, or configure the optional parameter Import Policy.

11 Click on the Apply button to save the change.

12 Click on the Static/Group Source tab button and click on the Add icon. The MLD Group Source Static, null (Create) window opens.

13 Configure the mandatory Group Address parameter and the optional Group Source Address parameter.

14 Click on the Apply button to save the changes.

15 Click on the SSM Translation tab button and click on the Add icon. The MLD Interface Source Specific Multicast, null (Create) window opens.

16 Configure the mandatory parameters:

- Start Multicast Address
- End Multicast Address

17 Configure the optional parameter Group Source Address.

18 Click on the Apply button to save the changes.

19 Click on the OK button. The MLD Interface, Routing Instance (Create) form closes.

31.26 Bridging configuration procedures

The following procedures describe how to configure bridging.

Procedure 31-53 To configure bridging on a 7250 SAS or Telco device

This procedure applies to 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Click on an icon that represents a 7250 SAS or Telco device. The Bridge Instance icon appears.

3 Right-click on the Bridge Instance icon and choose Properties. The Bridge (Edit) form opens with the General tab displayed.

4 Click on the IGMP Snooping tab button.

5 Configure the parameters:

- IGMP Snooping
- Query Source IP Zero

You must set the IGMP Snooping parameter to Enabled before you can configure the Query Source IP Zero parameter. IGMP snooping is required in a BTV VLAN and when MVR is used in a ring group to which the device belongs.

6 Click on the TLS tab button to configure parameters associated with 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices in TLS VLAN ring groups.

7 Configure the parameters:

- TLS Admin Status
- Ethertype
- Jumbo Frame

The Jumbo Frame parameter is configurable only for Telco devices.

8 Click on the MVR tab button to configure parameters associated with 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, and Telco devices in BTV ring groups.

9 Configure the parameters:

- MVR Admin Status
- Mode
- Query Time (seconds)

The Mode parameter is configurable only for Telco devices.

10 Click on the Multicast Groups tab button to view the list of multicast group IP addresses for the specified VLAN.

11 Click on the QoS MAC Static tab button to configure static MAC QoS parameters for a port on the bridge.

Note — The QoS MAC Static tab button is not available for 7250 SAS and 7250 SAS-ES NEs, Release 2.0 or newer and the 7250 SAS-ESA.

i Click on the Create button. The QoS MAC Static Entry form opens.

ii Configure the parameters:

- Name
- Description
- MAC Address
- VLAN ID
- Priority

iii Click on the Select button to choose a physical port on the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device as an interface. The Select Interface form opens.

iv Select a port in the list and click on the OK button. The Select Interface form closes, and the port identifier appears in the Interface panel.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The new static MAC QoS entry appears on the form.

12 Click on the QoS MAC Secure tab button to configure secure MAC QoS parameters for the bridge.

Note — The QoS MAC Secure tab button is not available for 7250 SAS and 7250 SAS-ES NEs, Release 2.0 or newer or the 7250 SAS-ESA.

i Click on the Create button. The QoS MAC Secure Entry form opens.

ii Configure the parameters:

- Name
- Description
- MAC Address
- VLAN ID
- Priority

iii Click on the Select button to choose a physical port on the 7250 SAS, 7250 SAS-ES, 7250 SAS-ESA, or Telco device as an interface. The Select Interface form opens.

iv Select a port in the list and click on the OK button. The Select Interface form closes, and the port identifier appears in the Interface panel.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The new secure MAC QoS entry appears on the form.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The Bridge (Edit) form closes.

Procedure 31-54 To configure bridging on an OmniSwitch

Perform this procedure to configure OmniSwitch bridging, STP, and LPS parameters.

Caution — Changing bridge parameter values may affect the spanning tree calculations and trigger a topology change in the network.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Locate and expand an object that represents an OmniSwitch. A Bridge Instance object appears below the OmniSwitch object.

3 Right-click on the Bridge Instance object and choose Properties. The Bridge (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- STP Mode
- Path Cost

Configure the Auto VLAN Containment parameter if you the chose the flat STP mode.

5 Configure LPS, if required.

i Click on the Learned Port Security tab button. The Learned Port Security General tab is displayed.

ii Configure the parameters:

- Learning Time Window (minutes)
- Status

Note 1 — The Status parameter does not appear on the form and the Restart Timer option is dimmed until you enter a non-zero value for the Learning Time Window (minutes) parameter.

Note 2 — Click on the More Actions button and choose Restart Timer to restart the MAC source learning timer if you need to restart dynamic MAC address learning on a port.

iii Click on the Ports tab button.

iv Click on the Create button to select ports on which you want to enable learned port security. The Select Port - Bridge form opens.

v Choose one or more ports and click on the OK button. The Select Port - Bridge form closes and the selected ports appear in the Ports form.

vi Click on the Apply button to enable learned port security on the selected ports. A dialog box appears.

vii Click on the Yes button.

viii If you need to apply the same LPS properties to multiple ports but do not need to configure static MAC addresses on the ports, go to step 5xxiv.

Note — Static MAC addresses can only be added to LPS-enabled ports individually.

ix Choose a port and click on the Properties button. The Learned Port Security (Edit) form opens.

x Click on the Properties button. The Physical Port (Edit) form opens on the General tab.

xi Click on the LPS Learned MAC Entries tab button.

xii Click on the Create button to add static MAC entries. The MAC Entries (Create) form opens.

Note — A port must be LPS-enabled and belong to a VLAN before you can add static MAC addresses.

xiii Click on the Select button. The Select VLAN Site - MAC Entries form opens.

xiv Configure the filter criteria. A list of VLANs appears at the bottom of the Select VLAN Site - MAC Entries form.

xv Choose a VLAN from the list.

xvi Click on the OK button. The Select VLAN Site - MAC Entries form closes.

xvii Configure the MAC Address parameter.

xviii Click on the Apply button to save the configuration.

xix Repeat steps 5xvii to 5xviii if you need to add another static MAC address to the port.

xx Click on the OK button. A dialog box appears.

xxi Click on the Yes button to close the dialog box.

xxii Click on the OK button to close the Physical Port (Edit) form. A dialog box appears.

xxiii Click on the Yes button. Go to step 5xxv.

xxiv Choose multiple ports and click on the Properties button. The Learned Port Security (Edit) form opens.

xxv Configure the parameters:

- Violation
- Administrative State
- Low MAC Range
- High MAC Range
- Max. MAC Addresses to Learn
- Max. Filtered MACs to Learn
- Trap Threshold

xxvi Click on the OK button to save the configuration and close the Learned Port Security (Edit) form.

xxvii If you need to stop the aging out of dynamic MAC addresses on the LPS port, convert the dynamic MAC addresses to static MAC addresses. Choose the port and click on the More Actions button and choose Convert to Static.

Note — If traffic containing MAC addresses outside of the allowable MAC address range attempts to access an LPS port, the switch either restricts access to the port for that traffic or shuts the port down to all traffic. When this happens, the port is in an operationally violated state and an alarm is raised.

See Procedure 31-55 for information about how to release a violated LPS port.

6 Perform one of the following actions:

a Configure the STP Flat Mode.

b Configure the STP 1x1 Mode; go to step 25.

7 Click on the Spanning Tree tab button. The STP Flat Mode CIST General tab is displayed.

8 Configure the parameters:

Caution — Changing the Protocol parameter to MSTP resets the flat bridge priority and path.

- Protocol
- Priority
- Forwarding Delay (seconds)
- Hello Time (seconds)
- Max Age (seconds)
- TX Hold Count
- Instance BPDU Switching

9 Click on the Port tab button.

10 Choose one or more ports from the list.

11 Click on the Properties button. The CIST Instance Ports (Edit) form opens.

12 Configure the parameters:

- Priority
- Path Cost
- Mode
- Connection Type
- Admin Edge
- Auto Edge
- Restricted Role
- Restricted TCN

13 Click on the OK button. The CIST Instance Ports (Edit) form closes.

14 Click on the MSTI tab button if you need to configure MSTI, otherwise go to step 34.

Note — In order to configure MSTI, the Protocol parameter must be set to MSTP.

15 Click on the Create button. The MST Instance (Create) form opens.

16 Configure the parameters:

- Instance Index
- Priority
- Instance Name
- Auto VLAN Containment

17 Click on the VLAN tab button.

18 Click on the Create button to assign a VLAN to the MSTI. The Select VLAN Sites - MST Instance form opens.

19 Choose one or more VLANs from the list and click on the OK button. The VLANs appear on the MST Instance VLAN form.

20 Click on the OK button. A dialog box appears.

21 Click on the Yes button.

22 Click on the MST Region tab button.

23 Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

24 Go to step 34.

25 Click on the Spanning Tree tab button.

Caution — Changing the STP 1x1 Mode configuration may affect the STP calculations for this instance of the VLAN and trigger a topology change in the network.

26 Click on the STP 1x1 Mode tab button.

27 Choose a 1x1 instance from the list and click on the Properties button. The VLAN STP Instance (Edit) form opens with the General tab displayed.

28 Configure the parameters:

- Protocol
- Forwarding Delay (seconds)
- Max Age (seconds)
- Instance BPDU Switching
- Priority
- Hello Time (seconds)
- TX Hold Count

29 Click on the Port tab button.

30 Choose one or more ports from the list of ports that have been assigned to VLANs and click on the Properties button. The VLAN STP Instance Ports (Edit) form opens.

31 Configure the parameters:

- Priority
- Mode
- Auto Edge
- Restricted Role
- Path Cost
- Connection Type
- Auto Edge
- Restricted TCN

32 Click on the OK button. The VLAN STP Instance Ports (Edit) form closes.

33 Click on the OK button. The VLAN STP Instance form closes.

34 Click on the TLS tab button.

35 Configure the TLS Mode parameter.

36 Click on the QoS tab button.

37 Configure the parameters:

- QoS Status
- Trust Ports
- Default Servicing Mode
- Default Bridged Disposition
- Default Routed Disposition
- Default IGMP Disposition

38 Click on the Apply button. A dialog box appears.

39 Click on the Yes button. The applied values for the Default Bridged Disposition, Default Routed Disposition, and Default IGMP Disposition parameters should be the same as the configured values.

40 Click on the IGMP Port Group Limit tab button.

41 Configure the filter criteria. A list of ports appears.

Note — Only ports that are active (administratively Up) appear in the list.

42 Choose one or more ports from the list and click on the Properties button.

43 The IGMP Port Group Limit (Edit) or IGMP Port Group Limit - (Multiple Instances) (Edit) form opens.

44 Configure the parameters:

- Port Max Group
- Port Action

45 Click on the OK button.

Note — Click on the Multicast VLAN Port tab button in the multicast VLAN IGMP site properties to view the Port Max Group and Port Action parameter information for a multicast VLAN port. You can also view the number of IGMP groups dynamically learned by the port. See Procedure 69-19 for more information.

46 If you need to configure the IGMP port group limit parameters for an inactive (administratively Down) port, click on the Create button. Otherwise, go to step 57.

47 The Select Port form opens.

48 Configure the filter criteria. A list of ports appears.

49 Choose one or more ports from the list and click on the OK button. The Select Port form closes and the selected ports appear in the list of ports.

50 Choose an inactive port from the list and click on the Properties button.

51 Configure the parameters:

- Port Max Group
- Port Action

52 Repeat steps 50 and 51 for each inactive port that you need to configure.

53 Click on the Apply button. A dialog box appears.

54 Click on the Yes button to save your configuration.

Note 1 — The inactive ports do not appear in the list of ports. Only active ports are displayed in the list. You can view the configuration of the inactive ports using the OmniSwitch CLI.

Note 2 — Click on the Multicast VLAN Port tab button in the multicast VLAN IGMP site properties to view the Port Max Group and Port Action parameter information for a multicast VLAN port. You can also view the number of IGMP groups dynamically learned by the port. See Procedure 69-19 for more information.

55 Click on the MVRP tab button to configure MVRP (if required).

56 Configure the parameters:

- VLAN Registration Protocol Type
- Status
- Transparent Switching Status
- Max VLAN

57 Click on the OK button. A dialog box appears.

58 Click on the Yes button. The Bridge (Edit) form closes.

Procedure 31-55 To release a violated OmniSwitch LPS port

Perform the following procedure to release a violated LPS port.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Locate and expand an object that represents an OmniSwitch. A Bridge Instance object appears below the OmniSwitch object.

3 Right-click on the Bridge Instance object and choose Properties. The Bridge (Edit) form opens with the General tab displayed.

4 Click on the Learned Port Security tab button. The Learned Port Security General tab is displayed.

5 Click on the Port tab button.

6 Select one or more violated LPS ports. Violated LPS ports are highlighted in orange. When you select one or more violated ports the Release Violated Port option is enabled.

7 Click on the More Actions button and choose Release Violated Port to release the selected ports. Releasing a violated port restores the port to the same operational state it was in before the violation. When a violated port is released, all MAC addresses known to the port are flushed from the switch MAC address table.

8 Close the Bridge (Edit) form.

---

32 — MPLS

32.1 MPLS overview

The 5620 SAM supports the configuration and provisioning of MPLS paths and LSPs.

MPLS is a data-carrying mechanism that emulates some properties of a circuit-switched network over a packet-switched network. MPLS prepends a packet with an MPLS header that is comprised of labels in a stack. As an NE forwards a packet through an MPLS network, it examines the top label for routing instructions and pops it off the stack; the contents below the label stack are not examined. The label stack is not removed until it reaches the egress NE.

MPLS uses one or more IGPs, such as IS-IS, OSPF, or RIP, to forward packets. Regardless of the IGP chosen, the MPLS configuration is the same. An advantage of MPLS is that if more than one IGP is enabled, it continues to work when another protocol fails. See chapter 31 for more information on IS-IS, OSPF, and RIP.

MPLS can be used as the underlying transport mechanism for service tunnels. For MPLS to be used as such, an MPLS mesh and an LSP mesh must be created before the tunnel is created. Since LSPs and service tunnels are unidirectional, they must be created in both directions. See chapter 33 for more information about service tunnels.

When MPLS is enabled on a 5620 SAM-managed NE routing instance, the 5620 SAM displays an MPLS instance below the routing instance in the network view of the navigation tree. Using this view, you can perform various functions on the MPLS instance, for example, assign an L3 interface to an MPLS instance.

If a link, NE, or path fails, MPLS can determine a redundant path by using fast reroute. Fast reroute uses an alternative NE to complete the failed LSP. Fast reroute provides the following types of route protection.

- Many-to-one—one backup route is maintained for multiple protected LSPs on an NE.
- One-to-one—a separate backup route is maintained for each protected LSP on an NE algorithm.

You can list and view MPLS objects such as MPLS and RSVP instances and interfaces, static and dynamic LSPs, cross connections, and MPLS paths using the 5620 SAM Manage MPLS Objects form.

LSPs

An LSP is a path through an MPLS network that is set up based on criteria in a forwarding equivalency class, or FEC. A FEC is a set of characteristics that define how NEs in an MPLS network forward packets that are bound to an MPLS label. A FEC includes specifications such as the destination IP address and QoS parameters. A FEC is associated with a specific LSP, but an LSP may be used for multiple FECs.

An LSP begins at a PE device called an LER, which is the ingress NE that prepends a label to a packet based on a FEC and sends the packets to the next transit NE in the path. The transit NE swaps the packet label for a new one, and sends the packet to the next NE. The LER that acts as the egress PE NE removes the label and forwards the packet according to the header of the next layer, for example, IP.

LSPs are unidirectional; they enable the label switching of a packet through an MPLS network from one endpoint to another. Bidirectional communication through an MPLS network requires the configuration of an LSP in the opposite direction.

The types of LSPs are the following.

- Static LSPs specify a static path through an MPLS network. All transit NEs require manual configuration with LSP labels and require no signaling protocol, such as LDP or RSVP.
- Bypass-only LSPs are LSPs with manually configured bypass tunnels on Point-of-Local-Repair (PLR) nodes. Such LSPs are used exclusively for the purpose of bypass protection.
- Dynamic, or signaled LSPs, use a protocol such as LDP or RSVP. The signaling protocol allows an ingress NE to dynamically assign labels to an egress NE. You must configure the ingress NE, but not the transit NEs in an LSP. LDP LSPs are not explicitly defined. The downstream unsolicited (DU) method configures them automatically through the network.
- Point-to-Multipoint LSPs allow the source of multicast traffic to forward packets to one or many multicast receivers over a network without requiring a multicast protocol, such as PIM, to be configured in the network.

You can apply a metric value to a dynamic LSP or a Point-to-Multipoint LSP that determines which LSP the 5620 SAM uses when multiple LSPs lead to the same destination. The metric value for a static route is set to 1 and cannot be configured.

You can list and view detailed information on LSPs, templates, cross connections, service tunnels, and detour and bypass information on the LSP (Edit) forms.

Dynamic LSPs

A dynamic LSP uses a signaling protocol such as LDP or RSVP-TE and an MPLS path between two NEs. You can then create an LSP between the two NEs and bind it to an MPLS path. An LSP-MPLS path binding is called an LSP path. You can configure the LSP path after the MPLS path and the LSP are bound.

Dynamic LSPs are categorized as follows:

- Explicit-path LSPs resemble static LSPs when all hops are strict; each hop in the LSP requires explicit configuration. MPLS uses RSVP-TE to set up an explicit-path LSP. Transit NE hops can be strict, and use a direct path between NEs, or loose, and include other NEs in the path between NEs.
- Constrained-path LSPs have dynamically assigned intermediate NE hops that rely on CSPF to find a path that satisfies the LSP constraints. CSPF is a routing algorithm that takes different LSP constraints, such as the available bandwidth and MPLS administrative groups, into account to balance the network load. When the CSPF path is found, RSVP uses the path to request the LSP setup. If Fast Reroute is enabled, the ingress NE signals the downstream NEs to set up a detour configuration for the LSP.

When an LSP is established, the reserved bandwidth is controlled by the bandwidth parameter at the primary path level, regardless of whether the LSP has auto-bandwidth enabled. When auto-bandwidth is enabled and a trigger occurs, the NE attempts to change the bandwidth of the LSP to a value between the minimum and maximum bandwidth, which are configurable at the LSP level. Automatic bandwidth allocation is supported on RSVP LSPs that have both CSPF and MBB enabled. If an RSVP LSP is configured for auto-bandwidth, the ingress LER determines, at every adjust interval, whether to attempt an auto-bandwidth adjustment. You can change the minimum bandwidth, maximum bandwidth, or threshold parameters on an operational LSP, however, the changes do not take effect until the next auto-bandwidth trigger, for example, an adjust interval expiry. If the bandwidth adjustment fails, for example, the CSPF cannot find a path, the existing LSP is maintained with its existing bandwidth reservation. See Procedure 32-8 for more information.

Static LSPs

A static LSP uses an IGP instead of a signaling protocol, such as LDP or RSVP-TE. The 5620 SAM attempts to derive the hop configurations based on the hop labels in the path. You must use an ingress label that is unique within an NE when you create a new static hop; otherwise, the 5620 SAM rejects the new hop.

You can assign static label mappings for LSP cross-connections on an MPLS interface during interface creation or modification. A static label map is used only for intervening unmanaged NEs. The 5620 SAM attempts to derive the interface and label values from the swap egress label of the previous hop. The Static Label Maps form lists the static label maps for an interface whether they are created using the 5620 SAM client GUI, an OSS client, or CLI.

The 5620 SAM does not raise an alarm against an unmanaged NE.

The 5620 SAM raises an alarm against a static LSP under the following conditions when the LSP destination is managed by the 5620 SAM:

- No hops are configured for the static LSP.
- The last hop does not match the LSP destination.
- The label action specified for the last hop is not a pop action.

Point-to-Multipoint LSPs

A Point-to-Multipoint (P2MP) MPLS LSP allows the source of multicast traffic to forward packets to one or many multicast receivers over a network without requiring a multicast protocol, such as PIM, to be configured in the network. A P2MP LSP tree is established in the control plane for which the path consists of a head-end node, one or many branch nodes, and multiple leaf nodes. Packets that are injected by the head-end node are replicated in the data plane at the branching nodes before they are delivered to the leaf nodes.

The P2MP LSP has a source IP address but does not a have a destination address. Instead, you must create S2L Leaf nodes for each destination in the P2MP LSP tree. The P2MP LSPs are not supported in SDP bindings.

Each P2MP LSP object has one P2MP LSP Instance object. This is the primary instance, and can hold multiple child S2L Paths objects. Just as the P2MP LSP can appear as a tree, each S2L Path object then represents a root-to-leaf (S2L) sub-LSP path for the primary instance. The S2L Paths can be empty paths, or can specify a list of explicit hops. The same path can be used by more that one S2L of the instance. However the destination IP address must have a unique argument per S2L, because it corresponds to the address of the egress LER node.

PIM tunnel interfaces are associated with a P2MP LSP. The tunnel interfaces are needed at both the ingress LER and the egress LER nodes. You must also associate static multicast groups to the tunnel interfaces that are associated with the P2MP LSPs.

On the ingress side, you can create one or more tunnel interfaces in PIM and associate each with a different RSVP P2MP LSP. The tunnel interface is associated with the P2MP LSP name. You can then assign static multicast group joins to each tunnel interface using an IGMP configuration. A specific <*,G> or <S,G> can only be associated with a single tunnel interface. A multicast packet which is received on an interface and matches the <*,G> or <S,G> specified in the IGMP join for the tunnel interface is replicated and forwarded to all branches of the P2MP LSP.

On the egress side, the PIM tunnel interface is associated with both the P2MP LSP name and the system address of the ingress LER. You must define a multicast info policy to associate specific multicast groups, or a specific <S,G>, to the primary tunnel interface on each egress LER leaf node. The multicast info policy must then be applied to the router. A multicast packet synced from a tunnel interface associated with a P2MP LSP on the egress leaf node can then be forwarded over a PIM or IGMP interface, which can be an access interface or a network interface, including a spoke SDP-based IES interface. You may create multiple tunnel interfaces per node, where each interface is associated with a different P2MP LSP. The P2MP LSP association to a multicast group can be applied at the bundle, channel, and/or source channel level in the policy.

You can create a P2MP LSP using the LSP template for MVPN from the Policies→MPLS→LSP Template MVPN menu option. You can configure the scope as either local or global. The global template can be modified and multiple local versions can exist on the NEs. You must assign a default MPLS path to the template on the local definition before the template is turned up. If you modify the template, you must shut down the local policy first. When you turn up the local policy, all previously created P2MP LSP parameters are synchronized with the new template. See Procedure 32-23 for more information.

Bypass LSPs and manual bypass tunnels

You can create manual bypass tunnels and dynamic (or automatic) bypass tunnels on the SR/ESS, 7705 SAR, and 7210 SAS. You can manually configure an LSP to be bypass-only on a PLR node. The LSP is then used exclusively for the purpose of bypass protection.

You can use manual bypass alone or with dynamic bypass. When used with the dynamic bypass, the manual bypass has precedence over the dynamic bypass for the path selection.

Dynamic bypass tunnels can be disabled on a per node basis. They are enabled by default. If dynamic bypass is disabled on a node while dynamic bypass tunnels are active, traffic loss occurs. Furthermore, if no suitable manual bypass LSPs are found, the protected LSP remains without protection.

A bypass-only LSP does not have all the configurable attributes of a regular dynamic LSP. The main differences include:

- Manual bypass LSPs only support primary path. No secondary or standby paths can be created.
- Manual bypass LSPs do not support bandwidth or fast-reroute.
- Path monitoring is not available for manual bypass LSPs.
- Manual bypass LSPs cannot be assigned to a service tunnel, or be added to an LDP targeted peer as the LDP tunnelling LSP.
- There is no rule-based topology support available for manual bypass LSPs.
- There is no network-wide LSP view (the physical map LSP view) support available for manual bypass LSPs,
- You cannot create a static LSP using a tunnel template.

The following additional characteristics also apply to a manual bypass:

- The default protection level for a bypass tunnel is “node-protect”.
- CSPF is supported for the manual bypass tunnel. When CSPF is enabled, loose path and hop-less path are allowed on a manual bypass tunnel. The CSPF calculation is performed when the manual bypass tunnel is first set up.

Tunnel Templates

Tunnel templates allow users to configure dynamic LSP, LSP path, and SDP templates to define common characteristics for a tunnel or templatable tunnel object. Configure tunnel templates to reduce configuration time. See the *5620 SAM Scripts and Templates Developer Guide* for information about creating tunnel XML API templates.

To simplify creating tunnel templates, the 5620 SAM provides examples of common tunnel templates that can be copied and customized. You can also create a tunnel template from an existing templatable object. See the *5620 SAM Scripts and Templates Developer Guide* for information about using tunnel template examples and creating a tunnel template from an existing object.

After a template is configured, dynamic LSPs, LSP paths and SDPs can be configured by choosing a create from template button during configuration. Users can configure multiple LSP paths for a dynamic LSP. For example you can configure one primary, one standby, and many secondary LSP paths.

When the 5620 SAM auto-tunnel creation is used to create LSP paths, the LSP paths must use a hopless path. If the paths belong to the same LSP, they must use different MPLS paths, even when the MPLS paths are hopless. For a RSVP LSP policy, one LSP template can be specified. When an LSP template with multiple LSP paths is specified, many LSP paths are created.

LSP Path Optimization Policy

The 5620 SAM allows you to resignal LSP Paths to take advantage of new paths that are less congested, fewer hops, have a lower metric and meet least-fill criteria. NEs periodically check the network to determine whether a more efficient path is available and notify the 5620 SAM when another path is eligible for re-signalling. 5620 SAM maintains a list of LSP Paths that are eligible for re-signaling. When a LSP Path is eligible for optimization, the LSP Path can be routed to a different path. When a LSP Path not eligible for optimization, the LSP Path cannot use newly available network resources.

A LSP Path optimization policy allows the operator to filter the LSP Path candidates and set the execution rules to determine the candidacy and priority of an LSP Path for re signalling. The 5620 SAM operator can define LSPs Paths that are eligible for re-signaling and if a path is selected, the LSP Path is added to a candidate list. Execution rules determine the sequence in which the LSP Paths can re-signal and the number of seconds between re-signalling. Execution rules apply to the entire candidate list. Each time that optimization starts, the candidate list is filtered according to the candidate definition values and then re sequenced according to the sequencing target and order values.

To ensure that NEs are not overloaded by LSP re-signaling, an LSP Path optimization schedule can be created to identify when re-signaling can be evaluated and executed. You can also manually execute LSP Path optimization schedules. To avoid network congestion and maintain QoS standards, one policy should be executed at a time. Repetitive re-signaling requests are ignored, including manual or scheduled re-signaling requests. However, a re-signaling request that is initiated from the LSP Path binding properties window executes regardless of whether another LSP optimization policy is in progress.

The NEs notify the 5620 SAM about the current state and outcome of LSP Path re-signaling. You can access the LSP Path property window to view information about the state of LSP Path optimization. The following parameters are displayed:

- The Resignal Eligible parameter indicates whether a LSP Path is eligible for optimization. When the parameter value is true, the LSP Path can be optimized. When the parameter value is false, the LSP Path is not eligible for optimization.
- The Last Performed Type parameter indicates how resignaling was performed. Typically the value is Manual Resignal. However, if a schedule was set, the value is Timer Based Resignal.
- The Last Performed parameter indicates the last time the LSP Path was chosen to be re-signaled.
- The Last Performed State parameter indicates the re-signal state of a specific LSP Path.

LDP-over-RSVP tunnels

In networks that contain dozens of NEs spanning multiple routing areas, many RSVP service tunnels may be required. To reduce the number of RSVP tunnels required for service deployment in large networks, you can use the 5620 SAM to create LSPs using LDP-over-RSVP, sometimes called tunnel-in-tunnel encapsulation. An SDP can ride on multiple LDP-over-RSVP tunnels.

The 5620 SAM supports automatic, rule-based service-tunnel creation using NEs that are grouped according to their role in the 5620 SAM-managed network. This functionality greatly reduces the time and effort required to provision a mesh of service tunnels. See chapter 33 for more information about rule-based automatic service-tunnel creation.

The 5620 SAM can use tunnel rules and groups to create new RSVP LSP bindings between a PE device that is added to the network and the existing ABRs. It can also create a new LDP-over-RSVP tunnel between a new NE and an existing PE NE. See chapter 33 for more information about tunnel creation using rules and groups.

Service traffic that is transported by an LDP-over-RSVP tunnel requires a VC label, an LDP label, and an RSVP label. Unlike T-LDP sessions that use IGP SPF algorithms, RSVP LSPs are not advertised to an IGP instance. When the same FEC applies to the destination of an LDP-over-RSVP LSP tunnel and an IGP-based LDP tunnel, the 5620 SAM uses the LDP tunnel by default to minimize network overhead.

Using tunnel-in-tunnel encapsulation, a pair of LSP tunnels and a T-LDP session between two NEs are equivalent to two adjacent LDP NEs with a non-tunneled LDP session between them. In other words, the LDP tunnel uses the RSVP LSP as one hop between LSRs in the network.

During the configuration of LDP-over-RSVP, you can specify an explicit list of dynamic and static LSPs, or use the 5620 SAM to find eligible LSPs. After an LSP is explicitly configured for LDP tunnelling, the 5620 SAM associates the LDP targeted peer with the LSP.

You can configure LDP-over-RSVP to enable an OSPF area router to be a stitching point. You can specify which NEs to use as the stitching points in each area. When there are many NEs in an area, this function helps to reduce the number of LSPs required, because a full mesh is not required.

For an LSP to be eligible for LDP-over-RSVP, the following conditions apply:

- The LSP must be an RSVP-owned LSP (strict or loose)
- The LSP must start and terminate either on:
    - The router ID (system IP address)
    - The router ID (loopback address when used in multi-instance OSPF
- The OSPF system/loopback address must be advertised
- A T-LDP session must exist between the originating and terminating routers using the addresses cited above
- LDP-over-RSVP availability must be enabled in the LSP configuration. This indicates that the LSP is eligible for LDP-over-RSVP, and RSVP signals to the IGP that the LSP should be included in the SPF run.

Shared Risk Link Groups

Shared Risk Link Groups, or SRLGs, are constructs which allow you to perform two operations that enhance overall system reliability. Firstly, you can establish a FRR LSP path. In addition, you can also use SRLGs to establish a secondary LSP path which is disjointed from the primary LSP path.

Configured SRLGs are associated with MPLS interfaces. The SRLGs are used by the CSPF when computing a FRR detour/bypass path, or a secondary LSP path. Links which are members of the same SRLG represent resources which are assumed to share the same risk. These links are therefore avoided when computing and setting up an alternate LSP path.

- FRR backup

  The SRLG constraint can be enabled system-wide on a PLR node, in the computation of a FRR detour or bypass to be associated with a primary LSP path. CSPF includes the SRLG constraint in the computation of a FRR detour or bypass. CSPF then prunes all links with interfaces which belong to the same SRLGs as the egress interface being protected (or the immediate downstream node, depending on the protection level). If a path is found, the bypass or detour is set up. If not, and you included the Enable SRLG for FRR - Strict option, then the bypass or detour is not set up. If the Enable SRLG for FRR - Strict option is not specified, and a path exists that meets other TE constraints (other than the SRLG constraint), then the bypass or detour is still set up.
- Secondary LSP backup

  The SRLG constraint can also be enabled per LSP path on a head-end LER in the computation of an LSP secondary path that includes the standby path. The SRLG constraint is additional to the admin group constraint on the same secondary LSP path. CSPF includes the SRLG constraint in the computation of the secondary LSP path, which requires that the primary LSP path is configured and active. CSPF prunes links with interfaces that belong to the same SRLGs as the interfaces included in the primary path. If a path is found, the secondary LSP path is set up. Otherwise, CSPF keeps trying to set up the secondary LSP path.

You can enable only the SRLG constraint for the FRR backup operation. However, you can enable both the SRLG constraint and the admin-group include/exclude constraint for the secondary LSP backup path operation. In either case, you can still apply the admin-group constraint for the primary path.

The following conditions also apply to SRLGs:

- An SRLG is modeled as a policy object. It therefore follows the normal policy behavior for creation, listing, updating, deletion, distribution and resynchronization
- SRLGs are defined node wide
- Configured SRLGs are associated with MPLS interfaces. A specific MPLS interface can belong to multiple SRLGs. Up to 64 SRLGs can be associated with a specific MLPLS interface

Bandwidth-based equal cost RSVP LSP path selection

When multiple equal-cost paths satisfy the constraints of a specific RSVP LSP path, CSPF in the 7x50 head-end node uses a random number generator to select a path and return it to MPLS. While this method actually balances the number of LSP paths over the links in the network, it does not necessarily balance the bandwidth utilization across those links.

In order to achieve load balancing of the bandwidth amongst the available LSP paths, CSPF must include the link utilization as a criterion in the path selection. One algorithm that considers this is referred to as the "least-fill" path selection. This algorithm identifies the single link in each of the equal-cost paths that has the least available bandwidth in proportion to its maximum reservable bandwidth. CSPF then selects the path containing the link with the largest such available bandwidth to maximum reservable bandwidth percentage. The net effect of using this algorithm is that over time, LSP paths become spread over the network links in such a way that the percentage of link utilization is balanced.

When comparing the percentages of least available link bandwidth across the sorted paths, if two percentages differ by less than a value you configure as a minimum threshold, CSPF considers them equal. It then applies a random number generator to select amongst these paths. You can also specify a reoptimization threshold, which allows you include a path cost consideration into the decision of when to alter the paths used by the LSP.

LSP on-demand resynchronization

LSP on-demand resynchronization is supported on the 7750 SR and 7710 SR. You can modify the nms-server.xml file to allow a user to manually resynchronize an LSP. On-demand resynchronization does not affect the existing manual full node resynchronization functionality. However, when LSP on-demand resynchronization is enabled, any scheduled resynchronization is blocked for the following LSP objects:

- RSVP session
- cross-connect
- in-segment
- out-segment
- actual hop
- CSPF hop

Therefore, these LSP objects are not resynchronized as a result of a relevant trap. The exception is that for 5650 CPAM path monitored LSPs, the actual hop trap (a generic trap) is still processed.

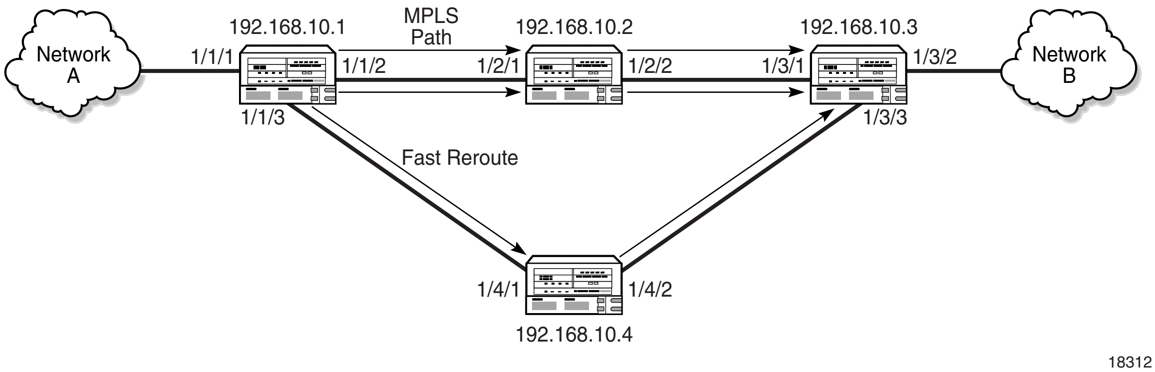
By default, the LSP on-demand resynchronization functionality is disabled. See chapter 6 for information about how to enable LSP on-demand resynchronization. After you enable LSP on-demand resynchronization, click on the Resync button on the LSP configure form to start the manual LSP on-demand resynchronization. The following objects are resynchronized, depending on the type of LSP:

- for a dynamic LSP: the LSP, LSP path, CSPF and actual paths, bypass or detour path, cross-connects, in-segments, out-segments, and RSVP sessions
- for a manual bypass LSP: the LSP, LSP path, CSPF and actual paths, cross-connects, in-segments, out-segments, and RSVP sessions
- for a static LSP: the head-end LSP, the static hops, static label maps, cross-connects, in-segments, and out-segments. You must manually resynchronize all of the planned hop sites in a static LSP before creating a static LSP.

32.2 Sample MPLS configuration

Figure 32-1 shows an example of an MPLS service configuration. The actual configuration depends on the specific network requirements.

Figure 32-1 Sample MPLS configuration



The high-level tasks that are required to configure the MPLS service example in Figure 32-1 follow.

Preconfiguration

1 Before you begin, verify that the following preconfigurations have been made.

- An IGP is enabled on all participating NEs and includes the system interface in the IS-IS or OSPF area.
- Any additional Layer 3 interfaces that you wish to use are configured.

Configuration

2 Create an MPLS path as follows:

i Specify 192.168.10.1 as the source network element.

ii Specify 192.168.10.2 and 192.168.10.4 as hops.

iii Specify interface 1/3/2 on 192.168.10.3 as the destination site. This is the final hop in the MPLS path.

3 Create a dynamic LSP as follows:

i Specify interface 1/1/1 on 192.168.10.1 as the source IP address.

ii Specify 192.168.10.3 as the destination IP address.

4 Bind the dynamic LSP created in step 3 to the MPLS path created step 2.

32.3 Workflow to configure MPLS

1. Enable and configure one or more IGPs such as IS-IS, RIP, and OSPF to include the system interface on all NEs that are to participate in the MPLS network. See the appropriate device documentation for more information.

2. Enable MPLS on the routing instances of all NEs that are to participate in the MPLS network. See Procedure 32-1 for more information.

3. Create or configure an MPLS instance. Assign Layer 3 interfaces, including the system management interface, to the MPLS instance. See Procedure 32-2 or Procedure 32-3 for more information.

4. Create a mesh of MPLS paths. See Procedure 32-4 for more information.

5. Create a mesh of LSPs.

    a. Create a static LSP. See Procedure 32-6 for more information.

    b. Create a dynamic LSP. See Procedure 32-8 for more information. See Procedure 32-9 for more information on creating a dynamic LSP from a tunnel template.

    c. Create a Point-to-Multipoint LSP. See Procedure 32-14 for more information.

    d. Create a Manual Bypass LSP. See Procedure 32-15 for more information.

    e. Create a mesh of LSPs on a 7250 SAS device.

        i. Create a guarding LSP. See Procedure 32-10 for more information.

        ii. Create a dynamic LSP. See Procedure 32-11 for more information.

6. If your mesh includes dynamic LSPs or bypass-only LSPs, configure an LSP path. See Procedure 32-17 or Procedure 32-18 for more information.

7. If required, create an LSP Path optimization policy. See Procedure 32-19 for more information.

Note 1 — Only static LSPs and static FRR LSPs are supported on the OS 9700E and OS 9800E NEs.

Note 2 — RSVP is not supported on the OS 9700E and OS 9800E NEs.

Note 3 — Label actions cannot be modified on NEs after the labels are created by the 5620 SAM.

32.4 MPLS procedures

Use the following 5620 SAM procedures to manage MPLS.

Procedure 32-1 To enable MPLS on a routing instance

1 Choose Routing from the 5620 SAM navigation tree view selector.

2 Navigate to a routing instance. The path is Routing→NE→Routing Instance.

3 Right click on the routing instance and choose Properties from the contextual menu. The Routing Instance (Edit) form opens.

4 Click on the Protocols tab button.

5 Select the MPLS Enabled parameter. RSVP is enabled by default and cannot be disabled using the 5620 SAM.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Routing Instance (Edit) form closes.

The 5620 SAM creates an MPLS instance and displays it below the routing instance in the navigation tree.

Procedure 32-2 To configure an MPLS instance

Note 1 — The MPLS instance on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, must be enabled using the CLI.

Note 2 — The only parameter that you can configure on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, is the Dynamic Bypass parameter.

Note 3 — The following tab buttons are supported on the OS 9700E and OS 9800E NEs for MPLS configuration at the site level:

- General
- Interfaces
- In Segments
- Cross Connects
- Out Segments
- Static Label Maps
- Faults

1 Enable MPLS on an NE, as described in Procedure 32-1.

2 Choose Routing from the 5620 SAM navigation tree view selector.

3 Navigate to an MPLS instance. The path is Routing→NE→Routing Instance→MPLS.

4 Right-click on the MPLS icon in the navigation tree, and choose Properties from the contextual menu. The MPLS (Edit) form opens with the General tab displayed.

5 Configure the parameters.

- Administrative State
- Fast Reroute
- Dynamic Bypass
- Static LSPs Fast Retry Timer (seconds)
- Exponential Backoff Retry
- Maximum Bypass Associations
- In the LSP Resignal panel:
  - Enable
  - Resignal Timer (min)
- In the P2MP LSP Resignal panel:
  - Enable
  - Resignal Timer (min)
- In the Hold Timer panel:
  - Enable
  - Hold Timer (seconds)
- In the Shared Risk Link Group panel:
  - Enable SRLG for FRR
  - Strict
- In the Least-Fill panel:
  - Least Minimum Threshold
  - Least Reoptimization Threshold
- In the TTL Propagate panel:
  - Shortcut Local TTL Propagate
  - Shortcut Transit TTL Propagate
- In the Auto Bandwidth Multipliers panel:
  - Sample Multiplier
  - Adjust Multiplier
- In the Inter Area/Level Traffic Engineering panel:
  - CSPF On Loose Hop

6 If you are configuring an MPLS instance on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, go to step 7. Otherwise, if you need to configure OAM diagnostics for the MPLS instance, click on the Tests tab button. See chapter 38 for more information about configuring OAM diagnostics.

7 To configure MPLS interfaces on the MPLS instance, click on the Interfaces tab button. See Procedure 32-3 for more information about configuring MPLS interfaces. If you are configuring an MPLS instance on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, go to step 14.

8 To configure the collection of ingress accounting statistics for the MPLS instance, click on the Accounting tab button.

9 Click on the Create button. The , Routing Instance (Create) form opens.

10 Configure the parameters in the LSP Information block:

- LSP Name
- Sender Address

11 Configure the parameters in the Ingress Accounting Statistics block:

- Click on the Select button. The Select Accounting Policy - IngStatsPolicy - Routing Instance form opens. Choose the required accounting policy and click on OK. Only accounting policies with the CombinedMplsLspIngressStats stats type are available for selection.
- Collect Accounting Statistics
- Administrative State

Note — The collection of egress accounting statistics is configured in Procedure 32-8.

See the 5620 SAM Statistics Management Guide for more information on the collection of statistics.

12 Click on the following tab buttons to view information about the MPLS instance, as required.

- In Segments to view the MPLS ingress segment information, such as label assignments
- Cross Connects to vie w the LSP cross-connection information
- Out Segments to view the MPLS egress segment information, such as label assignments
- Static Label Maps to view static hop mapping information
- Statistics to view MPLS site and interface statistics
- Faults to view alarm information for the MPLS instance

13 Click on the More Actions button and choose View RSVP Site to view the associated RSVP instance on the NE.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The MPLS (Edit) form closes.

Procedure 32-3 To create an MPLS interface

Perform this procedure to create an MPLS interface by assigning a network interface to an MPLS instance.

This procedure requires the existence of an L3 network interface on the NE that hosts the MPLS instance. See section 30.1 for more information about configuring network interfaces.

Note — The following tab buttons are supported on the OS 9700E and OS 9800E NEs for MPLS configuration at the interface level:

- General
- In Segments
- Static Label Maps
- Cross Connects
- Out Segments
- Faults

1 Choose Routing from the 5620 SAM navigation tree view selector.

2 Navigate to an MPLS instance icon. The path is Routing→NE→Routing Instance→MPLS.

3 Right-click on the MPLS icon and choose Create Interface from the contextual menu. The MPLS Interface (Create) form opens with the General tab displayed.

4 Assign an L3 network interface as the MPLS interface.

i Click on the Select button. The Select Interface form opens.

ii Choose an interface from the list and click on the OK button.The interface is displayed in the Interface panel on the MPLS Interface (Create) form.

5 Configure the parameters:

- Description
- Administrative State

If you are creating an MPLS interface on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, go to 7.

6 In the TE Metric block, configure the parameters:

- TE Metric Enabled
- TE Metric

7 Click on the Apply button. The form displays additional tabs, and the 5620 SAM creates the MPLS interface and displays it below the MPLS instance in the navigation tree.

If you are creating an MPLS interface on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, go to 10.

8 Configure a Shared Risk Link Group, if required.

i Click on the Shared Risk Link Groups tab button. The Shared Risk Link Group list page opens.

ii Click on the Create button. The SharedRiskLinkGroup (Path/Routing Management: MPLS) Select form opens.

iii Click on the Search button. The available SRLGs are displayed.

iv Select the required SRLGs and click OK. Up to 64 SRLGs can be associated with a specific MPLS interface. The SharedRiskLinkGroup (Path/Routing Management: MPLS) Select form closes and the selected SRLG is displayed in the Shared Risk Link Group list page.

9 Configure a static label map, if required. A static label map is required when there are intervening unmanaged NEs between the managed NEs in an MPLS path.

Note — Alcatel-Lucent recommends that you use a static label mapping only to specify unmanaged NEs.

i Click on the Static Label Maps tab button.

ii Click on the Create button. The Static Label Map (Create) form opens. Alternatively, you can choose a Static Label Map from the list and click on the Properties button to edit the Static Label Map properties.

iii Configure the Label Action parameter. When you change the Label Action parameter from unspecified to Pop or Swap, the Static Label Map (Create) form changes to include other parameters. Configure the other parameters as required:

- Ingress Label
- Egress Label
- Egress Label
- Enable Implicit Null Label
- Next Hop
- Next Hop
- Administrative State

The Egress Label, Next Hop and Enable Implicit Null Label parameters are only configurable when the Label Action parameter value is set to Swap.

The Egress Label and Next Hop parameters are configurable only when the Label Action parameter value is set to Swap/Protect-Swap.

The 5620 SAM sets the Label Action parameter value to Pop when the hop destination matches the destination LSP.

iv Click on the OK button. A dialog box appears.

v Click on the OK button.

10 Click on the Administrative Groups tab button to assign MPLS administrative groups to the interface, as required. After you assign administrative groups to an MPLS interface, the total value of the groups is displayed in a bit mask format by the Groups Included (bitmask) indicator on the General tab.

11 Click on the following tab buttons to view information about the MPLS interface, as required.

- In Segments to view the MPLS ingress segment information, such as label assignments
- Cross Connects to vie w the LSP cross-connection information
- Out Segments to view the MPLS egress segment information, such as label assignments
- Statistics to view the MPLS site and interface statistics
- Faults to view alarm information for the MPLS interface

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The MPLS Interface properties form closes.

Procedure 32-4 To create an MPLS path

1 Choose Manage→MPLS→MPLS Paths from the 5620 SAM main menu. The Manage MPLS Paths form opens.

2 Click on the Create button. The Create MPLS Path form opens with the Name the MPLS Path step displayed.

3 Configure the parameters.

- Name
- Description

4 Click on the Next button. The Define Source Site step displayed.

5 Perform one of the following actions to specify a 5620 SAM-managed NE for the Starting Network Element parameter value.

a Choose an NE from a list.

i Click on the Select button. The Select a Network Element - Select Source Site form opens.

ii Select an NE in the list and click on the OK button. The management IP address of the NE is displayed as the source site of the MPLS path.

b Enter the management IP address of the port.

6 Click on the Next button. The Define the provisioned Path step is displayed.

7 Click on the Insert Hop button to insert an MPLS path hop. The Hop for New MPLS Path (Create) form opens.

8 Configure the Specify Site parameter. Perform one of the following actions.

a Specify the IP address of an unmanaged NE.

i Choose Manually.

ii Configure the IP Address parameter.

b Select a managed NE.

i Choose By Selection.

ii Click on the Select button. The Select a Network Element - New MPLS Path form opens.

iii Select an NE in the list and click on the OK button. The management IP address of the NE is displayed as the Name and IP Address values.

iv Specify an alternative interface on the NE to be used as the hop point, if required, by manually configuring the IP Address parameter.

9 Configure the Hop Type parameter.

Note — The Hop Type parameter is set to a value of strict and is not configurable for any of the hops on a path that originate from or terminate on a 7250 SAS-ES 2.0.

10 Click on the Apply button.

11 Insert an additional hop, if required, by repeating steps 8 to 10.

12 Click on the OK button. The Create MPLS Path form reappears.

13 To change the hop sequence, choose a hop and click the Move Up or Move Down button. The first hop in the list is the first hop, and the last hop in the list becomes the destination site when the form changes are saved.

14 Click on the Next button. The Set Initial State step is displayed.

15 Configure the Administrative parameter. This parameter is set to Up and is not configurable if the path originates on 7250 SAS-ES or 7250 SAS-ESA NEs.

16 Click on the Finish Button to save the configuration. You are prompted to view the MPLS path.

17 Enable the View the newly created MPLS path parameter to view the MPLS path configuration after closing the form, if required.

18 Click on the Close button. The Create MPLS Path form closes.

19 If the View the newly created MPLS path parameter in step 16 is enabled, the MPLS Path (Edit) form opens with the newly created MPLS path configuration displayed.

i View the configuration, if required.

ii Close the MPLS Path (Edit) form.

20 Close the Manage MPLS Paths form.

Procedure 32-5 To view an MPLS path

1 Choose Manage→MPLS→MPLS Paths from the 5620 SAM main menu. The Manage MPLS Paths form opens.

2 Configure the filter criteria. A list of MPLS paths is displayed.

3 View the MPLS path information as required. The information includes the following:

- name and description
- ID
- source and destination sites
- administrative and operational states

Procedure 32-6 To create a static LSP

Note — When LSP on-demand resynchronization is enabled, manually resynchronize all of the planned hops in the static LSP before you create a static LSP. This is to ensure that validations on the static LSP can be run properly. See chapter 6 for information about enabling LSP on-demand resynchronization.

1 Choose Manage→MPLS→Static LSPs from the 5620 SAM main menu. The Manage Static LSPs form opens.

2 Click on the Create button. The Static LSP (Create) form opens.

3 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID
- Source Site ID
- Egress Label
- Enable Implicit Null Label
- Next Hop
- Administrative
- Destination Site ID

Note 1 — If a range policy is applied to a service tunnel, a grey text box appears beside the Service ID parameter to indicate that a range policy is in effect.

If a format policy is applied to a service tunnel, a combo box appears beside the object field during object creation, to indicate that a format policy is enforced. When there is only one matching policy, the combo box is greyed out. When there are multiple matching policies the combo box is used to select a policy. The items in the combo box are ordered by the policy's Priority parameter.

Note 2 — The Administrative parameter applies to the source NE only, not to the entire static LSP

4 Click on the Static Hops tab button.

5 Click on the Create button. The Static Hop (Create) form opens.

6 Configure the Hop Index parameter.

7 Click on the Select button in the Site panel to configure the Site ID parameter. The Select Site - Static Hop form opens with a list of the available hop sites.

8 Select a site in the list and click on the OK button. The Select Site - Static Hop form closes and the Static Hop (Create) form displays the site information.

9 Click on the Select button in the Interface panel to configure the Interface Name parameter. The Select Interface - Static Hop form opens with a list of the available interfaces on the hop site.

10 Select an interface in the list and click on the OK button. The Select Interface - Static Hop form closes and the Static Hop (Create) form displays the interface name.

11 Configure the parameters.

- Label Action
- Ingress Label
- Egress Label
- Egress Label
- Enable Implicit Null Label
- Next Hop
- Next Hop
- Administrative State

The Egress Label, Enable Implicit Null Label and Next Hop parameters are configurable when the Label Action parameter value is set to Swap.

The Egress Label and Next Hop parameters are configurable only when the Label Action parameter value is set to Swap/Protect-Swap.

12 Click on the OK button. The Static Hop (Create) form closes and a dialog box appears.

13 Click on the OK button. Static LSP (Create) form reappears.

14 Insert an additional hop, if required, by repeating steps 5 and 13.

15 Click on the OK button. The Static LSP (Create) form closes and a dialog box appears.

16 Click on the Yes button. The Static LSP (Create) form closes and the Manage Static LSPs form reappears.

17 Close the Manage Static LSPs form.

Procedure 32-7 To view and configure a static LSP

The following procedure applies only to the 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7450 ESS, 7750 SR, and 7710 SR. See the device documentation for related information specific to the 7250 SAS-ES and 7250 SAS-ESA if required.

1 Choose Manage→MPLS→Static LSPs from the 5620 SAM main menu. The Manage Static LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of static LSPs is displayed.

3 Select an LSP in the list and click on the Properties button. The Static LSP (Edit) form opens.

4 Click on the following tab buttons to view information about the static LSP, as required.

- Static Hops to view and configure LSP hops
- Service Tunnels to view a list of service tunnels associated with the static LSP
- LDP Tunneling to view a list of LDP-over-RSVP tunnels associated with the static LSP
- Statistics to view the static LSP site and interface statistics
- Faults to view alarm information for the static LSP

5 Close the Static LSP (Edit) form.

6 Close the Manage Static LSPs form.

Procedure 32-8 To create a Dynamic LSP

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Click on the Create button. The Create Dynamic LSP form opens with the Identification step displayed.

3 Configure the parameters.

- Name
- Description
- ID
- Auto-Assign ID
- Preference

Note — When a range policy is applied to a dynamic LSP, a dimmed text field appears beside the Service ID parameter to indicate that a range policy is in effect.

If a format policy is applied to a dynamic LSP, a combo box appears beside the object field during object creation, to indicate that a format policy is in effect. When there is only one matching policy, the combo box is greyed out. When there are multiple matching policies the combo box is used to select a policy. The sequence of the options in the combo box are specified by the policy Priority parameter.

4 Click on the Next button. The Define Source and Destination Sites step is displayed.

5 Specify the source and destination sites for the dynamic LSP.

Note — You can also manually specify an IP address for each parameter in this step.

i Click on the Source Site ID parameter Select button. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

ii Select a site in the list and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the source site information, which includes the Source IP Address parameter value. This parameter is automatically populated with the system IP address of the site.

iii Click on the Destination Site ID parameter Select button. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

iv Select a site in the list and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the destination site information. The displayed destination interface is the system interface because an LSP can terminate only on a system interface.

6 Click on the Next button. The Auto Select Hop-Less MPLS Path form opens.

7 Configure the parameters.

- Auto Select Hop-less Path
- Reserved Bandwidth (Mbps)

The Reserved Bandwidth (Mbps) parameter is configurable when the Auto Select Hop-less Path parameter is enabled.

8 If the Auto Select Hop-less Path parameter in step 7 is enabled, go to step 10.

9 Click on the Next button. The Add MPLS Paths form opens. This step binds the LSP to the MPLS path to create an MPLS path.

i Configure the Termination Validation parameter.

ii Click on the Create button. The LSP-Path Binding form opens with the Choose Path Type step displayed.

iii Configure the Type parameter.

iv Click on the Next button. The Choose MPLS Path step is displayed. Select an MPLS path in the list to associate with the LSP. You can also create an MPLS path by clicking on the Create MPLS Path button. See Procedure 32-4 for more information.

v Click on the Next button. The Set Traffic Options form opens.

vi Configure the parameters.

- Reserved Bandwidth (Mbps)
- Inherit Value
- Hop Limit
- Record Actual Path
- Path Preference

The Path Preference is only configurable on Standby LSP paths (Type parameter set to standby).

vii Click on the Next button. The Set Initial States form opens.

viii Configure the Administrative parameter.

ix Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

x Click on the OK button. The Create Dynamic LSP form reappears.

10 Click on the Next button. The Properties - Traffic Engineering and Protection step is displayed.

11 Configure the parameters.

- Fast Reroute
- Hop Limit
- IGP Shortcut Enabled
- BGP RSVP LSP Transport Tunnel
- BGP Shortcut Enabled
- Diff-Serv Class Type
- Main Class Type Retry Limit

12 Click on the Next button. The Properties - Fast Reroute step is displayed.

13 Configure the parameters:

- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect

14 Click on the Next button. The Properties - Signalling step is displayed.

15 Configure the parameters.

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP

16 Click on the Next button. The Properties - Make before Break step is displayed.

17 Configure the Make before Break parameter.

18 Click on the Next button. The Properties - CSPF form opens.

19 In the CSPF block, configure the parameters:

- Enable CSPF
- Enable TE Metric
- Inter Area CSPF To First Loose Hop

20 Click on the Next button. The Properties - Route Selection step is displayed.

21 Configure the parameters:

- Metric
- Least-Fill Path Selection

The Least-Fill Path Selection parameter can only be enabled when the Enable CSPF parameter is enabled in step 19.

22 Click on the Next button. The Properties - Administrative Groups step is displayed.

23 Assign one or more MPLS administrative groups to the dynamic LSP.

i Select the required MPLS administrative groups in the Unassigned list.

ii Click on the right arrow button. The groups are assigned to the dynamic LSP and moved to the Assigned list.

After you assign administrative groups to an MPLS interface, the total value of the groups is displayed in a bit mask format by the Groups Included (bitmask) indicator on the General tab.

24 Configure the Propagate Admin Group parameter.

25 Click on the Next button. The Properties - LDP Tunneling step is displayed.

26 Configure the LDP over RSVP include parameter.

27 Click on the Next button. The Properties - Auto-Bind step is displayed.

28 Configure the Enable Auto-Bind parameter.

Note — The Enable Auto-Bind parameter is configurable only on a 7710 SR or 7750 SR.

29 Click on the Next button. The Set Initial State step is displayed.

30 Configure the Administrative parameter.

31 Click on the Finish button. The 5620 SAM prompts you to view the dynamic LSP.

32 Enable the View the newly created Dynamic LSP parameter to view the dynamic LSP configuration after closing the form, if required.

Note — If you enable the View the newly created Dynamic Lsp parameter you can configure the collection of egress accounting statistics using the dynamic LSP configuration form.

33 Click on the Close button. The Create Dynamic LSP form closes.

34 If the View the newly created Dynamic LSP parameter is enabled in step 32, the Dynamic LSP (Edit) form opens with the newly created dynamic LSP configuration displayed.

i View the configuration, if required.

ii If you need to enable the collection of egress accounting statistics, go to step iv. Otherwise go to step ix.

iii If you need to configure auto-bandwidth for the dynamic LSP, go to step vi. Otherwise, go to step ix.

iv Click on the Accounting tab button.

v Configure the parameters in the Egress Accounting Statistics panel:

- Click on the Select button. The Select Accounting Policy - Dynamic LSP form opens. Choose the required accounting policy and click on the OK button. Only accounting policies with the CombinedMplsLspEgressStats stats type are available for selection.
- Collect Accounting Statistics
- Administrative State

Note 1 — The Ingress Accounting Statistics panel displays a read-only view. If an ingress accounting statistics record exists, you can click on the Properties button to view the record.

Note 2 — The collection of ingress accounting statistics is configured in Procedure 32-2.

See the 5620 SAM Statistics Management Guide for more information on about the collection of statistics.

vi Click on the Properties tab button.

vii Set the Auto Bandwidth parameter in the Traffic Engineering And Protection panel to true to view and configure the auto-bandwidth parameters.

viii Configure the parameters in the Auto Bandwidth panel.

- Adjust Up Threshold (percent)
- Adjust Down Threshold (percent)
- Minimum Bandwidth (mbps)
- Monitor Bandwidth
- Sample Multiplier
- Overflow Limit
- Adjust Up Bandwidth (mbps)
- Adjust Down Bandwidth (mbps)
- Maximum Bandwidth (mbps)
- Adjust Multiplier
- Overflow Limit Threshold (percent)
- Overflow Limit Bandwidth (mbps)

ix Click on OK to close the Dynamic LSP (Edit) form.

35 Click on OK to close the Manage Dynamic LSPs form.

Procedure 32-9 To create a dynamic LSP from a tunnel template

Before you can create an LSP from a tunnel template, you must create the tunnel template. You can use an existing LSP to create a tunnel template. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Click on the Create from Template button. A Create Dynamic LSP from Template window opens with a list of tunnel templates.

3 Choose a template from the list.

4 Click on the OK button. A Create Dynamic LSP from Template form opens.

5 Configure the parameters.

- Name
- Description
- ID
- Auto-Assign ID
- Preference
- Administrative State

6 Specify the source sites for the dynamic LSP.

i Click on the Select button beside the Source Site ID parameter. The Select Network Element form opens with a list of the available sites.

ii Choose a site from the list and click on the OK button. The Select a Network Element form closes and the Create Dynamic LSP from Template form displays the source site information.

iii Click on the Select button beside the Source IP Address parameter. The Select Network Element form opens with a list of the available sites.

iv Choose a site from the list and click on the Ok button. The Select a Network Element form closes and the Create Dynamic LSP from Template form displays the source IP address information.

7 Configure the Destination Site ID and the Destination IP Address parameters.

8 Configure the Show created object parameter.

9 Click on the Accounting tab button.

10 Click on the Select button beside the Accounting Policy parameter. A Select Policy window opens.

11 Choose a policy from the list.

12 Click on the OK button.

13 Configure the Collect Accounting Statistics and the Administrative State parameters.

14 Click on the Properties tab button.

15 Configure the parameters:

Note — The number of parameters that can be configured depends on how the template was created. All of the following parameters are configurable when the template is based on an object. A subset of the following parameters can be configured when the template is based on an object class.

- Guarding Lsp
- Guarding Lsp
- Fast Reroute
- Hop Limit
- Diff-Serv Class Type
- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect
- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP
- Make before Break
- Enable CSPF
- Enable TE Metric
- Metric
- Least-Fill Path Selection
- Groups Included
- Groups Excluded (bitmap)
- Persistent
- Permit Merge
- Record Actual Route
- Record Label
- Committed Rate
- Peak Rate
- Setup Priority
- Hold Priority
- Backup Setup Priority
- Backup Hold Priority
- LDP over RSVP include
- Enable Auto-Bind

16 Click on the OK button. When the LSP configuration is successful, the Create Dynamic LSP from Template form closes and the Dynamic LSP (Edit) form reappears.

If the LSP configuration is unsuccessful, the Create Dynamic LSP from Template form remains open and an error message appears.

17 Close the Manage Dynamic LSPs form.

Procedure 32-10 To create a guarding LSP on a 7250 SAS device

This procedure applies to 7250 SAS-ES and 7250 SAS-ESA devices.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form appears.

2 Click on the Create button. The Create Dynamic LSP form opens with the Identification step displayed.

3 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID
- Preference

4 Click on the Next button. The Define Source and Destination Sites step is displayed.

5 Specify the source and destination sites for the dynamic LSP.

Note — You can also specify an IP address for each parameter in this step.

i Click on the Select button beside the Source Site ID parameter. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

ii Choose a site in the list and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the source site information, which includes the Source IP Address parameter. The parameter is automatically configured with the system IP address of the site.

iii Click on the Select button beside the Destination Site ID parameter. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

iv Choose a destination site and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the destination site information. The displayed destination interface is the system interface and cannot be changed.

6 Click on the Next button. The Guarding LSP step is displayed.

7 Enable the Guarding Lsp parameter.

8 Configure the Guarded Destination parameter.

9 Click on the Next button. The Add MPLS Paths step is displayed.

i Configure the Termination Validation parameter.

ii Click on the Create button. The LSP-Path Binding form opens with the Choose Path Type step displayed. The Type parameter is set to primary and cannot be configured.

iii Click on the Next button. The Choose MPLS Path step is displayed. Choose an MPLS path to associate with the LSP. If required, create an MPLS path by clicking on the Create MPLS Path button. See Procedure 32-4 for more information.

iv If the guarding LSP originates on a 7250 SAS-ES or 7250 SAS-ESA, Release 2.0, go to step 9ix.

v Click on the Next button.The Set Traffic Engineering Parameters step is displayed.

vi Configure the parameters:

- Persistent
- Permit Merge
- Record Actual Path
- Record Label

vii Click on the Next button. The Set Path Parameters step is displayed.

viii Configure the parameters:

- Enable CSPF
- Setup Priority
- Hold Priority

ix Click on the Next button. The Set Initial State form is displayed.

x Configure the Administrative parameter. If the LSP originates on a 7250 SAS-ES or 7250 SAS-ESA, Release 2.0, the Administrative parameter cannot be configured.

xi Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

xii Click on the OK button.

10 If the guarding LSP originates on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, go to step 14, click on the Next button. The Properties - Session Attributes step is displayed.

11 Configure the parameters:

- Persistent
- Permit Merge
- Record Actual Route
- Record Label

12 Click on the Next button. The Properties - Path Parameters step is displayed.

13 Configure the parameters:

- Committed Rate
- Setup Priority
- Backup Setup Priority
- Peak Rate
- Hold Priority
- Backup Hold Priority

14 Click on the Next button. The Set Initial State step is displayed.

15 Configure the Administrative parameter. The Administrative parameter is set to Up and cannot be configured if the guarding LSP originates on a 3.0 NE.

16 Click on the Finish button. The 5620 SAM prompts you to view the dynamic LSP.

17 Enable the View the newly created Dynamic LSP parameter to view the dynamic LSP, if required. Otherwise, go to step 19.

18 When the View the newly created Dynamic LSP parameter is enabled, the Dynamic LSP (Edit) form appears with the newly created dynamic LSP configuration displayed.

i View the configuration.

ii Close the Dynamic LSP (Edit) form and go to step 20.

19 Click on the Close button. The Create Dynamic LSP form closes.

20 Close the Manage Dynamic LSPs form.

Procedure 32-11 To create dynamic LSP on a 7250 SAS device

This procedure applies to 7250 SAS-ES and 7250 SAS-ESA devices.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form appears.

2 Click on the Create button. The Create Dynamic LSP form opens with the Identification step displayed.

3 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID
- Preference

4 Click on the Next button. The Define Source and Destination Sites step is displayed.

5 Specify the source and destination sites for the dynamic LSP.

Note — You can also specify an IP address for each parameter in this step.

i Click on the Select button beside the Source Site ID parameter. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

ii Choose a site in the list and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the source site information, which includes the Source IP Address parameter. The parameter is automatically configured with the system IP address of the site.

iii Click on the Select button beside the Destination Site ID parameter. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

iv Choose a destination site and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the destination site information. The displayed destination interface is the system interface because an LSP can terminate only on a system interface.

6 Click on the Next button. The Guarding LSP step is displayed.

7 Click on the Next button. The Add MPLS Paths... step is displayed.

8 Configure the Termination Validation parameter.

9 Click on the Create button. The LSP-Path Binding form opens with the Choose Path Type step displayed. You cannot configure the Type parameter, the value is set to primary.

10 Click on the Next button. The Choose MPLS Path step is displayed. Choose an MPLS path to associate with the LSP. If required, create an MPLS path by clicking on the Create MPLS Path button. See Procedure 32-4 for more information.

11 If the LSP originates on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, go to step 25.

12 Click on the Next button. The Set Initial State step is displayed.

13 Configure the Administrative parameter. The Administrative parameter is set to Up and cannot be configured.

14 Click on the Finish button. The LSP-Path Binding closes and a dialog box appears.

15 Click on the Yes button. The Create Dynamic LSP form is displayed.

16 Click on the Next button. The Properties - Traffic Engineering and Protection step is displayed.

17 Configure the Fast Reroute parameter. If you selected False, go to step 20.

18 Click the Next button. The Properties - step is displayed.

19 Configure the Hop Limit parameter. The Backup Type parameter is displayed but is not configurable.

20 Click on the Next button. The Properties - Session Attributes step is displayed.

21 Configure the parameters:

- Persistent
- Permit Merge
- Record Actual Route
- Record Label

These parameters are read-only when the LSP originates from a 7250 SAS-ES or 7250 SAS-ESA, Release 2.0, and the Fast Reroute parameter is True.

22 Click on the Next button. The Properties - Path Parameters step is displayed.

23 Configure the parameters:

- Committed Rate
- Setup Priority
- Backup Setup Priority
- Hold Priority
- Peak Rate
- Backup Hold Priority

24 Go to step 48.

25 Click on the Next button. The Set Fast Reroute step opens.

26 Configure the Fast Reroute parameter. If you selected False, go to step 29.

27 Click on the Next button. The Set Fast Reroute Backup Properties step is displayed.

28 Configure the parameters:

- Hop Limit
- Backup Setup Priority
- Backup Hold Priority

The Backup Type parameter is displayed, but is not configurable.

29 Click on the Next button. The Set Traffic Engineering Parameters step is displayed.

30 Configure the parameters:

- Persistent
- Permit Merge
- Record Actual Path
- Record Label

The parameters are read-only when the Fast Reroute parameter is True.

31 Click on the Next button. The Set Path Parameters step is displayed.

32 Configure the parameters:

- Enable CSPF
- Setup Priority
- Hold Priority

33 Click on the Next button. The Set Initial States step is displayed.

34 Configure the Administrative parameter.

35 Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

36 Click on the OK button.

37 If you do not need to add a secondary LSP path, go to step 48.

38 Click on the Create button. The LSP-Path Binding opens and the Choose Path Type step is displayed. The Type parameter is set to secondary if a primary path exists.

39 Click on the Next button. The Choose MPLS Path step is displayed. Choose an MPLS path to associate with the LSP. If required, create an MPLS path by clicking on the Create MPLS Path button. See Procedure 32-4 for more information.

40 Click on the Next button. The Set Traffic Engineering Parameters step is displayed.

41 Configure the parameters:

- Persistent
- Permit Merge
- Record Actual Path
- Record Label

42 Click on the Next button. The Set Path Parameters step is displayed.

43 Configure the parameters:

- Enable CSPF
- Setup Priority
- Hold Priority

44 Click on the Next button. The Set Initial State step opens.

45 Configure the Administrative parameter.

46 Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

47 Click on the OK button.

Caution — If you must delete a configured secondary LSP on a 7250 SAS, Release 3.0, you must first delete the MPLS Path entries you created in step 39. If you fail to do so, any new secondary LSP created on that 7250 SAS will inherit incorrect path information.

48 Click on the Next button. The Set Initial State step opens.

49 Configure the Administrative parameter. The Administrative parameter is Up and you cannot configure the value if the LSP originates on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0.

50 Click on the Finish button. The 5620 SAM prompts you to view the dynamic LSP.

51 Enable the View the newly created Dynamic LSP parameter to view the dynamic LSP configuration, if required. Otherwise, go to step 53.

52 When the View the newly created Dynamic LSP parameter is enabled, the Dynamic LSP (Edit) form appears with the newly created dynamic LSP configuration displayed.

- i View the configuration.
- ii Close the Dynamic LSP (Edit) form, and go to step 54.

53 Click on the Close button. The Create Dynamic LSP form closes.

54 Close the Manage Dynamic LSPs form.

Procedure 32-12 To configure an LSP on a 7250 SAS device

Perform the following procedure to configure an LSP that originates on a 7250 SAS-ES or 7250 SAS-ESA device.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of dynamic LSPs is displayed.

3 Choose an LSP in the list and click the on Properties button. The Dynamic LSP (Edit) form opens with the General tab displayed.

4 Click on the LSP-Path Bindings tab button. A list of LSP paths is displayed.

5 You can add a secondary LSP path on a 7250 SAS-ES or 7250 SAS-ESA, Release 3.0, if required. Otherwise, go to step 15.

6 Click on the Create button. The LSP-Path Binding opens and the Choose Path Type step is displayed. The Type parameter is set to secondary if a primary path exists.

7 Click on the Next button. The Choose MPLS Path step is displayed. Choose an MPLS path to associate with the LSP. You can also create an MPLS path by clicking on the Create MPLS Path button. See Procedure 32-4 for more information.

8 Click on the Next button. The Set Traffic Engineering Parameters step is displayed.

9 Configure the parameters:

- Persistent
- Permit Merge
- Record Actual Path
- Record Label

10 Click on the Next button. The Set Path Parameters step is displayed.

11 Configure the parameters:

- Enable CSPF
- Setup Priority
- Hold Priority

12 Click on the Next button. The Set Initial States step opens.

13 Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

14 Click on the OK button.

15 Choose an LSP path in the list and click on the Properties button. The LSP-Path Binding (Edit) form opens with the General tab displayed.

16 Configure the parameters.

- Type
- Administrative
- Setup Priority
- Hold Priority
- Fast Reroute
- Backup Type
- Hop Limit
- Record Actual Path
- Record Label
- Persistent
- Permit Merge
- Backup Setup Priority
- Backup Hold Priority
- Enable CSPF

The configurable parameters depend on:

- the type of LSP path
- the software version of the originating NE
- whether fast reroute is enabled

17 Click on the Administrative Groups tab button.

18 Assign an MPLS administrative group to the LSP path.

i Choose an MPLS administrative group in the Unassigned list.

ii Click on the right arrow button. The group is assigned to the LSP path and moves to the Assigned list.

19 View a list of hops, if required.

i Click on the following tab buttons to list the path hops:

- Provisioned Path
- Actual Path

ii Click on the Topology View button to view the topology map for the path. See chapter 5 for information about using topology maps.

20 Click on the OK button. The LSP-Path Binding (Edit) form closes.

21 Click on the OK button. The Dynamic LSP (Edit) form closes.

Procedure 32-13 To list dynamic LSPs

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Configure the filter criteria. A list of dynamic LSPs is displayed.

3 Select an LSP in the list and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 To view LSP path information:

i Click on the LSP Paths tab button.

ii Double-click on an LSP path in the list.

iii Review the state information.

LSP path information includes whether the bypass tunnel for the LSP is active, or whether the LSP is in a fast reroute state.

Procedure 32-14 To create a Point-to-Multipoint LSP

1 Choose Manage→MPLS→Point-to-Multipoint LSPs from the 5620 SAM main menu. The Manage Point-to-Multipoint LSPs form opens.

2 Click on the Create button. The P2MP LSP (Create) form opens with the General tab displayed.

3 Configure the parameters.

- Name
- ID
- Auto-Assign ID
- P2MPId
- Administrative
- System ID (Loopback IP Address)
- IP Address

When you configure the System ID (Loopback IP Address) parameter, the Management IP Address and Site Name parameters are automatically populated with the values associated with that node. The IP Address parameter is also automatically populated, however, you can specify a new value for the parameter, if required.

4 Click on the Properties tab.

5 Configure the following parameters in the Traffic Engineering and Protection panel.

- Fast Reroute
- Hop Limit
- Diff-Serv Class Type

6 Configure the following parameters in the Fast Reroute panel.

- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect

The Node Protect parameter is only configurable when the Reserved Bandwidth (Mbps) parameter is set to a value greater than 0.

7 Configure the Make before Break parameter.

8 Configure the following parameters in the CSPF panel.

- Enable CSPF
- Enable TE Metric

9 Configure the following parameters in the Signalling panel.

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP

10 Click on the P2MP Primary Instance tab.

11 Click the Create button. The P2MP Instance (Create) form opens on the General tab.

12 Configure the parameters.

- Name
- ID
- Auto-Assign ID
- Administrative

13 Click on the Properties tab.

14 Configure the following parameters in the Traffic Engineering Properties panel.

- Reserved Bandwidth (Mbps)
- Hop Limit
- Inherit Value
- Record Actual Path
- Record Label

When you enable the Inherit Value parameter, the Hop Limit parameter for the P2MP Instance is set to the same value as you configured for the parent P2MP LSP.

15 Configure the following parameters in the Make Before Break panel.

- Make before Break
- Inherit Value
- Resignal

When you enable the Inherit Value parameter, the Make before Break parameter for the P2MP instance is set to the same value as you configured for the parent P2MP LSP.

16 Configure the following parameters in the Administrative Groups panel.

- Inherit Value (for Groups Included)
- Inherit Value (for Groups Excluded)

When you enable the Inherit Value parameters, the Included and/or Excluded Groups for the P2MP instance are set to the same values you configure for the parent P2MP LSP. If you do not enable the Inherit Value parameters, you can configure the Included Groups and Excluded Groups for the P2MP Instance independently from the parent P2MP LSP. (See step 21.)

17 Click on the S2L Paths tab.

18 Click the Create button. The S2L Path (Create) form opens. Each S2L Path object represents a root-to-leaf (S2L) sub-LSP path for the primary instance of the P2MP LSP.

19 Configure the parameters.

- Name
- ID
- Destination Site ID
- Administrative

20 Repeat steps 18 and 19 to configure another S2L Path, if required.

21 Click on the Administrative Groups tab.

22 Assign one or more MPLS administrative groups to the P2MP Instance.

- **i** Choose the required Included Groups in the Unassigned list.
- **ii** Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.
- **iii** Select the required Excluded Groups in the Unassigned list.
- **iv** Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

  After you assign the Included and Excluded Groups, the total value of the groups is displayed in a bit mask format by the Groups Included and Groups Excluded indicators on the P2MP Instance Properties tab.

23 Click on the OK button. The P2MP Instance (Create) form closes.

24 Click on the S2L Paths tab in the main P2MP LSP (Create) form.

25 Click on the Search button to populate the table. The S2L Paths you configured in step 18 appears. You can select an entry from the list and click on Properties to edit it, if required.

26 Click on the Administrative Groups tab in the main P2MP LSP (Create) form.

27 Assign one or more MPLS administrative groups to the P2MP LSP.

- **i** Select the required Included Groups in the Unassigned list.
- **ii** Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and move to the Assigned list.
- **iii** Select the required Excluded Groups in the Unassigned list.
- **iv** Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and move to the Assigned list.

  After you assign the Included and Excluded Groups, the total value of the groups is displayed in a bit mask format by the Groups Included (bitmap) and Groups Excluded (bitmap) indicators on the P2MP LSP Properties tab.

28 Click OK to close the P2MP LSP (Create) form.

29 Close the Manage Point-to-Multipoint LSPs form.

30 To complete the configuration of the Point-to-Multipoint LSP, you must:

- **a** Configure the required PIM tunnel interfaces. See Procedure 30-2.
- **b** Configure tunnel interfaces on the required IGMP routing instance. See Procedure 31-37.
- **c** Configure tunnel interfaces on the required multicast info policy. See Procedure 49-4 for more information.

31 After you complete the configuration of the Point-to-Multipoint LSP, you can reopen the P2MP LSP form to create, configure and run OAM diagnostics, if required.

- **i** Click on the Tests tab button. The Test Suite, P2MP Ping, and P2MP Trace tabs are displayed.
- **ii** Create or search for the test suite or particular type of test you want to run from the tab pages. Click on either the Create or Search buttons as required.
- **iii** Click the Execute button to run a selected test.

  Refer to chapters 38 and 78 for more information about configuring OAM diagnostics.

Procedure 32-15 To create a Manual Bypass LSP

1 Choose Manage→MPLS→Manual Bypass LSPs from the 5620 SAM main menu. The Manage Manual Bypass LSPs form appears.

2 Click on the Create button. The Create Bypass-only LSP form opens with the Identification step displayed.

3 Configure the parameters.

- Name
- Description
- ID
- Auto-Assign ID

4 Click on the Next button. The Define Source and Destination Sites step is displayed.

5 Specify the source and destination sites for the manual bypass LSP.

Note — You can also manually specify an IP address for each parameter in this step.

i Click on the Source Site ID parameter Select button. The Select a Network Element - Create Bypass-only LSP form opens with a list of the available sites.

ii Select a site in the list and click on the OK button. The Select a Network Element - Create Bypass-only LSP form closes and the Create Bypass-only LSP form displays the source site information, which includes the Source IP Address parameter value. This parameter is automatically populated with the system IP address of the site.

iii Click on the Destination Site ID parameter Select button. The Select a Network Element - Create Bypass-only LSP form opens with a list of the available sites.

iv Select a site in the list and click on the OK button. The Select a Network Element - Create Bypass-only LSP form closes and the Create Bypass-only LSP form displays the destination site information. The displayed destination interface is the system interface because an LSP can terminate only on a system interface.

6 Click on the Next button. The Auto Select Hop-Less MPLS Path form opens.

7 Configure the Auto Select Hop-less Path parameter.

8 If the Auto Select Hop-less Path parameter in step 7 is enabled, go to step 10.

9 Click on the Next button. The LSP-Path Binding opens, with the Choose MPLS Path step displayed.

i Select an MPLS path in the list to associate with the LSP. You can also create an MPLS path by clicking on the Create MPLS Path button. See Procedure 32-4 for more information.

ii Click on the Next button. The Set Traffic Options step is displayed.

iii Configure the parameters.

- Hop Limit
- Inherit Value
- Record Actual Path

iv Click on the Next button. The Set Initial States step is displayed.

v Configure the Administrative parameter.

vi Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

vii Click on the OK button. The Create Bypass-only LSP form reappears.

10 Click on the Next button. The Properties step is displayed.

11 Configure the Hop Limit parameter in the Traffic Engineering And Protection block.

12 Configure the Make before Break parameter.

13 In the CSPF block, configure the parameters:

- Enable CSPF
- TE Metric
- Inter Area CSPF To First Loose Hop

14 Configure the following parameters in the Signalling block:

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP

15 Configure the following parameters in the Inter Area/Level Traffic Engineering block:

- Exclude Node in ERO
- Exclude Node IP Address

16 Click on the Next button. The Admin Groups step is displayed.

17 Assign one or more included MPLS administrative groups to the bypass-only LSP.

i Select the required MPLS administrative groups in the Included Groups - Unassigned list.

ii Click on the right arrow button. The groups are assigned to the bypass-only LSP and move to the Assigned list.

Note — When you assign included administrative groups to an MPLS interface, the assigned groups are displayed in bit mask form by the Groups Included (bitmask) indicator on the General tab.

18 Assign one or more excluded MPLS administrative groups to the bypass-only LSP, if required.

i Select the required MPLS administrative groups in the Excluded Groups - Unassigned list.

ii Click on the right arrow button. The groups are assigned to the bypass-only LSP and move to the Assigned list.

Note — When you assign excluded administrative groups to an MPLS interface, the assigned groups are displayed in bit mask form by the Groups Excluded (bitmask) indicator on the General tab.

19 Configure the Propagate Admin Group parameter.

20 Click on the Next button. The Set Initial State step is displayed.

21 Configure the Administrative parameter.

22 Click on the Finish button. The 5620 SAM prompts you to view the bypass-only LSP.

23 Enable the View the newly created Bypass Only Lsp parameter to view the bypass-only LSP configuration after closing the form, if required.

24 Click on the Close button. The Create Bypass-only LSP form closes.

25 If the View the newly created Bypass Only Lsp parameter in step 23 is enabled, the Bypass-only LSP (Edit) form opens with the newly created bypass-only LSP configuration displayed.

  i View the configuration, if required.

  ii Close the Bypass-only LSP (Edit) form.

26 Close the Manage Manual Bypass LSPs form.

Procedure 32-16 To view and configure a Manual Bypass LSP

1 Choose Manage→MPLS→Manual Bypass LSPs from the 5620 SAM main menu. The Manage Manual Bypass LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of Bypass-only LSPs is displayed.

3 Select an LSP in the list and click on the Properties button. The Bypass-only LSP (Edit) form opens with the General tab displayed.

4 Click on the desired tab buttons to view or configure information about the bypass-only LSP, as required.

5 If you have made any configuration changes, click on Apply or OK in the Bypass-only LSP (Edit) form and a dialog box appears.

6 Click on the Yes button. The Bypass-only LSP (Edit) form closes.

7 Close the Manage Manual Bypass LSPs form.

Procedure 32-17 To configure an LSP path

The following procedure applies to Dynamic LSPs and Manual Bypass LSPs, unless otherwise noted. Dynamic LSPs are used to demonstrate the steps.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of dynamic LSPs is displayed.

3 Select a dynamic LSP from the list.

4 Click the on Properties button. The Dynamic LSP (Edit) window opens with the General tab displayed.

5 Click on the LSP-Path Bindings tab button. A list of LSP paths is displayed.

6 If you are accessing this form to update the MPLS path for a Dynamic LSP, then go to step 10. Otherwise, go to step 7.

7 Select an LSP-Path Binding from the list and click on the Properties button. The LSP-Path Binding (Edit) form opens with the General tab displayed.

8 Configure the parameters:

- Type
- Administrative
- Backup Type
- Reserved Bandwidth (Mbps)
- Hop Limit
- Inherit Value
- Record Actual Path
- Record Label
- Diff-Serv Class Type
- Inherit Value
- Diff-Serv Backup Class Type
- Make before Break
- Inherit Value
- Resignal
- Enable CSPF
- Groups Included
- Inherit Value
- Groups Excluded (bitmap)
- Inherit Value

The Diff-Serv Backup Class Type parameter is only applicable to Dynamic LSPs.

9 Replace the existing MPLS path for a primary or secondary LSP with another MPLS path, if required, by proceeding as follows:

Note — You can update the existing MPLS path only for a primary or secondary LSP path that has the Make before Break parameter enabled, and that has a release 8.0 or later source NE. The MPLS path you want to use must already exist on the NE, and must not be used by any other LSP paths under the parent LSP.

i Click on the More Actions button and choose Update MPLS Path. The Choose MPLS Path form opens and displays the eligible MPLS paths.

ii Select the required MPLS path from the list.

iii Click on the OK button. The Choose MPLS Path form closes and the LSP-Path Binding (Edit) form is refreshed with the parameters related to the updated MPLS path selection.

iv Click on the OK button. The The LSP-Path Binding (Edit) form closes and the LSP-Path Binding list is refreshed with the updated MPLS path selected.

v Go to step 14.

10 Select the MPLS path from the list that you want to use to replace the existing path. Refer to the Note in step 9 for restrictions.

11 Click on the More Actions button and choose Update MPLS Path. The Choose MPLS Path form opens and displays the eligible MPLS paths.

12 Select the required MPLS path from the list.

13 Click on the OK button. The Choose MPLS Path form closes and the LSP-Path Binding list is refreshed with the updated MPLS path selected.

14 Click the Set as Secondary or Set as Standby buttons for a selected LSP-Path Binding to change its Type to one of these choices, if required.

15 Click the Switch Standby to Standby button for a selected LSP-Path Binding if you need to switch from the current active standby LSP path to another standby LSP path. This applies only to dynamic LSPs. The button choices include:

- Switch: This option allows you to switch manually from an active standby path to another inactive standby path. You can do this as often as required, without having to select Clear first.
- Force Switch: This option is essentially the same as the Switch option, but you cannot switch back unless you first press Clear to remove the Force Switch flag.
- Clear: This option is used to clear the Force Switch flag.

16 Click on the Administrative Groups tab button.

17 Assign an MPLS administrative group to the dynamic LSP.

i Select an MPLS administrative group in the Unassigned list.

ii Click on the right arrow button. The group is assigned to the dynamic LSP and moves to the Assigned list.

After you assign administrative groups to an MPLS interface, the total value of the assigned groups is displayed in a bit mask format by the Groups Included (bitmask) indicator on the General tab.

18 Click on the General Tab and in the Shared Risk Link Group panel, configure the Enable SRLG for FRR or Enable SRLG parameter, if available and required.

19 Click on the Tests tab button to configure OAM diagnostics for the LSP path, if required. The supported test type tab buttons appear. See chapter 38 for more information about configuring OAM diagnostics.

20 View a list of hops, if required.

i Click on the following tab buttons to list the path hops, if required:

- Provisioned Path
- Actual Path
- CSPF Path

ii Click on the Topology View button to view the topology map for the path, if required. See chapter 5 for information about using topology maps.

21 Click on the OK button. The LSP-Path Binding (Edit) form closes.

22 Click on the OK button. The Dynamic LSP (Edit) form closes.

Procedure 32-18 To create an LSP path using a tunnel template

Before you can create an LSP path from a tunnel template, you must create the tunnel template. You can use an existing LSP path to create a tunnel template. See the *5620 SAM Scripts and Templates Developer Guide* for more information.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs window opens.

2 Click on the Create from Template button. A Create Dynamic LSP from Template form opens with a list of previously created templates.

3 Choose a LSP template from the list. The template must be one where you associated a child LSP Path template to the parent LSP template. See Procedure 6-3 for information about creating parent and child objects for tunnel templates.

4 Click on the OK button. A Create Dynamic LSP from Template window opens. See Procedure 32-9 for information about creating a dynamic LSP from a template.

5 Click on the OK button. The Dynamic LSP (Edit) form opens.

6 Click on the LSP-Path Bindings tab button.

7 Click on the Create from Template button. A pop-up menu appears with an LSP path template.

8 Click on the template that you want to use for the LSP path.

9 Configure the parameters:

- Type
- Administrative
- Fast Reroute
- Backup Type
- Hop Limit
- Backup Setup Priority
- Backup Hold Priority
- Minimum Bandwidth (mbps)
- Committed Rate
- Peak Rate
- Setup Priority
- Hold Priority
- Reserved Bandwidth
- Hop Limit
- Record Actual Path
- Record Label
- Persistent
- Permit Merge
- IGP Shortcut Enabled
- Diff-Serv Class Type
- Diff-Serv Backup Class Type
- Main Class Type Retry Limit
- Make before Break
- Resignal
- Enable CSPF
- Rebuild Timer
- Groups Included
- Groups Excluded (bitmap)
- Groups Included
- Enable SRLG
- Show created object

The IGP Shortcut Enabled, Diff-Serv Backup Class Type, and Main Class Type Retry Limit parameters are configurable for LSPs that have source NEs at Release 8.0 or later.

10 Click on the Inheritance tab button.

11 Configure the Overridden Properties parameter.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Create LSP Path From Template form closes.

14 Close the Manage Dynamic LSPs window.

Procedure 32-19 To configure an LSP Path optimization policy

1 Choose Manage→MPLS→LSP Path Optimization from the 5620 SAM main menu. The Manage LSP Path Optimization window opens.

2 Choose LSP Path Optimization Policy (Path/Routing Management: MPLS) from the drop-down menu.

3 Click on the Create button. A drop-down menu appears.

4 Choose Create Optimization Policy. The LSP Path Optimization Policy (Create) window opens with the General tab displayed.

5 Configure the parameters:

- ID
- Auto-Assign ID
- Description

6 Click on the Candidate Definition tab button to apply filters to define eligible LSP Paths for optimization. When no filters are applied, all eligible LSP Paths are listed in the Execution Candidates window.

7 To further limit the number LSP Paths that are listed in the Execution Candidate window, define rule-based groups and add only those NEs that contain the LSP Paths that you need include.

   i Click on Select button beside the Filter Name parameter in the LSP Path Filter panel. A Select LSP Path Filter dialog box appears.

   ii Apply a filter, or create and apply a filter and click on the Search button. A list of LSP Path filters is displayed.

   iii Choose an LSP Path filter from the list.

   iv Click on the OK button. The LSP Path Filter panel is refreshed with the selected LSP Path Filter.

   v Click on Select button beside the Filter Name parameter in the Dynamic LSP Filter panel.

   vi Apply a filter, or create and apply a filter and click on the Search button. A list of dynamic LSP filters is displayed.

   vii Choose a dynamic LSP filter from the list

   viii Click on the OK button. The Dynamic LSP Filter panel is refreshed with the selected dynamic LSP filter.

   ix Click on Select button beside the Name parameter in the Rule-Based Group panel. A list of rule-based groups is displayed

   x Choose a rule-based group from the list.

   xi Click on the OK button. The Rule-Based Group panel is refreshed with the selected rule-based group.

8 Click on the Execution Rules tab button. Configure the parameters:

- Sequencing Target
- Sequencing Order
- Pacing Interval (seconds)

9 Click on the Apply button, the window is refreshed with schedule information.

Note 1 — The Schedule Optimization button does not appear during LSP path optimization policy creation. The LSP path optimization policy must be created first before a schedule can be applied. You must click on the Apply button.

Note 2 — After a schedule is applied to a LSP Optimization Policy, you cannot make changes to the schedule from the Optimization Scheduled Task window.

10 Click on the Schedule Optimization button. An Optimization Scheduled Task (Create) form opens.

11 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

12 Click on the Select button beside the ID parameter. A Select Schedule - Optimization Scheduled Task window opens.

13 Perform one of the following:

a Click on the Create button to create a schedule. A SAM Schedule Create form opens. See Procedure 79-1 for more information about creating a schedule.

b Choose a previously created schedule.

14 Click on the OK button. The Optimization Scheduled Task window refreshes with the schedule and optimization information.

15 Click on the OK button. The Select Schedule - Optimization Scheduled Task window closes and the LSP Path Optimization Policy window reappears.

16 Click on the Execution Candidates tab button.

17 Click on the Search button to display only the eligible LSP Paths that were filtered in step 7. If a filter was not applied, all eligible LSP Paths are listed.

18 Click on the Optimize button. To view the results of optimization, see Procedure 32-21.

19 Close the LSP Path Optimization Policy window.

Procedure 32-20 To terminate an LSP Path optimization policy that is in progress

1 Choose Manage→MPLS→LSP Path Optimization from the 5620 SAM main menu. The Manage LSP Path Optimization window opens.

2 Choose LSP Path Optimization Policy (Path/Routing Management: MPLS) from the drop-down menu.

3 Create a filter to search for optimization policies that are in progress. Click on the Search button. A list of LSP Path optimization policies that are in progress appears.

4 Choose a LSP Path optimization policy from the list.

5 Click on the Properties button. The LSP Path Optimization Policy (Edit) window opens with the General tab displayed.

6 Click on the More Actions button and choose Stop Current Optimization. The Optimization parameter value changes from In Progress to Not In Progress.

7 Close the LSP Path Optimization Policy (Edit) window.

Procedure 32-21 To view LSP Path optimization policy results

Use the following procedure to view the re-signaling information as a result of the LSP Path optimization policy execution. See Procedure 32-19 for more information about configuring a LSP Path optimization policy.

1 Choose Manage→MLPS→LSP Path Optimization from the 5620 SAM main menu. The Manage LSP Path Optimization window opens.

2 Select LSP Path (Path/Routing Management MPLS) from the drop-down menu.

3 Click on the Search button. A list of LSP Paths appears.

4 Choose the LSP Path on which you executed a LSP optimization policy.

5 Click on the Properties button. An LSP-Path Binding (Edit) window opens.

6 View the following parameters, as described in section 32.1.

- Resignal Eligible
- Last Performed Type
- Last Performed
- Last Performed State

7 Close the LSP-Path Binding window.

8 Close the Manage LSP Path Optimization window.

Procedure 32-22 To view detour and bypass path information

Perform this procedure to view information regarding detour and bypass tunnel paths and their protected LSPs. Detour and bypass paths are typically configured for fast-reroute-enabled LSPs on NEs for service protection against NE or link failure. The RSVP protocol is used to detect an NE or link loss.

Note 1 — This procedure applies to dynamic LSPs only.

Note 2 — Detours are employed in One-to-One backup configurations. A separate backup LSP is established for each LSP that is backed up.

Bypass Tunnels are employed in Many-to-One backup configurations in which a single backup LSP is used to back up multiple original LSPs.

Whether a path is a detour or bypass path is determined by the Backup Type value specified during LSP creation. The Backup Type parameter can be set only when Fast Reroute for the LSP is set to true.

1 Navigate to a dynamic LSP that you want to examine. The path is Manage→MPLS→Dynamic LSPs.

2 Select the required LSP and click on the Properties button. The Dynamic LSP (Edit) form opens.

3 Click on the RSVP Sessions tab button. The detour or bypass originating, transiting, and terminating RSVP sessions associated with the LSP are listed. Type, site, next and previous hop, and other related information is available.

4 Select the desired RSVP session of type detour or bypass from the list and click on the Properties button. The Session (View) form opens.

5 To view the Protected LSPs for the specific bypass or detour:

- **i** Click on the Protected LSP Paths tab button. All the protected LSPs for a specific bypass or detour tunnel are listed.
- **ii** Use the scroll bar at the bottom of the list frame to view the available information on the Protected LSPs.

6 To view the Detour or Bypass Tunnel Paths for the detour or bypass tunnel:

- **i** Click on the Detour/Bypass Tunnel Path tab button. Information regarding the detour or bypass paths is displayed. Sufficient information is provided to permit tracing a path from its originating site, through its transit hops, and to its termination site.
- **ii** Use the scroll bar at the bottom of the list frame to view the available information on the paths, including ID, Type, and so on.

7 To view additional specific Detour or Bypass information, perform the following steps, as appropriate:

- **a** For a selected detour session, click on the Detour tab button. The Detour Session ID, Detour PLR ID, and Avoided Downstream Site ID are listed.
- **b** For a selected bypass session, click on the Bypass Tunnel tab button. The Bypass Tunnel's current State is displayed.

Note — For 5620 SAM to accurately gather the information about the detour and bypass tunnel path (and the LSPs protected by a detour or a bypass tunnel), 5620 SAM must be managing all routers participating the LSP fast reroute. This is required by 5620 SAM for all SR and 7705 SAR nodes along the primary path of a fast reroute-enabled LSP.

Procedure 32-23 To create an LSP template for MVPN

1 Choose Policies→MPLS→LSP Template MVPN from the 5620 SAM main menu. The Manage LSP Template for Mvpn form opens.

2 Perform one of the following:

- **a** Configure the Policy scope parameter to Global.
- **b** Configure the Policy scope parameter to Local.
  - **i** Configure the Local Node IP Address parameter, if required
  - **ii** Click on the Select button and choose a device.

3 Click on the Create button. The LSP Template MVPN Policy (Create) form opens.

4 Configure the parameters:

- Displayed Name
- Description

5 Click on the Properties tab button.

6 Configure the parameters in the Traffic Engineering and Protection panel:

- Reserved Bandwidth
- Fast Reroute
- Hop Limit
- Record Actual Path
- Record Label

7 Configure the parameters in the Fast Reroute panel:

- Backup Type
- Hop Limit

Note — The Backup Type and Hop Limit parameters are configurable if the Fast Reroute parameter is set to true.

8 Configure the Make before Break parameter.

9 Configure the parameters in the CSPF panel:

- Enable CSPF
- Enable TE Metric

10 Configure the parameters in the Signalling panel:

- Retry Timer (seconds)
- Retry Limit

11 Click on the Administrative Groups tab button.

12 Assign one or more MPLS administrative groups to the LSP template MVPN policy.

i Choose the required Included Groups in the Unassigned list.

ii Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

iii Choose the required Excluded Groups in the Unassigned list.

iv Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

After you assign the Included and Excluded Groups, the total value of the groups is displayed in a bit mask format by the Groups Included and Groups Excluded indicators on the LSP Template MVPN Policy Properties tab.

13 Click on the OK button. The LSP Template MVPN Policy, Global Policy (Create) form closes and the Manage Lsp Template for Mvpn form reappears with the LSP MVPN template displayed.

14 Choose the LSP MVPN template and click on the Properties button. The LSP Template MVPN Policy - Global Policy (Edit) form opens with the General tab displayed.

15 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when the policies are used by resources on the device.

Note 1 — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 46 for more information.

Note 2 — The MVPN LSP template cannot be used until you choose a default MPLS path and configure the Administrative parameter in the local policy definition after the global policy is distributed. After the changes are applied to the local policy, the policy can be switched back to Sync With Global mode and the local changes are saved.

16 Click on the Local Definitions tab button.

17 Click on the Search button. A list of LSP MVPN templates is displayed.

18 Choose an LSP MVPN template from the list and click on the Properties button. The LSP Template MVPN Policy, Local Policy (Edit) form opens with the General tab button displayed.

19 Click on the Switch Mode button to change the configuration mode to Local Edit Only.

20 Click on the Properties tab button.

21 Click on the Select button to choose a default MPLS path. The Select Default MPLS Path - Lsp MVPN Template, Local Policy window opens with a list of default MPLS paths displayed.

22 Choose an MPLS path from the list and click on the OK button. The default MPLS path is displayed.

23 Click on the General tab button.

24 Configure the Administrative parameter.

25 Click on the OK button. A dialog box appears.

26 Click on the OK button. The LSP Template MVPN Policy, Local Policy form closes.

Procedure 32-24 To list and view MPLS objects

1 Choose Manage→MPLS→MPLS Objects from the 5620 SAM main menu. The Manage MPLS Objects form opens.

2 Select an MPLS object type in the list and click on the Search button. A list of MPLS objects is displayed.

3 Select an object in the list and click on the Properties button. The properties form for the object appears.

4 View the information on the various tabs, as required.

5 Close the object properties form.

6 Close the Manage MPLS Objects form.

33 — Service tunnels

33.1 Service tunnel overview

A service tunnel is an entity used to uni-directionally direct traffic from one device to another device. The service tunnel is provisioned to use a specific encapsulation method, such as GRE or MPLS, and the services are then mapped to the service tunnel. For instance, multi-node VLL and VPLS traffic is transmitted using uni-directional service tunnels in this way.

The most common type of tunnel used in 5620 SAM is a Service Distribution Point binding. Service tunnels originate on an SDP on a source NE and terminate at a destination NE. The destination NE directs packets from the service tunnel to the correct service egress interfaces (SAPs) on that device. Services that originate and terminate on the same NE do not require service tunnels, since the same NE is both the source and the destination.

However, since the concept of a tunnel is a logical construct within 5620 SAM, a number of different configurable objects can actually be used as service tunnels, including:

- SDP binding:
  Since SDP bindings can be associated to a service of any type, the service tunnel discovery includes services that are associated to SDP bindings of a given service.
- Service to Tunnel Association:
  Discovery adds tunnels that are associated to a given service.
- Ethernet tunnel (G.8031):
  Discovery adds the global Ethernet Tunnel that the Tunnel Endpoint (SAP's terminating port) is a member of.
- Ethernet ring (G.8032):
  Discovery adds the Ethernet Ring that the Ethernet Element is a member of.
- Ethernet radio ring (G.8032):
  Discovery adds the Ethernet radio ring that the Ethernet Element is a member of.
- PBB:
  Discovery adds the VPLS or MVPLS services which contain the PBB tunnel (B-Sites) of the given Epipe or VPLS.
- P2MP RSVP LSP:
  Discovery adds the P2MP LSPs retrieved from the MVPN LSP Template associated to PIM sites.
- Optical Transport Service:
  Discovery adds optical services that are traversing through network interfaces which are being used by an L2/L3 VPN through any static or dynamic LSPs that are bound to SDPs on the service.
- Mobile backhaul (applicable to 9500 MPR and 7705 SAR on MPLS-based services running over VLAN):
  Discovery adds MPR VLL services that are either associated to an SDP tunnel or are traversing through network interfaces which are being used by an L2/L3 VPN through any static or dynamic LSPs that are bound to SDPs on the service.

The Service Tunnels tab exists on all applicable service configuration forms. This tab lists all objects considered as service tunnels (SDPs, Ethernet rings, Ethernet tunnels, other services, and so forth) that are currently used by the service you are querying. The associated Discover Service Tunnels button removes any previously discovered service tunnels on the service and triggers a manual re-discovery of these, based on direct usage and current service configurations.

For composite services, the service tunnel discovery action triggers the discovery of service tunnels on all participating services. Hence, the listing includes all service tunnels currently being used by member services.

Another tab titled Flow-through Services also exists on the configuration forms of all the objects that can be used as a service tunnel. This tab lists all other services that are currently using the object you are querying as a service tunnel. The associated Discover Flow-through Services button removes any previously discovered flow-through services and triggers a manual re-discovery of these, based on direct usage and current service configurations.

For composite services, the concept of using a service as a service tunnel is not currently supported. Therefore, the Flow-through Services tab does not appear on the composite service configuration forms.

For fault management, note that an “association” type of alarm relationship exists between a service and the service tunnels it uses. This allows the service tunnel alarms to propagate up to the service level. These association alarms are displayed on the Alarms on Related Objects sub-tab, under the Faults tab of the service. Since this is a one-way association relationship, no service alarms are propagated to the service tunnels that the service is currently using.

Tunnel selection profiles

A Tunnel Selection Profile is used by 5620 SAM to assign transport tunnels for a service when the service has been configured for automatic SDP binding creation. However, for services where the SDP binding creation is performed manually, the Tunnel Selection Profile can also still be used. In these cases, tunnels and return tunnels are chosen by the system when the automatic selection of such transport tunnels is enabled and a Tunnel Selection Profile is specified.

The Tunnel Selection Profile contains Steering Parameters. When the profile is used within a service to create SDP bindings, any tunnels tagged with the Steering Parameters included in that profile become eligible for consideration in the tunnel selection process.

33.2 IP/MPLS service tunnels

Distributed service traffic is transported between PE NEs by circuits aggregated in unidirectional service tunnels.

The operational theory of a service tunnel is that the encapsulation of the data between the two managed edge NEs appears like a Layer 2 path to the service data although it is really traversing an IP or IP/MPLS core.

Tunnel policies from older versions of 5620 SAM can be converted to the newer template-based policies by using a “Convert” button located on the rule configuration form. You cannot configure CoS forwarding, LDP-over-RSVP, or multiple LSP bindings on SDP features.

A service tunnel uses GRE or MPLS encapsulation. For MPLS, a mesh of MPLS paths and LSPs must be present in the network core. You associate service tunnels with LSPs during service tunnel configuration. The 5620 SAM supports LSP creation using a basic LDP variant such as T-LDP, or using LDP over RSVP for tunnel-in-tunnel functionality based on traffic classification.

A 5620 SAM operator binds a service site to a service tunnel during service configuration. A service tunnel has a unique ID on an NE and cannot be deleted when it is currently associated with a service.

ACL IP and ACL MAC policy filters for service tunnels contain options for forwarding packets on a specific service tunnel based on matching criteria, as described in chapter 48.

IP/MPLS service tunnels design considerations

Consider the following before you configure IP/MPLS service tunnels:

- Service tunnels are unidirectional, so they are required in both directions between the source NE and the destination NE.
- The tunnel is not specific to one service or one type of service. After a tunnel exists, multiple SDPs can be aggregated over the tunnel. The SDPs can belong to different services and different customers.
- When a tunnel already exists, 5620 SAM does not automatically create a new tunnel, even if the only available tunnel is down. This prevents the creation of multiple inoperable tunnels.
- All services that are mapped to a tunnel use the same transport encapsulation type defined for the tunnel.
- Operations on the tunnel affect all the services that are associated with the tunnel. For example, the operational and administrative states of a tunnel control the state of service circuits that are carried on the tunnel. In the case of LSP-based tunnels, an LSP can be replaced in the tunnel without reconfiguring each service bound to the tunnel.
- A service tunnel is locally unique to an NE. The same tunnel ID can appear on other NEs.
- A service tunnel uses the system IP address to identify the far-end edge NE.
- A service tunnel can be configured using a tunnel template. A user that is assigned the create tunnel template scope of command role can create a tunnel template. The template manager can also apply the tunnel template to a service tunnel. See the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with tunnel templates.
- An SDP tunnel template can be applied to an auto tunnel policy.

See the appropriate device documentation for more detailed information about service tunnels.

Class-based forwarding

Packets of the same CoS and service are forwarded over a specific RSVP LSP (or a static LSP), which is part of an SDP that the service (instance) is bound to. The forwarding decision is based on the forwarding class of the packet, as assigned by the ingress QoS policy defined for the SAP.

When implementing class-based forwarding, consider the following:

- Class-based forwarding is typically implemented using the service tunnel configuration forms, as detailed in Procedure 33-1. Class-based forwarding configurations can also be altered after their initial creation by editing the service tunnel configuration form as detailed in Procedure 33-13.
- An LSP can carry packets of a forwarding class for one service and at the same time, carry packets of a different forwarding class for another service. In other words, the same LSP can be used by more than one SDP, even where the forwarding class assignments are different.
- Within an SDP, only one LSP can support a specific CoS.
- A service instance (or service site) can be bound to SDPs of differing CoS configurations, as well as regular SDPs.
- One LSP in the SDP must be designated as the default LSP. The default LSP is used by the SDP if there is no available LSP that matches the packet's forwarding class. When the default LSP is down, the SDP is also brought down.
- Class-based forwarding can be applied to all services supported by the SRs. For VPLS, you can specify an LSP to forward all multicast/broadcast packets (by default, the default LSP is used). For VLL, shared queuing must be enabled on the ingress SAP to support the class-based forwarding.
- Class-based forwarding is configurable on the 7750 SR, 7710 SR, and 7450 ESS

33.3 Ethernet (G.8031) tunnels

The IEEE 802.1ah Provider Backbone Bridging specification employs Provider MSTP to ensure loop avoidance in a resilient native Ethernet core. With P-MSTP, failover times depend largely on the size of the network and the connectivity model used in the network. MPLS tunnels provide core scaling and fast failover times using MPLS FRR. A service based on native Ethernet backbone achieves the same fast failover times as MPLS FRR.

Core Ethernet tunnels compliant with the ITU-T G.8031 specification achieve 50 ms resiliency for backbone failures. A configured Ethernet tunnel can be selected when configuring an L2 access interface on a B-VPLS.

The 5620 SAM uses two different approaches to configure Ethernet tunnels in the network.

- Approach 1 (recommended):
  5620 SAM provisions an end-to-end Ethernet G.8031 tunnel which reduces configuration errors and aids the diagnosis of any problem in the tunnel. 5620 SAM automatically configures the Ethernet tunnel endpoint and path endpoint on each of the participating NEs. See Procedure 33-6 for more information.
  The Ethernet tunnel and path are network wide objects that provide the following benefits:
  - the Ethernet tunnel provides the aggregated State of the Tunnel and reports any inconsistency in the configuration of the endpoints or paths
  - faster and easier provisioning that allows you to configure common properties such as holdTime and revertTime at the network level and then apply them to each tunnel endpoint
  - 5620 SAM accelerates the creation of global and local MAs, and MEPs by using a continuity check
- Approach 2:
  The 5620 SAM provides the ability to provision Ethernet tunnel endpoints and path endpoints separately on each NE. See Procedure 33-5 for more information on creating Ethernet endpoints. If Ethernet tunnel endpoints are created this way (or discovered from the NE) you can associate them to a network-wide Ethernet tunnel and path, but this must be done manually.

Note — Network-wide Ethernet tunnels and paths are not automatically discovered from the NE.

33.4 Ethernet (G.8032) tunnels

Ethernet Ring Protection (ERP) as specified in ITU-T G.8032, is a protection mechanism for Ethernet ring topologies. ERP provides sub-50ms protection and recovery switching for Ethernet traffic in a ring topology, and, at the same time, ensures that loops are not formed at the Ethernet layer. G.8032v1 supports a single ring topology; G.8032v2 supports multiple rings/ladder topology.

ERP topology

An ERP topology is a collection of Ethernet ring nodes that forms a closed physical loop. Between two and sixteen Ethernet ring nodes are supported per ERP topology. One ERP topology is supported per NE. Up to two ERP instances are supported per ERP topology. Ethernet ring links connect two adjacent Ethernet ring nodes participating in the same ERP topology.

Loop avoidance in the ring is achieved by guaranteeing that at anytime, traffic may flow on all but one of the ring links. This link is called the ring protection link (RPL). One designated node, the RPL Owner (also referred to as the master node), is responsible to block traffic over the RPL.

You can configure the following service types in an ERP (G.8032) topology on the following NEs:

- VPLS. VPLS that support ERP SAPs can connect to other rings and Ethernet services using VPLS SAPs.
    - 7210 SAS 3.0, Release 1 or later devices with one exception. ERP is not supported on the 7210 SAS-X 24F 2XFP, Release 3.0 R1. ERP is supported on the 7210 SAS-X 24F 2XFP, Release 3.0 R2.
- VLAN service
    - OS 6400, OS 6850, OS 6850E, OS 6855, OS 9700E, OS 9800E, Release 6.4.4 or later
    - OS 6250M, Release 6.6.2 or later
    - 9500 MPR, Release 3.1 or later
- VLL service (Cpipe and Epipe services only)
    - 9500 MPR, Release 3.1 or later

Note — For OmniSwitch NEs, only the Ethernet ring element configuration (and not Ethernet ring) is supported on the 5620 SAM. See Procedure 33-8 for more information.

33.5 Workflow to configure service tunnels

1 Before you can create a MPLS service tunnel, you must create a static or dynamic LSP. See Procedure 32-6 for statics LSPs. See Procedure 32-8 for dynamic LSPs.

2 As required, create an IP/MPLS service tunnel, an Ethernet service tunnel, or an Ethernet ring and assign it to an NE.

a Create an IP/MPLS service tunnel. See Procedure 33-1 for more information.

b Create an IP/MPLS service tunnel from a tunnel template. See Procedure 33-2 for more information.

c Create an Ethernet service tunnel.

i Create an Ethernet service tunnel endpoint. See Procedure 33-5 for more information.

ii Create an Ethernet service tunnel and assign endpoints to it. See Procedure 33-6 for more information.

d Create an Ethernet ring.

i Create an Ethernet ring element for all supported devices except for OmniSwitch and 9500 MPR devices. See Procedure 33-7 for more information.

ii Create an Ethernet ring element for an OmniSwitch. See Procedure 33-8 for more information.

iii Create an Ethernet radio ring element for an 9500 MPR. See Procedure 33-9 for more information.

iv Create an Ethernet ring and assign elements to the ring. See Procedure 33-10 for more information.

Note — Service tunnels are unidirectional, so they are required in both directions between the source NE and the destination NE.

3 If you created an IP/MPLS service tunnel in step 2, create a steering parameter and a tunnel selection profile and assign the tunnel selection profile to an SDP binding.

i Create a steering parameter. See Procedure 33-3 for more information.

ii Create a tunnel selection profile. See Procedure 33-4 for more information.

33.6 Configuring service tunnel procedures

Procedure 33-1 describes how to create an IP/MPLS service tunnel.

Procedure 33-1 To create an IP/MPLS service tunnel

Before you can create a MPLS service tunnel, you must create a static or dynamic LSP. See Procedure 32-6 for statics LSPs. See Procedure 32-8 for dynamic LSPs.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Click on the Create button and choose IP/MPLS Service Tunnel (SDP). The IP/MPLS Service Tunnel (SDP) step form opens with the Name & Describe Service Tunnel (SDP) step displayed.

3 Configure the parameters.

- Name
- Description
- Auto-Assign ID
- ID

Note 1 — If a range policy is applied to a service tunnel, a grey text box appears beside the ID parameter to indicate that a range policy is in effect.

Note 2 — If a format policy is applied to a service tunnel, a combo box appears beside the object field during object creation to indicate that a format policy is in effect. When there is only one matching policy, the combo box is greyed out. When there are multiple matching policies the combo box is used to choose a policy. The sequence of the options in the combo box are ordered by the policy Priority parameter.

4 Click on the Next button. The Pick Source Node step is displayed.

5 Configure the Source Site ID parameter. Perform one of the following:

  a Choose an NE from the list.

    i Click on the Select button. The Select a Network Element - Pick Source Node form opens.

    ii Choose an NE in the list and click on the OK button. The Select a Network Element - Pick Source Node form closes and the Create Service Tunnel (SDP) form displays the source NE IP address.

  b Enter the NE IP address.

6 Click on the Next button. The Pick Destination Node step is displayed.

7 Configure the Destination Site ID parameter. Perform one of the following:

  a Choose an NE from the list.

    i Click on the Select button. The Select a Network Element - Pick Destination Node form opens.

    ii Choose an NE in the list and click on the OK button. The Select a Network Element - Pick Destination Node form closes and the Create Service Tunnel (SDP) form displays the destination NE IP address.

  b Enter the NE IP address.

8 Click on the Next button. The Specify Transport step is displayed.

9 Perform one of the following:

a For GRE service tunnels:

i Specify GRE for the Underlying Transport parameter.

ii Configure the Signaling parameter.

iii Go to step 19.

b For MPLS service tunnels:

i Specify MPLS for the Underlying Transport parameter.

Note 1 — If the source or destination site is a 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], or 7250 SAS-ES, you cannot configure the Underlying Transport parameter. The 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], and 7250 SAS-ES support only MPLS with TLDP signalling, LDP is not enabled.

Note 2 — When you implement class-based forwarding or specify a transport destination address, you must select MPLS as the Underlying Transport parameter.

Note 3 — When you specify a transport destination address, you cannot implement class-based forwarding.

Note 4 — When you configure a service tunnel whose source site is a 7705 SAR (version 3.0 or later), you may select IPv4 as the Underlying Transport parameter if the destination site is also a 7705 SAR (version 3.0 or later), a GNE, or an unmanaged IP address.

ii Configure the parameters:

- Mixed Lsp Mode
- Revert Time (seconds)
- Ldp Enabled
- Bgp Tunnel Enabled
- Signaling

The Revert Time (seconds) parameter displays when the Mixed Lsp Mode parameter is set to true.

Note 1 — When you implement class-based forwarding, you must use one of the following parameter configurations:

- Set Mixed Lsp Mode to true.
- Set Mixed Lsp Mode, Ldp Enabled, and Bgp Tunnel Enabled parameters to false.

Note 2 — When you specify a transport destination address, you must use the following parameter configurations:

- Set Ldp Enabled to true.
- Set Mixed Lsp Mode and Bgp Tunnel Enabled to false.

Note 3 — You cannot set Bgp Tunnel Enabled to true when Ldp Enabled or Mixed Lsp Mode is set to true.

Note 4 — You cannot create a BGP or an LDP tunnel when an LSP exists between the source and destination nodes you chose in steps 4 and 7 respectively.

iii If you set the Ldp Enabled parameter to true, go to step 17.

iv If you set the Bgp Tunnel Enabled parameter to true, go to step 19.

10 Click on the Next button. The Specify Class Forwarding step is displayed.

11 Configure the parameters:

- Class Forwarding Capability
- Administrative State
- Enforce Diff-Serv Lsp-Fc Map

Note — When the Class Forwarding Capability parameter is set to Off, the existing class-forwarding configurations are removed.

The Administrative State and Enforce Diff-Serv Lsp-Fc Map parameters are configurable when the Class Forwarding Capability parameter is set to On.

12 Click on the Next button. The Associate LSPs step is displayed.

13 Click on the Add button to bind an LSP to the service tunnel. The Bind LSPs to Service Tunnel form opens with the Bind LSP to Service Tunnel Stage step displayed.

14 Select an LSP and click on the Finish button.

15 Click on the Close button. The Bind LSPs to Service Tunnel form closes and the LSP is listed on the Create Service Tunnel (SDP) form.

16 If you are enabling class-based forwarding on the LSP:

a Select an LSP from the list and click on the Set As Default LSP button. This is mandatory. The Default LSP Name appears in the associated field.

b For a VPLS, you can optionally specify an LSP to forward all multicast/broadcast packets. If this is not specified, the default LSP is used. If it is specified, the Multicast LSP Name appears in the associated field.

c For any LSPs used for class-based forwarding (including the default), you must select the LSP from the list and click on the Choose a Forwarding Class button. Select the desired forwarding class from the fly-out menu. Your choice appears in the Forwarding Class to LSP Mappings table.

d When you have finished configuring the LSPs, go to step 17. If the source is a 7250 SAS-ES site, go to step 27.

17 Click on the Next button. The Specify Transport Destination Address step is displayed.

Note — This step displays if the Underlying Transport parameter you specified in step 9 was set to MPLS and the Ldp Enabled parameter was set to true.

18 Configure the Transport Destination Address parameter.

19 Click on the Next button. The Specify Hello Parameters step is displayed.

20 Configure the parameters.

- Keep-Alive Enabled
- Hello Time
- Hello Request Timeout
- Max Drop Count
- Hello Message Length
- Hold Down Time

21 Click on the Next button. The Specify MTU Values step is displayed.

22 Configure the parameters.

- Administrative MTU
- Advertised MTU Override

23 Click on the Next button. The Specify Metric step is displayed, if applicable.

24 Configure the Metric parameter, if applicable.

25 Click on the Next button. The VC Type Related Parameters step is displayed, if applicable.

26 Configure the VLAN VC Ethertype parameters, if applicable.

27 Click on the Next button. The Specify Initial State step is displayed.

28 Configure the Administrative parameter.

29 Click on the Next button. The Booking Factor step is displayed.

Note — This step displays if the Underlying Transport parameter you specified in step 9 was set to MPLS and the Ldp Enabled parameter was set to false.

30 Configure the SDP Bandwidth Booking Factor (%) parameter.

31 Click on the Next button. The Associate Service step is displayed.

32 Click on the Select button. The Select Associated Service window opens.

33 Choose a service from the list and click on the OK button. The Select Associated Service window closes. The Associated Service Name and Associated Service ID are updated.

34 Click on the Next button. The Steering Parameters step is displayed.

35 Select the Steering Parameters in the Unassigned list that you want to assign to the tunnel and click the right-pointing arrow to move them into the Assigned list.

36 Click on the Next button. The Network Domain step is displayed.

37 Click the Select button. The Select Network Domain window opens.

38 Choose a network domain from the list and click on the OK button. The Select Network Domain window closes. The Name field is updated.

Note — All SDPs are associated with a network domain. This association is done during the creation or when editing an SDP in the Tunnel (Edit) form. You can also modify the network domain in the Tunnel (Edit) form. See step 42. The Egress Interfaces Consistency State status specifies if all the interface associations to SDP belong to a particular domain.

39 Click on the Finish button to save the configuration. The 5620 SAM prompts you to view the service tunnel configuration.

40 Enable the View the newly created tunnel parameter to view the service tunnel configuration after closing the form, if required.

41 Click on the Close button. The Create Service Tunnel (SDP) form closes.

42 If the View the newly created tunnel parameter in step 40 is enabled, the Tunnel (Edit) form opens with the newly-created service tunnel configuration displayed.

- **i** View or modify the configuration, if required.
- **ii** Click on the Create a template button, if required. See the *5620 SAM Scripts and Templates Developer Guide* for information about creating a template.
- **iii** Close the Tunnel (Edit) form.

43 Close the Manage Service Tunnels form.

Procedure 33-2 To create an SDP using a tunnel template

Before you can create an SDP from a tunnel template, you must create the SDP tunnel template. For more information about creating SDP tunnel templates, see the *5620 SAM Scripts and Templates Developer Guide*.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create from Template button. A Create Service Tunnel From Template window opens with a list of previously configured SDP tunnel templates.

3 Choose a tunnel template from the list.

4 Click on the OK button. A Create Tunnel from Template form opens with the General tab displayed.

5 Configure the parameters.

- Name
- Description
- Auto-Assign ID
- ID
- Underlying Transport
- PBB Ethernet Type
- Ldp Enabled
- Signaling
- Source Site ID
- Destination Site ID
- Transport Destination Address
- Administrative
- Administrative MTU
- Advertised MTU Override
- Metric
- VLAN VC Ethertype
- No VLAN VC Ethertype

6 Click on the SDP Bandwidth tab button. Configure the SDP Bandwidth Booking Factor (%) parameter.

7 Click on the Maintenance Tab button and configure the following parameters:

- Keep-Alive Enabled
- Hello Time
- Hello Message Length
- Hello Request Timeout
- Hold Down Time
- Max Drop Count

8 Click on the Accounting tab button.

9 Click on the Select button beside the Accounting Policy parameter to assign an accounting policy to the service tunnel. A Select Policy window opens with a list of accounting policies.

10 Choose a policy from the list and click on the OK button. The Select Policy widow closes and the Accounting Policy parameter is updated

11 Configure the Show created object parameter, if required.

12 Click on the OK button. When the SDP configuration is successful, the Create SDP from Template form closes and the Tunnel (Edit) form appears.

If the SDP configuration is unsuccessful, the Create SDP from Template form remains open and an error message appears.

13 Close the Tunnel (Edit) form.

Procedure 33-3 To create a Steering Parameter

A Steering Parameter is assigned to a service tunnel and acts as a marker for the Tunnel Selection Profile. More than one Steering Parameter can be assigned to a tunnel.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Click on the Create button and choose Steering Parameter. The Steering Parameter (Create) form opens.

3 Configure the Name and Value parameters.

4 Click on the OK button. The Steering Parameter (Create) form closes.

Note — You can also examine an existing Steering Parameter by conducting a search using the Manage Service Tunnels form. Viewing an existing Steering Parameter displays Service Tunnels and Tunnel Selection Profiles tab pages. These allow you to see which of these items make use of the Steering Parameter. A Faults tab displays any related alarms that have been logged.

5 Close the Manage Service Tunnels form.

Procedure 33-4 To create a Tunnel Selection Profile

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Click on the Create button and choose Tunnel Selection Profile. The Tunnel Selection Profile (Create) form opens with the General tab displayed.

3 Configure the parameters.

- Profile Name
- Description
- Transport Type
- Multi-Segment Tunnel Selection
- Redundant Path Selection

4 Click on the Select button.

5 Choose an SDP Binding Template from the list, if required, and click OK. The Script ID, Name, and Description fields for the selected SDP Binding Template are populated in the Tunnel Selection Profile (Create) form.

Note — Specifying an SDP Binding Template in the profile allows the 5620 SAM to use the configuration information contained in the template for the automatic creation of SDP bindings. See the *5620 SAM Scripts and Templates Developer Guide* for information about creating a template.

6 Click on the Steering Parameters tab button.

7 Click on the Steering Parameters that you want to include in the profile in the Included Steering Parameters-Unassigned portion of the form. If you are selecting more than one, hold down the Shift key after your first selection.

8 Click the right-pointing arrow to move the selected Steering Parameters into the Included Steering Parameters-Assigned portion of the form.

You can move an assigned parameter back into the unassigned portion of the form if required, by selecting it and clicking the left-pointing arrow.

9 Click on the Steering Parameters that you want to exclude from the profile in the Excluded Steering Parameters-Unassigned portion of the form. If you are selecting more than one, hold down the Shift key after your first selection.

10 Click the right-pointing arrow to move the selected Steering Parameters into the Excluded Steering Parameters-Assigned portion of the form.

You can move an assigned parameter back into the unassigned portion of the form if required, by selecting it and clicking the left-pointing arrow.

11 Click on the OK button. The Tunnel Selection Profile (Create) form closes.

Note — When configuring an existing profile, the Tunnel Selection Profile (Edit) form displays additional tabs pages, including Services, SDP Bindings, and Spoke Connectors. These allow you to see which of these items make use of the Tunnel Selection Profile. A Faults tab displays any related alarms that have been logged.

12 Close the Manage Service Tunnels form.

Procedure 33-5 To create or configure an Ethernet Tunnel Endpoint

Procedure 33-6 describes how to create a new Ethernet Tunnel Endpoint or configure an existing one.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 If you are configuring an existing Ethernet Tunnel Endpoint, go to step 8.

3 Click on the Create button.

4 Click on Ethernet Tunnel Endpoint from the contextual menu. The Select Network Elements window opens.

5 Choose a site on which to create an Ethernet tunnel endpoint.

6 Click on the OK button. The Ethernet Tunnel Endpoint (Create) form opens with the General tab displayed.

7 Go to step 10.

8 Select Ethernet Tunnel Endpoint (Ethernet Tunnel) on the drop-down menu in the Manage Service Tunnels window. Click on the Search button to display a list of the existing endpoints.

9 Select the endpoint you want to configure and click on the Properties button.

The Ethernet Tunnel Endpoint (Edit) form opens with the General tab displayed.

10 Configure the following parameters:

- Tunnel Endpoint ID
- Site ID
- Protection Type
- Encap Type
- Administrative State
- Hold Time Down
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Access Adapt QoS
- Enable Per Forwarding Path Ingress Queue
- Operational Path Endpoint Threshold
- Description
- Configured MAC Address

The Tunnel Endpoint ID and Site ID are only configurable when you are creating a new Ethernet Tunnel Endpoint.

The Access Adapt QoS, Enable Per Forwarding Path Ingress Queue, and Operational Path Endpoint Threshold parameters are only displayed when the Protection Type is set to Load Sharing.

11 Click on the Path Endpoints tab button to configure the Path Endpoints.

12 Perform one of the following:

a If you are configuring an existing Ethernet Tunnel Path Endpoint, select the required path endpoint from the list and click Properties. The Ethernet Tunnel Path Endpoint (Edit) form opens with the General tab displayed.

b If you are configuring a new Ethernet Tunnel Path Endpoint, click on the Create button. The Ethernet Tunnel Path Endpoint (Create) form opens with the General tab displayed.

13 Configure the following parameters for each Path Endpoint.

- Path ID
- Description
- Administrative State
- Precedence
- APS Command

The Path ID parameter is only configurable when you are creating a new Ethernet Tunnel Path Endpoint.

The APS Command parameter is only displayed and configurable when you are configuring an existing Ethernet Tunnel Path Endpoint and when the Protection Type parameter you configured in step 10 is set to G8031 1:1. The associated “Perform APS Command” button is used to perform the selected command on the path endpoint.

14 Click on the Properties button in the Ethernet Path block if you need to view or alter parameters on the Ethernet Path or configure a CFM Test. The Ethernet Path - Properties button is only displayed and selectable when you are configuring an existing Ethernet Tunnel Path Endpoint.

15 If you are configuring an existing Ethernet Tunnel Path Endpoint, go to step 23.

16 Click on the Port tab.

17 Click on the Select button. The Select Member Port window opens.

18 Click on the Search button to list the available ports. Choose the port to use for the Ethernet tunnel path endpoint.

19 Click on the OK button. The Ethernet Tunnel Path Endpoint (Create) form displays the selected member port.

20 Configure the parameters:

- Control Tag (Outer Encapsulation Value)
- Control Tag (Inner Encapsulation Value)

21 Click on the OK button. The Ethernet Tunnel Path Endpoint (Create) form closes and the Path Endpoints tab displays the new Ethernet Tunnel Path Endpoint in the list.

22 Go to step 30.

23 Click on the MEPs tab, if you need to create a MEP for the existing Ethernet Tunnel Path Endpoint. Otherwise go to step 30.

24 Click on the Create button. The MEP (Create) form opens with the General tab displayed.

25 Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Control MEP
- Control Sap Tag
- Low-priority Defect
- MAC Address
- Fault Propagation
- Type
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)

The Control MEP parameter is only displayed if the Interface Type parameter is set to Ethernet Tunnel Path Endpoint.

The Control Sap Tag parameter is only configurable on a 7210 SAS-M Release 4.0 R2 and later, or a 7210 SAS-X Release 4.0 R2 and later.

Note — When configuring a Down MEP on a Subscriber Group Interface SAP, the Direction parameter cannot be configured.

26 If the Maintenance Domain for this MEP has a Name Type of none and its Maintenance Association has a Name Format of icc-based, then the Y.1731 TEST and the AIS tabs will also be displayed. See Procedure 68-18 for more information.

27 Click on the OK button. A dialog box appears.

28 Click on the OK button. The MEP (Create) form closes and the newly-created MEP is displayed in the list on the MEPs tab.

29 Click on the OK button. The Ethernet Tunnel Path Endpoint (Edit) form closes and the Path Endpoints tab displays the available Ethernet Tunnel Path Endpoints in the list.

30 Repeat steps 12 to 29 for any other Ethernet Tunnel Path Endpoints you need to create or configure.

31 Click OK. A dialog box appears.

32 Click Yes to close the Ethernet Tunnel Endpoint form.

Procedure 33-6 To create an Ethernet tunnel

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create button.

3 Click on Ethernet Tunnel from the contextual menu. The Ethernet Tunnel (Create) window opens.

4 Configure the following parameters:

- Tunnel ID
- Name
- Description
- Protection Type
- Encap Type
- Hold Time Down
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Access Adapt QoS
- Enable Per Forwarding Path Ingress Queue
- Operational Path Endpoint Threshold

The Access Adapt QoS, Enable Per Forwarding Path Ingress Queue, and Operational Path Endpoint Threshold parameters are only displayed when the Protection Type is set to Load Sharing.

5 Click on the Apply button. The Ethernet Tunnel (Edit) window opens with the General tab displayed.

6 Click on the Components tab button. Right click on Tunnel Endpoints and choose one of the following from the contextual menu.

a Create Ethernet Tunnel Endpoint.

i Refer to Procedure 33-5 to create an Ethernet Tunnel Endpoint. The endpoint will be listed as Endpoint A on the Ethernet Tunnel form in the Tunnel Endpoints Section.

Note — The parameter values specified in step 4 are automatically applied in the Ethernet Endpoint form when creating an endpoint.

ii Repeat step i to create Endpoint B.

iii Go to step 7.

b Add Existing Endpoint.

i The Select Endpoints window opens.

ii Click on the Search button and select an endpoint.

iii Click OK.

iv The endpoint is listed as Endpoint A on the Ethernet Tunnel form in the Tunnel Endpoints Section.

Note — The parameter values specified in step 4 are not automatically applied to the selected Ethernet endpoint.

v Repeat steps i to iv to select Endpoint B.

7 Right click on Paths and choose Create Ethernet Paths from the contextual menu to create a path. The Ethernet Path (Create) window opens with the General tab displayed.

8 Configure the parameters:

- Auto-Assign ID
- ID
- Description

9 Click on the Endpoints tab button. Perform one of the following:

a Manually configure the following parameters for endpoints A and B.

- Site ID
- Path ID
- Precedence
- Administrative State
- Control Tag (Outer Encapsulation Value)
- Control Tag (Inner Encapsulation Value)
- Member Port

Note — A path endpoint cannot be administratively enabled on a Release 8.0 or later NE if either of following is true:

- An operationally up same-fate SAP on the Ethernet tunnel endpoint does not have a tag configured for the path endpoint.
- The Control Tag (Outer Encapsulation Value), Control Tag (Inner Encapsulation Value), and Member Port parameters are not configured.

b Perform the following steps to specify a path endpoint for endpoints A and B.

i Click on the Select button beside the Path ID parameter. The Select Path Endpoint form opens.

ii Click on the Search button and select an available endpoint.

iii Click OK. The endpoint parameters are automatically populated.

Note — To delete an Ethernet tunnel path endpoint, click on the Search button to display a list of endpoints, select an endpoint, then click on the Delete button.

10 Click on the Intermediate Services tab button to view and specify the intermediate services for the Ethernet path. The services that you add to the list (or that already appear there) are in the order of proceeding from Endpoint A to Endpoint B. Perform the following to add an intermediate service:

i Click on the Create button. The Select Service window opens.

ii Click on the Search button to display a list of intermediate services available to include in this path. Only VLL services can be included.

iii Select the required service and click on the OK button.

The Select Service window closes and the service you chose is displayed in the list on the Intermediate Services tab.

Note — 5620 SAM does not perform a validation to confirm whether the selected service is actually along the path between the two path endpoints.

iv Repeat steps i to iii to add another intermediate service, if required.

Note 1 — If you have an intermediate service highlighted in the list and want to add another service immediately above it, click on the Insert Component button rather than the Create button. The Create button places an additional service at the bottom of the list, whereas the Insert Component button places it directly above a highlighted service.

Note 2 — You can change the ordering of intermediate services in the list by selecting a particular service and using the Move Up or Move Down buttons.

11 Click on the CFM Continuity Check tab button to configure a CFM Continuity Check test for each path.

It is mandatory to have the following steps completed before selecting a test:

- Create a Maintenance Domain. The Name Type must be None. See chapter 80 for more information.
- Create a CFM Continuity Check Test. See Procedure 38-6 for information.

12 Click on the Select button. The Select CFM Test window opens.

13 Click on the Search button to list the available CFM tests. Select a CFM test.

14 Click on the OK button. The CFM Test is listed and the MEP Auto Creation check boxes are enabled.

15 Perform one of the following:

a Enable one of the MEP Auto Creation buttons:

i Click on the Run Continuity Check Protocol button to create Maintenance Associations and local and remote MEPs. Any existing Remote MEPs that do not match the local MEPs are deleted. MEPs are turned up and CCM Messages are enabled, and the control MEP property is set on the MEPs.

ii Click on the Create MEPs button to create local MEPs. Any existing Remote MEPs that do not match the local MEPs are deleted.

b Continue to step 16 and select the Run Continuity Check Protocol button or Create MEPs button at a later date.

16 If required, click on the MEP tab button to display the MEP form and select the check box to set the Control MEP parameter.

17 Click on the OK button. The Ethernet Tunnel window is displayed with the new Path information.

18 If the Protection Type parameter in step 4 was set to G8031 1:1, then repeat steps 7 to 17 for the other path.

19 If the Protection Type parameter in step 4 was set to Load Sharing, then repeat steps 7 to 17 for all paths.

20 Click Apply. The Path Id, Operational State, and CC Protocol State are updated and the path endpoints with this specific configuration are sent to the NEs.

> **Note —** The CC protocol state appears under the global path (in the navigation tree and on the CFM Continuity Check form). The CC protocol state displays the state of the continuity check protocol running between the MEPs of the two endpoints of the path.

21 Click OK. A dialog box appears.

22 Click Yes to close the Ethernet Tunnel (Create) form.

Procedure 33-7 To create or configure an Ethernet Ring Element

This procedure describes how to create a new Ethernet Ring Element or configure an existing one.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 If you are configuring an existing Ethernet Ring Element, go to step 8.

3 Click on the Create button.

4 Click on Ethernet Ring Element from the contextual menu.

5 Choose a site from the Select Network Elements window to create an Ethernet Ring Element.

> **Note —** You can create multiple ring elements at this point if you select more than one site here.

6 Click on the OK button. The Ethernet Ring Element (Create) form opens with the General tab displayed.

7 Go to step 10.

8 Select Ethernet Ring Element (Ethernet Ring) on the drop-down menu in the Manage Service Tunnels window. Click on the Search button to display a list of the existing ring elements.

9 Select the ring element you want to configure and click on the Properties button.

The Ethernet Ring Element (Edit) form opens with the General tab displayed.

10 Configure the following parameters:

- ID
- Auto-Assign ID
- Site ID
- Description
- Administrative State
- Compatible Version
- CCM Hold Time Down (deciseconds)
- CCM Hold Time Up (deciseconds)
- Guard Time (deciseconds)
- Revert Time (seconds)
- Ring Protection Link Type
- Ring Node ID

The ID and Site ID are only configurable when you are creating a new Ethernet Ring Element.

11 Configure the parameters for a sub-ring, if required:

- Type
- Ethernet Ring ID
- VPLS
- Propagate Topology Change

12 Click on the Path Endpoints tab button to configure the Path Endpoints.

13 Perform one of the following:

a If you are configuring an existing Ethernet Ring Path Endpoint, select the required path endpoint from the list and click Properties. The Ethernet Ring Path Endpoint (Edit) form opens with the General tab displayed.

b If you are configuring a new Ethernet Ring Path Endpoint, click on the Create button. The Ethernet Ring Path Endpoint (Create) form opens with the General tab displayed.

14 Configure the following parameters for each Path Endpoint.

- Path ID
- Description
- Administrative State
- Path Endpoint Type

The Path ID parameter is only configurable when you are creating a new Ethernet Ring Path Endpoint.

15 If configuring an Ethernet Ring Path Endpoint on a 7210 SAS-M Release 4.0 R2 and later, or a 7210 SAS-X Release 4.0 R2 and later, configure the Switch Command parameter and click on the Perform Switch Command button.

16 If you are configuring an existing Ethernet Ring Path Endpoint, go to step 24.

17 Click on the Port tab.

18 Click on the Select button. The Select Member Port window opens.

19 Click on the Search button to list the available ports. Choose the port to use for the Ethernet ring path endpoint.

20 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form displays the selected member port.

21 Configure the parameters:

- R-APS Tag (Outer Encapsulation Value)
- R-APS Tag (Inner Encapsulation Value)

22 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form closes.

The Path Endpoints tab displays the new Ethernet Ring Path Endpoint in the list.

23 Repeat steps 3 to 22 for the other Ethernet Ring Path Endpoint you need to create, if required.

24 Click OK. A dialog box appears.

25 Click Yes to close the Ethernet Ring Element form.

Procedure 33-8 To create or configure an Ethernet Ring Element on an OmniSwitch NE

This procedure describes how to create a new Ethernet Ring Element or configure an existing one on an eligible OmniSwitch NE.

Note 1 — For ERP created with stacked VLAN services, only NNIs can be added as ERP path endpoints.

Note 2 — Before creating ERP with stacked VLAN services, the port/LAG mode must be Network and Bind type must be ERP, associated with that particular VLAN. To achieve this:

- From the Equipment view, chose a port. Right- click on the port, and choose Properties. The Physical Port form opens.
- Choose the Network value for the Mode parameter.
- Choose the ERP value for the Bind Type parameter.
- Port → L2 Network Interfaces → VLAN, delete the VLAN association in which the ERP needs to be created
- Port → L2 Network Interfaces → VLAN, add it to the stacked VLAN with the Bind Type value as ERP.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 If you are configuring an existing Ethernet Ring Element, go to step 8.

3 Click on the Create button.

4 Click on Ethernet Ring Element from the contextual menu.

5 Choose an OmniSwitch site from the Select Network Elements window to create an Ethernet Ring Element.

6 Click on the OK button. The Ethernet Ring Element (Create) form opens with the General tab displayed.

7 Go to step 10.

8 Select Ethernet Ring Element (Ethernet Ring) on the drop-down menu in the Manage Service Tunnels window. Click on the Search button to display a list of the existing ring elements.

9 Select the ring element you want to configure and click on the Properties button.

The Ethernet Ring Element (Edit) form opens with the General tab displayed.

10 Configure the following parameters:

- ID
- Auto-Assign ID
- Site ID
- Description
- Administrative State
- Guard Time (centiseconds)
- Revert Time (minutes)
- Ring Protection Link Type
- Name
- Service ID
- AIS Meg Level

The ID and Site ID are only configurable when you are creating a new Ethernet Ring Element.

11 Click on the Path Endpoints tab button to configure the Path Endpoints.

12 Perform one of the following:

a If you are configuring an existing Ethernet Ring Path Endpoint, select the required path endpoint from the list and click Properties. The Ethernet Ring Path Endpoint (Edit) form opens with the General tab displayed.

b If you are configuring a new Ethernet Ring Path Endpoint, click on the Create button. The Ethernet Ring Path Endpoint (Create) form opens with the General tab displayed.

13 Configure the following parameters for each Path Endpoint.

- Path ID
- Description
- Administrative State
- Path Endpoint Type

The Path ID parameter is only configurable when you are creating a new Ethernet Ring Path Endpoint.

14 If you are configuring an existing Ethernet Ring Path Endpoint, go to step 22.

15 Click on the Port tab.

16 Click on the Select button. The Select Member Port form opens.

17 Click on the Search button to list the available ports. Choose the port to use for the Ethernet ring path endpoint.

18 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form displays the selected member port.

Note 1 — You must select a ring element for each site that will be part of the Ethernet ring.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner or None. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — The Ethernet Ring Path can be a LAG or port.

19 Configure the parameters:

- Path ID
- Path ID

20 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form closes.

The Path Endpoints tab displays the new Ethernet Ring Path Endpoint in the list.

21 Repeat steps 3 to 20 for the other Ethernet Ring Path Endpoint you need to create, if required.

22 Click OK. A dialog box appears.

23 Click Yes to close the Ethernet Ring Element form.

24 Click on the Protected Services tab button to view and specify the services for the Ethernet path. The services that you add to the list (or that already appear there) are in the order of proceeding from Endpoint A to Endpoint B. Perform the following to add a standard or stacked VLAN service:

i Click on the Add button. The Select Service window opens.

ii Click on the Search button to display a list of services available to include in this path. Only standard and stacked VLAN services can be included.

iii Select the required service and click on the OK button.

The Select Service window closes and the service you chose is displayed in the list on the Services tab.

Note 1 — 5620 SAM does not perform a validation to confirm whether the selected service is actually along the path between the two path endpoints.

Note 2 — If ERP is created with standard VLAN service, then standard VLAN services for Release 6.4.4/6.6.2 NEs and IPM Enterprise VLAN services for Release 6.6.2 NEs can be added as Protected services.

Note 3 — If ERP is created with stacked VLAN service, then stacked/IPM stacked VKLAN services for 6.4.4/6.6.2 NEs can be added as Protected Services.

25 To edit or view Protected Services, click on the Properties button of a selected standard VLAN service. The Ethernet Ring Element (Edit) form opens with the General tab displayed.

26 Click on the Protected Services tab button. Select a service. The Protected Services (Edit) form opens. Click on the Properties tab to edit or view the Protected service.

27 To view collected statistics, click on the Statistics tab button. To collect statistics, click on the Collect button. See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

28 Click on the OK button. The Ethernet Ring Element (Edit) form closes.

Procedure 33-9 To create an Ethernet radio ring element on a 9500 MPR

Radio ring elements are supported on the 9500 MPR Release 3.1 or later devices.

Create the ERP topology

1 Right-click on a 9500 MPR NE, and select Properties from the drop-down menu. A Network Element [Edit] form opens with the General tab selected.

2 Click on the Radio Ring Component tab button.

3 Click on the Create button. The Radio Ring Component new Object [Create] form opens.

4 Configure the ID and Topology Name parameters.

5 Click on the Select button beside the East Port Name parameter. The Select East Port - Radio Ring Component - new Object form opens.

6 Choose a port for the east port and click on the OK button.

7 Click on the Select button beside the West Port Name parameter. The Select West Port - Radio Ring Component - new Object form opens.

8 Choose a port for the west port and click on the OK button.

9 Click on the OK button to save the changes and close the Radio Ring Component new Object [Create] form.

10 Click on the OK button to save the changes and close the Network Element [Edit] form.

Create the radio ring representation

11 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

12 Click on the Create button and choose Radio Ring from the contextual menu. The Radio Ring, new Object [Create] form opens with the General tab displayed.

13 Configure the following parameters:

- Mgr ID
- Auto-Assign ID
- Name
- Description
- Hold Time Down
- Guard Time

14 Click on the OK button to save the change and close the Radio Ring, new Object [Create] form.

Create the radio ring element

15 Choose Radio Ring [Ethernet Ring] in the drop-down menu in the Manage Service Tunnels window and click on the Search button to display a list of the radio ring elements.

16 Choose the radio ring element you want to configure and click on the Properties button. The Radio Ring [Edit] form opens with the General tab displayed.

17 Click on the Components tab button. The Radio Ring and Ring Element icons display.

18 Right-click on the Ring Element icon and choose Create Ethernet Ring Element from the contextual menu. The Select Network Elements [Edit] form opens.

19 Double-click on a Radio Ring. The Ethernet Ring Element new Object [Create] form opens.

20 Configure the following parameters:

- ID
- Auto-Assign ID
- Site ID
- Topology Name
- Description
- CCM Hold Time Down (deciseconds)
- Guard Time
- Ring Protection Link Type
- R-APS Vlan ID
- MEG Level

21 Click on the OK button to save the change and close the Ethernet Ring Element new Object [Create] form.

Add other ring elements

22 As required, add other ring elements to the radio ring by performing the following:

i Right-click on the Ring Element icon on the Radio Ring [Edit] form and choose Add Existing Element from the contextual menu. The Select Elements form opens.

ii Click on the Search button to display a list of the existing radio ring elements.

iii Choose a radio ring element on click on the OK button.

iv Repeat the substeps above to add other ring elements.

Add the radio ring to a VLAN path

23 Perform Procedure 69-12 to create a VLAN path. Choose Ring Based as the VLAN path type to add the radio ring to the VLAN.

Create the service on the ERPS topology

24 Perform one of the following to create a service for the 9500 MPR:

a Perform Procedure 69-8 to create a 9500 MPR (dot1q) VLAN service.

b Perform Procedure 70-3 to create a Epipe VLL service.

c Perform Procedure 70-10 to create a Cpipe VLL service.

Note 1 — For VLL services, the terminating sites have to be manually added to the service. For VLAN services, the sites get auto-populated.

Note 2 — When you create the VLL or VLAN service for the 9500 MPR, select the Ring Based path type.

Procedure 33-10 To create an Ethernet Ring

This procedure describes how to create an Ethernet Ring and its associated Control VPLS and data services.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create button.

3 Click on Ethernet Ring from the contextual menu. The Ethernet Ring (Create) window opens.

4 Configure the following parameters:

- Mgr ID
- Auto-Assign ID
- Element ID
- Name
- Description
- Hold Time Down
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Guard Time (deciseconds)
- Compatible Version

5 Click on the Apply button. The Ethernet Ring (Edit) window opens with the General tab displayed.

6 Click on the Components tab button.

7 Right click on Ring Elements and choose one of the following items from the contextual menu.

a Create Ethernet Ring Element.

i Perform steps 5 to 22 in Procedure 33-7 to create an Ethernet Ring Element. When you are done, the element will be displayed on the Components tab in Ethernet Ring form.

Note 1 — You must create a ring element for each site that will be part of the Ethernet ring.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner and one element configured as an RPL neighbor. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — The parameter values specified in step 4 are initially populated in the Ethernet Ring Element form when creating a ring element from the Components tab. However, you can change these as required.

ii Repeat step i to create the other required ring elements.

Note — You can create all the ring elements required for the ring in one step. See step 5 in Procedure 33-7.

iii Go to step 8.

b Add Existing Element.

i The Select Element window opens.

ii Click on the Search button and select an element.

iii Click OK.

The element will be displayed on the Components tab in Ethernet Ring form.

Note 1 — You must select a ring element for each site that will be part of the Ethernet ring.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner and one element configured as an RPL neighbor. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — When you add an existing Ethernet endpoint, the parameter values specified in step 4 are not populated into the properties of that endpoint.

iv Repeat steps i to iii to select the other required ring elements.

8 Right click on Paths and choose Create Ethernet Ring Path from the contextual menu to create a path. The Ethernet Path (Create) form opens with the General tab displayed.

Note — You must create a path for each element in the ring. Each element (site) in the ring will therefore have two endpoints (from two different paths) associated with it.

9 Configure the parameters:

- Auto-Assign ID
- ID
- Description

10 Click on the Endpoints tab button to configure the endpoints for the path.

Perform one of the following:

Note — One and only one endpoint within the entire Ethernet ring must have its Ring Protection Link Type parameter configured as Ring Protection Link End. All other endpoints in the Ethernet ring must have this parameter set to a value of Normal.

a Manually enter the following parameters for Endpoints A and B.

- Path ID
- Ring Protection Link Type
- Administrative State
- R-APS Tag (Outer Encapsulation Value)
- R-APS Tag (Inner Encapsulation Value)
- Member Port

Note — Path endpoints cannot be administratively enabled if:

- the R-APS Tag or Member Port parameters are not configured
- a MEP is not configured on the path endpoint

b Select an available path endpoint on endpoints A and B.

i Click on the Select button in the Path Endpoint section. The Select Path Endpoint window opens.

ii Click on the Search button and select an available endpoint.

iii Click OK. The endpoint parameters are automatically populated.

11 Click on the CFM Continuity Check tab button to configure a CFM Test for the path.

12 Click on the Select button. The Select CFM Test window opens. Perform one of the following:

a Click on the Search button to list the available CFM tests.

i Select the required CFM test.

ii Click OK.

The Select CFM Test window closes and the Global ID and ID parameters for the selected test appear on the CFM Continuity Check tab.

b Click on the Create button to create the required CFM test. The Global Maintenance Entity Group (Create) form opens, with the General tab displayed.

Note — The Initial CCM Interval for the CFM test you select or create must be set to either 10 ms or 100 ms, otherwise the subsequent MEP creation will fail. The 7210 SAS-E, 7210 SAS-M and 7210 SAS-X do not support the 10 ms value.

Refer to Procedure 38-6 for information on creating the test.

13 Click on the Intermediate Services tab button to view and specify the intermediate services for the Ethernet path. The services that you add to the list (or that already appear there) are in the order of proceeding from Endpoint A to Endpoint B. Perform the following to add an intermediate service:

i Click on the Create button. The Select Service window opens.

ii Click on the Search button to display a list of intermediate services available to include in this path. Only VLL services can be included.

iii Select the required service and click on the OK button.

The Select Service window closes and the service you chose is displayed in the list on the Intermediate Services tab.

Note — 5620 SAM does not perform a validation to confirm whether the selected service is actually along the path between the two path endpoints.

iv Repeat steps i to iii to add another intermediate service, if required.

Note 1 — If you have an intermediate service highlighted in the list and want to add another service immediately above it, click on the Insert Component button rather than the Create button. The Create button places an additional service at the bottom of the list, whereas the Insert Component button places it directly above a highlighted service.

Note 2 — You can change the ordering of intermediate services in the list by selecting a particular service and using the Move Up or Move Down buttons.

14 Right click on Interconnects and choose Create Ethernet Ring Interconnect from the contextual menu to create an interconnect. The Ethernet Ring Interconnect (Create) form opens.

15 Configure the parameters:

- Auto-Assign ID
- ID
- Description

16 Configure the Element A end node for the interconnect.

i In the Element A panel, click on the Select button next to the ID field and select a site from the Select Element - Ethernet Ring Interconnect form.

ii Configure the parameters:

- Type
- Interconnected Ethernet Ring Element
- Propagate Topology Change

17 Configure the Element B end node for the interconnect.

i In the Element B panel, click on the Select button next to the ID field and select a site from the Select Element - Ethernet Ring Interconnect form.

ii Configure the parameters:

- Type
- Interconnected Ethernet Ring Element
- Propagate Topology Change

18 Click OK. A dialog box appears.

19 Click Yes to close the Ethernet Ring (Create) form.

20 Create a Control VPLS for the Ethernet ring.

i Perform Procedure 71-1 to create the VPLS, just as you would create a regular VPLS.

ii Perform Procedure 71-3 to create an L2 Access Interface for each path endpoint in the Ethernet ring. Each site in the Control VPLS must therefore have two control L2 Access Interfaces.

When creating the L2 access interfaces, ensure the following requirements:

- The Terminating Port and Encap Type must have the same values used to create the particular path endpoint in step 10.
- The Outer Encapsulation Value and Inner Encapsulation Value for the port in each L2 Access Interface must be set to the same value as the R-APS Tag (Outer Encapsulation Value) and R-APS Tag (Inner Encapsulation Value) respectively that you used for the particular path endpoint in step 10. This defines the interface as a Control SAP for the Ethernet ring.

21 Create the VPLS data services required for the Ethernet Ring.

i Perform Procedure 71-1 to create the VPLS, just as you would create a regular VPLS. The VPLS data service must be a regular VPLS, I-VPLS, or B-VPLS type.

ii Perform Procedure 71-3 to create an L2 Access Interface for each path endpoint in the Ethernet ring. Each site in the VPLS data service must therefore have at least two L2 Access Interfaces.

When creating the L2 access interfaces, the Terminating Port and Encap Type must have the same values used to create the particular path endpoint in step 10.

Procedure 33-11 To discover service tunnels

Use this procedure to list all service tunnels objects (SDPs, Ethernet rings, Ethernet tunnels, other services, and so forth) that are currently used by the service you are querying.

1. Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
2. Configure the filter criteria and click on the Search button. A list of services is displayed.
3. Select a service in the list and click on the Properties button. The Service (Edit) form opens with the General tab displayed.
4. Click on the Service Tunnels tab.
5. Click the Discover Service Tunnels button to re-populate the list.

   Any previously discovered service tunnels on the service are removed and an on-demand re-discovery of these is triggered.

   A confirmation dialog appears when the discovery is complete.
6. Click OK.
7. Click on an item in the list and the Properties button to view the object information.
8. Close the Service (Edit) form.

Procedure 33-12 To discover flow-through services

Use this procedure to list all other services that are currently using the object you are querying as a service tunnel. These are collectively referred to as flow-through services. Refer to the "Service tunnel overview" section for a list of applicable service tunnel objects.

1. Open the configuration form of the object you want to examine.
2. Click on the Flow-through Services tab.
3. Click the Discover Flow-through Services button to re-populate the list.

   Any previously discovered flow-through services are removed and a manual re-discovery of these is triggered.

   A confirmation dialog appears when the discovery is complete.
4. Click OK.

5 Click on a service in the list and the Properties button to view the service information.

6 Close the object's configuration form.

Procedure 33-13 To view and manage service tunnels and tunnel elements

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens

2 Configure the filter criteria from the drop-down menu. The list contains all object types that can be used as service tunnels, along with related service tunnel management objects. The listing is hierarchical and includes:

- Ethernet Ring Element
- Ethernet Tunnel Endpoint
- Service Tunnel
    - Ethernet Tunnel
    - Ethernet Ring
    - P2MP LSP
    - Service (Service Management)
        - IES Service
        - MPR VLL
        - Mirror Service
        - Optical Transport Service
        - VLAN Service
        - VLL
        - VPLS
        - VPRN
    - Tunnel (Service Tunnel Management)
- Steering Parameter
- Tunnel Selection Profile

Note — For all service tunnel objects except Service, the search will display all objects of that type, regardless of whether or not they are being used as a service tunnel.

If you want to see only those objects that are currently being used as a service tunnel, enable the check box for the "Used By a Service" configurable filter item that exists in the list form.

3 Click on the Search button. A list containing the selected object type is displayed.

Note — If you searched on Service (or on a specific service type) used as a service tunnel, be aware that the generated list contents are subject to change, depending on current usage and on when the last on-demand (manual) discovery was conducted. There is no auto-discovery for this listing.

In other words, only those services will be listed that were known to be used as service tunnels when the last discovery was conducted. Since the discovery is only updated on user demand, the list of services generated here may not be up to date.

Procedure 33-11 details the on-demand discovery of service tunnels (including a service used by another service as a tunnel).

4 Select a service tunnel in the list and click on the Properties button. The Tunnel (Edit) form opens with the General tab displayed.

5 View or configure the parameters on the General tab, as required.

6 View the States and State Cause indicators, if applicable, for troubleshooting information, such as a failed OAM diagnostic.

7 Click on the other tab buttons to view information or modify the parameters.

Note — The following tab buttons are not available for IP/MPLS service tunnels if the source is a 7250 SAS-ES:

- Tests
- Maintenance
- Accounting
- Statistics

8 Save the changes and close the Tunnel (Edit) form.

9 Close the Manage Service Tunnels form.

Procedure 33-14 To run an OAM validation test on a service tunnel

An OAM validator test suite must be created for the tested entity. See chapter 78 for more information about how to create an OAM validator test suite.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens

2 Configure the filter criteria and click on the Search button. A list of service tunnels is displayed.

3 Select a service tunnel in the list and click on the Properties button. The Tunnel (Edit) form opens with the General tab displayed.

4 Click on the More Actions button and choose Validate.

If an OAM validator test suite is not associated to the service tunnel, a dialog box appears. Perform the following steps:

i Click on the OK button to associate the service tunnel with an existing OAM validator test suite. The Choose Validator Test Suite form appears.

ii Configure the filter criteria. A list of OAM validator test suites appears.

iii Select a OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab button.

7 Click on the Validation Result tab button.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab button to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise, go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result (Edit) form.

14 Close the Tunnel (Edit) form.

15 Close the Manage Service Tunnels form.

Procedure 33-15 To view the service tunnel topology

1 Choose Application→Service Tunnel Topology from the 5620 SAM main menu. The Service Tunnel Topology map opens.

2 View the topology map as required. See chapter 5 for information about using topology maps.

3 Close the topology map.

34 — Lawful Intercept

34.1 Overview

Lawful Intercept, or LI, is a term that describes the interception and monitoring of network subscriber traffic by authorized agencies for law-enforcement purposes. A subscriber whose traffic is intercepted using LI is called a target. LI target traffic is replicated by a service mirror that uses subscriber information as the match criteria. LI has the following characteristics.

- LI is not detectable by a target subscriber.
- LI-related traffic is delivered separately from other network traffic.
- LI-related alarms only appear for authorized LI users.
- LI configuration information is stored in a separate and encrypted file.
- LI uses SSL security for data encryption, server authentication and message integrity between the 5620 SAM server and the single-user GUI clients or client delegate servers.

LI functions are managed separately from other 5620 SAM functions. LI mirroring is a special type of service mirroring that requires the following:

- on each LI NE in a mirror service:
    - SSH user security
    - an LI user profile
    - a user account that has LI privileges
- on the 5620 SAM:
    - SSL on the single-user GUI clients, client delegate servers and JMS server
    - a user account that has LI privileges
    - an assigned liMgmt scope of command role
    - an LI mediation policy

LI management requires a dedicated user authorization level. The 5620 SAM LI configuration forms, parameters, mirror services, and mirrored traffic appear only for a user with LI privileges, who can perform the following:

- create, configure, and view LI sources that use IP, MAC, SAP, and subscriber filters
- view LI-related alarms
- configure LI mediation policies
- modify the LI user password

Caution — An LI user password cannot be modified unless it is known. When an LI user password is not known, the LI user account is unavailable.

See chapter 72 for more information about mirror service management. See chapter 9 for more information about user privileges and scope of command roles.

Security

The 5620 SAM admin user, or an operator with an assigned admin scope of command role, must create an LI user account to be used for LI configuration. A user with the admin scope of command can perform only the following LI functions:

- Create an LI user scope of command profile and associate a non-admin user account with the LI profile.
- Configure an LI user profile that is restricts the LI user to LI activities only and does not allow system administrator activities.
- Create a password for the LI user.
- Configure CLI and SNMP access for the LI user account.

The 5620 SAM admin user cannot perform the following LI functions:

- Assign LI privileges to a user that is associated with the admin profile.
- View LI-related alarms.
- Delete an LI user.
- View, create, modify, or delete LI objects.
- View or modify LI mediation policies.

The following conditions apply to LI users and LI user groups:

- LI configuration requires the liMgmt scope of command role.
- The liMgmt role can be assigned to only one scope of command profile.
- A scope of command profile that has an assigned liMgmt role can include other roles except for the admin role.
- You cannot change the scope of command profile assignment for a user group when the profile includes the liMgmt role.
- An LI user group must be created as an LI user group; you cannot change a non-LI user group to an LI user group
- You cannot change an LI user group to a non-LI user group.
- A user account can have the liMgmt or the admin role, but not both.
- A user that belongs to an LI user group cannot be changed to a non-LI user.
- An LI span of control profile restricts LI user access to specific NEs.

34.2 Workflow to configure LI

The following is the sequence of high-level activities required to configure LI for the 5620 SAM.

1. Enable SSH security on each NE that is to perform an LI function. For more information about configuring SSH, see chapter 14.

2. Enable SSL security between the 5620 SAM main server and single-user GUI clients, and between the 5620 SAM main server and client delegate servers. For more information about configuring SSL security, see chapter 10.

3. Plan the 5620 SAM LI user-account creation according to the requirements for LI user access to other 5620 SAM functional areas.

4 As the 5620 SAM admin user, perform the following steps to create an LI user on the 5620 SAM. See Procedure 34-1 for more information.

   i Create a 5620 SAM LI scope of command profile that has an assigned liMgmt role.

   ii Create a 5620 SAM LI user group that is associated with the new scope of command profile.

   iii Create a 5620 SAM LI user account and assign it to the new user group.

5 If required, create an additional NE LI user account using the 5620 SAM GUI. See Procedure 34-7 for more information.

6 Provide the credentials for the 5620 SAM LI user account to the authorized LI administrator or LI user.

7 As the LI user, change the password of the 5620 SAM LI user account so that it is unknown to the 5620 SAM admin user. See Procedure 9-28 in chapter 9 for more information.

8 As the NE admin user, perform the following steps using a CLI to create an LI user on the NE.

   i Create an LI user profile on the NE. See Procedure 34-2 for information about creating an NE user profile using a CLI.

   ii Create an LI user account on the NE that is associated with the LI user profile. See Procedure 34-3 for information about creating an NE user account using a CLI.

9 Provide the credentials for the LI NE user account to the LI user.

10 As the LI user, perform the following steps.

   i Change the password of the LI NE user account so that it is unknown to the NE admin user. See Procedure 34-4 for more information.

   ii Create a 5620 SAM LI mediation policy for the NE that uses SSH for CLI sessions and secure file transfers. See Procedure 34-5 for more information.

   iii Specify whether the NE stores the LI source configuration locally or reconfigures the LI sources after a reboot. See chapter 10 for information about saving LI source configurations.

   iv Use the 5620 SAM to enable NE discovery for LI. See Procedure 34-6 for more information.

   v Configure LI mirror services. See chapter 72 for information about configuring mirror services.

   vi Configure the LI Filter Lock to configure who can modify base IPv4 and MAC filters referenced by an LI Source. See Procedure 34-8 for more information.

   vii As required, view LI user and system logs to monitor LI activity. See chapter 9 for more information about accessing user and system logs.

34.3 5620 SAM LI configuration procedures

This section describes how to configure LI on the 5620 SAM and on an NE.

Procedure 34-1 To create an LI user account on the 5620 SAM

Note — You require 5620 SAM admin user privileges to perform this procedure.

1 Using an account with an assigned security scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Management (Edit) form opens with the General tab displayed.

2 Click on the Scope of Command tab button.

3 Choose Profile (security) from the object drop-down list.

4 Click on the Create button. The Scope of Command Profile (Create) form opens with the General tab displayed.

5 Configure the parameters:

- Auto-Assign ID
- Profile ID
- Profile Name
- Description

6 Assign one or more scope of command roles to the profile. Perform the following steps.

i Click on the Roles tab button.

ii Click on the Add button. The Select Scope Of Command Role(s) - ScopeOfCommandProfile form opens.

iii Select one or more roles to include in the scope of command profile.

Note 1 — One of the roles you choose must be the liMgmt role.

Note 2 — You cannot include the admin role in an LI scope of command profile.

Note 3 — The 5620 SAM allows the creation of only one scope of command profile that contains the liMgmt role.

iv Click on the OK button. The Select Scope of Command Role(s) - ScopeOfCommandProfile form closes and a dialog box appears.

v Click on the OK button.

vi Click on the OK button. The Scope of Command Profile (Create) form closes.

7 Click on the User Groups tab button.

8 Click on the Create button. The User Group (Create) form opens with the General tab displayed.

9 Configure the parameters:

- User Group
- Description
- User Group State
- Apply Local Authentication Only
- Account Expiry
- Password Expiry
- Override Global Timeout
- Client Timeout (minutes)

10 Perform the following steps to assign the new LI scope of command profile to the user group.

i Click on the Select button beside the Profile ID field in the Scope of Command panel. The Select Scope of Command Profile - User Group form opens.

ii Select a profile from the list and click on the OK button. The Select Scope of Command Profile - User Group list form closes and the User Group (Create) form is refreshed with the scope of command profile information.

11 Perform the following steps to assign a span of control profile to the user group.

i Click on the Select button beside the Profile ID field in the Span of Control panel. The Select Span of Control Profile - User Group form opens.

ii Select a profile from the list and click on the OK button. The Select Span of Control Profile - User Group list form closes and the User Group (Create) form is refreshed with the span of control profile information.

12 Click on the OK button. The User Group (Create) form closes and the 5620 SAM User Security - Security Management (Edit) form reappears.

13 Click on the Users tab button. The User (Create) form opens.

14 Configure the parameters:

- User Name
- Description
- User State
- E-mail Address
- Password Change Required
- User Password
- Confirm Password
- Valid Client IP address
- Enable IP Address validation

15 Perform the following to associate the user with the newly created LI user group.

i Click on the Select button beside the User Group parameter. The groupName - User list form opens.

ii Choose the new LI user group from the list and click on the OK button. The groupName - User list form closes and the User (Create) form is refreshed with the user group information.

16 Click on the OK button. The User (Create) form closes and the 5620 SAM User Security - Security Management (Edit) form reappears.

17 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 34-2 To create an NE LI user profile using CLI

Note — You require NE admin user privileges to perform this procedure.

1 Open an SSH session on the NE as described in chapter 15.

2 Enter the following commands in sequence at the prompt to create an NE user profile. The following is a sample configuration:

```
configure system security profile li-prof ↵
default-action deny-all ↵
li ↵
 entry 10 ↵
 match "configure li" ↵
 action permit ↵
 exit ↵
 entry 20 ↵
 match "exit" ↵
 action permit ↵
 exit ↵
 entry 30 ↵
 match "help" ↵
 action permit ↵
 exit ↵
 entry 40 ↵
 match "back" ↵
 action permit ↵
 exit ↵
 entry 50 ↵
```

```
match "show li" ↵
action permit ↵
exit ↵
entry 60 ↵
match "info" ↵
action permit ↵
exit ↵
entry 70 ↵
match "configure system security user" ↵
action permit ↵
exit ↵
entry 80 ↵
match "admin save" ↵
action permit ↵
exit ↵
exit ↵
admin save ↵
```

3 Close the SSH session.

4 Right-click on the NE in the 5620 SAM topology map and choose Resync from the contextual menu to update the NE configuration in the 5620 SAM.

Procedure 34-3 To create an LI user account on an NE using a CLI

Note — You require NE admin user privileges to perform this procedure.

1 Open an SSH session on the NE as described in chapter 15.

2 Enter the following commands in sequence at the prompt to create an LI user:

```
configure system security snmp ↵
```

To specify the SNMP access group configuration, perform one of the following:

a For NE releases prior to 8.0 R7, type:

access group *LI_group* security-model usm security-level privacy context li exact read li-view write li-view notify iso ↵

b For NE releases 8.0 R7 to 8.0 R9 and 9.0 R1 to 9.0 R2, type:

access group *LI_group* security-model usm security-level privacy context li exact read iso write iso notify iso ↵

c For NE releases 8.0 R10+ and 9.0 R3+, type:

access group "*LI_group*" security-model usm security-level privacy read "iso" write "iso" notify "iso" ↵

access group "*LI_group*" security-model usm security-level privacy context "li" exact read "li-view" write "li-view" notify "iso" ↵

exit all ↵

configure system security user *LI_username* ↵

password *LI_password* ↵

access console li snmp ↵

snmp group *LI_group* ↵

console member *LI_profile* ↵

console no member default ↵

exit all ↵

admin save ↵

where
LI_group is the name of the LI user group on the NE
LI_usename is the name of the LI user account on the NE
LI_password is the password for the LI user account on the NE
LI_profile is the name of an LI user profile; see Procedure 34-2 for information about creating an LI user profile

3 Close the SSH session.

4 Right-click on the NE in the 5620 SAM topology map and choose Resync from the contextual menu to update the NE configuration in the 5620 SAM.

Procedure 34-4 To configure NE LI user security

Perform this procedure to change the password for an LI user account on an NE and to configure LI user authentication and SNMP data encryption on the NE.

Note — You require NE LI user privileges to perform this procedure.

1 Use the NE LI user account to open an SSH session on the NE. See chapter 15 for information about opening an SSH session on an NE.

2 Enter the following command to obtain the SNMP engine ID of the NE.

`show system info ↵`

The SNMP engine ID is displayed.

3 Record the SNMP engine ID for use in the following steps.

4 Log in to a 5620 SAM main server, client delegate server, or single-user client station using an appropriate user account.

Note 1 — If you are logging on to a main server or client delegate server station, you must log in as the samadmin user.

Note 2 — If you are logging on to a 5620 SAM single-user client station, you must log in as a local administrator, or as the user that installed the client.

5 Open a console window.

6 Navigate to the *install_dir*/nms/bin directory

where *install_dir* is the 5620 SAM installation location, typically /opt/5620sam/server or /opt/5620sam/client on Solaris, or C:\5620sam\client on Windows

7 Perform the following steps to generate an MD5 authentication key for the NE LI user account. An authentication key is used to create an encrypted authentication password.

i Perform one of the following.

- On a Solaris station, enter the following at the CLI prompt:

`./nmsclient.bash password2key MD5` ***`password engine_ID`*** **↵**

- On a Windows station, enter the following at the CLI prompt:

`nmsclient.bat password2key MD5` ***`password engine_ID`*** **↵**

where
password is the ASCII password string used to generate the key
engine_ID is the SNMP engine ID obtained in step 2

The utility generates the authentication key.

ii Record the key value for use later in the procedure.

8 Perform the following steps to generate an MD5 DES privacy key for the NE LI user account. A DES privacy key is used to encrypt the SNMP packets for additional security.

i Perform one of the following.

- On a Solaris station, enter the following at the CLI prompt:

./nmsclient.bash password2key MD5 *password engine_ID* ↵

- On a Windows station, enter the following at the CLI prompt:

nmsclient.bat password2key MD5 *password engine_ID* ↵

where
password is the ASCII password string used to generate the key
engine_ID is the SNMP engine ID obtained in step 2

The utility generates the DES privacy key.

ii Record the key value for use later in the procedure.

9 Close the console window.

10 Enter the following commands in sequence at the CLI prompt to change the LI user password and to configure LI security for the user account:

configure system security user *username* ↵

password *new_LI_password* ↵

snmp ↵

authentication md5 *authentication_key* privacy des-key *DES_privacy_key* ↵

exit all ↵

admin save ↵

where
LI_group is the name of the LI user group on the NE
LI_usename is the name of the LI user account on the NE
new_LI_password is the new password for the LI user account on the NE
authentication_key is the MD5 authentication key value generated for the NE LI user in step 7
DES_privacy_key is the DES privacy key value generated for the NE LI user in step 8

11 Close the SSH session.

Procedure 34-5 To configure LI mediation

Perform this procedure to create an LI mediation policy that enables the creation of source objects for an LI service mirror.

Note — You require 5620 SAM LI user privileges to perform this procedure.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Click on the LI Mediation Security tab button.

3 Click on the Create button. The LI Mediation Policy (Create) form opens.

4 Click on the Select button beside the User Name parameter to view a list of configured users. The Select Site User For SNMP Access form opens.

5 Select the NE LI user created in Procedure 34-3 from the list and click on the OK button. The user name is displayed on the LI Mediation Policy (Create) form.

6 The SNMP passwords in the 5620 SAM mediation policy must match the encrypted passwords generated for the NE LI user in Procedure 34-4. Perform the following steps to set the mediation-policy passwords.

- **i** Click on the Properties button. The NE User Configuration form opens.
- **ii** Click on the SNMPv3 tab button.
- **iii** Enable the Authentication Protocol parameter.
- **iv** Specify the password used to generate the authentication key in Procedure 34-4 for the New Authentication Password and Confirm New Auth Password parameters.
- **v** Enable the Privacy Protocol parameter.
- **vi** Specify the password used to generate the DES encryption key in Procedure 34-4 for the New Privacy Password and Confirm New Privacy Password parameters.
- **vii** Click on the OK button. A dialog box appears.
- **viii** Click on the Yes button. The NE User Configuration form closes.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Mediation Policy (Create) form closes and the Mediation (Edit) form reappears.

9 Click on the OK button. The Mediation (Edit) form closes.

Procedure 34-6 To enable NE discovery for LI

Perform this procedure to enable LI discovery of an NE. Before you can enable LI discovery for an NE, the NE must be successfully discovered. See chapter 14 for information about configuring NE discovery.

Note — You require 5620 SAM LI user privileges to perform this procedure.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form opens with the Discovery Rules tab displayed.

2 Click on the Managed State tab button. A list of discovered NEs is displayed.

3 Choose an NE on which Procedures 34-2 and 34-3 have been performed, and click on the Properties button. The Node Discovery Control (Edit) form opens with the General tab displayed.

4 Click on the LI Mediation Security tab button.

5 Click on the Select button in the Dual Read Access Mediation Policy panel. The Configure Mediation Security - Node Discovery Control list form opens.

6 Choose the LI mediation policy created in Procedure 34-5 and click on the OK button. The Configure Mediation Security - Node Discovery Control list form closes.

7 Click on the Select button in the Dual Write Access Mediation Policy panel. The Configure Mediation Security - Node Discovery Control list form opens.

8 Choose the LI mediation policy created in Procedure 34-5 and click on the OK button. The Configure Mediation Security - Node Discovery Control list form closes.

9 Click on the Select button in the Dual Trap Access Mediation Policy panel. The Configure Mediation Security - Node Discovery Control list form opens.

10 Choose the LI mediation policy created in Procedure 34-5 and click on the OK button. The Configure Mediation Security - Node Discovery Control list form closes.

11 Click on the OK button. The Node Discovery Control (Edit) form closes and the Discovery Manager (Edit) form reappears.

12 Click on the Resync Status tab button.

13 Click on the Search button. A list of NEs is displayed.

14 Choose the NE and click on the Resync button. The Resync Options form opens.

15 Select Choose MIB Entries and click on the Next button. The Choose MIB Entries list form opens.

16 Select all TIMETRA-MIRROR-MIB entries in the list and click on the Finish button.

Note — Resynchronizing only the TIMETRA-MIRROR-MIB entries resynchronizes only LI source objects and keeps the resynchronization time to the minimum required.

17 Click on the Close button. The Resync Options form closes and the Discovery Manager (Edit) form reappears.

18 Click on the OK button. The Discovery Manager (Edit) form closes.

Procedure 34-7 To create an additional NE LI user account using the 5620 SAM GUI

Note 1 — You require 5620 SAM LI user privileges to perform this procedure.

Note 2 — Before you can perform this procedure, at least one LI user account must exist on the NE.

Note 3 — Before you can perform this procedure, a 5620 SAM LI user must enable LI discovery for the NE using Procedure 34-6.

1 Choose Administration→Security→NE User Configuration from the 5620 SAM main menu. The NE User Configuration form opens.

2 Click on the Create button. The NE User (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- User Name
- Description
- Access

You must specify the li, snmp, and console values for the Access parameter.

Additional configurable parameters are displayed.

4 Configure the additional parameters:

- Password
- Confirm Password
- Home Directory
- Restrict to Home
- Console Login Exec File
- Console Cannot Change Password
- Console New Password At Login

Specify an MD5 authentication key for the Password parameter. See Procedure 34-4 for information about generating a user authentication key.

5 Perform the following steps to assign a console profile, if required.

- **i** Click on the Console Profiles tab button. The list of profiles numbered one through eight appears. A user can have up to eight console profiles.
- **ii** Use the Select button beside one of the Profile 1 through Profile 8 parameters to choose a console profile. See chapter 21 for information about creating console profiles.

6 Click on the SNMPv3 tab button.

- **i** Enable the Authentication Protocol parameter.
- **ii** Specify an authentication key generated using Procedure 34-4 for the New Authentication Password and Confirm New Auth Password parameters.
- **iii** Enable the Privacy Protocol parameter.
- **iv** Specify a DES encryption key generated using Procedure 34-4 for the New Privacy Password and Confirm New Privacy Password parameters.
- **v** Click on the OK button. A dialog box appears.
- **vi** Click on the OK button. The NE User (Create) form closes and the NE User Configuration form reappears.

7 Close the NE User Configuration form.

Procedure 34-8 To configure the LI Filter Lock

This procedure allows a 5620 SAM LI user to configure a parameter that will permit base IPv4 and MAC filters referenced by an LI Source to be modified or deleted. The LI Filter Lock parameter specifies who can modify the LI filters. The available options are:

- Locked: no users can modify the LI filters
- Unlocked For LI Users: only users with LI privileges can modify the LI filters
- Unlocked For All: all users can modify the LI filters

Note — You require 5620 SAM LI user privileges to view the LI Configuration Status tab and to perform this procedure.

1 Right-click on a discovered device in the Equipment navigation tree and choose Properties from the contextual menu. The Network Element (Edit) form is displayed.

2 Click on the LI Configuration Status tab button.

3 Configure the LI Filter Lock parameter.

4 Click OK to apply the configuration and close the Network Element (Edit) form.

Procedure 34-9 To configure LI NAT Source

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of mirror services appears.

3 Choose a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens with the General tab displayed.

4 Click on the Sites tab button. A list of mirror service sites are displayed.

5 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

6 Click on the LI NAT Sources tab button.

7 Click on the Configure LI Source Configuration button.

8 Click on the Ethernet Header tab button.

9 Configure the parameters:

- Source MAC Address
- Destination MAC Address
- EtherType

10 Click on the L2 Aware Subscribers tab button.

11 Click on the Create button. The LI Source NAT L2 Aware Subscriber (Create) form opens.

12 Configure the Subscriber ID and Intercept ID parameters.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The LI Source NAT L2 Aware Subscriber (Create) form becomes a tab.

15 Click on the OK button. The LI Source NAT L2 Aware Subscriber (Create) tab closes and the Mirror Service (Edit) form reappears with the Sites tab displayed.

16 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

17 Click on the LI NAT Sources tab button. The Ethernet Header tab is displayed.

18 Click on the Dual Stack Lite LSN Subscribers tab button.

19 Click on the Create button. The LI Source Dual Stack Lite LSN Subscriber (Create) form opens.

20 Configure the parameters:

- Routing Instance ID
- IP Address
- Prefix Length
- Intercept ID

21 Click on the OK button. A dialog box appears.

22 Click on the OK button. The LI Source Dual Stack Lite LSN Subscriber (Create) form becomes a tab.

23 Click on the OK button. The LI Source Dual Stack Lite LSN Subscriber (Create) tab closes and the Mirror Service (Edit) form reappears with the Sites tab displayed.

24 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

25 Click on the LI NAT Sources tab button. The Ethernet Header tab is displayed.

26 Click on the Classic LSN Subscribers tab button.

27 Click on the Create button. The LI Source Classic LSN Subscriber (Create) form opens.

28 Configure the parameters:

- Routing Instance ID
- IP Address
- Prefix Length
- Intercept ID

29 Click on the OK button. A dialog box appears.

30 Click on the OK button. The LI Source Classic LSN Subscriber (Create) form becomes a tab.

31 Click on the OK button. The LI Source Classic LSN Subscriber (Create) tab closes and the Mirror Service (Edit) form reappears with the Sites tab displayed.

32 Click on the Apply button. A dialog box appears.

33 Click on the Yes button.

34 Close the Mirror Service (Edit) form.

35 Close the Manage Mirror Services form.

Procedure 34-10 To enable or disable use of a secure channel for LI users

Perform this procedure to enable or disable use of an SSL connection for LI users and to make HTTPS requests over the XML OSS interface and the 5620 SAM GUI.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Search for the following XML tag. The secure channel check for LI Users can be enabled or disabled.

```
<liConf
```

```
liUserRequireSSL="value"
```

where *value* is set to true or false to enable or disable the secure channel check for LI users.

6 Save and close the nms-server.xml file.

7 Open a console window.

8 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

9 Enter the following at the prompt:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and the value defined is updated.

35 — IPsec

35.1 IPsec overview

The 5620 SAM supports the configuration of IPsec VPRN services, which are generically called IPsec VPNs. An IPsec VPN enables the secure extension of a corporate VPN over uncontrolled or untrusted private and public networks. The ISA-IPSEC MDA on the 7750 SR, Release 6.1 or later, provides IPsec tunneling and encryption between sites.

You can use the 5620 SAM to configure IPsec sessions and the security associations that are required in a bi-directional IPsec tunnel. You can configure multiple IPsec tunnels for a VPRN.

5620 SAM IPsec session configuration supports the following:

- encryption methods such as DES, 3DES, AES-128, AES-192, and AES-256
- authentication and hashing methods such as HMAC-MD5 and HMAC-SHA1
- key distribution methods such as IKE shared secret with PFS, and manual exchange
- key generation algorithms such as Diffie-Helman
- IPsec modes
- shared secret authentication
- NAT traversal
- DPD for the IPsec tunnel

An IPsec VPN service includes IPsec tunnels that terminate on IES or VPRN IPsec gateways. These gateways support L3 forwarding through an interface that connects to an IPsec tunnel. You can use the 5620 SAM to configure VPRN services to which individual hosts connect over the Internet to an IES or VPRN IPsec gateway. You can configure one or more tunnel interfaces in a VPRN service, and can configure multiple tunnel security profiles for each tunnel interface.

IKE policies are used to negotiate IPsec security associations, or SAs, between IPsec peers. AN SA is a relationship between two or more IPsec peers that defines how the peers communicate securely. IKE policies are exchanged between IPsec peers to negotiate a secure communication channel; they specify how traffic is encrypted between source and destination sites in an IPsec VPN by establishing a shared security policy using authentication keys.

IPsec transform policies specify the protocol for the IPsec authentication header and the encryption protocol for the encapsulating security payload, or ESP, and define the attributes that are used to secure the data.

After an IPsec peer initiates an IPsec session, there are two main phases:

- authentication and protection of IPsec peer identities and negotiation of matching IKE SA policies between peers to establish a secure channel for negotiating IPsec SAs in the next phase
- IPsec SA parameter negotiation and establishment of matching peer SAs

After the second phase, the IPsec peers exchange data over the IPsec tunnel according to the IPsec parameters in the IKE and IPsec transform policies.

You can create a tunnel template to configure shared IPsec transforms and IKE policies. Each IPsec peer configuration can include the following:

- one or more configured IPsec transforms
- one IKE policy
- one unique IPsec tunnel
- one tunnel filter defined in the IPsec tunnel configuration

Each IPsec tunnel between IKE peers is identified by a unique remote peer IP address or a unique local IP address.

You can use the IPsec Application Function Manager to create and manage end-to-end IPsec components to form a secure VPN. See section 35.2 for more information.

The 5620 SAM OSSI supports IPsec VPN configuration.

IPv6 IPsec

OSPFv3 authentication requires IPv6. IPv6 IPsec requires the following:

- IPsec transport mode —required because the NE acts as an OSPFv3 authentication host
- IPsec static security association—defines the SPI values, algorithms, protocol and keys to be used, and requires the same configuration at each end of the tunnel
- AH and ESP
- MD5 and SHA1

BFD

You can use BFD for static LAN-to-LAN IPsec tunnels on the 7750 SR-c4, 7750 SR-7, 7750 SR-12, and 7750 SR-c12. The following is the configuration information for implementing BFD over static LAN-to-LAN IPsec tunnels:

- You can have only one BFD session between a source/destination address pair.
- Each tunnel can be associated with only one BFD session. However, one or more tunnels, to a maximum of 500, can be associated with same BFD session.
- If one BFD session is associated with multiple tunnels, the tunnel that carries the BFD traffic must be operationally up before any of the other tunnels can be operationally up.
- When the 5620 SAM does not receive BFD packets from a peer before the detection time expires or a signal down notification is sent from a remote peer, the BFD session is considered down. When the 5620 SAM sets the associated IPsec tunnels in a down state, 5620 SAM performs the following:
  - sends a Delete Payload message to each remote peer from each associated tunnel and SA
  - removes the state and table entries from each associated tunnel and SA

35.2 IPsec VPN

You can create and manage the association between IPsec components, public and private services, to form a secure VPN. See “Typical applications for IPsec corporate services” in this section for the typical applications of an IPsec VPN.

You use the IPsec VPN step forms to perform the following:

- Configure the corporate service type.
- Enable the link between the corporate and secure service.
- Choose an NE service site.
- Configure the secure VPRN service.
- Configure the delivery service.
- Choose the Tunnel group.
- Create the policy.
- Deploy the IPsec VPN.

Tunnel types

Table 35-1 lists the tunnel types that you can create for an IPsec VPN.

Table 35-1 Tunnel types

Tunnel type	7750 SR, Release 6.0	7750 SR, Release 7.0 or later	7210 SAS
Dynamic (site-to-site)		✓	
Dynamic (soft client)		✓	
Static	✓	✓	✓

The 5620 SAM creates the following after the successful creation of an IPsec VPN, regardless of the tunnel type:

- a secure VPRN service and NE sites
- the IES or VPRN delivery service and NE sites
- if you specify that the secure and corporate services are to be linked, a composite service that contains the corporate and secure services

The 5620 SAM performs specific configuration actions after the successful creation of an IPsec VPN, depending on the tunnel type. See Procedures 35-15 to 35-17 for more information.

Typical applications for IPsec corporate services

Figure 35-1 shows one public L3 VPRN service that is associated with the corresponding private VPRN service. The private VPRN service belongs to a larger private VPRN. The public service can be a VPRN or IES service. The private service can only be a VPRN service.

Figure 35-1 Static IPsec tunnel

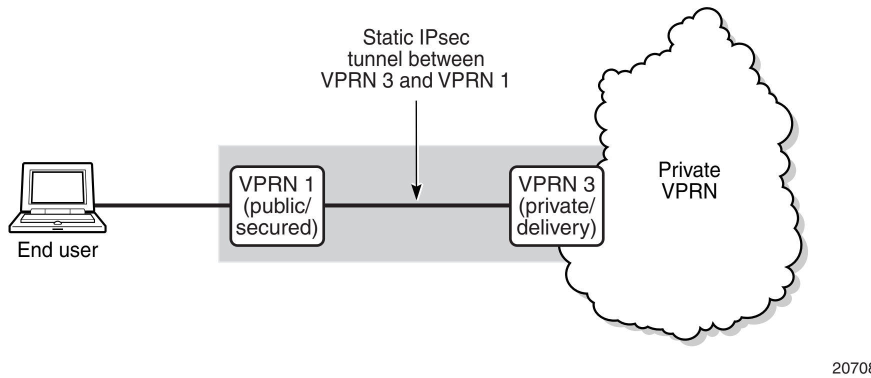


Figure 35-2 shows two public L3 VPRNs, VPRN 1 and VPRN 2, which are connected to the private, secure service VPRN 3 through an IPsec gateway. The public services can be VPRN or IES services. The private service can only be a VPRN service.

Figure 35-2 IPsec tunnels for a site

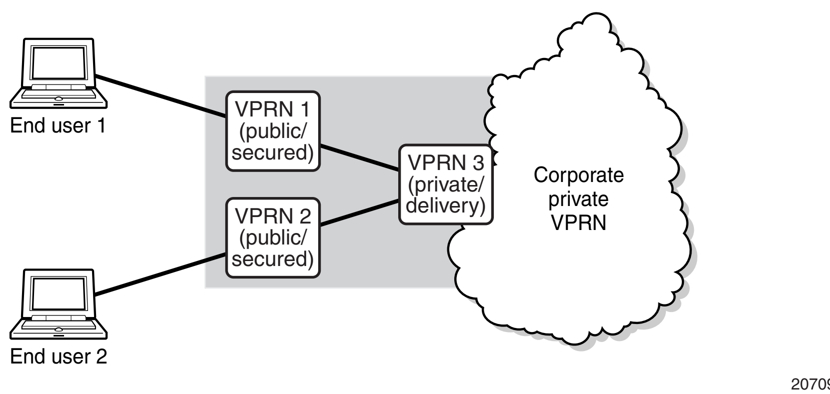

Figure 35-3 is the same as Figure 35-1, but Figure 35-3 shows IPsec tunnels across multiple sites. Site A, Site B, and Site C are part of the private service VPRN 4. For the site, there is a secure IPsec tunnel between a public service and a private service. The public services can be L3 VPRN or L3 IES services. The private service can only be a VPRN service.

Figure 35-3 IPsec tunnels for multiple sites

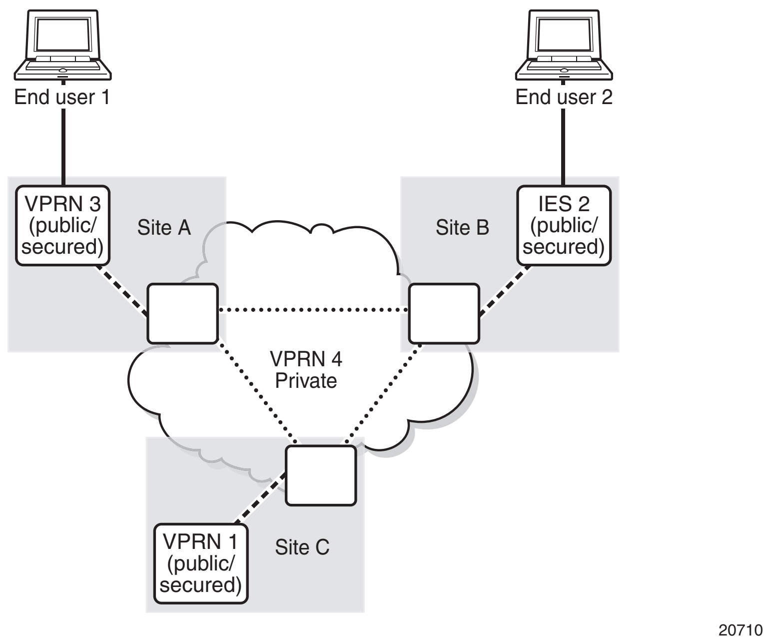

Figure 35-4 shows a private VPRN that is connected to a corporate network and a VPLS that is the corporate network. The public IES and private VPRN service are connected to VPLS network through a CCAG or SCP. CCAG connects the private VPRN to the VPLS network.

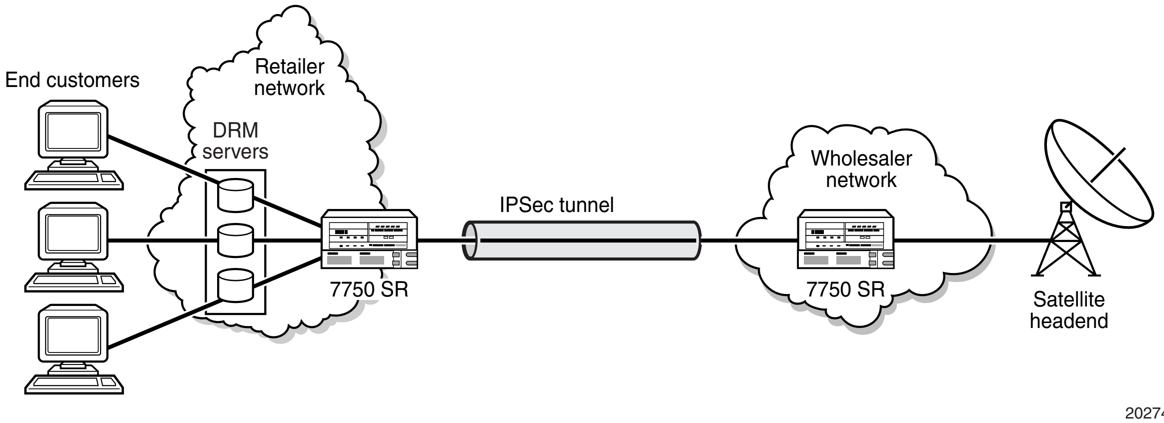
35.3 Sample video wholesale IPsec configuration

Larger providers or a cooperative of smaller providers often unite to provide a video headend to avoid the costs of investing in a satellite headend locations on their own ground station, to provide tripleplay features. Each retail subscriber can purchase content from this single station and receive it over IP. However, encryption is required so that the signal cannot be understood if intercepted.

Figure 35-5 shows a sample video wholesale configuration with a high-speed encrypted tunnel.

Figure 35-5 Sample video wholesale configuration



35.4 Workflow to configure and manage an IPsec configuration

See section 35.5 for the workflow to configure and manage an IPsec configuration using the IPsec VPN step forms.

1 Provision the ISA-IPSEC MDA on the 7750 SR, Release 6.1 or later. See chapters 16 and 17 for more information about IPsec equipment configuration.

- **i** Create or configure ISA-Tunnel groups.
- **ii** Assign the active and backup tunnel group members to the ISA-Tunnel groups.

2 Configure an IKE policy. See Procedure 35-1 for more information.

3 Configure an IPsec transform policy. See Procedure 35-2 for more information.

4 If your network will include shared IPsec transform and IKE policies, then configure an IPsec tunnel template. See Procedure 35-4 for more information.

5 Configure an IPsec security policy. See Procedure 35-5 for more information.

6 If you are configuring IPsec on a VPRN, then create the private-facing tunnel interface. See Procedure 35-6 for more information.

- **i** Create a private IPsec SAP.
- **ii** Configure ingress and egress policies, if required.

7 Create the public-facing tunnel interface. See Procedure 35-7 for more information.

- **i** Create an L3 access interface on an IES or VPRN. See chapters 73 and 74 for more information about creating an L3 access interface.
- **ii** Define the IPsec public SAP for the L3 access interface.
- **iii** Specify the IPsec gateway, if required, on the 7750 SR, Release 7.0 or later.

8 If you are configuring IPsec on a VPRN, then create IPsec tunnels on the VPRN tunnel interface. See Procedure 35-8 for more information.

9 Configure the static route.See Procedure 30-20 in chapter 30 for more information.

35.5 Workflow to configure and manage an IPsec configuration using the IPsec VPN

1 Create a corporate service and, if required, a service template. See Table 35-2 and the *5620 SAM Scripts and Templates Developer Guide* for more information.

2 Create an IPsec VPN. See Procedure 35-10 for more information.

3 Select the NE service sites for the IPsec VPN. See Procedure 35-11 for more information.

4 Create or select the secure VPRN service for the IPsec VPN. See Procedure 35-12 for more information.

5 Create or select the delivery service for the IPsec VPN. See Procedure 35-13 for more information.

6 Select the tunnel group for the IPsec VPN. See Procedure 35-14 for more information.

7 Assign policies and configurations to the IPsec VPN.

   i If you chose Dynamic (Site-to-Site) for the Tunnel Type parameter in step 2 of Procedure 35-14, then see Procedure 35-15 for more information.

   ii If you chose Dynamic (Soft Client) for the Tunnel Type parameter in step 2 of Procedure 35-14, then see Procedure 35-16 for more information.

   iii If you chose Static for the Tunnel Type parameter in step 2 of Procedure 35-14, then see Procedure 35-17 for more information.

8 Deploy the IPsec VPN.

35.6 Workflow to enable BFD over a static LAN-to-LAN IPsec tunnel

1 Create an tunnel interface on a VPRN, as described in Procedure 35-6.

2 Create an IPsec tunnel on the VPRN tunnel interface, as described in Procedure 35-8.

3 Enable BFD for the static LAN-to-LAN IPsec tunnel, as described in Procedure 35-9.

4 Assign a BFD service and interface that can be used for the BFD session on the IPsec tunnel.

35.7 General IPsec procedures

The following procedures describe how to perform general 5620 SAM IPsec configuration tasks, such as policy creation. See section 35.8 for IPsec VPN procedures.

Procedure 35-1 To configure an IKE policy

1. Choose Policies→ISA Policies→IKE from the 5620 SAM main menu. The IKE Policy form opens.

2. Perform one of the following:

   a. Specify a filter to search for and edit an existing policy, if required, and click on the Search button. Choose a policy from the list and click on the Properties button. The IKE Policy (Edit) form opens with the General tab displayed.

   b. Click on the Create button. The IKE Policy (Create) form opens with the General tab displayed.

3. Configure the parameters:

   - Auto-Assign ID
   - ID
   - Version
   - Description
   - Mode
   - Diffie-Hellman (DH) Group
   - Perfect Forward Secrecy (PFS)
   - PFS DH Group
   - Authentication Algorithm
   - Authorization Method
   - Encryption Algorithm
   - Internet Security Association and Key Management Life Time (seconds)
   - IPsec Life Time (seconds)

4. Click on the NAT Traversal tab button.

5. Configure the parameters:

   - NAT Traversal
   - Keep Alive Interval
   - Force Keep Alive

6. Click on the DPD tab button.

7. Configure the parameters:

   - Dead Peer Detection (DPD)
   - Interval
   - Max Retries

   The Interval and Max Retries parameters are not configurable if the Dead Peer Detection (DPD) parameter is set to Disabled.

8. Click on the Apply button.

9. Click on the General tab button.

10 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute option is disabled and the policy cannot be distributed to the network elements. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions.

Click on the Switch Mode button beside the Configuration Mode parameter. A dialog box appears. Click on the Yes button. The configuration mode of the policy is changed to Released.

11 Close the IKE Policy (Create) form.

12 Close the IKE Policy form.

Procedure 35-2 To configure an IPsec transform

1 Choose Policies→ISA Policies→IPSec Transform from the 5620 SAM main menu. The IPSec Transform form opens.

2 Perform one of the following:

  a Specify a filter to search for and edit an existing policy, if required, and click on the Search button. Choose a policy from the list and click on the Properties button. The IPSec Transform (Edit) form opens with the General tab displayed.

  b Click on the Create button. The IPSec Transform (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Auto-Assign ID
- Policy ID
- Description
- Authentication Algorithm
- Encryption Algorithm

4 Click on the Apply button.

5 Click on the More Actions button and choose Distribute to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.
