About This Guide

This guide describes logical IP routing interfaces, virtual routers, IP and MAC-based filtering, and cflowd support provided by the 7750 SR OS and presents configuration and implementation examples.

This document is organized into functional chapters and provides concepts and descriptions of the implementation flow, as well as Command Line Interface (CLI) syntax and command usage.

Audience

This manual is intended for network administrators who are responsible for configuring the 7750 SR-Series routers. It is assumed that the network administrators have an understanding of networking principles and configurations. Protocols, standards, and services described in this manual include the following:

- IP router configuration
- Virtual routers
- IP-based filters
- Cflowd

List of Technical Publications

The 7750 SR documentation set is composed of the following books:

- **7750 SR OS Basic System Configuration Guide**
This guide describes basic system configurations and operations.
- **7750 SR OS System Management Guide**
This guide describes system security and access configurations as well as event logging and accounting logs.
- **7750 SR OS Interface Configuration Guide**
This guide describes card, Media Dependent Adapter (MDA), and port provisioning.
- **7750 SR OS Router Configuration Guide**
This guide describes logical IP routing interfaces and associated attributes such as an IP address, port, link aggregation group (LAG) as well as IP and MAC-based filtering, VRRP and Cflowd.
- **7750 SR OS Routing Protocols Guide**
This guide provides an overview of routing concepts and provides configuration examples for RIP, OSPF, IS-IS, Multicast, BGP, and route policies.
- **7750 SR OS MPLS Guide**
This guide describes how to configure Multiprotocol Label Switching (MPLS) and Label Distribution Protocol (LDP).
- **7750 SR OS Services Guide**
This guide describes how to configure service parameters such as service distribution points (SDPs), customer information, and user services.
- **7750 SR OS OAM and Diagnostic Guide**
This guide describes how to configure features such as service mirroring and Operations, Administration and Management (OAM) tools.
- **7750 SR OS Triple Play Guide**
This guide describes Triple Play services and support provided by the 7750 SR and presents examples to configure and implement various protocols and services.
- **7750 SR Quality of Service Guide**
This guide describes how to configure Quality of Service (QoS) policy management.
- **OS Multi-Service ISA Guide**
This guide describes services provided by integrated service adapters such as Application Assurance, IPSec, ad insertion (ADI) and Network Address Translation (NAT).

Technical Support

If you purchased a service agreement for your router and related products from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller for assistance. If you purchased an Alcatel-Lucent service agreement, contact your welcome center at:

Web: http://www1.alcatel-lucent.com/comps/pages/carrier_support.jhtml

Getting Started

In This Chapter

This chapter provides process flow information to configure routing entities, virtual routers, IP and MAC filters, and Cflowd.

Alcatel-Lucent 7750 SR-Series Router Configuration Process

[Table 1](#) lists the tasks necessary to configure logical IP routing interfaces, virtual routers, IP and MAC-based filtering, and Cflowd.

This guide is presented in an overall logical configuration flow. Each section describes a software area and provides CLI syntax and command usage to configure parameters for a functional area.

Table 1: Configuration Process

Area	Task	Chapter
Router configuration	Configure router parameters, including router interfaces and addresses, router IDs, autonomous systems, and confederations.	IP Router Configuration on page 19
Protocol configuration	VRRP	VRRP on page 261
	IP and MAC filters	Filter Policies on page 367
	Cflowd	Cflowd on page 521
Reference	List of IEEE, IETF, and other proprietary entities.	Standards and Protocol Support on page 577

IP Router Configuration

In This Chapter

This chapter provides information about commands required to configure basic router parameters.

Topics in this chapter include:

- [Configuring IP Router Parameters on page 20](#)
 - [Interfaces on page 20](#)
 - [Autonomous Systems \(AS\) on page 37](#)
 - [Confederations on page 38](#)
 - [Proxy ARP on page 40](#)
 - [Bi-directional Forwarding Detection on page 49](#)
- [Configuration Notes on page 57](#)

Configuring IP Router Parameters

In order to provision services on a 7750 SR-Series router, logical IP routing interfaces must be configured to associate attributes such as an IP address, port or the system with the IP interface.

A special type of IP interface is the system interface. A system interface must have an IP address with a 32-bit subnet mask. The system interface is used as the router identifier by higher-level protocols such as OSPF and BGP, unless overwritten by an explicit router ID.

The following router features can be configured:

- [Interfaces on page 20](#)
- [Creating an IP Address Range on page 24](#)
- [Autonomous Systems \(AS\) on page 37](#)
- [Confederations on page 38](#)
- [Proxy ARP on page 40](#)

Refer to 7750 SR OS Triple Play Guide for information about DHCP and support provided by the 7750 SR as well as configuration examples. on page 33

Interfaces

7750 SR-Series routers use different types of interfaces for various functions. Interfaces must be configured with parameters such as the interface type (network and system) and address. A port is not associated with a system interface. An interface can be associated with the system (loopback address).

Network Interface

A network interface (a logical IP routing interface) can be configured on one of the following entities:

- A physical or logical port
- A SONET/SDH channel

Network Domains

In order to determine which network ports (and hence which network complexes) are eligible to transport traffic of individual SDPs, network-domain is introduced. This information is then used for the sap-ingress queue allocation algorithm applied to VPLS SAPs. This algorithm is optimized in such a way that no sap-ingress queues are allocated if the given port does not belong to the network-domain used in the given VPLS. In addition, sap-ingress queues will not be allocated towards network ports (regardless of the network-domain membership) if the given VPLS does not contain any SDPs.

Sap-ingress queue allocation takes into account the following aspects:

- SHG membership of individual SDPs
- Network-domain definition under SDP to restrict the topology the given SDP can be set-up in

The implementation supports four network-domains within any given VPLS.

Network-domain configuration at the SDP level is ignored when the given SDP is used for Epipe, Ipipe, or Apipe bindings.

Network-domain configuration is irrelevant for Layer 3 services (Layer 3 VPN and/or IES service). It can be defined in the base routing context and associated only with network interfaces in this context. Network domains are not applicable to loopback and system interfaces.

The network-domain information will only be used for ingress VPLS sap queue-allocation. It will not be taken into account by routing during SDP setup. As a consequence, if the given SDP is routed through network interfaces that are not part of the configured network domain, the packets will be still forwarded, but their QoS and queuing behavior will be based on default settings. In addition, the packet will not appear in SAP stats.

There will be always one network-domain that exists with reserved name default. The interfaces will always belong to a default network-domain. It will be possible to assign given interface to different user-defined network-domains. The loopback and system interface will be also associated with the default network-domain at the creation. However, any attempt to associate such interfaces with any explicitly defined network-domain will be blocked at the CLI level as there is no benefit for that association.

Any SDP can be assigned only to one network domain. If none is specified, the system will assign the default network-domain. This means that all SAPs in VPLS will have queue reaching all fwd-complexes serving interfaces that belong to the same network-domains as the SDPs.

It is possible to assign/remove network-domain association of the interface/SDP without requiring deletion of the respective object.

System Interface

The system interface is associated with the network entity (such as a specific router or switch), not a specific interface. The system interface is also referred to as the loopback address. The system interface is associated during the configuration of the following entities:

- The termination point of service tunnels
- The hops when configuring MPLS paths and LSPs
- The addresses on a target router for BGP and LDP peering

The system interface is used to preserve connectivity (when routing reconvergence is possible) when an interface fails or is removed. The system interface is also referred to as the loopback address and is used as the router identifier. A system interface must have an IP address with a 32-bit subnet mask.

Unicast RPF (uRPF)

uRPF helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including smurf and tribe flood network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

In strict mode, uRPF checks whether the incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

In loose mode, uRPF checks whether the packet has a source address with a corresponding prefix in the routing table; loose mode does not check whether the interface expects to receive a packet with a specific source address prefix.

Loose uRPF check is supported for ECMP, IGP shortcuts and VPRN MP-BGP routes. Packets coming from a source that matches any ECMP, IGP shortcut or VPRN MP-BGP route will pass the uRPF check even when the uRPF mode is set to strict mode on the incoming interface.

If there is a default route in the router and the packets are coming from the interface that the default route is pointing to, the following can occur:

- If uRPF is in loose mode, uRPF check succeeds.
 - If uRPF is in strict mode, then:
 - uRPF check succeeds if one of the following is true:
 - The source IP address of the packet matches any of the routes that can be originated from this specific interface.
 - The source IP address of the packet doesn't match any specific routes in the forwarding table.
 - uRPF check fails if the following is true:
 - The source IP address of the packet matches a route in the forwarding table, but the next-hop of the route is not on this specific interface.

If the source IP address matches a discard/blackhole route, the packet is treated as if it failed uRPF check.

Creating an IP Address Range

An IP address range can be reserved for exclusive use for services by defining the **config>router>service-prefix** command. When the service is configured, the IP address must be in the range specified as a service prefix. If no service prefix command is configured, then no limitation exists.

Addresses in the range of a service prefix can be allocated to a network port unless the *exclusive* parameter is used. Then, the address range is exclusively reserved for services.

When defining a range that is a superset of a previously defined service prefix, the subset will be replaced with the superset definition. For example, if a service prefix exists for 10.10.10.0/24, and a new service prefix is configured as 10.10.0.0/16, then the old address (10.10.10.0/24) will be replaced with the new address (10.10.0.0/16).

When defining a range that is a subset of a previously defined service prefix, the subset will replace the existing superset, providing addresses used by services are not affected; for example, if a service prefix exists for 10.10.0.0/16, and a new service prefix is configured as 10.10.10.0/24, then the 10.10.0.0/16 entry will be removed, provided that no services are configured that use 10.10.x.x addresses other than 10.10.10.x.

QoS Policy Propagation Using BGP (QPPB)

This section discusses QPPB as it applies to VPRN, IES, and router interfaces. Refer to the Internet Enhanced Service section in the Services Guide and the IP Router Configuration section in the 7x50 OS Router Configuration Guide.

QoS policy propagation using BGP (QPPB) is a feature that allows a route to be installed in the routing table with a forwarding-class and priority so that packets matching the route can receive the associated QoS. The forwarding-class and priority associated with a BGP route are set using BGP import route policies. In the industry this feature is called QPPB, and even though the feature name refers to BGP specifically. On SR routers, QPPB is supported for BGP (IPv4, IPv6, VPN-IPv4, VPN-IPv6), RIP and static routes.

While SAP ingress and network QoS policies can achieve the same end result as QPPB, assigning a packet arriving on a particular IP interface to a specific forwarding-class and priority/profile based on the source IP address or destination IP address of the packet ?the effort involved in creating the QoS policies, keeping them up-to-date, and applying them across many nodes is much greater than with QPPB. In a typical application of QPPB, a BGP route is advertised with a BGP community attribute that conveys a particular QoS. Routers that receive the advertisement accept the route into their routing table and set the forwarding-class and priority of the route from the community attribute.

QPPB Applications

There are two typical applications of QPPB:

1. Coordination of QoS policies between different administrative domains.
 2. Traffic differentiation within a single domain, based on route characteristics.
-

Inter-AS Coordination of QoS Policies

The operator of an administrative domain A can use QPPB to signal to a peer administrative domain B that traffic sent to certain prefixes advertised by domain A should receive a particular QoS treatment in domain B. More specifically, an ASBR of domain A can advertise a prefix XYZ to domain B and include a BGP community attribute with the route. The community value implies a particular QoS treatment, as agreed by the two domains (in their peering agreement or service level agreement, for example). When the ASBR and other routers in domain B accept and install the route for XYZ into their routing table, they apply a QoS policy on selected interfaces that classifies traffic towards network XYZ into the QoS class implied by the BGP community value.

QPPB may also be used to request that traffic sourced from certain networks receive appropriate QoS handling in downstream nodes that may span different administrative domains. This can be

Configuring IP Router Parameters

achieved by advertising the source prefix with a BGP community, as discussed above. However, in this case other approaches are equally valid, such as marking the DSCP or other CoS fields based on source IP address so that downstream domains can take action based on a common understanding of the QoS treatment implied by different DSCP values.

In the above examples, coordination of QoS policies using QPPB could be between a business customer and its IP VPN service provider, or between one service provider and another.

Traffic Differentiation Based on Route Characteristics

There may be times when a network operator wants to provide differentiated service to certain traffic flows within its network, and these traffic flows can be identified with known routes. For example, the operator of an ISP network may want to give priority to traffic originating in a particular ASN (the ASN of a content provider offering over-the-top services to the ISP's customers), following a certain AS_PATH, or destined for a particular next-hop (remaining on-net vs. off-net).

[Figure 1](#) shows an example of an ISP that has an agreement with the content provider managing AS300 to provide traffic sourced and terminating within AS300 with differentiated service appropriate to the content being transported. In this example we presume that ASBR1 and ASBR2 mark the DSCP of packets terminating and sourced, respectively, in AS300 so that other nodes within the ISP's network do not need to rely on QPPB to determine the correct forwarding-class to use for the traffic. Note however, that the DSCP or other COS markings could be left unchanged in the ISP's network and QPPB used on every node.

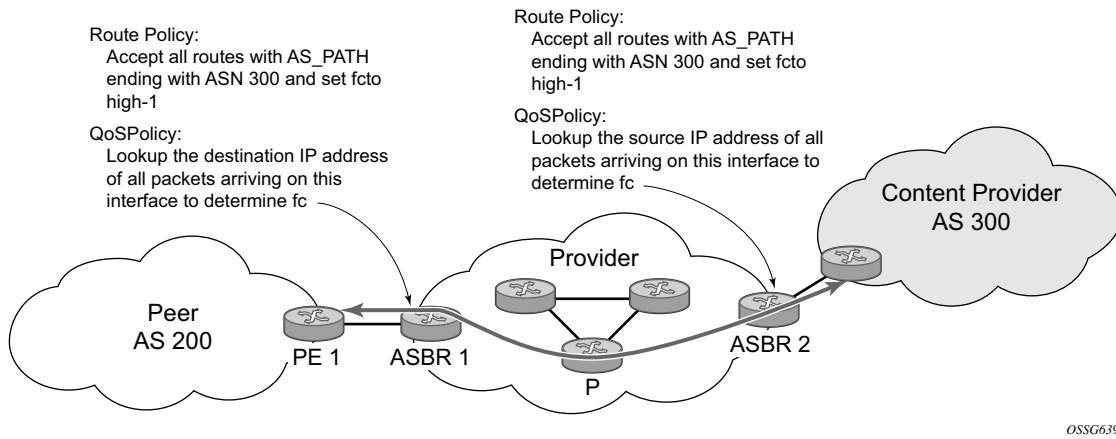

Figure 1: Use of QPPB to Differentiate Traffic in an ISP Network

QPPB

There are two main aspects of the QPPB feature:

- The ability to associate a forwarding-class and priority with certain routes in the routing table.
 - The ability to classify an IP packet arriving on a particular IP interface to the forwarding-class and priority associated with the route that best matches the packet.
-

Associating an FC and Priority with a Route

This feature uses a command in the route-policy hierarchy to set the forwarding class and optionally the priority associated with routes accepted by a route-policy entry. The command has the following structure:

```
fc fc-name [priority {low | high}]
```

The use of this command is illustrated by the following example:

```
config>router>policy-options
  begin
  community gold members 300:100
  policy-statement qppb_policy
    entry 10
      from
        protocol bgp
        community gold
      exit
      action accept
        fc hl priority high
      exit
    exit
  exit
  commit
```

The **fc** command is supported with all existing from and to match conditions in a route policy entry and with any action other than reject, it is supported with next-entry, next-policy and accept actions. If a next-entry or next-policy action results in multiple matching entries then the last entry with a QPPB action determines the forwarding class and priority.

A route policy that includes the **fc** command in one or more entries can be used in any import or export policy but the **fc** command has no effect except in the following types of policies:

- VRF import policies:
→ config>service>vprn>vrf-import

- BGP import policies:
 - `config>router>bgp>import`
 - `config>router>bgp>group>import`
 - `config>router>bgp>group>neighbor>import`
 - `config>service>vprn>bgp>import`
 - `config>service>vprn>bgp>group>import`
 - `config>service>vprn>bgp>group>neighbor>import`
- RIP import policies:
 - `config>router>rip>import`
 - `config>router>rip>group>import`
 - `config>router>rip>group>neighbor>import`
 - `config>service>vprn>rip>import`
 - `config>service>vprn>rip>group>import`
 - `config>service>vprn>rip>group>neighbor>import`

As evident from above, QPPB route policies support routes learned from RIP and BGP neighbors of a VPRN as well as for routes learned from RIP and BGP neighbors of the base/global routing instance.

QPPB is supported for BGP routes belonging to any of the address families listed below:

- IPv4 (AFI=1, SAFI=1)
- IPv6 (AFI=2, SAFI=1)
- VPN-IPv4 (AFI=1, SAFI=128)
- VPN-IPv6 (AFI=2, SAFI=128)

Note that a VPN-IP route may match both a VRF import policy entry and a BGP import policy entry (if `vpn-apply-import` is configured in the base router BGP instance). In this case the VRF import policy is applied first and then the BGP import policy, so the QPPB QoS is based on the BGP import policy entry.

This feature also introduces the ability to associate a forwarding-class and optionally priority with IPv4 and IPv6 static routes. This is achieved using the following modified versions of the static-route commands:

- `static-route {ip-prefix/prefix-length|ip-prefix netmask} [fc fc-name [priority {low | high}]] next-hop ip-int-name|ip-address`
- `static-route {ip-prefix/prefix-length|ip-prefix netmask} [fc fc-name [priority {low | high}]] indirect ip-address`

Priority is optional when specifying the forwarding class of a static route, but once configured it can only be deleted and returned to unspecified by deleting the entire static route.

Displaying QoS Information Associated with Routes

The following commands are enhanced to show the forwarding-class and priority associated with the displayed routes:

- show router route-table
- show router fib
- show router bgp routes
- show router rip database
- show router static-route

This feature uses a **qos** keyword to the **show>router>route-table** command. When this option is specified the output includes an additional line per route entry that displays the forwarding class and priority of the route. If a route has no fc and priority information then the third line is blank. The following CLI shows an example:

```
show router route-table [family] [ip-prefix[/prefix-length]] [longer | exact] [protocol protocol-name] qos
```

An example output of this command is shown below:

```
A:Dut-A# show router route-table 10.1.5.0/24 qos
=====
Route Table (Router: Base)

```

Enabling QPPB on an IP interface

To enable QoS classification of ingress IP packets on an interface based on the QoS information associated with the routes that best match the packets the **qos-route-lookup** command is necessary in the configuration of the IP interface. The **qos-route-lookup** command has parameters to indicate whether the QoS result is based on lookup of the source or destination IP address in every packet. There are separate **qos-route-lookup** commands for the IPv4 and IPv6 packets on an interface, which allows QPPB to be enabled for IPv4 only, IPv6 only, or both IPv4 and IPv6. Note however, current QPPB based on a source IP address is not supported for IPv6 packets nor is it supported for ingress subscriber management traffic on a group interface.

The **qos-route-lookup** command is supported on the following types of IP interfaces:

- base router network interfaces (config>router>interface)
- VPRN SAP and spoke SDP interfaces (config>service>vprn>interface)
- VPRN group-interfaces (config>service>vprn>sub-if>grp-if)
- IES SAP and spoke SDP interfaces (config>service>ies>interface)
- IES group-interfaces (config>service>ies>sub-if>grp-if)

When the **qos-route-lookup** command with the destination parameter is applied to an IP interface and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the **fc** and **priority** associated with that route, overriding the **fc** and **priority/profile** determined from the **sap-ingress** or **network qos** policy associated with the IP interface (see section 5.7 for further details). If the destination address of the incoming packet matches a route with no QoS information the **fc** and **priority** of the packet remain as determined by the **sap-ingress** or **network qos** policy.

Similarly, when the **qos-route-lookup** command with the source parameter is applied to an IP interface and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the **fc** and **priority** associated with that route, overriding the **fc** and **priority/profile** determined from the **sap-ingress** or **network qos** policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the **fc** and **priority** of the packet remain as determined by the **sap-ingress** or **network qos** policy.

Currently, QPPB is not supported for ingress MPLS traffic on network interfaces or on CsC PE'-CE' interfaces (config>service>vprn>nw-if).

QPPB When Next-Hops are Resolved by QPPB Routes

In some circumstances (IP VPN inter-AS model C, Carrier Supporting Carrier, indirect static routes, etc.) an IPv4 or IPv6 packet may arrive on a QPPB-enabled interface and match a route A1 whose next-hop N1 is resolved by a route A2 with next-hop N2 and perhaps N2 is resolved by a route A3 with next-hop N3, etc. In release 9.0 the QPPB result is based only on the forwarding-class and priority of route A1. If A1 does not have a forwarding-class and priority association then the QoS classification is not based on QPPB, even if routes A2, A3, etc. have forwarding-class and priority associations.

QPPB and Multiple Paths to a Destination

When ECMP is enabled some routes may have multiple equal-cost next-hops in the forwarding table. When an IP packet matches such a route the next-hop selection is typically based on a hash algorithm that tries to load balance traffic across all the next-hops while keeping all packets of a given flow on the same path. The QPPB configuration model described in [Associating an FC and Priority with a Route on page 28](#) allows different QoS information to be associated with the different ECMP next-hops of a route. The forwarding-class and priority of a packet matching an ECMP route is based on the particular next-hop used to forward the packet.

When Edge PIC [1] is enabled some BGP routes may have a backup next-hop in the forwarding table in addition to the one or more primary next-hops representing the equal-cost best paths allowed by the ECMP/multipath configuration. When an IP packet matches such a route a reachable primary next-hop is selected (based on the hash result) but if all the primary next-hops are unreachable then the backup next-hop is used. The QPPB configuration model described in [Associating an FC and Priority with a Route on page 28](#) allows the forwarding-class and priority associated with the backup path to be different from the QoS characteristics of the equal-cost best paths. The forwarding class and priority of a packet forwarded on the backup path is based on the fc and priority of the backup route.

QPPB and Policy-Based Routing

When an IPv4 or IPv6 packet with destination address X arrives on an interface with both QPPB and policy-based-routing enabled:

- There is no QPPB classification if the IP filter action redirects the packet to a directly connected interface, even if X is matched by a route with a forwarding-class and priority
- QPPB classification is based on the forwarding-class and priority of the route matching IP address Y if the IP filter action redirects the packet to the indirect next-hop IP address Y, even if X is matched by a route with a forwarding-class and priority

QPPB and GRT Lookup

Source-address based QPPB is not supported on any SAP or spoke SDP interface of a VPRN configured with the **grt-lookup** command.

QPPB Interaction with SAP Ingress QoS Policy

When QPPB is enabled on a SAP IP interface the forwarding class of a packet may change from **fc1**, the original **fc** determined by the SAP ingress QoS policy to **fc2**, the new **fc** determined by QPPB. In the ingress datapath SAP ingress QoS policies are applied in the first P chip and route lookup/QPPB occurs in the second P chip. This has the implications listed below:

- Ingress remarking (based on profile state) is always based on the original **fc** (**fc1**) and subclass (if defined).
- The profile state of a SAP ingress packet that matches a QPPB route depends on the configuration of **fc2** only. If the de-1-out-profile flag is enabled in **fc2** and **fc2** is not mapped to a priority mode queue then the packet will be marked out of profile if its DE bit = 1. If the profile state of **fc2** is explicitly configured (in or out) and **fc2** is not mapped to a priority mode queue then the packet is assigned this profile state. In both cases there is no consideration of whether or not **fc1** was mapped to a priority mode queue.
- The priority of a SAP ingress packet that matches a QPPB route depends on several factors. If the de-1-out-profile flag is enabled in **fc2** and the DE bit is set in the packet then priority will be low regardless of the QPPB priority or **fc2** mapping to profile mode queue, priority mode queue or policer. If **fc2** is associated with a profile mode queue then the packet priority will be based on the explicitly configured profile state of **fc2** (in profile = high, out profile = low, undefined = high), regardless of the QPPB priority or **fc1** configuration. If **fc2** is associated with a priority mode queue or policer then the packet priority will be based on QPPB (unless DE=1), but if no priority information is associated with the route then the packet priority will be based on the configuration of **fc1** (if **fc1** mapped to a priority mode queue then it is based on DSCP/IP prec/802.1p and if **fc1** mapped to a profile mode queue then it is based on the profile state of **fc1**).

[Table 2](#) summarizes these interactions.

Table 2: QPPB Interactions with SAP Ingress QoS

Original FC object mapping	New FC object mapping	Profile	Priority (drop preference)	DE=1 override	In/out of profile marking
Profile mode queue	Profile mode queue	From new base FC unless overridden by DE=1	From QPPB, unless packet is marked in or out of profile in which case follows profile. Default is high priority	From new base FC	From original FC and sub-class
Priority mode queue	Priority mode queue	Ignored	If DE=1 override then low otherwise from QPPB. If no DEI or QPPB overrides then from original dot1p/exp/DSCP mapping or policy default.	From new base FC	From original FC and sub-class
Policer	Policer	From new base FC unless overridden by DE=1	If DE=1 override then low otherwise from QPPB. If no DEI or QPPB overrides then from original dot1p/exp/DSCP mapping or policy default.	From new base FC	From original FC and sub-class
Priority mode queue	Policer	From new base FC unless overridden by DE=1	If DE=1 override then low otherwise from QPPB. If no DEI or QPPB overrides then from original dot1p/exp/DSCP mapping or policy default.	From new base FC	From original FC and sub-class
Policer	Priority mode queue	Ignored	If DE=1 override then low otherwise from QPPB. If no DEI or QPPB overrides then from original dot1p/exp/DSCP mapping or policy default.	From new base FC	From original FC and sub-class

Table 2: QPPB Interactions with SAP Ingress QoS (Continued)

Original FC object mapping	New FC object mapping	Profile	Priority (drop preference)	DE=1 override	In/out of profile marking
Profile mode queue	Priority mode queue	Ignored	If DE=1 override then low otherwise from QPPB. If no DEI or QPPB overrides then follows original FC's profile mode rules.	From new base FC	From original FC and sub-class
Priority mode queue	Profile mode queue	From new base FC unless overridden by DE=1	From QPPB, unless packet is marked in or out of profile in which case follows profile. Default is high priority	From new base FC	From original FC and sub-class
Profile mode queue	Policer	From new base FC unless overridden by DE=1	If DE=1 override then low otherwise from QPPB. If no DEI or QPPB overrides then follows original FC's profile mode rules.	From new base FC	From original FC and sub-class
Policer	Profile mode queue	From new base FC unless overridden by DE=1	From QPPB, unless packet is marked in or out of profile in which case follows profile. Default is high priority	From new base FC	From original FC and sub-class

Router ID

The router ID, a 32-bit number, uniquely identifies the router within an autonomous system (AS) (see [Autonomous Systems \(AS\) on page 37](#)). In protocols such as OSPF, routing information is exchanged between areas, groups of networks that share routing information. It can be set to be the same as the loopback address. The router ID is used by both OSPF and BGP routing protocols in the routing table manager instance.

There are several ways to obtain the router ID. On each 7750 SR-Series router, the router ID can be derived in the following ways.

- Define the value in the **config>router** *router-id* context. The value becomes the router ID.
- Configure the system interface with an IP address in the **config>router>interface** *ip-int-name* context. If the router ID is not manually configured in the **config>router** *router-id* context, then the system interface acts as the router ID.
- If neither the system interface or router ID are implicitly specified, then the router ID is inherited from the last four bytes of the MAC address.
- The router can be derived on the protocol level; for example, BGP.

Autonomous Systems (AS)

Networks can be grouped into areas. An area is a collection of network segments within an AS that have been administratively assigned to the same group. An area's topology is concealed from the rest of the AS, which results in a significant reduction in routing traffic.

Routing in the AS takes place on two levels, depending on whether the source and destination of a packet reside in the same area (intra-area routing) or different areas (inter-area routing). In intra-area routing, the packet is routed solely on information obtained within the area; no routing information obtained from outside the area can be used. This protects intra-area routing from the injection of bad routing information.

Routers that belong to more than one area are called area border routers. All routers in an AS do not have an identical topological database. An area border router has a separate topological database for each area it is connected to. Two routers, which are not area border routers, belonging to the same area, have identical area topological databases.

Autonomous systems share routing information, such as routes to each destination and information about the route or AS path, with other ASs using BGP. Routing tables contain lists of next hops, reachable addresses, and associated path cost metrics to each router. BGP uses the information and path attributes to compile a network topology.

Confederations

Configuring confederations is optional and should only be implemented to reduce the IBGP mesh inside an AS. An AS can be logically divided into smaller groupings called sub-confederations and then assigned a confederation ID (similar to an autonomous system number). Each sub-confederation has fully meshed IBGP and connections to other ASs outside of the confederation.

The sub-confederations have EBGP-type peers to other sub-confederations within the confederation. They exchange routing information as if they were using IBGP. Parameter values such as next hop, metric, and local preference settings are preserved. The confederation appears and behaves like a single AS.

Confederations have the following characteristics.

- A large AS can be sub-divided into sub-confederations.
- Routing *within* each sub-confederation is accomplished via IBGP.
- EBGP is used to communicate *between* sub-confederations.
- BGP speakers within a sub-confederation must be fully meshed.
- Each sub-confederation (member) of the confederation has a different AS number. The AS numbers used are typically in the private AS range of 64512 — 65535.

To migrate from a non-confederation configuration to a confederation configuration requires a major topology change and configuration modifications on each participating router. Setting BGP policies to select an optimal path through a confederation requires other BGP modifications.

There are no default confederations. Router confederations must be explicitly created. [Figure 2](#) depicts a confederation configuration example.

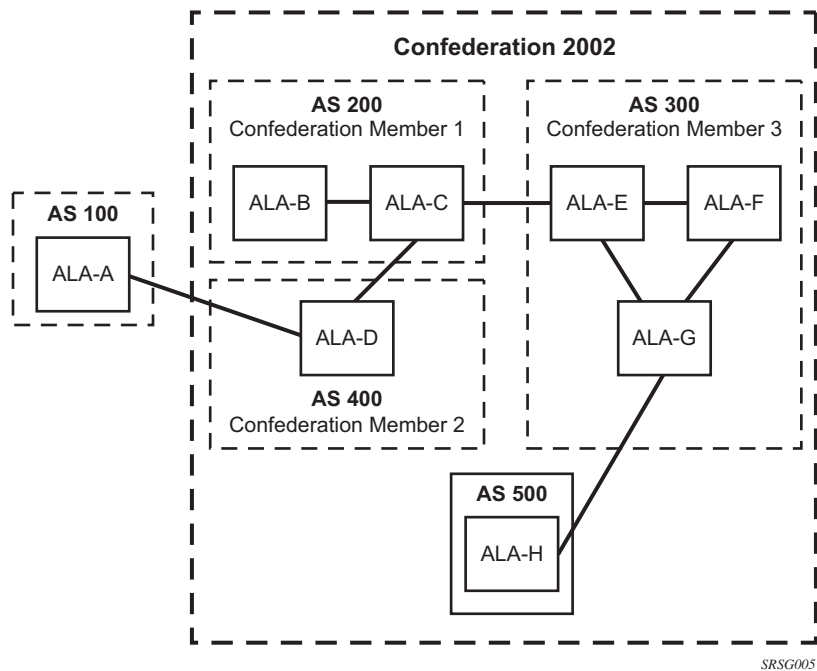

Figure 2: Confederation Configuration

Proxy ARP

Proxy ARP is the technique in which a router answers ARP requests intended for another node. The router appears to be present on the same network as the “real” node that is the target of the ARP and takes responsibility for routing packets to the “real” destination. Proxy ARP can help nodes on a subnet reach remote subnets without configuring routing or a default gateway.

Typical routers only support proxy ARP for directly attached networks; the 7750 SR-Series is targeted to support proxy ARP for all known networks in the routing instance where the virtual interface proxy ARP is configured.

In order to support DSLAM and other edge like environments, proxy ARP supports policies that allow the provider to configure prefix lists that determine for which target networks proxy ARP will be attempted and prefix lists that determine for which source hosts proxy ARP will be attempted.

In addition, the proxy ARP implementation will support the ability to respond for other hosts within the local subnet domain. This is needed in environments such as DSL where multiple hosts are in the same subnet but can not reach each other directly.

Static ARP is used when a 7750 SR-Series needs to know about a device on an interface that cannot or does not respond to ARP requests. Thus, the configuration can state that if it has a packet with a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

DHCP Relay

Refer to 7750 SR OS Triple Play Guide for information about DHCP and support provided by the 7750 SR as well as configuration examples.

Internet Protocol Versions

The TiMOS implements IP routing functionality, providing support for IP version 4 (IPv4) and IP version 6 (IPv6). IP version 6 (RFC 1883, *Internet Protocol, Version 6 (IPv6)*) is a newer version of the Internet Protocol designed as a successor to IP version 4 (IPv4) (RFC-791, *Internet Protocol*). The changes from IPv4 to IPv6 effect the following categories:

- Expanded addressing capabilities — IPv6 increases the IP address size from 32 bits (IPv4) to 128 bits, to support more levels of addressing hierarchy, a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a scope field to multicast addresses. Also, a new type of address called an anycast address is defined that is used to send a packet to any one of a group of nodes.
- Header format simplification — Some IPv4 header fields have been dropped or made optional to reduce the common-case processing cost of packet handling and to limit the bandwidth cost of the IPv6 header.
- Improved support for extensions and options — Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.
- Flow labeling capability — The capability to enable the labeling of packets belonging to particular traffic flows for which the sender requests special handling, such as non-default quality of service or “real-time” service was added in IPv6.
- Authentication and privacy capabilities — Extensions to support authentication, data integrity, and (optional) data confidentiality are specified for IPv6.

Figure 3: IPv6 Header Format

Table 3: IPv6 Header Field Descriptions

Field	Description
Version	4-bit Internet Protocol version number = 6.
Prio.	4-bit priority value.
Flow Label	24-bit flow label.
Payload Length	16-bit unsigned integer. The length of payload, for example, the rest of the packet following the IPv6 header, in octets. If the value is zero, the payload length is carried in a jumbo payload hop-by-hop option.
Next Header	8-bit selector. Identifies the type of header immediately following the IPv6 header. This field uses the same values as the IPv4 protocol field.
Hop Limit	8-bit unsigned integer. Decremented by 1 by each node that forwards the packet. The packet is discarded if the hop limit is decremented to zero.
Source Address	128-bit address of the originator of the packet.
Destination Address	128-bit address of the intended recipient of the packet (possibly not the ultimate recipient if a routing header is present).

IPv6 Applications

Examples of the IPv6 applications supported by the TiMOS include:

- IPv6 Internet exchange peering — [Figure 4](#) shows an IPv6 Internet exchange where multiple ISPs peer over native IPv6.

Figure 4: IPv6 Internet Exchange

- IPv6 transit services — [Figure 5](#) shows IPv6 transit provided by an ISP.

Figure 5: IPv6 Transit Services

- IPv6 services to enterprise customers and home users — [Figure 6](#) shows IPv6 connectivity to enterprise and home broadband users.

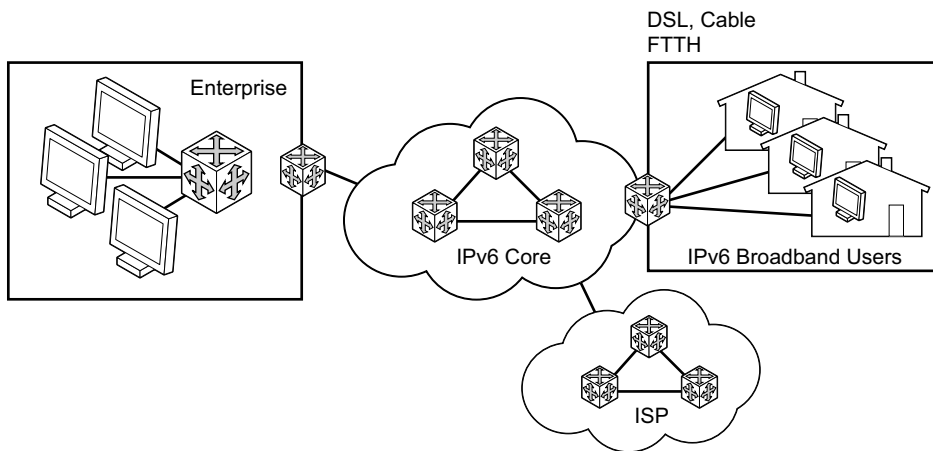

Figure 6: IPv6 Services to Enterprise Customers and Home Users

- IPv6 over IPv4 relay services — IPv6 over IPv4 tunnels are one of many IPv6 transition methods to support IPv6 in an environment where not only IPv4 exists but native IPv6 networks depend on IPv4 for greater IPv6 connectivity. 7750 SR OS 7450 ESS7710 SR OS supports dynamic IPv6 over IPv4 tunneling. The ipv4 source and destination address are taken from configuration, the source address is the ipv4 system address and the ipv4 destination is the next hop from the configured 6over4 tunnel.

IPv6 over IPv4 is an automatic tunnel method that gives a prefix to the attached IPv6 network. [Figure 7](#) shows IPv6 over IPv4 tunneling to transition from IPv4 to IPv6.

Figure 7: IPv6 over IPv4 Tunnels

DNS

The DNS client is extended to use IPv6 as transport and to handle the IPv6 address in the DNS AAAA resource record from an IPv4 or IPv6 DNS server. An assigned name can be used instead of an IPv6 address since IPv6 addresses are more difficult to remember than IPv4 addresses.

IPv6 Provider Edge Router over MPLS (6PE)

6PE allows IPv6 domains to communicate with each other over an IPv4 MPLS core network. This architecture requires no backbone infrastructure upgrades and no re-configuration of core routers, because forwarding is purely based on MPLS labels. 6PE is a cost effective solution for IPv6 deployment.

Fig_30

Figure 8: Example of a 6PE Topology within One AS

6PE Control Plane Support

The 6PE MP-BGP routers support:

- IPv4/IPv6 dual-stack
 - MP-BGP can be used between 6PE routers to exchange IPv6 reachability information.
 - The 6PE routers exchange IPv6 prefixes over MP-BGP sessions running over IPv4 transport. The MP-BGP AFI used is IPv6 (value 2).
 - An IPv4 address of the 6PE router is encoded as an IPv4-mapped IPv6 address in the BGP next-hop field of the IPv6 NLRI. By default, the IPv4 address that is used for peering is used. It is configurable through the route policies.
 - The 6PE router binds MPLS labels to the IPv6 prefixes it advertises. The SAFI used in MP-BGP is the SAFI (value 4) label. The router uses the IPv6 explicit null (value 2) label for all the IPv6 prefixes that it advertises and can accept an arbitrary label from its peers.
 - LDP is used to create the MPLS full mesh between the 6PE routers and the IPv4 addresses that are embedded in the next-hop field are reachable by LDP LSPs. The ingress 6PE router uses the LDP LSPs to reach remote 6PE routers.
-

6PE Data Plane Support

The ingress 6PE router can push two MPLS labels to send the packets to the egress 6PE router. The top label is an LDP label used to reach the egress 6PE router. The bottom label is advertised in MP-BGP by the remote 6PE router. Typically, the IPv6 explicit null (value 2) label is used but an arbitrary value can be used when the remote 6PE router is from a vendor other than Alcatel-Lucent.

The egress 6PE router pops the top LDP tunnel label. It sees the IPv6 explicit null label, which indicates an IPv6 packet is encapsulated. It also pops the IPv6 explicit null label and performs an IPv6 route lookup to find out the next hop for the IPv6 packet.

Bi-directional Forwarding Detection

Bi-directional Forwarding Detection (BFD) is a light-weight, low-overhead, short-duration detection of failures in the path between two systems. If a system stops receiving BFD messages for a long enough period (based on configuration) it is assumed that a failure along the path has occurred and the associated protocol or service is notified of the failure.

BFD can provide a mechanism used for liveness detection over any media, at any protocol layer, with a wide range of detection times and overhead, to avoid a proliferation of different methods.

SR OS supports asynchronous and on demand modes of BFD in which BFD messages are set to test the path between systems.

If multiple protocols are running between the same two BFD endpoints then only a single BFD session is established, and all associated protocols will share the single BFD session.

In addition to the typical asynchronous mode, there is also an echo function defined within RFC 5880, *Bi-directional Forwarding Detection*, that allows either of the two systems to send a sequence of BFD echo packets to the other system, which loops them back within that system's forwarding plane. If a number of these echo packets are lost then the BFD session is declared down.

BFD Control Packet

The base BFD specification does not specify the encapsulation type to be used for sending BFD control packets. Instead it is left to the implementers to use the appropriate encapsulation type for the medium and network. The encapsulation for BFD over IPv4 and IPv6 networks is specified in draft-ietf-bfd-v4v6-1hop-04.txt, *BFD for IPv4 and IPv6 (Single Hop)*. This specification requires that BFD control packets be sent over UDP with a destination port number of 3784 and the source port number must be within the range 49152 to 65535.

In addition, the TTL of all transmitted BFD packets must have an IP TTL of 255. All BFD packets received must have an IP TTL of 255 if authentication is not enabled. If authentication is enabled, the IP TTL should be 255 but can still be processed if it is not (assuming the packet passes the enabled authentication mechanism).

If multiple BFD sessions exist between two nodes, the BFD discriminator is used to de-multiplex the BFD control packet to the appropriate BFD session.

Control Packet Format

The BFD control packet has 2 sections, a mandatory section and an optional authentication section.

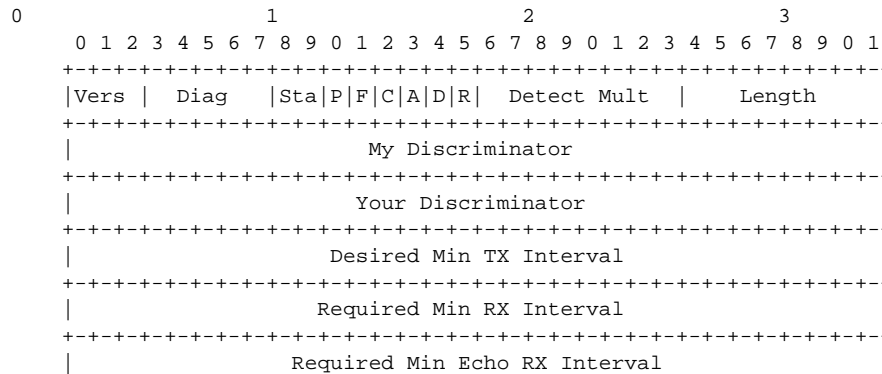

Figure 9: Mandatory Frame Format

Table 4: BFD Control Packet Field Descriptions

Field	Description
Vers	The version number of the protocol. The initial protocol version is 0.
Diag	A diagnostic code specifying the local system’s reason for the last transition of the session from Up to some other state. Possible values are: 0-No diagnostic 1-Control detection time expired 2-Echo function failed 3-Neighbor signaled session down 4-Forwarding plane reset 5-Path down 6-Concatenated path down 7-Administratively down
D Bit	The “demand mode” bit. (Not supported)
P Bit	The poll bit. If set, the transmitting system is requesting verification of connectivity, or of a parameter change.
F Bit	The final bit. If set, the transmitting system is responding to a received BFD control packet that had the poll (P) bit set.
Rsvd	Reserved bits. These bits must be zero on transmit and ignored on receipt.
Length	Length of the BFD control packet, in bytes.

Table 4: BFD Control Packet Field Descriptions (Continued)

Field	Description
My Discriminator	A unique, nonzero discriminator value generated by the transmitting system, used to demultiplex multiple BFD sessions between the same pair of systems.
Your Discriminator	The discriminator received from the corresponding remote system. This field reflects back the received value of my discriminator, or is zero if that value is unknown.
Desired Min TX Interval	This is the minimum interval, in microseconds, that the local system would like to use when transmitting BFD control packets.
Required Min RX Interval	This is the minimum interval, in microseconds, between received BFD control packets that this system is capable of supporting.
Required Min Echo RX Interval	This is the minimum interval, in microseconds, between received BFD echo packets that this system is capable of supporting. If this value is zero, the transmitting system does not support the receipt of BFD echo packets.

BFD for RSVP-TE

BFD will notify RSVP-TE if the BFD session goes down, in addition to notifying other configured BFD enabled protocols (for example, OSPF, IS-IS and PIM). This notification will then be used by RSVP-TE to begin the reconvergence process. This greatly accelerates the overall RSVP-TE response to network failures.

All encapsulation types supporting IPv4 and IPv6 is supported as all BFD packets are carried in IPv4 and IPv6 packets; this includes Frame Relay and ATM.

BFD is supported on the following interfaces:

- Ethernet (Null, Dot1Q & QinQ)
- POS interfaces (including APS)
- Channelized interfaces (PPP, HDLC, FR and ATM) on ASAP (priority 1) and channelized MDAs (Priority 2) including link bundles and IMA
- Spoke SDPs
- LAG interfaces
- VSM interfaces

Echo Support

Echo support for BFD calls for the support of the echo function within BFD. By supporting BFD echo, the 7750 SR loops back received BFD echo messages to the original sender based on the destination IP address in the packet.

The echo function is useful when the local router does not have sufficient CPU power to handle a periodic polling rate at a high frequency. As a result, it relies on the echo sender to send a high rate of BFD echo messages through the receiver node, which is only processed by the receiver's forwarding path. This allows the echo sender to send BFD echo packets at any rate.

The 7750 does not support the sending of echo requests, only the response to echo requests.

BFD Support for BGP

This feature enhancement allows BGP peers to be associated with the BFD session. If the BFD session failed, then BGP peering will also be torn down.

Centralized BFD

The following applications of centralized BFD require BFD to run on the SF/CPM.

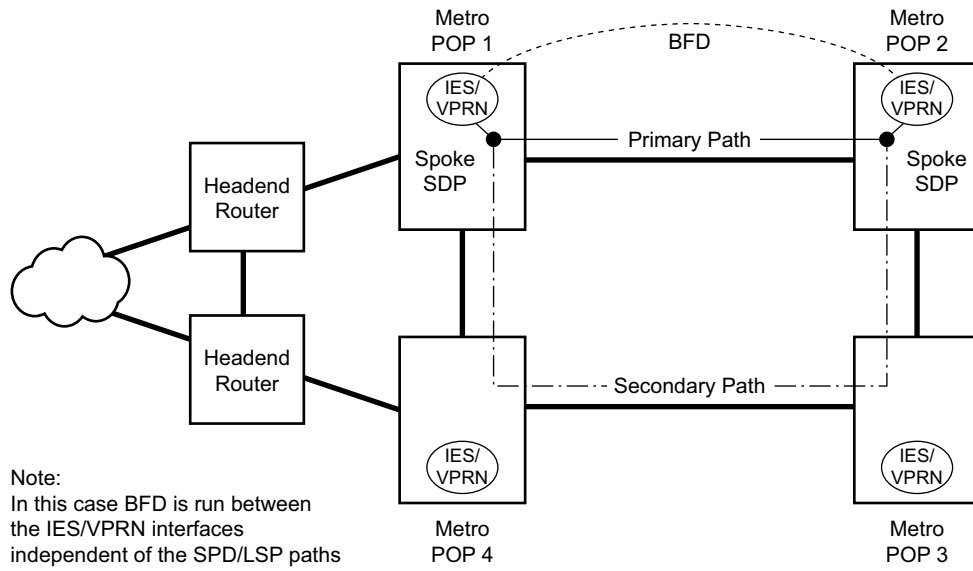

- IES Over Spoke SDP
 - BFD Over LAG and VSM Interfaces
-

IES Over Spoke SDP

One application for a central BFD implementation is so BFD can be supported over spoke SDPs used to inter-connection IES or VPRN interfaces. When there are spoke SDPs for inter-connections over an MPLS network between two routers, BFD is used to speed up failure detections between nodes so re-convergence of unicast and multicast routing information can begin as quickly as possible.

The MPLS LSP associated with the spoke SDP can enter or egress from multiple interfaces on the box. BFD for these types of interfaces can not exist on the IOM itself.

Configuring IP Router Parameters

Fig_31

Figure 10: BFD for IES/VPRN over Spoke SDP

BFD Over LAG and VSM Interfaces

A second application for a central BFD implementation is so BFD can be supported over LAG or VSM interface. This is useful where BFD is not used for link failure detection but instead for node failure detection. In this application, the BFD session can run between the IP interfaces associated with the LAG or VSM interface, but there is only one session between the two nodes. There is no requirement for the message flow to across a certain link, or VSM, to get to the remote node.

Fig_32

Figure 11: BFD over LAG

Process Overview

The following items are components to configure basic router parameters.

- **Interface** — A logical IP routing interface. Once created, attributes like an IP address, port, link aggregation group or the system can be associated with the IP interface.
- **Address** — The address associates the device's system name with the IP system address. An IP address must be assigned to each IP interface.
- **System interface** — This creates an association between the logical IP interface and the system (loopback) address. The system interface address is the circuitless address (loopback) and is used by default as the router ID for protocols such as OSPF and BGP.
- **Router ID** — (Optional) The router ID specifies the router's IP address.
- **Autonomous system** — (Optional) An autonomous system (AS) is a collection of networks that are subdivided into smaller, more manageable areas.
- **Confederation** — (Optional) Creates confederation autonomous systems within an AS to reduce the number of IBGP sessions required within an AS.

Configuration Notes

The following information describes router configuration caveats.

- A system interface and associated IP address should be specified.
- Boot options file (BOF) parameters must be configured prior to configuring router parameters.
- Confederations can be configured before protocol connections (such as BGP) and peering parameters are configured.
- IPv6 interfaces and associated routing protocols may only be configured on the following systems:
 - Chassis systems running in chassis mode c or d.
 - Chassis systems running in mixed-mode with IPv6 functionality limited to those interface on slots with IOM3-XP/IMMs or later line cards.
 - 7750 SR-c4/12.
- An iom2-20g and a SFM2 card are required to enable the IPv6 CPM filter and per-peer queuing functionality.

Configuring an IP Router with CLI

This section provides information to configure an IP router.

Router Configuration Overview

In a 7750 SR, an interface is a logical named entity. An interface is created by specifying an interface name under the `configure>router` context. This is the global router configuration context where objects like static routes are defined. An IP interface name can be up to 32 alphanumeric characters long, must start with a letter, and is case-sensitive; for example, the interface name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed.

To create an interface on an Alcatel-Lucent 7750 SR-Series router, the basic configuration tasks that must be performed are:

- Assign a name to the interface.
- Associate an IP address with the interface.
- Associate the interface with a network interface or the system interface.
- Configure appropriate routing protocols.

A system interface and network interface should be configured.

System Interface

The system interface is associated with the network entity (such as a specific 7750 SR-Series), not a specific interface. The system interface is also referred to as the loopback address. The system interface is associated during the configuration of the following entities:

- The termination point of service tunnels
- The hops when configuring MPLS paths and LSPs
- The addresses on a target router for BGP and LDP peering.

The system interface is used to preserve connectivity (when routing reconvergence is possible) when an interface fails or is removed. The system interface is used as the router identifier. A system interface must have an IP address with a 32-bit subnet mask.

Network Interface

A network interface can be configured on one of the following entities a physical port or LAG:

- A physical or logical port
- A SONET/SDH channel

Basic Configuration

NOTE: Refer to each specific chapter for specific routing protocol information and command syntax to configure protocols such as OSPF and BGP.

The most basic router configuration must have the following:

- System name
- System address

The following example displays a router configuration:

```
A:ALA-A> config# info
. . .
#-----
# Router Configuration
#-----
    router
        interface "system"
            address 10.10.10.103/32
        exit
        interface "to-104"
            address 10.0.0.103/24
            port 1/1/1
        exit
        exit
        autonomous-system 100
        confederation 1000 members 100 200 300
    router-id 10.10.10.103
. . .
    exit
    isis
    exit
. . .
#-----
A:ALA-A> config#
```

Common Configuration Tasks

The following sections describe basic system tasks.

- [Configuring a System Name on page 62](#)
- [Configuring Interfaces on page 63](#)
 - [Configuring a System Interface on page 63](#)
 - [Configuring a Network Interface on page 63](#)
- [Configuring Proxy ARP on page 80](#)
- [Creating an IP Address Range on page 82](#)
- [Configuring an Autonomous System on page 88](#)[Configuring Overload State on a Single SFM on page 89](#)
-

Configuring a System Name

Use the `system` command to configure a name for the device. The name is used in the prompt string. Only one system name can be configured. If multiple system names are configured, the last one configured will overwrite the previous entry.

If special characters are included in the system name string, such as spaces, #, or ?, the entire string must be enclosed in double quotes. Use the following CLI syntax to configure the system name:

CLI Syntax: `config# system`
`name system-name`

Example:

```
config# system
config>system# name ALA-A
ALA-A>config>system# exit all
ALA-A#
```

The following example displays the system name output.

```
A:ALA-A>config>system# info
#-----
# System Configuration
#-----
name "ALA-A"
location "Mt.View, CA, NE corner of FERG 1 Building"
coordinates "37.390, -122.05500 degrees lat."
snmp
exit
. . .
exit
```

Configuring Interfaces

The following command sequences create a system and a logical IP interface. The system interface assigns an IP address to the interface, and then associates the IP interface with a physical port. The logical interface can associate attributes like an IP address or port.

Note that the system interface cannot be deleted.

Configuring a System Interface

To configure a system interface:

CLI Syntax:

```
config>router
  interface interface-name
    address {[ip-address/mask]|[ip-address] [netmask]}
      [broadcast {all-ones|host-ones}]
    secondary {[address/mask|ip-address][netmask]}
      [broadcast {all-ones|host-ones}] [igp-inhibit]
```

Configuring a Network Interface

To configure a network interface:

CLI Syntax:

```
config>router
  interface interface-name
    address ip-addr{/mask-length / mask} [broadcast {all-ones | host-ones}]
    cflowd {acl | interface}
    egress
      filter ip ip-filter-id
      filter ipv6 ipv6-filter-id
    ingress
      filter ip ip-filter-id
      filter ipv6 ipv6-filter-id
    port port-name
```

Common Configuration Tasks

The following displays an IP configuration output showing interface information.

```
A:ALA-A>config>router# info
#-----
# IP Configuration
#-----
    interface "system"
      address 10.10.0.4/32
    exit
    interface "to-ALA-2"
      address 10.10.24.4/24
      port 1/1/1
      egress
        filter ip 10
      exit
    exit
...
#-----
A:ALA-A>config>router#
```

To enable CPU protection:

CLI Syntax: config>router
 interface *interface-name*
 cpu-protection *policy-id*

CPU protection policies are configured in the **config>sys>security>cpu-protection** context. See the 7750 SR OS System Management Guide.

Configuring IPv6 Parameters

IPv6 interfaces and associated routing protocols may only be configured on the following systems:

- Chassis systems running in chassis mode c or d.
- Chassis systems running in mixed-mode, with IPv6 functionality limited to those interface on slots with IOM3-XP/IMMs or later line cards.
- 7750 SR-c4/12.

The following displays the interface configuration showing the IPv6 default configuration when IPv6 is enabled on the interface.

```
A:ALA-49>config>router>if>ipv6# info detail
-----
` port 1/2/37
  ipv6
    packet-too-big 100 10
    param-problem 100 10
    redirects 100 10
    time-exceeded 100 10
    unreachablees 100 10
  exit
-----
A:ALA-49>config>router>if>ipv6# exit all
```

Use the following CLI syntax to configure IPv6 parameters on a router interface.

CLI Syntax: config>router# interface *interface-name*
 port *port-name*
 ipv6
 address {*ipv6-address/prefix-length*} [*eui-64*]
 icmp6
 packet-too-big [*number seconds*]
 param-problem [*number seconds*]
 redirects [*number seconds*]
 time-exceeded [*number seconds*]
 unreachablees [*number seconds*]
 neighbor *ipv6-address mac-address*

The following displays a configuration example showing interface information.

```
A:ALA-49>config>router>if# info
-----
address 10.11.10.1/24
port 1/2/37
ipv6
```

Common Configuration Tasks

```
        address 10::1/24
    exit
-----
A:ALA-49>config>router>if#
```

Configuring IPv6 Over IPv4 Parameters

This section provides several examples of the features that must be configured in order to implement IPv6 over IPv4 relay services.

- [Tunnel Ingress Node on page 67](#)
 - [Learning the Tunnel Endpoint IPv4 System Address on page 69](#)
 - [Configuring an IPv4 BGP Peer on page 70](#)
 - [An Example of a IPv6 Over IPv4 Tunnel Configuration on page 71](#)
- [Tunnel Egress Node on page 72](#)
 - [Learning the Tunnel Endpoint IPv4 System Address on page 73](#)
 - [Configuring an IPv4 BGP Peer on page 74](#)
 - [An Example of a IPv6 Over IPv4 Tunnel Configuration on page 75](#)

Tunnel Ingress Node

This configuration shows how the interface through which the IPv6 over IPv4 traffic leaves the node. This must be configured on a network interface.

CLI Syntax:

```
config>router
  static-route ::C8C8:C802/128 indirect 200.200.200.2
  interface ip-int-name
    address {ip-address/mask|ip-address netmask} [broadcast
    all-ones|host-ones]
    port port-name
```

The following displays configuration output showing interface configuration.

```
A:ALA-49>configure>router# info
-----
...
    interface "ip-1.1.1.1"
      address 1.1.1.1/30
      port 1/1/1
    exit
...
-----
A:ALA-49>configure>router#
```

Common Configuration Tasks

Both the IPv4 and IPv6 system addresses must to configured

CLI Syntax: config>router
 interface *ip-int-name*
 address {*ip-address/mask*|*ip-address netmask*} [broadcast all-ones|host-ones]
 ipv6
 address *ipv6-address/prefix-length* [eui-64]

The following displays configuration output showing interface information.

```
A:ALA-49>configure>router# info
-----
...
    interface "system"
        address 200.200.200.1/32
        ipv6
            address 3FFE::C8C8:C801/128
        exit
    exit
...
-----
A:ALA-49>configure>router#
```

Learning the Tunnel Endpoint IPv4 System Address

This configuration displays the OSPF configuration to learn the IPv4 system address of the tunnel endpoint.

CLI Syntax: config>router
ospf
area *area-id*
interface *ip-int-name*

The following displays a configuration showing OSPF output.

```
A:ALA-49>configure>router# info
-----
...
    ospf
      area 0.0.0.0
        interface "system"
        exit
        interface "ip-1.1.1.1"
        exit
      exit
    exit
-----
A:ALA-49>configure>router#
```

Configuring an IPv4 BGP Peer

This configuration display the commands to configure an IPv4 BGP peer with (IPv4 and) IPv6 protocol families.

CLI Syntax:

```
config>router
  bgp
    export policy-name [policy-name...(upto 5 max)]
    router-id ip-address
    group name
      family [ipv4][vpn-ipv4] [ipv6] [mcast-ipv4]
      type {internal|external}
      neighbor ip-address
        local-as as-number [private]
        peer-as as-number
```

The following displays a configuration showing BGP output.

```
A:ALA-49>configure>router# info
-----
...
      bgp
        export "ospf3"
        router-id 200.200.200.1
        group "main"
          family ipv4 ipv6
          type internal
          neighbor 200.200.200.2
            local-as 1
            peer-as 1
          exit
        exit
      exit
    exit
  ...
-----
A:ALA-49>configure>router#
```

An Example of a IPv6 Over IPv4 Tunnel Configuration

The IPv6 address is the next-hop as it is received through BGP. The IPv4 address is the system address of the tunnel's endpoint static-route ::C8C8:C802/128 indirect 200.200.200.2.

This configuration displays an example to configure a policy to export IPv6 routes into BGP.

```

CLI Syntax: config>router
                bgp
                export policy-name [policy-name...(upto 5 max)]
                router-id ip-address
                group name
                    family [ipv4] [vpn-ipv4] [ipv6] [mcast-ipv4]
                    type {internal|external}
                    neighbor ip-address
                        local-as as-number [private]
                        peer-as as-number

```

The following displays the configuration output.

```

A:ALA-49>configure>router# info
-----
...
    policy-options
      policy-statement "ospf3"
        description "Plcy Stmtnt For 'From ospf3 To bgp'"
        entry 10
          description "Entry From Protocol ospf3 To bgp"
          from
            protocol ospf3
          exit
          to
            protocol bgp
          exit
          action accept
          exit
        exit
      exit
    exit
  ...
-----
A:ALA-49>configure>router#

```

Tunnel Egress Node

This configuration shows how the interface through which the IPv6 over IPv4 traffic leaves the node. It must be configured on a network interface. Both the IPv4 and IPv6 system addresses must be configured.

CLI Syntax:

```
config>router
configure router static-route ::C8C8:C801/128 indirect
200.200.200.1
interface ip-int-name
address {ip-address/mask>|ip-address netmask} [broadcast all-ones|host-ones]
ipv6
address ipv6-address/prefix-length [eui-64]
port port-name
```

The following displays interface configuration.

```
A:ALA-49>configure>router# info
-----
...
interface "ip-1.1.1.2"
address 1.1.1.2/30
port 1/1/1
exit
interface "system"
address 200.200.200.2/32
ipv6
address 3FFE::C8C8:C802/128
exit
exit
-----
```

Learning the Tunnel Endpoint IPv4 System Address

This configuration displays the OSPF configuration to learn the IPv4 system address of the tunnel endpoint.

CLI Syntax: config>router
ospf
area *area-id*
interface *ip-int-name*

The following displays OSPF configuration information.

```
A:ALA-49>configure>router# info
-----
...
    ospf
      area 0.0.0.0
        interface "system"
          exit
        interface "ip-1.1.1.2"
          exit
      exit
    exit
-----
A:ALA-49>configure>router#
```

Configuring an IPv4 BGP Peer

This configuration display the commands to configure an IPv4 BGP peer with (IPv4 and) IPv6 protocol families.

CLI Syntax:

```
config>router
  bgp
    export policy-name [policy-name...(upto 5 max)]
    router-id ip-address
    group name
      family [ipv4] [vpn-ipv4] [ipv6] [mcast-ipv4]
      type {internal|external}
      neighbor ip-address
        local-as as-number [private]
        peer-as as-number
```

The following displays the IPv4 BGP peer configuration example.

```
A:ALA-49>configure>router# info
-----
...
      bgp
        export "ospf3"
        router-id 200.200.200.2
        group "main"
          family ipv4 ipv6
          type internal
          neighbor 200.200.200.1
            local-as 1
            peer-as 1
          exit
        exit
      exit
    exit
  ...
-----
A:ALA-49>configure>router#
```

An Example of a IPv6 Over IPv4 Tunnel Configuration

The IPv6 address is the next-hop as it is received through BGP. The IPv4 address is the system address of the tunnel's endpoint static-route ::C8C8:C802/128 indirect 200.200.200.2

This configuration displays an example to configure a policy to export IPv6 routes into BGP.

```

CLI Syntax:  config>router
                 bgp
                 export policy-name [policy-name...(upto 5 max)]
                 router-id ip-address
                 group name
                   family [ipv4] [vpn-ipv4] [ipv6] [mcast-ipv4]
                   type {internal|external}
                   neighbor ip-address
                       local-as as-number [private]
                       peer-as as-number

```

The following displays an IPv6 over IPv4 tunnel configuration

```

A:ALA-49>configure>router# info
-----
...
    policy-options
      policy-statement "ospf3"
        description "Plcy Stmt For 'From ospf3 To bgp'"
        entry 10
          description "Entry From Protocol ospf3 To bgp"
          from
            protocol ospf3
          exit
          to
            protocol bgp
          exit
          action accept
          exit
        exit
      exit
    exit
  -----
A:ALA-49>configure>router#

```

Router Advertisement

To configure the router to originate router advertisement messages, the **router-advertisement** command must be enabled. All other router advertisement configuration parameters are optional. Router advertisement on all IPv6-enabled interfaces will be enabled.

Use the following CLI syntax to enable router advertisement and configure router advertisement parameters:

```
CLI Syntax: config>router# router-advertisement
                interface ip-int-name
                  current-hop-limit number
                  managed-configuration
                  max-advertisement-interval seconds
                  min-advertisement-interval seconds
                  mtu mtu-bytes
                  other-stateful-configuration
                  prefix ipv6-prefix/prefix-length
                    autonomous
                    on-link
                    preferred-lifetime {seconds / infinite}
                    valid-lifetime {seconds / infinite}
                  reachable-time milli-seconds
                  retransmit-time milli-seconds
                  router-lifetime seconds
                  no shutdown
                  use-virtual-mac
```

The following displays a router advertisement configuration example.

```
*A:sim131>config>router>router-advert# info
-----
                interface "n1"
                  prefix 3::/64
                  exit
                  use-virtual-mac
                  no shutdown
                exit
-----
*A:sim131>config>router>router-advert# interface n1
*A:sim131>config>router>router-advert>if# prefix 3::/64
*A:sim131>config>router>router-advert>if>prefix# info detail
-----
                autonomous
                on-link
                preferred-lifetime 604800
                valid-lifetime 2592000
-----
*A:tahi>config>router>router-advert>if>prefix#
```

Configuring IPv6 Parameters

The following displays the interface configuration showing the IPv6 default configuration when IPv6 is enabled on the interface.

```
A:ALA-49>config>router>if>ipv6# info detail
-----
port 1/3/37
  ipv6
    packet-too-big 100 10
    param-problem 100 10
    redirects 100 10
    time-exceeded 100 10
    unreachablees 100 10
  exit
-----
A:ALA-49>config>router>if>ipv6# exit all
```

The following displays an IPv6 configuration example.

```
A:ALA-49>config>router>if# info
-----
address 10.11.10.1/24
port 1/3/37
  ipv6
    address 10::1/24
  exit
-----
A:ALA-49>config>router>if#
```

An Example of a IPv6 Over IPv4 Tunnel Configuration

The IPv6 address is the next-hop as it is received through BGP. The IPv4 address is the system address of the tunnel's endpoint static-route ::C8C8:C802/128 indirect 200.200.200.2

This configuration displays an example to configure a policy to export IPv6 routes into BGP.

CLI Syntax:

```
config>router
  bgp
    export policy-name [policy-name...(upto 5 max)]
    router-id ip-address
    group name
      family [ipv4] [vpn-ipv4] [ipv6] [mcast-ipv4]
      type {internal|external}
      neighbor ip-address
        local-as as-number [private]
        peer-as as-number
```

The following displays the configuration showing the policy output.

Common Configuration Tasks

```
A:ALA-49>configure>router# info
-----
...
    policy-options
      policy-statement "ospf3"
        description "Plcy Stmt For 'From ospf3 To bgp'"
        entry 10
          description "Entry From Protocol ospf3 To bgp"
          from
            protocol ospf3
          exit
          to
            protocol bgp
          exit
          action accept
          exit
        exit
      exit
    exit
  exit
-----
A:ALA-49>configure>router#
```

Router Advertisement

To configure the router to originate router advertisement messages, the **router-advertisement** command must be enabled. All other router advertisement configuration parameters are optional. Router advertisement on all IPv6-enabled interfaces will be enabled.

Use the following CLI syntax to enable router advertisement and configure router advertisement parameters:

```
CLI Syntax: config>router# router-advertisement
                interface ip-int-name
                  current-hop-limit number
                  managed-configuration
                  max-advertisement-interval seconds
                  min-advertisement-interval seconds
                  mtu mtu-bytes
                  other-stateful-configuration
                  prefix ipv6-prefix/prefix-length
                    autonomous
                    on-link
                    preferred-lifetime {seconds / infinite}
                    valid-lifetime {seconds / infinite}
                  reachable-time milli-seconds
                  retransmit-time milli-seconds
                  router-lifetime seconds
                  no shutdown
                  use-virtual-mac
```

The following displays the output showing the router advertisement configuration.

```
*A:sim131>config>router>router-advert# info
-----
                interface "n1"
                  prefix 3::/64
                  exit
                  use-virtual-mac
                  no shutdown
                exit
-----
*A:sim131>config>router>router-advert# interface n1
*A:sim131>config>router>router-advert>if# prefix 3::/64
*A:sim131>config>router>router-advert>if>prefix# info detail
-----
                autonomous
                on-link
                preferred-lifetime 604800
                valid-lifetime 2592000
                -----
*A:sim131>config>router>router-advert>if>prefix#
```

Configuring Proxy ARP

To configure proxy ARP, you can configure:

- A prefix list in the **config>router>policy-options>prefix-list** context.
- A route policy statement in the **config>router>policy-options>policy-statement** context and apply the specified prefix list.
 - In the policy statement **entry>to** context, specify the host source address(es) for which ARP requests can or cannot be forwarded to non-local networks, depending on the specified action.
 - In the policy statement **entry>from** context, specify network prefixes that ARP requests will or will not be forwarded to depending on the action if a match is found. For more information about route policies, refer to the 7750 SR OS Routing Protocols Guide.
- Apply the policy statement to the **proxy-arp** configuration in the **config>router>interface** context.

CLI Syntax: config>router# policy-options
begin
commit
prefix-list *name*
 prefix *ip-prefix/mask* [exact|longer|through
 length|prefix-length-range *length1-length2*]

Use the following CLI syntax to configure the policy statement specified in the **proxy-arp-policy** *policy-statement* command.

CLI Syntax: config>router# policy-options
begin
commit
policy-statement *name*
 default-action {accept | next-entry | next-policy | re-
 ject}
 entry *entry-id*
 action {accept | next-entry | next-policy | reject}
 to
 prefix-list *name* [*name...*(upto 5 max)]
 from
 prefix-list *name* [*name...*(upto 5 max)]

The following displays prefix list and policy statement configuration examples:

```
A:ALA-49>config>router>policy-options# info  
-----  
    prefix-list "prefixlist1"
```

```

        prefix 10.20.30.0/24 through 32
    exit
    prefix-list "prefixlist2"
        prefix 10.10.10.0/24 through 32
    exit
...
    policy-statement "ProxyARPolicy"
        entry 10
            from
                prefix-list "prefixlist1"
            exit
            to
                prefix-list "prefixlist2"
            exit
            action reject
        exit
        default-action accept
    exit
    exit
...
-----
A:ALA-49>config>router>policy-options#

```

Use the following CLI to configure proxy ARP:

CLI Syntax: config>router>interface *interface-name*
 local-proxy-arp
 proxy-arp-policy *policy-name* [*policy-name...*(upto 5 max)]
 remote-proxy-arp

The following displays a proxy ARP configuration example:

```

A:ALA-49>config>router>if# info
-----
    address 128.251.10.59/24
    local-proxy-arp
    proxy-arp
        policy-statement "ProxyARPolicy"
    exit
-----
A:ALA-49>config>router>if#

```

Creating an IP Address Range

An IP address range can be reserved for exclusive use for services by defining the `config>router>service-prefix` command. When the service is configured, the IP address must be in the range specified as a service prefix. If no service prefix command is configured, then no limitation exists.

The `no service-prefix ip-prefix/mask` command removes all address reservations. A service prefix cannot be removed while one or more services use address(es) in the range to be removed.

CLI Syntax: `config>router
service-prefix ip-prefix/mask [exclusive]`

Configuring an LDP Shortcut

This command enables you to forward user IP packets and specified control IP packets using LDP shortcuts over all network interfaces in the system that participate in the IS-IS and OSPF routing protocols. The default is to disable the LDP shortcut across all interfaces in the system.

IGP Route Resolution

When LDP shortcut is enabled, LDP populates the RTM with next-hop entries corresponding to all prefixes for which it activated an LDP FEC. For a given prefix, two route entries are populated in RTM. One corresponds to the LDP shortcut next-hop and has an owner of LDP. The other one is the regular IP next-hop. The LDP shortcut next-hop always has preference over the regular IP next-hop for forwarding user packets and specified control packets over a given outgoing interface to the route next-hop.

The prior activation of the FEC by LDP is done by performing an exact match with an IGP route prefix in RTM. It can also be done by performing a longest prefix-match with an IGP route in RTM if the `aggregate-prefix-match` option is enabled globally in LDP `ldp-interarea-prd`.

Note that the LDP next-hop entry is not exported to LDP control plane or to any other control plane protocols except OSPF, IS-IS, and specific OAM control plane as specified in [Handling of Control Packets on page 84](#).

This feature is not restricted to /32 FEC prefixes. However only /32 FEC prefixes will be populated in the CPM Tunnel Table for use as a tunnel by services.

All user and specified control packets for which the longest prefix match in RTM yields the FEC prefix will be forwarded over the LDP LSP. The following is an example of the resolution process.

Assume the egress LER advertised a FEC for some /24 prefix using the fec-originate command. At the ingress LER, LDP resolves the FEC by checking in RTM that an exact match exists for this prefix. Once LDP activated the FEC, it programs the NHLFE in the egress data path and the LDP tunnel information in the ingress data path tunnel table.

Next, LDP provides the shortcut route to RTM which will associate it with the same /24 prefix. There will be two entries for this /24 prefix, the LDP shortcut next-hop and the regular IP next-hop. The latter was used by LDP to validate and activate the FEC. RTM then resolves all user prefixes which succeed a longest prefix match against the /24 route entry to use the LDP LSP.

Assume now the aggregate-prefix-match was enabled and that LDP found a /16 prefix in RTM to activate the FEC for the /24 FEC prefix. In this case, RTM adds a new more specific route entry of /24 and has the next-hop as the LDP LSP but it will still not have a specific /24 IP route entry. RTM then resolves all user prefixes which succeed a longest prefix match against the /24 route entry to use the LDP LSP while all other prefixes which succeed a longest prefix-match against the /16 route entry will use the IP next-hop. LDP shortcut will also work when using RIP for routing.

LDP Shortcut Forwarding Plane

Once LDP activated a FEC for a given prefix and programmed RTM, it also programs the ingress Tunnel Table in IOM with the LDP tunnel information.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet by the ingress IOM will result in the packet being sent labeled with the label stack corresponding to the NHLFE of the LDP LSP when the preferred RTM entry corresponds to an LDP shortcut.

If the preferred RTM entry corresponds to an IP next-hop, the IPv4 packet is forwarded unlabelled.

The switching from the LDP shortcut next-hop to the regular IP next-hop when the LDP FEC becomes unavailable depends on whether the next-hop is still available. If it is (for example, the LDP FEC was withdrawn due to LDP control plane issues) the switchover should be faster. If the next-hop determination requires IGP to re-converge, this will take longer. However no target is set.

The switching from a regular IP next-hop to an LDP shortcut next-hop will normally occur only when both are available. However, the programming of the NHLFE by LDP and the programming of the LDP tunnel information in the ingress IOM tunnel table are asynchronous. If Tunnel Table is configured first, it is possible that traffic will be black holed for some time .

ECMP Considerations

When ECMP is enabled and multiple equal-cost next-hops exit for the IGP route, the ingress IOM will spray the packets for this route based on hashing routine currently supported for IPv4 packets.

Common Configuration Tasks

When the preferred RTM entry corresponds to an LDP shortcut route, spraying will be performed across the multiple next-hops for the LDP FEC. The FEC next-hops can either be direct link LDP neighbors or T-LDP neighbors reachable over RSVP LSPs in the case of LDP-over-RSVP but not both. This is as per ECMP for LDP in existing implementation.

When the preferred RTM entry corresponds to a regular IP route, spraying will be performed across regular IP next-hops for the prefix.

Spraying across regular IP next-hops and LDP-shortcut next-hops concurrently is not supported.

Handling of Control Packets

All control plane packets will not see the LDP shortcut route entry in RTM with the exception of the following control packets which will be forwarded over an LDP shortcut when enabled:

- A locally generated or in transit ICMP Ping and trace route of an IGP route. The transit message appears as a user packet to the ingress LER node.
- A locally generated response to a received ICMP ping or trace route message.

All other control plane packets that require an RTM lookup and knowledge of which destination is reachable over the LDP shortcut will continue to be forwarded over the IP next-hop route in RTM.

Handling of Multicast Packets

Multicast packets cannot be forwarded or received from an LDP LSP. This is because there is no support for the configuration of such an LSP as a tunnel interfaces in PIM. Only an RSVP P2MP LSP is currently allowed.

If a multicast packet is received over the physical interface, the RPF check will not resolve to the LDP shortcut as the LDP shortcut route in RTM is not made available to multicast application.

Interaction with LDP Shortcut for BGP Route Resolution

There is no interaction between an LDP shortcut for BGP next-hop resolution and the LDP shortcut for IGP route resolution. BGP will continue to resolve a BGP next-hop to an LDP shortcut if the user enabled the LDP shortcut option in BGP *BGP-Shortcut*:

CLI Syntax: `config>router>bgp>igp-shortcut ldp`

Interaction with LDP Shortcut for Static Route Resolution

There is no interaction between LDP shortcut for static route resolution and the LDP shortcut for IGP route resolution. A static route will continue to be resolved by searching an LDP LSP which FEC prefix matches the specified indirect next-hop for the route. In contrast, the LDP shortcut for IGP route resolution uses the LDP LSP as a route.

LDP Control Plane

In order for the LDP shortcut to be usable, a 7x50 must originate a <FEC, label> binding for each IGP route it learns of even if it did not receive a binding from the next-hop for that route. In other words, it must assume it is an egress LER for the FEC until the route disappears from the routing table or the next-hop advertised a binding for the FEC prefix. In the latter case, the 7x50 becomes a transit LSR for the FEC.

In the current TiMOS, a 7x50 will originate a <FEC, label> binding for its system interface address only by default. The only way to originate a binding for local interfaces and routes which are not local to the system is by using the fec-originate capability.

You must use the **fec-originate** command to generate bindings for all non-local routes for which this node acts as an egress LER for the corresponding LDP FEC. Specifically, this feature must support the FEC origination of IGP learned routes and subscriber/host routes statically configured or dynamically learned over subscriber IES interfaces.

An LDP LSP used as a shortcut by IPv4 packets may also be tunneled using the LDP-over-RSVP feature.

Deriving the Router ID

The router ID defaults to the address specified in the system interface command. If the system interface is not configured with an IP address, then the router ID inherits the last four bytes of the MAC address. The router ID can also be manually configured in the `config>router router-id` context. On the BGP protocol level, a BGP router ID can be defined in the `config>router>bgp router-id` context and is only used within BGP.

Note that if a new router ID is configured, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized the new router ID is used. An interim period of time can occur when different protocols use different router IDs. To force the new router ID, issue the `shutdown` and `no shutdown` commands for each protocol that uses the router ID, or restart the entire router.

Use the following CLI syntax to configure the router ID:

CLI Syntax:

```
config>router
  router-id router-id
  interface ip-int-name
    address {ip-address/mask | ip-address netmask} [broad-
      cast all-ones | host-ones]
```

The following example displays a router ID configuration:

```
A:ALA-4>config>router# info
#-----
# IP Configuration
#-----
      interface "system"
        address 10.10.0.4/32
      exit
      . . .
      router-id 10.10.0.4
#-----
A:ALA-4>config>router#
```

Configuring a Confederation

Configuring a confederation is optional. The AS and confederation topology design should be carefully planned. Autonomous system (AS), confederation, and BGP connection and peering parameters must be explicitly created on each participating router. Identify AS numbers, confederation numbers, and members participating in the confederation.

Refer to the BGP section for CLI syntax and command descriptions.

Use the following CLI syntax to configure a confederation:

CLI Syntax: `config>router`
`confederation confed-as-num members member-as-num`

The following example displays the commands to configure the confederation topology diagram displayed in [Figure 2 on page 39](#).

NOTES:

- Confederations can be preconfigured prior to configuring BGP connections and peering.
- Each confederation can have up to 15 members.

The following displays a confederation example.

```
A:ALA-B>config>router# info
#-----
# IP Configuration
#-----
    interface "system"
      address 10.10.10.103/32
    exit
    interface "to-104"
      shutdown
      address 10.0.0.103/24
      port 1/1/1
    exit
    autonomous-system 100
    confederation 2002 members 200 300 400
    router-id 10.10.10.103
#-----
A:ALA-B>config>router#
```

Configuring an Autonomous System

Configuring an autonomous system is optional. Use the following CLI syntax to configure an autonomous system:

CLI Syntax: `config>router`
`autonomous-system as-number`

The following displays an autonomous system configuration example:

```
A:ALA-A>config>router# info
#-----
# IP Configuration
#-----
      interface "system"
        address 10.10.10.103/32
      exit
    interface "to-104"
      address 10.0.0.103/24
      port 1/1/1
      exit
    exit
    autonomous-system 100
    router-id 10.10.10.103
#-----
A:ALA-A>config>router#
```

Configuring Overload State on a Single SFM

A 7x50 system with a single SFM installed has a system multicast throughput that is only a half of a 7x50 system with dual SFMs installed. For example, in a mixed environment in which IOM1s, IOM2s, and IOM3s are installed in the same system (chassis mode B or C), system multicast throughput doubles when redundant SFMs are used instead of a single SFM. If the required system multicast throughput is between 16G and 32G (which means both SFMs are being actively used), when there is an SFM failure, multicast traffic needs to be rerouted around the node.

Some scenarios include:

- There is only one SFM installed in the system
- One SFM (active or standby) failed in a dual SFM configuration
- The system is in the ISSU process

You can use an overload state in IGP to trigger the traffic reroute by setting the overload bit in IS-IS or setting the metric to maximum in OSPF. Since PIM uses IGP to find out the upstream router, a next-hop change in IGP will cause PIM to join the new path and prune the old path, which effectively reroutes the multicast traffic downstream. When the problem is resolved, the overload condition is cleared, which will cause the traffic to be routed back to the router.

Service Management Tasks

This section discusses the following service management tasks:

- [Changing the System Name on page 90](#)
 - [Modifying Interface Parameters on page 91](#)
 - [Deleting a Logical IP Interface on page 92](#)
-

Changing the System Name

The `system` command sets the name of the device and is used in the prompt string. Only one system name can be configured. If multiple system names are configured, the last one configured will overwrite the previous entry.

Use the following CLI syntax to change the system name:

CLI Syntax: `config# system`
 name *system-name*

The following example displays the command usage to change the system name:

Example: A:ALA-A>config>system# name tgif
 A:TGIF>config>system#

The following example displays the system name change:

```
A:ALA-A>config>system# name TGIF
A:TGIF>config>system# info
#-----
# System Configuration
#-----
      name "TGIF"
      location "Mt.View, CA, NE corner of FERG 1 Building"
      coordinates "37.390, -122.05500 degrees lat."
      synchronize
      snmp
        exit
        security
          snmp
            community "private" rwa version both
          exit
        . . .
#-----
A:TGIF>config>system#
```

Modifying Interface Parameters

Starting at the `config>router` level, navigate down to the router interface context.

To modify an IP address, perform the following steps:

```
Example:A:ALA-A>config>router# interface "to-sr1"
A:ALA-A>config>router>if# shutdown
A:ALA-A>config>router>if# no address
A:ALA-A>config>router>if# address 10.0.0.25/24
A:ALA-A>config>router>if# no shutdown
```

To modify a port, perform the following steps:

```
Example:A:ALA-A>config>router# interface "to-sr1"
A:ALA-A>config>router>if# shutdown
A:ALA-A>config>router>if# no port
A:ALA-A>config>router>if# port 1/1/2
A:ALA-A>config>router>if# no shutdown
```

The following example displays the interface configuration:

```
A:ALA-A>config>router# info
#-----
# IP Configuration
#-----
        interface "system"
            address 10.0.0.103/32
        exit
        interface "to-sr1"
            address 10.0.0.25/24
            port 1/1/2
        exit
        router-id 10.10.0.3
#-----
A:ALA-A>config>router#
```

Deleting a Logical IP Interface

The `no` form of the `interface` command typically removes the entry, but all entity associations must be shut down and/or deleted before an interface can be deleted.

1. Before an IP interface can be deleted, it must first be administratively disabled with the `shutdown` command.
2. After the interface has been shut down, it can then be deleted with the **`no interface`** command.

CLI Syntax: `config>router`
`no interface ip-int-name`

Example: `config>router# interface test-interface`
`config>router>if# shutdown`
`config>router>if# exit`
`config>router# no interface test-interface`
`config>router#`

For router interface VRRP commands, see [VRRP Command Reference on page 303](#).

Router Interface IPv6 Commands

```

config
  — router [router-name]
    — [no] interface ip-int-name
      — [no] ipv6
        — address ipv6-address/prefix-length [eui-64]
        — no address ipv6-address/prefix-length
        — bfd transmit-interval [receive receive-interval] [multiplier multiplier]
          [echo-receive echo-interval [type cpm-np]]
        — no bfd
        — icmp6
          — packet-too-big [number seconds]
          — no packet-too-big
          — param-problem [number seconds]
          — no param-problem
          — redirects [number seconds]
          — no redirects
          — time-exceeded [number seconds]
          — no time-exceeded
          — unreachables [number seconds]
          — no unreachables
        — [no] local-proxy-nd
        — neighbor ipv6-address [mac-address]
        — no neighbor ipv6-address
        — proxy-nd-policy policy-name [ policy-name...(up to 5 max)]
        — no proxy-nd-policy
        — [no] qos-route-lookup
        — [no] urpf-check
          — mode {strict | loose}
          — no mode
      — [no] qos-route-lookup
      — [no] urpf-check
        — mode {strict | loose}
        — no mode

```

Router Advertisement Commands

```
config
  — router
    — [no] router-advertisement
      — [no] interface ip-int-name
        — current-hop-limit number
        — no current-hop-limit
        — [no] managed-configuration
        — max-advertisement-interval seconds
        — no max-advertisement-interval
        — min-advertisement-interval seconds
        — no min-advertisement-interval
        — mtu mtu-bytes
        — no mtu
        — [no] other-stateful-configuration
        — prefix [ipv6-prefix/prefix-length]
          — [no] autonomous
          — [no] on-link
          — preferred-lifetime {seconds | infinite}
          — no preferred-lifetime
          — valid-lifetime {seconds | infinite}
          — no valid-lifetime
        — reachable-time milli-seconds
        — no reachable-time
        — retransmit-time milli-seconds
        — no retransmit-time
        — router-lifetime seconds
        — no router-lifetime
        — [no] shutdown
        — [no] use-virtual-mac
```

Show Commands

Configuration Commands

Generic Commands

shutdown

Syntax	[no] shutdown
Context	config>router>interface
Description	<p>The shutdown command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the no shutdown command.</p> <p>The shutdown command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.</p> <p>Unlike other commands and parameters where the default state is not indicated in the configuration file, shutdown and no shutdown are always indicated in system generated configuration files.</p> <p>The no form of the command puts an entity into the administratively enabled state.</p>
Default	no shutdown

description

Syntax	description <i>description-string</i> no description
Context	config>router>if config>router>if>dhcp config>router>if>vrrp config>router>l2tp>group config>router>l2tp>group>tunnel
Description	<p>This command creates a text description stored in the configuration file for a configuration context.</p> <p>The no form of the command removes the description string from the context.</p>
Default	No description is associated with the configuration context.
Parameters	<i>description-string</i> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

Router Global Commands

router

Syntax	router <i>router-name</i>
Context	config
Description	This command enables the context to configure router parameters, and interfaces, route policies, and protocols.
Parameters	<i>router-name</i> — Specify the router-name.
Values	router-name: Base, management
Default	Base

aggregate

Syntax	aggregate <i>ip-prefix/ip-prefix-length</i> [summary-only] [as-set] [aggregator <i>as-number:ip-address</i>] no aggregate <i>ip-prefix/mask</i>								
Context	config>router								
Description	<p>This command creates an aggregate route.</p> <p>Use this command to group a number of routes with common prefixes into a single entry in the routing table. This reduces the number of routes that need to be advertised by this router and reduces the number of routes in the routing tables of downstream routers.</p> <p>Both the original components and the aggregated route (source protocol aggregate) are offered to the Routing Table Manager (RTM). Subsequent policies can be configured to assign protocol-specific characteristics (BGP, IS-IS or OSPF) such as the route type, or OSPF tag, to aggregate routes.</p> <p>Multiple entries with the same prefix but a different mask can be configured; for example, routes are aggregated to the longest mask. If one aggregate is configured as 10.0./16 and another as 10.0.0./24, then route 10.0.128/17 would be aggregated into 10.0/16, and route 10.0.0.128/25 would be aggregated into 10.0.0/24. If multiple entries are made with the same prefix and the same mask, the previous entry is overwritten.</p> <p>The no form of the command removes the aggregate.</p>								
Default	No aggregate routes are defined.								
Parameters	<i>ip-prefix</i> — The destination address of the aggregate route in dotted decimal notation.								
Values	<table> <tr> <td>ipv4-prefix</td> <td>a.b.c.d (host bits must be 0)</td> </tr> <tr> <td>ipv4-prefix-length</td> <td>0 — 32</td> </tr> <tr> <td>ipv6-prefix</td> <td>x:x:x:x:x:x:x (eight 16-bit pieces)</td> </tr> <tr> <td></td> <td>x:x:x:x:x:d.d.d.d</td> </tr> </table>	ipv4-prefix	a.b.c.d (host bits must be 0)	ipv4-prefix-length	0 — 32	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)		x:x:x:x:x:d.d.d.d
ipv4-prefix	a.b.c.d (host bits must be 0)								
ipv4-prefix-length	0 — 32								
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)								
	x:x:x:x:x:d.d.d.d								

x: [0 — FFFF]H
 d: [0 — 255]D
 ipv6-prefix-length 0 — 128

The mask associated with the network address expressed as a mask length.

Values 0 — 32

summary-only — This optional parameter suppresses advertisement of more specific component routes for the aggregate.

To remove the **summary-only** option, enter the same aggregate command without the **summary-only** parameter.

as-set — This optional parameter is only applicable to BGP and creates an aggregate where the path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized.

Use this feature carefully. Aggregating several paths can result in the constant withdrawal and insertion of AS-PATHs as associated component routes of the aggregate that are experiencing changes.

aggregator as-number:ip-address — This optional parameter specifies the BGP aggregator path attribute to the aggregate route. When configuring the aggregator, a two-octet AS number used to form the aggregate route must be entered, followed by the IP address of the BGP system that created the aggregate route.

autonomous-system

Syntax **autonomous-system** *autonomous-system*
no autonomous-system

Context config>router

Description This command configures the autonomous system (AS) number for the router. A router can only belong to one AS. An AS number is a globally unique number with an AS. This number is used to exchange exterior routing information with neighboring ASs and as an identifier of the AS itself.

If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted either by administratively disabling/enabling (**shutdown/no shutdown**) the BGP instance or rebooting the system with the new configuration.

Default No autonomous system number is defined.

Parameters *autonomous-system* — The autonomous system number expressed as a decimal integer.

Values 1 — 4294967295

confederation

Syntax **confederation** *confed-as-num members as-number [as-number...up to 15 max]*
no confederation [*confed-as-num members as-number...up to 15 max*]

Context config>router

Description	<p>This command creates confederation autonomous systems within an AS.</p> <p>This technique is used to reduce the number of IBGP sessions required within an AS. Route reflection is another technique that is commonly deployed to reduce the number of IBGP sessions.</p> <p>The no form of the command deletes the specified member AS from the confederation.</p> <p>When no members are specified in the no statement, the entire list is removed and confederation is disabled.</p> <p>When the last member of the list is removed, confederation is disabled.</p>
Default	no confederation - no confederations are defined.
Parameters	<p><i>confed-as-num</i> — The confederation AS number expressed as a decimal integer.</p> <p style="padding-left: 2em;">Values 1 — 65535</p> <p>members <i>member-as-num</i> — The AS number(s) of members that are part of the confederation, expressed as a decimal integer. Up to 15 members per <i>confed-as-num</i> can be configured.</p> <p style="padding-left: 2em;">Values 1 — 65535</p>

ecmp

Syntax	<p>ecmp <i>max-ecmp-routes</i></p> <p>no ecmp</p>
Context	config>router
Description	<p>This command enables ECMP and configures the number of routes for path sharing; for example, the value 2 means two equal cost routes will be used for cost sharing.</p> <p>ECMP can only be used for routes learned with the same preference and same protocol. See the discussion on preferences in the static-route command.</p> <p>When more ECMP routes are available at the best preference than configured in <i>max-ecmp-routes</i>, then the lowest next-hop IP address algorithm is used to select the number of routes configured in <i>max-ecmp-routes</i>.</p> <p>The no form of the command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, then the route with the lowest next-hop IP address is used.</p>
Default	no ecmp
Parameters	<p><i>max-ecmp-routes</i> — The maximum number of equal cost routes allowed on this routing table instance, expressed as a decimal integer. Setting ECMP <i>max-ecmp-routes</i> to 1 yields the same result as entering no ecmp.</p> <p style="padding-left: 2em;">Values 0 — 32</p>

fib-priority

Syntax	fib-priority {high standard}
Context	config>router
Description	This command specifies the FIB priority for VPRN.

ignore-icmp-redirect

Syntax	[no] ignore-icmp-redirect
Context	config>router
Description	This command drops ICMP redirects received on the management interface. The no form of the command accepts ICMP redirects received on the management interface.

ip-fast-reroute

Syntax	[no] ip-fast-reroute
Context	config>router
Description	<p>This command enables IP Fast-Reroute (FRR) feature on the system.</p> <p>This feature provides for the use of a Loop-Free Alternate (LFA) backup next-hop for forwarding in-transit and CPM generated IP packets when the primary next-hop is not available. IP FRR is supported on IPv4 and IPv6 OSPF/IS-IS prefixes forwarded in the base router instance to a network IP interface or to an IES SAP interface or spoke interface. It is also supported for VPRN VPN-IPv4 OSPF prefixes and VPN-IPv6 OSPF prefixes forwarded to a VPRN SAP interface or spoke interface.</p> <p>IP FRR also provides a LFA backup next-hop for the destination prefix of a GRE tunnel used in an SDP or in VPRN auto-bind.</p> <p>When any of the following events occurs, IGP instructs in the fast path the IOMs to enable the LFA backup next-hop:</p> <ol style="list-style-type: none"> OSPF/IS-IS interface goes operationally down: physical or local admin shutdown. Timeout of a BFD session to a next-hop when BFD is enabled on the OSPF/IS-IS interface <p>When the SPF computation determines there is more than one primary next-hop for a prefix, it will not program any LFA next-hop in RTM. Thus, the IP prefix will resolve to the multiple equal-cost primary next-hops that provide the required protection.</p> <p>The no form of this command disables the IP FRR feature on the system</p>
Default	no ip-fast-reroute

mc-maximum-routes

Syntax	mc-maximum-routes <i>number</i> [log-only] [threshold <i>threshold</i>] no mc-maximum-routes
Context	config>router
Description	<p>This command specifies the maximum number of multicast routes that can be held within a VPN routing/forwarding (VRF) context. When this limit is reached, a log and SNMP trap are sent. If the log-only parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then no new joins will be processed.</p> <p>The no form of the command disables the limit of multicast routes within a VRF context. Issue the no form of the command only when the VPRN instance is shutdown.</p>
Default	no mc-maximum-routes
Parameters	<p><i>number</i> — Specifies the maximum number of routes to be held in a VRF context.</p> <p>Values 1 — 2147483647</p> <p>log-only — Specifies that if the maximum limit is reached, only log the event. log-only does not disable the learning of new routes.</p> <p>threshold <i>threshold</i> — The percentage at which a warning log message and SNMP trap should be sent.</p> <p>Values 0 — 100</p> <p>Default 10</p>

multicast-info

Syntax	multicast-info-policy <i>policy-name</i> no multicast-info-policy
Context	configure>router
Description	This command configures multicast information policy.
Parameters	<p><i>policy-name</i> — Specifies the policy name.</p> <p>Values 32 chars max</p>

network-domains

Syntax	network-domains
Context	config>router
Description	This command opens context for defining network-domains. This command is applicable only in the base routing context.

description

Syntax	[no] description <i>string</i>
Context	config>router>network-domains>network-domain
Description	This command creates a text description stored in the configuration file for a configuration context. The no form of the command removes the description string from the context.
Default	no description
Parameters	<i>string</i> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special character (#, \$, space, etc.), the entire string must be enclosed within double quotes.

network-domain

Syntax	network-domain <i>network-domain-name</i> [create] no network-domain <i>network-domain-name</i>
Context	config>router>network-domains
Description	This command creates network-domains that can be associated with individual interfaces and SDPs.
Default	network-domain “default”
Parameters	<i>network-domain-name</i> — Network domain name character string.

router-id

Syntax	router-id <i>ip-address</i> no router-id
Context	config>router
Description	This command configures the router ID for the router instance. The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID. When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs. To force the new router ID to be used, issue the shutdown and no shutdown commands for each protocol that uses the router ID, or restart the entire router. The no form of the command to reverts to the default value.
Default	The system uses the system interface address (which is also the loopback address). If a system interface address is not configured, use the last 32 bits of the chassis MAC address.
Parameters	<i>router-id</i> — The 32 bit router ID expressed in dotted decimal notation or as a decimal value.

service-prefix

Syntax	service-prefix <i>ip-prefix/mask</i> <i>ip-prefix netmask</i> [exclusive] no service-prefix <i>ip-prefix/mask</i> <i>ip-prefix netmask</i>														
Context	config>router														
Description	<p>This command creates an IP address range reserved for IES or VPLS services.</p> <p>The purpose of reserving IP addresses using service-prefix is to provide a mechanism to reserve one or more address ranges for services.</p> <p>When services are defined, the address must be in the range specified as a service prefix. If a service prefix is defined, then IP addresses assigned for services must be within one of the ranges defined in the service-prefix command. If the service-prefix command is not configured, then no limitations exist.</p> <p>Addresses in the range of a service prefix can be allocated to a network port unless the exclusive parameter is used. Then, the address range is exclusively reserved for services.</p> <p>When a range that is a superset of a previously defined service prefix is defined, the subset is replaced with the superset definition; for example, if a service prefix exists for 10.10.10.0/24, and a service prefix is configured as 10.10.0.0/16, then 10.10.10.0/24 is replaced by the new 10.10.0.0/16 configuration.</p> <p>When a range that is a subset of a previously defined service prefix is defined, the subset replaces the existing superset, providing addresses used by services are not affected; for example, if a service prefix exists for 10.10.0.0/16, and a service prefix is configured as 10.10.10.0/24, then the 10.10.0.0/16 entry is removed as long as no services are configured that use 10.10.x.x addresses other than 10.10.10.x.</p> <p>The no form of the command removes all address reservations. A service prefix cannot be removed while one or more service uses an address or addresses in the range.</p>														
Default	no service-prefix - no IP addresses are reserved for services.														
Parameters	<p><i>ip-prefix/mask</i> — The IP address prefix to include in the service prefix allocation in dotted decimal notation.</p> <p>Values</p> <table border="0"> <tr> <td>ipv4-prefix:</td> <td>a.b.c.d (host bits must be 0)</td> </tr> <tr> <td>ipv4-prefix-length:</td> <td>0 — 32</td> </tr> <tr> <td>ipv6-prefix:</td> <td>x:x:x:x:x:x:x (eight 16-bit pieces)</td> </tr> <tr> <td></td> <td>x:x:x:x:x:d.d.d.d</td> </tr> <tr> <td></td> <td>x: [0 — FFFF]H</td> </tr> <tr> <td></td> <td>d: [0 — 255]D</td> </tr> <tr> <td>ipv6-prefix-length:</td> <td>0 — 128</td> </tr> </table> <p>Values exclusive</p> <p>When this option is specified, the addresses configured are exclusively used for services and cannot be assigned to network ports.</p>	ipv4-prefix:	a.b.c.d (host bits must be 0)	ipv4-prefix-length:	0 — 32	ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces)		x:x:x:x:x:d.d.d.d		x: [0 — FFFF]H		d: [0 — 255]D	ipv6-prefix-length:	0 — 128
ipv4-prefix:	a.b.c.d (host bits must be 0)														
ipv4-prefix-length:	0 — 32														
ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces)														
	x:x:x:x:x:d.d.d.d														
	x: [0 — FFFF]H														
	d: [0 — 255]D														
ipv6-prefix-length:	0 — 128														

sgt-qos

Syntax	sgt-qos
Context	config>router
Description	This command configures DSCP/Dot1p re-marking for self-generated traffic.

application

Syntax	application <i>dscp-app-name</i> ptp dscp { <i>dscp-value</i> [<i>dscp-name</i>]} application <i>dot1p-app-name</i> dot1p <i>dot1p-priority</i> no application { <i>dscp-app-name</i> <i>dot1p-app-name</i> }
Context	config>router>sgt-qos
Description	This command configures DSCP/Dot1p re-marking for applications.
Parameters	<i>dscp-app-name</i> — Specifies the DSCP application name. Values bgp, cflowd, dhcp, dns, ftp, icmp, igmp, igmp-reporter, l2tp, ldp, mld, msdp, ndis, ntp, ospf, pim, radius, rip, rsvp, snmp, snmp-notification, srrp, ssh, syslog, tacplus, telnet, tftp, traceroute, vrrp <i>dscp-value</i> — Specifies the DSCP value Values 0 — 63 <i>dscp-name</i> — Specifies the DSCP name. none, be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63 <i>dot1p-priority</i> — Specifies the Dot1p priority. Values none, 0 — 7 <i>dot1p-app-name</i> — Specifies the Dot1p application name. Values arp, isis, pppoe

dscp

Syntax	dscp <i>dscp-name</i> fc <i>fc-name</i> no dscp <i>dscp-name</i>
Context	config>router>sgt-qos
Description	This command configures DSCP name to FC mapping.

Configuration Commands

Parameters	<i>dscp-name</i> — Specifies the DSCP name. Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63 <i>fc-name</i> — Specifies the forward class name. Values be, l2, af, l1, h2, ef, h1, nc
-------------------	--

triggered-policy

Syntax	triggered-policy no triggered-policy
Context	config>router
Description	<p>This command triggers route policy re-evaluation.</p> <p>By default, when a change is made to a policy in the config router policy options context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a 7750 SR router, the consequences could be dramatic. It would be more effective to control changes on a peer-by-peer basis.</p> <p>If the triggered-policy command is enabled, and a given peer is established, and you want the peer to remain up, in order for a change to a route policy to take effect, a clear command with the <i>soft</i> or <i>soft inbound</i> option must be used; for example, clear router bgp neighbor x.x.x.x soft. This keeps the peer up, and the change made to a route policy is applied only to that peer or group of peers.</p>

single-sfm-overload

Syntax	single-sfm-overload [holdoff-time holdoff-time] no single-sfm-overload
Context	config>router
Description	<p>This command, if enabled, will cause the OSPF for the service to enter an overload state when the node only has a single SFM functioning.</p> <p>The no form of this command causes the overload state to be cleared.</p>
Default	no single-sfm-overload
Parameters	<i>holdoff-time</i> — This parameter specifies the delay between the detection of a single SFM and enacting the overload state. Values 1— 600 seconds Default 0 seconds

static-route

Syntax	<pre>[no] static-route {ip-prefix/prefix-length ip-prefix netmask} [preference preference] [metric metric] [tag tag] [enable disable] next-hop ip-int-name ip-address [mcast-family] [bfd-enable {cpe-check cpe-ip-address [interval seconds] [drop-count count] [log]}] {prefix-list prefix-list-name [all none]} {fc fc-name [priority {low high}]}] [ldp-sync] [no] static-route {ip-prefix/prefix-length ip-prefix netmask} [preference preference] [metric metric] [tag tag] [enable disable] indirect ip-address [ldp rsvp-te [disallow-igp]] [cpe-check cpe-ip-address [interval seconds] [drop-count count] [log]} {prefix-list prefix- list-name [all none]} {fc fc-name [priority {low high}]}} [no] static-route {ip-prefix/prefix-length ip-prefix netmask} [preference preference] [metric metric] [tag tag] [enable disable] black-hole [mcast-family] {prefix-list prefix-list- name [all none]}</pre>				
Context	config>router				
Description	<p>This command creates static route entries for both the network and access routes. When configuring a static route, either next-hop, indirect or black-hole must be configured. The no form of the command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.</p> <p>If a CPE connectivity check target address is already being used as the target address in a different static route, then cpe-check parameters must match. If they do not, the new configuration command will be rejected.</p> <p>If a static-route command is issued with no cpe-check target but the destination prefix/netmask and next-hop matches a static route that did have an associated cpe-check, the cpe-check test will be removed from the associated static route.</p>				
Default	No static routes are defined.				
Parameters	<p><i>ip-prefix/prefix-length</i> — The destination address of the static route.</p> <table border="0"> <tr> <td style="vertical-align: top;">Values</td> <td> <pre>ipv4-prefix a.b.c.d (host bits must be 0) ipv4-prefix-length 0 — 32 ipv6-prefix x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x [0 — FFFF]H d [0 — 255]D ipv6-prefix-length 0 — 128</pre> </td> </tr> </table> <p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-addr</i> portion of the address command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <table border="0"> <tr> <td style="vertical-align: top;">Values</td> <td> <pre>ipv4-address a.b.c.d (host bits must be 0) ipv6-address x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses</pre> </td> </tr> </table>	Values	<pre>ipv4-prefix a.b.c.d (host bits must be 0) ipv4-prefix-length 0 — 32 ipv6-prefix x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x [0 — FFFF]H d [0 — 255]D ipv6-prefix-length 0 — 128</pre>	Values	<pre>ipv4-address a.b.c.d (host bits must be 0) ipv6-address x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses</pre>
Values	<pre>ipv4-prefix a.b.c.d (host bits must be 0) ipv4-prefix-length 0 — 32 ipv6-prefix x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x [0 — FFFF]H d [0 — 255]D ipv6-prefix-length 0 — 128</pre>				
Values	<pre>ipv4-address a.b.c.d (host bits must be 0) ipv6-address x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses</pre>				

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

ldp-sync — Extends the LDP synchronization feature to a static route. When an interface comes back up, it is possible that a preferred static route using the interface as next-hop for a given prefix is enabled before the LDP adjacency to the peer LSR comes up on this interface. In this case, traffic on an SDP that uses the static route for the far-end address would be black-holed until the LDP session comes up and the FECs exchanged.

This option when enabled delays the activation of the static route until the LDP session comes up over the interface and the ldp-sync-timer configured on that interface has expired.

preference preference — The preference of this static route versus the routes from different sources such as BGP or OSPF, expressed as a decimal integer. When modifying the preference of an existing static route, the metric will not be changed unless specified.

Different protocols should not be configured with the same preference. If this occurs, the tiebreaker is according to the default preference table defined in Table 5 on page 117.

If multiple routes are learned with an identical preference using the same protocol, the lowest-cost route is used. If multiple routes are learned with an identical preference using the same protocol, and the costs (metrics) are equal, then the route to use is determined by the configuration of the **ecmp** command

prefix-list prefix-list-name [all | none] — Specifies the prefix-list to be considered.

metric metric — The cost metric for the static route, expressed as a decimal integer. This value is used when importing the static route into other protocols such as OSPF. When the metric is configured as 0 then the metric configured in OSPF, default-import-metric, applies. When modifying the metric of an existing static route, the preference will not change unless specified. This value is also used to determine which static route to install in the forwarding table:

- If there are multiple static routes with the same preference but different metrics then the lower cost (metric) route will be installed.
- If there are multiple static routes with equal preferences and metrics then ECMP rules apply .
- If there are multiple routes with different preferences then the lower preference route will be installed.

Default 1

Values 0 — 65535

next-hop [ip-address | ip-int-name] — Specifies the directly connected next hop IP address used to reach the destination. If the next hop is over an unnumbered interface or a point-to-point interface, the ip-int-name of the unnumbered or point-to-point interface (on this node) can be configured.

The **next-hop** keyword and the **indirect** or **black-hole** keywords are mutually exclusive. If an identical command is entered (with the exception of either the **indirect** or **black-hole** parameters), then this static route will be replaced with the newly entered command, and unless specified, the respective defaults for preference and metric will be applied.

The *ip-address* configured here can be either on the network side or the access side on this node. This address must be associated with a network directly connected to a network configured on this node.

Values	ip-int-name	32 chars max
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x[-interface] x:x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses

indirect ip-address — Specifies that the route is indirect and specifies the next hop IP address used to reach the destination.

The configured *ip-addr* is not directly connected to a network configured on this node. The destination can be reachable via multiple paths. The indirect address can only be resolved from a dynamic routing protocol. Another static route cannot be used to resolve the indirect address.

The **indirect** keyword and the **next-hop** or **black-hole** keywords are mutually exclusive. If an identical command is entered (with the exception of either the **next-hop** or **black-hole** parameters), then this static route will be replaced with the newly entered command and unless specified the respective defaults for preference and metric will be applied.

The *ip-addr* configured can be either on the network or the access side and is normally at least one hop away from this node.

black-hole — Specifies the route is a black hole route. If the destination address on a packet matches this static route, it will be silently discarded.

The **black-hole** keyword and the **next-hop** or **indirect** keywords are mutually exclusive. If an identical command is entered (with the exception of either the **next-hop** or **indirect** parameters), then this static route will be replaced with the newly entered command, and unless specified, the respective defaults for preference and metric will be applied.

disallow-igp — This value is valid only for indirect static routes. If set and if none of the defined tunneling mechanisms (RSVP-TE, LDP or IP) qualify as a next-hop, the normal IGP next-hop to the indirect next-hop address will not be used. If not set then the IGP next-hop to the indirect next-hop address can be used as the next-hop of the last resort.

tag — Adds a 32-bit integer tag to the static route. The tag is used in route policies to control distribution of the route into other protocols.

Table 5: Default Route Preferences

Route Type	Preference	Configurable
Direct attached	0	No
Static-route	5	Yes
OSPF Internal routes	10	Yes
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes

Table 5: Default Route Preferences

Route Type	Preference	Configurable
OSPF External	150	Yes
IS-IS level 1 external	160	Yes
IS-IS level 2 external	165	Yes
BGP	170	Yes

Default 5
Values 1 — 255

enable — Static routes can be administratively enabled or disabled. Use the **enable** parameter to re-enable a disabled static route. In order to enable a static route, it must be uniquely identified by the IP address, mask, and any other parameter that is required to identify the exact static route.

The administrative state is maintained in the configuration file.

Default enable

disable — Static routes can be administratively enabled or disabled. Use the **disable** parameter to disable a static route while maintaining the static route in the configuration. In order to enable a static route, it must be uniquely identified by the IP address, mask, and any other parameter that is required to identify the exact static route.

The administrative state is maintained in the configuration file.

Default enable

bfd-enable — It associates the state of the static route to a BFD session between the local system and the configured nexthop. This keyword cannot be configured if the nexthop is **indirect** or **blackhole** keywords are specified.

mcast-family — Enables submission of the IPv4 or IPv6 static route into IPv4 or IPv6 multicast RTM.

Values mcast-ipv4, mcast-ipv6

rsvp-te — This parameter allows the static route to be resolved via an RSVP-TE based LSP. The static route nexthop will be resolved via the best RSVP-TE based LSP to the associated indirect next hop. By default, if an RSVP-TE LSP is not available, the IGP route table will be used to resolve the associated nexthop. If the keyword “disallow-igp” is configured, the associated static route will not be resolved through the IPv4 route table if an RSVP-TE based LSP is not available.

cpe-check *target-ip-address* — This parameter specifies the IP address of the target CPE device. ICMP pings will be sent to this target IP address. This parameter must be configured to enable the CPE connectivity feature for the associated static route. The target-ip-address cannot be in the same subnet as the static route subnet itself to avoid possible circular references. This option is mutually exclusive with BFD support on a given static route.

Default no cpe-check enabled

interval *seconds* — This optional parameter specifies the interval between ICMP pings to the target IP address.

Values 1 —255 seconds

Default 1 seconds

drop-count *count* — This optional parameter specifies the number of consecutive ping-replies that must be missed to declare the CPE down and to de-active the associated static route.

Values 1 —255

Default 3

log — This optional parameter enables the ability to log transitions between active and in-active based on the CPE connectivity check. Events should be sent to the system log, syslog and SNMP traps.

Router L2TP Commands

l2tp

Syntax	l2tp
Context	config>router
Description	This command enables the context to configure L2TP parameters. L2TP extends the PPP model by allowing Layer 2 and PPP endpoints to reside on different devices interconnected by a packet-switched network.

calling-number-format

Syntax	calling-number-format <i>ascii-spec</i> no calling-number-format
Context	config>router>l2tp
Description	This command specifies the L2TP calling number AVP.
Parameters	<i>ascii-spec</i> — Specified as either char-specification or <i>ascii-spec</i> . <i>char-specification</i> — Ascii-char char-origin <i>char-origin</i> — % origin <i>origin</i> — S r s
Values	S : system name, the value of TIMETRA-CHASSIS_MIB::tmnxChassisName r : Agent Remote ID s : SAP ID, formatted as a character string

exclude-avps

Syntax	exclude-avps calling-number no exclude-avps
Context	config>router>l2tp
Description	This command configures the L2TP AVPs to exclude.

peer-address-change-policy

Syntax	peer-address-change-policy { accept ignore reject }
Context	config>router>l2tp

Configuration Commands

Description This command specifies what to do in case the system receives a L2TP response from another address than the one the request was sent to.

Parameters **accept** — Specifies that this system accepts any source IP address change of received L2TP control messages related to a locally originated tunnel in the state waitReply and rejects any peer address change for other tunnels; in case the new peer IP address is accepted, it is learned and used as destination address in subsequent L2TP messages.

ignore — Specifies that this system ignores any source IP address change of received L2TP control messages, does not learn any new peer IP address and does not change the destination address in subsequent L2TP messages.

reject — Specifies that this system rejects any source IP address change of received L2TP control messages and drops those messages.

receive-window-size

Syntax **receive-window-size** [4..1024]
no receive-window-size

Context config>router>l2tp

Description This command configures the L2TP receive window size.

session-limit

Syntax **session-limit** *session-limit*
no session-limit

Context config>router>l2tp

Description This command configures the L2TP session limit of this router.

Parameters *session-limit* — Specifies the session limit.

Values 1..131071

group

Syntax **group** *tunnel-group-name* [create]
no group *tunnel-group-name*

Context config>router>l2tp

Description This command configures an L2TP tunnel group.

Parameters *tunnel-group-name* — Specifies a name string to identify a L2TP group up to 63 characters in length.

create — This keyword is mandatory when creating a tunnel group name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

session-limit

Syntax	session-limit <i>session-limit</i> no session-limit
Context	config>router>l2tp
Description	This command configures the L2TP session limit for the router. L2TP is connection-oriented. The L2TP Network Server (LNS) and LAC maintain state for each call that is initiated or answered by an LAC. An L2TP session is created between the LAC and LNS when an end-to-end PPP connection is established between a remote system and the LNS. Datagrams related to the PPP connection are sent over the tunnel between the LAC and LNS. There is a one to one relationship between established L2TP sessions and their associated calls.
Parameters	<i>session-limit</i> — Specifies the number of sessions allowed.
	Default no session-limit
	Values 1 — 131071

avp-hiding

Syntax	avp-hiding <i>sensitive always</i> no avp-hiding
Context	config>router>l2tp>group
Description	This command configures Attribute Value Pair (AVP) hiding. This capability can be used to avoid the passing of sensitive data, such as user passwords, as cleartext in an AVP. The no form of the command returns the value to never allow AVP hiding.
Parameters	<i>avp-hiding</i> — Specifies the method to be used for the authentication of the tunnels in this L2TP group.
	Default no avp-hiding
	Values sensitive — AVP hiding is used only for sensitive information (such as username/password). always — AVP hiding is always used.

challenge

Syntax	challenge <i>always</i> no challenge
Context	config>router>l2tp>group

Configuration Commands

Description	This command configures the use of challenge-response authentication. The no form of the command reverts to the default never value.
Parameters	<i>always</i> — Specifies when challenge-response is to be used for the authentication of the tunnels in this L2TP group. Default no challenge Values always

destruct-timeout

Syntax	destruct-timeout <i>destruct-timeout</i> no destruct-timeout
Context	config>router>l2tp>group config>router>l2tp>group>tunnel
Description	This command configures the period of time that the data of a disconnected tunnel will persist before being removed. The no form of the command removes the value from the configuration.
Default	no destruct-timeout
Parameters	<i>destruct-timeout</i> — [Specifies the automatic removal of dynamic L2TP sessions, in seconds, that are no longer active. Default no destruct-timeout Values 60 — 86400

hello-interval

Syntax	hello-interval <i>hello-interval</i> no hello-interval
Context	config>router>l2tp>group
Description	This command configures the time interval between two consecutive tunnel Hello messages. The Hello message is an L2TP control message sent by either peer of a LAC-LNS control connection. This control message is used as a keepalive for the tunnel. The no form of the command removes the interval from the configuration.
Default	60
Parameters	<i>hello-interval</i> — Specifies the time interval, in seconds, between two consecutive tunnel Hello messages. Default no hello-interval Values 60 — 3600

idle-timeout

Syntax	idle-timeout <i>idle-timeout</i> no idle-timeout
Context	config>router>l2tp>group
Description	This command configures the period of time that an established tunnel with no active sessions will persist before being disconnected. Enter the no form of the command to maintain a persistent tunnel. The no form of the command removes the idle timeout from the configuration.
Default	no idle-timeout
Parameters	<i>idle-timeout</i> — Specifies the idle timeout value, in seconds until the group is removed. Default no idle-timeout Values 0 — 3600

lns-group

Syntax	lns-group <i>lns-group-id</i> no lns-group
Context	config>router>l2tp>group
Description	This command configures the ISA LNS group.
Parameters	<i>lns-group-id</i> — Specifies the LNS group ID. Values 1 — 4

load-balance-method

Syntax	load-balance-method { <i>per-session</i> <i>per-tunnel</i> } no load-balance-method
Context	config>router>l2tp>group
Description	This command describes how new sessions are assigned to an L2TP ISA MDA.
Parameters	per-session — Specifies that the lowest granularity for load-balancing is a session; each session can be assigned to a different ISA MDA. per-tunnel — Specifies that the lowest granularity for load-balancing is a tunnel; all sessions associated with the same tunnel are assigned to the same ISA MDA; this may be useful or required in certain cases, for example: <ul style="list-style-type: none"> • MLPPP with multiple links per bundle;

- HPOl intermediate destination arbiters where the intermediate destination is an L2TP tunnel.

local-address

Syntax	local-address <i>ip-address</i> no local-address
Context	config>router>l2tp>group>tunnel
Description	This command configures the local address.
Parameters	<i>ip-address</i> — Specifies the IP address used during L2TP authentication.

local-name

Syntax	local-name <i>host-name</i> no local-name
Context	config>router>l2tp>group config>router>l2tp>group>tunnel
Description	This command creates the local host name used by this system for the tunnels in this L2TP group during the authentication phase of tunnel establishment. It can be used to distinguish tunnels. The no form of the command removes the name from the configuration.
Default	local-name
Parameters	<i>host-name</i> — Specifies the host name, up to 64 characters in length, that the router will use to identify itself during L2TP authentication. Default no local-name

max-retries-estab

Syntax	max-retries-estab <i>max-retries</i> no max-retries-estab
Context	config>router>l2tp>group config>router>l2tp>group>tunnel
Description	This command configures the number of retries allowed for this L2TP tunnel while it is established, before its control connection goes down. The no form of the command removes the value from the configuration.
Default	no max-retries-estab
Parameters	<i>max-retries</i> — Specifies the maximum number of retries for an established tunnel.

Default no max-retries-estab

Values 2 — 7

max-retries-not-estab

Syntax **max-retries-not-estab** *max-retries*
no max-retries-not-estab

Context config>router>l2tp>group
config>router>l2tp>group>tunnel

Description This command configures the number of retries allowed for this L2TP tunnel while it is not established, before its control connection goes down.

The **no** form of the command removes the value from the configuration.

Default no max-retries-not-estab

Parameters *max-retries* — Specifies the maximum number of retries for non-established tunnels.

Default no max-retries-not-estab

Values 2 — 7

password

Syntax **password** *password* [**hash** | **hash2**]
no password

Context config>router>l2tp>group
config>router>l2tp>group>tunnel

Description This command configures the password between L2TP LAC and LNS

The no form of the command removes the password.

Default no password

Parameters *password* — Configures the password used for challenge/response calculation and AVP hiding. The maximum length can be up to 20 characters if unhashed, 32 characters if hashed, 54 characters if the hash2 keyword is specified.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted

hash2 — Specifies the key is entered in a more complex encrypted form. If the **hash2** parameter is not used, the less encrypted **hash** form is assumed.

Default no password

ppp

Syntax	ppp
Context	config>router>l2tp>group
Description	This command configures PPP for the L2TP tunnel group.

authentication

Syntax	authentication {chap pap pref-chap}
Context	config>router>l2tp>group>ppp
Description	This command configures the PPP authentication protocol to negotiate.

authentication-policy

Syntax	authentication-policy <i>auth-policy-name</i> no authentication-policy
Context	config>router>l2tp>group>ppp
Description	This command configures the authentication policy.
Parameters	<i>auth-policy-name</i> — Specifies the authentication policy name. Values 32 chars max

default-group-interface

Syntax	default-group-interface <i>ip-int-name</i> service-id <i>service-id</i> no default-group-interface
Context	config>router>l2tp>group>ppp
Description	This command configures the default group interface.
Parameters	<i>ip-int-name</i> — Specifies the interface name. Values 32 chars max <i>service-id</i> — Specifies the service ID. Values 1..2147483648 <i>svc-name</i> — Specifies the service name (instead of service ID). Values 64 chars max

keepalive

Syntax	keepalive <i>seconds</i> [hold-up-multiplier <i>multiplier</i>] no keepalive
Context	config>router>l2tp>group>ppp
Description	This command configures the PPP keepalive interval and multiplier.
Parameters	<i>seconds</i> — Specifies in seconds the interval. Values 10..300 <i>multiplier</i> — Specifies the multiplier. Values 1..5

mtu

Syntax	mtu <i>mtu-bytes</i> no mtu
Context	config>router>l2tp>group>ppp
Description	This command configures the maximum PPP MTU size.
Parameters	<i>mtu-bytes</i> — Specifies, in bytes, the maximum PPP MTU size. Values 512..9212

proxy-authentication

Syntax	[no] proxy-authentication
Context	config>router>l2tp>group>ppp
Description	This command configures the use of the authentication AVPs received from the LAC.

proxy-lcp

Syntax	[no] proxy-lcp
Context	config>router>l2tp>group>ppp
Description	This command configures the use of the proxy LCP AVPs received from the LAC.

user-db

Syntax	user-db <i>local-user-db-name</i>
---------------	--

Configuration Commands

no user-db

Context	config>router>l2tp>group>ppp
Description	This command configures the local user database to use for PPP PAP/CHAP authentication.
Parameters	<i>local-user-db-name</i> — Specifies the local user database name.
Values	32 chars max

session-assign-method

Syntax	session-assign-method <i>weighted</i> no session-assign-method
Context	config>router>l2tp>group
Description	This command specifies how new sessions are assigned to one of the set of suitable tunnels that are available or could be made available.
Default	no session-assign-method
Parameters	<i>weighted</i> — specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.
Default	no session-assign-method. All new sessions are placed by preference in existing tunnels.
Values	<i>weighted</i> — Enables weighted preference to tunnels in the group.

session-limit

Syntax	session-limit <i>session-limit</i> no session-limit
Context	config>router>l2tp>group config>router>l2tp>group>tunnel
Description	This command configures the session limit. The value controls how many L2TP session will be allowed within a given context (system, group, tunnel). The no form of the command removes the value from the configuration.
Default	no session-limit
Parameters	<i>session-limit</i> — Specifies the allowed number of sessions within the given context.
Values	1 — 131071

Router L2TP Tunnel Commands

tunnel

Syntax	tunnel <i>tunnel-name</i> [create] no tunnel <i>tunnel-name</i>
Context	config>router>l2tp>group
Description	This command configures an L2TP tunnel. A tunnel exists between a LAC-LNS pair and consists of a Control Connection and zero or more L2TP sessions. The tunnel carries encapsulated PPP datagrams and control messages between the LAC and the L2TP Network Server (LNS).
Parameters	<i>tunnel-name</i> — Specifies a valid string to identify a L2TP up to 32 characters in length. create — mandatory while creating a new tunnel

auto-establish

Syntax	[no] auto-establish
Context	config>router>l2tp>group>tunnel
Description	This command specifies if this tunnel is to be automatically set up by the system. no auto-establish

avp-hiding

Syntax	avp-hiding { never sensitive always } no avp-hiding
Context	config>router>l2tp>group>tunnel
Description	This command configures Attribute Value Pair (AVP) hiding. This capability can be used to avoid the passing of sensitive data, such as user passwords, as cleartext in an AVP. Note that it is recommended that sensitive information not be sent in clear text. The no form of the command removes the parameter of the configuration and indicates that the value on group level will be taken.
Default	no avp-hiding
Parameters	<i>avp-hiding</i> — Specifies the method to be used for the authentication of the tunnel. Values never — AVP hiding is not used. sensitive — AVP hiding is used only for sensitive information (such as username/password). always — AVP hiding is always used.

challenge

Syntax	challenge <i>challenge-mode</i> no challenge
Context	config>router>l2tp>group>tunnel
Description	This command configures the use of challenge-response authentication. The no form of the command removes the parameter from the configuration and indicates that the value on group level will be taken.
Default	no challenge
Parameters	<i>challenge-mode</i> — Specifies when challenge-response is to be used for the authentication of the tunnel. Values always — Always allows the use of challenge-response authentication. never — Never allows the use of challenge-response authentication.

hello-interval

Syntax	hello-interval <i>hello-interval</i> hello-interval infinite no hello-interval
Context	config>router>l2tp>group>tunnel
Description	This command configures the number of seconds between sending Hellos for a L2TP tunnel. The no form removes the parameter from the configuration and indicates that the value on group level will be taken.
Parameters	<i>hello-interval</i> — Specifies the time interval, in seconds, between two consecutive tunnel Hello messages. Values 60 — 3600 infinite — Specifies that no hello messages are sent.

idle-timeout

Syntax	idle-timeout <i>idle-timeout</i> idle-timeout infinite no idle-timeout
Context	config>router>l2tp>group>tunnel
Description	This command configures the idle timeout to wait before being disconnect. The no form indicates that the parameter will be removed from the configuration and that the value specified on group level will be taken.

Parameters *idle-timeout* — Specifies the idle timeout, in seconds.
Values 0 — 3600
infinite — Specifies that the tunnel will not be closed when idle.

peer

Syntax **peer** *ip-address*
no peer

Context config>router>l2tp>group>tunnel

Description This command configures the peer address.
The **no** form of the command removes the IP address from the tunnel configuration.

Default no peer

Parameters *ip-address* — Sets the LNS IP address for the tunnel.

preference

Syntax **preference** *preference*
no preference

Context config>router>l2tp>group>tunnel

Description This command configures a preference number that indicates the relative preference assigned to a tunnel when using a weighted session assignment.
The **no** form of the command removes the preference value from the tunnel configuration.

Default no preference

Parameters *preference* — Specifies the tunnel preference number with its group. The value 0 corresponds to the highest preference.
Values 0 — 16777215

remote-name

Syntax **remote-name** *host-name*
no remote-name

Context config>router>l2tp>group>tunnel

Description This command configures a string to be compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

Parameters *host-name* — Specifies a remote host name for the tunnel up to 64 characters in length.

Router Interface Commands

interface

Syntax	[no] interface <i>ip-int-name</i>
Context	config>router
Description	<p>This command creates a logical IP routing interface. Once created, attributes like IP address, port, or system can be associated with the IP interface.</p> <p>Interface names are case-sensitive and must be unique within the group of IP interfaces defined for config router interface and config service ies interface. Interface names must not be in the dotted decimal notation of an IP address.; for example, the name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it is confusing.</p> <p>When a new name is entered, a new logical router interface is created. When an existing interface name is entered, the user enters the router interface context for editing and configuration.</p> <p>Although not a keyword, the ip-int-name “system” is associated with the network entity (such as a specific 7450 ESS), not a specific interface. The system interface is also referred to as the loopback address.</p> <p>The no form of the command removes the IP interface and all the associated configurations. The interface must be administratively shut down before issuing the no interface command.</p>
Default	No interfaces or names are defined within the system.
Parameters	<p><i>ip-int-name</i> — The name of the IP interface. Interface names must be unique within the group of defined IP interfaces for config router interface and config service ies interface commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.</p> <p>Values 1 — 32 alphanumeric characters.</p> <p>If the <i>ip-int-name</i> already exists, the context is changed to maintain that IP interface. If <i>ip-int-name</i> already exists within another service ID or is an IP interface defined within the config router commands, an error will occur and the context will not be changed to that IP interface. If <i>ip-int-name</i> does not exist, the interface is created and the context is changed to that interface for further command processing.</p>

address

Syntax	address { <i>ip-address/mask</i> <i>ip-address netmask</i> } [broadcast { all-ones / host-ones }] no address
Context	config>router>interface
Description	<p>This command assigns an IP address, IP subnet, and broadcast address format to an IP interface. Only one IP address can be associated with an IP interface.</p> <p>An IP address must be assigned to each IP interface. An IP address and a mask combine to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interfaces in the same routing context within the router.</p> <p>The local subnet that the address command defines must not be part of the services address space within the routing context by use of the config router service-prefix command. Once a portion of the address space is allocated as a service prefix, that portion is not available to IP interfaces for network core connectivity.</p> <p>The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. Show commands display CIDR notation and are stored in configuration files.</p> <p>By default, no IP address or subnet association exists on an IP interface until it is explicitly created.</p> <p>The no form of the command removes the IP address assignment from the IP interface. Interface-specific configurations for IGP protocols like OSPF are also removed. The no form of this command can only be performed when the IP interface is administratively shut down. Shutting down the IP interface will operationally stop any protocol interfaces or MPLS LSPs that explicitly reference that IP address. When a new IP address is defined, the IP interface can be administratively enabled (no shutdown), which reinitializes the protocol interfaces and MPLS LSPs associated with that IP interface.</p> <p>If a new address is entered while another address is still active, the new address will be rejected.</p>
Default	No IP address is assigned to the IP interface.
Parameters	<p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-addr</i> portion of the address command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <p>Values 1.0.0.0 — 223.255.255.255</p> <p><i>/</i> — The forward slash is a parameter delimiter that separates the <i>ip-addr</i> portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the <i>ip-addr</i>, the “/” and the <i>mask-length</i> parameter. If a forward slash does not immediately follow the <i>ip-addr</i>, a dotted decimal mask must follow the prefix.</p> <p><i>mask-length</i> — The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the <i>ip-addr</i> from the <i>mask-length</i> parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1— 32. Note that a mask length of 32 is reserved for system IP addresses.</p> <p>Values 1 — 32</p>

mask — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-addr* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical ‘AND’ function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

Values 128.0.0.0 — 255.255.255.255

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

broadcast {all-ones | host-ones} — The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones**, which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-addr* and the *mask-length* or *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

Default host-ones

Values all-ones, host-ones

allow-directed-broadcasts

Syntax [no] **allow-directed-broadcasts**

Context config>router>interface

Description This command enables the forwarding of directed broadcasts out of the IP interface.

A directed broadcast is a packet received on a local router interface destined for the subnet broadcast address of another IP interface. The **allow-directed-broadcasts** command on an IP interface enables

or disables the transmission of packets destined to the subnet broadcast address of the egress IP interface.

When enabled, a frame destined to the local subnet on this IP interface is sent as a subnet broadcast out this interface. **NOTE:** Allowing directed broadcasts is a well-known mechanism used for denial-of-service attacks.

By default, directed broadcasts are not allowed and are discarded at this egress IP interface.

The **no** form of the command disables directed broadcasts forwarding out of the IP interface.

Default no allow-directed-broadcasts — Directed broadcasts are dropped.

arp-timeout

Syntax **arp-timeout** *seconds*
no arp-timeout

Context config>router>interface

Description This command configures the minimum time, in seconds, an ARP entry learned on the IP interface is stored in the ARP table. ARP entries are automatically refreshed when an ARP request or gratuitous ARP is seen from an IP host. Otherwise, the ARP entry is aged from the ARP table. If the **arp-timeout** value is set to 0 seconds, ARP aging is disabled.

The **no** form of the command reverts to the default value.

Default 14400 seconds (4 hours)

Parameters *seconds* — The minimum number of seconds a learned ARP entry is stored in the ARP table, expressed as a decimal integer. A value of 0 specifies that the timer is inoperative and learned ARP entries will not be aged.

Values 0 — 65535

bfd

Syntax **bfd** *transmit-interval* [**receive** *receive-interval*] [**multiplier** *multiplier*] [**echo-receive** *echo-interval*] [**type** *cpm-np*]
no bfd

Context config>router>interface
config>router>interface>ipv6

Description This command specifies the bi-directional forwarding detection (BFD) parameters for the associated IP interface. If no parameters are defined the default values are used.

The multiplier specifies the number of consecutive BFD messages that must be missed from the peer before the BFD session state is changed to down and the upper level protocols (OSPF, IS-IS, BGP or PIM) is notified of the fault.

The **no** form of the command removes BFD from the router interface regardless of the IGP/RSVP.

Important notes: On the 7750-SR the *transmit-interval* and **receive** *receive-interval* values can only

be modified to a value less than 100 ms when:

1. The **type cpm-np option** is explicitly configured.
2. The service is shut down (**shutdown**)
3. The interval is specified 10 — 100000.
4. The service is re-enabled (**no shutdown**)

To remove the **type cpm-np** option, re-issue the **bfd** command without specifying the **type** parameter.

Default	no bfd
Parameters	<p><i>transmit-interval</i> — Sets the transmit interval, in milliseconds, for the BFD session.</p> <p>Values 10 — 100000 10 — 100000 (see Important Notes above)</p> <p>Default 100</p> <p><i>receive receive-interval</i> — Sets the receive interval, in milliseconds, for the BFD session.</p> <p>Values 10 — 100000 10 — 100000 (see Important Notes above)</p> <p>Default 100</p> <p><i>multiplier multiplier</i> — Set the multiplier for the BFD session.</p> <p>Values 3— 20</p> <p>Default 3</p> <p><i>echo-receive echo-interval</i> — Sets the minimum echo receive interval, in milliseconds, for the session.</p> <p>Values 100 — 100000</p> <p>Default 100</p> <p>type cpm-np — Selects the CPM network processor as the local termination point for the BFD session. See Important Notes, above.</p>

cflowd

Syntax	cflowd {acl interface} [direction] no cflowd
Context	config>router>interface
Description	<p>This command enables cflowd to collect traffic flow samples through a router for analysis.</p> <p>cflowd is used for network planning and traffic engineering, capacity planning, security, application and user profiling, performance monitoring, usage-based billing, and SLA measurement. When cflowd is enabled at the interface level, all packets forwarded by the interface are subjected to analysis according to the cflowd configuration.</p>

If cflowd is enabled without either egress-only or both specified or with the ingress-only keyword specified, then only ingress sampling will be enabled on the associated IP interface.

Default	no cflowd
Parameters	<p>acl — Specifies the policy associated with a filter.</p> <p>interface — Specifies the policy associated with an IP interface.</p> <p><i>direction</i> — Specifies the direction to collect traffic flow samples.</p> <p>Values ingress-only — Enables ingress sampling only on the associated interface. egress-only — Enables egress sampling only on the associated interface. both — Enables both ingress and egress cflowd sampling.</p> <p>Default ingress-only</p>

cpu-protection

Syntax	cpu-protection <i>policy-id</i> no cpu-protection
Context	config>router>interface
Description	This command assigns an existing CPU protection policy for the interface. The CPU protection policies are configured in the config>sys>security>cpu-protection>policy <i>cpu-protection-policy-id</i> context.
Parameters	<p><i>policy-id</i> — Specifies an existing CPU protection policy.</p> <p>Values 1 — 255</p>

delayed-enable

Syntax	delayed-enable <i>seconds</i> no delayed-enable
Context	config>router>if
Description	This command creates a delay to make the interface operational by the specified number of <i>seconds</i> . The value is used whenever the system attempts to bring the interface operationally up.
Parameters	<p><i>seconds</i> — Specifies a delay, in seconds, to make the interface operational.</p> <p>Values 1 — 1200</p>

local-proxy-arp

Syntax	[no] local-proxy-arp
Context	config>router>interface

Configuration Commands

Description This command enables local proxy ARP on the interface.

Default no local-proxy-arp

ldp-shortcut

Syntax [no] ldp-shortcut

Context config>router

Description This command enables the resolution of IGP routes using LDP LSP across all network interfaces participating in the IS-IS and OSPF routing protocol in the system.

When LDP shortcut is enabled, LDP populates the routing table with next-hop entries corresponding to all prefixes for which it activated an LDP FEC. For a given prefix, two route entries are populated in the system routing table. One route corresponds to the LDP shortcut next-hop and has an owner of LDP. The other route is the regular IP next-hop. The LDP shortcut next-hop always has preference over the regular IP next-hop for forwarding user packets and specified control packets over a given outgoing interface to the route next-hop.

All user and specified control packets for which the longest prefix match in RTM yields the FEC prefix will be forwarded over the LDP LSP.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet by the ingress IOM will result in the packet being sent labeled with the label stack corresponding to the NHLFE of the LDP LSP when the preferred RTM entry corresponds to an LDP shortcut.

If the preferred RTM entry corresponds to an IP next-hop, the IPv4 packet is forwarded unlabelled.

When ECMP is enabled and multiple equal-cost next-hops exit for the IGP route, the ingress IOM will spray the packets for this route based on hashing routine currently supported for IPv4 packets. When the preferred RTM entry corresponds to an LDP shortcut route, spraying will be performed across the multiple next-hops for the LDP FEC. The FEC next-hops can either be direct link LDP neighbors or T-LDP neighbors reachable over RSVP LSPs in the case of LDP-over-RSVP but not both.

When the preferred RTM entry corresponds to a regular IP route, spraying will be performed across regular IP next-hops for the prefix..

The no form of this command disables the resolution of IGP routes using LDP shortcuts.

Default no ldp-shortcut

ldp-sync-timer

Syntax ldp-sync-timer *seconds*
no ldp-sync-timer

Context config>router>interface

Description This command enables synchronization of IGP and LDP. When a link is restored after a failure, IGP sets the link cost to infinity and advertises it. The actual value advertised in OSPF is 0xFFFF (65535). The actual value advertised in IS-IS regular metric is 0x3F (63) and in IS-IS wide-metric is 0xFFFFFE (16777214). This feature is not supported on RIP interfaces.

Note that if an interface belongs to both IS-IS and OSPF, a physical failure will cause both IGPs to advertise infinite metric and to follow the IGP-LDP synchronization procedures. If only one IGP bounced on this interface or on the system, then only the affected IGP advertises the infinite metric and follow the IGP-LDP synchronization procedures.

Next LDP hello adjacency is brought up with the neighbour. The LDP synchronization timer is started by IGP from the time the LDP session to the neighbor is UP over the interface. This is to allow time for the label-FEC bindings to be exchanged.

When the LDP synchronization timer expires, the link cost is restored and is re-advertised. IGP will announce a new best next-hop and LDP will use it if the label binding for the neighbor's FEC is available.

If the user changes the cost of an interface, the new value is advertised at the next flooding of link attributes by IGP. However, if the LDP synchronization timer is still running, the new cost value will only be advertised after the timer expired. Also, the new cost value will be advertised after the user executes any of the following commands if the currently advertised cost is different:

- tools>perform>router>isis>ldp-sync-exit
- tools>perform>router>ospf>ldp-sync-exit
- config>router>interface>no ldp-sync-timer
- config>router>ospf>disable-ldp-sync
- router>isis>disable-ldp-sync

If the user changes the value of the LDP synchronization timer parameter, the new value will take effect at the next synchronization event. In other words, if the timer is still running, it will continue using the previous value.

If parallel links exist to the same neighbor, then the bindings and services should remain UP as long as there is one interface that is UP. However, the user configured LDP synchronization timer still applies on the failed then restored interface. In this case, the 7750 will only consider this interface for forwarding after IGP re-advertised its actual cost value.

Note that the LDP Sync Timer State is not always synched across to the standby CPM, so after an activity switch the timer state might not be same as it was on the previous active CPM.

The **no** form of this command disables IGP/LDP synchronization and deletes the configuration

Default no ldp-sync-timer

Parameters *seconds* — Specifies the time interval for the IGP-LDP synchronization timer in seconds.

Values 1 – 1800

loopback

Syntax [**no**] **loopback**

Context config>router>interface

Configuration Commands

Description	This command configures the interface as a loopback interface.
Default	Not enabled

lsr-load-balancing

Syntax	lsr-load-balancing <i>hashing-algorithm</i> no lsr-load-balancing
Context	config>router>if
Description	This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per interface setting.
Default	no lsr-load-balancing
Parameters	lbl-only — Only the label is used in the hashing algorithm. lbl-ip — The IP header is included in the hashing algorithm. ip-only — the IP header is used exclusively in the hashing algorithm

mac

Syntax	mac <i>ieee-mac-addr</i> no mac
Context	config>router>interface
Description	This command assigns a specific MAC address to an IP interface. Only one MAC address can be assigned to an IP interface. When multiple mac commands are entered, the last command overwrites the previous command. The no form of the command returns the MAC address of the IP interface to the default value.
Default	IP interface has a system-assigned MAC address.
Parameters	<i>ieee-mac-addr</i> — Specifies the 48-bit MAC address for the IP interface in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i> , where <i>aa</i> , <i>bb</i> , <i>cc</i> , <i>dd</i> , <i>ee</i> and <i>ff</i> are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

multihoming

Syntax	[no] multihoming primary secondary [hold-time holdover-time]
Context	config>router>interface
Description	This command sets the associated loopback interface to be an anycast address used in multi-homing resiliency, as either the primary or a secondary (a primary address on the alternate router). The

optional hold-time parameter is only applicable for the secondary context and specifies how long label information learned about the secondary anycast address should be kept after that peer is declared down. This timer should be set to a value large enough for the remainder of the network to detect the failure and complete the reconvergence process.

The `no` form of the command disables this setting.

Default no multihoming

Parameters *holdover-time* — Specifies the number of seconds the router should hold label information learned from the alternate router in its secondary table. This is to allow the reset of the network to reconverge after a router failure before the anycase based label assignments are flushed from the forwarding plane.

Values 0 - 65535

Default 90

network-domain

Syntax `network-domain network-domain-name`
`no network-domain`

Context config>router>interface

Description This command assigns a given interface to a given network-domain. The network-domain is then taken into account during sap-ingress queue allocation for VPLS SAP.

The network-domain association can only be done in a base-routing context. Associating a network domain with an loop-back or system interface will be rejected. Associating a network-domain with an interface that has no physical port specified will be accepted, but will have no effect as long as a corresponding port, or LAG, is defined..

Single interfaces can be associated with multiple network-domains.

Default per default “default” network domain is assigned

ntp-broadcast

Syntax `[no] ntp-broadcast`

Context config>router>interface

Description This command enables SNTP broadcasts received on the IP interface. This parameter is only valid when the SNTP **broadcast-client** global parameter is configured.

The `no` form of the command disables SNTP broadcast received on the IP interface.

Default no ntp-broadcast

port

Syntax	port <i>port-name</i> no port																																
Context	config>router>interface																																
Description	<p>This command creates an association with a logical IP interface and a physical port. An interface can also be associated with the system (loopback address).</p> <p>The command returns an error if the interface is already associated with another port or the system. In this case, the association must be deleted before the command is re-attempted. The <i>port-id</i> can be in one of the following forms:</p> <ul style="list-style-type: none"> • Ethernet interfaces <p>If the card in the slot has MDAs, <i>port-id</i> is in the slot_number/MDA_number/port_number format; for example, 1/1/3 specifies port 3 of the MDA installed in MDA slot 1 on the card installed in chassis slot 1.</p> • SONET/SDH interfaces <p>When the <i>port-id</i> represents a POS interface, the <i>port-id</i> must include the <i>channel-id</i>. The POS interface must be configured as a network port.</p> <p>The no form of the command deletes the association with the port. The no form of this command can only be performed when the interface is administratively down.</p>																																
Default	No port is associated with the IP interface.																																
Parameters	<p><i>port-name</i> — The physical port identifier to associate with the IP interface.</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="vertical-align: top;">Values</td> <td><i>port-name</i></td> <td><i>port-id[:encap-val]</i></td> <td></td> </tr> <tr> <td></td> <td></td> <td>encap-val</td> <td>0 for null 0..4094 for dot1q</td> </tr> <tr> <td></td> <td><i>port-id</i></td> <td><i>slot/mda/port[.channel]</i></td> <td></td> </tr> <tr> <td></td> <td></td> <td><i>bundle-id</i></td> <td>- <i>bundle-type-slot/mda.bundle-num</i> bundle keyword type ima, fr, ppp bundle-num 1..336</td> </tr> <tr> <td></td> <td></td> <td><i>bpgrp-id</i></td> <td><i>bpgrp-type-bpgrp-num</i> bpgrp keyword type ima, ppp bpgrp-num 1..2000</td> </tr> <tr> <td></td> <td></td> <td><i>aps-id</i></td> <td><i>aps-group-id[.channel]</i> aps keyword group-id 1..64</td> </tr> <tr> <td></td> <td></td> <td><i>ccag-id</i></td> <td><i>ccag-id.path-id[cc-type]</i> ccag keyword id 1..8 path-id a, b cc-type .sap-net, .net-sap</td> </tr> <tr> <td></td> <td></td> <td><i>lag-id</i></td> <td><i>lag-id</i></td> </tr> </table>	Values	<i>port-name</i>	<i>port-id[:encap-val]</i>				encap-val	0 for null 0..4094 for dot1q		<i>port-id</i>	<i>slot/mda/port[.channel]</i>				<i>bundle-id</i>	- <i>bundle-type-slot/mda.bundle-num</i> bundle keyword type ima, fr, ppp bundle-num 1..336			<i>bpgrp-id</i>	<i>bpgrp-type-bpgrp-num</i> bpgrp keyword type ima, ppp bpgrp-num 1..2000			<i>aps-id</i>	<i>aps-group-id[.channel]</i> aps keyword group-id 1..64			<i>ccag-id</i>	<i>ccag-id.path-id[cc-type]</i> ccag keyword id 1..8 path-id a, b cc-type .sap-net, .net-sap			<i>lag-id</i>	<i>lag-id</i>
Values	<i>port-name</i>	<i>port-id[:encap-val]</i>																															
		encap-val	0 for null 0..4094 for dot1q																														
	<i>port-id</i>	<i>slot/mda/port[.channel]</i>																															
		<i>bundle-id</i>	- <i>bundle-type-slot/mda.bundle-num</i> bundle keyword type ima, fr, ppp bundle-num 1..336																														
		<i>bpgrp-id</i>	<i>bpgrp-type-bpgrp-num</i> bpgrp keyword type ima, ppp bpgrp-num 1..2000																														
		<i>aps-id</i>	<i>aps-group-id[.channel]</i> aps keyword group-id 1..64																														
		<i>ccag-id</i>	<i>ccag-id.path-id[cc-type]</i> ccag keyword id 1..8 path-id a, b cc-type .sap-net, .net-sap																														
		<i>lag-id</i>	<i>lag-id</i>																														

lag	keyword
id	1..200

proxy-arp-policy

Syntax	[no] proxy-arp-policy <i>policy-name</i> [<i>policy-name...</i> (up to 5 max)]
Context	config>router>interface
Description	<p>This command enables and configure proxy ARP on the interface and specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a particular neighbor. The policy-name is configured in the config>router>policy-options context.</p> <p>Use proxy ARP so the 7750 SR responds to ARP requests on behalf of another device. Static ARP is used when a 7750 SR needs to know about a device on an interface that cannot or does not respond to ARP requests. Thus, the 7750 SR OS configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address.</p>
Default	no proxy-arp-policy
Parameters	<i>policy-name</i> — The export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. The specified policy name(s) must already be defined.

qos-route-lookup

Syntax	qos-route-lookup [source destination] no qos-route-lookup
Context	config>router>interface config>router>interface>ipv6
Description	<p>This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.</p> <p>If the optional destination parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.</p> <p>If the optional source parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the</p>

incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. Subscriber management group interfaces also do not support the source QPPB option.

The **no** form of the command reverts to the default.

Default destination

Parameters **source** — Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

destination — Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

qos

Syntax **qos** *network-policy-id* [**queue-redirect-group** *queue-group-name*]
no qos

Context config>router>interface

Description This command associates a network Quality of Service (QoS) policy with an IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Packets are marked using QoS policies on edge devices. Invoking a QoS policy on a network port allows for the packets that match the policy criteria to be remarked.

The queue-redirect-group parameter creates an association between the IP interface and an egress port queue group. When the network QoS policy ID contains an egress forwarding plane that is directed to a queue group queue ID, the network QoS policy must be applied to the IP interface with a valid egress port queue group name. The queue group name must exist on the egress port associated with the IP interface and the group must contain a queue ID matching the queue ID for each redirected forwarding class in the QoS policy.

The IP interface may redirect its forwarding classes to a single port queue group. Forwarding classes that are not redirected to a queue within the group are mapped to the default forwarding class egress queue on the port.

If the QoS command is re-executed without the queue-redirect-group parameter specified, all forwarding classes will be remapped to the default port forwarding class egress queues.

The **no** form of the command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

Default	qos 1 — IP interface associated with network QoS policy 1.
Parameters	<i>network-policy-id</i> — An existing network policy ID to associate with the IP interface.
Values	1 — 65535
queue-redirect-group	<i>queue-group-name</i> — This optional parameter specifies that the <i>queue-group-name</i> will be used for all egress forwarding class redirections within the network QoS policy ID. The specified <i>queue-group-name</i> must exist as a port egress queue group on the port associated with the IP interface.

remote-proxy-arp

Context	config>router>interface
Description	This command enables remote proxy ARP on the interface.
Default	no remote-proxy-arp

secondary

Syntax	secondary {[<i>ip-address/mask</i> <i>ip-address netmask</i>]} [broadcast { all-ones host-ones }] [igp-inhibit] no secondary <i>ip-addr</i>
Context	config>router>interface
Description	Use this command to assign up to 16 secondary IP addresses to the interface. Each address can be configured in an IP address, IP subnet or broadcast address format. <i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the address command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Values 1.0.0.0 — 223.255.255.255 / — The forward slash is a parameter delimiter that separates the <i>ip-address</i> portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the <i>ip-addr</i> , the “/” and the <i>mask-length</i> parameter. If a forward slash does not immediately follow the <i>ip-addr</i> , a dotted decimal mask must follow the prefix. <i>mask-length</i> — The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the <i>ip-address</i> from the <i>mask-length</i> parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1— 32. Note that a mask length of 32 is reserved for system IP addresses. Values 1 — 32

mask — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-addr* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical ‘AND’ function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

Values 128.0.0.0 — 255.255.255.255

broadcast {all-ones | host-ones} — The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones**, which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-addr* and the *mask-length* or *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

igp-inhibit — The secondary IP address should not be recognized as a local interface by the running IGP.

static-arp

Syntax	static-arp <i>ip-addr ieee-mac-addr</i> no static-arp <i>ip-addr</i>
Context	config>router>interface
Description	This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface. If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address. The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a 7750 SR needs to know about a device on an interface that cannot or does not respond to ARP requests. Thus, the 7750 SR OS configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the 7750 SR responds to ARP requests on behalf of another device.

The **no** form of the command removes a static ARP entry.

Default	No static ARPs are defined.
Parameters	<p><i>ip-addr</i> — Specifies the IP address for the static ARP in IP address dotted decimal notation.</p> <p><i>ieee-mac-addr</i> — Specifies the 48-bit MAC address for the static ARP in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i>, where <i>aa</i>, <i>bb</i>, <i>cc</i>, <i>dd</i>, <i>ee</i> and <i>ff</i> are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p>

strip-label

Syntax	[no] strip-label
Context	config>router>interface
Description	<p>This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.</p> <p>If the packets do not have an IP header ediatly following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed.</p> <p>This command is only supported on:</p> <ul style="list-style-type: none"> • Optical ports • IOM3-XP cards • Null/Dot1q encaps • Network ports • IPv4 <p>The no form of the command removes the strip-label command.</p> <p>In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.</p>
Default	no strip-label

tos-marking-state

Syntax	tos-marking-state {trusted untrusted} no tos-marking-state
Context	config>router>interface
Description	<p>This command is used on a network IP interface to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP</p>

interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all IES and network IP interface as untrusted. When the ingress network IP interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing. The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of the command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default trusted

Parameters **trusted** — The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set

untrusted — Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

unnumbered

Syntax **unnumbered** [*ip-address* | *ip-int-name*]
no unnumbered

Context config>router>interface

Description This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of the command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Parameters *ip-addr* | *ip-int-name* — Optional. The IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a particular interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

Default no unnumbered

qos-route-lookup

Syntax **qos-route-lookup** [**source** | **destination**]
no qos-route-lookup

Context config>router>if
config>router>if>ipv6

Description This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. Subscriber management group interfaces also do not support the source QPPB option.

The **no** form of the command reverts to the default.

Default destination

Parameters **source** — Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

destination — Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

urpf-check

Syntax	[no] urpf-check
Context	config>router>if config>router>if>ipv6
Description	This command enables unicast RPF (uRPF) Check on this interface. The no form of the command disables unicast RPF (uRPF) Check on this interface.
Default	disabled

mode

Syntax	mode {strict loose} no mode
Context	config>router>if>urpf-check
Description	This command specifies the mode of unicast RPF check. The no form of the command reverts to the default (strict) mode.
Default	strict
Parameters	strict — When specified, uRPF checks whether incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix. loose — In loose mode, uRPF checks whether incoming packet has source address with a corresponding prefix in the routing table. However, the loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. This object is valid only when urpf-check is enabled.

mh-primary-interface

Syntax	[no] mh-primary-interface
Context	config>router
Description	This command creates a loopback interface for use in multihoming resiliency. Once active, this interface can be used to advertise reachability information to the rest of the network using the primary address, which is backed up by the secondary. The reachability for this address is advertised via IGP and LDP protocols to allow the resolution of BGP routes advertised with this address. The no form of the command disables this setting.
Default	no multihoming

address

Syntax	address { <i>ip-address/mask</i> <i>ip-address netmask</i> } no address
Context	config>router>mh-primary-interface config>router>mh-secondary-interface
Description	<p>This command assigns an IP address, IP subnet and broadcast address format to an IP interface. Only one IP address can be associated with an IP interface. An IP address must be assigned to each IP interface for the interface to be active. An IP address and a mask combine to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interface in the same routing context within the router.</p> <p>The local subnet that the address command defines must not be part of the services address space within the routing context by use of the config>router>service-prefix command. Once a portion of the address space is allocated as a service prefix, that portion is not available to IP interfaces for network core connectivity. The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. Show commands display CIDR notation and are stored in configuration files.</p> <p>By default, no IP address or subnet association exists on an IP interface until it is explicitly created.</p> <p>The no form of the command removes the IP address assignment from the IP interface. Interface specific configurations for IGP protocols like OSPF are also removed. The no form of this command can only be performed when the IP interface is administratively shut down. Shutting down the IP interface will operationally stop any protocol interfaces or MPLS LSPs that explicitly reference that IP address. When a new IP address is defined, the IP interface can be administratively enabled (no shutdown), which reinitializes the protocol interfaces and MPLS LSPs associated with that IP interface.</p> <p>If a new address is entered while another address is still active, the new address will be rejected.</p>
Parameters	<p><i>ip-address</i> — The IP address of the IP interface. The ip-addr portion of the address command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <p>Values 1.0.0.0 - 223.255.255.255</p> <p>/ — The forward slash is a parameter delimiter that separates the ip-addr portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the ip-addr, the "/" and the mask-length parameter. If a forward slash does not immediately follow the ip-addr, a dotted decimal mask must follow the prefix.</p> <p><i>mask-length</i> — The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the ip-addr from the mask-length parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1-32. Note that a mask length of 32 is reserved for system IP addresses.</p> <p>Values 1-32</p> <p><i>mask</i> — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the ip-addr from a traditional dotted decimal mask. The mask</p>

Configuration Commands

parameters indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

Values 128.0.0.0 - 255.255.255.255

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 - 255.255.255.255 (network bits all 1 and host bits all 0).

description

Syntax	description <i>description-string</i> no description
Context	config>router>mh-primary-interface config>router>mh-secondary-interface
Description	This command creates a text description stored in the configuration file for a configuration context. The no form of the command removes the description string from the context.
Default	no description
Parameters	<i>description-string</i> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special character (#, \$, space, etc.), the entire string must be enclosed within double quotes.

shutdown

Syntax	[no] shutdown
Context	config>router>mh-primary-interface config>router>mh-secondary-interface
Description	The shutdown command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. Unlike other commands and parameters where the default state is not indicated in the configuration file, shutdown and no shutdown are always indicated in system generated configuration files. The no form of the command puts an entity into the administratively enabled state.
Default	no shutdown

mh-secondary-interface

Syntax **[no] mh-secondary-interface**

Context	config>router
Description	This command creates a loopback interface for use in multihoming resiliency. This address is considered the secondary multihoming address and is only used to resolve routes advertised by the primary router in the event that router becomes unavailable. For this purpose, the reachability for this address is advertised via IGP and LDP protocols to allow the resolution of BGP routes advertised with this address by the primary multihoming router. The no form of the command disables this setting.
Default	no mh-secondary-interface

hold-time

Syntax	hold-time <i>holdover-time</i> no hold-time
Context	config>router>mh-secondary-interface
Description	The optional hold-time parameter is only applicable for the secondary context and specifies how long label information learned about the secondary anycast address should be kept after that peer is declared down. This timer should be set to a value large enough for the remainder of the network to detect the failure and complete the reconvergence process. The no form of the command resets the hold-time back to the default value.
Default	no hold-time
Parameters	<i>holdover-time</i> — Specifies the number of seconds the router should hold label information learned from the alternate router in its secondary label table. This is to allow the reset of the network to reconverge after a router failure before the anycast based label assignments are flushed from the forwarding plane. Values 0-65535 Default 90

Router Interface Filter Commands

egress

Syntax	egress
Context	config>router>interface
Description	This command enables access to the context to configure egress network filter policies for the IP interface. If an egress filter is not defined, no filtering is performed.

ingress

Syntax	ingress
Context	config>router>interface
Description	This command enables access to the context to configure ingress network filter policies for the IP interface. If an ingress filter is not defined, no filtering is performed.

flowspec

Syntax	flowspec no flowspec
Context	config>router>interface>ingress
Description	<p>This command enables flowspec filtering on an IP interface of the base router. Filtering is based on all of the flowspec routes that have been received and accepted by the base router. Ingress traffic on an IP interface can be filtered by both a user-defined ip filter and flowspec. In this case, the user-defined ip filter entries are evaluated before the flowspec routes and the default action of the user-defined ip filter applies as the very last rule.</p> <p>The no form of the command removes flowspec filtering from an IP interface.</p>
Default	No interfaces have flowspec enabled.

filter

Syntax	filter ip <i>ip-filter-id</i> filter ipv6 <i>ipv6-filter-id</i> no filter [ip <i>ip-filter-ip</i>] [ipv6 <i>ipv6-filter-id</i>]
Context	config>router>if>ingress config>router>if>egress

- Description** This command associates an IP filter policy with an IP interface.
- Filter policies control packet forwarding and dropping based on IP match criteria.
- The *ip-filter-id* must have been pre-configured before this **filter** command is executed. If the filter ID does not exist, an error occurs.
- Only one filter ID can be specified.
- The **no** form of the command removes the filter policy association with the IP interface.
- Default** No filter is specified.
- Parameters** **ip** *ip-filter-id* — The filter name acts as the ID for the IP filter policy expressed as a decimal integer. The filter policy must already exist within the **config>filter>ip** context.
- Values** 1 — 16384
- ipv6** *ipv6-filter-id* — The filter name acts as the ID for the IPv6 filter policy expressed as a decimal integer. The filter policy must already exist within the **config>filter>ipv6** context.
- Values** 1 — 65535

Router Interface ICMP Commands

icmp

Syntax	icmp
Context	config>router>interface
Description	This command enables access to the context to configure Internet Control Message Protocol (ICMP) parameters on a network IP interface. ICMP is a message control and error reporting protocol that also provides information relevant to IP packet processing.

mask-reply

Syntax	[no] mask-reply
Context	config>router>if>icmp
Description	<p>This command enables responses to ICMP mask requests on the router interface.</p> <p>If a local node sends an ICMP mask request to the router interface, the mask-reply command configures the router interface to reply to the request.</p> <p>The no form of the command disables replies to ICMP mask requests on the router interface.</p>
Default	mask-reply — Replies to ICMP mask requests.

redirects

Syntax	redirects [<i>number seconds</i>] no redirects
Context	config>router>if>icmp
Description	<p>This command enables and configures the rate for ICMP redirect messages issued on the router interface.</p> <p>When routes are not optimal on this router, and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.</p> <p>The redirects command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects are issued can be controlled with the optional <i>number</i> and <i>time</i> parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.</p> <p>By default, generation of ICMP redirect messages is enabled at a maximum rate of 100 per 10 second time interval.</p> <p>The no form of the command disables the generation of ICMP redirects on the router interface.</p>

Default	redirects 100 10 — Maximum of 100 redirect messages in 10 seconds.
Parameters	<p><i>number</i> — The maximum number of ICMP redirect messages to send, expressed as a decimal integer. This parameter must be specified with the <i>time</i> parameter.</p> <p>Values 10 — 1000</p> <p><i>seconds</i> — The time frame, in seconds, used to limit the <i>number</i> of ICMP redirect messages that can be issued, expressed as a decimal integer.</p> <p>Values 1 — 60</p>

ttl-expired

Syntax	ttl-expired [<i>number seconds</i>] no ttl-expired
Context	config>router>if>icmp
Description	<p>This command configures the rate that Internet Control Message Protocol (ICMP) Time To Live (TTL) expired messages are issued by the IP interface.</p> <p>By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.</p> <p>The no form of the command disables the generation of TTL expired messages.</p>
Default	ttl-expired 100 10 — Maximum of 100 TTL expired message in 10 seconds.
Parameters	<p><i>number</i> — The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. The <i>seconds</i> parameter must also be specified.</p> <p>Values 10 — 1000</p> <p><i>seconds</i> — The time frame, in seconds, used to limit the <i>number</i> of ICMP TTL expired messages that can be issued, expressed as a decimal integer.</p> <p>Values 1 — 60</p>

unreachables

Syntax	unreachables [<i>number seconds</i>] no unreachables
Context	config>router>if>icmp
Description	<p>This command enables and configures the rate for ICMP host and network destination unreachable messages issued on the router interface.</p> <p>The unreachables command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional <i>number</i> and <i>seconds</i> parameters by indicating the maximum number of destination unreachable messages that can be issued on the interface for a given time interval.</p>

By default, generation of ICMP destination unreachable messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of the command disables the generation of ICMP destination unreachable on the router interface.

Default unreachable 100 10 — Maximum of 100 unreachable messages in 10 seconds.

Parameters *number* — The maximum number of ICMP unreachable messages to send, expressed as a decimal integer. The *seconds* parameter must also be specified.

Values 10 — 1000

seconds — The time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued, expressed as a decimal integer.

Router Interface IPv6 Commands

ipv6

Syntax	[no] ipv6
Context	config>router>interface
Description	This command configures IPv6 for a router interface. The no form of the command disables IPv6 on the interface.
Default	not enabled

address

Syntax	address { <i>ipv6-address/prefix-length</i> } [eui-64] no address { <i>ipv6-address/prefix-length</i> }										
Context	config>router>if>ipv6										
Description	This command assigns an IPv6 address to the interface.										
Default	none										
Parameters	<i>ipv6-address/prefix-length</i> — Specify the IPv6 address on the interface.										
Values	<table> <tr> <td>ipv6-address/prefix: ipv6-address</td> <td>x:x:x:x:x:x:x (eight 16-bit pieces)</td> </tr> <tr> <td></td> <td>x:x:x:x:x:d.d.d</td> </tr> <tr> <td></td> <td>x [0 — FFFF]H</td> </tr> <tr> <td></td> <td>d [0 — 255]D</td> </tr> <tr> <td>prefix-length</td> <td>1 — 128</td> </tr> </table>	ipv6-address/prefix: ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)		x:x:x:x:x:d.d.d		x [0 — FFFF]H		d [0 — 255]D	prefix-length	1 — 128
ipv6-address/prefix: ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)										
	x:x:x:x:x:d.d.d										
	x [0 — FFFF]H										
	d [0 — 255]D										
prefix-length	1 — 128										
	eui-64 — When the eui-64 keyword is specified, a complete IPv6 address from the supplied prefix and 64-bit interface identifier is formed. The 64-bit interface identifier is derived from MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, the Base MAC address of the chassis should be used.										

icmp6

Syntax	icmp6
Context	config>router>if>ipv6
Description	This command enables the context to configure ICMPv6 parameters for the interface.

packet-too-big

Syntax	packet-too-big [<i>number seconds</i>] no packet-too-big
Context	config>router>if>ipv6>icmp6
Description	This command configures the rate for ICMPv6 packet-too-big messages.
Parameters	<i>number</i> — Limits the number of packet-too-big messages issued per the time frame specified in the <i>seconds</i> parameter. Values 10 — 1000 <i>seconds</i> — Determines the time frame, in seconds, that is used to limit the number of packet-too-big messages issued per time frame. Values 1 — 60

param-problem

Syntax	param-problem [<i>number seconds</i>] no param-problem
Context	config>router>if>ipv6>icmp6
Description	This command configures the rate for ICMPv6 param-problem messages.
Parameters	<i>number</i> — Limits the number of param-problem messages issued per the time frame specified in the <i>seconds</i> parameter. Values 10 — 1000 <i>seconds</i> — Determines the time frame, in seconds, that is used to limit the number of param-problem messages issued per time frame. Values 1 — 60

redirects

Syntax	redirects [<i>number seconds</i>] no redirects
Context	config>router>if>ipv6>icmp6
Description	This command configures the rate for ICMPv6 redirect messages. When configured, ICMPv6 redirects are generated when routes are not optimal on the router and another router on the same subnetwork has a better route to alert that node that a better route is available. The no form of the command disables ICMPv6 redirects.
Default	100 10 (when IPv6 is enabled on the interface)

- Parameters** *number* — Limits the number of redirects issued per the time frame specified in *seconds* parameter.
- Values** 10 — 1000
- seconds* — Determines the time frame, in seconds, that is used to limit the number of redirects issued per time frame.
- Values** 1 — 60

time-exceeded

- Syntax** **time-exceeded** [*number seconds*]
no time-exceeded
- Context** config>router>if>ipv6>icmp6
- Description** This command configures rate for ICMPv6 time-exceeded messages.
- Parameters** *number* — Limits the number of time-exceeded messages issued per the time frame specified in *seconds* parameter.
- Values** 10 — 1000
- seconds* — Determines the time frame, in seconds, that is used to limit the number of time-exceeded messages issued per time frame.
- Values** 1 — 60

unreachables

- Syntax** **unreachables** [*number seconds*]
no unreachables
- Context** config>router>if>ipv6>icmp6
- Description** This command configures the rate for ICMPv6 unreachable messages. When enabled, ICMPv6 host and network unreachable messages are generated by this interface.
- The **no** form of the command disables the generation of ICMPv6 host and network unreachable messages by this interface.
- Default** 100 10 (when IPv6 is enabled on the interface)
- Parameters** *number* — Determines the number destination unreachable ICMPv6 messages to issue in the time frame specified in *seconds* parameter.
- Values** 10 — 1000
- seconds* — Sets the time frame, in seconds, to limit the number of destination unreachable ICMPv6 messages issued per time frame.
- Values** 1 — 60

link-local-address

Syntax	link-local-address <i>ipv6-address</i> [preferred] no link-local-address
Context	config>router>if>ipv6
Description	This command configures the link local address.

local-proxy-nd

Syntax	[no] local-proxy-nd
Context	config>router>if>ipv6
Description	This command enables local proxy neighbor discovery on the interface. The no form of the command disables local proxy neighbor discovery.

proxy-nd-policy

Syntax	proxy-nd-policy <i>policy-name</i> [<i>policy-name...</i> (up to 5 max)] no proxy-nd-policy
Context	config>router>if>ipv6
Description	This command configure a proxy neighbor discovery policy for the interface.
Parameters	<i>policy-name</i> — The neighbor discovery policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. The specified policy name(s) must already be defined.

neighbor

Syntax	neighbor [<i>ipv6-address</i>] [<i>mac-address</i>] no neighbor [<i>ipv6-address</i>]
Context	config>router>if>ipv6
Description	This command configures an IPv6-to-MAC address mapping on the interface. Use this command if a directly attached IPv6 node does not support ICMPv6 neighbor discovery, or for some reason, a static address must be used. This command can only be used on Ethernet media. The <i>ipv6-address</i> must be on the subnet that was configured from the IPv6 address command or a link-local address.

Parameters *ipv6-address* — The IPv6 address assigned to a router interface.

Values *ipv6-address*: x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x: [0 — FFFF]H
 d: [0 — 255]D

mac-address — Specifies the MAC address for the neighbor in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

Router Advertisement Commands

router-advertisement

Syntax	[no] router-advertisement
Context	config>router
Description	This command configures router advertisement properties. By default, it is disabled for all IPv6 enabled interfaces. The no form of the command disables all IPv6 interface. However, the no interface <i>interface-name</i> command disables a specific interface.
Default	disabled

interface

Syntax	[no] interface <i>ip-int-name</i>
Context	config>router>router-advertisement
Description	This command configures router advertisement properties on a specific interface. The interface must already exist in the config>router>interface context.
Default	No interfaces are configured by default.
Parameters	<i>ip-int-name</i> — Specify the interface name. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

current-hop-limit

Syntax	current-hop-limit <i>number</i> no current-hop-limit
Context	config>router>router-advert>if
Description	This command configures the current-hop-limit in the router advertisement messages. It informs the nodes on the subnet about the hop-limit when originating IPv6 packets.
Default	64
Parameters	<i>number</i> — Specifies the hop limit. Values 0 — 255. A value of zero means there is an unspecified number of hops.

managed-configuration

Syntax	[no] managed-configuration
Context	config>router>router-advert>if
Description	This command sets the managed address configuration flag. This flag indicates that DHCPv6 is available for address configuration in addition to any address autoconfigured using stateless address autoconfiguration. See RFC 3315, <i>Dynamic Host Configuration Protocol (DHCP) for IPv6</i> .
Default	no managed-configuration

max-advertisement-interval

Syntax	[no] max-advertisement-interval <i>seconds</i>
Context	config>router>router-advert>if
Description	This command configures the maximum interval between sending router advertisement messages.
Default	600
Parameters	<i>seconds</i> — Specifies the maximum interval in seconds between sending router advertisement messages.
Values	4 — 1800

min-advertisement-interval

Syntax	[no] min-advertisement-interval <i>seconds</i>
Context	config>router>router-advert>if
Description	This command configures the minimum interval between sending ICMPv6 neighbor discovery router advertisement messages.
Default	200
Parameters	<i>seconds</i> — Specify the minimum interval in seconds between sending ICMPv6 neighbor discovery router advertisement messages.
Values	3 — 1350

mtu

Syntax	[no] mtu <i>mtu-bytes</i>
Context	config>router>router-advert>if
Description	This command configures the MTU for the nodes to use to send packets on the link.

Configuration Commands

Default	no mtu — The MTU option is not sent in the router advertisement messages.
Parameters	<i>mtu-bytes</i> — Specify the MTU for the nodes to use to send packets on the link.
Values	1280 — 9212

other-stateful-configuration

Syntax	[no] other-stateful-configuration
Description	This command sets the "Other configuration" flag. This flag indicates that DHCPv6lite is available for autoconfiguration of other (non-address) information such as DNS-related information or information on other servers in the network. See RFC 3736, <i>Stateless Dynamic Host Configuration Protocol (DHCP) for IPv6</i> .
Default	no other-stateful-configuration

prefix

Syntax	[no] prefix [ipv6-prefix/prefix-length]														
Context	config>router>router-advert>if														
Description	This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.														
Default	none														
Parameters	<i>ip-prefix</i> — The IP prefix for prefix list entry in dotted decimal notation.														
Values	<table><tr><td>ipv4-prefix</td><td>a.b.c.d (host bits must be 0)</td></tr><tr><td>ipv4-prefix-length</td><td>0 — 32</td></tr><tr><td>ipv6-prefix</td><td>x:x:x:x:x:x:x (eight 16-bit pieces)</td></tr><tr><td></td><td>x:x:x:x:x:d.d.d.d</td></tr><tr><td></td><td>x: [0 — FFFF]H</td></tr><tr><td></td><td>d: [0 — 255]D</td></tr><tr><td>ipv6-prefix-length</td><td>0 — 128</td></tr></table>	ipv4-prefix	a.b.c.d (host bits must be 0)	ipv4-prefix-length	0 — 32	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)		x:x:x:x:x:d.d.d.d		x: [0 — FFFF]H		d: [0 — 255]D	ipv6-prefix-length	0 — 128
ipv4-prefix	a.b.c.d (host bits must be 0)														
ipv4-prefix-length	0 — 32														
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)														
	x:x:x:x:x:d.d.d.d														
	x: [0 — FFFF]H														
	d: [0 — 255]D														
ipv6-prefix-length	0 — 128														
prefix-length	— Specifies a route must match the most significant bits and have a prefix length.														
Values	1 — 128														

autonomous

Syntax	[no] autonomous
Context	config>router>router-advert>if>prefix

Description	This command specifies whether the prefix can be used for stateless address autoconfiguration.
Default	enabled

on-link

Syntax	[no] on-link
Context	config>router>router-advert>if>prefix
Description	This command specifies whether the prefix can be used for onlink determination.
Default	enabled

preferred-lifetime

Syntax	[no] preferred-lifetime { <i>seconds</i> infinite }
Context	config>router>router-advert>if
Description	This command configures the remaining length of time in seconds that this prefix will continue to be preferred, such as, time until deprecation. The address generated from a deprecated prefix should not be used as a source address in new communications, but packets received on such an interface are processed as expected.
Default	604800
Parameters	<i>seconds</i> — Specifies the remaining length of time in seconds that this prefix will continue to be preferred. infinite — Specifies that the prefix will always be preferred. A value of 4,294,967,295 represents infinity.

valid-lifetime

Syntax	valid-lifetime { <i>seconds</i> infinite }
Context	config>router>router-advert>if
Description	This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity. The address generated from an invalidated prefix should not appear as the destination or source address of a packet.
Default	2592000
Parameters	<i>seconds</i> — Specifies the remaining length of time in seconds that this prefix will continue to be valid. infinite — Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

reachable-time

Syntax	reachable-time <i>milli-seconds</i> no reachable-time
Context	config>router>router-advert>if
Description	This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.
Default	no reachable-time
Parameters	<i>milli-seconds</i> — Specifies the length of time the router should be considered reachable. Values 0 — 3600000

retransmit-time

Syntax	retransmit-timer <i>milli-seconds</i> no retransmit-timer
Context	config>router>router-advert>if
Description	This command configures the retransmission frequency of neighbor solicitation messages.
Default	no retransmit-time
Parameters	<i>milli-seconds</i> — Specifies how often the retransmission should occur. Values 0 — 1800000

router-lifetime

Syntax	router-lifetime <i>seconds</i> no router-lifetime
Context	config>router>router-advert>if
Description	This command sets the router lifetime.
Default	1800
Parameters	<i>seconds</i> — The length of time, in seconds, (relative to the time the packet is sent) that the prefix is valid for route determination. Values 0, 4 — 9000 seconds. 0 means that the router is not a default router on this link.

use-virtual-mac

Syntax	[no] use-virtual-mac
Context	config>router>router-advert>if
Description	<p>This command enables sending router advertisement messages using the VRRP virtual MAC address, provided that the virtual router is currently the master.</p> <p>If the virtual router is not the master, no router advertisement messages are sent.</p> <p>The no form of the command disables sending router advertisement messages.</p>
Default	no use-virtual-mac

Show Commands

aggregate

Syntax	aggregate [<i>family</i>] [active]
Context	show>router
Description	This command displays aggregate routes.
Parameters	<i>family</i> — Specifies to display IPv4 or IPv6 aggregate routes. Values ipv4, ipv6 active — When the active keyword is specified, inactive aggregates are filtered out.

arp

Syntax	arp [<i>ip-int-name</i> <i>ip-address/mask</i> mac <i>ieee-mac-address</i> summary] [local dynamic static managed]
Context	show>router
Description	This command displays the router ARP table sorted by IP address. If no command line options are specified, all ARP entries are displayed.
Parameters	<i>ip-address/mask</i> — Only displays ARP entries associated with the specified IP address and mask. <i>ip-int-name</i> — Only displays ARP entries associated with the specified IP interface name. mac ieee-mac-addr — Only displays ARP entries associated with the specified MAC address. summary — Displays an abbreviate list of ARP entries. [local dynamic static managed] — Only displays ARP information associated with the keyword.
Output	ARP Table Output — The following table describes the ARP table output fields:

Label	Description
IP Address	The IP address of the ARP entry.
MAC Address	The MAC address of the ARP entry.
Expiry	The age of the ARP entry.
Type	Dyn — The ARP entry is a dynamic ARP entry. Inv — The ARP entry is an inactive static ARP entry (invalid). Oth — The ARP entry is a local or system ARP entry. Sta — The ARP entry is an active static ARP entry.

Label	Description (Continued)
*Man	The ARP entry is a managed ARP entry.
Int	The ARP entry is an internal ARP entry.
[I}	The ARP entry is in use.
Interface	The IP interface name associated with the ARP entry.
No. of ARP Entries	The number of ARP entries displayed in the list.

Sample Output

```
*B:7710-Red-RR# show router arp

authentication

Syntax	authentication
Context	show>router
Description	This command enables the command to display authentication statistics.

statistics

Syntax	statistics statistics interface [<i>ip-int-name</i> <i>ip-address</i>] statistics policy <i>name</i>
Context	show>router>authentication
Description	This command displays interface or policy authentication statistics.
Parameters	interface [<i>ip-int-name</i> <i>ip-address</i>] — Specifies an existing interface name or IP address. Values <i>ip-int-name</i> : 32 chars max <i>ip-address</i> : a.b.c.d policy name — Specifies an existing policy name.
Output	Authentication Statistics Output — The following table describes the show authentication statistics output fields:

Label	Description
Client Packets Authenticate Fail	The number of packets that failed authentication.
Client Packets Authenticate Ok	The number of packets that were authenticated.

Sample Output

interface

- Syntax** `interface [interface-name]`
- Context** `show>router>bfd`
- Description** This command displays interface information.
- Output** **BFD interface Output** — The following table describes the show BFD interface output fields:

Label	Description
TX Interval	Displays the interval, in milliseconds, between the transmitted BFD messages to maintain the session
RX Interval	Displays the expected interval, in milliseconds, between the received BFD messages to maintain the session
Multiplier	Displays the integer used by BFD to declare when the neighbor is down.

Sample Output

```
*A:Dut-B# show router bfd interface

```

session

- Syntax** `session [src ip-address [dst ip-address] | detail]`
`session [type type]`
`session [summary]`
- Context** `show>router>bfd`
- Description** This command displays session information.

Parameters *ip-address* — Only displays the interface information associated with the specified IP address.

Values ipv4-address a.b.c.d (host bits must be 0)

type — Specifies the session type.

Values iom | central | cpm-np

Output **BFD Session Output** — The following table describes the show BFD session output fields:

Label	Description
State	Displays the administrative state for this BFD session.
Protocol	Displays the active protocol.
Tx Intvl	Displays the interval, in milliseconds, between the transmitted BFD messages to maintain the session
Tx Pkts	Displays the number of transmitted BFD packets.
Rx Intvl	Displays the expected interval, in milliseconds, between the received BFD messages to maintain the session
Rx Pkts	Displays the number of received packets.
Mult	Displays the integer used by BFD to declare when the neighbor is down.

Sample Output

```

dhcp

Syntax	dhcp
Context	show>router
Description	This command enables the context to display DHCP related information.

dhcp6

Syntax	dhcp6
Context	show>router
Description	This command enables the context to display DHCP6 related information.

statistics

Syntax	statistics [<i>ip-int-name</i> <i>ip-address</i>]
Context	show>router>dhcp show>router>dhcp6
Description	This command displays statistics for DHCP relay and DHCP snooping. If no IP address or interface name is specified, then all configured interfaces are displayed. If an IP address or interface name is specified, then only data regarding the specified interface is displayed.
Parameters	<i>ip-int-name</i> <i>ip-address</i> — Displays statistics for the specified IP interface.
Output	Show DHCP Statistics Output — The following table describes the output fields for DHCP statistics.

Label	Description
Received Packets	The number of packets received from the DHCP clients.
Transmitted Packets	The number of packets transmitted to the DHCP clients.
Received Malformed Packets	The number of malformed packets received from the DHCP clients.

Label	Description (Continued)
Received Untrusted Packets	The number of untrusted packets received from the DHCP clients.
Client Packets Discarded	The number of packets received from the DHCP clients that were discarded.
Client Packets Relayed	The number of packets received from the DHCP clients that were forwarded.
Client Packets Snooped	The number of packets received from the DHCP clients that were snooped.
Server Packets Discarded	The number of packets received from the DHCP server that were discarded.
Server Packets Relayed	The number of packets received from the DHCP server that were forwarded.
Server Packets Snooped	The number of packets received from the DHCP server that were snooped.

Sample Output

```

ecmp

- Syntax** **ecmp**
- Context** show>router
- Description** This command displays the ECMP settings for the router.
- Output** **ECMP Settings Output** — The following table describes the output fields for the router ECMP settings.

Label	Description
Instance	The router instance number.
Router Name	The name of the router instance.
ECMP	False — ECMP is disabled for the instance. True — ECMP is enabled for the instance.
Configured-ECMP-Routes	The number of ECMP routes configured for path sharing.

Sample Output

```

A:ALA-A# show router ecmp
=====
Router ECMP

fib

Syntax **fib** *slot-number* [*family*] [*ip-prefix/prefix-length*] [**longer**] [**secondary**] [**exclude-services**]
fib *slot-number* [*family*] **summary**
fib *slot-number* **nh-table-usage**

Context show>router

Description This command displays the active FIB entries for a specific IOM.

Parameters *slot-number* — Displays routes only matching the specified chassis slot number.

Default all IOMs

Values 1 — 10

family — Displays the router IP interface table to display.

Values **ipv4** — Displays only those peers that have the IPv4 family enabled.

ipv6 — Displays the peers that are IPv6-capable.

ip-prefix/prefix-length — Displays FIB entries only matching the specified ip-prefix and length.

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-length: 0 — 32

Values ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 — FFFF]H

d: [0 — 255]D

ipv6-prefix-length: 0 — 128

longer — Displays FIB entries matching the *ip-prefix/mask* and routes with longer masks.

secondary — Displays secondary VRF ID information.

summary — Displays summary FIB information for the specified slot number.

nh-table-usage — Displays next-hop table usage.

Sample Output

```
show router fib 1 131.132.133.134/32

icmp6

Syntax icmp6**Context** show>router

Description This command displays Internet Control Message Protocol Version 6 (ICMPv6) statistics. ICMP generates error messages (for example, ICMP destination unreachable messages) to report errors during processing and other diagnostic functions. ICMPv6 packets can be used in the neighbor discovery protocol and path MTU discovery.

Output **icmp6 Output** — The following table describes the show router icmp6 output fields:

Label	Description
Total	The total number of all messages.
Destination Unreachable	The number of message that did not reach the destination.
Time Exceeded	The number of messages that exceeded the time threshold.
Echo Request	The number of echo requests.
Router Solicits	The number of times the local router was solicited.
Neighbor Solicits	The number of times the neighbor router was solicited.
Errors	The number of error messages.
Redirects	The number of packet redirects.
Pkt Too big	The number of packets that exceed appropriate size.
Echo Reply	The number of echo replies.
Router Advertisements	The number of times the router advertised its location.
Neighbor Advertisements	The number of times the neighbor router advertised its location.

Sample Output

```
A:SR-3>show>router>auth# show router icmp6

interface

- Syntax** **interface** [{{*ip-address* | *ip-int-name*} [**statistics**] [**detail**] [**family**]} | [**summary**] | [**exclude-services**]
interface *family* [**detail**]]
- Context** show>router
- Description** This command displays the router IP interface table sorted by interface index.
- Parameters** *ip-address* — Only displays the interface information associated with the specified IP address.
- | Values | ipv4-address | a.b.c.d (host bits must be 0) |
|--------|--------------|-------------------------------------|
| | ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
| | | x:x:x:x:x:d.d.d.d |
| | | x: [0 — FFFF]H |
| | | d: [0 — 255]D |
- ip-int-name* — Only displays the interface information associated with the specified IP interface name.
- detail** — Displays detailed IP interface information.
- statistics** — Displays packet statistics for an interface on the router.
- summary** — Displays summary IP interface information for the router.
- exclude-services** — Displays IP interface information, excluding IP interfaces configured for customer services. Only core network IP interfaces are displayed.

family — Specifies the router IP interface family to display.

Values **ipv4** — Displays only those peers that have the IPv4 family enabled.

Values **ipv6** — Displays the peers that are IPv6-capable.

Output **Standard IP Interface Output** — The following table describes the standard output fields for an IP interface.

Label	Description
Interface-Name	The IP interface name.
Type	n/a — No IP address has been assigned to the IP interface, so the IP address type is not applicable. Pri — The IP address for the IP interface is the Primary address on the IP interface. Sec — The IP address for the IP interface is a secondary address on the IP interface.
IP-Address	The IP address and subnet mask length of the IP interface. n/a — Indicates no IP address has been assigned to the IP interface.
Adm	Down — The IP interface is administratively disabled. Up — The IP interface is administratively enabled.
Opr	Down — The IP interface is operationally disabled. Up — The IP interface is operationally disabled.
Mode	Network — The IP interface is a network/core IP interface. Service — The IP interface is a service IP interface.
Port/SAP Id	The physical network port or the SAP identifier associated with the IP interface.

Sample Output

```

Detailed IP Interface Output — The following table describes the detailed output fields for an IP interface.

Label	Description
If Name	The IP interface name.
Admin State	Down — The IP interface is administratively disabled. Up — The IP interface is administratively enabled.
Oper State	Down — The IP interface is operationally disabled. Up — The IP interface is operationally enabled.

Label	Description (Continued)
IP Addr/mask	The IP address and subnet mask length of the IP interface. Not Assigned – Indicates no IP address has been assigned to the IP interface.
IPV6 Addr	The IPv6 address of the interface.
If Index	The interface index of the IP router interface.
Virt If Index	The virtual interface index of the IP router interface.
Last Oper Change	The last change in operational status.
Global If Index	The global interface index of the IP router interface.
Sap ID	The SAP identifier.
TOS Marker	The TOS byte value in the logged packet.
If Type	Network – The IP interface is a network/core IP interface. Service – The IP interface is a service IP interface.
SNTP B.cast	Displays if the broadcast-client global parameter is configured.
IES ID	The IES identifier.
QoS Policy	The QoS policy ID associated with the IP interface.
MAC Address	The MAC address of the interface.
Arp Timeout	The ARP timeout for the interface, in seconds, which is the time an ARP entry is maintained in the ARP cache without being refreshed.
ICMP Mask Reply	False – The IP interface will not reply to a received ICMP mask request. True – The IP interface will reply to a received ICMP mask request.
Arp Populate	Displays whether ARP is enabled or disabled.
Host Conn Verify	The host connectivity verification.
LdpSyncTimer	Specifies the IGP/LDP sync timer value.
Cflowd	Specifies the type of Cflowd analysis that is applied to the interface. acl – ACL Cflowd analysis is applied to the interface. interface – Interface cflowd analysis is applied to the interface. none – No Cflowd analysis is applied to the interface.

neighbor

Syntax `neighbor [ip-int-name | ip-address | mac ieee-mac-address | summary]`

Context show>router

Description This command displays information about the IPv6 neighbor cache.

Parameters *ip-int-name* — Specify the IP interface name.
ip-address — Specify the address of the IPv6 interface address.
mac *ieee-mac-address* — Specify the MAC address.
summary — Displays summary neighbor information.

Output **Neighbor Output** — The following table describes neighbor output fields.

Label	Description
IPv6 Address	Displays the IPv6 address.
Interface	Displays the name of the IPv6 interface name.
MAC Address	Specifies the link-layer address.
State	Displays the current administrative state.
Exp	Displays the number of seconds until the entry expires.
Type	Displays the type of IPv6 interface.
Interface	Displays the interface name.

Label	Description (Continued)
Rtr	Specifies whether a neighbor is a router.
Mtu	Displays the MTU size.

Sample Output

```
B:CORE2# show router neighbor

policy

Syntax	policy [<i>name</i> damping prefix-list <i>name</i> as-path <i>name</i> community <i>name</i> admin]
Context	show>router
Description	This command displays policy-related information.
Parameters	name — Specify an existing policy-statement name. damping — Specify damping to display route damping profiles.

prefix-list *name* — Specify a prefix list name to display the route policy entries.

as-path *name* — Specify the route policy AS path name to display route policy entries.

community *name* — Specify a route policy community name to display information about a particular community member.

admin — Specify the **admin** keyword to display the entities configured in the config>router>policy-options context.

Output **Policy Output** — The following table describes policy output fields.

Label	Description
Policy	The policy name.
Description	Displays the description of the policy.

Sample Output

policy-edits

Syntax **policy-edits**

Context show>router

Description This command displays edited policy information.

route-table

Syntax **route-table** [*ip-prefix[/prefix-length]*] [**longer** | **exact** | **protocol**] | [**protocol** *protocol-name*] [**all**]
route-table [**family**] **summary**
route-table *tunnel-endpoints* [*ip-prefix[/prefix-length]*] [**longer** | **exact** | **protocol**]
route-table [*ip-prefix[/prefix-length]*] **next-hop-type tunneled**
route-table [**next-hop-type tunneled**]

Context show>router

Description This command displays the active routes in the routing table.
 If no command line arguments are specified, all routes are displayed, sorted by prefix.

Parameters **family** — Specify the type of routing information to be distributed by this peer group.

Values **ipv4** — Displays only those BGP peers that have the IPv4 family enabled and not those capable of exchanging IP-VPN routes.
ipv6 — Displays the BGP peers that are IPv6 capable.
mcast-ipv4 — Displays the BGP peers that are IPv4 multicast capable.
mcast-ipv6 — Displays multicast IPv6 route table.

ip-prefix[/prefix-length] — Displays routes only matching the specified ip-address and length.

Values

ipv4-prefix:	a.b.c.d (host bits must be set to 0)
ipv4-prefix-length:	0 — 32
ipv6 ipv6-prefix[/pref*]:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 — FFFF]H
	d: [0 — 255]D
prefix-length:	1 — 128ipv6

longer — Displays routes matching the *ip-prefix/mask* and routes with longer masks.

exact — Displays the exact route matching the *ip-prefix/mask* masks.

protocol *protocol-name* — Displays routes learned from the specified protocol.

Values local, sub-mgmt, managed, static, ospf, ospf3, isis, rip, aggregate, bgp, bgp-vpn

summary — Displays a route table summary information.

tunnel-endpoints — Specifies to include tunnel endpoint information.

Output **Standard Route Table Output** — The following table describes the standard output fields for the route table.

Label	Description
Dest Address	The route destination address and mask.
Next Hop	The next hop IP address for the route destination.
Type	Local — The route is a local route.

Label	Description (Continued)
	Remote — The route is a remote route.
Protocol	The protocol through which the route was learned.
Age	The route age in seconds for the route.
Metric	The route metric value for the route.
Pref	The route preference value for the route.
No. of Routes	The number of routes displayed in the list.

Sample Output

```
*A:Dut-B# show router route-table

rtr-advertisement

- Syntax** `rtr-advertisement [interface interface-name] [prefix ipv6-prefix[/prefix-length]]`
rtr-advertisement [conflicts]
- Context** show>router
- Description** This command displays router advertisement information.
 If no command line arguments are specified, all routes are displayed, sorted by prefix.
- Parameters** *interface-name* — Maximum 32 characters.
ipv6-prefix[/prefix-length] — Displays routes only matching the specified ip-address and length.
- Values**
- | | | |
|------|----------------------|-------------------------------------|
| ipv6 | ipv6-prefix[/pref*]: | x:x:x:x:x:x:x (eight 16-bit pieces) |
| | | x:x:x:x:x:d.d.d.d |
| | | x: [0 — FFFF]H |
| | | d: [0 — 255]D |
| | prefix-length: | 1 — 128 |
- Output** **Router-Advertisement Table Output** — The following table describes the output fields for router-advertisement.

Label	Description
Rtr Advertisement Tx/Last Sent	The number of router advertisements sent and time since they were sent.
Nbr Solicitation Tx	The number of neighbor solicitations sent and time since they were sent.
Nbr Advertisement Tx	The number of neighbor advertisements sent and time since they were sent.
Rtr Advertisement Rx	The number of router advertisements received and time since they were received.
Nbr Advertisement Rx	The number of neighbor advertisements received and time since they were received.
Max Advert Interval	The maximum interval between sending router advertisement messages.
Managed Config	True — Indicates that DHCPv6 has been configured. False — Indicates that DHCPv6 is not available for address configuration.
Reachable Time	The time, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation.
Retransmit Time	The time, in milliseconds, between retransmitted neighbor solicitation messages.

Label	Description (Continued)
Link MTU	The MTU number the nodes use for sending packets on the link.
Rtr Solicitation Rx	The number of router solicitations received and time since they were received.
Nbr Solicitation Rx	The number of neighbor solicitations received and time since they were received.
Min Advert Interval	The minimum interval between sending ICMPv6 neighbor discovery router advertisement messages.
Other Config	True – Indicates there are other stateful configurations. False – Indicates there are no other stateful configurations.
Router Lifetime	Displays the router lifetime in seconds.
Hop Limit	Displays the current hop limit.

Sample Output

```

static-arp

Syntax	static-arp [<i>ip-addr</i> <i>ip-int-name</i> mac <i>ieee-mac-addr</i>]
Context	show>router
Description	This command displays the router static ARP table sorted by IP address. If no options are present, all ARP entries are displayed.

- Parameters**
- ip-addr* — Only displays static ARP entries associated with the specified IP address.
 - ip-int-name* — Only displays static ARP entries associated with the specified IP interface name.
 - mac** *ieee-mac-addr* — Only displays static ARP entries associated with the specified MAC address.

Output **Static ARP Table Output** — The following table describes the output fields for the ARP table.

Label	Description
IP Address	The IP address of the static ARP entry.
MAC Address	The MAC address of the static ARP entry.
Age	The age of the ARP entry. Static ARPs always have 00:00:00 for the age.
Type	Inv — The ARP entry is an inactive static ARP entry (invalid). Sta — The ARP entry is an active static ARP entry.
Interface	The IP interface name associated with the ARP entry.
No. of ARP Entries	The number of ARP entries displayed in the list.

Sample Output

```

static-route

Syntax	static-route [family] [[<i>ip-prefix /mask</i>] [preference <i>preference</i>] [next-hop <i>ip-address</i>] tag <i>tag</i>]
Context	show>router
Description	This command displays the static entries in the routing table. If no options are present, all static routes are displayed sorted by prefix.
Parameters	family — Specify the type of routing information to be distributed by this peer group. Values ipv4 — Displays only those BGP peers that have the IPv4 family enabled and not those capable of exchanging IP-VPN routes. ipv6 — Displays the BGP peers that are IPv6 capable. mcast-ipv4 — Displays the BGP peers that are IPv4 multicast capable. ip-prefix /mask — Displays static routes only matching the specified <i>ip-prefix</i> and <i>mask</i> . Values ipv4-prefix: a.b.c.d (host bits must be 0) ipv4-prefix-length: 0 — 32 ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D ipv6-prefix-length: 0 — 128 preference preference — Only displays static routes with the specified route preference. Values 0 — 65535 next-hop ip-address — Only displays static routes with the specified next hop IP address. Values ipv4-address: a.b.c.d (host bits must be 0) ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

tag tag — Displays the tag used to add a 32-bit integer tag to the static route. The tag is used in route policies to control distribution of the route into other protocols.

Values 1 — 4294967295

Output Static Route Output — The following table describes the output fields for the static route table.

Label	Description
IP Addr/mask	The static route destination address and mask.
Pref	The route preference value for the static route.
Metric	The route metric value for the static route.
Type	BH — The static route is a black hole route. The <code>Nexthop</code> for this type of route is <code>black-hole</code> . ID — The static route is an indirect route, where the <code>nexthop</code> for this type of route is the non-directly connected next hop. NH — The route is a static route with a directly connected next hop. The <code>Nexthop</code> for this type of route is either the next hop IP address or an egress IP interface name.
Next Hop	The next hop for the static route destination.
Protocol	The protocol through which the route was learned.
Interface	The egress IP interface name for the static route. <code>n/a</code> — indicates there is no current egress interface because the static route is inactive or a black hole route.
Active	N — The static route is inactive; for example, the static route is disabled or the next hop IP interface is down. Y — The static route is active.
No. of Routes	The number of routes displayed in the list.

Sample Output

```
A:ALA-A# show router static-route

service-prefix

Syntax `service-prefix`

Description This command displays the address ranges reserved by this node for services sorted by prefix.

Output **Service Prefix Output** — The following table describes the output fields for service prefix information.

Label	Description
IP Prefix	The IP prefix of the range of addresses included in the range for services.
Mask	The subnet mask length associated with the IP prefix.
Exclusive	<code>false</code> — Addresses in the range are not exclusively for use for service IP addresses. <code>true</code> — Addresses in the range are exclusively for use for service IP addresses and cannot be assigned to network IP interfaces.

Sample Output

```
A:ALA-A# show router service-prefix

A:ALA-A#
```

sgt-qos

Syntax `sgt-qos`

Context `show>router`

Description This command displays self-generated traffic QoS related information.

application

Syntax `application [app-name] [dscp|dot1p]`

Context `show>router>sgt-qos`

Description This command displays application QoS settings.

Show Commands

Parameters *app-name* — The specific application.

Values arp, bgp, cflowd, dhcp, dns, ftp, icmp, igmp, isis, ldp, mld, msdp, ndis, ntp, ospf, pimradius, rip, rsvpsnmp, snmp-notification, srrp, ssh, syslog, tacplus, telnet, tftp, traceroute, vrrp, pppoe

dscp-map

Syntax **dscp-map** [*dscp-name*]

Context show>router>sgt-qos

Description This command displays DSCP to FC mappings.

Parameters *dscp-name* — The specific DSCP name.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

status

Syntax **status**

Context show>router

Description This command displays the router status.

Output **Router Status Output** — The following table describes the output fields for router status information.

Label	Description
Router	The administrative and operational states for the router.
OSPF	The administrative and operational states for the OSPF protocol.
RIP	The administrative and operational states for the RIP protocol.
ISIS	The administrative and operational states for the IS-IS protocol.
MPLS	The administrative and operational states for the MPLS protocol.
RSVP	The administrative and operational states for the RSVP protocol.
LDP	The administrative and operational states for the LDP protocol.
BGP	The administrative and operational states for the BGP protocol.

Label	Description (Continued)
Max Routes	The maximum number of routes configured for the system.
Total Routes	The total number of routes in the route table.
ECMP Max Routes	The number of ECMP routes configured for path sharing.
<i>service-id</i>	state – Current single SFM state start – Last time this vRtr went into overload, after having respected the hold-off time interval – How long the vRtr remained or is in overload
Triggered Policies	No – Triggered route policy re-evaluation is disabled. Yes – Triggered route policy re-evaluation is enabled.

Sample Output

Note that there are multiple instances of OSPF. OSPF-0 is persistent. OSPF-1 through OSPF-31 are present when that particular OSPF instance is configured.

tunnel-table

- Syntax** `tunnel-table [ip-address[/mask]] [protocol protocol | sdp sdp-id] [summary]`
- Context** `show>router`
- Description** This command displays tunnel table information. Note that auto-bind GRE tunnels are not displayed in **show** command output. GRE tunnels are not the same as SDP tunnels that use the GRE encapsulation

type. When the **auto-bind** command is used when configuring a VPRN service, it means the MP-BGP NH resolution is referring to the core routing instance for IP reachability. For a VPRN service this object specifies the lookup to be used by the routing instance if no SDP to the destination exists.

- Parameters
- ip-address[/mask]* — Displays the specified tunnel table’s destination IP address and mask.
 - protocol** *protocol* — Displays LDP protocol information.
 - sdp** *sdp-id* — Displays information pertaining to the specified SDP.
 - summary** — Displays summary tunnel table information.

Output Tunnel Table Output — The following table describes tunnel table output fields.

Label	Description
Destination	The route’s destination address and mask.
Owner	Specifies the tunnel owner.
Encap	Specifies the tunnel’s encapsulation type.
Tunnel ID	Specifies the tunnel (SDP) identifier.
Pref	Specifies the route preference for routes learned from the configured peer(s).
Nexthop	The next hop for the route’s destination.
Metric	The route metric value for the route.

Sample Output

```
A:ALA-A>config>service# show router tunnel-table

session

Syntax `session connection-id connection-id [detail]`

`session [detail] [session-id session-id (v2)] [state session-state][peer ip-address] [group group-name] [assignment-id assignment-id] [local-name local-host-name] [remote-name remote-host-name] [tunnel-id tunnel-id (v2)]`

`session [detail] [state session-state] [peer ip-address] [group group-name] [assignment-id assignment-id] [local-name local-host-name] [remote-name remote-host-name] [control-connection-id connection-id (v3)]`

Context `show>router>l2tp`

Description This command displays L2TP session operational information.

- Parameters**
- connection-id** *connection-id* — Specifies the identification number for a Layer Two Tunneling Protocol connection.
 - Values** 1 — 429496729
 - detail** — Displays detailed L2TP session information.
 - session-id** *session-id* (v2) — Specifies the identification number for a Layer Two Tunneling Protocol session.
 - Values** 1 — 65535
 - state** *session-state* — Specifies the values to identify the operational state of the L2TP session.
 - Values** closed, closed-by-peer, established, idle, wait-reply, wait-tunnel
 - peer** *ip-address* — Specifies the IP address of the peer.
 - Values**

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses
 - group** *group-name* — Specifies a string to identify a Layer Two Tunneling Protocol Tunnel group.
 - assignment-id** *assignment-id* — Specifies a string that distinguishes this Layer Two Tunneling Protocol tunnel.
 - local-name** *local-host-name* — Specifies the host name used by this system during the authentication phase of tunnel establishment.
 - remote-name** *remote-host-name* — Specifies a string that is compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.
 - tunnel-id** *tunnel-id* (v2) — Specifies the local identifier of this Layer Two Tunneling Protocol tunnel, when L2TP version 2 is used.
 - Values** 1 — 65535
 - control-connection-id** *connection-id* (v3) — Specifies an identification number for a Layer Two Tunneling Protocol session.
 - Values** 1 — 429496729

Sample Output

```
*A:Dut-C# show router l2tp session

tunnel

Syntax **tunnel** [**statistics**] [**detail**] [**peer** *ip-address*] [**state** *tunnel-state*] [**remote-connection-id** *remote-connection-id (v3)*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *host-name*] [**remote-name** *host-name*]

tunnel [**statistics**] [**detail**] [**peer** *ip-address*] [**state** *tunnel-state*] [**remote-tunnel-id** *remote-tunnel-id (v2)*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *host-name*] [**remote-name** *host-name*]

tunnel *tunnel-id (v2)* [**statistics**] [**detail**]

tunnel connection-id *connection-id* (v3) [**statistics**] [**detail**]

Context show>router>l2tp

Description This command displays L2TP tunnel operational information.

Parameters **statistics** — Displays L2TP tunnel statistics.

detail — Displays detailed L2TP tunnel information.

peer *ip-address* — Displays information for the the IP address of the peer.

state *tunnel-state* — Displays the operational state of the tunnel.

remote-connection-id *remote-connection-id* (v3) — Displays information for the specified remote connection ID.

group *group-name* — Displays L2TP tunnel information for the specified tunnel group.

assignment-id *assignment-id* —

local-name *host-name* — Specifies a local host name used by this system.

remote-name *host-name* — Specifies a remote host name used by this system.

connection-id *connection-id* — Specifies the identification number for a Layer Two Tunneling Protocol connection.

Values 1 — 429496729

detail — Displays detailed L2TP session information.

session-id *session-id* (v2) — Displays information for the specified the L2TP session.

Values 1 — 65535

state *session-state* — Displays the operational state of the L2TP session.

Values closed, closed-by-peer, draining, drained, established, established-idle, idle, wait-reply, wait-conn

peer *ip-address* — Displays information for the specified peer IP address.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

tunnel-id *tunnel-id* (v2) — Displays information for the specified ID of a L2TP tunnel.

In L2TP version 2, it is the 16-bit tunnel ID.

Values 1 — 65535

control-connection-id *connection-id* (v3) — Displays information for the specified ID of a L2TP tunnel. In L2TP version 3, it is the 32-bit control connection ID.

Values 1 — 429496729

Sample Output

```

*A:Dut-C# show router l2tp tunnel

Clear Commands

router

Syntax	router <i>router-instance</i>									
Context	clear>router									
Description	This command clears for a the router instance in which they are entered.									
Parameters	<i>router-instance</i> — Specify the router name or service ID.									
	<table> <tr> <td>Values</td> <td><i>router-name:</i></td> <td>Base, management, vpls-management</td> </tr> <tr> <td></td> <td><i>service-id:</i></td> <td>1 — 2147483647</td> </tr> <tr> <td>Default</td> <td>Base</td> <td></td> </tr> </table>	Values	<i>router-name:</i>	Base, management, vpls-management		<i>service-id:</i>	1 — 2147483647	Default	Base	
Values	<i>router-name:</i>	Base, management, vpls-management								
	<i>service-id:</i>	1 — 2147483647								
Default	Base									

arp

Syntax	arp { all <i>ip-addr</i> interface { <i>ip-int-name</i> <i>ip-addr</i> }}
Context	clear>router
Description	This command clears all or specific ARP entries. The scope of ARP cache entries cleared depends on the command line option(s) specified.
Parameters	<p>all — Clears all ARP cache entries.</p> <p><i>ip-addr</i> — Clears the ARP cache entry for the specified IP address.</p> <p>interface <i>ip-int-name</i> — Clears all ARP cache entries for the IP interface with the specified name.</p> <p>interface <i>ip-addr</i> — Clears all ARP cache entries for the specified IP interface with the specified IP address.</p>

bfd

Syntax	bfd src-ip <i>ip-address</i> dst-ip <i>ip-address</i> bfd all
Context	clear>router
Description	This command enables the context to clear bi-directional forwarding (BFD) sessions and statistics.

Clear Commands

session

Syntax	session src-ip <i>ip-address</i> dst-ip <i>ip-address</i>
Context	clear>router>bfd
Description	This command clears BFD sessions.
Parameters	src-ip <i>ip-address</i> — Specifies the address of the local endpoint of this BFD session. dst-ip <i>ip-address</i> — Specifies the address of the remote endpoint of this BFD session.

statistics

Syntax	statistics src-ip <i>ip-address</i> dst-ip <i>ip-address</i> statistics all
Context	clear>router>bfd
Description	This command clears BFD statistics.
Parameters	src-ip <i>ip-address</i> — Specifies the address of the local endpoint of this BFD session. dst-ip <i>ip-address</i> — Specifies the address of the remote endpoint of this BFD session. all — Clears statistics for all BFD sessions.

dhcp

Syntax	dhcp
Context	clear>router
Description	This command enables the context to clear DHCP related information.

dhcp6

Syntax	dhcp6
Context	clear>router
Description	This command enables the context to clear DHCP6 related information.

forwarding-table

Syntax	forwarding-table [<i>slot-number</i>]
Context	clear>router
Description	This command clears entries in the forwarding table (maintained by the IOMs). If the slot number is not specified, the command forces the route table to be recalculated.
Parameters	<i>slot-number</i> — Clears the specified card slot.
	Default all IOMs
	Values 1 — 10

grt-lookup

Syntax	grt-lookup
Context	clear>router
Description	This command re-evaluates route policies for GRT.

icmp-redirect-route

Syntax	icmp-redirect-route { all <i>ip-address</i> }
Context	clear>router
Description	This command deletes routes created as a result of ICMP redirects received on the management interface.
Parameters	all — Clears all routes. <i>ip-address</i> — Clears the routes associated with the specified IP address.

icmp6

Syntax	icmp6 all icmp6 global icmp6 interface <i>interface-name</i>
Context	clear>router
Description	This command clears ICMP statistics.
Parameters	all — Clears all statistics. global — Clears global statistics.

Clear Commands

interface-name — Clears ICMP6 statistics for the specified interface.

interface

Syntax	interface [<i>ip-int-name</i> <i>ip-addr</i>] [icmp] [urpf-stats] [statistics]
Context	clear>router
Description	This command clears IP interface statistics. If no IP interface is specified either by IP interface name or IP address, the command will perform the clear operation on all IP interfaces.
Parameters	<i>ip-int-name</i> / <i>ip-addr</i> — The IP interface name or IP interface address. Default All IP interfaces. icmp — Specifies to reset the ICMP statistics for the IP interface(s) used for ICMP rate limiting. urpf-stats — - Resets the statistics associated with uRPF failures. statistics — - Resets the IP interface traffic statistics.

l2tp

Syntax	l2tp
Context	clear>router
Description	This command enables the context to clear L2PT data.

group

Syntax	group <i>tunnel-group-name</i>
Context	clear>router>l2tp
Description	This command clears L2PT data.
Parameters	<i>tunnel-group-name</i> — Specifies a Layer Two Tunneling Protocol Tunnel Group name.

tunnel

Syntax	tunnel <i>tunnel-id</i>
Context	clear>router>l2tp
Description	This command clears L2PT data.

Parameters *tunnel-group-name* — Clears L2TP tunnel statistics.

statistics

Syntax **statistics**

Context
clear>router>l2tp
clear>router>l2tp>group
clear>router>l2tp> tunnel

Description This command clears statistics for the specified context.

statistics

Syntax **statistics** [*ip-address* | *ip-int-name*]

Context
clear>router>dhcp
clear>router>dhcp6

Description This command clear statistics for DHCP and DHCP6and DHCP6 relay and snooping statistics.
If no IP address or interface name is specified, then statistics are cleared for all configured interfaces.
If an IP address or interface name is specified, then only data regarding the specified interface is cleared.

Parameters *ip-address* | *ip-int-name* — Displays statistics for the specified IP interface.

neighbor

Syntax **neighbor** {**all** | *ip-address*}
neighbor [**interface** *ip-int-name* | *ip-address*]

Context clear>router

Description This command clears IPv6 neighbor information.

Parameters **all** — Clears IPv6 neighbors.

ip-int-name — Clears the specified neighbor interface information.

Values 32 characters maximum

ip-address — Clears the specified IPv6 neighbors.

Values ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x: [0 — FFFF]H
d: [0 — 255]D

router-advertisement

Syntax	router-advertisement all router-advertisement [interface <i>interface-name</i>]
Context	clear>router
Description	This command clears all router advertisement counters.
Parameters	<i>all</i> — Clears all router advertisement counters for all interfaces. interface <i>interface-name</i> — Clear router advertisement counters for the specified interface.

Debug Commands

destination

Syntax	destination <i>trace-destination</i>
Context	debug>trace
Description	This command specifies the destination to send trace messages.
Parameters	<i>trace-destination</i> — The destination to send trace messages.
Values	stdout, console, logger, memory

enable

Syntax	[no] enable
Context	debug>trace
Description	This command enables the trace. The no form of the command disables the trace.

trace-point

Syntax	[no] trace-point [module <i>module-name</i>] [type <i>event-type</i>] [class <i>event-class</i>] [task <i>task-name</i>] [function <i>function-name</i>]
Context	debug>trace
Description	This command adds trace points. The no form of the command removes the trace points.

router

Syntax	router <i>router-instance</i>
Context	debug
Description	This command configures debugging for a router instance.
Parameters	<i>router-instance</i> — Specify the router name or service ID.
Values	<i>router-name:</i> Base, management <i>service-id:</i> 1 — 2147483647

Debug Commands

Default Base

ip

Syntax ip
Context debug>router
Description This command configures debugging for IP.

arp

Syntax arp
Context debug>router>ip
Description This command configures route table debugging.

icmp

Syntax [no] icmp
Context debug>router>ip
Description This command enables ICMP debugging.

icmp6

Syntax icmp6 [*ip-int-name*]
no icmp6
Context debug>router>ip
Description This command enables ICMP6 debugging.

interface

Syntax [no] interface [*ip-int-name* | *ip-address* | *ipv6-address* | *ipv6-address*]
Context debug>router>ip
Description This command displays the router IP interface table sorted by interface index.

Parameters *ip-address* — Only displays the interface information associated with the specified IP address.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
x:	[0 — FFFF]H
d:	[0 — 255]D

ip-int-name — Only displays the interface information associated with the specified IP interface name.

Values 32 characters maximum

packet

Syntax **packet** [*ip-int-name* | *ip-address*] [**headers**] [*protocol-id*]
no packet [*ip-int-name* | *ip-address*]

Context debug>router>ip

Description This command enables debugging for IP packets.

Parameters *ip-int-name* — Only displays the interface information associated with the specified IP interface name.

Values 32 characters maximum

ip-address — Only displays the interface information associated with the specified IP address.

headers — Only displays information associated with the packet header.

protocol-id — Specifies the decimal value representing the IP protocol to debug. Well known protocol numbers include ICMP(1), TCP(6), UDP(17). The **no** form the command removes the protocol from the criteria.

Values 0 — 255 (values can be expressed in decimal, hexadecimal, or binary)

route-table

Syntax **route-table** [*ip-prefix/prefix-length*]
route-table *ip-prefix/prefix-length longer*
no route-table

Context debug>router>ip

Description This command configures route table debugging.

Parameters *ip-prefix* — The IP prefix for prefix list entry in dotted decimal notation.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 — 32
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
x:	[0 — FFFF]H

Debug Commands

ipv6-prefix-length d: [0 — 255]D
 0 — 128

longer — Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values greater than the specified *mask*.

tunnel-table

Syntax **tunnel-table** [*ip-address*] [**ldp** | **rsvp** [**tunnel-id** *tunnel-id*]] **sdp** [**sdp-id** *sdp-id*]]

Context debug>router>ip

Description This command enables debugging for tunnel tables.

mtrace

Syntax [**no**] **mtrace**

Context debug>router

Description This command configures debugging for mtrace.

tms

Syntax [**no**] **tms** [**interface** <*tms-interface*>] **api** [**detail**] <*tms-interface*>

Context debug>router

Description This command configures debugging for Threat Management Services.

misc

Syntax [**no**] **misc**

Context debug>router>mtrace

Description This command enables debugging for mtrace miscellaneous.

packet

Syntax [**no**] **packet** [**query** | **request** | **response**]

Context debug>router>mtrace

Description This command enables debugging for mtrace packets.

In This Chapter

This chapter provides information about configuring Virtual Router Redundancy Protocol (VRRP) parameters. Topics in this chapter include:

VRRP Overview

The Virtual Router Redundancy Protocol (VRRP) for IPv4 is defined in the IETF RFC 3768, *Virtual Router Redundancy Protocol*. VRRP for IPv6 is specified in *draft-ietf-vrrp-unified-spec-02.txt*. VRRP describes a method of implementing a redundant IP interface shared between two or more routers on a common LAN segment, allowing a group of routers to function as one virtual router. When this IP interface is specified as a default gateway on hosts directly attached to this LAN, the routers sharing the IP interface prevent a single point of failure by limiting access to this gateway address. VRRP can be implemented on IES service interfaces and on core network IP interfaces.

If the master virtual router fails, the backup router configured with the highest acceptable priority becomes the master virtual router. The new master router assumes the normal packet forwarding for the local hosts.

Figure 12 displays an example of a VRRP configuration.

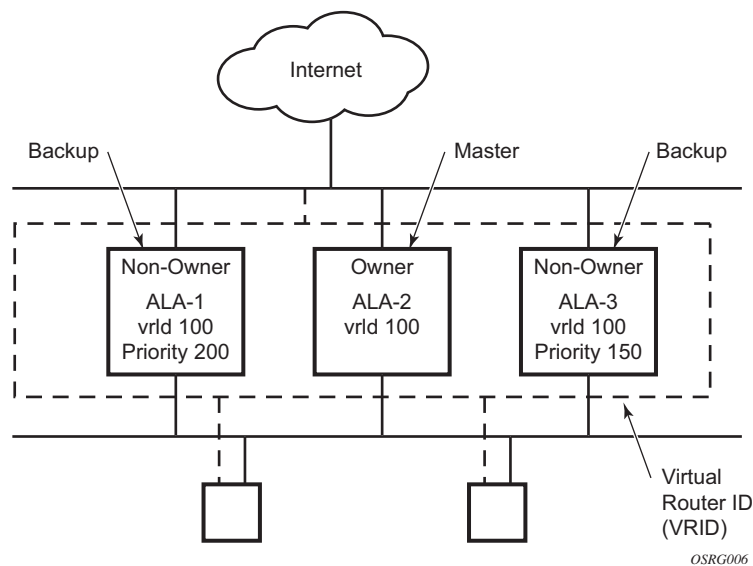

Figure 12: VRRP Configuration

VRRP Components

VRRP consists of the following components:

- [Virtual Router on page 263](#)
 - [IP Address Owner on page 263](#)
 - [Primary and Secondary IP Addresses on page 264](#)
 - [Virtual Router Master on page 264](#)
 - [Virtual Router Backup on page 265](#)
 - [Owner and Non-Owner VRRP on page 265](#)
-

Virtual Router

A virtual router is a logical entity managed by VRRP that acts as a default router for hosts on a shared LAN. It consists of a Virtual Router Identifier (VRID) and a set of associated IP addresses (or address) across a common LAN. A VRRP router can backup one or more virtual routers.

The purpose of supporting multiple IP addresses within a single virtual router is for multi-netting. This is a common mechanism that allows multiple local subnet attachment on a single routing interface. Up to four virtual routers are possible on a single Alcatel-Lucent IP interface. The virtual routers must be in the same subnet. Each virtual router has its own VRID, state machine and messaging instance.

IP Address Owner

VRRP can be configured in either an owner or non-owner mode. The owner is the VRRP router whose virtual router IP address is the same as the real interface IP address. This is the router that responds to packets addressed to one of the IP addresses for ICMP pings, TCP connections, etc. All other virtual router instances participating in this message domain must have the same VRID configured and cannot be configured as owner.

7750 SR OS allows the virtual routers to be configured as non-owners of the IP address. VRRP on a 7750 SR router can be configured to allow non-owners to respond to ICMP echo requests when they become the virtual router master for the virtual router. Telnet and other connection-oriented protocols can also be configured for non-owner master response. However, the individual application conversations (connections) will not survive a VRRP failover. A non-owner VRRP

router operating as a backup will not respond to any packets addressed to any of the virtual router IP addresses.

Primary and Secondary IP Addresses

A primary address is an IP address selected from the set of real interface address. VRRP advertisements are always sent using the primary IP address as the source of the IP packet.

A 7750 SR IP interface must always have a primary IP address assigned for VRRP to be active on the interface. 7750 SR OS supports both primary and secondary IP addresses (multi-netting) on the IP interface. The virtual router's VRID primary IP address is always the primary address on the IP interface. VRRP uses the primary IP address as the IP address placed in the source IP address field of the IP header for all VRRP messages sent on that interface.

Virtual Router Master

The VRRP router which controls the IP address(es) associated with a virtual router is called the master. The master is responsible for forwarding packets sent to the VRRP IP addresses. An election process provides dynamic failover of the forwarding responsibility if the master becomes unavailable. This allows any of the virtual router IP addresses on the LAN to be used as the default first hop router by end hosts. This enables a higher availability default path without requiring configuration of dynamic routing or router discovery protocols on every end host.

If the master is unavailable, each backup virtual router for the VRID compare the configured priority values to determine the master role. In case of a tie, the virtual router with the highest primary IP address becomes master.

The `preempt` parameter can be set to `false` to prevent a backup virtual router with a better priority value from becoming master when an existing non-owner virtual router is the current master. This is determined on a first-come, first-served basis.

While master, a virtual router routes and originates all IP packets into the LAN using the physical MAC address for the IP interface as the Layer 2 source MAC address, not the VRID MAC address. ARP packets also use the parent IP interface MAC address as the Layer 2 source MAC address while inserting the virtual router MAC address in the appropriate hardware address field. VRRP messages are the only packets transmitted using the virtual router MAC address as the Layer 2 source MAC.

Virtual Router Backup

A new virtual router master is selected from the set of VRRP routers available to assume forwarding responsibility for a virtual router should the current master fail.

Owner and Non-Owner VRRP

The owner controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The owner assumes the role of the master virtual router. Only one virtual router in the domain can be configured as owner. All other virtual router instances participating in this message domain must have the same VRID configured.

The most important parameter to be defined on a non-owner virtual router instance is the priority. The priority defines a virtual router's selection order in the master election process. The priority value and the preempt mode determine the virtual router with the highest priority to become the master virtual router.

The base priority is used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy. VRRP priority control policies can be used to either override or adjust the base priority value depending on events or conditions within the chassis.

For information about non-owner access parameters, refer to [VRRP Non-Owner Accessibility on page 282](#).

Configurable Parameters

In addition to backup IP addresses, to facilitate configuration of a virtual router on 7750 SR routers, the following parameters can be defined in owner configurations:

- [Virtual Router ID \(VRID\) on page 266](#)
- [Message Interval and Master Inheritance on page 268](#)
- [VRRP Message Authentication on page 270](#)
- [Authentication Data on page 272](#)
- [Virtual MAC Address on page 272](#)

The following parameters can be defined in non-owner configurations:

- [Virtual Router ID \(VRID\) on page 266](#)
 - [Priority on page 266](#)
 - [Message Interval and Master Inheritance on page 268](#)
 - [Master Down Interval on page 269](#)
 - [Preempt Mode on page 269](#)
 - [VRRP Message Authentication on page 270](#)
 - [Authentication Data on page 272](#)
 - [Virtual MAC Address on page 272](#)
 - [Inherit Master VRRP Router's Advertisement Interval Timer on page 273](#)
 - [Policies on page 273](#)
-

Virtual Router ID (VRID)

The VRID must be configured with the same value on each virtual router associated with the redundant IP address (IP addresses). It is placed in all VRRP advertisement messages sent by each virtual router.

Priority

The priority value affects the interaction between this VRID and the same VRID of other virtual routers participating on the same LAN. A higher priority value defines a greater priority in becoming the virtual router master for the VRID. The priority value can only be configured when

the defined IP address on the IP interface is different than the virtual router IP address (non-owner mode).

When the IP address on the IP interface matches the virtual router IP address (owner mode), the priority value is fixed at 255, the highest value possible. This virtual router member is considered the owner of the virtual router IP address. There can only be one owner of the virtual router IP address for all virtual router members.

The priority value 0 is reserved for VRRP advertisement message purposes. It is used to tell other virtual routers in the same VRID that this virtual router is no longer acting as master, triggering a new election process. When this happens, each backup virtual router sets its master down timer equal to the skew time value. This shortens the time until one of the backup virtual routers becomes master.

The current master virtual router must transmit a VRRP advertisement message immediately upon receipt of a VRRP message with priority set to 0. This prevents another backup from becoming master for a short period of time.

Non-owner virtual routers may be configured with a priority of 254 through 1. The default value is 100. Multiple non-owners can share the same priority value. When multiple non-owner backup virtual routers are tied (transmit VRRP advertisement messages simultaneously) in the election process, both become master simultaneously, the one with the best priority will win the election. If the priority value in the message is equal to the master's local priority value, then the primary IP address of the local master and the message is evaluated as the tie breaker. The higher IP address becomes master. (The primary IP address is the source IP address of the VRRP advertisement message.)

The priority is also used to determine when to preempt the existing master. If the preempt mode value is true, VRRP advertisement messages from inferior (lower priority) masters are discarded, causing the master down timer to expire and the transition to master state.

The priority value also dictates the skew time added to the master timeout period.

IP Addresses

Each virtual router participating in the same VRID should be defined with the same set of IP addresses. These are the IP addresses being used by hosts on the LAN as gateway addresses. Multi-netting supports 16 IP addresses on the IP interface, up to 16 addresses can be assigned to a specific a virtual router instance.

Message Interval and Master Inheritance

Each virtual router is configured with a message interval per VRID within which it participates. This parameter must be the same for every virtual router on the VRID.

For IPv4, the default advertisement interval is 1 second and can be configured between 100 milliseconds and 255 seconds 900 milliseconds. For IPv6, the default advertisement interval is 1 second and can be configured between 100 milliseconds and 40 seconds 950 milliseconds.

As specified in the RFC, the advertisement interval field in every received VRRP advertisement message must match the locally configured advertisement interval. If a mismatch occurs, depending on the inherit configuration, the current master's advertisement interval setting can be used to operationally override the locally configured advertisement interval setting. If the current master changes, the new master setting is used. If the local virtual router becomes master, the locally configured advertisement interval is enforced.

If a VRRP advertisement message is received with an advertisement interval set to a value different than the local value and the inherit parameter is disabled, the message is discarded without processing.

The master virtual router on a VRID uses the advertisement interval to load the advertisement timer, specifying when to send the next VRRP advertisement message. Each backup virtual router on a VRID uses the advertisement interval (with the configured local priority) to derive the master down timer value.

VRRP advertisements messages that are fragmented, contain IP options (IPv4), or contain extension headers (IPv6) require a longer message interval to be configured.

Skew Time

The skew time is used to add a time period to the master down interval. This is not a configurable parameter. It is derived from the current local priority of the virtual router's VRID. To calculate the skew time, the virtual router evaluates the following formula:

For IPv4: $\text{Skew Time} = ((256 - \text{priority}) / 256) \text{ seconds}$

For IPv6: $\text{Skew Time} = (((256 - \text{priority}) * \text{Master_Adver_Interval}) / 256) \text{ centiseconds}$

The higher priority value, the smaller the skew time will be. This means that virtual routers with a lower priority will transition to master slower than virtual routers with higher priorities.

Master Down Interval

The master down interval is a calculated value used to load the master down timer. When the master down timer expires, the virtual router enters the master state. To calculate the master down interval, the virtual router evaluates the following formula:

$$\text{Master Down Interval} = (3 \times \text{Operational Advertisement Interval}) + \text{Skew Time}$$

The operational advertisement interval is dependent upon the state of the inherit parameter. When the inherit parameter is enabled, the operational advertisement interval is derived from the current master's advertisement interval field in the VRRP advertisement message. When inherit is disabled, the operational advertisement interval must be equal to the locally configured advertisement interval.

The master down timer is only operational when the local virtual router is operating in backup mode.

Preempt Mode

Preempt mode is a true or false configured value which controls whether a specific backup virtual router preempts a lower priority master. The IP address owner will always become master when available. Preempt mode cannot be set to false on the owner virtual router. The default value for preempt mode is true.

When preempt mode is true, the advertised priority from the incoming VRRP advertisement message from the current master is compared to the local configured priority. If the local priority is higher, the received VRRP advertisement message is discarded. This will result in the eventual expiration of the master down timer causing a transition to the master state. If the received priority is equal to the local priority, the message is not discarded and the current master will not be discarded. Note that when in the backup state, the received primary IP address is not part of the decision to preempt and is not used as a tie breaker when the received and local priorities are equal.

When preempt is enabled, the virtual router instance overrides any non-owner master with an in-use message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

VRRP Message Authentication

The authentication type parameter defines the type of authentication used by the virtual router in VRRP advertisement message authentication. VRRP message authentication is applicable to IPv4 only. The current master uses the configured authentication type to indicate any egress message manipulation that must be performed in conjunction with any supporting authentication parameters before transmitting a VRRP advertisement message. The configured authentication type value is transmitted in the message authentication type field with the appropriate authentication data field filled in. Backup routers use the authentication type message field value in interpreting the contained authentication data field within received VRRP advertisement messages.

VRRP supports three message authentication methods which provide varying degrees of security. The supported authentication types are:

- 0 – No Authentication
- 1 – Simple Text Password
- 2 – IP Authentication Header

Authentication Type 0 – No Authentication

The use of type 0 indicates that VRRP advertisement messages are not authenticated (provides no authentication). The master transmitting VRRP advertisement messages will transmit the value 0 in the egress messages authentication type field and the authentication data field. Backup virtual routers receiving VRRP advertisement messages with the authentication type field equal to 0 will ignore the authentication data field in the message.

All compliant VRRP advertisement messages are accepted. The following fields within the received VRRP advertisement message are checked for compliance (the VRRP specification may require additional checks).

- IP header checks specific to VRRP
 - IP header destination IP address – Must be 224.0.0.18
 - IP header TTL field – Must be equal to 255, the packet must not have traversed any IP routed hops
 - IP header protocol field – must be 112 (decimal)

- VRRP message checks
 - Version field – Must be set to the value 2
 - Type field – Must be set to the value of 1 (advertisement)
 - Virtual router ID field – Must match one of the configured VRID on the ingress IP interface (All other fields are dependent on matching the virtual router ID field to one of the interfaces configured VRID parameters)
 - Priority field – Must be equal to or greater than the VRID in-use priority or be equal to 0 (Note, equal to the VRID in-use priority and 0 requires further processing regarding master/backup and senders IP address to determine validity of the message)
 - Authentication type field – Must be equal to 0
 - Advertisement interval field – Must be equal to the VRID configured advertisement interval
 - Checksum field – Must be valid
 - Authentication data fields – Must be ignored.

VRRP messages not meeting the criteria are silently dropped.

Authentication Type 1 – Simple Text Password

The use of type 1 indicates that VRRP advertisement messages are authenticated with a clear (simple) text password. All virtual routers participating in the virtual router instance must be configured with the same 8 octet password. Transmitting virtual routers place a value of 1 in the VRRP advertisement message authentication type field and put the configured simple text password into the message authentication data field. Receiving virtual routers compare the message authentication data field with the local configured simple text password based on the message authentication type field value of 1.

The same checks are performed for type 0 with the following exceptions (the VRRP specification may require additional checks):

- VRRP message checks
 - Authentication type field – Must be equal to 1
 - Authentication data fields – Must be equal to the VRID configured simple text password

Any VRRP message not meeting the type 0 verification checks with the exceptions above are silently discarded.

Authentication Failure

Any received VRRP advertisement message that fails authentication must be silently discarded with an invalid authentication counter incremented for the ingress virtual router instance.

Authentication Data

This feature is different than the VRRP advertisement message field with the same name. This is any required authentication information that is pertinent to the configured authentication type. The type of authentication data used for each authentication type is as follows:

<u>Authentication Type</u>	<u>Authentication Data</u>
0	None, authentication is not performed
1	Simple text password consisting of 8 octets

Virtual MAC Address

The MAC address can be used instead of an IP address in ARP responses when the virtual router instance is master. The MAC address configuration must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts will result. All VRRP advertisement messages are transmitted with *ieee-mac-addr* as the source MAC.

VRRP Advertisement Message IP Address List Verification

VRRP advertisement messages contain an IP address count field that indicates the number of IP addresses listed in the sequential IP address fields at the end of the message. The 7750 SR OS implementation always logs mismatching events. The decision on where and whether to forward the generated messages depends on the configuration of the event manager.

To facilitate the sending of mismatch log messages, each virtual router instance keeps the mismatch state associated with each source IP address in the VRRP master table. Whenever the state changes, a mismatch log message is generated indicating the source IP address within the message, the mismatch or match event and the time of the event.

With secondary IP address support, multiple IP addresses may be found in the list and it should match the IP address on the virtual router instance. Owner and non-owner virtual router instances

have the supported IP addresses explicitly defined, making mismatched supported IP address within the interconnected virtual router instances a provisioning issue.

Inherit Master VRRP Router's Advertisement Interval Timer

The virtual router instance can inherit the master VRRP router's advertisement interval timer which is used by backup routers to calculate the master down timer.

The inheritance is only configurable in the non-owner nodal context. It is used to allow the current virtual router instance master to dictate the master down timer for all backup virtual routers.

IPv6 Virtual Router Instance Operationally Up

Once the IPv6 virtual router is properly configured with a minimum of one link-local backup address, the parent interface's router advertisement must be configured to use the virtual MAC address for the virtual router to be considered operationally up.

Policies

Policies can be configured to control VRRP priority with the virtual router instance. VRRP priority control policies can be used to override or adjust the base priority value depending on events or conditions within the chassis.

The policy can be associated with more than one virtual router instance. The priority events within the policy override or diminish the base priority dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

Policies can only be configured in the non-owner VRRP context. For non-owner virtual router instances, if policies are not configured, then the base priority is used as the in-use priority.

VRRP Priority Control Policies

This implementation of VRRP supports control policies to manipulate virtual router participation in the VRRP master election process and master self-deprecation. The local priority value for the virtual router instance is used to control the election process and master state.

VRRP Virtual Router Policy Constraints

Priority control policies can only be applied to non-owner VRRP virtual router instances. Owner VRRP virtual routers cannot be controlled by a priority control policy because they are required to have a priority value of 255 that cannot be diminished. Only one VRRP priority control policy can be applied to a non-owner virtual router instance.

Multiple VRRP virtual router instances may be associated with the same IP interface, allowing multiple priority control policies to be associated with the IP interface.

An applied VRRP priority control policy only affects the in-use priority on the virtual router instance when the preempt mode has been enabled. A virtual router instance with preempt mode disabled will always use the base priority as the in-use priority, ignoring any configured priority control policy.

VRRP Virtual Router Instance Base Priority

Non-owner virtual router instances must have a base priority value between 1 and 254. The value 0 is reserved for master termination. The value 255 is reserved for owners. The default base priority for non-owner virtual router instances is the value 100.

The base priority is the starting priority for the VRRP instance. The actual in-use priority for the VRRP instance is derived from the base priority and an optional VRRP priority control policy.

VRRP Priority Control Policy Delta In-Use Priority Limit

A VRRP priority control policy enforces an overall minimum value that the policy can inflict on the VRRP virtual router instance base priority. This value provides a lower limit to the delta priority events manipulation of the base priority.

A delta priority event is a conditional event defined in the priority control policy that subtracts a given amount from the current, in-use priority for all VRRP virtual router instances to which the policy is applied. Multiple delta priority events can apply simultaneously, creating a dynamic priority value. The base priority for the instance, less the sum of the delta values derives the actual priority value in-use.

An explicit priority event is a conditional event defined in the priority control policy that explicitly defines the in-use priority for the virtual router instance. The explicitly defined values are not affected by the delta in-use priority limit. When multiple explicit priority events happen simultaneously, the lowest value is used for the in-use priority. The configured base priority is not a factor in explicit priority overrides of the in-use priority.

The allowed range of the Delta In-Use Priority Limit is 1 to 254. The default is 1, which prevents the delta priority events from operationally disabling the virtual router instance.

VRRP Priority Control Policy Priority Events

The main function of a VRRP priority control policy is to define conditions or events that impact the system's ability to communicate with outside hosts or portions of the network. When one or multiple of these events are true, the base priority on the virtual router instance is either overwritten with an explicit value, or a sum of delta priorities is subtracted from the base priority. The result is the in-use priority for the virtual router instance. Any priority event may be configured as an explicit event or a delta event.

Explicit events override all delta events. When multiple explicit events occur, the event with the lowest priority value is assigned to the in-use priority. As events clear, the in-use priority is reevaluated accordingly and adjusted dynamically.

Delta priority events also have priority values. When no explicit events have occurred within the policy, the sum of the occurring delta events priorities is subtracted from the base priority of each virtual router instance. If the result is lower than the delta in-use priority limit, the delta in-use priority limit is used as the in-use priority for the virtual router instance. Otherwise, the in-use priority is set to the base priority less the sum of the delta events.

Each event generates a VRRP priority event message indicating the policy-id, the event type, the priority type (delta or explicit) and the event priority value. Another log message is generated when the event is no longer true, indicating that it has been cleared.

Priority Event Hold-Set Timers

Hold-set timers are used to dampen the effect of a flapping event. A flapping event is where the event continually transitions between clear and set. The hold-set value is loaded into a hold set timer that prevents a set event from transitioning to the cleared state until it expires.

Each time an event transitions between cleared and set, the timer is loaded and begins to count down to zero. If the timer reaches zero, the event will be allowed to enter the cleared state once more. Entering the cleared state is always dependent on the object controlling the event conforming to the requirements defined in the event itself. It is possible, on some event types, to have a further set action reload the hold set timer. This extends the amount of time that must expire before entering the cleared state.

For an example of a hold-set timer setting, refer to [LAG Degrade Priority Event on page 277](#).

Port Down Priority Event

The port down priority event is tied to either a physical port or a SONET/SDH channel. The port or channel operational state is evaluated to determine a port down priority event or event clear.

When the port or channel operational state is up, the port down priority event is considered false or cleared. When the port or channel operational state is down, the port down priority event is considered true or set.

LAG Degraded Priority Event

The LAG degraded priority event is tied to an existing Link Aggregation Group (LAG). The LAG degraded priority event is conditional to percentage of available port bandwidth on the LAG. Multiple bandwidth percentage thresholds may be defined, each with its own priority value.

If the LAG transitions from one threshold to the next, the previous threshold priority value is subtracted from the total delta sum while the new threshold priority value is added to the sum. The new sum is then subtracted from the base priority and compared to the delta in-use priority limit to derive the new in-use priority on the virtual router instance.

The following example illustrates a LAG priority event and its interaction with the hold set timer in changing the in-use priority.

The following state and timer settings are used for the LAG events displayed in [Table 6](#):

- User-defined thresholds: 2 ports down 4 ports down 6 ports down
- LAG configured ports: 8 ports
- Hold set timer (hold-set): 5 seconds

Table 6: LAG Events

Time	LAG Port State	Parameter	State	Comments
0	All ports down	Event State	Set - 8 ports down	
		Event Threshold	6 ports down	
		Hold Set Timer	5 seconds	Set to hold-set parameter

VRRP Priority Control Policies

Table 6: LAG Events (Continued)

Time	LAG Port State	Parameter	State	Comments
1	One port up	Event State	Set - 8 ports down	Cannot change until Hold Set Timer expires
		Event Threshold	6 ports down	
		Hold Set Timer	5 seconds	
2	All ports up	Event State	Set - 8 ports down	Still waiting for Hold Set Timer expires
		Event Threshold	6 ports down	
		Hold Set Timer	3 seconds	
5	All ports up	Event State	Cleared - All ports up	Event cleared
		Event Threshold	None	
		Hold Set Timer	Expired	
100	Five ports down	Event State	Set - 5 ports down	Set to hold-set parameter
		Event Threshold	4 ports down	
		Hold Set Timer	Expired	
102	Three ports down	Event State	Set - 5 ports down	
		Event Threshold	4 ports down	
		Hold Set Timer	3 seconds	
103	All ports up	Event State	Set - 5 ports down	
		Event Threshold	4 ports down	
		Hold Set Timer	2 second	
104	Two ports down	Event State	Set - 5 ports down	Current threshold is 5, so 2 down has no effect
		Event Threshold	4 ports down	
		Hold Set Timer	1 second	
105	Two ports down	Event State	Set - 2 ports down	
		Event Threshold	2 ports down	
		Hold Set Timer	Expired	
200	Four ports down	Event State	Set - 2 ports down	Set to hold-set parameter
		Event Threshold	4 ports down	
		Hold Set Timer	5 seconds	

Table 6: LAG Events (Continued)

Time	LAG Port State	Parameter	State	Comments
202	Seven ports down	Event State	Set - 7 ports down	Changed due to increase
		Event Threshold	6 ports down	
		Hold Set Timer	5 seconds	Set to hold-set due to threshold increase
206	All ports up	Event State	Set - 7 ports down	
		Event Threshold	6 ports down	
		Hold Set Timer	1 second	
207	All ports up	Event State	Cleared - All ports up	
		Event Threshold	None	Event cleared
		Hold Set Timer	Expired	

Host Unreachable Priority Event

The host unreachable priority event creates a continuous ping task that is used to test connectivity to a remote host. The path to the remote host and the remote host itself must be capable and configured to accept ICMP echo request and replies for the ping to be successful.

The ping task is controlled by interval and size parameters that define how often the ICMP request messages are transmitted and the size of each message. A historical missing reply parameter defines when the ping destination is considered unreachable.

When the host is unreachable, the host unreachable priority event is considered true or set. When the host is reachable, the host unreachable priority event is considered false or cleared.

Route Unknown Priority Event

The route unknown priority event defines a task that monitors the existence of a given route prefix in the system's routing table.

The route monitoring task can be constrained by a condition that allows a prefix that is less specific than the defined prefix to be considered as a match. The source protocol can be defined to indicate the protocol the installed route must be populated from. To further define match criteria when multiple instances of the route prefix exist, an optional next hop parameter can be defined.

VRRP Priority Control Policies

When a route prefix exists within the active route table that matches the defined match criteria, the route unknown priority event is considered false or cleared. When a route prefix does not exist within the active route table matching the defined criteria, the route unknown priority event is considered true or set.

VRRP Non-Owner Accessibility

Although the RFC states that only VRRP owners can respond to ping and other management-oriented protocols directed to the VRID IP addresses, 7750 SR OS allows an override of this restraint on a per VRRP virtual router instance basis.

Non-Owner Access Ping Reply

When non-owner access ping reply is enabled on a virtual router instance, ICMP echo request messages destined to the non-owner virtual router instance IP addresses are not discarded at the IP interface when operating in master mode. ICMP echo request messages are always discarded in backup mode.

When non-owner access ping reply is disabled on a virtual router instance, ICMP echo request messages destined to the non-owner virtual router instance IP addresses are silently discarded in both the master and backup modes.

Non-Owner Access Telnet

When non-owner access Telnet is enabled on a virtual router instance, authorized Telnet sessions may be established that are destined to the virtual router instance IP addresses when operating in master mode. Telnet sessions are always discarded at the IP interface when destined to a virtual router IP address operating in backup mode. Enabling non-owner access Telnet does not guarantee Telnet access, proper management and security features must be enabled to allow Telnet on this interface and possibly from the given source IP address.

When non-owner access Telnet is disabled on a virtual router instance, Telnet sessions destined to the non-owner virtual router instance IP addresses are silently discarded in both master and backup modes.

Non-Owner Access SSH

When non-owner access SSH is enabled on a virtual router instance, authorized SSH sessions may be established that are destined to the virtual router instance IP addresses when operating in master mode. SSH sessions are always discarded at the IP interface when destined to a virtual router IP address operating in backup mode. Enabling non-owner access SSH does not guarantee SSH access, proper management and security features must be enabled to allow SSH on this interface and possibly from the given source IP address. SSH is applicable to IPv4 VRRP only.

When non-owner access SSH is disabled on a virtual router instance, SSH sessions destined to the non-owner virtual router instance IP addresses are silently discarded in both master and backup modes.

VRRP Configuration Process Overview

Figure 13 displays the process to provision VRRP parameters.

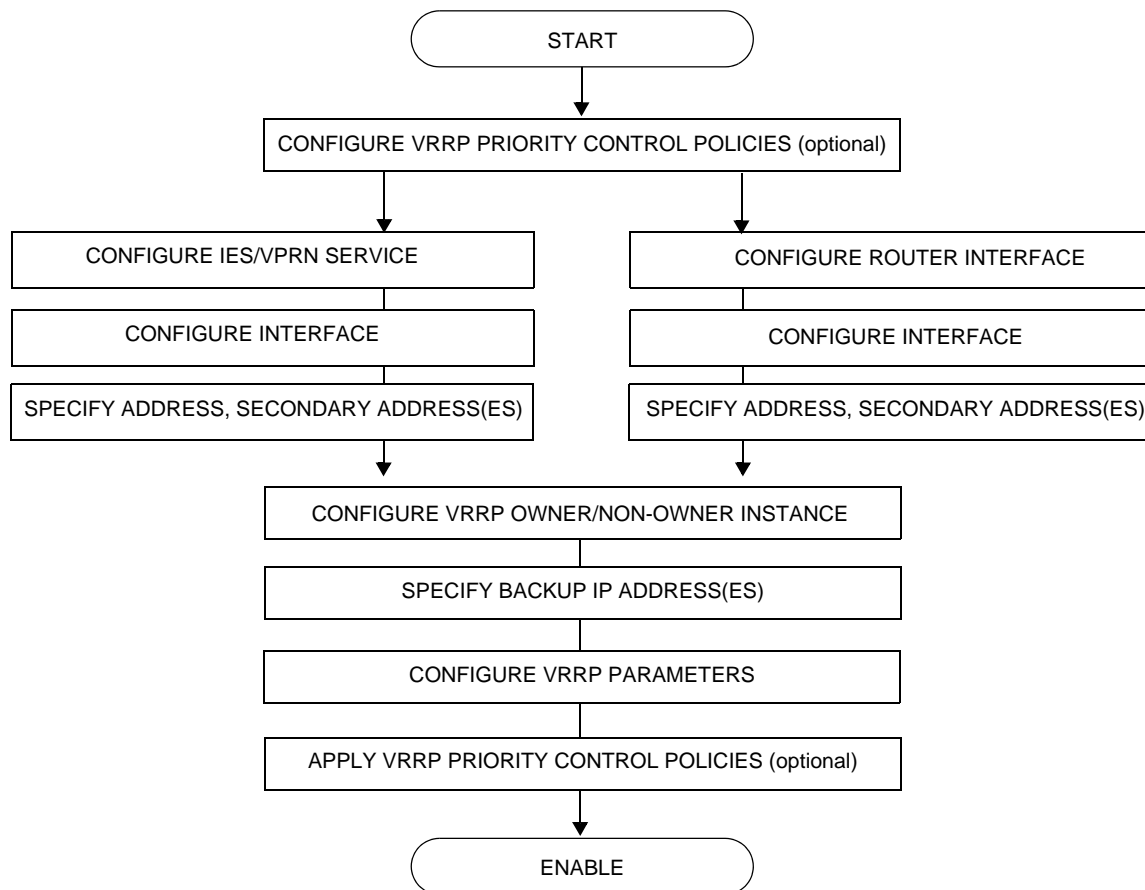

Figure 13: VRRP Configuration and Implementation Flow

Configuration Notes

This section describes VRRP configuration caveats.

General

- Creating and applying VRRP policies are optional.
- Backup command:
 - The backup IP address(es) must be on the same subnet. The backup addresses explicitly define which IP addresses are in the VRRP advertisement message IP address list.
 - In the owner mode, the backup IP address must be identical to one of the interface's IP addresses. The backup address explicitly defines which IP addresses are in the VRRP advertisement message IP address list.
 - For IPv6, one of the backup addresses configured must be the link-local address of the owner VRRP instance.

Configuring VRRP with CLI

This section provides information to configure VRRP using the command line interface.

Topics in this section include:

- [VRRP Configuration Overview on page 288](#)
- [Basic VRRP Configurations on page 289](#)
- [Common Configuration Tasks on page 293](#)
- [Configuring VRRP Policy Components on page 295](#)
- [VRRP Configuration Management Tasks on page 300](#)
- [Modifying a VRRP Policy on page 300](#)
- [Deleting a VRRP Policy on page 301](#)
- [Modifying Service and Interface VRRP Parameters on page 302](#)
 - [Modifying Non-Owner Parameters on page 302](#)
 - [Modifying Owner Parameters on page 302](#)
 - [Deleting VRRP on an Interface or Service on page 302](#)

VRRP Configuration Overview

Configuring VRRP policies and configuring VRRP instances on interfaces and router interfaces is optional. The basic owner and non-owner VRRP configurations on an IES or router interface must specify the **backup** *ip-address* parameter.

VRRP helps eliminate the single point of failure in a routed environment by using virtual router IP address shared between two or more routers connecting the common domain. VRRP provides dynamic fail over of the forwarding responsibility if the master becomes unavailable.

The VRRP implementation allows one master per IP subnet. All other VRRP instances in the same domain must be in backup mode.

Preconfiguration Requirements

VRRP policies:

- VRRP policies must be configured before they can be applied to an interface or IES or VPRN VRRP instance. VRRP policies are configured in the **config>vrrp** context.

Configuring VRRP on an IES or VPRN service interface:

- The service customer account must be created prior to configuring an IES or VPRN VRRP instance.
- The interface address must be specified in the both the owner and non-owner IES, VPRN or router interface instances.

Basic VRRP Configurations

Configure VRRP parameters in the following contexts:

- [VRRP Policy on page 289](#)
- [VRRP IES Service Parameters on page 290](#)
- [VRRP Router Interface Parameters on page 292](#)

VRRP Policy

Configuring and applying VRRP policies are optional. There are no default VRRP policies. Each policy must be explicitly defined. A VRRP configuration must include the following:

- Policy ID
- Define at least one of the following priority events:
 - Port down
 - LAG port down
 - Host unreachable
 - Route unknown

The following example displays a sample configuration of a VRRP policy.

```
A:SR2>config>vrrp>policy# info
-----
      delta-in-use-limit 50
      priority-event
        port-down 4/1/2
          hold-set 43200
          priority 100 delta
        exit
        port-down 4/1/3
          priority 200 explicit
        exit
        lag-port-down 1
          number-down 3
          priority 50 explicit
        exit
        exit
        host-unreachable 10.10.24.4
          drop-count 25
        exit
        route-unknown 10.10.0.0/32
          priority 50 delta
          protocol bgp
        exit
      exit
-----
```

VRRP IES Service Parameters

VRRP parameters are configured within an IES service with two contexts, owner or non-owner. The status is specified when the VRRP configuration is created. When configured as owner, the virtual router instance owns the backup IP addresses. All other virtual router instances participating in this message domain must have the same **vrid** configured and cannot be configured as owner.

For IPv4, up to 4 virtual routers IDs (vrid) can be configured on an IES service interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one virtual router instance can be configured on an IES service interface.

VRRP parameters configured within an IES service must include the following:

- VRID
- Backup IP address(es)

The following example displays a sample configuration of a IES service owner and non-owner VRRP configurations.

```
A:SR2>config>service>ies# info
-----
      interface "tuesday" create
        address 10.10.36.2/24
        sap 7/1/1.2.2 create
        vrrp 19 owner
          backup 10.10.36.2
          authentication-type password
          authentication-key "testabc"
        exit
      exit
      interface "testing" create
        address 10.10.10.16/24
        sap 1/1/55:0 create
        vrrp 12
          backup 10.10.10.15
          policy 1
          authentication-type password
          authentication-key "testabc"
        exit
      exit
      no shutdown
-----
A:SR2>config>service>ies#
```

Configure VRRP for IPv6

The following output shows a VRRP for IPV6 configuration example. The interface must be configured first.

```
*A:nlt7750-3>config>router>router-advert# info
-----
      interface "DSC-101-Application"
        use-virtual-mac
        no shutdown
      exit
...
-----
*A:nlt7750-3>config>router>router-advert#

*A:nlt7750-3>config>service>ies# info
-----
      description "VLAN 921 for DSC-101 Application"
      interface "DSC-101-Application" create
        address 10.152.2.220/28
        vrrp 217
          backup 10.152.2.222
          priority 254
          ping-reply
        exit
        ipv6
          address FD10:D68F:1:221::FFFD/64
          link-local-address FE80::D68F:1:221:FFFD preferred
          vrrp 219
            backup FE80::D68F:1:221:FFFF
            priority 254
            ping-reply
          exit
        exit
      sap ccag-1.a:921 create
        description "cross connect to VPLS 921"
      exit
    exit
    no shutdown
-----
*A:nlt7750-3>config>service>ies#
```

VRRP Router Interface Parameters

VRRP parameters are configured on a router interface with two contexts, owner or non-owner. The status is specified when the VRRP configuration is created. When configured as owner, the virtual router instance owns the backed up IP addresses. All other virtual router instances participating in this message domain must have the same vrid configured and cannot be configured as owner.

For IPv4, up to 4 virtual routers IDs (vrid) can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one virtual router instance can be configured on a router interface.

VRRP parameters configured on a router interface must include the following:

- VRID
- Backup IP address(es)

The following example displays a sample configuration of a router interface owner and non-owner VRRP configurations.

```
A:SR4>config>router# info
#-----
echo "IP Configuration "
#-----
      interface "system"
        address 10.10.0.4/32
      exit
      interface "test1"
        address 10.10.14.1/24
        secondary 10.10.16.1/24
        secondary 10.10.17.1/24
        secondary 10.10.18.1/24
      exit
      interface "test2"
        address 10.10.10.23/24
        vrrp 1 owner
          backup 10.10.10.23
          authentication-type password
          authentication-key "testabc"
        exit
      exit
#-----
A:SR4>config>router#
```

Common Configuration Tasks

This section provides a brief overview of the tasks that must be performed to configure VRRP and provides the CLI commands.

VRRP parameters are defined under a service interface or a router interface context. An IP address must be assigned to each IP interface. Only one IP address can be associated with an IP interface but several secondary IP addresses also be associated.

Owner and non-owner configurations must include the following parameters:

- All participating routers in a VRRP instance must be configured with the same *vrid*.
- All participating *non-owner* routers can specify up to 16 backup IP addresses (IP addresses the master is representing). The *owner* configuration must include at least one backup IP address.
- For IPv6, all participating routers must be configured with the same link-local backup address (the one configured for the owner instance.)

Other owner and non-owner configurations include the following optional commands:

- `authentication-type`
- `authentication-key`
- `MAC`
- `message-interval`

In addition to the common parameters, the following *non-owner* commands can be configured:

- `master-int-inherit`
- `priority`
- `policy`
- `ping-reply`
- `preempt`
- `telnet-reply`
- `ssh-reply (IPv4 only)`
- `[no] shutdown`

Creating Interface Parameters

If you have multiple subnets configured on an Ethernet interface, you can configure VRRP on each subnet.

The following displays an IP interface configuration example:

```
A:SR1>config>router# info
#-----
echo "IP Configuration "
#-----
      interface "system"
        address 10.10.0.1/32
      exit
      interface "testA"
        address 123.123.123.123/24
      exit
      interface "testB"
        address 10.10.14.1/24
        secondary 10.10.16.1/24
        secondary 10.10.17.1/24
        secondary 10.10.18.1/24
      exit
      router-id 10.10.0.1
#-----
A:SR1>config>router#
```

Configuring VRRP Policy Components

The following displays a VRRP policy configuration example:

```
A:SR1>config>vrrp# info
-----
    policy 1
      delta-in-use-limit 50
      priority-event
      port-down 1/1/2
        hold-set 43200
        priority 100 delta
      exit
      route-unknown 0.0.0.0/0
        protocol isis
      exit
    exit
  exit
-----
A:SR1>config>vrrp#
```

Configuring Service VRRP Parameters

VRRP parameters can be configured on an interface in a service to provide virtual default router support which allows traffic to be routed without relying on a single router in case of failure. VRRP can be configured the following ways:

- [Non-Owner VRRP Example on page 296](#)
- [Owner Service VRRP on page 297](#)

Non-Owner VRRP Example

The following displays a basic non-owner VRRP configuration example:

```
A:SR2>config>service>ies# info
-----
...
    interface "testing" create
      address 10.10.10.16/24
      sap 1/1/55:0 create
      vrrp 12
        backup 10.10.10.15
        policy 1
        authentication-type password
        authentication-key "testabc"
      exit
    exit
  no shutdown
-----
A:SR2>config>service>ies#
```

Owner Service VRRP

The following displays the owner VRRP configuration example:

```
A:SR4>config>router# info
#-----
echo "IP Configuration "
#-----
...
    interface "test2"
      address 10.10.10.23/24
      vrrp 1 owner
        backup 10.10.10.23
        authentication-type password
        authentication-key "testabc"
      exit
    exit
#-----
A:SR4>config>router#
```

Configuring Router Interface VRRP Parameters

VRRP parameters can be configured on an interface in an interface to provide virtual default router support which allows traffic to be routed without relying on a single router in case of failure.

VRRP can be configured the following ways:

- [Router Interface VRRP Non-Owner on page 298](#)

Router Interface VRRP Non-Owner

The following displays a non-owner interface VRRP configuration example:

```
A:SR2>config># info
#-----
    interface "if-test"
        address 10.20.30.40/24
        secondary 10.10.50.1/24
        secondary 10.10.60.1/24
        secondary 10.10.70.1/24
        vrrp 1
            backup 10.10.50.2
            backup 10.10.60.2
            backup 10.10.70.2
            backup 10.20.30.41
            ping-reply
            telnet-reply
            authentication-type password
            authentication-key "testabc"
        exit
    exit
#-----
A:SR2>config>#
```

Router Interface VRRP Owner

The following displays router interface owner VRRP configuration example:

```
A:SR2>config>router# info
#-----
    interface "vrrpowner"
        address 10.10.10.23/24
        vrrp 1 owner
            backup 10.10.10.23
            authentication-type password
            authentication-key "testabc"
        exit
    exit
#-----
A:SR2>config>router#
```

VRRP Configuration Management Tasks

This section discusses the following VRRP configuration management tasks:

- [Modifying a VRRP Policy on page 300](#)
 - [Deleting a VRRP Policy on page 301](#)
 - [Modifying Service and Interface VRRP Parameters on page 302](#)
 - [Modifying Non-Owner Parameters on page 302](#)
 - [Modifying Owner Parameters on page 302](#)
 - [Deleting VRRP on an Interface or Service on page 302](#)
-

Modifying a VRRP Policy

To access a specific VRRP policy, you must specify the policy ID. To display a list of VRRP policies, use the `show vrrp policy` command.

The following example displays the modified VRRP policy configuration:

```
A:SR2>config>vrrp>policy# info
-----
      delta-in-use-limit 50
      priority-event
        port-down 1/1/2
          hold-set 43200
          priority 100 delta
        exit
      port-down 1/1/3
        priority 200 explicit
      exit
      host-unreachable 10.10.24.4
        drop-count 25
      exit
    exit
-----
A:SR2>config>vrrp>policy#
```

Deleting a VRRP Policy

Policies are only applied to non-owner VRRP instances. A VRRP policy cannot be deleted if it is applied to an interface or to an IES service. Each instance in which the policy is applied must be deleted.

The `Applied` column in the following example displays whether or not the VRRP policies are applied to an entity.

```
A:SR2#
=====
VRRP Policies
=====
Policy      Current      Current      Current      Delta      Applied
Id          Priority & Effect  Explicit    Delta Sum    Limit
-----
1           200 Explicit    200          100         50         Yes
15          254          None         None         1           No
32          100          None         None         1           No
=====
A:SR2#
```

Modifying Service and Interface VRRP Parameters

Modifying Non-Owner Parameters

Once a VRRP instance is created as non-owner, it cannot be modified to the `owner` state. The `vrid` must be deleted and then recreated with the `owner` keyword to invoke IP address ownership.

Modifying Owner Parameters

Once a VRRP instance is created as `owner`, it cannot be modified to the non-owner state. The `vrid` must be deleted and then recreated *without* the `owner` keyword to remove IP address ownership.

Entering the `owner` keyword is optional when entering the `vrid` for modification purposes.

Deleting VRRP on an Interface or Service

The `vrid` does not need to be shutdown to remove the virtual router instance from an interface or service.

Example:

```
config>router#interface
config>router# interface if-test
config>router>if# shutdown
config>router>if# exit
config>router# no interface if-test
config>router#
```

The following example displays the command usage to delete a VRRP instance from an interface or IES service:

Example:

```
config>service#ies 10
config>service>ies# interface "test"
config>service>ies>if# vrrp 1
config>service>ies>if>vrrp# shutdown
config>service>ies>if>vrrp# exit
config>service>ies>if# no vrrp 1
config>service>ies>if# exit all
```

VRRP Network Interface Commands

```

config
  — router
    — [no] interface interface-name
      — address {ip-address/mask | ip-address netmask} [broadcast all-ones | host-ones]
      — no address
      — [no] allow-directed-broadcasts
      — arp-timeout seconds
      — no arp-timeout
      — description description-string
      — no description
      — secondary {ip-address/mask | ip-address netmask} [broadcast all-ones | host-ones] [igp-inhibit]
      — no secondary {ip-address/mask | ip-address netmask}
      — [no] shutdown
      — static-arp ip-address ieee-address
      — [no] static-arp ip-address
      — tos-marking-state {trusted | untrusted}
      — no tos-marking-state
      — unnumbered [ip-int-name | ip-address]
      — no unnumbered
      — vrrp virtual-router-id [owner] *
      — no vrrp virtual-router-id
        — authentication-key [authentication-key | hash-key] [hash | hash2]
        — no authentication-key
        — [no] backup ip-address
        — [no] bfd-enable service-id interface interface-name dst-ip ip-address
        — [no] bfd-enable interface interface-name dst-ip ip-address
        — init-delay seconds
        — no init-delay
        — mac mac-address
        — no mac
        — [no] master-int-inherit
        — message-interval {[seconds] [milliseconds milliseconds]}
        — no message-interval
        — [no] ping-reply
        — policy policy-id
        — no policy
        — [no] preempt
        — priority priority
        — no priority
        — [no] ssh-reply
        — [no] standby-forwarding
        — [no] telnet-reply
        — [no] shutdown
        — [no] traceroute-reply

```

* Note that VRRP commands are applicable to router interfaces, IES interfaces and VPRN. The **authentication-key**, **authentication-type**, **bfd-enable**, and **ssh-reply** commands are applicable only to IPv4 contexts, not IPv6.

Router Interface IPv6 Commands

```

config
  — router [router-name]
    — [no] interface ip-int-name
      — [no] ipv6

      — no packets interface ip-int-name [vrid virtual-router-id]
      — no packets interface ip-int-name vrid virtual-router-id ipv6
```

Configuration Commands

Interface Configuration Commands

authentication-key

Syntax	authentication-key [<i>authentication-key</i> <i>hash-key</i>] [hash hash2] no authentication-key
Context	config>router>if>vrrp
Description	<p>This command sets the simple text authentication key used to generate master VRRP advertisement messages and validates VRRP advertisements.</p> <p>If simple text password authentication is not required, the authentication-key command is not required.</p> <p>The command is configurable in both non-owner and owner vrrp nodal contexts.</p> <p>The <i>key</i> parameter identifies the simple text password to be used when VRRP Authentication Type 1 is enabled on the virtual router instance. Type 1 uses an eight octet long string that is inserted into all transmitted VRRP advertisement messages and is compared against all received VRRP advertisement messages. The authentication data fields are used to transmit the <i>key</i>.</p> <p>The <i>key</i> string is case sensitive and is left justified in the VRRP advertisement message authentication data fields. The first field contains the first four characters with the first octet (starting with IETF RFC bit position 0) containing the first character. The second field similarly holds the fifth through eighth characters. Any unspecified portion of the authentication data field is padded with a 0 value in the corresponding octet.</p> <p>If the command is re-executed with a different password key defined, the new key is used ediatly.</p> <p>The authentication-key command can be executed at anytime.</p> <p>To change the current in-use password key on multiple virtual router instances:</p> <ol style="list-style-type: none"> 1. Identify the current master. 2. Shutdown the virtual router instance on all backups. 3. Execute the authentication-key command on the master to change the password key. 4. Execute the authentication-key command and no shutdown command on each backup. <p>The no form of the command reverts to the default value.</p>
Default	no authentication-key — The authentication key value is the null string.
Parameters	<i>authentication-key</i> — The authentication key. Allowed values are any string up to 8 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

hash-key — The hash key. The key can be any combination of ASCII characters up to 22 (*hash-key1*) or 121 (*hash-key2*) characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

This is useful when a user must configure the parameter, but for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the **hash2** parameter is not used, the less encrypted **hash** form is assumed.

backup

Syntax	[no] backup <i>ip-address</i>
Context	config>router>if>vrrp
Description	<p>This command associates router IP addresses with the parental IP interface IP addresses.</p> <p>The backup command has two distinct functions when used in an owner or a non-owner context of the virtual router instance.</p> <p>Non-owner virtual router instances actually create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). The backup command in owner virtual router instances does not create a routable IP interface address; it simply defines the existing parental IP interface IP addresses that are advertised by the virtual router instance.</p> <p>For owner virtual router instances, the backup command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. Advertising a correct list is important. The specified <i>ip-addr</i> must be equal to one of the existing parental IP interface IP addresses (primary or secondary) or the backup command will fail.</p> <p>For non-owner virtual router instances, the backup command actually creates an IP interface IP address used for routing IP packets and communicating with the system when the access commands are defined (ping-reply, telnet-reply, and ssh-reply). The specified <i>ip-addr</i> must be an IP address that is within one of the parental IP interface local subnets created with the address or secondary commands. If a local subnet does not exist that includes the specified <i>ip-addr</i> or if <i>ip-addr</i> is the same IP address as the parental IP interface IP address, the backup command will fail.</p> <p>The new interface IP address created with the backup command assumes the mask and parameters of the corresponding parent IP interface IP address. The <i>ip-addr</i> is only active when the virtual router instance is operating in the master state. When not operating as master, the virtual router instance acts as if it is operationally down. It will not respond to ARP requests to <i>ip-addr</i>, nor will it route packets received with its <i>vrid</i> derived source MAC address. A non-master virtual router instance always silently discards packets destined to <i>ip-addr</i>. A single virtual router instance may only have a single virtual router IP address from a given parental local subnet. Multiple virtual router instances can define a virtual router IP address from the same local subnet as long as each is a different IP address.</p>

In IPv4, up to sixteen **backup** *ip-addr* commands can be executed within the same virtual router instance. Executing **backup** multiple times with the same *ip-addr* results in no operation performed and no error generated. At least one successful **backup** *ip-addr* command must be executed before the virtual router instance can enter the operational state.

When operating as (non-owner) master, the default functionality associated with *ip-addr* is ARP response to ARP requests to *ip-addr*, routing of packets destined to the virtual router instance source MAC address and silently discarding packets destined to *ip-addr*. Enabling the non-owner-access parameters selectively allows ping, Telnet and SSH connectivity to *ip-addr* when the virtual router instance is operating as master.

The **no** form of the command removes the specified virtual router IP address from the virtual router instance. For non-owner virtual router instances, this causes all routing and local access associated with the *ip-addr* to cease. For **owner** virtual router instances, the **no backup** command only removes *ip-addr* from the list of advertised IP addresses. If the last *ip-addr* is removed from the virtual router instance, the virtual router instance will enter the operationally down state

Special Cases

Assigning the Virtual Router ID IP Address — Once the *vrid* is created on the parent IP interface, IP addresses need to be assigned to the virtual router instance. If the *vrid* was created with the keyword **owner**, the virtual router instance IP addresses must have one or more of the parent IP interface defined IP addresses (primary and secondary). For non-owner virtual router instances, the virtual router IP addresses each must be within one of the parental IP interface IP address defined local subnets. For both **owner** and non-owner virtual router instances, the virtual router IP addresses must be explicitly defined using the **backup** *ip-addr* command.

Virtual Router Instance IP Address Assignment Conditions — The RFC does not specify that the assigned IP addresses to the virtual router instance must be in the same subnet as the parent IP interface primary IP address or secondary IP addresses. The only requirement is that all virtual routers participating in the same virtual router instance have the same virtual router IP addresses assigned. To avoid confusion, the assigned virtual router IP addresses must be in a local subnet of one of the parent IP interfaces IP addresses. For **owner** virtual router instances the assigned virtual router IP address must be the same as one of the parental interface primary or secondary IP addresses.

The following rules apply when adding, changing, or removing parental and virtual router IP addresses:

Owner Virtual Router IP Address Parental Association — When an IP address is assigned to an **owner** virtual router instance, it must be associated with one of the parental IP interface-assigned IP addresses. The virtual router IP address must be equal to the primary or one of the secondary IP addresses within the parental IP interface.

Example - Owner Virtual Router Instance

Parent IP addresses:	10.10.10.10/24	
	11.11.11.11/24	
Virtual router IP addresses:	10.10.10.11	Invalid (not equal to parent IP address)
	10.10.10.10	Associated (same as parent IP address 10.10.10.10)
	10.10.11.11	Invalid (not equal to parent IP address)

11.11.11.254	Invalid (not equal to parent IP address)
11.11.11.255	Invalid (not equal to parent IP address)

Non-Owner Virtual Router IP Address Parental Association — When an IP address is assigned to a non-owner virtual router instance, it must be associated with one of the parental IP interface assigned IP addresses. The virtual router IP address must be a valid IP address within one of the parental IP interfaces local subnet. Local subnets are created by the primary or secondary IP addresses in conjunction with the IP addresses mask. If the defined virtual router IP address is equal to the associated subnet's broadcast address, it is invalid. Virtual router IP addresses for non-owner virtual router instances that are equal to a parental IP interface IP address are also invalid.

The same virtual router IP address may not be assigned to two separate virtual router instances. If the virtual router IP address already exists on another virtual router instance, the virtual router IP address assignment will fail.

Example - Non-Owner Virtual Router Instance

Parent IP addresses:	10.10.10.10/24	
	11.11.11.11/24	
Virtual router IP addresses:	10.10.10.11	Associated with 10.10.10.10 (in subnet)
	10.10.10.10	Invalid (same as parent IP address)
	10.10.11.11	Invalid (outside of all Parent IP subnets)
	11.11.11.254	Associated with 11.11.11.11 (in subnet)
	11.11.11.255	Invalid (broadcast address of 11.11.11.11/24)

Virtual Router IP Address Assignment without Parent IP Address — When assigning an IP address to a virtual router instance, an associated IP address (see **Owner Virtual Router IP Address Parental Association** and **Non-Owner Virtual Router IP Address Parental Association**) on the parental IP interface must already exist. If an associated IP address on the parental IP interface is not configured, the virtual router IP address assignment fails.

Parent Primary IP Address Changed — When a virtual router IP address is set and the associated parent IP interface IP address is changed, the new parent IP interface IP address is evaluated to ensure it meets the association rules defined in **Owner Virtual Router IP Address Parental Association** or **Non-Owner Virtual Router IP Address Parental Association**. If the association check fails, the parental IP address change is not allowed. If the parental IP address change fails, the previously configured IP address definition remains in effect.

Only the primary parent IP address can be changed. Secondary addresses must be removed before the new IP address can be added. **Parent Primary or Secondary IP Address Removal** explains IP address removal conditions.

Parent Primary or Secondary IP Address Removal — When a virtual router IP address is successfully set, but removing the associated parent IP interface IP address is attempted and fails. All virtual router IP addresses associated with the parental IP interface IP address must be deleted prior

to removing the parental IP address. This includes virtual router IP address associations from multiple virtual router instances on the IP interface.

Default	no backup — No virtual router IP address is assigned.
Parameters	<i>ip-address</i> — The virtual router IP address expressed in dotted decimal notation. The IP virtual router IP address must be in the same subnet of the parental IP interface IP address or equal to one of the primary or secondary IP addresses for owner virtual router instances.
Values	1.0.0.1 - 223.255.255.254

backup

Syntax	config>router>if>ipv6>vrrp
Description	<p>This command associates router IPv6 addresses with the parental IP interface IP addresses.</p> <p>The backup command has two distinct functions when used in an owner or a non-owner context of the virtual router instance.</p> <p>Non-owner virtual router instances actually create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). The backup command in owner virtual router instances does not create a routable IP interface address; it simply defines the existing parental IP interface IP addresses that are advertised by the virtual router instance.</p> <p>For owner virtual router instances, the backup command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. Advertising a correct list is important. The specified <i>ipv6-addr</i> must be equal to one of the existing parental IP interface IP addresses (link-local or global) or the backup command will fail.</p> <p>For non-owner virtual router instances, the backup command actually creates an IP interface IP address used for routing IP packets and communicating with the system when the access commands are defined (ping-reply, telnet-reply, and ssh-reply). The specified <i>ipv6-addr</i> must be an IP address that is within one of the parental IP interface local subnets created with the link-local-address or address commands. If a local subnet does not exist that includes the specified <i>ipv6-addr</i> or if <i>ipv6-addr</i> is the same IP address as the parental IP interface IP address, the backup command will fail.</p> <p>The new interface IP address created with the backup command assumes the mask and parameters of the corresponding parent IP interface IP address. The <i>ipv6-addr</i> is only active when the virtual router instance is operating in the master state. For IPv6 VRRP, the parental interface's IP address that is in the same subnet as the backup address must be manually-configured, non EUI-64 and configured to be in the preferred state.</p> <p>When not operating as master, the virtual router instance acts as if it is operationally down. It will not respond to ARP requests to <i>ipv6-addr</i>, nor will it route packets received with its <i>vid</i> derived source MAC address. A non-master virtual router instance always silently discards packets destined to <i>ipv6-addr</i>. A single virtual router instance may only have a single virtual router IP address from a given parental local subnet. Multiple virtual router instances can define a virtual router IP address from the same local subnet as long as each is a different IP address.</p>

Executing **backup** multiple times with the same *ipv6-addr* results in no operation performed and no error generated. At least one successful **backup** *ipv6-addr* command must be executed before the virtual router instance can enter the operational state.

When operating as (non-owner) master, the default functionality associated with *ipv6-addr* is ARP response to ARP requests to *ip-addr*, routing of packets destined to the virtual router instance source MAC address and silently discarding packets destined to *ipv6-addr*. An IPv6 virtual router instance can enter the operational state only if one of the configured backup address is a link-local address and the router advertisement of the interface is configured to use the virtual MAC address. Enabling the non-owner-access parameters selectively allows ping, Telnet and traceroute connectivity to *ipv6-addr* when the virtual router instance is operating as master.

The **no** form of the command removes the specified virtual router IP address from the virtual router instance. For non-owner virtual router instances, this causes all routing and local access associated with the *ipv6-addr* to cease. For **owner** virtual router instances, the **no backup** command only removes *ipv6-addr* from the list of advertised IP addresses. If the last *ipv6-addr* or the link-local address is removed from the virtual router instance, the virtual router instance will enter the operationally down state

Special Cases

Assigning the Virtual Router ID Address — Once the *vrid* is created on the parent IP interface, IP addresses need to be assigned to the virtual router instance. If the *vrid* was created with the keyword **owner**, the virtual router instance IP addresses must have one or more of the parent IP interface defined IP addresses. For non-owner virtual router instances, the virtual router IP addresses each must be within one of the parental IP interface IP address defined local subnets. For both **owner** and non-owner virtual router instances, the virtual router IP addresses must be explicitly defined using the **backup** *ipv6-addr* command.

The following rules apply when adding, changing, or removing parental and virtual router IP addresses:

Owner Virtual Router IP Address Parental Association — When an IP address is assigned to an **owner** virtual router instance, it must be associated with one of the parental IP interface-assigned IP addresses.

Example - Owner Virtual Router Instance

Parent IP addresses:	10.10.10.10/24	
	11.11.11.11/24	
Virtual router IP addresses:	10.10.10.11	Invalid (not equal to parent IP address)
	10.10.10.10	Associated (same as parent IP address 10.10.10.10)
	10.10.11.11	Invalid (not equal to parent IP address)
	11.11.11.254	Invalid (not equal to parent IP address)
	11.11.11.255	Invalid (not equal to parent IP address)

Non-Owner Virtual Router IP Address Parental Association — When an IP address is assigned to a non-owner virtual router instance, it must be associated with one of the parental IP interface assigned IP addresses. The virtual router IP address must be a valid IP address within one of

the parental IP interfaces local subnet. Local subnets are created by the link-local or global IP addresses in conjunction with the IP addresses mask. If the defined virtual router IP address is equal to the associated subnet's broadcast address, it is invalid. Virtual router IP addresses for non-owner virtual router instances that are equal to a parental IP interface IP address are also invalid.

The same virtual router IP address may not be assigned to two separate virtual router instances. If the virtual router IP address already exists on another virtual router instance, the virtual router IP address assignment will fail.

One exception to this rule is for the IPv6 link-local address that is configured as a backup address. The same link-local address can be configured in all virtual routers that use the same vrid.

Example - Non-Owner Virtual Router Instance

Parent IP addresses:	10.10.10.10/24	
	11.11.11.11/24	
Virtual router IPv6 addresses:	10.10.10.11	Associated with 10.10.10.10 (in subnet)
	10.10.10.10	Invalid (same as parent IP address)
	10.10.11.11	Invalid (outside of all Parent IP subnets)
	11.11.11.254	Associated with 11.11.11.11 (in subnet)
	11.11.11.255	Invalid (broadcast address of 11.11.11.11/24)

Virtual Router IP Address Assignment without Parent IP Address — When assigning an IP address to a virtual router instance, an associated IP address (see **Owner Virtual Router IP Address Parental Association** and **Non-Owner Virtual Router IP Address Parental Association**) on the parental IP interface must already exist. If an associated IP address on the parental IP interface is not configured, the virtual router IP address assignment fails.

Virtual Router IPv6 Address Assignment — An IPv6 backup address requires that the parental IP address that is in the same subnet as the backup address must be manually configured, non-EUI-64 and configured to be in the preferred state.

Default	no backup — No virtual router IP address is assigned.	
Parameters	<i>ipv6-address</i> — The virtual router IP address expressed in dotted decimal notation. The IP virtual router IP address must be in the same subnet of the parental IP interface IP address or equal to one of the the parent interface addresses for owner virtual router instances.	
Values	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x::d.d.d.d x: [0..FFFF]H d: [0..255]D

bfd-enable

Syntax	[no] bfd-enable [<i>service-id</i>] interface <i>interface-name</i> dst-ip <i>ip-address</i> [no] bfd-enable interface <i>interface-name</i> dst-ip <i>ip-address</i>						
Context	config>router>if>vrrp config>router>if>ipv6>vrrp						
Description	<p>This commands assigns a bi-directional forwarding (BFD) session providing heart-beat mechanism for the given VRRP/SRRP instance. There can be only one BFD session assigned to any given VRRP/SRRP instance, but there can be multiple SRRP/VRRP sessions using the same BFD session.</p> <p>BFD control the state of the associated interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set by the BFD command under the IP interface. The specified interface may not be configured with BFD; when it is, the virtual router will then initiate the BFD session.</p> <p>The no form of this command removes BFD from the configuration.</p>						
Default	none						
Parameters	<p><i>service-id</i> — Specifies the service ID of the interface running BFD.</p> <table border="0"> <tr> <td style="padding-right: 10px;">Values</td> <td><i>service-id:</i></td> <td>1 — 2147483647</td> </tr> <tr> <td></td> <td><i>svc-name:</i></td> <td>64 characters maximum</td> </tr> </table> <p>interface <i>interface-name</i> — Specifies the name of the interface running BFD. The specified interface may not yet be configured with BFD. However, when it is, this virtual router will then initiate the BFD session.</p> <p>dst-ip <i>ip-address</i> — Specifies the destination address to be used for the BFD session.</p>	Values	<i>service-id:</i>	1 — 2147483647		<i>svc-name:</i>	64 characters maximum
Values	<i>service-id:</i>	1 — 2147483647					
	<i>svc-name:</i>	64 characters maximum					

init-delay

Syntax	init-delay <i>seconds</i> no init-delay		
Context	config>router>if>vrrp config>router>if>ipv6>vrrp		
Description	This command configures a VRRP initialization delay timer.		
Parameters	<p><i>seconds</i> — Specifies the initialization delay timer for VRRP, in seconds.</p> <table border="0"> <tr> <td style="padding-right: 10px;">Values</td> <td>1 — 65535</td> </tr> </table>	Values	1 — 65535
Values	1 — 65535		

mac

Syntax	mac <i>mac-address</i> no mac
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	<p>This command sets an explicit MAC address used by the virtual router instance overriding the VRRP default derived from the VRID.</p> <p>Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts using the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.</p> <p>The mac command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with <i>mac-address</i> as the destination MAC is also enabled. The mac setting must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts will result. All VRRP advertisement messages are transmitted with <i>mac-address</i> as the source MAC.</p> <p>The command can be configured in both non-owner and owner vrrp nodal contexts.</p> <p>The mac command can be executed at any time and takes effect ediatly. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is ediatly sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as backup, the gratuitous ARP and VRRP advertisement message is not sent.</p> <p>The no form of the command restores the default VRRP MAC address to the virtual router instance.</p>
Default	no mac — The virtual router instance uses the default VRRP MAC address derived from the VRID.
Parameters	<i>mac-address</i> — The 48-bit MAC address for the virtual router instance in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i> where <i>aa</i> , <i>bb</i> , <i>cc</i> , <i>dd</i> , <i>ee</i> and <i>ff</i> are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC, and non-IEEE reserved MAC addresses.

master-int-inherit

Syntax	[no] master-int-inherit
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	<p>This command enables the virtual router instance to inherit the master VRRP router's advertisement interval timer which is used by backup routers to calculate the master down timer.</p> <p>The master-int-inherit command is only available in the non-owner nodal context and is used to allow the current virtual router instance master to dictate the master down timer for all backup virtual routers. The master-int-inherit command has no effect when the virtual router instance is operating as master.</p>

If **master-int-inherit** is not enabled, the locally configured **message-interval** must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

The **no** form of the command restores the default operating condition which requires the locally configured **message-interval** to match the received VRRP advertisement message advertisement interval field value.

Default no master-int-inherit — The virtual router instance does not inherit the master VRRP router's advertisement interval timer and uses the locally configured message interval.

message-interval

Syntax	message-interval {[<i>seconds</i>] [milliseconds <i>milliseconds</i>]} no message-interval
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	<p>This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages and to derive the master down timer as backup.</p> <p>For an owner virtual router instance, the administrative advertisement timer directly sets the operational advertisement timer and indirectly sets the master down timer for the virtual router instance.</p> <p>Non-owner virtual router instances usage of the message-interval setting is dependent on the state of the virtual router (master or backup) and the state of the master-int-inherit parameter.</p> <ul style="list-style-type: none">• When a non-owner is operating as master for the virtual router, the configured message-interval is used as the operational advertisement timer similar to an owner virtual router instance. The master-int-inherit command has no effect when operating as master.• When a non-owner is in the backup state with master-int-inherit disabled, the configured message-interval value is used to match the incoming VRRP advertisement message advertisement interval field. If the locally configured message interval does not match the advertisement interval field, the VRRP advertisement is discarded.• When a non-owner is in the backup state with master-int-inherit enabled, the configured message-interval is ignored. The master down timer is indirectly derived from the incoming VRRP advertisement message advertisement interval field value. <p>VRRP advertisements messages that are fragmented, contain IP options (IPv4), or contain extension headers (IPv6) require a longer message interval to be configured.</p> <p>The in-use value of the message interval is used to derive the master down timer to be used when the virtual router is operating in backup mode based on the following formula:</p> $(3x \text{ (in-use message interval) } + \text{ skew time})$ <p>The skew time portion is used to slow down virtual routers with relatively low priority values when competing in the master election process.</p> <p>The command is available in both non-owner and owner vrrp nodal contexts.</p>

By default, a **message-interval** of 1 second is used.

The **no** form of the command reverts to the default value.

Default	1 — Advertisement timer set to 1 second
Parameters	<i>seconds</i> — The number of seconds that will transpire before the advertisement timer expires expressed as a decimal integer.
	Values IPv4: 1 — 255 IPv6: 1 — 40
	milliseconds <i>milliseconds</i> — Specifies the time interval, in milliseconds, between sending advertisement messages. This parameter is not supported on the 7750 SR-1 or 7450 ESS-1 chassis.
	Values 100 — 900 IPv6: 10 — 990

policy

Syntax	policy <i>policy-id</i> no policy
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	<p>This command adds a VRRP priority control policy association with the virtual router instance.</p> <p>To further augment the virtual router instance base priority, VRRP priority control policies can be used to override or adjust the base priority value depending on events or conditions within the chassis.</p> <p>The policy can be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the priority command dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.</p> <p>The policy command is only available in the non-owner vrrp nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the policy command is not executed, the base priority is used as the in-use priority.</p> <p>The no form of the command removes existing VRRP priority control policy associations from the virtual router instance. All associations must be removed prior to deleting the policy from the system.</p>
Default	no policy — No VRRP priority control policy is associated with the virtual router instance.
Parameters	<i>policy-id</i> — The policy ID of the VRRP priority control expressed as a decimal integer. The <i>vrrp-policy-id</i> must already exist for the command to function.
	Values 1 — 9999

preempt

Syntax	[no] preempt
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	<p>This command enables the overriding of an existing VRRP master if the virtual router's in-use priority is higher than the current master.</p> <p>The priority of the non-owner virtual router instance, the preempt mode allows the best available virtual router to force itself as the master over other available virtual routers.</p> <p>When preempt is enabled, the virtual router instance overrides any non-owner master with an in-use message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.</p> <p>Enabling preempt mode improves the effectiveness of the base priority and the VRRP priority control policy mechanisms on the virtual router instance. If the virtual router cannot preempt an existing non-owner master, the affect of the dynamic changing of the in-use priority is diminished.</p> <p>The preempt command is only available in the non-owner vrrp nodal context. The owner may not be preempted because the priority of non-owners can never be higher than the owner. The owner always preempts all other virtual routers when it is available.</p> <p>Non-owner virtual router instances only preempt when preempt is set and the current master has an in-use message priority value less than the virtual router instances in-use priority.</p> <p>A master non-owner virtual router only allows itself to be preempted when the incoming VRRP advertisement message priority field value is one of the following:</p> <ul style="list-style-type: none"> • Greater than the virtual router in-use priority value. • Equal to the in-use priority value and the source IP address (primary IP address) is greater than the virtual router instance primary IP address. <p>By default, preempt mode is enabled on the virtual router instance.</p> <p>The no form of the command disables preempt mode and prevents the non-owner virtual router instance from preempting another, less desirable virtual router.</p>
Default	preempt — The preempt mode enabled on the virtual router instance where it will preempt a VRRP master with a lower priority.

priority

Syntax	priority <i>base-priority</i> no priority
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	This command configures the base router priority for the virtual router instance used in the master election process.

The **priority** is the most important parameter set on a non-owner virtual router instance. The priority defines a virtual router's selection order in the master election process. Together, the priority value and the **preempt** mode allow the virtual router with the best priority to become the master virtual router.

The *base-priority* is used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy. VRRP priority control policies can be used to either override or adjust the base priority value depending on events or conditions within the chassis.

The **priority** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed.

For non-owner virtual router instances, the default base priority value is 100.

The **no** form of the command reverts to the default value.

Default	100
Parameters	<i>base-priority</i> — The base priority used by the virtual router instance expressed as a decimal integer. If no VRRP priority control policy is defined, the <i>base-priority</i> is the in-use priority for the virtual router instance.
Values	1 — 254

ping-reply

Syntax	[no] ping-reply
Context	config>router>if>vrrp config>router>if>ipv6>vrrp
Description	<p>This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses.</p> <p>Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.</p> <p>7750 SR OS allows this access limitation to be selectively lifted for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.</p> <p>The ping-reply command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The Ping request can be received on any routed interface. Ping must not have been disabled at the management security level (either on the parental IP interface or based on the Ping source host address).</p> <p>When ping-reply is not enabled, ICMP echo requests to non-owner master virtual IP addresses are silently discarded.</p> <p>Non-owner backup virtual routers never respond to ICMP echo requests regardless of the ping-reply setting.</p> <p>The ping-reply command is only available in non-owner vrrp nodal context.</p> <p>By default, ICMP echo requests to the virtual router instance IP addresses are silently discarded.</p>

Interface Configuration Commands

The **no** form of the command configures discarding all ICMP echo request messages destined to the non-owner virtual router instance IP addresses.

Default **no ping-reply** — ICMP echo requests to the virtual router instance IP addresses are discarded.

shutdown

Syntax **[no] shutdown**

Context config>router>if>vrrp
config>router>if>ipv6>vrrp

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Special Cases **Non-Owner Virtual Router** — Non-owner virtual router instances can be administratively shutdown. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Shutting down the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup/master state changes.

If the **shutdown** command is executed, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.

By default, virtual router instances are created in the **no shutdown** state.

Whenever the administrative state of a virtual router instance transitions, a log message is generated.

Whenever the operational state of a virtual router instance transitions, a log message is generated.

Owner Virtual Router — An owner virtual router context does not have a **shutdown** command. To administratively disable an owner virtual router instance, use the **shutdown** command within the parent IP interface node which administratively downs the IP interface.

ssh-reply

Syntax **[no] ssh-reply**

Context config>router>if>vrrp

Description This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default **no ssh-reply** — SSH requests to the virtual router instance IP addresses are discarded.

standby-forwarding

Syntax **[no] standby-forwarding**

Context config>router>if>vrrp
config>router>if>ipv6>vrrp

Description This command specifies whether this VRRP instance allows forwarding packets to a standby router. When disabled, a standby router should not forward traffic sent to virtual router's MAC address. However, the standby router should forward traffic sent to the standby router's real MAC address. When enabled, a standby router should forward all traffic.

telnet-reply

Syntax **[no] telnet-reply**

Context config>router>if>vrrp
config>router>if>ipv6>vrrp

Description This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Proper login and CLI command authentication is still enforced.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default **no telnet-reply** — Telnet requests to the virtual router instance IP addresses are discarded.

traceroute-reply

Syntax **[no] traceroute-reply**

Context config>router>if>vrrp
config>router>if>ipv6>vrrp

Description This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

Default no traceroute-reply

vrrp

Syntax	vrrp <i>vrid</i> [owner] no vrrp <i>vrid</i>
Context	config>router>interface <i>ip-int-name</i> config>router>if>ipv6
Description	<p>This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.</p> <p>The optional owner keyword indicates that the owner controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The owner assumes the role of the master virtual router.</p> <p>All other virtual router instances participating in this message domain must have the same <i>vrid</i> configured and cannot be configured as owner. Once created, the owner keyword is optional when entering the <i>vrid</i> for configuration purposes.</p> <p>A <i>vrid</i> is internally associated with the IP interface. This allows the <i>vrid</i> to be used on multiple IP interfaces while representing different virtual router instances.</p> <p>For IPv4, up to four vrrp <i>vrid</i> nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one virtual router ID can be configured on a router interface.</p> <p>The no form of the command removes the specified <i>vrid</i> from the IP interface. This terminates VRRP participation and deletes all references to the <i>vrid</i> in conjunction with the IP interface. The <i>vrid</i> does not need to be shutdown to remove the virtual router instance.</p>
Special Cases	<p>Virtual Router Instance Owner IP Address Conditions — It is possible for the virtual router instance owner to be created prior to assigning the parent IP interface primary or secondary IP addresses. When this is the case, the virtual router instance is not associated with an IP address. The operational state of the virtual router instance is down.</p> <p>VRRP Owner Command Exclusions — By specifying the VRRP <i>vrid</i> as owner, The following commands are no longer available:</p> <ul style="list-style-type: none"> • vrrp priority — The virtual router instance owner is hard-coded with a priority value of 255 and cannot be changed. • vrrp master-int-inherit — Owner virtual router instances do not accept VRRP advertisement messages; the advertisement interval field is not evaluated and cannot be inherited. • ping-reply, telnet-reply and ssh-reply — The owner virtual router instance always allows Ping, Telnet and SSH if the management and security parameters are configured to accept them on the parent IP interface. • vrrp shutdown — The owner virtual router instance cannot be shutdown in the vrrp node. If this was allowed, VRRP messages would not be sent, but the parent IP interface address would continue to respond to ARPs and forward IP packets. Another virtual router instance may detect the missing master due to the termination of VRRP advertisement messages and become master. This would cause two routers responding to ARP requests for the same IP addresses. To shut-

Interface Configuration Commands

down the **owner** virtual router instance, use the **shutdown** command in the parent IP interface context. This will prevent VRRP participation, IP ARP reply and IP forwarding. To continue parent IP interface ARP reply and forwarding without VRRP participation, remove the **vrrp vrid** instance.

- traceroute-reply

Default **no vrrp** — No VRRP virtual router instance is associated with the IP interface.

Parameters *vrid* — The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 — 255

owner — Identifies this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. Once created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted and then recreated without the **owner** keyword to remove ownership.

Priority Policy Commands

delta-in-use-limit

Syntax	delta-in-use-limit <i>in-use-priority-limit</i> no delta-in-use-limit
Context	config>vrrp>policy <i>vrrp-policy-id</i>
Description	<p>This command sets a lower limit on the virtual router in-use priority that can be derived from the delta priority control events.</p> <p>Each <i>vrrp-priority-id</i> places limits on the delta priority control events to define the in-use priority of the virtual router instance. Setting this limit prevents the sum of the delta priority events from lowering the in-use priority value of the associated virtual router instances below the configured value.</p> <p>The limit has no effect on explicit priority control events. Explicit priority control events are controlled by setting the in-use priority to any value between 1 and 254.</p> <p>Only non-owner virtual router instances can be associated with VRRP priority control policies and their priority control events.</p> <p>Once the total sum of all delta events is calculated and subtracted from the base priority of the virtual router instance, the result is compared to the delta-in-use-limit value. If the result is less than the limit, the delta-in-use-limit value is used as the virtual router in-use priority value. If an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect.</p> <p>Setting the limit to a higher value than the default of 1 limits the effect of the delta priority control events on the virtual router instance base priority value. This allows for multiple priority control events while minimizing the overall effect on the in-use priority.</p> <p>Changing the <i>in-use-priority-limit</i> causes an ediate re-evaluation of the in-use priority values for all virtual router instances associated with this <i>vrrp-policy-id</i> based on the current sum of all active delta control policy events.</p> <p>The no form of the command reverts to the default value.</p>
Default	1 — The lower limit of 1 for the in-use priority, as modified, by delta priority control events.
Parameters	<p><i>in-use-priority-limit</i> — The lower limit of the in-use priority base, as modified by priority control policies. The <i>in-use-priority-limit</i> has the same range as the non-owner virtual router instance base-priority parameter. If the result of the total delta priority control events minus the virtual router instances base-priority, is less than the <i>in-use-priority-limit</i>, the <i>in-use-priority-limit</i> value is used as the virtual router instances in-use priority value.</p> <p>Setting the <i>in-use-priority-limit</i> to a value equal to or larger than the virtual router instance <i>base-priority</i> prevents the delta priority control events from having any effect on the virtual router instance in-use priority value.</p>
Values	1 — 254

description

Syntax	description <i>string</i> no description
Context	config>vrrp>policy <i>vrrp-policy-id</i>
Description	<p>This command creates a text description stored in the configuration file for a configuration context.</p> <p>The description command associates a text string with a configuration context to help identify the content in the configuration file.</p> <p>The no form of the command removes the string from the configuration.</p>
Default	none
Parameters	<i>string</i> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

policy

Syntax	policy <i>policy-id</i> [context <i>service-id</i>] no policy <i>policy-id</i>
Context	config>vrrp
Description	<p>This command creates the context to configure a VRRP priority control policy which is used to control the VRRP in-use priority based on priority control events. It is a parental node for the various VRRP priority control policy commands that define the policy parameters and priority event conditions.</p> <p>The virtual router instance priority command defines the initial or base value to be used by non-owner virtual routers. This value can be modified by assigning a VRRP priority control policy to the virtual router instance. The VRRP priority control policy can override or diminish the base priority setting to establish the actual in-use priority of the virtual router instance.</p> <p>The policy <i>policy-id</i> command must be created first, before it can be associated with a virtual router instance.</p> <p>Because VRRP priority control policies define conditions and events that must be maintained, they can be resource intensive. The number of policies is limited to 1000.</p> <p>The <i>policy-id</i> do not have to be consecutive integers. The range of available policy identifiers is from 1 to 9999.</p> <p>The no form of the command deletes the specific <i>policy-id</i> from the system.</p> <p>The <i>policy-id</i> must be removed first from all virtual router instances before the no policy command can be issued. If the <i>policy-id</i> is associated with a virtual router instance, the command will fail.</p>
Default	none

Parameters *vrp-policy-id* — The VRRP priority control ID expressed as a decimal integer that uniquely identifies this policy from any other VRRP priority control policy defined on the system. Up to 1000 policies can be defined.

Values 1 — 9999

context *service-id* — Specifies the service ID to which this policy applies. A value of zero (0) means that this policy does not apply to a service but applies to the base router instance.

Values 1 — 2147483647

priority-event

Syntax [no] **priority-event**

Context config>vrrp>policy *vrp-priority-id*

Description This command creates the context to configure VRRP priority control events used to define criteria to modify the VRRP in-use priority.

A priority control event specifies an object to monitor and the effect on the in-use priority level for an associated virtual router instance.

Up to 32 priority control events can be configured within the **priority-event** node.

The **no** form of the command clears any configured priority events.

Priority Policy Event Commands

hold-clear

Syntax	hold-clear <i>seconds</i> no hold-clear
Context	config>vrrp>policy>priority-event>port-down config>vrrp>policy>priority-event>lag-port-down config>vrrp>policy>priority-event>route-unknown
Description	<p>This command configures the hold clear time for the event. The <i>seconds</i> parameter specifies the hold-clear time, the amount of time in seconds by which the effect of a cleared event on the associated virtual router instance is delayed.</p> <p>The hold-clear time is used to prevent black hole conditions when a virtual router instance advertises itself as a master before other conditions associated with the cleared event have had a chance to enter a forwarding state.</p>
Default	no hold-clear
Parameters	<p><i>seconds</i> — Specifies the amount of time in seconds by which the effect of a cleared event on the associated virtual router instance is delayed.</p> <p>Values 0 — 86400</p>

hold-set

Syntax	hold-set <i>seconds</i> no hold-set
Context	config>vrrp>policy>priority-event>host-unreachable config>vrrp>policy>priority-event>lag-port-down config>vrrp>policy>priority-event>port-down config>vrrp>policy>priority-event>route-unknown
Description	<p>This command specifies the amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events. A flapping event continually transitions between clear and set.</p> <p>The hold-set command is used to dampen the effect of a flapping event. The hold-set value is loaded into a hold set timer that prevents a set event from transitioning to the cleared state until it expires.</p> <p>Each time an event transitions between cleared and set, the timer is loaded and begins a countdown to zero. When the timer reaches zero, the event is allowed to enter the cleared state. Entering the cleared state is dependent on the object controlling the event, conforming to the requirements defined in the event itself. It is possible, on some event types, to have another set action reload the hold-set timer. This extends the amount of time that must expire before entering the cleared state.</p>

Once the hold set timer expires and the event meets the cleared state requirements or is set to a lower threshold, the current set effect on the virtual router instances in-use priority can be removed. As with **lag-port-down** events, this may be a decrease in the set effect if the *clearing* amounts to a lower set threshold.

The **hold-set** command can be executed at anytime. If the hold-set timer value is configured larger than the new *seconds* setting, the timer is loaded with the new **hold-set** value.

The **no** form of the command reverts the default value.

Default	0 — The hold-set timer is disabled so event transitions are processed ediatly.
Parameters	<p><i>seconds</i> — The number of seconds that the hold set timer waits after an event enters a set state or enters a higher threshold set state, depending on the event type.</p> <p>The value of 0 disables the hold set timer, preventing any delay in processing lower set thresholds or cleared events.</p> <p>Values 0 — 86400</p>

priority

Syntax	priority <i>priority-level</i> [{ delta explicit }] no priority
Context	<pre>config>vrrp>policy>priority-event>host-unreachable <i>ip-addr</i> config>vrrp>policy>priority-event>lag-port-down <i>lag-id</i>>number-down <i>number-of-lag-ports-down</i> config>vrrp>policy>priority-event>port-down <i>port-id</i> [<i>channel-id</i>] config>vrrp>policy>priority-event>route-unknown <i>prefix/mask-length</i></pre>
Description	<p>This command controls the effect the set event has on the virtual router instance in-use priority.</p> <p>When the event is set, the <i>priority-level</i> is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the delta or explicit keywords are specified.</p> <p>Multiple set events in the same policy have interaction constraints:</p> <ul style="list-style-type: none"> • If any set events have an explicit priority value, all the delta priority values are ignored. • The set event with the lowest explicit priority value defines the in-use priority that are used by all virtual router instances associated with the policy. • If no set events have an explicit priority value, all the set events delta priority values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy. • If the delta priorities sum exceeds the delta-in-use-limit parameter, then the delta-in-use-limit parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy. <p>If the priority command is not configured on the priority event, the <i>priority-value</i> defaults to 0 and the qualifier keyword defaults to delta, thus, there is no impact on the in-use priority.</p> <p>The no form of the command reverts to the default values.</p>

Priority Policy Event Commands

Default 0 delta — The set event will subtract 0 from the base priority (no effect).

Parameters *priority-level* — The priority level adjustment value expressed as a decimal integer.

Values 0 — 254

delta | explicit — Configures what effect the *priority-level* will have on the base priority value.

When **delta** is specified, the *priority-level* value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event *priority-level* values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value. If the **delta** priority event is cleared, the *priority-level* is no longer used in the in-use priority calculation.

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

Default delta

Values delta, explicit

Priority Policy Port Down Event Commands

port-down

Syntax	<code>[no] port-down port-id</code>
Context	<code>config>vrrp>policy>priority-event</code>
Description	<p>This command configures a port down priority control event that monitors the operational state of a port or SONET/SDH channel. When the port or channel enters the operational down state, the event is considered set. When the port or channel enters the operational up state, the event is considered cleared.</p> <p>Multiple unique port-down event nodes can be configured within the priority-event context up to the overall limit of 32 events. Up to 32 events can be defined in any combination of types.</p> <p>The port-down command can reference an arbitrary port or channel. The port or channel does not need to be pre-provisioned or populated within the system. The operational state of the port-down event will indicate:</p> <ul style="list-style-type: none">• Set – non-provisioned• Set – not populated• Set – down• Cleared – up <p>When the port or channel is provisioned, populated, or enters the operationally up or down state, the event operational state is updated appropriately.</p> <p>When the event enters the operationally down, non-provisioned, or non-populated state, the event is considered to be set. When an event transitions from clear to set, the set is processed ediatly and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from cleared to set, a hold set timer is loaded with the value configured by the events hold-set command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold set timer expires, the timer is reset to the hold-set value, extending the time before another clear can take effect.</p> <p>When the event enters the operationally up state, the event is considered to be cleared. Once the events hold-set expires, the effects of the events priority value are ediatly removed from the in-use priority of all associated virtual router instances.</p> <p>The actual effect on the virtual router instance in-use priority value depends on the defined event priority and its delta or explicit nature.</p> <p>The no form of the command deletes the specific port or channel monitoring event. The event may be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances will be re-evaluated. The events hold-set timer has no effect on the removal procedure.</p>
Default	no port-down — No port down priority control events are defined.
Parameters	<i>port-id</i> — The port ID of the port monitored by the VRRP priority control event.

Priority Policy Port Down Event Commands

The *port-id* can only be monitored by a single event in this policy. The port can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

Values	port-id	<i>slot/mda/port[.channel]</i>
	aps-id	<i>aps-group-id[.channel]</i>
	aps	keyword
	group-id	1 — 64
	bundle-type-slot/mda.<bundle-num>	
	bundle	keyword
	type	ima, ppp
	bundle-num	1 —256
	ccag-id	<i>ccag-id.path-id[cc-type]</i>
	ccag	keyword
	id	1 — 8
	path-id	a, b
	cc-type	.sap-net, .net-sap

The POS channel on the port monitored by the VRRP priority control event. The *port-id.channel-id* can only be monitored by a single event in this policy. The channel can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

If the port is provisioned, but the *channel* does not exist or the port has not been populated, the appropriate event operational state is Set – non-populated.

If the port is not provisioned, the event operational state is Set – non-provisioned.

If the POS interface is configured as a clear-channel, the *channel-id* is 1 and the channel bandwidth is the full bandwidth of the port.

Priority Policy LAG Events Commands

lag-port-down

Syntax	[no] lag-port-down <i>lag-id</i>
Context	config>vrrp>policy>priority-event
Description	<p>This command creates the context to configure Link Aggregation Group (LAG) priority control events that monitor the operational state of the links in the LAG.</p> <p>The lag-port-down command configures a priority control event. The event monitors the operational state of each port in the specified LAG. When one or more of the ports enter the operational down state, the event is considered to be set. When all the ports enter the operational up state, the event is considered to be clear. As ports enter the operational up state, any previous set threshold that represents more down ports is considered cleared, while the event is considered to be set.</p> <p>Multiple unique lag-port-down event nodes can be configured within the priority-event node up to the maximum of 32 events.</p> <p>The lag-port-down command can reference an arbitrary LAG. The <i>lag-id</i> does have to already exist within the system. The operational state of the lag-port-down event will indicate:</p> <ul style="list-style-type: none">• Set – non-existent• Set – one port down• Set – two ports down• Set – three ports down• Set – four ports down• Set – five ports down• Set – six ports down• Set – seven ports down• Set – eight ports down• Cleared – all ports up <p>When the <i>lag-id</i> is created, or a port in <i>lag-id</i> becomes operationally up or down, the event operational state must be updated appropriately.</p> <p>When one or more of the LAG composite ports enters the operationally down state or the <i>lag-id</i> is deleted or does not exist, the event is considered to be set. When an event transitions from clear to set, the set is processed ediatly and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold set timer is loaded with the value configured by the events hold-set command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold set timer expires, the timer is reset to the hold-set value, extending the time before another clear can take effect.</p>

The **lag-port-down** event is considered to have a tiered event set state. While the priority impact per number of ports down is totally configurable, as more ports go down, the effect on the associated virtual router instances in-use priority is expected to increase (lowering the priority). When each configured threshold is crossed, any higher thresholds are considered further event sets and are processed ediatly with the hold set timer reset to the configured value of the **hold-set** command. As the thresholds are crossed in the opposite direction (fewer ports down then previously), the priority effect of the event is not processed until the hold set timer expires. If the number of ports down threshold again increases before the hold set timer expires, the timer is only reset to the **hold-set** value if the number of ports down is equal to or greater than the threshold that set the timer.

The event contains **number-down** nodes that define the priority delta or explicit value to be used based on the number of LAG composite ports that are in the operationally down state. These nodes represent the event set thresholds. Not all port down thresholds must be configured. As the number of down ports increase, the **number-down** *ports-down* node that expresses a value equal to or less than the number of down ports describes the delta or explicit priority value to be applied.

The **no** form of the command deletes the specific LAG monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

Default no lag-port-down — No LAG priority control events are created.

Parameters *lag-id* — The LAG ID that the specific event is to monitor expressed as a decimal integer. The *lag-id* can only be monitored by a single event in this policy. The LAG may be monitored by multiple VRRP priority control policies. A port within the LAG and the LAG ID itself are considered to be separate entities. A composite port may be monitored with the **port-down** event while the *lag-id* the port is in is monitored by a **lag-port-down** event in the same policy.

Values 1 — 200

number-down

Syntax [**no**] **number-down** *number-of-lag-ports-down*

Context config>vrrp>policy>priority-event>lag-port-down *lag-id*

Description This command creates a context to configure an event set threshold within a lag-port-down priority control event.

The **number-down** command defines a sub-node within the **lag-port-down** event and is uniquely identified with the *number-of-lag-ports-down* parameter. Each **number-down** node within the same **lag-port-down** event node must have a unique *number-of-lag-ports-down* value. Each **number-down** node has its own **priority** command that takes effect whenever that node represents the current threshold.

The total number of sub-nodes (uniquely identified by the *number-of-lag-ports-down* parameter) allowed in a single **lag-port-down** event is equal to the total number of possible physical ports allowed in a LAG.

A **number-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold. When the number of ports down equals a given threshold, that is the active threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default no number-down — No threshold for the LAG priority event is created.

Parameters *number-of-lag-ports-down* — The number of LAG ports down to create a set event threshold. This is the active threshold when the number of down ports in the LAG equals or exceeds *number-of-lag-ports-down*, but does not equal or exceed the next highest configured *number-of-lag-ports-down*.

Values 1 — 8

Priority Policy Host Unreachable Event Commands

drop-count

Syntax	drop-count <i>consecutive-failures</i> no drop-count
Context	config>vrrp <i>vrrp-policy-id</i> >priority-event>host-unreachable <i>ip-addr</i>
Description	<p>This command configures the number of consecutively sent ICMP echo request messages that must fail before the host unreachable priority control event is set.</p> <p>The drop-count command is used to define the number of consecutive message send attempts that must fail for the host-unreachable priority event to enter the set state. Each unsuccessful attempt increments the event's consecutive message drop counter. With each successful attempt, the event's consecutive message drop counter resets to zero.</p> <p>If the event's consecutive message drop counter reaches the drop-count value, the host-unreachable priority event enters the set state.</p> <p>The event's hold-set value defines how long the event must stay in the set state even when a successful message attempt clears the consecutive drop counter. The event is not cleared until the consecutive drop counter is less than the drop-count value and the hold-set timer has a value of zero (expired).</p> <p>The no form of the command reverts to the default value.</p>
Default	3 — 3 consecutive ICMP echo request failures are required before the host unreachable priority control event is set.
Parameters	<p><i>consecutive-failures</i> — The number of ICMP echo request message attempts that must fail for the event to enter the set state. It also defines the threshold so a lower consecutive number of failures can clear the event state.</p> <p>Values 1 — 60</p>

host-unreachable

Syntax	[no] host-unreachable <i>ip-address</i>
Context	config>vrrp>policy>priority-event
Description	<p>This command creates the context to configure a host unreachable priority control event to monitor the ability to receive ICMP echo reply packets from an IP host address.</p> <p>A host unreachable priority event creates a continuous ICMP echo request (ping) probe to the specified <i>ip-address</i>. If a ping fails, the event is considered to be set. If a ping is successful, the event is considered to be cleared.</p> <p>Multiple unique (different <i>ip-address</i>) host-unreachable event nodes can be configured within the priority-event node to a maximum of 32 events.</p>

The **host-unreachable** command can reference any valid local or remote IP address. The ability to ARP a local IP address or find a remote IP address within a route prefix in the route table is considered part of the monitoring procedure. The **host-unreachable** priority event operational state tracks ARP or route table entries dynamically appearing and disappearing from the system. The operational state of the **host-unreachable** event can be one of the following:

Host Unreachable Operational State	Description
Set – no ARP	No ARP address found for <i>ip-addr</i> for drop-count consecutive attempts. Only applies when IP address is considered local.
Set – no route	No route exists for <i>ip-addr</i> for drop-count consecutive attempts. Only when IP address is considered remote.
Set – host unreachable	ICMP host unreachable message received for drop-count consecutive attempts.
Set – no reply	ICMP echo request timed out for drop-count consecutive attempts.
Set – reply received	Last ICMP echo request attempt received an echo reply but historically not able to clear the event.
Cleared – no ARP	No ARP address found for <i>ip-addr</i> - not enough failed attempts to set the event.
Cleared – no route	No route exists for <i>ip-addr</i> - not enough failed attempts to set the event.
Cleared – host unreachable	ICMP host unreachable message received - not enough failed attempts to set the event.
Cleared – no reply	ICMP echo request timed out - not enough failed attempts to set the event.
Cleared – reply received	Event is cleared - last ICMP echo request received an echo reply.

Unlike other priority event types, the **host-unreachable** priority event monitors a repetitive task. A historical evaluation is performed on the success rate of receiving ICMP echo reply messages. The operational state takes its cleared and set orientation from the historical success rate. The informational portion of the operational state is derived from the last attempt's result. It is possible for the previous attempt to fail while the operational state is still cleared due to an insufficient number of failures to cause it to become set. It is also possible for the state to be set while the previous attempt was successful.

When an event transitions from clear to set, the set is processed ediatly and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

Priority Policy Host Unreachable Event Commands

The hold-set timer be expired and the historical success rate must be met prior to the event operational state becoming cleared.

The **no** form of the command deletes the specific IP host monitoring event. The event may be deleted at anytime. When the event is deleted, the in-use priority of all associated virtual router instances must be reevaluated. The event's **hold-set** timer has no effect on the removal procedure.

Default **no host-unreachable** — No host unreachable priority events are created.

Parameters *ip-addr* — The IP address of the host for which the specific event will monitor connectivity. The *ip-addr* can only be monitored by a single event in this policy. The IP address can be monitored by multiple VRRP priority control policies. The IP address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ip-addr* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

Values

ipv4-address :	a.b.c.d
ipv6-address :	x:x:x:x:x:x[-interface]
x:	[0..FFFF]H
interface:	32 chars maximum, mandatory for link local addresses

Note that the link-local IPv6 address must have an interface name specified. The global IPv6 address must not have an interface name specified.

interval

Syntax **interval** *seconds*
no interval

Context config>vrrp *vrrp-policy-id*>priority-event>host-unreachable *ip-addr*

Description This command configures the number of seconds between host unreachable priority event ICMP echo request messages directed to the host IP address.

The **no** form of the command reverts to the default value.

Default 1

Parameters *seconds* — The number of seconds between the ICMP echo request messages sent to the host IP address for the host unreachable priority event.

Values 1 — 60

timeout

Syntax	timeout <i>seconds</i> no timeout
Context	config>vrrp <i>vrrp-policy-id</i> >priority-event>host-unreachable <i>ip-addr</i>
Description	<p>This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.</p> <p>The timeout value is not directly related to the configured interval parameter. The timeout value may be larger, equal, or smaller, relative to the interval value.</p> <p>If the timeout value is larger than the interval value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.</p> <p>With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the timeout value. The timer decrements until:</p> <ul style="list-style-type: none"> • An internal error occurs preventing message sending (request unsuccessful). • An internal error occurs preventing message reply receiving (request unsuccessful). • A required route table entry does not exist to reach the IP address (request unsuccessful). • A required ARP entry does not exist and ARP request timed out (request unsuccessful). • A valid reply is received (request successful). <p>Note that it is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.</p> <p>If an ICMP echo reply message is not received prior to the timeout period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.</p> <p>If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.</p> <p>If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.</p> <p>The no form of the command reverts to the default value.</p>
Default	1
Parameters	<i>seconds</i> — The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.
Values	1 — 60

Priority Policy Route Unknown Event Commands

less-specific

Syntax	<code>[no] less-specific [allow-default]</code>
Context	<code>config>vrrp>policy>priority-event>route-unknown <i>prefix/mask-length</i></code>
Description	<p>This command allows a CIDR shortest match hit on a route prefix that contains the IP route prefix associated with the route unknown priority event.</p> <p>The less-specific command modifies the search parameters for the IP route prefix specified in the route-unknown priority event. Specifying less-specific allows a CIDR shortest match hit on a route prefix that contains the IP route prefix.</p> <p>The less-specific command eases the RTM lookup criteria when searching for the <i>prefix/mask-length</i>. When the route-unknown priority event sends the prefix to the RTM (as if it was a destination lookup), the result route table prefix (if a result is found) is checked to see if it is an exact match or a less specific match. The less-specific command enables a less specific route table prefix to match the configured prefix. When less-specific is not specified, a less specific route table prefix fails to match the configured prefix. The allow-default optional parameter extends the less-specific match to include the default route (0.0.0.0).</p> <p>The no form of the command prevents RTM lookup results that are less specific than the route prefix from matching.</p>
Default	no less-specific — The route unknown priority events requires an exact prefix/mask match.
Parameters	allow-default — When the allow-default parameter is specified with the less-specific command, an RTM return of 0.0.0.0 matches the IP prefix. If less-specific is entered without the allow-default parameter, a return of 0.0.0.0 will not match the IP prefix. To disable allow-default , but continue to allow less-specific match operation, only enter the less-specific command (without the allow-default parameter).

next-hop

Syntax	<code>[no] next-hop <i>ip-address</i></code>
Context	<code>config>vrrp>policy>priority-event>route-unknown <i>prefix/mask-length</i></code>
Description	<p>This command adds an allowed next hop IP address to match the IP route prefix for a route-unknown priority control event.</p> <p>If the next-hop IP address does not match one of the defined <i>ip-address</i>, the match is considered unsuccessful and the route-unknown event transitions to the set state.</p> <p>The next-hop command is optional. If no next-hop <i>ip-address</i> commands are configured, the comparison between the RTM prefix return and the route-unknown IP route prefix are not included in the next hop information.</p>

When more than one next hop IP addresses are eligible for matching, a **next-hop** command must be executed for each IP address. Defining the same IP address multiple times has no effect after the first instance.

The **no** form of the command removes the *ip-address* from the list of acceptable next hops when looking up the **route-unknown** prefix. If this *ip-address* is the last next hop defined on the **route-unknown** event, the returned next hop information is ignored when testing the match criteria. If the *ip-address* does not exist, the **no next-hop** command returns a warning error, but continues to execute if part of an **exec** script.

Default no next-hop — No next hop IP address for the route unknown priority control event is defined.

Parameters *ip-address* — The IP address for an acceptable next hop IP address for a returned route prefix from the RTM when looking up the **route-unknown** route prefix.

Values

ipv4-address :	a.b.c.d
ipv6-address :	x:x:x:x:x:x:x[-interface]
x:	[0..FFFF]H
interface:	32 chars maximum, mandatory for link local addresses

Note that the link-local IPv6 address must have an interface name specified. The global IPv6 address must not have an interface name specified.

protocol

Syntax **protocol** {**bgp** | **bgp-vpn** | **ospf** | **is-is** | **rip** | **static**}
no protocol

Context config>vrrp>policy>priority-event>route-unknown *prefix/mask-length*

Description This command adds one or more route sources to match the route unknown IP route prefix for a route unknown priority control event.

If the route source does not match one of the defined protocols, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **protocol** command is optional. If the **protocol** command is not executed, the comparison between the RTM prefix return and the **route-unknown** IP route prefix will not include the source of the prefix. The **protocol** command cannot be executed without at least one associated route source parameter. All parameters are reset each time the **protocol** command is executed and only the explicitly defined protocols are allowed to match.

The **no** form of the command removes protocol route source as a match criteria for returned RTM route prefixes.

To remove specific existing route source match criteria, execute the **protocol** command and include only the specific route source criteria. Any unspecified route source criteria is removed.

Default no protocol — No route source for the route unknown priority event is defined.

Parameters **bgp** — This parameter defines BGP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp** parameter,

Priority Policy Route Unknown Event Commands

a returned route prefix with a source of BGP will not be considered a match and will cause the event to enter the set state.

bgp-vpn — This parameter defines **bgp-vpn** as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp-vpn** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp-vpn** parameter, a returned route prefix with a source of **bgp-vpn** will not be considered a match and will cause the event to enter the set state.

ospf — This parameter defines OSPF as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **ospf** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **ospf** parameter, a returned route prefix with a source of OSPF will not be considered a match and will cause the event to enter the set state.

is-is — This parameter defines IS-IS as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **is-is** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **is-is** parameter, a returned route prefix with a source of IS-IS will not be considered a match and will cause the event to enter the set state.

rip — This parameter defines RIP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **rip** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **rip** parameter, a returned route prefix with a source of RIP will not be considered a match and will cause the event to enter the set state.

static — This parameter defines a static route as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **static** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **static** parameter, a returned route prefix with a source of static route will not be considered a match and will cause the event to enter the set state.

route-unknown

Syntax	[no] route-unknown <i>prefix/mask-length</i>
Context	config>vrrp>policy>priority-event
Description	<p>This command creates a context to configure a route unknown priority control event that monitors the existence of a specific active IP route prefix within the routing table.</p> <p>The route-unknown command configures a priority control event that defines a link between the VRRP priority control policy and the Route Table Manager (RTM). The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes proper action according to the priority event definition. If the route prefix exists and is active in the routing table according to the conditions defined, the event is in the cleared state. If the route prefix is removed, becomes inactive or fails to meet the event criteria, the event is in the set state.</p> <p>The command creates a route-unknown node identified by <i>prefix/mask-length</i> and containing event control commands.</p>

Multiple unique (different *prefix/mask-length*) **route-unknown** event nodes can be configured within the **priority-event** node up to the maximum limit of 32 events.

The **route-unknown** command can reference any valid IP address mask-length pair. The IP address and associated mask length define a unique IP router prefix. The dynamic monitoring of the route prefix results in one of the following event operational states:

route-unknown Operational State	Description
Set – non-existent	The route does not exist in the route table.
Set – inactive	The route exists in the route table but is not being used.
Set – wrong next hop	The route exists in the route table but does not meet the next-hop requirements.
Set – wrong protocol	The route exists in the route table but does not meet the protocol requirements.
Set – less specific found	The route exists in the route table but does not meet any less-specific requirements.
Set – default best match	The route exists in the route table as the default route but the default route is not allowed for route matching.
Cleared – less specific found	A less specific route exists in the route table and meets all criteria including the less-specific requirements.
Cleared – found	The route exists in the route table manager and meets all criteria.

An existing route prefix in the RTM must be active (used by the IP forwarding engine) to clear the event operational state. It may be less specific (the defined prefix may be contained in a larger prefix according to Classless Inter-Domain Routing (CIDR) techniques) if the event has the **less-specific** statement defined. The less specific route that incorporates the router prefix may be the default route (0.0.0.0) if the **less-specific allow-default** statement is defined. The matching prefix may be required to have a specific next hop IP address if defined by the event **next-hop** command. Finally, the source of the RTM prefix may be required to be one of the dynamic routing protocols or be statically defined if defined by the event **protocol** command. If an RTM prefix is not found that matches all the above criteria (if defined in the event control commands), the event is considered to be set. If a matching prefix is found in the RTM, the event is considered to be cleared.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **no** form of the command is used to remove the specific *prefix/mask-length* monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated

Priority Policy Route Unknown Event Commands

virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

Default **no route-unknown** — No route unknown priority control events are defined for the priority control event policy.

Parameters *prefix* — The IP prefix address to be monitored by the route unknown priority control event in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255

mask-length — The subnet mask length expressed as a decimal integer associated with the IP *prefix* defining the route prefix to be monitored by the route unknown priority control event.

Values 0 — 32

ip-address — The IP address of the host for which the specific event will monitor connectivity. The *ip-addr* can only be monitored by a single event in this policy. The IP address can be monitored by multiple VRRP priority control policies. The IP address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ip-addr* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

Values *ip-prefix/mask:* ip-prefix a.b.c.d (host bits must be 0)
mask 0 — 32

ipv6-address/prefix:

ipv6-address x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
prefix-length 1 — 128

Show Commands

instance

Syntax **instance**
instance [**interface** *interface-name* [**vrid** *virtual-router-id*]
instance interface *interface-name* **vrid** *virtual-router-id* **ipv6**

Context show>vrrp

Description This command displays information for VRRP instances.
 If no command line options are specified, summary information for all VRRP instances displays.

Parameters **interface** *ip-int-name* — Displays detailed information for the VRRP instances on the specified IP interface including status and statistics.

Default Summary information for all VRRP instances.

vrid *virtual-router-id* — Displays detailed information for the specified VRRP instance on the IP interface.

Default All VRIDs for the IP interface.

Values 1 — 255

ipv6 — Specifies the IPv6 instance.

Output **VRRP Instance Output** — The following table describes the instance command output fields for VRRP.

Label	Description
Interface name	The name of the IP interface.
VR ID	The virtual router ID for the IP interface
Own Owner	Yes — Specifies that the virtual router instance as owning the virtual router IP addresses. No — Indicates that the virtual router instance is operating as a non-owner.
Adm	Up — Indicates that the administrative state of the VRRP instance is up. Down — Indicates that the administrative state of the VRRP instance is down.
Oper	Up — Indicates that the operational state of the VRRP instance is up. Down — Indicates that the operational state of the VRRP instance is down.

Label	Description (Continued)
State	<p>When owner, backup defines the IP addresses that are advertised within VRRP advertisement messages.</p> <p>When non-owner, backup actually creates an IP interface IP address used for routing IP packets and communicating with the system when the access commands are defined (ping-reply, telnet-reply, and ssh-reply).</p>
Pol Id	The value that uniquely identifies a Priority Control Policy.
Base Priority	The <i>base-priority</i> value used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy.
InUse Priority	The current in-use priority associated with the VRRP virtual router instance.
Msg Int	The administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages and to derive the master down timer as backup.
Inh Int	<p>Yes — When the VRRP instance is a non-owner and is operating as a backup and the master-int-inherit command is enabled, the master down timer is indirectly derived from the value in the advertisement interval field of the VRRP message received from the current master.</p> <p>No — When the VRRP instance is operating as a backup and the master-int-inherit command is <i>not</i> enabled, the configured advertisement interval is matched against the value in the advertisement interval field of the VRRP message received from the current master. If the two values do not match then the VRRP advertisement is discarded.</p> <p>If the VRRP instance is operating as a master, this value has no effect.</p>
Backup Addr	The backup virtual router IP address.
BFD	Indicates BFD is enabled.
VRRP State	Specifies whether the VRRP instance is operating in a master or backup state.
Policy ID	<p>The VRRP priority control policy associated with the VRRP virtual router instance.</p> <p>A value of 0 indicates that no control policy policy is associated with the virtual router instance.</p>
Preempt Mode	<p>Yes — The preempt mode is enabled on the virtual router instance where it will preempt a VRRP master with a lower priority.</p> <p>No — The preempt mode is disabled and prevents the non-owner virtual router instance from preempting another, less desirable virtual router.</p>

Label	Description (Continued)
Ping Reply	<p>Yes — A non-owner master is enabled to reply to ICMP Echo requests directed to the virtual router instance IP addresses.</p> <p>Ping Reply is valid only if the VRRP virtual router instance associated with this entry is a non-owner.</p> <p>A non-owner backup virtual router never responds to such ICMP echo requests irrespective if Ping Reply is enabled.</p> <p>No — ICMP echo requests to the virtual router instance IP addresses are discarded.</p>
Telnet Reply	<p>Yes — Non-owner masters can to reply to TCP port 23 Telnet requests directed at the virtual router instances IP addresses.</p> <p>No — Telnet requests to the virtual router instance IP addresses are discarded.</p>
SSH Reply	<p>Yes — Non-owner masters can to reply to SSH requests directed at the virtual router instances IP addresses.</p> <p>No — All SSH request messages destined to the non-owner virtual router instance IP addresses are discarded.</p>
Primary IP of Master	The IP address of the VRRP master.
Primary IP	The IP address of the VRRP owner.
Up Time	The date and time when the operational state of the event last changed.
Virt MAC Addr	The virtual MAC address used in ARP responses when the VRRP virtual router instance is operating as a master.
Auth Type	Specifies the VRRP authentication Type 0 (no authentication), Type 1 (simple password), or Type 2 (MD5) for the virtual router.
Addr List Mismatch	<p>Specifies whether a trap was generated when the IP address list received in the advertisement messages received from the current master did not match the configured IP address list.</p> <p>This is an edge triggered notification. A second trap will not be generated for a packet from the same master until this event has been cleared.</p>
Master Priority	The priority of the virtual router instance which is the current master.
Master Since	<p>The date and time when operational state of the virtual router changed to master.</p> <p>For a backup virtual router, this value specifies the date and time when it received the first VRRP advertisement message from the virtual router which is the current master.</p>

Sample Output

```

*A:ALA-A# show router vrrp instance

policy

Syntax `policy [vrrp-policy-id [event event-type specific-qualifier]]`

Context show>vrrp

Description This command displays VRRP priority control policy information.
If no command line options are specified, a summary of the VRRP priority control event policies displays.

Parameters *vrrp-policy-id* — Displays information on the specified priority control policy ID.

Default All VRRP policies IDs

Values 1 — 9999

event event-type — Displays information on the specified VRRP priority control event within the policy ID.

Default All event types and qualifiers

Values **port-down** *port-id*
lag-port-down *lag-id*
host-unreachable *host-ip-addr*
route-unknown *route-prefix/mask*

specific-qualifier — Display information about the specified qualifier.

Values port-id, lag-id, host-ip-addr, route-prefix/mask

Output **VRRP Policy Output** — The following table describes the VRRP policy command output fields.

Label	Description
Policy Id	The VRRP priority control policy associated with the VRRP virtual router instance. A value of 0 indicates that no control policy policy is associated with the virtual router instance.
Current Priority & Effects	
Current Explicit	When multiple explicitly defined events associated with the priority control policy happen simultaneously, the lowest value of all the current explicit priorities will be used as the in-use priority for the virtual router.

Label	Description (Continued)
Current Delta Sum	The sum of the priorities of all the delta events when multiple delta events associated with the priority control policy happen simultaneously. This sum is subtracted from the base priority of the virtual router to give the in-use priority.
Delta Limit	<p>The delta-in-use-limit for a VRRP policy. Once the total sum of all delta events has been calculated and subtracted from the base-priority of the virtual router, the result is compared to the delta-in-use-limit value. If the result is less than this value, the delta-in-use-limit value is used as the virtual router in-use priority value. If an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect.</p> <p>If the delta-in-use-limit is 0, the sum of the delta priority control events to reduce the virtual router's in-use-priority to 0 can prevent it from becoming or staying master.</p>
Current Priority	The configured delta-in-use-limit priority for a VRRP priority control policy or the configured delta or explicit priority for a priority control event.
Applied	The number of virtual router instances to which the policy has been applied. The policy cannot be deleted unless this value is 0.
Description	A text string which describes the VRRP policy.
Event Type & ID	<p>A delta priority event is a conditional event defined in a priority control policy that subtracts a given amount from the base priority to give the current in-use priority for the VRRP virtual router instances to which the policy is applied.</p> <p>An explicit priority event is a conditional event defined in a priority control policy that explicitly defines the in-use priority for the VRRP virtual router instances to which the policy is applied.</p> <p>Explicit events override all delta Events. When multiple explicit events occur simultaneously, the event with the lowest priority value defines the in-use priority.</p>
Event Oper State	The operational state of the event.
Hold Set Remaining	The amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events.
Priority & Effect	<p>Delta – The <i>priority-level</i> value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event <i>priority-level</i> values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value.</p> <p>If the delta priority event is cleared, the <i>priority-level</i> is no longer used in the in-use priority calculation.</p>

Label	Description (Continued)
	<p>Explicit – The <i>priority-level</i> value is used to override the base priority of the virtual router instance if the priority event is set and no other explicit priority event is set with a lower <i>priority-level</i>.</p> <p>The set explicit priority value with the lowest <i>priority-level</i> determines the actual in-use protocol value for all virtual router instances associated with the policy.</p>
In Use	Specifies whether or not the event is currently affecting the in-use priority of some virtual router.

Sample Output

```
A:ALA-A# show vrrp policy

VRRP Policy Event Output — The following table describes a specific event VRRP policy command output fields.

Label	Description
Description	A text string which describes the VRRP policy.
Policy Id	The VRRP priority control policy associated with the VRRP virtual router instance. A value of 0 indicates that no control policy is associated with the virtual router instance.
Current Priority	The base router priority for the virtual router instance used in the master election process.
Current Explicit	When multiple explicitly defined events associated with the priority control policy happen simultaneously, the lowest value of all the current explicit priorities will be used as the in-use priority for the virtual router.
Applied	The number of virtual router instances to which the policy has been applied. The policy cannot be deleted unless this value is 0.
Current Delta Sum	The sum of the priorities of all the delta events when multiple delta events associated with the priority control policy happen simultaneously. This sum is subtracted from the base priority of the virtual router to give the in-use priority.
Delta Limit	The delta-in-use-limit for a VRRP policy. Once the total sum of all delta events has been calculated and subtracted from the base-priority of the virtual router, the result is compared to the delta-in-use-limit value. If the result is less than this value, the delta-in-use-limit value is used as the virtual router in-use priority value. If an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect. If the delta-in-use-limit is 0, the sum of the delta priority control events to reduce the virtual router's in-use-priority to 0 can prevent it from becoming or staying master.
Applied to Interface Name	The interface name where the VRRP policy is applied.
VR ID	The virtual router ID for the IP interface.
Opr	Up — Indicates that the operational state of the VRRP instance is up. Down — Indicates that the operational state of the VRRP instance is down.
Base Pri	The base priority used by the virtual router instance.
InUse Priority	The current in-use priority associated with the VRRP virtual router instance.

Label	Description (Continued)
Master Priority	The priority of the virtual router instance which is the current master.
Priority	The base priority used by the virtual router instance.
Priority Effect	<p>Delta – A delta priority event is a conditional event defined in a priority control policy that subtracts a given amount from the base priority to give the current in-use priority for the VRRP virtual router instances to which the policy is applied.</p> <p>Explicit – A conditional event defined in a priority control policy that explicitly defines the in-use priority for the VRRP virtual router instances to which the policy is applied.</p> <p>Explicit events override all delta events. When multiple explicit events occur simultaneously, the event with the lowest priority value defines the in-use priority.</p>
Current Priority	The configured delta-in-use-limit priority for a VRRP priority control policy or the configured delta or explicit priority for a priority control event.
Event Oper State	The operational state of the event.
Hold Set Remaining	The amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events.
Priority	The base priority used by the virtual router instance.
Priority Effect	<p>Delta – The <i>priority-level</i> value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event <i>priority-level</i> values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value.</p> <p>If the delta priority event is cleared, the <i>priority-level</i> is no longer used in the in-use priority calculation.</p> <p>Explicit – The <i>priority-level</i> value is used to override the base priority of the virtual router instance if the priority event is set and no other explicit priority event is set with a lower <i>priority-level</i>.</p> <p>The set explicit priority value with the lowest <i>priority-level</i> determines the actual in-use protocol value for all virtual router instances associated with the policy.</p>
Hold Set Config	The configured number of seconds that the hold set timer waits after an event enters a set state or enters a higher threshold set state, depending on the event type.
Value In Use	Yes – The event is currently affecting the in-use priority of some virtual router.

Label	Description (Continued)
	No – The event is not affecting the in-use priority of some virtual router.
# trans to Set	The number of times the event has transitioned to one of the 'set' states.
Last Transition	The time and date when the operational state of the event last changed.

Sample Output

```

Monitor Commands

instance

- Syntax** `instance interface interface-name vr-id virtual-router-id [ipv6] [interval seconds] [repeat repeat] [absolute | rate]`
- Context** monitor>router>vrrp
- Description** Monitor statistics for a VRRP instance.
- Parameters**
- interface-name* — The name of the existing IP interface on which VRRP is configured.
 - vr-id virtual-router-id* — The virtual router ID for the existing IP interface, expressed as a decimal integer.
 - interval seconds* — Configures the interval for each display in seconds.
 - Default** 5 seconds
 - Values** 3 — 60
 - repeat repeat* — Configures how many times the command is repeated.
 - Default** 10
 - Values** 1 — 999
 - absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
 - rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.
 - ipv6** — Specifies to monitor IPv6 instances.

Sample Output

```
*A:ALA-A# monitor router vrrp instance interface n2 vr-id 1

Clear Commands

interface

Syntax	interface <i>ip-int-name</i> [vrid <i>virtual-router-id</i>] interface <i>ip-int-name</i> vrid <i>virtual-router-id</i> ipv6
Context	clear>router>vrrp
Description	This command resets VRRP protocol instances on an IP interface.
Parameters	<i>ip-int-name</i> — The IP interface to reset the VRRP protocol instances. vrid <i>vrid</i> — Resets the VRRP protocol instance for the specified VRID on the IP interface. Default All VRIDs on the IP interface. Values 1 — 255 ipv6 — Clears IPv6 information for the specified interface.

statistics

Syntax	statistics [policy <i>policy-id</i>]
Context	clear>router>vrrp
Description	This command enables the context to clear and reset VRRP entities.
Parameters	policy <i>policy-id</i> — Clears statistics for the specified policy. Values 1 — 9999

statistics

Syntax	statistics interface <i>interface-name</i> [vrid <i>virtual-router-id</i>] statistics statistics interface <i>interface-name</i> vrid <i>virtual-router-id</i> ipv6
Context	clear>router>vrrp
Description	This command clears statistics for VRRP instances on an IP interface or VRRP priority control policies.
Parameters	interface <i>ip-int-name</i> — Clears the VRRP statistics for all VRRP instances on the specified IP interface.

vrld *virtual-router-id* — Clears the VRRP statistics for the specified VRRP instance on the IP interface.

Default All VRRP instances on the IP interface.

Values 1 — 255

policy [*vrrp-policy-id*] — Clears VRRP statistics for all or the specified VRRP priority control policy.

Default All VRRP policies.

Values 1 — 9999

ipv6 — Clears IPv6 statistics for the specified interface.

VRRP Debug Commands

events

Syntax	events events interface <i>ip-int-name</i> [vrid <i>virtual-router-id</i>] events interface <i>ip-int-name</i> vrid <i>virtual-router-id</i> ipv6 no events no events interface <i>ip-int-name</i> vrid <i>virtual-router-id</i> ipv6 no events interface <i>ip-int-name</i> [vrid <i>virtual-router-id</i>]
Context	debug>router>vrrp
Description	This command enables debugging for VRRP events. The no form of the command disables debugging.
Parameters	<i>ip-int-name</i> — Displays the specified interface name. vrid <i>virtual-router-id</i> — Displays the specified VRID. ipv6 — Debugs the specified IPv6 VRRP interface.

packets

Syntax	packets interface <i>ip-int-name</i> [vrid <i>virtual-router-id</i>] packets no packets interface <i>ip-int-name</i> [vrid <i>virtual-router-id</i>] [ipv6] no packets
Context	debug>router>vrrp
Description	This command enables debugging for VRRP packets. The no form of the command disables debugging.
Parameters	<i>ip-int-name</i> — Displays the specified interface name. vrid <i>virtual-router-id</i> — Displays the specified VRID.

Filter Policies

In This Chapter

This chapter provides information about filter policies and management.

Topics in this chapter include:

- [Filter Policy Configuration Overview on page 368](#)
 - [Service and Network Port-Based Filtering on page 368](#)
 - [Filter Policy Entities on page 369](#)
 - [Redirect Policies on page 371](#)
 - [VID Filters on page 374](#)
- [Creating and Applying Policies on page 378](#)
- [Configuration Notes on page 389](#)

Filter Policy Configuration Overview

Filter policies, also referred to as Access Control Lists (ACLs), are templates applied to services or network ports to control network traffic into (ingress) or out of (egress) a service access port (SAP) or network port based on IP, IPv6, and MAC matching criteria. Filters are applied to services to look at packets entering or leaving a SAP or network interface. Filters can be used on several interfaces. The same filter can be applied to ingress traffic, egress traffic, or both. Ingress filters affect only inbound traffic destined for the routing complex, and egress filters affect only outbound traffic sent from the routing complex.

Configuring an entity with a filter policy is optional. If an entity such as a service or network port is not configured with filter policies, then all traffic is allowed on the ingress and egress interfaces. By default, there are no filters associated with services or interfaces. They must be explicitly created and associated. When you create a new filter, default values are provided although you must specify a unique filter ID value to each new filter policy as well as each new filter entry and associated actions. The filter entries specify the filter matching criteria.

Only one ingress IP or MAC filter policy and one egress IP or MAC filter policy can be applied to a Layer 2 SAP. Only one ingress IP filter policy and one egress IP filter policy can be applied to a Layer 3 SAP or network interface. Only one ingress IPv6 filter policy and one egress IPv6 filter policy can be applied to a Layer 3 SAP or network interface but this can be in combination with an IP filter policy.

Network filter policies control the forwarding and dropping of packets based on IP or MAC match criteria. Note that non-IP packets are not hitting the IP filter policy, so the default action in the filter policy will not apply to these packets.

Service and Network Port-Based Filtering

IP, IPv6, and MAC filter policies specify either a forward or a drop action for packets based on information specified in the match criteria. You can create up to 2047 IPv6 and 2047 MAC filter policies per node although your network can handle up to 65535 policies including policies pushed out globally or to specific nodes. Within each filter policy, you can create up to 16384 entries.

Filter entry matching criteria can be as general or specific as you require, but all conditions in the entry must be met in order for the packet to be considered a match and the specified entry action performed. The process stops when the first complete match is found and executes the action defined in the entry, either to drop or forward packets that match the criteria.

Filter Policy Entities

A filter policy compares the match criteria specified within a filter entry to packets coming through the system, in the order the entries are numbered in the policy. When a packet matches all the parameters specified in the entry, the system takes the specified action to either drop or forward the packet. If a packet does not match the entry parameters, the packet continues through the filter process and is compared to the next filter entry, and so on. If the packet does not match any of the entries, then system executes the default action specified in the filter policy. Each filter policy is assigned a unique filter ID. Each filter policy is defined with:

- Scope
- Default action
- Description
- At least one filter entry

Each filter entry contains:

- Match criteria
- An action

Applying Filter Policies

Filter policies can be associated with the following entities:

Table 8: Applying Filter Policies

IP Filter	MAC Filter	IPv6 Filter
Security CPM filter	N/A	Security CPM filter
CRON TOD-suite	CRON TOD-suite	CRON TOD-suite
Router interface	N/A	Router interface
Egress multicast group	Egress multicast group	Egress multicast group
VLL SAP, spoke SDP	VLL SAP, spoke SDP	VLL SAP, spoke SDP
IES interface SAP, subscriber-interface	N/A	IES interface SAP, subscriber-interface
Ipipe SAP, spoke SDP	N/A	N/A
VPLS mesh/spoke SDP, SAP	VPLS mesh/spoke SDP, SAP	VPLS mesh/spoke SDP, SAP

Table 8: Applying Filter Policies (Continued)

IP Filter	MAC Filter	IPv6 Filter
VPRN interface SAP, spoke SDP, subscriber-interface	N/A	VPRN interface SAP
Epipe SAP, spoke SDP	Epipe SAP, spoke SDP	Epipe SAP, spoke SDP
Fpipe SAP, spoke SDP	Fpipe SAP, spoke SDP	Fpipe SAP, spoke SDP
Ipipe SAP, spoke SDP	Ipipe SAP, spoke SDP	Ipipe SAP, spoke SDP
Pseudowire template	Pseudowire template	Pseudowire template

Filter policies can be applied to specific service types:

- Epipe — Both MAC and IP filters are supported on an Epipe SAP and spoke SDPs.
- IES — Only IP and IPv6 filters are supported on an IES IP interface and spoke SDPs.
- VPLS — Both MAC and IP filters are supported on a VPLS SAP and mesh and spoke SDPs.
- VPRN — Only IP filters are supported on VPRN interface SAPS and spoke SDPs.

Filter policies are applied to the following service entities:

- SAP ingress — IP and MAC filter policies applied on the SAP ingress define the Service Level Agreement (SLA) enforcement of service packets as they ingress a SAP according to the filter policy match criteria.
- SAP egress — Filter policies applied on SAP egress define the Service Level Agreement (SLA) enforcement for service packets as they egress on the SAP according to the filter policy match criteria.
- IES interfaces
- Network ingress — IP filter policies are applied to network ingress IP interfaces.
- Network egress — IP filter policies are applied to network egress IP interfaces.

Redirect Policies

Redirect policies define one or more cache server destinations and provides a method to determine which destination is used. Redirection policies are used to identify cache servers (or other redirection target destinations) and define health check test methods used to validate the ability for the destination to receive redirected traffic. This destination monitoring greatly diminishes the likelihood of a destination receiving packets it cannot process.

Redirection identifies packets to be redirected and specifies the method to reach the web cache server. Packets are identified by IP filter entries. The redirection action is accomplished and supported with Policy Based Routing. Only IP routed frames can be redirected. Bridged IP packets that match the entry criteria will not be redirected.

Redirection policies can contain multiple destinations. Each destination is assigned an initial or base priority describing its relative importance within the policy. The destination with the highest priority value is selected.

There are no default redirect policies. Each redirect policy must be explicitly configured and specified in an IP filter entry.

To facilitate redirection based on a redirection policy, an IP filter must be created and applied to the appropriate ingress or egress IP interfaces where redirection is required. The entry criteria for the filter entry must specify a redirect policy to enable the appropriate IP packets to be redirected from the normal IP routing next hop. If packets do not meet any of the defined match criteria, then those packets are routed normally through the destination-based routing process.

The redirection policy is referenced within the action context for an IP filter entry, binding the filter entry to the policy and the IP destinations managed by the policy. The policy specifies the destination IP address where the packets matching the filter entry will be redirected. When the policy determines the destination for packets matching the filter, the action on the filter entry is similar to provisioning that destination IP address as an indirect next hop Policy Based Route (PBR) action.

Web Redirection (Captive Portal)

Redirection policies can be configured on 7750 SR devices. Redirection policies were designed for testing purposes. The new redirection policy can now block a customer's request from an intended recipient and force the customer to connect to the service's portal server. 255 unique entries with http-redirect are allowed.

Traffic Flow

The following example provides a brief scenario of a customer connection with web redirection.

1. The customer gets an IP address using DHCP (if the customer is trying to set a static IP he will be blocked by the anti-spoofing filter).
2. The customer tries to connect to a website.
3. The router intercepts the HTTP GET request and blocks it from the network
4. The router then sends the customer a HTTP 302 (service temporarily unavailable/moved). The target URL should then include the customer's IP and MAC addresses as part of the portal's URL.
5. The customer's web browser will then close the original connection and open a new connection to the web portal.
6. The web portal updates the ACL (directly or through SSC) to remove the redirection policy.
7. The customer connects to the original site.

Figure 14: Web Redirect Traffic Flow

Starred entries (*) are items the router performs masquerading as the destination, regardless of the destination IP address or type of service.

Information needed by the filter that may be sent to the portal:

- Customer's IP address
- Customer's MAC address
- Original requested URL
- Customer's SAP
- Customer's subscriber identification string

Note that the subscriber identification string is available only when used with subscriber management. Refer to the subscriber management section of the 7750 SR OS Triple Play Guide and the 7750 SR OS Router Configuration Guide.

Since most web sites are accessed using the domain name the router allows either DNS queries or responds to DNS with the portal's IP address.

VID Filters

VID Filters extend the capability of current Ethernet Ports with null or default SAP tag configuration to match and take action on VID tags. Service delimiting tags (for example QinQ 1/1/1:10.20 or dot1q 1/1/1:10, where outer tag 10 and inner tags 20 are service delimiting) allow fine grain control of frame operations based on the VID tag. Service delimiting tags are exact match and are stripped from the frame as illustrated in [Figure 15](#). Exact match or service delimiting Tags do not require VID filters. VID filters can only be used to match on frame tags that are after the service delimiting tags.

With VID Filters operators can choose to match VID tags for up to two tags on ingress or egress or both.

- The outer-tag is the first tag in the packet that is carried transparently through the service.
- The inner-tag is the second tag in the packet that is carried transparently through the service.

VID Filters add the capability to perform VID value filter policies on default tags (1/1/1:* or 1/1/1:x.*, or 1/1/1:*0), or null tags (1/1/1, 1/1/1:0 or 1/1/1:x.0). The matching is based on the port configuration and the SAP configuration.

In the industry the QinQ tags are often referred to as the C-VID (Customer VID) and S-VID (service VID). The terms outer tag and inner tag allow flexibility without having to refer to C-TAG and an S-TAG explicitly.. The position of inner and outer tags is relative to the port configuration and SAP configuration. Matching of tags is allowed for up to the first two tags on a frame. Since service delimiting tags may be 0, 1 or 2 tags.

The meaning of inner and outer has been designed to be consistent for egress and ingress when the number of non service delimiting tags is consistent. Service 1 in [Figure 15](#) shows a conversion from qinq to a single dot1q example where there is one non-service delimiting tag on ingress and egress. Service 2 shows a symmetric example with two non-service delimiting tags (plus and additional tag for illustration) to two non-service delimiting tags on egress. Service 3 illustrates single non-service delimiting tags on ingress and to two tags with one non-service delimiting tag on ingress and egress.

SAP-ingress QoS setting allows for MAC-criteria type VID which uses the VID filter matching capabilities [QoS and VID Filters \(moved to QoS guide\) on page 313](#).

A VID filter entry can be used as a debug or lawful intercept mirror source entry.

Figure 15: VID Filtering Examples

VID filters are available on Ethernet SAPs for Epipe, VPLS or I-VPLS including eth-tunnel and eth-ring services.

Arbitrary Bit Matching of VID Filters

In addition to matching an exact value, a VID filter mask allows masking any set of bits. The masking operation is $((\text{value} \& \text{vid-mask}) = (\text{tag and vid-mask}))$. For example: A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6. VID filters allow explicit matching of VIDs and matching of any bit pattern within the VID tag.

When using VID filters on SAPs only VID filters are allowed on this SAP. Filters of type normal and ISID are not allowed.

An additional check for the “0” VID tag may be required when using certain wild card operations. For example frames with no tags on null encapsulated ports will match a value of 0 in outer tag and inner tag because there are no tags in the frame for matching. If a zero tag is possible but not desired it can be explicitly filtered using exact match on “0” prior to testing other bits for “0”.

Note that **configure>system>ethernet>new-qinq-untagged-sap** is a special QinQ function for single tagged QinQ frames with a null second tag. Using this in combination with VID filters is not recommended. Note that the outer-tag is the only tag available for filtering on egress for frames arriving from MPLS SDPs or from PBB services even though additional tags may be carried transparently.

Port Group Configuration Example

Figure 16: Port Groups

Figure 16 shows a customer use example where some VLANs are prevented from ingress or egressing certain ports. In the example, port A sap 1/1/1:1.* would have a filter as shown below while port A sap 1/1/1:2.* would not.:

```
mac-filter 4 create
  default-action forward
  type vid
  entry 1 create
    match frame-type ethernet_II
      outer-tag 30 4095
    exit
  action drop
  exit
exit
```

Creating and Applying Policies

Figure 17 displays the process to create redirect policies and apply them to a service SAP or router interface.

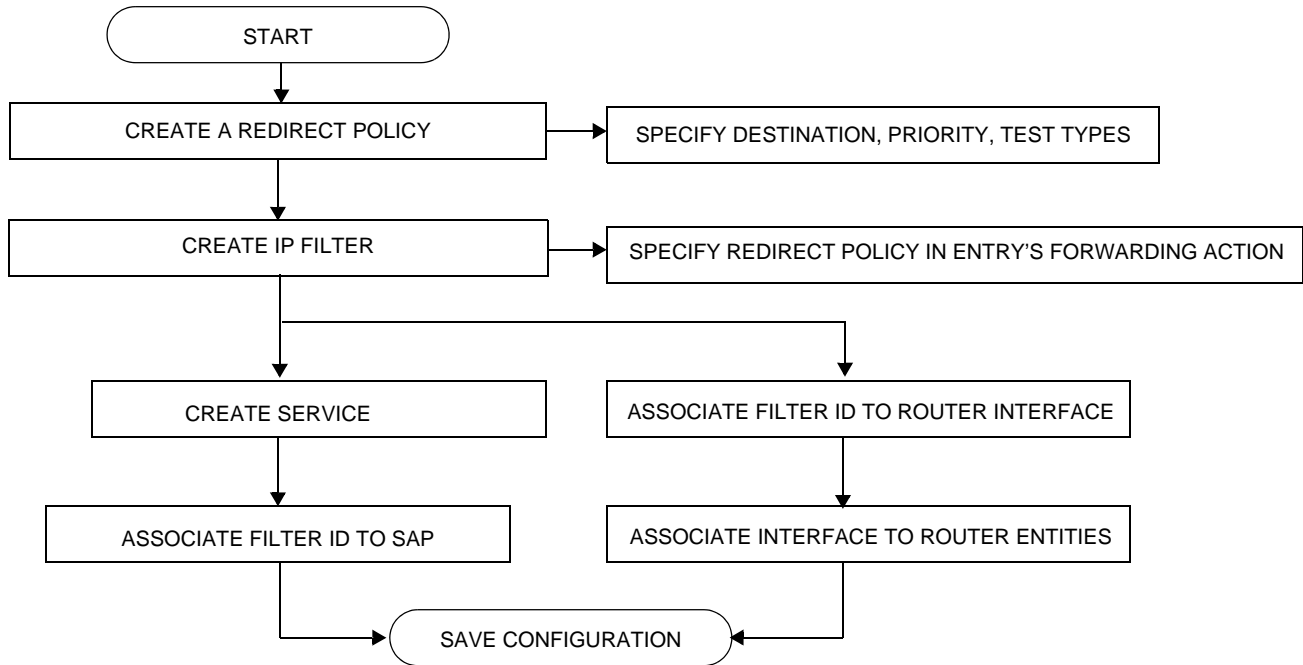

Figure 17: Filter Creation and Implementation Flow

Figure 18 displays the process to create filter policies and apply them to a service or network port.

Figure 18: Creating and Applying Filter Policies

Packet Matching Criteria

Up to 65535 IP and 65535 MAC filter IDs (unique filter policies) can be defined. A maximum of 16384 filter entries can be defined in one filter at the same time. Each filter ID can contain up to 65535 filter entries. A maximum of 16384 filter entries can be defined in 1 filter at the same time. As few or as many match parameters can be specified as required, but all conditions must be met in order for the packet to be considered a match and the specified action performed. The process stops when the first complete match is found and then executes the action defined in the entry, either to drop or forward packets that match the criteria.

IP filter policies match criteria that associate traffic with an ingress or egress SAP. Matching criteria to drop or forward IP traffic include:

- Source IP address and mask
Source IP address and mask values can be entered as search criteria. The IP Version 4 addressing scheme consists of 32 bits expressed in dotted decimal notation (X.X.X.X).
Address ranges are configured by specifying mask values, the 32-bit combination used to describe the address portion which refers to the subnet and which portion refers to the host. The mask length is expressed as an integer (range 1 to 32).
The IP Version 6 (IPv6) addressing scheme consists of 128 bits expressed in compressed representation of IPv6 addresses (RFC 1924, *A Compact Representation of IPv6 Addresses*).
- Destination IP address and mask — Destination IP address and mask values can be entered as search criteria.
- Protocol — Entering a protocol ID (such as TCP, UDP, etc.) allows the filter to search for the protocol specified in this field.
- Protocol — For IPv6: entering a next header allows the filter to match the first next header following the IPv6 header.
- Source port/range — Entering the source port number or port range allows the filter to search for matching TCP or UDP port and range values.
- Destination port/range — Entering the destination port number or port range allows the filter to search for matching TCP or UDP values .
- DSCP marking — Entering a DSCP marking enables the filter to search for the DSCP marking specified in this field. See [Table 9, DSCP Name to DSCP Value Table, on page 383](#).
- ICMP code — Entering an ICMP code allows the filter to search for matching ICMP code in the ICMP header.
- ICMP type — Entering an ICMP type allows the filter to search for matching ICMP types in the ICMP header.

- Fragmentation — IPv4 only: Enable fragmentation matching. A match occurs if packets have either the MF (more fragment) bit set or have the Fragment Offset field of the IP header set to a non-zero value.
- Option value — Entering an option value enables the first filter to search for a specific IP option.
- Option present — Enabling the option presence allows the filter to search for presence or absence of IP options in the packet. Padding and EOOL are also considered as IP options.
- TCP-ACK/SYN flags — Entering a TCP-SYN/TCP-ACK flag allows the filter to search for the TCP flags specified in these fields.

MAC filter policies match criteria that associate traffic with an ingress or egress SAP. Matching criteria to drop or forward MAC traffic include:

- Frame type
Entering the frame type allows the filter to match for a specific type of frame format; for example, Ethernet-II will match for only ethernet-II frames.
- Source MAC address and mask
Entering the source MAC address range allows the filter to search for matching a source MAC address and/or range. Enter the source MAC address and mask in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx; for example, 00:dc:98:1d:00:00.
- Destination MAC address and mask
Entering the destination MAC address range allows the filter to search for matching a destination MAC address and/or range. Enter the destination MAC address and mask in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx; for example, 02:dc:98:1d:00:01.
- Dot1p and mask
Entering an IEEE 802.1p value or range allows the filter to search for matching 802.1p frame. The Dot1p and mask accepts decimal, hex, or binary in the range of 0 to 7.
- Ethertype
Entering an Ethernet type II Ethertype value to be used as a filter match criterion. The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. The Ethertype accepts decimal, hex, or binary in the range of 1536 to 65535.
- IEEE 802.2 LLC SSAP
Specifying an Ethernet 802.2 LLC DSAP value allows the filter to match a source access point on the network node designated in the source field of a packet. The SSAP and mask accepts decimal, hex, and binary in the range of 0 to 255.
- IEEE 802.2 LLC DSAP
Specifying an Ethernet 802.2 LLC DSAP value allows the filter to match a destination access point on the network node designated in the destination field of a packet. The DSAP and mask accepts decimal, hex, and binary in the range of 0 to 255.

- IEEE 802.3 LLC SNAP PID

Specifying an Ethernet IEEE 802.3 LLC SNAP PID allows the filter to match the two-byte protocol ID that follows the three-byte OUI field. The DSAP and mask accepts decimal and hex in the range of 0 to 65535.

- IEEE 802.1ag ISID from the I-TAG – allows the filter to match the 24 bits ISID value from the PBB I-TAG. This match criteria is mutually exclusive with all the other match criteria under a particular mac-filter list. The resulting mac-filter can be applied as required on a BVPLS SAP or PW basis just in the egress direction. A new **mac-filter type** attribute is defined to control the use of ISID match criteria and must be set to **isid** to allow the use of isid match criteria. The ISID tag is identified using the PBB ethertype provisioned under `config>port>ethernet>pbb-etype`.

1	0	23	151	DPS	Dynamic packet state
1	0	24	152	UMP	Upstream multicast packet
1	2	13	205	FINN	Experimental flow control

Ordering Filter Entries

When entries are created, they should be arranged sequentially from the most explicit entry to the least explicit. Filter matching ceases when a packet matches an entry. The entry action is performed on the packet. 7750 SR supports either drop or forward action. To be considered a match, the packet must meet all the conditions defined in the entry.

Packets are compared to entries in a filter policy in an ascending entry ID order. To reorder entries in a filter policy, edit the entry ID value; for example, to reposition entry ID 6 to a more explicit location, change the entry ID 6 value to entry ID 2.

When a filter consists of a single entry, the filter executes actions as follows:

- If a packet matches all the entry criteria, the entry's specified action is performed (drop or forward).
- If a packet does not match all of the entry criteria, the policy's default action is performed.

If a filter policy contains two or more entries, packets are compared in ascending entry ID order (1, 2, 3 or 10, 20, 30, etc.):

- Packets are compared with the criteria in the first entry ID.
- If a packet matches all the properties defined in the entry, the entry's specified action is executed.
- If a packet does not completely match, the packet continues to the next entry, and then subsequent entries.
- If a packet does not completely match any subsequent entries, then the default action is performed.

Figure 19 displays an example of several packets forwarded upon matching the filter criteria and several packets traversing through the filter entries and then dropped.

Figure 19: Filtering Process Example

Applying Filters

After filters are created, they can be applied to the following entities:

- [Applying a Filter to a SAP on page 388](#)
 - [Applying a Filter to a Network Port a Network IP on page 388](#)
-

Applying a Filter to a SAP

During the SAP creation process, ingress and egress filters are selected from a list of qualifying IP and MAC filters. When ingress filters are applied to a SAP, packets received at the SAP are checked against the matching criteria in the filter entries. If the packet completely matches all criteria in an entry, the checking stops and an entry action is performed. If permitted, the traffic is forwarded according to the specification of the action. If the packets do not match, the default filter action is applied. If permitted, the traffic is forwarded.

When egress filters are applied to a SAP, packets received at the egress SAP are checked against the matching criteria in the filter entries. If the packet completely matches all criteria in an entry, the checking stops. If permitted, the traffic is transmitted. If denied, the traffic is dropped. If the packets do not match, the default filter action is applied.

Filters can be added or changed to an existing SAP configuration by modifying the SAP parameters. Filter policies are not operational until they are applied to a SAP and the service enabled.

Applying a Filter to a Network Port a Network IP

An IP filter can be applied to a network port IP interface. Packets received on the interface are checked against the matching criteria in the filter entries. If the packet completely matches all criteria in an entry, the checking stops. If permitted, the traffic is forwarded. If the packets do not match, they are discarded or forwarded based on the default action specified in the policy.

Configuration Notes

The following information describes filter implementation caveats:

- Creating a filter policy is optional.
- Associating a service with a filter policy is optional.
- When a filter policy is configured, it should be defined as having either an *exclusive* scope for one-time use, or a *template* scope meaning that the filter can be applied to multiple SAPs.
- A specific filter must be explicitly associated with a specific service in order for packets to be matched.
- Each filter policy must consist of at least one filter entry. Each entry represents a collection of filter match criteria. When packets enter the ingress or egress ports, packets are compared to the criteria specified within the entry or entries.
- When a large (complex) filter is configured, it may take a few seconds to load the filter policy configuration and be instantiated.
- The action keyword must be entered for the entry to be active. Any filter entry without the action keyword will be considered incomplete and be inactive.

MAC Filters

- If a MAC filter policy is created with an entry and entry action specified but the packet matching criteria is not defined, then all packets processed through this filter policy entry will pass and take the action specified. There are no default parameters defined for matching criteria.
- MAC filters cannot be applied to network interfaces, routable VPLS or IES services.
- MAC filters cannot be applied to network interfaces.
- Some of the MAC match criteria fields are exclusive to each other, based on the type of Ethernet frame. Use the following table to determine the exclusivity of fields.

Table 11: MAC Match Criteria Exclusivity Rules

Frame Format	Etype	LLC – Header (ssap & dsap)	SNAP-OUI	SNAP- PID
Ethernet – II	Yes	No	No	No
802.3	No	Yes	No	No
802.3 – snap	No	No ^a	Yes	Yes

Configuration Notes

- a. When snap header is present, this is always set to AA-AA.

IP Filters

- Define filter entry packet matching criteria — If a filter policy is created with an entry and entry action specified but the packet matching criteria is not defined, then all packets processed through this filter policy entry will pass and take the action specified. There are no default parameters defined for matching criteria.
 - Action — An action parameter must be specified for the entry to be active. Any filter entry without an action parameter specified will be considered incomplete and be inactive.
 - When you configure a filter policy which is intended for filter-based mirroring, you must specify that the scope is *exclusive*.
-

IPv6 Filters

- Define filter entry packet matching criteria — If a filter policy is created with an entry and entry action specified but the packet matching criteria is not defined, then all packets processed through this filter policy entry will pass and take the action specified. There are no default parameters defined for matching criteria.
 - Action — An action parameter must be specified for the entry to be active. Any filter entry without an action parameter specified will be considered incomplete and be inactive.
-

Log Filter

- Summarization logging is the collection and summarization of log messages for 1 specific log-id within a period of time.
- Filter log can be applied to different filters or CPM hardware filters.
- The implementation of the feature applies to filter logs with destination syslog.
- In case of VPLS scenario both Layer 2 & Layer 3 are applicable.
 - Layer 2: Source MAC or optionally destination MAC
 - Layer 3: Source IPv6 or optionally destination IPv6 for Layer 3 filters.
- The summarization interval is 100 seconds.
- Upon activation of a summary, a mini-table with src/dst-address and count is created for each type (IP/IPv6/MAC).
- Every received log packet (due to filter hit) is examined for source or destination address. If the log packet (source/destination address) matches a source/destination address entry in the mini-table a packet received previously), the summary counter of the matching address is incremented.

Configuration Notes

- If source or destination address of the log messages does not match an entry already present in the table, the source/destination address is stored in a free entry in the mini-table.
- In case the mini-table has no more free entries, only total counter is incremented.
- At expiry of the summarization interval, the mini-table for each type is flushed to the syslog destination.

Configuring Filter Policies with CLI

This section provides information to configure filter policies using the command line interface.

Topics in this section include:

- [Basic Configuration on page 394](#)
- [Common Configuration Tasks on page 395](#)
 - [Creating an IP Filter Policy on page 395](#)
 - [Creating an IPv6 Filter Policy on page 400](#)
 - [Creating Filter Log Policies on page 407](#)
 - [Applying Filter Policies on page 408](#)
 - [Apply Filter Policies to a Network Port on page 411](#)
 - [Creating a Redirect Policy on page 413](#)
 - [Configuring Policy-Based Forwarding for Deep Packet Inspection in VPLS on page 414](#)
- [Filter Management Tasks on page 417](#)
 - [Renumbering Filter Policy Entries on page 417](#)
 - [Modifying an IP Filter Policy on page 419](#)
 - [Deleting a Filter Policy on page 423](#)
 - [Deleting a Filter Policy on page 423](#)
 - [Copying Filter Policies on page 429](#)

Basic Configuration

The most basic IP, IPv6 and MAC filter policies must have the following:

- A filter ID
- Template scope, either *exclusive* or *template*
- Default action, either drop or forward
- At least one filter entry
 - Specified action, either drop or forward
 - Specified matching criteria

The following example displays a sample configuration of an IP filter policy. The configuration blocks all incoming TCP session except Telnet and allows all outgoing TCP sessions from IP net 10.67.132.0/24. [Figure 20](#) depicts the interface to apply the filter.

```
A:ALA-1>config>filter# info
-----
ip-filter 3 create
  entry 10 create
    match protocol 6
      dst-port eq 23
      src-ip 10.67.132.0/24
    exit
  action forward
  exit
entry 20 create
  match protocol 6
    tcp-syn true
    tcp-ack false
  exit
  action drop
  exit
exit
exit
-----
A:ALA-1>config>filter#
```

OSRG007

Figure 20: Applying an IP Filter to an Ingress Interface

Common Configuration Tasks

This section provides a brief overview of the tasks that must be performed for both IP and MAC filter configurations and provides the CLI commands.

To configure a filter policy, perform the following tasks:

- [Creating an IP Filter Policy on page 395](#)
- [Creating an IPv6 Filter Policy on page 400](#)
- [Creating a MAC Filter Policy on page 402](#)
- [Creating Filter Log Policies on page 407](#)
- [Applying Filter Policies on page 408](#)
- [Apply Filter Policies to a Network Port on page 411](#)

Creating an IP Filter Policy

Configuring and applying filter policies is optional. Each filter policy must have the following:

- The filter type specified (IP)
- A filter policy ID
- A default action, either drop or forward
- Filter policy scope specified, either *exclusive* or *template*
- At least one filter entry with matching criteria specified

IP Filter Policy

The following displays an exclusive filter policy configuration example:

```
A:ALA-7>config>filter# info
-----
...
    ip-filter 12 create
        description "IP-filter"
        scope exclusive
    exit
...
-----
A:ALA-7>config>filter#
```

IP Filter Entry

Within a filter policy, configure filter entries which contain criteria against which ingress, egress, or network traffic is matched. The action specified in the entry determine how the packets are handled, either dropped or forwarded.

- Enter a filter entry ID. The system does not dynamically assign a value.
- Assign an action, either drop or forward.
- Specify matching criteria.

Use the following CLI syntax to create an IP filter entry:

CLI Syntax: `config>filter# ip-filter filter-id [create]
 entry entry-id [time-range time-range-name] [create]
 description description-string`

The following displays an IP filter entry configuration example.

```
A:ALA-7>config>filter>ip-filter# info
-----
      description "filter-main"
      scope exclusive
      entry 10 create
          description "no-91"
          match
          exit
          no action
      exit
  exit
-----
A:ALA-7>config>filter>ip-filter#
```

Configuring the HTTP-Redirect Option

If http-redirect is specified as an action, a corresponding forward entry must be specified before the redirect. Note that http-redirect is not supported on 7750 SR-1 or 7450 ESS-1 models.

The following displays an http-redirect configuration example:

```
A:ALA-48>config>filter>ip-filter# info
-----
description "filter-main"
scope exclusive
entry 10 create
  description "no-91"
  match
    dst-ip 10.10.10.91/24
    src-ip 10.10.0.100/24
  exit
  no action
exit
entry 20 create
  match protocol tcp
  dst-ip 100.0.0.2/32
  dst-port eq 80
  exit
  action forward
exit
entry 30 create
  match protocol tcp
  dst-ip 10.10.10.91/24
  dst-port eq 80
  exit
  action http-redirect "http://100.0.0.2/login.cgi?mac=$MAC$sap=$S
AP&ip=$IP&orig_url=$URL"
  exit
-----
A:ALA-48>config>filter>ip-filter#
```

Filter Sampling

Within a filter entry, you can specify that traffic matching the associated IP filter entry is sampled. If the IP interface is set to cflowd ip-filter mode. Enabling filter-sample enables the cflowd tool.

The following displays an IP filter entry configuration example.

```
A:ALA-7>config>filter>ip-filter# info
-----
description "filter-main"
scope exclusive
entry 10 create
description "no-91"
filter-sample
interface-disable-sample
match
exit
action forward redirect-policy redirect1
exit
-----
A:ALA-7>config>filter>ip-filter#
```

IP Entry Matching Criteria

Use the following CLI syntax to configure IP filter matching criteria:

The following displays an IP filter matching configuration.

```
*A:ALA-48>config>filter>ip-filter# info
-----
description "filter-mail"
scope exclusive
entry 10 create
  description "no-91"
  filter-sample
  interface-disable-sample
  match
    dst-ip 10.10.10.91/24
    src-ip 10.10.10.103/24
  exit
  action forward redirect-policy redirect2
exit
-----
*A:ALA-48>config>filter>ip-filter#
```

Creating an IPv6 Filter Policy

Configuring and applying IPv6 filter policies is optional. Each filter policy must have the following:

- The IPv6 filter type specified
 - An IPv6 filter policy ID
 - A default action, either drop or forward.
 - Template scope specified, either *exclusive* or *template*
 - At least one filter entry with matching criteria specified
-

IPv6 Filter Policy

Use the following CLI syntax to create an IPv6 filter policy:

The following displays an IPv6 filter policy configuration example:

```
A:ALA-49>config>filter>ipv6-filter# info
-----
description "New IPv6 filter info"
scope exclusive
exit
-----
A:ALA-49>config>filter>ipv6-filter# tree detail
```

IPv6 Filter Entry

Within an IPv6 filter policy, configure filter entries which contain criteria against which ingress, egress, or network traffic is matched. The action specified in the entry determine how the packets are handled, either dropped or forwarded.

- Enter an IPv6 filter entry ID. The system does not dynamically assign a value.
- Assign an action, either drop or forward.
- Specify matching criteria.

The following displays an IPv6 filter entry configuration example.

```
A:ALA-49>config>filter>ipv6-filter# info
-----
description "New IPv6 filter info"
scope exclusive
entry 1 create
  match
    dst-ip 11::12/128
    src-ip 13::14/128
  exit
  action drop
exit
-----
A:ALA-49>config>filter>ipv6-filter#
```

Creating a MAC Filter Policy

Configuring and applying filter policies is optional. Each filter policy must have the following:

- The filter type specified (MAC).
 - A filter policy ID.
 - A default action, either drop or forward.
 - Filter policy scope, either *exclusive* or *template*.
 - At least one filter entry.
 - Matching criteria specified.
-

MAC Filter Policy

The following displays an MAC filter policy configuration example:

```
A:ALA-7>config>filter# info
-----
...
    mac-filter 90 create
        description "filter-west"
        scope exclusive
    exit
-----
A:ALA-7>config>filter#
```

Creating an ISID Filter

The following displays an ISID filter configuration example:

```
A;ALA-7>config>filter# info
-----
mac-filter 90 create
  description "filter-wan-man"
  scope template
  type isid
  entry 1 create
    description "drop-local-isids"
    match
      isid 100 to 1000
    exit
    action drop
  exit
  entry 2 create
    description "allow-wan-isids"
    match
      isid 150
    exit
    action forward
  exit
```

Creating a VID Filter

The following displays VID filter configuration example:

```
A:TOP_NODE>config>filter>mac-filter# info
-----
default-action forward
type vic
entry 1 create
  match frame-type ethernet_II
  ouiter-tag 85 4095
  exit
  action drop
exit
entry 2 create
  match frame-type ethernet_II
  ouiter-tag 43 4095
  exit
  action drop
exit
-----
A:TOP_NODE>config>filter>mac-filter#
```

MAC Filter Entry

Within a filter policy, configure filter entries which contain criteria against which ingress, egress, or network traffic is matched. The action specified in the entry determine how the packets are handled, either dropped or forwarded.

- Enter a filter entry ID. The system does not dynamically assign a value.
- Assign an action, either drop or forward.
- Specify matching criteria.

The following displays a MAC filter entry configuration example:

```
A:sim1>config>filter# info
-----
      mac-filter 90 create
        entry 1 create
          description "allow-104"
          match
          exit
          action drop
        exit
      exit
-----
A:sim1>config>filter#
```

MAC Entry Matching Criteria

The following displays a filter matching configuration example.

```
A:ALA-7>config>filter>mac-filter# info
-----
      description "filter-west"
      scope exclusive
      entry 1 create
        description "allow-104"
        match
          src-mac 00:dc:98:1d:00:00 ff:ff:ff:ff:ff:ff
          dst-mac 02:dc:98:1d:00:01 ff:ff:ff:ff:ff:ff
        exit
      action drop
    exit
-----
A:ALA-7>config>filter#
```

Creating Filter Log Policies

The following displays a filter matching configuration example.

```
A:ALA-48>config>filter>log# info detail
-----
      description "Test filter log."
      destination memory 1000
      wrap-around
      no shutdown
-----
A:ALA-48>config>filter>log#
```

Applying Filter Policies

Table 12: Applying Filter Policies

IP Filter	MAC Filter	IPv6 Filter
Epipe SAP, spoke SDP	Epipe SAP, spoke SDP	N/A
Fpipe SAP, spoke SDP	N/A	N/A
IES interface SAP	N/A	IES interface SAP
Ipipe SAP, spoke SDP	N/A	N/A
VPLS mesh SDP, spoke SDP, SAP	VPLS mesh SDP, spoke SDP, SAP	N/A
VPRN interface SAP, spoke SDP	N/A	N/A

Apply IP and MAC Filter Policies

The following example shows an example of applying an IP and a MAC filter policy to an Epipe service:

```

CLI Syntax: config>service# epipe service-id
                sap sap-id
                  egress
                    filter {ip ip-filter-id | mac mac-filter-id}
                ingress
                    filter {ip ip-filter-id | mac mac-filter-id}
                spoke-sdp sdp-id:vc-id [vc-type {ether | vlan}]
                  egress
                    filter {ip ip-filter-id | mac mac-filter-id}
                  ingress
                    filter {ip ip-filter-id | mac mac-filter-id}
  
```

The following output displays IP and MAC filters assigned to an ingress and egress SAP and spoke SDP:

```

A:ALA-48>config>service>epipe# info
-----
                sap 1/1/1.1.1 create
                  ingress
                    filter ip 10
                  exit
                  egress
                    filter mac 92
                  exit
                exit
                spoke-sdp 8:8 create
                  ingress
                    filter ip 10
                  exit
                  egress
                    filter mac 91
                  exit
                exit
                no shutdown
-----
A:ALA-48>config>service>epipe#
  
```

Apply an IPv6 Filter Policy to an IES SAP

The following output displays an IPv6 filters assigned to an IES service interface:

```
A:ALA-48>config>service>ies# info
-----
      interface "testA" create
        address 192.22.1.1/24
        sap 2/1/3:0 create
        exit
        ipv6
          ingress
            filter ipv6 100
          egress
            filter ipv6 100
        exit
      exit
...
-----
A:ALA-48>config>service>ies#
```

Apply Filter Policies to a Network Port

IP filter policies can be applied to network IP interfaces. MAC filters cannot be applied to network IP interfaces or to routable IES services. IPv6 filter policies can be applied to network IP interfaces in the IPv6 context within the interface configuration.

Apply an IP Interface

CLI Syntax: `config>router# interface ip-int-name`

The following displays an IP filter applied to an interface at ingress.

```
A:ALA-48>config>router# info
#-----
# IP Configuration
#-----
...
    interface "to-104"
      address 10.0.0.103/24
      port 1/1/1
      ingress
        filter ip 10
      exit
      egress
        filter ip 10
      exit
    exit
...
#-----
A:ALA-48>config>router#
```

Apply an IPv6 Interface

The following displays IPv6 filters applied to an interface at ingress and egress.

```
A:config>router>if# info
-----
      port 1/1/1
      ipv6
        address 3FFE::101:101/120
      exit
      ingress
        filter ip 2
        filter ipv6 1
      exit
      egress
        filter ip 2
        filter ipv6 1
      exit
-----
A:config>router>if#
```

Creating a Redirect Policy

Configuring and applying redirect policies is optional. Each redirect policy must have the following:

- A destination IP address
- A priority (default is 100)
- At least one of the following tests must be enabled:
 - Ping test
 - SNMP test
 - URL test

The following displays a redirection policy configuration:

```
A:ALA-7>config>filter# info
-----
    redirect-policy "redirect1" create
      destination 10.10.10.104 create
      description "SNMP_to_104"
      priority 105
      snmp-test "SNMP-1"
        interval 30
        drop-count 30 hold-down 120
      exit
      no shutdown
    exit
  destination 10.10.10.105 create
    priority 95
    ping-test
      timeout 30
      drop-count 5
    exit
    no shutdown
  exit
  destination 10.10.10.106 create
    priority 90
    url-test "URL_to_106"
      url "http://aww.alcatel.com/ipd/"
      interval 60
      return-code 2323 4567 raise-priority 96
    exit
    no shutdown
  exit
...
-----
A:ALA-7>config>filter#
```

Configuring Policy-Based Forwarding for Deep Packet Inspection in VPLS

The purpose policy-based forwarding is to capture traffic from a customer and perform a deep packet inspection (DPI) and forward traffic, if allowed, by the DPI.

In the following example, the split horizon groups are used to prevent flooding of traffic. Traffic from customers enter at SAP 1/1/5:5. Due to the mac-filter 100 that is applied on ingress, all traffic with dot1p 07 marking will be forwarded to SAP 1/1/22:1, which is the DPI.

DPI performs packet inspection/modification and either drops the traffic or forwards the traffic back into the box through SAP 1/1/21:1. Traffic will then be sent to spoke-sdp 3:5.

SAP 1/1/23:5 is configured to see if the VPLS service is flooding all the traffic. If flooding is performed by the router then traffic would also be sent to SAP 1/1/23:5 (which it should not).

Figure shows an example to configure policy-based forwarding for deep packet inspection on a VPLS service. For information about configuring services, refer to the 7750 SR OS Services Guide.

Figure 21: Policy-Based Forwarding for Deep Packet Inspection

The following displays a VPLS service configuration with DPI example:

```
*A:ALA-48>config>service# info
-----
...
    vpls 10 customer 1 create
        service-mtu 1400
        split-horizon-group "dpi" residential-group create
        exit
        split-horizon-group "split" create
        exit
        stp
            shutdown
        exit
        sap 1/1/21:1 split-horizon-group "split" create
            disable-learning
            static-mac 00:00:00:31:11:01 create
        exit
        sap 1/1/22:1 split-horizon-group "dpi" create
            disable-learning
            static-mac 00:00:00:31:12:01 create
        exit
        sap 1/1/23:5 create
            static-mac 00:00:00:31:13:05 create
        exit
        no shutdown
    exit
...
-----
*A:ALA-48>config>service#
```

The following displays a MAC filter configuration example:

```
*A:ALA-48>config>filter# info
-----
...
    mac-filter 100 create
        default-action forward
        entry 10 create
            match
                dot1p 7 7
            exit
            log 101
            action forward sap 1/1/22:1
        exit
    exit
...
-----
*A:ALA-48>config>filter#
```

Common Configuration Tasks

The following displays the MAC filter added to the VPLS service configuration:

```
*A:ALA-48>config>service# info
-----
...
    vpls 10 customer 1 create
        service-mtu 1400
        split-horizon-group "dpi" residential-group create
        exit
        split-horizon-group "split" create
        exit
        stp
            shutdown
        exit
        sap 1/1/5:5 split-horizon-group "split" create
            ingress
                filter mac 100
            exit
            static-mac 00:00:00:31:15:05 create
        exit
        sap 1/1/21:1 split-horizon-group "split" create
            disable-learning
            static-mac 00:00:00:31:11:01 create
        exit
        sap 1/1/22:1 split-horizon-group "dpi" create
            disable-learning
            static-mac 00:00:00:31:12:01 create
        exit
        sap 1/1/23:5 create

Filter Management Tasks

This section discusses the following filter policy management tasks:

- [Renumbering Filter Policy Entries on page 417](#)
 - [Modifying an IP Filter Policy on page 419](#)
 - [Modifying an IPv6 Filter Policy on page 421](#)
 - [Deleting a Filter Policy on page 423](#)
 - [Modifying a Redirect Policy on page 427](#)
 - [Deleting a Redirect Policy on page 428](#)
 - [Copying Filter Policies on page 429](#)
-

Renumbering Filter Policy Entries

The system exits the matching process when the first match is found and then executes the actions in accordance with the specified action. Because the ordering of entries is important, the numbering sequence can be rearranged. Entries should be numbered from the most explicit to the least explicit.

Use the following CLI syntax to renumber existing MAC or IP filter entries to re-sequence filter entries:

CLI Syntax:

```
config>filter
  ip-filter filter-id
    renum old-entry-number new-entry-number
  mac-filter filter-id
    renum old-entry-number new-entry-number
```

Example:

```
config>filter>ip-filter# renum 10 15
config>filter>ip-filter# renum 20 10
config>filter>ip-filter# renum 40 1
```

The following displays the original filter entry order on the left side and the reordered filter entries on the right side:

Filter Management Tasks

```
A:ALA-7>config>filter# info
-----
...
ip-filter 11 create
  description "filter-main"
  scope exclusive
  entry 10 create
    description "no-91"
    filter-sample
    interface-disable-sample
    match
      dst-ip 10.10.10.91/24
      src-ip 10.10.10.103/24
    exit
    action forward redirect-policy redirect1
  exit
entry 20 create
  match
    dst-ip 10.10.10.91/24
    src-ip 10.10.0.100/24
  exit
  action drop
exit

exit
...
-----
A:ALA-7>config>filter#
```

Modifying an IP Filter Policy

To access a specific IP filter, you must specify the filter ID. Use the `no` form of the command to remove the command parameters or return the parameter to the default setting.

```
Example:    config>filter>ip-filter# description "New IP filter info"
              config>filter>ip-filter# entry 2 create
              config>filter>ip-filter>entry$ description "new entry"
              config>filter>ip-filter>entry# action drop
              config>filter>ip-filter>entry# match dst-ip 10.10.10.104/32
              config>filter>ip-filter>entry# exit
              config>filter>ip-filter#
```

The following output displays the modified IP filter output:

```
A:ALA-7>config>filter# info
-----
...
      ip-filter 11 create
        description "New IP filter info"
        scope exclusive
        entry 1 create
          match
            dst-ip 10.10.10.91/24
            src-ip 10.10.10.106/24
          exit
          action drop
        exit
      entry 2 create
        description "new entry"
        match
          dst-ip 10.10.10.104/32
        exit
        action drop
      exit
    entry 10 create
      match
        dst-ip 10.10.10.91/24
        src-ip 10.10.0.100/24
      exit
      action drop
    exit
  entry 15 create
    description "no-91"
    match
      dst-ip 10.10.10.91/24
      src-ip 10.10.10.103/24
    exit
    action forward
  exit
entry 30 create
```

Filter Management Tasks

```
        match
            dst-ip 10.10.10.91/24
            src-ip 10.10.0.200/24
        exit
        action forward
    exit
exit
..
-----
A:ALA-7>config>filter#
```

Modifying an IPv6 Filter Policy

To access a specific IPv6 filter, you must specify the filter ID. Use the **no** form of the command to remove the command parameters or return the parameter to the default setting.

```

Example:    config>filter# ipv6-filter 11
                config>filter>ipv6-filter# description "IPv6 filter for
Customer
                1"
                config>filter>ipv6-filter# scope exclusive
                config>filter>ipv6-filter# entry 1
                config>filter>ipv6-filter>entry# description "Fwds matching
                packets"
                config>filter>ipv6-filter>entry# action forward
                config>filter>ipv6-filter>entry# exit
  
```

The following output displays the modified IPv6 filter output:

```

A:ALA-49>config>filter>ipv6-filter# info
-----
description "IPv6 filter for Customer 1"
scope exclusive
entry 1 create
  description "Fwds matching packets"
  match
    dst-ip 11::12/128
    src-ip 13::14/128
  exit
  action forward
exit
-----
A:ALA-49>config>filter>ipv6-filter#
  
```

Modifying a MAC Filter Policy

To access a specific MAC filter, you must specify the filter ID. Use the `no` form of the command to remove the command parameters or return the parameter to the default setting.

```
Example: config>filter# mac-filter 90
            config>filter>mac-filter# description "New filter info"
            config>filter>mac-filter# entry 1
            config>filter>mac-filter>entry# description "New entry info"
            config>filter>mac-filter>entry# action forward
            config>filter>mac-filter>entry# exit
            config>filter>mac-filter# entry 2 create
            config>filter>mac-filter>entry$ action drop
            config>filter>mac-filter>entry# match
            config>filter>mac-filter>entry>match# dot1p 7 7
```

The following output displays the modified MAC filter output:

```
A:ALA-7>config>filter# info
-----
...
    mac-filter 90 create
      description "New filter info"
      scope exclusive
      entry 1 create
        description "New entry info"
        match
          src-mac 00:dc:98:1d:00:00 ff:ff:ff:ff:ff:ff
          dst-mac 02:dc:98:1d:00:01 ff:ff:ff:ff:ff:ff
        exit
        action forward
      exit
      entry 2 create
        match
          dot1p 7 7
        exit
        action drop
      exit
    exit
...
-----
A:ALA-7>config>filter#
```

Deleting a Filter Policy

Before you can delete a filter, you must remove the filter association from the applied ingress and egress SAPs and network interfaces.

- [From an Ingress SAP on page 423](#)
 - [From an Egress SAP on page 423](#)
 - [From a Network Interface on page 424](#)
 - [From the Filter Configuration on page 426](#)
-

From an Ingress SAP

To remove a filter from an ingress SAP, enter the following CLI commands:

CLI Syntax: `config>service# [epipe | ies | vpls] service-id
sap port-id[:encap-val]
ingress
no filter`

Example: `config>service# epipe 5
config>service>epipe# sap 1/1/2:3
config>service>epipe>sap# ingress
config>service>epipe>sap>ingress# no filter`

From an Egress SAP

To remove a filter from an egress SAP, enter the following CLI commands:

CLI Syntax: `config>service# [epipe | ies | vpls] service-id
sap port-id[:encap-val]
egress
no filter`

Example: `config>service# epipe 5
config>service>epipe# sap 1/1/2:3
config>service>epipe>sap# egress
config>service>epipe>sap>egress# no filter`

From a Network Interface

To delete a filter from a network interface, enter the following CLI commands:

CLI Syntax: config>router# interface *ip-int-name*
 ingress
 no filter

Example: config>router# interface 11
 config>router>if# shutdown
 config>filter>if# exit
 config>filter# no interface 11

IP and IPv6 filters can be assigned and deleted together or separately. To delete both IP and IPv6 filter associations, consider the following examples:

```
A:ALA-49>config>router>if# info
-----
port 1/1/1
ipv6
  address 3FFE::101:101/120
exit
ingress
  filter ip 2
  filter ipv6 1
exit
egress
  filter ip 2
  filter ipv6 1
exit
-----
```

```
A:ALA-49>config>router>if#
```

CLI Syntax: config>router>if#
 config>router>if# ingress no filter

```
A:ALA-49>config>router>if# info
-----
port 1/1/1
ipv6
  address 3FFE::101:101/120
exit
egress
  filter ip 2
  filter ipv6 1
exit
-----
```

```
A:ALA-49>config>router>if#
```

CLI Syntax: config>router>if# egress no filter ip 2

```
A:ALA-49>config>router>if# info
-----
    port 1/1/1
    ipv6
      address 3FFE::101:101/120
    exit
    egress
      filter ipv6 1
    exit
-----
A:ALA-49>config>router>if#
```

CLI Syntax: config>router>if# ingress filter ip 2
 config>router>if# ingress filter ipv6 1

```
A:ALA-49>config>router>if# info
-----
    port 1/1/1
    ipv6
      address 3FFE::101:101/120
    exit
    ingress
      filter ip 2
      filter ipv6 1
    exit
    egress
      filter ipv6 1
    exit
-----
A:ALA-49>config>router>if#
```

CLI Syntax: config>router>if# ingress no filter ipv6 1

```
A:ALA-49>config>router>if# info
-----
    port 1/1/1
    ipv6
      address 3FFE::101:101/120
    exit
    ingress
      filter ip 2
    exit
    egress
      filter ipv6 1
    exit
-----
A:ALA-49>config>router>if#
```

CLI Syntax: config>router>if# ingress no filter

```
A:ALA-49>config>router>if#
-----
```

Filter Management Tasks

```
port 1/1/1
ipv6
  address 3FFE::101:101/120
exit
egress
  filter ipv6 1
exit
```

```
-----
A:ALA-49>config>router>if#
```

CLI Syntax: config>router>if# egress no filter

```
A:ALA-49>config>router>if#
```

```
-----
port 1/1/1
ipv6
  address 3FFE::101:101/120
exit
```

```
-----
A:ALA-49>config>router>if#
```

From the Filter Configuration

After you have removed the filter from the SAP, use the following CLI syntax to delete the filter.

CLI Syntax: config>filter# no ip-filter *filter-id*

CLI Syntax: config>filter# no mac-filter *filter-id*

CLI Syntax: config>filter# no ipv6-filter *filter-id*

Example: config>filter# no ip-filter 11 config>filter# no mac-filter
13

config>filter# no ipv6-filter 100

Modifying a Redirect Policy

To access a specific redirect policy, you must specify the policy name. Use the `no` form of the command to remove the command parameters or return the parameter to the default setting.

```

Example: config>filter# redirect-policy redirect1
             config>filter>redirect-policy# description "New redirect info"
             config>filter>redirect-policy# destination 10.10.10.106
             config>filter>redirect-policy>dest# no url-test "URL_to_106"
             config>filter>redirect-policy>dest# url-test "URL_to_Proxy"
             config>filter>redirect-policy>dest>url-test$ url http://
                 www.alcatel.com
             config>filter>redirect-policy>dest>url-test# interval 10
             config>filter>redirect-policy>dest>url-test# timeout 10
             config>filter>redirect-policy>dest>url-test# return-code 1
                 4294967295 raise-priority 255

```

```

A:ALA-7>config>filter# info
-----
...
redirect-policy "redirect1" create
  description "New redirect info"
  destination 10.10.10.104 create
    description "SNMP_to_104"
    priority 105
    snmp-test "SNMP-1"
      interval 30
      drop-count 30 hold-down 120
    exit
  no shutdown
exit
destination 10.10.10.105 create
  priority 95
  ping-test
    timeout 30
    drop-count 5
  exit
  no shutdown
exit
destination 10.10.10.106 create
  priority 90
  url-test "URL_to_Proxy"
    url "http://www.alcatel.com"
    interval 10
    timeout 10
    return-code 1 4294967295 raise-priority 255
  exit
  no shutdown
exit
no shutdown
exit
...
-----
A:ALA-7>config>filter#

```

Deleting a Redirect Policy

Before you can delete a redirect policy from the filter configuration, you must remove the policy association from the IP filter.

The following example shows the command usage to replace the configured redirect policy (**redirect1**) with a different redirect policy (**redirect2**) and then removing the **redirect1** policy from the filter configuration.

```
Example:config>filter>ip-filter 11
          config>filter>ip-filter# entry 1
          config>filter>ip-filter>entry# action forward redirect-policy
redirect2
          config>filter>ip-filter>entry# exit
          config>filter>ip-filter# exit
          config>filter# no redirect-policy redirect1
```

```
A:ALA-7>config>filter>ip-filter# info
-----
          description "This is new"
          scope exclusive
          entry 1 create
            filter-sample
            interface-disable-sample
            match
              dst-ip 10.10.10.91/24
              src-ip 10.10.10.106/24
            exit
            action forward redirect-policy redirect2
          exit
          entry 2 create
            description "new entry"
          ...
-----
A:ALA-7>config>filter>ip-filter#
```

Copying Filter Policies

When changes are made to an existing filter policy, they are applied immediately to all services where the policy is applied. If numerous changes are required, the policy can be copied so you can edit the “work in progress” version without affecting the filtering process. When the changes are completed, you can overwrite the work in progress version with the original version.

New filter policies can also be created by copying an existing policy and renaming the new filter.

CLI Syntax: `config>filter# copy filter-type src-filter-id [src-entry src-entry-id] to dst-filter-id [dst-entry dst-entry-id] [overwrite]`

The following displays the command usage to copy an existing IP filter (**11**) to create a new filter policy (**12**).

Example: `config>filter# copy ip-filter 11 to 12`

```
A:ALA-7>config>filter# info
-----
...
    ip-filter 11 create
      description "This is new"
      scope exclusive
      entry 1 create
        match
          dst-ip 10.10.10.91/24
          src-ip 10.10.10.106/24
        exit
      action drop
    exit
  entry 2 create
...
    ip-filter 12 create
      description "This is new"
      scope exclusive
      entry 1 create
        match
          dst-ip 10.10.10.91/24
          src-ip 10.10.10.106/24
        exit
      action drop
    exit
  entry 2 create
...
-----
A:ALA-7>config>filter#
```

Configuration Commands

Log Commands

```

config
  — filter
    — log log-id [create]
    — no log log-id
      — description description-string
      — no description
      — destination memory num-entries / syslog syslog-id
      — destination syslog syslog-id
      — no destination
      — [no] shutdown
      — summary
        — [no] shutdown
        — summary-crit dst-addr
        — summary-crit src-addr
        — no summary-crit
      — [no] wrap-around

```

DHCP Filter Policy Commands

```

config
  — filter
    — dhcp-filter filter-id [create]
    — no dhcp-filter filter-id
      — description description-string
      — no description
      — entry entry-id [create]
      — no entry entry-id
        — action {bypass-host-creation}
        — action drop

```

- **no action**
- **option** *dhcp-option-number* {**present** | **absent**}
- **option** *dhcp-option-number* **match hex** *hex-string* [**exact**] [**invert-match**]
- **option** *dhcp-option-number* **match string** *ascii-string* [**exact**] [**invert-match**]
- **no option**

IP Filter Policy Commands

- ```

config
 — filter
 — ip-filter filter-id [create]
 — no ip-filter filter-id
 — default-action {drop | forward}

## Redirect Policy Configuration Commands

```

config
 — filter
 — redirect-policy redirect-policy-name [create]
 — no redirect-policy redirect-policy-name
 — description description-string
 — no description
 — [no] shutdown
 — destination ip-address [create]
 — no destination ip-address
 — description description-string
 — no description
 — priority [priority]
 — no priority
 — [no] shutdown
 — [no] ping-test
 — drop-count consecutive-failures [hold-down seconds]
 — no drop-count
 — interval seconds
 — no interval
 — timeout seconds
 — no timeout
 — snmp-test test-name [create]
 — no snmp-test test-name
 — drop-count consecutive-failures [hold-down seconds]
 — no drop-count
 — interval seconds
 — no interval
 — oid oid-string community community-string
 — no oid
 — return-value return-value type return-type [disable | lower-
priority priority | raise-priority priority]
 — no return-value return-value type return-type
 — timeout seconds
 — no timeout
 — url-test test-name [create]
 — no url-test test-name
 — drop-count consecutive-failures [hold-down seconds]
 — no drop-count
 — interval seconds
 — no interval
 — return-code return-code-1 [return-code-2] [disable | lower-
priority priority | raise-priority priority]
 — no return-code return-code-1 [return-code-2]
 — timeout seconds
 — no timeout
 — url url-string [http-version version-string]
 — no url

```

## Generic Filter Commands

```

config
 — filter
 — copy ip-filter | ipv6-filter | mac-filter src-filter-id [src-entry src-entry-id] to dst-filter-id
 [dst-entry dst-entry-id] [overwrite]

```

## Show Commands

```

show
 — filter
 — download-failed
 — ip [ip-filter-id] [entry entry-id] [association | counters]
 — ipv6 [ipv6-filter-id] [entry entry-id] [association | counters]
 — log [bindings]
 — log log-id [match string]
 — mac {mac-filter-id [entry entry-id] [association | counters] }
 — redirect-policy {redirect-policy-name [dest ip-address] [association] }

```

## Clear Commands

```

clear
 — filter
 — ip filter-id [entry entry-id] [ingress | egress]
 — ipv6 filter-id [entry entry-id] [ingress | egress]
 — log log-id
 — mac filter-id [entry entry-id] [ingress | egress]

```

## Monitor Commands

```

monitor
 — filter ip ip-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]
 — filter ipv6 ipv6-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]
 — filter mac mac-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

```

| <b>Description</b> | <p>This command creates a configuration context for an IP filter policy.</p> <p>IP-filter policies specify either a forward or a drop action for packets based on the specified match criteria.</p> <p>The IP filter policy, sometimes referred to as an access control list (ACL), is a template that can be applied to multiple services or multiple network ports as long as the scope of the policy is template.</p> <p>Any changes made to the existing policy, using any of the sub-commands, will be applied immediately to all services where this policy is applied. For this reason, when many changes are required on an ip-filter policy, it is recommended that the policy be copied to a work area. That work-in-progress policy can be modified until complete and then written over the original filter policy. Use the <b>config filter copy</b> command to maintain policies in this manner.</p> <p>The <b>no</b> form of the command deletes the IP filter policy. A filter policy cannot be deleted until it is removed from all SAPs or network ports where it is applied.</p> |
| <b>Parameters</b>  | <i>filter-id</i> — Specifies the IP filter policy ID number.<br><b>Values</b> 1 — 65535<br><b>create</b> — Keyword required when first creating the configuration context. Once the context is created, one can navigate into the context without the <b>create</b> keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## ipv6-filter

| <b>Description</b> | <p>This command enables the context for a MAC filter policy.</p> <p>The mac-filter policy specifies either a forward or a drop action for packets based on the specified match criteria.</p> <p>The mac-filter policy, sometimes referred to as an access control list, is a template that can be applied to multiple services as long as the scope of the policy is template.</p> <p>Note it is not possible to apply a MAC filter policy to a network port or an IES service.</p> <p>Any changes made to the existing policy, using any of the sub-commands, will be applied immediately to all services where this policy is applied. For this reason, when many changes are required on a mac-filter policy, it is recommended that the policy be copied to a work area. That work-in-progress policy can be modified until complete and then written over the original filter policy. Use the <b>config filter copy</b> command to maintain policies in this manner.</p> <p>The <b>no</b> form of the command deletes the mac-filter policy. A filter policy cannot be deleted until it is removed from all SAP where it is applied.</p> |
| <b>Parameters</b>  | <i>filter-id</i> — The MAC filter policy ID number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                    | <b>create</b> — Keyword required when first creating the configuration context. Once the context is created, one can navigate into the context without the <b>create</b> keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## redirect-policy

|                |                                                         |
|----------------|---------------------------------------------------------|
| <b>Syntax</b>  | <b>[no] redirect-policy</b> <i>redirect-policy-name</i> |
| <b>Context</b> | config>filter                                           |

## Configuration Commands

|                    |                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>This command configures redirect policies.</p> <p>The <b>no</b> form of the command removes the redirect policy from the filter configuration only if the policy is not referenced in an IP filter and the IP filter is not in use (applied to a service or network interface).</p>                                                                                                |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <p><i>redirect-policy-name</i> — Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. There is no limit to the number of redirect policies that can be configured.</p> |

## Filter Log Destination Commands

### destination

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>destination memory</b> <i>num-entries</i><br><b>destination syslog</b> <i>syslog-id</i><br><b>no destination</b>                                                                                                                                                                                                                                                                                                                                         |
| <b>Context</b>     | config>filter>log                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | This command configures the destination for filter log entries for the filter log ID. Filter logs can be sent to either memory ( <b>memory</b> ) or to an existing Syslog server definition ( <b>server</b> ). If the filter log destination is <b>memory</b> , the maximum number of entries in the log must be specified. The <b>no</b> form of the command deletes the filter log association.                                                           |
| <b>Default</b>     | <b>no destination</b>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters</b>  | <b>memory</b> <i>num-entries</i> — Specifies the destination of the filter log ID is a memory log. The <i>num-entries</i> value is the maximum number of entries in the filter log expressed as a decimal integer.<br><b>Values</b> 10 — 50000<br><b>syslog</b> <i>syslog-id</i> — Specifies the destination of the filter log ID is a Syslog server. The <i>syslog-id</i> parameter is the number of the Syslog server definition.<br><b>Values</b> 1 — 10 |

### log

|                      |                                                                                                                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <b>log</b> <i>log-id</i> [ <b>create</b> ]<br><b>no log</b>                                                                                                                                                                                                                                                |
| <b>Context</b>       | config>filter                                                                                                                                                                                                                                                                                              |
| <b>Description</b>   | This command enables the context to create a filter log policy. The <b>no</b> form of the command deletes the filter log ID. The log cannot be deleted if there are filter entries configured to write to the log. All filter entry logging associations need to be removed before the log can be deleted. |
| <b>Special Cases</b> | <b>Filter log 101</b> — Filter log 101 is the default log and is automatically created by the system. Filter log 101 is always a memory filter log and cannot be changed to a Syslog filter log. The log size defaults to 1000 entries. The number of entries and wrap-around behavior can be edited.      |
| <b>Default</b>       | <b>log 101</b>                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>    | <i>log-id</i> — The filter log ID destination expressed as a decimal integer.<br><b>Values</b> 101 — 199                                                                                                                                                                                                   |

## shutdown

**Syntax** [no] shutdown

**Context** config>filter>log  
 config>filter>log>summary  
 config>filter>redirect-policy  
 config>filter>redirect-policy>destination

Administratively enables/disabled (AdminUp/AdminDown) an entity. Downing an entity does not change, reset or remove any configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the operational state of the entity to down and the operational state of any entities contained within the administratively down entity.

Unlike other commands and parameters where the default state will not be indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

**Default** no shutdown

## summary

**Syntax** summary

**Context** config>filter>log

**Description** This command enables the context to configure log summarization. These settings will only be taken into account when syslog is the log destination. Note that summary settings will only be taken into account in case the log destination is syslog.

**Parameters** none

## summary-crit

**Syntax** summary-crit dst-addr  
 summary-crit src-addr  
 no summary-crit

**Context** config>filter>log>summary

**Description** This command defines the the key of the index of the minitable. If key information is changed while summary is in no shutdown, the filter summary minitable is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

## Configuration Commands

**Default** dst-addr

**Parameters** **dst-addr** — Specifies that received log packets are summarized based on the destination IP, IPv6, or MAC address.  
**src-addr** — Specifies that received log packets are summarized based on the source IP, IPv6 or MAC address.

## wrap-around

**Syntax** [no] wrap-around

**Context** config>filter>log

**Description** This command configures a memory filter log to log until full or to store the most recent log entries (circular buffer).

Specifying **wrap-around** configures the memory filter log to store the most recent filter log entries (circular buffer). When the log is full, the oldest filter log entries are overwritten with new entries.

The **no** form of the command configures the memory filter log to accept filter log entries until full. When the memory filter log is full, filter logging for the log filter ID ceases.

**Default** wrap-around

---

## Filter Policy Commands

### default-action

|                    |                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>default-action {drop   forward}</b>                                                                                                                                                                                                                                                |
| <b>Context</b>     | config>filter>ip-filter<br>config>filter>ipv6-filter<br>config>filter>mac-filter                                                                                                                                                                                                      |
| <b>Description</b> | This command specifies the action to be applied to packets when the packets do not match the specified criteria in all of the IP filter entries of the filter.<br><br>When multiple <b>default-action</b> commands are entered, the last command will overwrite the previous command. |
| <b>Default</b>     | drop                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <b>drop</b> — Specifies all packets will be dropped unless there is a specific filter entry which causes the packet to be forwarded.<br><br><b>forward</b> — Specifies all packets will be forwarded unless there is a specific filter entry which causes the packet to be dropped.   |

### scope

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>scope {exclusive   template}</b><br><b>no scope</b>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Context</b>     | config>filter>ip-filter<br>config>filter>ipv6-filter<br>config>filter>mac-filter                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b> | This command configures the filter policy scope as exclusive or template. If the scope of the policy is template and is applied to one or more services or network interfaces, the scope cannot be changed.<br><br>The <b>no</b> form of the command sets the scope of the policy to the default of <b>template</b> .                                                                                                                                                             |
| <b>Default</b>     | <b>template</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <b>exclusive</b> — When the scope of a policy is defined as exclusive, the policy can only be applied to a single entity (SAP or network port). Attempting to assign the policy to a second entity will result in an error message. If the policy is removed from the entity, it will become available for assignment to another entity.<br><br><b>template</b> — When the scope of a policy is defined as template, the policy can be applied to multiple SAPs or network ports. |

## sub-insert-credit-control

|                    |                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sub-insert-credit-control start-entry</b> <i>entry-id</i> <b>count</b> <i>count</i><br><b>no sub-insert-credit-control</b>                                                |
| <b>Context</b>     | config>filter>ip-filter                                                                                                                                                      |
| <b>Description</b> | This command inserts point information for credit control for the filter.<br>The <b>no</b> form of the command reverts to the default.                                       |
| <b>Default</b>     | none                                                                                                                                                                         |
| <b>Parameters</b>  | <b>entry</b> <i>entry-id</i> — Identifies a filter on this system.<br><b>Values</b> 1 — 65535<br><b>count</b> <i>count</i> — Specifies the count.<br><b>Values</b> 1 — 65535 |

## sub-insert-radius

|                    |                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sub-insert-radius start-entry</b> <i>entry-id</i> <b>count</b> <i>count</i><br><b>no sub-insert-radius</b>                                                                          |
| <b>Context</b>     | config>filter>ip-filter                                                                                                                                                                |
| <b>Description</b> | This command insert point information for RADIUS for the filter.<br>The <b>no</b> form of the command reverts to the default.                                                          |
| <b>Default</b>     | none                                                                                                                                                                                   |
| <b>Parameters</b>  | <b>entry</b> <i>entry-id</i> — Specifies at what place the filter entries received from RADIUS will be inserted in the filter.<br><b>Values</b> 1 — 65535<br><b>count</b> <i>count</i> |

## sub-insert-wmark

|                    |                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sub-insert-wmark low</b> <i>low-watermark</i> <b>high</b> <i>high-watermark</i><br><b>no sub-insert-wmark</b>                                                      |
| <b>Context</b>     | config>filter>ip-filter                                                                                                                                               |
| <b>Description</b> | This command configures the low and high watermark percentage for inserted filter entry usage reporting.<br>The <b>no</b> form of the command reverts to the default. |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | none                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b> | <p><b>low</b> <i>low-watermark</i> — Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be cleared by the agent.</p> <p><b>Values</b> 0 — 100</p> <p><b>high</b> <i>high-watermark</i> — Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be raised by the agent.</p> <p><b>Values</b> 0 — 100</p> |

## type

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Context</b>     | config>filter>dhcp-filter<br>config>filter>ip-filter<br>config>filter>ipv6-filter<br>config>filter>mac-filter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | <p>This command creates or edits an IP, IPv6, or MAC filter entry. Multiple entries can be created using unique <i>entry-id</i> numbers within the filter. The implementation exits the filter on the first match found and executes the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.</p> <p>An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword <b>action</b> for it to be considered complete. Entries without the <b>action</b> keyword will be considered incomplete and hence will be rendered inactive.</p> <p>The <b>no</b> form of the command removes the specified entry from the IP or MAC filter. Entries removed from the IP or MAC filter are ediatly removed from all services or network ports where that filter is applied.</p> |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <p><i>entry-id</i> — An <i>entry-id</i> uniquely identifies a match criteria and the corresponding action. It is recommended that multiple entries be given <i>entry-ids</i> in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.</p> <p><b>Values</b>     1 — 65535</p> <p><b>time-range</b> <i>time-range-name</i> — Specifies the time range name to be associated with this filter entry up to 32 characters in length. The time-range name must already exist in the config&gt;cron context.</p> <p><b>create</b> — Keyword required when first creating the configuration context. Once the context is created, one can navigate into the context without the <b>create</b> keyword.</p>                                                                                                                           |

### log

|                |                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>  | <b>log</b> <i>log-id</i><br><b>no log</b>                                                          |
| <b>Context</b> | config>filter>ip-filter>entry<br>config>filter>ipv6-filter>entry<br>config>filter>mac-filter>entry |

**Description** This command creates the context to enable filter logging for a filter entry and specifies the destination filter log ID.

The filter log ID must exist before a filter entry can be enabled to use the filter log ID.

The **no** form of the command disables logging for the filter entry.

**Default** no log

**Parameters** *log-id* — The filter log ID destination expressed as a decimal integer.

**Values** 101 — 199

| <b>Description</b> | <p>This command specifies the action to take for packets that match this filter entry. The <b>action</b> command must be entered with a keyword specified in order for the entry to be active.</p> <p>Note that <b>action forward next-hop</b> cannot be applied to multicast traffic.</p> <p>Multiple action statements entered will overwrite previous actions parameters when defined.</p> <p>The <b>no</b> form of the command removes the specified <b>action</b> statement. The filter entry is considered incomplete and hence rendered inactive without the <b>action</b> keyword.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><b>drop</b> — Specifies packets matching the entry criteria will be dropped.</p> <p><b>forward</b> — Specifies packets matching the entry criteria will be forwarded.</p> <p>If neither drop nor forward is specified, the filter action is No-Op and the filter entry is inactive.</p> <p><b>next-hop</b> <i>ip-address</i> — The IP address of the direct next-hop to which to forward matching packets in dotted decimal notation.</p> <p><b>indirect</b> <i>ip-address</i> — The IP address of the indirect next-hop to which to forward matching packets in dotted decimal notation. The direct next-hop IP address and egress IP interface are determined by a route table lookup.</p> <p>If the next hop is not available, then a routing lookup will be performed and if a match is found the packet will be forwarded to the result of that lookup. If no match is found a "ICMP destination unreachable" message is send back to the origin.</p> <p><b>interface</b> <i>ip-int-name</i> — The name of the egress IP interface where matching packets will be forwarded from. This parameter is only valid for unnumbered point-to-point interfaces. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.</p> <p><b>redirect</b> <i>policy-name</i> — Specifies the redirect policy configured in the <b>config&gt;filter&gt;redirect-policy</b> context.</p> <p><b>sap</b> <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. Only Ethernet SAPs are supported (including q-in-q, BCP, bridged Ethernet in Frame Relay or ATM).Refer to</p> |

[Common CLI Command Descriptions on page 571](#) for SAP CLI command syntax and parameter descriptions.

**http-redirect** *url* — Specifies the HTTP web address that will be sent to the user's browser. Note that http-redirect is not supported on 7750 SR-1 or 7450 ESS-1 models.

**Values** 255 characters maximum

| <b>Context</b>     | config>filter>ipv6-filter>entry                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command specifies the action to take for packets that match this filter entry. The <b>action</b> keyword must be entered and a keyword specified in order for the entry to be active.<br><br>Multiple action statements entered will overwrite previous actions parameters when defined.<br><br>The <b>no</b> form of the command removes the specified <b>action</b> statement. The filter entry is considered incomplete and hence rendered inactive without the <b>action</b> keyword. |
| <b>Default</b>     | drop                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <b>drop</b> — Specifies packets matching the entry criteria will be dropped.<br><b>forward</b> — Specifies packets matching the entry criteria will be forwarded.                                                                                                                                                                                                                                                                                                                              |

## filter-sample

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b> | Specifies that traffic matching the associated IP filter entry is sampled if the IP interface is set to <b>cflowd acl</b> .<br><br>If the cflowd is either not enabled or set to <b>cflowd interface</b> mode, this command is ignored.<br><br>The <b>no</b> form removes this command for the system configuration, disallowing the sampling of packets if the ingress interface is in <b>cflowd acl</b> mode. |
| <b>Default</b>     | <b>no filter-sample</b>                                                                                                                                                                                                                                                                                                                                                                                         |

## interface-disable-sample

|                |                                               |
|----------------|-----------------------------------------------|
| <b>Syntax</b>  | [ <b>no</b> ] <b>interface-disable-sample</b> |
| <b>Context</b> | config>filter>ip-filter>entry                 |

config>filter>ipv6-filter>entry

**Description** Specifies that traffic matching the associated IP filter entry is not sampled if the IP interface is set to **cflowd interface** mode. This allows the option to not sample specific types of traffic when interface sampling is enabled.

If the cflowd is either not enabled or set to **cflowd acl** mode, this command is ignored.

The **no** form of this command enables sampling.

**Default** no interface-disable-sample

## match

**Syntax** **match** [**protocol** *protocol-id*]  
**no match**

**Context** config>filter>ip-filter>entry

**Description** This command enables the context to enter match criteria for the filter entry. When the match criteria have been satisfied the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured then all criteria must be satisfied (AND function) before the action associated with the match is executed.

A **match** context may consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

The **no** form of the command removes the match criteria for the *entry-id*.

**Parameters** **protocol** — The **protocol** keyword configures an IP protocol to be used as an IP filter match criterion. The protocol type such as TCP or UDP is identified by its respective protocol number.

*protocol-id* — Configures the decimal value representing the IP protocol to be used as an IP filter match criterion. Well known protocol numbers include ICMP(1), TCP(6), UDP(17). The **no** form the command removes the protocol from the match criteria.

**Values** 0 — 255 (values can be expressed in decimal, hexadecimal, or binary - DHB)  
keywords: none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp  
\* — udp/tcp wildcard

| Protocol | Protocol ID | Description               |
|----------|-------------|---------------------------|
| icmp     | 1           | Internet Control Message  |
| igmp     | 2           | Internet Group Management |
| ip       | 4           | IP in IP (encapsulation)  |
| tcp      | 6           | Transmission Control      |

| <b>Syntax</b>      | <b>match</b> [ <b>next-header</b> <i>next-header</i> ]<br><b>no match</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Context</b>     | config>filter>ipv6-filter>entry                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b> | <p>This command enables the context to enter match criteria for the filter entry. When the match criteria have been satisfied the action associated with the match criteria is executed.</p> <p>If more than one match criteria (within one match statement) are configured then all criteria must be satisfied (AND function) before the action associated with the match is executed.</p> <p>A <b>match</b> context may consist of multiple match criteria, but multiple <b>match</b> statements cannot be entered per entry.</p> <p>The <b>no</b> form of the command removes the match criteria for the <i>entry-id</i>.</p> |
| <b>Parameters</b>  | <p><i>next-header</i> — Specifies the IPv6 next header to match. Note that this parameter is analogous to the protocol parameter used in IP-Filter match criteria.</p> <p><b>Values</b> [0 — 42   45 — 49   52 — 59   61— 255] — protocol numbers accepted in decimal, hexadecimal, or binary - DHB</p> <p><b>keywords:</b> none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-icmp, ipv6-no-nxt, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp</p> <p>* — udp/tcp wildcard</p>                                                                           |

## MAC Filter Entry Commands

### action

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Context</b>     | config>filter>mac-filter>entry                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b> | <p>This command configures the action for a MAC filter entry. The <b>action</b> keyword must be entered for the entry to be active. Any filter entry without the <b>action</b> keyword will be considered incomplete and will be inactive.</p> <p>If neither drop nor forward is specified, this is considered a No-Op filter entry used to explicitly set a filter entry inactive without modifying match criteria or removing the entry itself.</p> <p>Multiple action statements entered will overwrite previous actions parameters when defined. To remove a parameter, use the no form of the action command with the specified parameter.</p> <p>The <b>no</b> form of the command removes the specified <b>action</b> statement. The filter entry is considered incomplete and hence rendered inactive without the <b>action</b> keyword.</p> |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <p><b>drop</b> — Specifies packets matching the entry criteria will be dropped.</p> <p><b>forward</b> — Specifies packets matching the entry criteria will be forwarded. Only Ethernet SAPs are supported (including q-in-q, BCP, bridged Ethernet in Frame Relay or ATM).</p> <p>If neither drop nor forward is specified, the filter action is no-op and the filter entry is inactive.</p> <p><b>sap</b> <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. Refer to <a href="#">Common CLI Command Descriptions on page 571</a> for SAP CLI command syntax and parameter descriptions.</p>                                                                                                                                                                                                                     |

| Port Type | Encap-Type | Allowed Values                     | Comments                                                                                                                         |
|-----------|------------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Ethernet  | Null       | 0                                  | The SAP is identified by the port.                                                                                               |
| Ethernet  | Dot1q      | 0 — 4094                           | The SAP is identified by the 802.1Q tag on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port.  |
| Ethernet  | QinQ       | qtag1: 0 — 4094<br>qtag2: 0 — 4094 | The SAP is identified by two 802.1Q tags on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port. |

## Configuration Commands

|                  |             |                                                                |                                                                                                                                             |
|------------------|-------------|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| SONET/SDH        | IPCP        | -                                                              | The SAP is identified by the channel. No BCP is deployed and all traffic is IP.                                                             |
| SONET/SDH<br>TDM | BCP-Null    | 0                                                              | The SAP is identified with a single service on the channel. Tags are assumed to be part of the customer packet and not a service delimiter. |
| SONET/SDH<br>TDM | BCP-Dot1q   | 0 — 4094                                                       | The SAP is identified by the 802.1Q tag on the channel.                                                                                     |
| SONET/SDH<br>TDM | Frame Relay | 16 — 991                                                       | The SAP is identified by the data link connection identifier (DLCI).                                                                        |
| SONET/SDH<br>ATM | ATM         | vpi (NNI) 0 — 4095<br>vpi (UNI) 0 — 255<br>vci 1, 2, 5 — 65535 | The SAP is identified by port or by PVPC or PVCC identifier (vpi, vpi/vci, or vpi range)                                                    |

*sdp-id* — The SDP identifier.

**Values** 1 — 17407

*vc-id* — The virtual circuit identifier. This value is used to validate the VC ID portion of each mesh SDP binding defined in the service. The default value of this object is equal to the service ID.

**Values** 1 — 4294967295

**http-redirect url** — Specifies the HTTP web address that will be sent to the user's browser.

**Values** 255 characters maximum

## match

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b> | <p>This command creates the context for entering/editing match criteria for the filter entry and specifies an Ethernet frame type for the entry. When the match criteria have been satisfied the action associated with the match criteria is executed.</p> <p>If more than one match criteria (within one match statement) are configured then all criteria must be satisfied (AND function) before the action associated with the match will be executed.</p> <p>A <b>match</b> context may consist of multiple match criteria, but multiple <b>match</b> statements cannot be entered per entry.</p> <p>The <b>no</b> form of the command removes the match criteria for the <i>entry-id</i>.</p> |

**Parameters** **frame-type** *keyword* — The **frame-type** keyword configures an Ethernet frame type to be used for the MAC filter match criteria.

**Default** **802dot3ethernet\_II**

**Values** 802dot3, 802dot2-llc, 802dot2-snap, ethernet\_II

**802dot3** — Specifies the frame type is Ethernet IEEE 802.3.

**802dot2-llc** — Specifies the frame type is Ethernet IEEE 802.2 LLC.

**802dot2-snap** — Specifies the frame type is Ethernet IEEE 802.2 SNAP.

**ethernet\_II** — Specifies the frame type is Ethernet Type II.

| <b>Description</b> | This command configures a destination TCP or UDP port number or port range for an IP filter match criterion. Note that an entry containing L4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the L4 information.<br><br>The <b>no</b> form of the command removes the destination port match criterion.                                                                                                                                                                                                                                                                                                                                 |           |                                                                    |           |                                                                       |           |                                                               |
| <b>Default</b>     | <b>none</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |                                                                    |           |                                                                       |           |                                                               |
| <b>Parameters</b>  | <b>lt</b>   <b>gt</b>   <b>eq</b> — Specifies the operator to use relative to <i>dst-port-number</i> for specifying the port number match criteria.<br><br><table> <tr> <td><b>lt</b></td> <td>specifies all port numbers less than <i>dst-port-number</i> match.</td> </tr> <tr> <td><b>gt</b></td> <td>specifies all port numbers greater than <i>dst-port-number</i> match.</td> </tr> <tr> <td><b>eq</b></td> <td>specifies that <i>dst-port-number</i> must be an exact match.</td> </tr> </table><br><b>eq</b> — Specifies the operator to use relative to <i>dst-port-number</i> for specifying the port number match criteria. *dst-port-number* — The destination port number to be used as a match criteria expressed as a decimal integer.

**Values** 1 — 65535

**range** *start end* — Specifies an inclusive range of port numbers to be used as a match criteria. The destination port numbers *start-port* and *end-port* are expressed as decimal integers.

**Values** 1 — 65535

| <b>Description</b> | Configures matching on ICMP code field in the ICMP header of an IP or IPv6 packet as a filter match criterion. Note that an entry containing L4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the L4 information.<br><br>This option is only meaningful if the protocol match criteria specifies ICMP (1).<br><br>The <b>no</b> form of the command removes the criterion from the match entry. |
| <b>Default</b>     | <b>no icmp-code</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <i>icmp-code</i> — The ICMP code values that must be present to match.<br><br><b>Values</b> 0 — 255                                                                                                                                                                                                                                                                                                                                                                                 |

## icmp-type

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b> | This command configures matching packets with a specific IP option or a range of IP options in the first option of the IP header as an IP filter match criterion.<br><br>The option-type octet contains 3 fields: <ul style="list-style-type: none"> <li>1 bit copied flag (copy options in all fragments)</li> <li>2 bits option class</li> <li>5 bits option number</li> </ul> The <b>no</b> form of the command removes the match criterion.                                                                                                                                                                              |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <i>ip-option-value</i> — Enter the 8 bit option-type as a decimal integer. The mask is applied as an AND to the option byte, the result is compared with the option-value.<br><br>The decimal value entered for the match should be a combined value of the eight bit option type field and not just the option number. Thus to match on IP packets that contain the Router Alert option (option number = 20), enter the option type of 148 (10010100).<br><br><b>Values</b> 0 — 255<br><br><i>ip-option-mask</i> — This is optional and may be used when specifying a range of option numbers to use as the match criteria. |

This 8 bit mask can be configured using the following formats:

| Format Style   | Format Syntax                      | Example   |
|----------------|------------------------------------|-----------|
| Decimal        | DDD                                | 20        |
| Hexadecimal    | 0xHH                               | 0x14      |
| Binary         | 0bBBBBBBBB                         | 0b0010100 |
| <b>Default</b> | <b>255 (decimal) (exact match)</b> |           |
| <b>Values</b>  | 1 — 255 (decimal)                  |           |

### multiple-option

|                    |                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>multiple-option {true   false}</b><br><b>no multiple-option</b>                                                                                                                                                                                                             |
| <b>Context</b>     | config>filter>ip-filter>entry>match                                                                                                                                                                                                                                            |
| <b>Description</b> | This command configures matching packets that contain one or more than one option fields in the IP header as an IP filter match criterion.<br><br>The <b>no</b> form of the command removes the checking of the number of option fields in the IP header as a match criterion. |
| <b>Default</b>     | <b>no multiple-option</b>                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <b>true</b> — Specifies matching on IP packets that contain more than one option field in the header.<br><b>false</b> — Specifies matching on IP packets that do not contain multiple option fields present in the header.                                                     |

### option-present

|                    |                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>option-present {true   false}</b><br><b>no option-present</b>                                                                                                                                                                                  |
| <b>Context</b>     | config>filter>ip-filter>entry>match                                                                                                                                                                                                               |
| <b>Description</b> | This command configures matching packets that contain the option field in the IP header as an IP filter match criterion.<br><br>The <b>no</b> form of the command removes the checking of the option field in the IP header as a match criterion. |
| <b>Parameters</b>  | <b>true</b> — Specifies matching on all IP packets that contain the option field in the header. A match will occur for all packets that have the option field present. An option field of zero is considered as no option present.                |

**false** — Specifies matching on IP packets that do not have any option field present in the IP header. (an option field of zero). An option field of zero is considered as no option present.

The source port numbers <i>start-port</i> and <i>end-port</i> are expressed as decimal integers.<br><b>Values</b> 1 — 65535 |

## tcp-ack

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>tcp-ack</b> { <b>true</b>   <b>false</b> }<br><b>no tcp-ack</b>                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Context</b>     | config>filter>ip-filter>entry>match<br>config>filter>ipv6-filter>entry>match                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | This command configures matching on the ACK bit being set or reset in the control bits of the TCP header of an IP packet as an IP filter match criterion. Note that an entry containing L4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the L4 information.<br><br>The <b>no</b> form of the command removes the criterion from the match entry. |
| <b>Default</b>     | no tcp-ack                                                                                                                                                                                                                                                                                                                                                                                                                            |

- Parameters**
- true** — Specifies matching on IP packets that have the ACK bit set in the control bits of the TCP header of an IP packet.
  - false** — Specifies matching on IP packets that do not have the ACK bit set in the control bits of the TCP header of the IP packet.

## tcp-syn

- Syntax** **tcp-syn {true | false}**  
**no tcp-syn**
- Context** config>filter>ip-filter>entry>match  
config>filter>ipv6-filter>entry>match
- Description** This command configures matching on the SYN bit being set or reset in the control bits of the TCP header of an IP packet as an IP filter match criterion. Note that an entry containing L4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the L4 information.
- The SYN bit is normally set when the source of the packet wants to initiate a TCP session with the specified destination IP address.
- The **no** form of the command removes the criterion from the match entry.
- Default** no tcp-syn
- Parameters**
- true** — Specifies matching on IP packets that have the SYN bit set in the control bits of the TCP header.
  - false** — Specifies matching on IP packets that do not have the SYN bit set in the control bits of the TCP header.

| <b>Syntax</b>      | <b>dot1p</b> <i>ip-value</i> [ <i>mask</i> ]<br><b>no dot1p</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Context</b>     | config>filter>mac-filter>entry                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>Configures an IEEE 802.1p value or range to be used as a MAC filter match criterion.</p> <p>When a frame is missing the 802.1p bits, specifying an dot1p match criterion will fail for the frame and result in a non-match for the MAC filter entry.</p> <p>The <b>no</b> form of the command removes the criterion from the match entry.</p> <p>SAP Egress</p> <p>Egress <b>dot1p</b> value matching will only match if the customer payload contains the 802.1p bits. For example, if a packet ingresses on a null encapsulated SAP and the customer packet is IEEE 802.1Q or 802.1p tagged, the 802.1p bits will be present for a match evaluation. On the other hand, if a customer tagged frame is received on a dot1p encapsulated SAP, the tag will be stripped on ingress and there will be no 802.1p bits for a MAC filter match evaluation; in this case, any filter entry with a dot1p match criterion specified will fail.</p> |
| <b>Default</b>     | no dot1p                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><i>ip-value</i> — The IEEE 802.1p value in decimal.</p> <p><b>Values</b>     0 — 7</p> <p><i>mask</i> — This 3-bit mask can be configured using the following formats:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Format Style | Format Syntax | Example |
|--------------|---------------|---------|
| Decimal      | D             | 4       |
| Hexadecimal  | 0xH           | 0x4     |
| Binary       | 0bBBB         | 0b100   |

To select a range from 4 up to 7 specify *p-value* of 4 and a *mask* of 0b100 for value and mask.

**Default**     **7 (decimal)**

**Values**     1 — 7 (decimal)

## dsap

- Syntax** **dsap** *dsap-value* [*mask*]  
**no dsap**
- Context** config>filter>mac-filter>entry>match
- Description** Configures an Ethernet 802.2 LLC DSAP value or range for a MAC filter match criterion. This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame. The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. [MAC Match Criteria Exclusivity Rules on page 389](#) describes fields that are exclusive based on the frame format. Use the **no** form of the command to remove the dsap value as the match criterion.
- Default** no dsap
- Parameters** *dsap-value* — The 8-bit dsap match criteria value in hexadecimal.
- Values** 0x00 — 0xFF (hex)
- mask* — This is optional and may be used when specifying a range of dsap values to use as the match criteria.
- This 8 bit mask can be configured using the following formats:

| Format Style | Format Syntax | Example    |
|--------------|---------------|------------|
| Decimal      | DDD           | 240        |
| Hexadecimal  | 0xHH          | 0xF0       |
| Binary       | 0BBBBBBBB     | 0b11110000 |

**Default** **FF (hex) (exact match)**  
0x00 — 0xFF

## dst-mac

- Syntax** **dst-mac** *ieee-address* [*mask*]  
**no dst-mac**
- Context** config>filter>mac-filter>entry
- Description** Configures a destination MAC address or range to be used as a MAC filter match criterion. The **no** form of the command removes the destination mac address as the match criterion.
- Default** no dst-mac

**Parameters** *ieee-address* — The MAC address to be used as a match criterion.  
**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

*mask* — A 48-bit mask to match a range of MAC address values.

This 48-bit mask can be configured using the following formats:

| Format Style | Format Syntax  | Example          |
|--------------|----------------|------------------|
| Decimal      | DDDDDDDDDDDDDD | 281474959933440  |
| Hexadecimal  | 0xHHHHHHHHHHHH | 0xFFFFFFFF000000 |
| Binary       | 0bBBBBBBB...B  | 0b11110000...B   |

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 0003FA000000 0xFFFFFFFF000000

**Default** 0xFFFFFFFFFFFF (exact match)  
**Values** 0x0000000000000000 — 0xFFFFFFFFFFFF

## etype

**Syntax** **etype** *ethernet-type*  
**no etype**

**Context** config>filter>mac-filter>entry

**Description** Configures an Ethernet type II Ethertype value to be used as a MAC filter match criterion.

The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. [Table 11, MAC Match Criteria Exclusivity Rules, on page 389](#) describes fields that are exclusive based on the frame format.

The **no** form of the command removes the previously entered etype field as the match criteria.

**Default** no etype

**Parameters** *ethernet-type* — The Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

**Values** 0x0600 — 0xFFFF

## isid

| <b>Description</b> | <p>This command configures an ISID value or a range of ISID values to be matched by the mac-filter parent. The pbb-etype value for the related SAP (inherited from the ethernet port configuration) or for the related SDP binding (inherited from SDP configuration) will be used to identify the ISID tag. When an isid statement is used in a match criteria the corresponding mac-filter can be applied only on the egress side of a SAP/SDP binding. In order to be able to use an isid match criteria one needs to set the mac-filter type attribute to isid. Once this configuration is performed only ISID match criteria are allowed in the mac-filter.</p> <p>The <b>no</b> form of this command removes the ISID match criterion.</p> |
| <b>Default</b>     | no isid                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                    | <p><i>value</i> — Specifies the ISID value, 24 bits. When just one present identifies a particular ISID to be used for matching.</p> <p><b>to</b> <i>higher-value</i> — Identifies a range of ISIDs to be used as matching criteria.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Context</b>     | config>filter>mac-filter>entry>match                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>This command configures the matching of the second tag that is carried transparently through the service. The inner-tag on ingress is the second tag on the frame if there are no service delimiting tags. Inner tag is the second tag before any service delimiting tags on egress but is dependent in the ingress configuration and may be set to 0 even in cases where additional tags are on the frame. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.</p> <p>The inner-tag is not applicable in ingress on dot1Q SAPs. The inner-tag may be populated on egress depending on the ingress SAP type.</p> <p>On QinQ SAPs of null and default that do not strip tags inner-tag will contain the second tag (which is still the second tag carried transparently through the service.) On ingress SAPs that strip any tags, inner-tag will contain 0 even if there are more than 2 tags on the frame.</p> <p>The optional vid_mask is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value and vid-mask) == (tag and vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.</p> <p>Note for QoS the VID type cannot be specified on the default QoS policy.</p> <p>The default vid-mask is set to 4095 for exact match.</p> |

| <b>Description</b> | <p>This command configures the matching of the first tag that is carried transparently through the service. Service delimiting tags are stripped from the frame and outer tag on ingress is the first tag after any service delimiting tags. Outer tag is the first tag before any service delimiting tags on egress. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.</p> <p>On dot1Q SAPs outer-tag is the only tag that can be matched. On dot1Q SAPs with exact match (sap 2/1/1:50) the outer-tag will be populated with the next tag that is carried transparently through the service or 0 if there is no additional VLAN tags on the frame.</p> <p>On QinQ SAPs that strip a single service delimiting tag, outer-tag will contain the next tag (which is still the first tag carried transparently through the service.) On SAPs with two service delimiting tags (two tags stripped) outer-tag will contain 0 even if there are more than 2 tags on the frame.</p> <p>The optional <i>vid_mask</i> is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value &amp; vid-mask) = (tag &amp; vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.</p> <p>Note for QoS the VID type cannot be specified on the default QoS policy.</p> <p>The default vid-mask is set to 4095 for exact match.</p> |

| <b>Syntax</b>      | <b>src-mac</b> <i>ieee-address</i> [ <i>ieee-address-mask</i> ]<br><b>no src-mac</b>                                                                                                                                                                            |
| <b>Context</b>     | config>filter>mac-filter>entry                                                                                                                                                                                                                                  |
| <b>Description</b> | Configures a source MAC address or range to be used as a MAC filter match criterion.<br><br>The <b>no</b> form of the command removes the source mac as the match criteria.                                                                                     |
| <b>Default</b>     | no src-mac                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <i>ieee-address</i> — Enter the 48-bit IEEE mac address to be used as a match criterion.<br><br><b>Values</b> HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit<br><br><i>ieee-address-mask</i> — This 48-bit mask can be configured using: |

| Format Style | Format Syntax  | Example         |
|--------------|----------------|-----------------|
| Decimal      | DDDDDDDDDDDDDD | 281474959933440 |
| Hexadecimal  | 0xHHHHHHHHHHHH | 0x0FFFFFF00000  |

| Format Style | Format Syntax | Example        |
|--------------|---------------|----------------|
| Binary       | 0bBBBBBBB...B | 0b11110000...B |

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFFFF000000

**Default** 0xFFFFFFFFFFFF (exact match)  
**Values** 0x0000000000000000 — 0xFFFFFFFFFFFF

## ssap

**Syntax** **ssap** *ssap-value* [*ssap-mask*]  
**no ssap**

**Context** config>filter>mac-filter>entry

**Description** This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. [MAC Match Criteria Exclusivity Rules on page 389](#) describes fields that are exclusive based on the frame format.

The **no** form of the command removes the ssap match criterion.

**Default** no ssap

**Parameters** *ssap-value* — The 8-bit ssap match criteria value in hex.

**Values** 0x00 — 0xFF

*ssap-mask* — This is optional and may be used when specifying a range of ssap values to use as the match criteria.

This 8 bit mask can be configured using the following formats:

| Format Style   | Format Syntax | Example    |
|----------------|---------------|------------|
| Decimal        | DDD           | 240        |
| Hexadecimal    | 0xHH          | 0xF0       |
| Binary         | 0bBBBBBBBB    | 0b11110000 |
| <b>Default</b> | <b>none</b>   |            |
| <b>Values</b>  | 0x00 — 0xFF   |            |

---

| <b>Context</b>     | config>filter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b> | This command copies existing filter list entries for a specific filter ID to another filter ID. The <b>copy</b> command is a configuration level maintenance tool used to create new filters using existing filters. It also allows bulk modifications to an existing policy with the use of the <b>overwrite</b> keyword. If <b>overwrite</b> is not specified, an error will occur if the destination policy ID exists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <p><b>ip-filter</b> — Indicates that the <i>source-filter-id</i> and the <i>dest-filter-id</i> are IP filter IDs.</p> <p><b>ipv6-filter</b> — This keyword indicates that the <i>source-filter-id</i> and the <i>dest-filter-id</i> are IPv6 filter IDs.</p> <p><b>mac-filter</b> — Indicates that the <i>source-filter-id</i> and the <i>dest-filter-id</i> are MAC filter IDs.</p> <p><i>source-filter-id</i> — The <i>source-filter-id</i> identifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword (<b>ip-filter</b>, <b>ipv6-filter</b> or <b>mac-filter</b>).</p> <p><i>dest-filter-id</i> — The <i>dest-filter-id</i> identifies the destination filter policy to which the copy command will attempt to copy. If the <b>overwrite</b> keyword does not follow, the filter policy ID cannot already exist within the system for the filter type the copy command is issued for. If the <b>overwrite</b> keyword is present, the destination policy ID may or may not exist.</p> <p><b>overwrite</b> — The <b>overwrite</b> keyword specifies that the destination filter ID may exist. If it does, everything in the existing destination filter ID will be completely overwritten with the contents of the source filter ID. If the destination filter ID exists, either <b>overwrite</b> must be specified or an error message will be returned. If <b>overwrite</b> is specified, the function of copying from source to destination occurs in a ‘break before make’ manner and therefore should be handled with care.</p> |

### renum

| <b>Description</b> | This command renumbers existing MAC or IP filter entries to properly sequence filter entries. This may be required in some cases since the OS exits when the first match is found and executes the actions according to the accompanying action command. This requires that entries be sequenced correctly from most to least explicit. |
| <b>Parameters</b>  | <i>old-entry-id</i> — Enter the entry number of an existing entry.                                                                                                                                                                                                                                                                      |
| <b>Values</b>      | 1 — 65535                                                                                                                                                                                                                                                                                                                               |

## Configuration Commands

*new-entry-id* — Enter the new entry-number to be assigned to the old entry.

**Values**     1 — 65535

## Redirect Policy Commands

### destination

|                    |                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] destination</b> <i>ip-address</i>                                                                                                                                                                                                     |
| <b>Context</b>     | config>filter>redirect-policy                                                                                                                                                                                                                 |
| <b>Description</b> | This command defines a cache server destination in a redirect policy. More than one destination can be configured. Whether a destination IP address will receive redirected packets depends on the effective priority value after evaluation. |
| <b>Default</b>     | none                                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <i>ip-address</i> — Specifies the IP address to send the redirected traffic.                                                                                                                                                                  |

### ping-test

|                    |                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] ping-test</b>                                                                                                                            |
| <b>Context</b>     | config>filter>destination>ping-test<br>config>filter>destination>snmp-test                                                                       |
| <b>Description</b> | This command configures parameters to perform connectivity ping tests to validate the ability for the destination to receive redirected traffic. |
| <b>Default</b>     | none                                                                                                                                             |

### drop-count

|                    |                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>drop-count</b> <i>consecutive-failures</i> [ <b>hold-down</b> <i>seconds</i> ]<br><b>no drop-count</b>                   |
| <b>Context</b>     | config>filter>destination>ping-test<br>config>filter>destination>snmp-test<br>config>filter>destination>url-test            |
| <b>Description</b> | This command specifies the number of consecutive requests that must fail for the destination to be declared unreachable.    |
| <b>Default</b>     | drop-count 3 hold-down 0                                                                                                    |
| <b>Parameters</b>  | <i>consecutive-failures</i> — Specifies the number of consecutive ping test failures before declaring the destination down. |
| <b>Values</b>      | 1 — 60                                                                                                                      |

## Configuration Commands

**hold-down** *seconds* — The amount of time, in seconds, that the system should be held down if any of the test has marked it unreachable.

**Values** 0 — 86400

### interval

**Syntax** **interval** *seconds*  
**no interval**

**Context** config>filter>destination>ping-test  
config>filter>destination>snmp-test  
config>filter>destination>url-test

**Description** This command specifies the amount of time, in seconds, between consecutive requests sent to the far end host.

**Default** 1

**Parameters** *seconds* — Specifies the amount of time, in seconds, between consecutive requests sent to the far end host.

**Values** 1 — 60

### timeout

**Syntax** **timeout** *seconds*  
**no timeout**

**Context** config>filter>destination>snmp-test  
config>filter>destination>url-test

**Description** Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

**Default** 1

**Parameters** *seconds* — Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

**Values** 1 — 60

### priority

**Syntax** **priority** *priority*  
**no priority**

**Context** config>filter>destination

|                    |                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Redirect policies can contain multiple destinations. Each destination is assigned an initial or base <b>priority</b> which describes its relative importance within the policy. If more than one destination is specified, the destination with the highest effective priority value is selected. |
| <b>Default</b>     | 100                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>priority</i> — The priority, expressed as a decimal integer, used to weigh the destination's relative importance within the policy.                                                                                                                                                            |
| <b>Values</b>      | 1 — 255                                                                                                                                                                                                                                                                                           |

## snmp-test

|                    |                                                                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>snmp-test</b> <i>test-name</i>                                                                                                                                                                                                                                                       |
| <b>Context</b>     | config>filter>redirect-policy>destination                                                                                                                                                                                                                                               |
| <b>Description</b> | This command enables the context to configure SNMP test parameters.                                                                                                                                                                                                                     |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <i>test-name</i> — specifies the name of the SNMP test. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. |

## oid

|                    |                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>oid</b> <i>oid-string</i> <b>community</b> <i>community-string</i>                                                                                                                                              |
| <b>Context</b>     | config>filter>redirect-policy>destination>snmp-test                                                                                                                                                                |
| <b>Description</b> | This command specifies the OID of the object to be fetched from the destination.                                                                                                                                   |
| <b>Default</b>     | none                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>oid-string</i> — Specifies the object identifier (OID) in the OID field.<br><b>community</b> <i>community-string</i> — The SNMP v2 community string or the SNMP v3 context name used to conduct this SNMP test. |

## return-value

|                    |                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>return-value</b> <i>return-value</i> <b>type</b> <i>return-type</i> [ <b>disable</b>   <b>lower-priority</b> <i>priority</i>   <b>raise-priority</b> <i>priority</i> ]                                      |
| <b>Context</b>     | config>filter>redirect-policy>destination>snmp-test                                                                                                                                                            |
| <b>Description</b> | This command specifies the criterion to adjust the priority based on the test result. Multiple criteria can be specified with the condition that they are not conflicting or overlap. If the returned value is |

within the specified range, the priority can be disabled, lowered or raised.

**Default** none

**Parameters** *return-value* — Specifies the SNMP value against which the test result is matched.

**Values** A maximum of 256 characters.

*return-type* — Specifies the SNMP object type against which the test result is matched.

**Values** integer, unsigned, string, ip-address, counter, time-ticks, opaque

**disable** — The keyword that specifies that the destination may not be used for the amount of time specified in the hold-time command when the test result matches the criterion.

**lower-priority** *priority* — Specifies the amount to lower the priority of the destination.

**Values** 1 — 255

**raise-priority** *priority* — Specifies the amount to raise the priority of the destination.

**Values** 1 — 255

### url-test

**Syntax** **url-test** *test-name*

**Context** config>filter>redirect-policy>destination

**Description** The context to enable URL test parameters. IP filters can be used to selectively cache some web sites.

**Default** none

**Parameters** **test-name** — The name of the URL test. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### return-code

**Syntax** **return-code** *return-code-1* [*return-code-2*] [**disable** | **lower-priority** *priority* | **raise-priority** *priority*]  
**no return-code** *return-code-1* [*return-code-2*]

**Context** config>filter>redirect-policy>destination>url-test

**Description** Return codes are returned when the URL test is performed. Values for the specified range are the return codes which can be given back to the system as a result of the test being performed.

For example, error code 401 for HTTP is “page not found.” If, while performing this test, the URL is not reachable, you can lower the priority by 10 points so that other means of reaching this destination are prioritized higher than the older one.

**Default** none

**Parameters** *return-code-1*, *return-code-2* — Specifies a range of return codes. When the URL test return-code falls within the specified range, the corresponding action is performed.

**Values**     *return-code-1*: 1 — 4294967294  
                   *return-code-2*: 2 — 4294967295

**disable** — Specifies that the destination may not be used for the amount of time specified in the hold-time command when the return code falls within the specified range.

**lower-priority** *priority* — Specifies the amount to lower the priority of the destination when the return code falls within the specified range.

**raise-priority** *priority* — Specifies the amount to raise the priority of the destination when the return code falls within the specified range.

## url

**Syntax** **url** *url-string* [**http-version** *version-string*]

**Context** config>filter>redirect-policy>destination>url-test

**Description** This command specifies the URL to be probed by the URL test.

**Default** none

**Parameters** *url-string* — Specify a URL up to 255 characters in length.

**http-version** *version-string* — Specifies the HTTP version, 80 characters in length.

---

## Show Commands

### download-failed

- Syntax** `download-failed`
- Context** `show>filter`
- Description** This command shows all filter entries for which the download has failed.
- Output** **download-failed Output** — The following table describes the filter download-failed output.

| Label        | Description                              |
|--------------|------------------------------------------|
| Filter-type  | Displays the filter type.                |
| Filter-ID    | Displays the ID of the filter.           |
| Filter-Entry | Displays the entry number of the filter. |

#### Sample Output

```
A:ALA-48# show filter download-failed
=====
Filter entries for which download failed
=====
Filter-type Filter-Id Filter-Entry

ip 1 10
=====
A:ALA-48#
```

### ip

- Syntax** `ip [ip-filter-id] [entry entry-id] [association | counters] [type <entry-type>]`
- Context** `show>filter`
- Description** This command shows IP filter information.
- Parameters** *ip-filter-id* — Displays detailed information for the specified filter ID and its filter entries.
- Values** 1 — 65535
- entry *entry-id*** — Displays information on the specified filter entry ID for the specified filter ID only.
- Values** 1 — 65535
- associations** — Appends information as to where the filter policy ID is applied to the detailed filter policy ID output.

**counters** — Displays counter information for the specified filter ID. Note that egress counters count the packets without Layer 2 encapsulation. Ingress counters count the packets with Layer 2 encapsulation.

**type *entry-type*** — Displays information on the specified filter ID for the specified *entry-type* only

**Output Show Filter (no filter-id specified)** — The following table describes the command output for the command when no filter ID is specified.

| Label       | Description                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------|
| Filter Id   | The IP filter ID                                                                                         |
| Scope       | Template – The filter policy is of type template.<br>Exclusive – The filter policy is of type exclusive. |
| Applied     | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.                |
| Description | The IP filter policy description.                                                                        |

**Sample Output**

```
A:ALA-49# show filter ip
=====
IP Filters
=====
Filter-Id Scope Applied Description

1 Template Yes
3 Template Yes
6 Template Yes
10 Template No
11 Template No

Num IP filters: 5
=====
A:ALA-49#

*A:Dut-C>config>filter# show filter ip
=====
IP Filters Total: 2
=====
Filter-Id Scope Applied Description

10001 Template Yes
fSpec-1 Template Yes BGP FlowSpec filter for the Base router

Num IP filters: 2
=====
*A:Dut-C>config>filter#
```

**Output Show Filter (with filter-id specified)** — The following table describes the command output for the command when a filter ID is specified.

| Label                 | Description                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Id             | The IP filter policy ID.                                                                                                                                                                                                   |
| Scope                 | Template – The filter policy is of type template.<br>Exclusive – The filter policy is of type exclusive.                                                                                                                   |
| Entries               | The number of entries configured in this filter ID.                                                                                                                                                                        |
| Description           | The IP filter policy description.                                                                                                                                                                                          |
| Applied               | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.                                                                                                                                  |
| Def. Action           | Forward – The default action for the filter ID for packets that do not match the filter entries is to forward.<br>Drop – The default action for the filter ID for packets that do not match the filter entries is to drop. |
| Filter Match Criteria | IP – Indicates the filter is an IP filter policy.                                                                                                                                                                          |
| Entry                 | The filter ID filter entry ID. If the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified.                                                              |
| Log Id                | The filter log ID.                                                                                                                                                                                                         |
| Src. IP               | The source IPv6 address and prefix length match criterion.                                                                                                                                                                 |
| Dest. IP              | The destination IPv6 address and prefix length match criterion.                                                                                                                                                            |
| Next-header           | The next header ID for the match criteria. Undefined indicates no next-header specified.                                                                                                                                   |
| ICMP Type             | The ICMP type match criterion. Undefined indicates no ICMP type specified.                                                                                                                                                 |
| Fragment              | False – Configures a match on all non-fragmented IP packets.<br>True – Configures a match on all fragmented IP packets.<br>Off – Fragments are not a matching criteria. All fragments and non-fragments implicitly match.  |
| Sampling              | Off – Specifies that traffic sampling is disabled.<br>On – Specifies that traffic matching the associated IP filter entry is sampled.                                                                                      |

| Label           | Description (Continued)                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP-Option       | Specifies matching packets with a specific IP option or a range of IP options in the IP header for IP filter match criteria.                                                                                                                                                                                                                      |
| TCP-syn         | <p>False – Configures a match on packets with the SYN flag set to false.</p> <p>True – Configured a match on packets with the SYN flag set to true.</p> <p>Off – The state of the TCP SYN flag is not considered as part of the match criteria.</p>                                                                                               |
| Match action    | <p>Default – The filter does not have an explicit forward or drop match action specified. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified.</p> <p>Drop – Drop packets matching the filter entry.</p> <p>Forward – The explicit action to perform is forwarding of the packet.</p> |
| Ing. Matches    | The number of ingress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                   |
| Src. Port       | The source TCP or UDP port number or port range.                                                                                                                                                                                                                                                                                                  |
| Dest. Port      | The destination TCP or UDP port number or port range.                                                                                                                                                                                                                                                                                             |
| Dscp            | The DiffServ Code Point (DSCP) name.                                                                                                                                                                                                                                                                                                              |
| ICMP Code       | The ICMP code field in the ICMP header of an IP packet.                                                                                                                                                                                                                                                                                           |
| Option-present  | <p>Off – Specifies not to search for packets that contain the option field or have an option field of zero.</p> <p>On – Matches packets that contain the option field or have an option field of zero be used as IP filter match criteria.</p>                                                                                                    |
| Int. Sampling   | <p>Off – Interface traffic sampling is disabled.</p> <p>On – Interface traffic sampling is enabled.</p>                                                                                                                                                                                                                                           |
| Multiple Option | <p>Off – The option fields are not checked.</p> <p>On – Packets containing one or more option fields in the IP header will be used as IP filter match criteria.</p>                                                                                                                                                                               |
| TCP-ack         | <p>False – Configures a match on packets with the ACK flag set to false.</p> <p>True – Configures a match on packets with the ACK flag set to true.</p> <p>Off – The state of the TCP ACK flag is not considered as part of the match criteria. as part of the match criteria.</p>                                                                |
| Egr. Matches    | The number of egress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                    |

**Output Show Filter Associations** — The following table describes the fields that display when the **associations** keyword is specified.

| Label       | Description                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Id   | The IP filter policy ID.                                                                                                                                                                                                   |
| Scope       | Template – The filter policy is of type Template.<br>Exclusive – The filter policy is of type Exclusive.                                                                                                                   |
| Entries     | The number of entries configured in this filter ID.                                                                                                                                                                        |
| Applied     | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.                                                                                                                                  |
| Def. Action | Forward – The default action for the filter ID for packets that do not match the filter entries is to forward.<br>Drop – The default action for the filter ID for packets that do not match the filter entries is to drop. |
| Service Id  | The service ID on which the filter policy ID is applied.                                                                                                                                                                   |
| SAP         | The Service Access Point on which the filter policy ID is applied.                                                                                                                                                         |
| (Ingress)   | The filter policy ID is applied as an ingress filter policy on the interface.                                                                                                                                              |
| (Egress)    | The filter policy ID is applied as an egress filter policy on the interface.                                                                                                                                               |
| Type        | The type of service of the service ID.                                                                                                                                                                                     |
| Entry       | The filter ID filter entry ID. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete as no action was specified.                                                                          |
| Log Id      | The filter log ID.                                                                                                                                                                                                         |
| Src. IP     | The source IP address and mask match criterion. 0.0.0.0/0 indicates no criterion specified for the filter entry.                                                                                                           |
| Dest. IP    | The destination IP address and mask match criterion. 0.0.0.0/0 indicates no criterion specified for the filter entry.                                                                                                      |
| Protocol    | The protocol ID for the match criteria. Undefined indicates no protocol specified.                                                                                                                                         |
| ICMP Type   | The ICMP type match criterion. Undefined indicates no ICMP type specified.                                                                                                                                                 |
| Fragment    | False – Configures a match on all non-fragmented IP packets.<br>True – Configures a match on all fragmented IP packets.                                                                                                    |

| Label           | Description (Continued)                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | Off – Fragments are not a matching criteria. All fragments and non-fragments implicitly match.                                                                                                                                                               |
| Sampling        | Off – Specifies that traffic sampling is disabled.                                                                                                                                                                                                           |
|                 | On – Specifies that traffic matching the associated IP filter entry is sampled.                                                                                                                                                                              |
| IP-Option       | Specifies matching packets with a specific IP option or a range of IP options in the IP header for IP filter match criteria.                                                                                                                                 |
| TCP-syn         | False – Configures a match on packets with the SYN flag set to false.                                                                                                                                                                                        |
|                 | True – Configured a match on packets with the SYN flag set to true.                                                                                                                                                                                          |
|                 | Off – The state of the TCP SYN flag is not considered as part of the match criteria.                                                                                                                                                                         |
| Match action    | Default – The filter does not have an explicit forward or drop match action specified. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete (no action was specified).                                                     |
|                 | Drop – Drop packets matching the filter entry.                                                                                                                                                                                                               |
|                 | Forward – The explicit action to perform is forwarding of the packet. If the action is Forward, then if configured the next hop information should be displayed, including Next hop: <IP address>, Indirect: <IP address> or Interface: <IP interface name>. |
| Ing. Matches    | The number of ingress filter matches/hits for the filter entry.                                                                                                                                                                                              |
| Src. Port       | The source TCP or UDP port number or port range.                                                                                                                                                                                                             |
| Dest. Port      | The destination TCP or UDP port number or port range.                                                                                                                                                                                                        |
| Dscp            | The DiffServ Code Point (DSCP) name.                                                                                                                                                                                                                         |
| ICMP Code       | The ICMP code field in the ICMP header of an IP packet.                                                                                                                                                                                                      |
| Option-present  | Off – Specifies not to search for packets that contain the option field or have an option field of zero.                                                                                                                                                     |
|                 | On – Matches packets that contain the option field or have an option field of zero be used as IP filter match criteria.                                                                                                                                      |
| Int. Sampling   | Off – Interface traffic sampling is disabled.                                                                                                                                                                                                                |
|                 | On – Interface traffic sampling is enabled.                                                                                                                                                                                                                  |
| Multiple Option | Off – The option fields are not checked.                                                                                                                                                                                                                     |
|                 | On – Packets containing one or more option fields in the IP header will be used as IP filter match criteria.                                                                                                                                                 |

| Label        | Description (Continued)                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP-ack      | False – Configures a match on packets with the ACK flag set to false.<br><br>True – configures a match on packets with the ACK flag set to true.<br><br>off – The state of the TCP ACK flag is not considered as part of the match criteria.h criteria. |
| Egr. Matches | The number of egress filter matches/hits for the filter entry.                                                                                                                                                                                          |

**Sample Output**

```
A:ALA-49# show filter ip 1 associations
=====
IP Filter
=====

*A:ALA-48#

```

## ipv6

- Syntax** `ipv6 {ipv6-filter-id [entry entry-id] [association | counters]}`
- Context** show>filter
- Description** This command shows IPv6 filter information.
- Parameters** *ipv6-filter-id* — Displays detailed information for the specified IPv6 filter ID and filter entries.
- Values** 1 — 65535
- entry** *entry-id* — Displays information on the specified IPv6 filter entry ID for the specified filter ID.
- Values** 1 — 9999
- associations** — Appends information as to where the IPv6 filter policy ID is applied to the detailed filter policy ID output.
- counters** — Displays counter information for the specified IPv6 filter ID. Note that egress counters count the packets without Layer 2 encapsulation. Ingress counters count the packets with Layer 2 encapsulation.
- Output** **Show Filter (no filter-id specified)** — The following table describes the command output for the command when no filter ID is specified.

| Label       | Description                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------|
| Filter Id   | The IP filter ID                                                                                         |
| Scope       | Template – The filter policy is of type template.<br>Exclusive – The filter policy is of type exclusive. |
| Applied     | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.                |
| Description | The IP filter policy description.                                                                        |

**Sample Output**

```

A:ALA-48# show filter ipv6
=====
IP Filters
=====
Filter-Id Scope Applied Description

100 Template Yes test
200 Exclusive Yes

Num IPv6 filters: 2
=====
A:ALA-48#

```

**Output Show Filter (with filter-id specified)** — The following table describes the command output for the command when a filter ID is specified.

| Label                 | Description                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Id             | The IP filter policy ID.                                                                                                                                                                                                   |
| Scope                 | Template – The filter policy is of type template.<br>Exclusive – The filter policy is of type exclusive.                                                                                                                   |
| Entries               | The number of entries configured in this filter ID.                                                                                                                                                                        |
| Description           | The IP filter policy description.                                                                                                                                                                                          |
| Applied               | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.                                                                                                                                  |
| Def. Action           | Forward – The default action for the filter ID for packets that do not match the filter entries is to forward.<br>Drop – The default action for the filter ID for packets that do not match the filter entries is to drop. |
| Filter Match Criteria | IP – Indicates the filter is an IP filter policy.                                                                                                                                                                          |
| Entry                 | The filter ID filter entry ID. If the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified.                                                              |
| Log Id                | The filter log ID.                                                                                                                                                                                                         |
| Src. IP               | The source IP address and mask match criterion. 0.0.0.0/0 indicates no criterion specified for the filter entry.                                                                                                           |
| Dest. IP              | The destination IP address and mask match criterion. 0.0.0.0/0 indicates no criterion specified for the filter entry.                                                                                                      |

| Label        | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol     | The protocol ID for the match criteria. Undefined indicates no protocol specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ICMP Type    | The ICMP type match criterion. Undefined indicates no ICMP type specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Fragment     | <p>False – Configures a match on all non-fragmented IP packets.</p> <p>True – Configures a match on all fragmented IP packets.</p> <p>Off – Fragments are not a matching criteria. All fragments and non-fragments implicitly match.</p>                                                                                                                                                                                                                                                                                                                               |
| Sampling     | <p>Off – Specifies that traffic sampling is disabled.</p> <p>On – Specifies that traffic matching the associated IP filter entry is sampled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IP-Option    | Specifies matching packets with a specific IP option or a range of IP options in the IP header for IP filter match criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TCP-syn      | <p>False – Configures a match on packets with the SYN flag set to false.</p> <p>True – Configured a match on packets with the SYN flag set to true.</p> <p>Off – The state of the TCP SYN flag is not considered as part of the match criteria.</p>                                                                                                                                                                                                                                                                                                                    |
| Match action | <p>Default – The filter does not have an explicit forward or drop match action specified. If the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified.</p> <p>Drop – Drop packets matching the filter entry.</p> <p>Forward – The explicit action to perform is forwarding of the packet. If the action is Forward, then if configured the nexthop information should be displayed, including Nexthop: &lt;IP address&gt;, Indirect: &lt;IP address&gt; or Interface: &lt;IP interface name&gt;.</p> |
| Ing. Matches | The number of ingress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Src. Port    | The source TCP or UDP port number or port range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Dest. Port   | The destination TCP or UDP port number or port range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Dscp         | The DiffServ Code Point (DSCP) name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ICMP Code    | The ICMP code field in the ICMP header of an IP packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Label           | Description (Continued)                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Option-present  | <p>Off – Specifies not to search for packets that contain the option field or have an option field of zero.</p> <p>On – Matches packets that contain the option field or have an option field of zero be used as IP filter match criteria.</p>      |
| Int. Sampling   | <p>Off – Interface traffic sampling is disabled.</p> <p>On – Interface traffic sampling is enabled.</p>                                                                                                                                             |
| Multiple Option | <p>Off – The option fields are not checked.</p> <p>On – Packets containing one or more option fields in the IP header will be used as IP filter match criteria.</p>                                                                                 |
| TCP-ack         | <p>False – Configures a match on packets with the ACK flag set to false.</p> <p>True – Configured a match on packets with the ACK flag set to true.</p> <p>Off – The state of the TCP ACK flag is not considered as part of the match criteria.</p> |
| Egr. Matches    | The number of egress filter matches/hits for the filter entry.                                                                                                                                                                                      |

### Sample Output

```
A:ALA-48# show filter ipv6 100
=====
IPv6 Filter
=====
Filter Id : 100 Applied : Yes

**Output** **Show Filter Associations** — The following table describes the fields that display when the **associations** keyword is specified.

| Label       | Description                                                                                                                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Id   | The IPv6 filter policy ID.                                                                                                                                                                                                               |
| Scope       | <p>Template – The filter policy is of type Template.</p> <p>Exclusive – The filter policy is of type Exclusive.</p>                                                                                                                      |
| Entries     | The number of entries configured in this filter ID.                                                                                                                                                                                      |
| Applied     | <p>No – The filter policy ID has not been applied.</p> <p>Yes – The filter policy ID is applied.</p>                                                                                                                                     |
| Def. Action | <p>Forward – The default action for the filter ID for packets that do not match the filter entries is to forward.</p> <p>Drop – The default action for the filter ID for packets that do not match the filter entries is to drop.</p>    |
| Service Id  | The service ID on which the filter policy ID is applied.                                                                                                                                                                                 |
| SAP         | The Service Access Point on which the filter policy ID is applied.                                                                                                                                                                       |
| (Ingress)   | The filter policy ID is applied as an ingress filter policy on the interface.                                                                                                                                                            |
| (Egress)    | The filter policy ID is applied as an egress filter policy on the interface.                                                                                                                                                             |
| Type        | The type of service of the service ID.                                                                                                                                                                                                   |
| Entry       | The filter ID filter entry ID. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified.                                                                                          |
| Log Id      | The filter log ID.                                                                                                                                                                                                                       |
| Src. IP     | The source IP address and mask match criterion. 0.0.0.0/0 indicates no criterion specified for the filter entry.                                                                                                                         |
| Dest. IP    | The destination IP address and mask match criterion. 0.0.0.0/0 indicates no criterion specified for the filter entry.                                                                                                                    |
| Protocol    | The protocol ID for the match criteria. Undefined indicates no protocol specified.                                                                                                                                                       |
| ICMP Type   | The ICMP type match criterion. Undefined indicates no ICMP type specified.                                                                                                                                                               |
| Fragment    | <p>False – Configures a match on all non-fragmented IP packets.</p> <p>True – Configures a match on all fragmented IP packets.</p> <p>Off – Fragments are not a matching criteria. All fragments and non-fragments implicitly match.</p> |
| Sampling    | Off – Specifies that traffic sampling is disabled.                                                                                                                                                                                       |

| Label           | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | On – Specifies that traffic matching the associated IP filter entry is sampled.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP-Option       | Specifies matching packets with a specific IP option or a range of IP options in the IP header for IP filter match criteria.                                                                                                                                                                                                                                                                                                                                                                                                    |
| TCP-syn         | False – Configures a match on packets with the SYN flag set to false.<br><br>True – Configures a match on packets with the SYN flag set to true.<br><br>Off – The state of the TCP SYN flag is not considered as part of the match criteria.                                                                                                                                                                                                                                                                                    |
| Match action    | Default – The filter does not have an explicit forward or drop match action specified. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified.<br><br>Drop – Drop packets matching the filter entry.<br><br>Forward – The explicit action to perform is forwarding of the packet. If the action is Forward, then if configured the nexthop information should be displayed, including Nexthop: <IP address>, Indirect: <IP address> or Interface: <IP interface name>. |
| Ing. Matches    | The number of ingress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Src. Port       | The source TCP or UDP port number or port range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Dest. Port      | The destination TCP or UDP port number or port range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Dscp            | The DiffServ Code Point (DSCP) name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ICMP Code       | The ICMP code field in the ICMP header of an IP packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Option-present  | Off – Specifies not to search for packets that contain the option field or have an option field of zero.<br><br>On – Matches packets that contain the option field or have an option field of zero be used as IP filter match criteria.                                                                                                                                                                                                                                                                                         |
| Int. Sampling   | Off – Interface traffic sampling is disabled.<br><br>On – Interface traffic sampling is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Multiple Option | Off – The option fields are not checked.<br><br>On – Packets containing one or more option fields in the IP header will be used as IP filter match criteria.                                                                                                                                                                                                                                                                                                                                                                    |
| TCP-ack         | False – Configures a match on packets with the ACK flag set to false.<br><br>True – Configured a match on packets with the ACK flag set to true.                                                                                                                                                                                                                                                                                                                                                                                |

| Label                     | Description (Continued)                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------|
|                           | <code>Off</code> – The state of the TCP ACK flag is not considered as part of the match criteria. |
| <code>Egr. Matches</code> | The number of egress filter matches/hits for the filter entry.                                    |

**Sample Output**

```
A:ALA-48# show filter ipv6 1 associations
=====
IPv6 Filter
=====

## log

**Syntax** `log log-id [match string] [bindings]`

**Context** show>filter

**Description** This command shows the contents of a memory-based or a file-based filter log.  
If the optional keyword **match** and *string* parameter are given, the command displays the given filter log from the first occurrence of the given string.

**Parameters** *log-id* — The filter log ID destination expressed as a decimal integer.

**Values** 101 — 199

**match string** — Specifies to start displaying the filter log entries from the first occurrence of *string*.

**bindings** — Displays the number of filter logs currently instantiated.

**Output** **Log Message Formatting** — Each filter log entry contains the following information in case summary log feature is not active (as appropriate).

| Label                                | Description                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>yyyy/mm/dd</i><br><i>hh:mm:ss</i> | The date and timestamp for the log filter entry where <i>yyyy</i> is the year, <i>mm</i> is the month, <i>dd</i> is the day, <i>hh</i> is the hour, <i>mm</i> is the minute and <i>ss</i> is the second. |
| Filter                               | The filter ID and the entry ID which generated the filter log entry in the form <i>Filter_ID:Entry_ID</i> .                                                                                              |
| Desc                                 | The description of the filter entry ID which generated the filter log entry.                                                                                                                             |
| Interface                            | The IP interface on which the filter ID and entry ID was associated which generated the filter log entry.                                                                                                |
| Action                               | The action of the filter entry on the logged packet.                                                                                                                                                     |
| Src MAC                              | The source MAC address of the logged packet.                                                                                                                                                             |
| Dst MAC                              | The destination MAC of the logged packet.                                                                                                                                                                |
| EtherType                            | The Ethernet type of the logged Ethernet type II packet.                                                                                                                                                 |
| Src IP                               | The source IP address of the logged packet. The source port will be displayed after the IP address as appropriate separated with a colon.                                                                |
| Dst IP                               | The destination IP address of the logged packet. The source port will be displayed after the IP address as appropriate separated with a colon.                                                           |
| Flags<br>(IP flags)                  | M — The more fragments IP flag is set in the logged packet.<br>DF — The do not fragment IP flag is set in the logged packet.                                                                             |
| TOS                                  | The TOS byte value in the logged packet.                                                                                                                                                                 |

| Label                               | Description (Continued)                                                                                                                                                                                                                                                         |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol                            | The IP protocol of the logged packet (TCP, UDP, ICMP or a protocol number in hex).                                                                                                                                                                                              |
| Flags<br>(TCP flags)                | URG – Urgent bit set.<br>ACK – Acknowledgement bit set.<br>RST – Reset bit set.<br>SYN – Synchronize bit set.<br>FIN – Finish bit set.                                                                                                                                          |
| HEX                                 | If an IP protocol does not have a supported decode, the first 32 bytes following the IP header are printed in a hex dump.<br>Log entries for non-IP packets include the Ethernet frame information and a hex dump of the first 40 bytes of the frame after the Ethernet header. |
| Total Log<br>Instances<br>(Allowed) | Specifies the maximum allowed instances of filter logs allowed on the system.                                                                                                                                                                                                   |
| Total Log<br>Instances (In Use)     | Specifies the instances of filter logs presently existing on the system.                                                                                                                                                                                                        |
| Total Log Bindings                  | Specifies the count of the filter log bindings presently existing on the system.                                                                                                                                                                                                |
| Type                                | The type of service of the service ID.                                                                                                                                                                                                                                          |
| Filter ID                           | Uniquely identifies an IP filter as configured on the system.                                                                                                                                                                                                                   |
| Entry ID                            | The identifier which uniquely identifies an entry in a filter table.                                                                                                                                                                                                            |
| Log                                 | Specifies an entry in the filter log table.                                                                                                                                                                                                                                     |
| Instantiated                        | Specifies if the filter log for this filter entry has or has not been instantiated.                                                                                                                                                                                             |

If the packet being logged does not have a source or destination MAC address (i.e., POS) then the MAC information output line is omitted from the log entry.

In case log summary is active, the filter log mini-tables contain the following information..

| Label                    | Description                                                              |
|--------------------------|--------------------------------------------------------------------------|
| <b>Summary Log LogID</b> | Displays the log ID.                                                     |
| Crit1                    | Summary criterion that is used as index into the mini-tables of the log. |
| TotCnt                   | The total count of logs.                                                 |
| ArpCnt                   | Displays the total number of ARP messages logged for this log ID.        |

| Label            | Description (Continued)                                                      |
|------------------|------------------------------------------------------------------------------|
| Src...<br>Dst... | The address type indication of the key in the mini-table.                    |
| count            | The number of messages logged with the specified source/destination address. |
| address          | The address for which count messages where received.                         |

## mac

**Syntax** `mac [mac-filter-id [associations | counters] [entry entry-id]]`

**Context** `show>filter`

**Description** This command displays MAC filter information.

**Parameters** *mac-filter-id* — Displays detailed information for the specified filter ID and its filter entries.

**Values** 1 — 65535

**associations** — Appends information as to where the filter policy ID is applied to the detailed filter policy ID output.

**counters** — Displays counter information for the specified filter ID.

**entry entry-id** — Displays information on the specified filter entry ID for the specified filter ID only.

**Values** 1 — 65535

**Output** **No Parameters Specified** — When no parameters are specified, a brief listing of IP filters is produced. The following table describes the command output for the command.

**Filter ID Specified** — When the filter ID is specified, detailed filter information for the filter ID

| Label       | Description                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------|
| Filter Id   | The IP filter ID                                                                                        |
| Scope       | Template – The filter policy is of type Template.<br>Exclusiv – The filter policy is of type Exclusive. |
| Applied     | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.               |
| Description | The MAC filter policy description.                                                                      |

and its entries is produced. The following table describes the command output for the command.

| Label                    | Description                                                                                                                                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Filter<br>Filter Id  | The MAC filter policy ID.                                                                                                                                                                                                  |
| Scope                    | Template – The filter policy is of type Template.<br>Exclusiv – The filter policy is of type Exclusive.                                                                                                                    |
| Description              | The IP filter policy description.                                                                                                                                                                                          |
| Applied                  | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.                                                                                                                                  |
| Def. Action              | Forward – The default action for the filter ID for packets that do not match the filter entries is to forward.<br>Drop – The default action for the filter ID for packets that do not match the filter entries is to drop. |
| Filter Match<br>Criteria | MAC – Indicates the filter is an MAC filter policy.                                                                                                                                                                        |
| Entry                    | The filter ID filter entry ID. If the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified.                                                              |
| Description              | The filter entry description.                                                                                                                                                                                              |
| FrameType                | Ethernet – The entry ID match frame type is Ethernet IEEE 802.3.<br>Ethernet II – The entry ID match frame type is Ethernet Type II.                                                                                       |
| Src MAC                  | The source MAC address and mask match criterion. When both the MAC address and mask are all zeroes, no criterion specified for the filter entry.                                                                           |
| Dest MAC                 | The destination MAC address and mask match criterion. When both the MAC address and mask are all zeroes, no criterion specified for the filter entry.                                                                      |

| Label          | Description (Continued)                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dot1p          | The IEEE 802.1p value for the match criteria. Undefined indicates no value is specified.                                                                                                                                                                                                                                                            |
| Ethertype      | The Ethertype value match criterion.                                                                                                                                                                                                                                                                                                                |
| DSAP           | The DSAP value match criterion.<br>Undefined indicates no value specified.                                                                                                                                                                                                                                                                          |
| SSAP           | SSAP value match criterion. Undefined indicates no value specified.                                                                                                                                                                                                                                                                                 |
| Snap-pid       | The Ethernet SNAP PID value match criterion. Undefined indicates no value specified.                                                                                                                                                                                                                                                                |
| Esnap-oui-zero | Non-Zero – Filter entry matches a non-zero value for the Ethernet SNAP OUI.<br>Zero – Filter entry matches a zero value for the Ethernet SNAP OUI.<br>Undefined – No Ethernet SNAP OUI value specified.                                                                                                                                             |
| Match action   | Default – The filter does not have an explicit forward or drop match action specified. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified.<br>Drop – Packets matching the filter entry criteria will be dropped.<br>Forward – Packets matching the filter entry criteria is forwarded. |
| Ing. Matches   | The number of ingress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                     |
| Egr. Matches   | The number of egress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                      |

### Sample Detailed Output

```

## li-mac

**Syntax** `li-mac [li-mac-filter-id [associations | counters] [entry entry-id]]`

**Context** show>filter

**Description** This command displays Lawful Intercept MAC filter information.

**Parameters** *li-mac-filter-id* — Displays detailed information for the specified Lawful Intercept filter ID and its filter entries.

**Values** 1— 65535

**associations** — Appends information as to where the Lawful Intercept filter policy ID is applied to the detailed filter policy ID output.

**counters** — Displays counter information for the specified Lawful Intercept filter ID.

**entry *entry-id*** — Displays information on the specified Lawful Intercept filter entry ID for the specified filter ID only.

**Values** 1 — 65535

**Output** **No Parameters Specified** — When no parameters are specified, a brief listing of IP filters is produced. The following table describes the command output for the command.

**Filter ID Specified** — When the filter ID is specified, detailed filter information for the filter ID

| Label       | Description                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------|
| Filter Id   | The IP filter ID                                                                                        |
| Scope       | Template – The filter policy is of type Template.<br>Exclusiv – The filter policy is of type Exclusive. |
| Applied     | No – The filter policy ID has not been applied.<br>Yes – The filter policy ID is applied.               |
| Description | The MAC filter policy description.                                                                      |

and its entries is produced. The following table describes the command output for the command.

| Label      | Description               |
|------------|---------------------------|
| MAC Filter | The MAC filter policy ID. |
| Filter Id  |                           |

| Label                 | Description (Continued)                                                                                                                                                                                                               |

| Def. Action           | <p>Forward – The default action for the filter ID for packets that do not match the filter entries is to forward.</p> <p>Drop – The default action for the filter ID for packets that do not match the filter entries is to drop.</p> |
| Filter Match Criteria | MAC – Indicates the filter is an MAC filter policy.                                                                                                                                                                                   |
| Entry                 | The filter ID filter entry ID. If the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified.                                                                         |
| Description           | The filter entry description.                                                                                                                                                                                                         |
| FrameType             | <p>Ethernet – The entry ID match frame type is Ethernet IEEE 802.3.</p> <p>Ethernet II – The entry ID match frame type is Ethernet Type II.</p>                                                                                       |
| Src MAC               | The source MAC address and mask match criterion. When both the MAC address and mask are all zeroes, no criterion specified for the filter entry.                                                                                      |
| Dest MAC              | The destination MAC address and mask match criterion. When both the MAC address and mask are all zeroes, no criterion specified for the filter entry.                                                                                 |
| Dot1p                 | The IEEE 802.1p value for the match criteria. Undefined indicates no value is specified.                                                                                                                                              |
| Ethertype             | The Ethertype value match criterion.                                                                                                                                                                                                  |
| DSAP                  | <p>The DSAP value match criterion.</p> <p>Undefined indicates no value specified.</p>                                                                                                                                                 |
| SSAP                  | SSAP value match criterion. Undefined indicates no value specified.                                                                                                                                                                   |
| Snap-pid              | The Ethernet SNAP PID value match criterion. Undefined indicates no value specified.                                                                                                                                                  |
| Esnap-oui-zero        | <p>Non-Zero – Filter entry matches a non-zero value for the Ethernet SNAP OUI.</p> <p>Zero – Filter entry matches a zero value for the Ethernet SNAP OUI.</p> <p>Undefined – No Ethernet SNAP OUI value specified.</p>                |

| Label        | Description (Continued)                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match action | Default – The filter does not have an explicit forward or drop match action specified. If the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified.<br>Drop – Packets matching the filter entry criteria will be dropped.<br>Forward – Packets matching the filter entry criteria is forwarded. |
| Ing. Matches | The number of ingress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                     |
| Egr. Matches | The number of egress filter matches/hits for the filter entry.                                                                                                                                                                                                                                                                                      |

### Sample Detailed Output

```
show li filter li-mac "testLiMacFilter"

```

**Filter Associations** — The associations for a filter ID will be displayed if the **associations** keyword is specified. The association information is appended to the filter information. The following table describes the fields in the appended associations output.

| Label              | Description                                                                   |
|--------------------|-------------------------------------------------------------------------------|
| Filter Association | Mac — The filter associations displayed are for a MAC filter policy ID.       |
| Service Id         | The service ID on which the filter policy ID is applied.                      |
| SAP                | The Service Access Point on which the filter policy ID is applied.            |
| Type               | The type of service of the Service ID.                                        |
| (Ingress)          | The filter policy ID is applied as an ingress filter policy on the interface. |
| (Egress)           | The filter policy ID is applied as an egress filter policy on the interface.  |

### Sample Output

```
show li filter li-mac "testLiMacFilter" association

=====
LI Mac Filter
=====
Filter Id : testLiMacFilter Associated : Yes
Entries : 4
Description : test LI Mac filter setup

Filter Association : Mac

mac filter 1
 Service Id : 60 Type : VPLS
 - SAP 1/1/6:7 (Ingress)
 - SAP 1/1/6:9 (Egress)
```

**Filter Entry Counters Output** — When the **counters** keyword is specified, the filter entry output displays the filter matches/hit information. The following table describes the command output for the command.

**Sample Output**

## redirect-policy

**Syntax** `redirect-policy {redirect-policy-name [dest ip-address] [association]}`

**Context** show>filter

**Description** This command shows redirect filter information.

**Parameters** *redirect-policy-name* — Displays information for the specified redirect policy.

**dest** *ip-address* — Directs the router to use a specified IP address for communication.

**association** — Appends association information.

**Output** **Redirect Policy Output** — The following table describes the fields in the redirect policy command output.

| Label              | Description                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Redirect Policy    | Specifies a specific redirect policy.                                                                                                                                     |
| Applied            | Specifies whether the redirect policy is applied to a filter policy entry.                                                                                                |
| Description        | Displays the user-provided description for this redirect policy.                                                                                                          |
| Active Destination | <i>ip address</i> – Specifies the IP address of the active destination.<br><i>none</i> – Indicates that there is currently no active destination.                         |
| Destination        | Specifies the destination IP address.                                                                                                                                     |
| Oper Priority      | Specifies the operational value of the priority for this destination. The highest operational priority across multiple destinations is used as the preferred destination. |
| Admin Priority     | Specifies the configured base priority for the destination.                                                                                                               |

| Label          | Description (Continued)                                                                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin State    | Specifies the configured state of the destination.<br><br>Out of Service – Tests for this destination will not be conducted.                                                                     |
| Oper State     | Specifies the operational state of the destination.                                                                                                                                              |
| Ping Test      | Specifies the name of the ping test.                                                                                                                                                             |
| Timeout        | Specifies the amount of time in seconds that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive. |
| Interval       | Specifies the amount of time in seconds between consecutive requests sent to the far end host.                                                                                                   |
| Drop Count     | Specifies the number of consecutive requests that must fail for the destination to be declared unreachable.                                                                                      |
| Hold Down      | Specifies the amount of time in seconds that the system should be held down if any of the test has marked it unreachable.                                                                        |
| Hold Remain    | Specifies the amount of time in seconds that the system will remain in a hold down state before being used again.                                                                                |
| Last Action at | Displays a time stamp of when this test received a response for a probe that was sent out.                                                                                                       |
| SNMP Test      | Specifies the name of the SNMP test.                                                                                                                                                             |
| URL Test       | Specifies the name of the URL test.                                                                                                                                                              |

| <b>Context</b>     | clear>filter                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | <p>Clears the counters associated with the IPv6 filter policy.</p> <p>By default, all counters associated with the filter policy entries are reset. The scope of which counters are cleared can be narrowed using the command line parameters.</p>                                                                     |
| <b>Default</b>     | Clears all counters associated with the IPv6 filter policy entries.                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><i>ip-filter-id</i> — The IP filter policy ID.</p> <p><b>Values</b> 1 — 65535</p> <p><i>entry-id</i> — Specifies that only the counters associated with the specified filter policy entry will be cleared.</p> <p><b>Values</b> 1 — 65535</p> <p><b>ingress</b> — Specifies to only clear the ingress counters.</p> |

**egress** — Specifies to only clear the egress counters.

## log

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|

| <b>Syntax</b>      | <b>filter ipv6</b> <i>ipv6-filter-id</i> <b>entry</b> <i>entry-id</i> [ <b>interval</b> <i>seconds</i> ] [ <b>repeat</b> <i>repeat</i> ] [ <b>absolute</b>   <b>rate</b> ]                                                                           |
| <b>Context</b>     | monitor                                                                                                                                                                                                                                              |
| <b>Description</b> | This command monitors the counters associated with the IPv6 filter policy.                                                                                                                                                                           |
| <b>Parameters</b>  | <p><i>ipv6-filter-id</i> — The IP filter policy ID.</p> <p><b>Values</b> 1 — 65535</p> <p><i>entry-id</i> — Specifies that only the counters associated with the specified filter policy entry will be monitored.</p> <p><b>Values</b> 1 — 65535</p> |

**interval** — Configures the interval for each display in seconds.

**Default** 5 seconds

**Values** 3 — 60

**repeat** *repeat* — Configures how many times the command is repeated.

**Default** 10

**Values** 1 — 999

**absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

## filter

**Syntax** **filter mac** *mac-filter-id* **entry** *entry-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

**Context** monitor

**Description** This command monitors the counters associated with the MAC filter policy.

**Parameters** *mac-filter-id* — The MAC filter policy ID.

**Values** 1 — 65535

*entry-id* — Specifies that only the counters associated with the specified filter policy entry will be cleared.

**Values** 1 — 65535

**interval** — Configures the interval for each display in seconds.

**Default** 5 seconds

**Values** 3 — 60

**repeat** *repeat* — Configures how many times the command is repeated.

**Default** 10

**Values** 1 — 999

**absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

---

## In This Chapter

This chapter provides information to configure Cflowd.

Topics in this chapter include:

- [Cflowd Overview on page 522](#)
  - [Operation on page 523](#)
  - [Cflowd Filter Matching on page 527](#)
- [Cflowd Configuration Process Overview on page 528](#)
- [Configuration Notes on page 529](#)

## Cflowd Overview

Cflowd is a tool used to sample IPv4, IPv6 and MPLS traffic data flows through a router. Cflowd enables traffic sampling and analysis by ISPs and network engineers to support capacity planning, trends analysis, and characterization of workloads in a network service provider environment.

Cflowd is also useful for Web host tracking, accounting, network planning and analysis, network monitoring, developing user profiles, data warehousing and mining, as well as security-related investigations. Collected information can be viewed several ways such as in port, AS, or network matrices, and pure flow structures. The amount of data stored depends on the cflowd configurations.

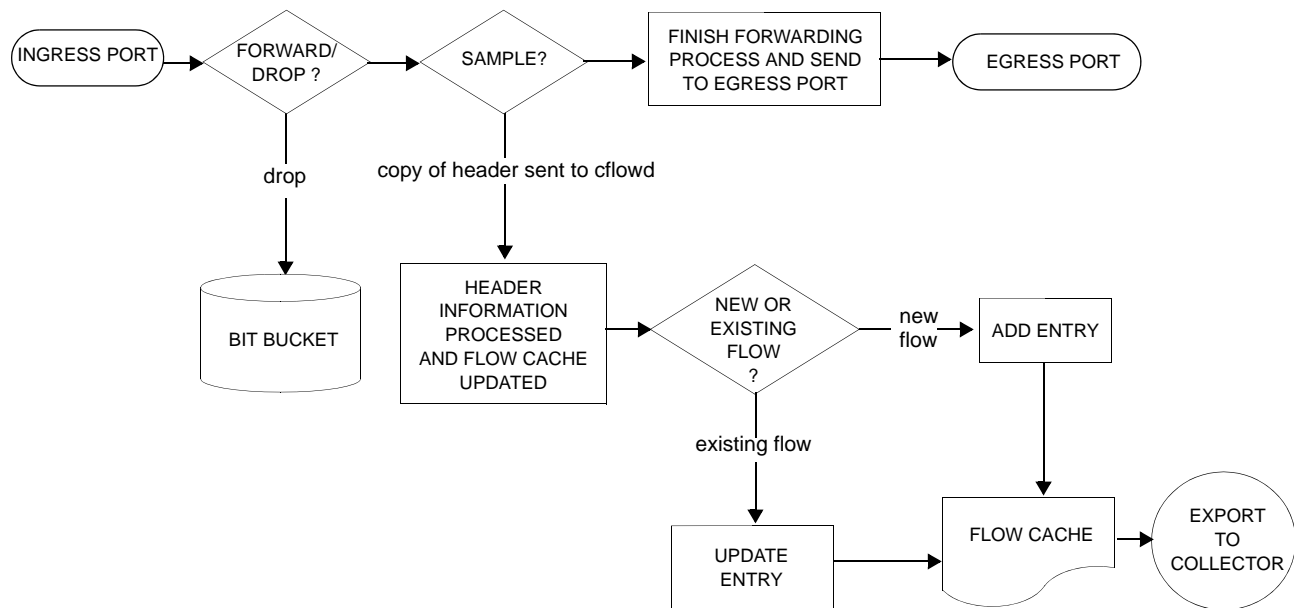

Cflowd maintains a list of data flows through a router. A flow is a uni-directional traffic stream defined by several characteristics such as source and destination IP addresses, source and destination ports, inbound interface, IP protocol and TOS bits.

When a router receives a packet for which it currently does not have a flow entry, a flow structure is initialized to maintain state information regarding that flow, such as the number of bytes exchanged, IP addresses, port numbers, AS numbers, etc. Each subsequent packet matching the same parameters of the flow contribute to the byte and packet count of the flow until the flow is terminated and exported to a collector for storage.

Cflowd is not supported on the 7750 SR-1 chassis.

## Operation

Figure 22 depicts the basic operation of the cflowd feature. This sample flow is only used to describe the basic steps that are performed. It is not intended to specify implementation.

**Figure 22: Basic Cflowd Steps**

1. As a packet ingresses a port, a decision is made to forward or drop the packet.
2. If the packet is forwarded, it is then decided if the packet should be sampled for cflowd.
3. If a new flow is found, a new entry is added to the cache. If the flow already exists in the cache, the flow statistics are updated.
4. If a new flow is detected and the maximum number of entries are already in the flow cache, the earliest expiry entry is removed. The earliest expiry entry/flow is the next flow that will expire due to the active or inactive timer expiration.
5. If a flow has been inactive for a period of time equal to or greater than the inactive timer (default 15 seconds), then the entry is removed from the flow cache.
6. If a flow has been active for a period of time equal to or greater than the active timer (default 30 minutes), then the entry is removed from the flow cache.

When a flow is exported from the cache, the collected data is sent to an external collector which maintains an accumulation of historical data flows that network operators can use to analyze traffic patterns.

Data is exported in one of the following formats:

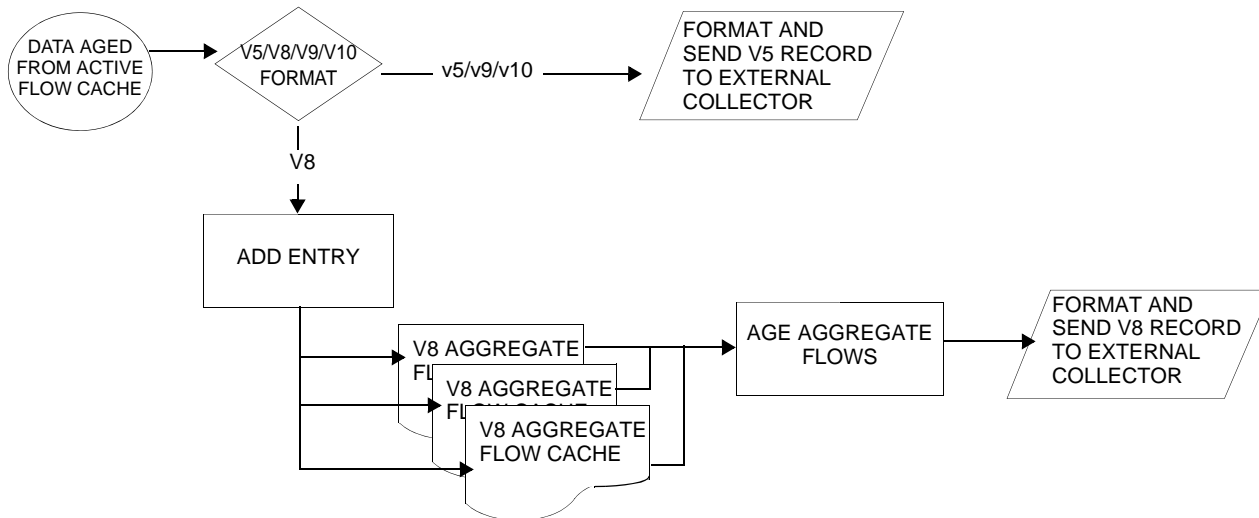

- Version 5 — Generates a fixed export record for each individual flow captured.
- Version 8 — Aggregates multiple individual flows into a fixed aggregate record.
- Version 9 — Generates a variable export record, depending on user configuration and sampled traffic type (IPv4, IPv6, or MPLS), for each individual flow captured.
- Version 10 (IPFIX) — Generates a variable export record, depending on user configuration and sampled traffic type (IPv4, IPv6, or MPLS), for each individual flow captured.

There are several different aggregate flow types including:

- AS matrix
- Destination prefix matrix
- Source prefix matrix
- Prefix matrix
- Protocol/port matrix.

V8 is an aggregated export format. As individual flows are aged out of the raw flow cache, the data is added to the aggregate flow cache for each configured aggregate type. Each of these aggregate flows are also aged in a manner similar to the method the active flow cache entries are aged. When an aggregate flow is aged out, it is sent to the external collector in the V8 record format.

[Figure 23](#) depicts Version 5, Version 8, Version 9, and Version 10 flow processing.

**Figure 23: V5, V8, V9, V10, and Flow Processing**

1. As flows are expired from the active flow cache, the export format must be determined, either Version 5, Version 8, Version 9, and Version 10.
2. If the export format is Version 5 or Version 9 and Version 10, no further processing is performed and the flow data is accumulated to be sent to the external collector.
3. If the export format is Version 8, then the flow entry is added to one or more of the configured aggregation matrices.

As the entries within the aggregate matrices are aged out, they are accumulated to be sent to the external flow collector in Version 8 format.

The sample rate and cache size are configurable values. The cache size default is 64K flow entries.

A flow terminates when one of the following conditions is met:

- When the inactive timeout period expires (default: 15 seconds). A flow is considered terminated when no packets are seen for the flow for N seconds.
- When an active timeout expires (default: 30 seconds). Default active timeout is 30 minutes. A flow terminates according to the time duration regardless of whether or not there are packets coming in for the flow.
- When the user executes a **clear cflowd** command.
- When other measures are met that apply to aggressively age flows as the cache becomes too full (such as *overflow percent*).

## Version 9

The Version 9 format is a more flexible format and allows for different templates or sets of cflowd data to be sent based on the type of traffic being sampled and the template set configured.

Version 9 is interoperable with RFC 3954, *Cisco Systems NetFlow Services Export Version 9*.

---

## Version 10

Version 10 is a new format and protocol that inter-operates with the specifications from the IETF as the IP Flow Information Export (IPFIX) standard. Like Version 9, the version 10 format uses templates to allow for different data elements regarding a flow that is to be exported and to handle different type of data flows such as IPv4, IPv6, and MPLS.

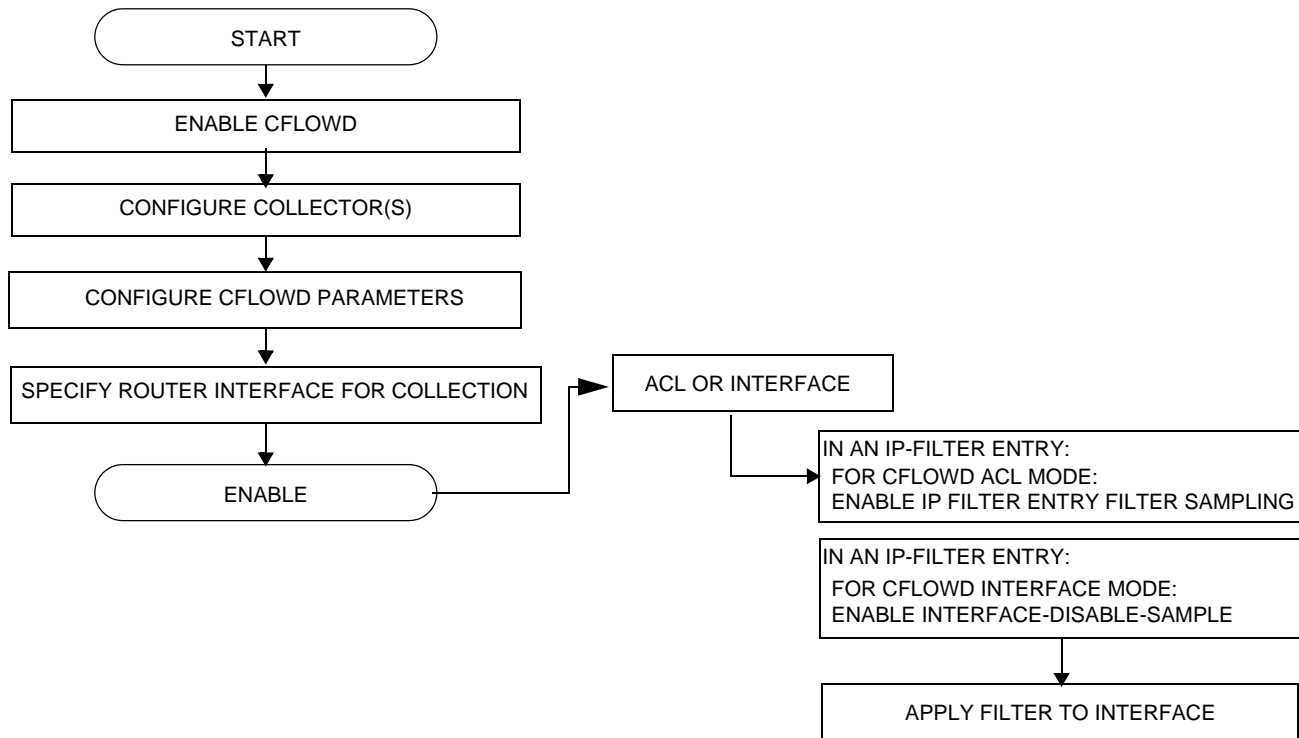

Version 10 is interoperable with RFC 5150 and 5102.

## Cflowd Filter Matching

In the filter-matching process, normally, every packet is matched against filter (access list) criteria to determine acceptability. With cflowd, only the first packet of a flow is checked. If the first packet is forwarded, an entry is added to the cflowd cache. Subsequent packets in the same flow are then forwarded without needing to be matched against the complete set of filters. Specific performance varies depending on the number and complexity of the filters.

## Cflowd Configuration Process Overview

Figure 24 displays the process to configure Cflowd parameters.

**Figure 24: Cflowd Configuration and Implementation Flow**

There are three modes in which cflowd can be enabled to sample traffic on a given interface:

- Cflowd interface, where all traffic entering a given port will be subjected to sampling as the configured sampling rate
- Cflowd interface plus the definition of IP filters which specify an action of interface-disable-sample, in which traffic that matches these filter entries will not be subject to cflowd sampling.
- Cflowd ACL, where IP filters must be created with entries containing the action filter-sampled. In this mode only traffic matching these filter entries will be subject to the cflowd sampling process.

## Configuration Notes

The following cflowd components must be configured for cflowd to be operational:

- Cflowd is enabled globally.
- At least one collector must be configured and enabled.
- A cflowd option must be specified and enabled on a router interface.
- Sampling must be enabled on either:
  - An IP filter which is applied to a port or service.
  - An interface on a port or service.

## Configuring Cflowd with CLI

This section provides information to configure cflowd using the command line interface.

Topics in this section include:

## Cflowd Configuration Overview

The 7750 SR OS implementation of cflowd supports the option to analyze traffic flow. The implementation also supports the use of traffic/access list (ACL) filters to limit the type of traffic that is analyzed.

Cflowd is not supported on the 7750 SR-1 chassis.

---

### Traffic Sampling

Traffic sampling does not examine all packets received by a router. Command parameters allow the rate at which traffic is sampled and sent for flow analysis to be modified. The default sampling rate is every 1000th packet. Excessive sampling over an extended period of time, for example, more than every 1000th packet, can burden router processing resources.

The following data is maintained for each individual flow in the raw flow cache:

- Source IP address
- Destinations IP address
- Source port
- Destination port
- Input interface
- Output interface
- IP protocol
- TCP flags
- First timestamp (of the first packet in the flow)
- Last timestamp (timestamp of last packet in the flow prior to expiry of the flow)
- Source AS number for peer and origin (taken from BGP)
- Destination AS number for peer and origin (taken from BGP)
- IP next hop
- BGP next hop
- ICMP type and code
- IP version
- Source prefix (from routing)
- Destination prefix (from routing)
- MPLS label stack from label 1 to 6

Within the raw flow cache, the following characteristics are used to identify an individual flow:

- Ingress interface
- Source IP address
- Destination IP address
- Source transport port number
- Destination transport port number
- IP protocol type
- IP TOS byte
- Virtual router id
- ICMP type and code
- MPLS labels

The 7750 SR OS implementation allows you to enable cflowd either at the interface level or as an action to a filter. By enabling cflowd at the interface level, all IP packets forwarded by the interface are subject to cflowd analysis. By setting cflowd as an action in a filter, only packets matching the specified filter are subject to cflowd analysis. This provides the network operator greater flexibility in the types of flows that are captured.

---

## Collectors

A collector defines the data flow for exporting sampled data from the cache. A maximum of 5 collectors can be configured. Each collector is identified by a unique IP address and UDP port value. Each collector can only export traffic in one version type, either V5, V8, V9, or V10.

The parameters within a collector configuration can be modified or the defaults retained.

The `autonomous-system-type` command defines whether the autonomous system information to be included in the flow data is based on the originating AS or external peer AS of the flow.

---

## Aggregation

V8 aggregation allows for flow data to be aggregated into larger, less granular flows. Use aggregation commands to specify the type of data to be collected.

The following aggregation schemes are supported:

- AS matrix — Flows are aggregated based on source and destination AS and ingress and egress interface.

- Protocol-port — Flows are aggregated based on the IP protocol, source port number, and destination port number.
- Source prefix — Flows are aggregated based on source prefix and mask, source AS, and ingress interface.
- Destination prefix — Flows are aggregated based on destination prefix and mask, destination AS, and egress interface.
- Source-destination prefix — Flows are aggregated based on source prefix and mask, destination prefix and mask, source and destination AS, ingress interface and egress interface.
- Raw — Flows are not aggregated and are sent to the collector in a V5 record.

## Basic Cflowd Configuration

This section provides information to configure cflowd and configuration examples of common configuration tasks. In order to sample traffic, the minimal cflowd parameters that need to be configured are:

- Cflowd must be enabled.
- At least one collector must be configured and enabled.
- Sampling must be enabled on either:
  - An IP filter entry and applied to a service or an port.
  - An interface applied to a port.

The following example displays a cflowd configuration.

```
A:ALA-1>config>cflowd# info detail

 active-timeout 30
 cache-size 65536inactive-timeout 15
 overflow 1
 rate 1000
 collector 10.10.10.103:2055 version 9
 no aggregation
 autonomous-system-type origin
 description "V9 collector"
 no shutdown
 exit
 template-retransmit 330
 exit
 no shutdown

A:ALA-1>config>cflowd#
```

## Common Configuration Tasks

This section provides a brief overview of the tasks that must be performed to configure cflowd and provides the CLI commands. In order to begin traffic flow sampling, cflowd must be enabled and at least one collector must be configured.

---

### Global Cflowd Components

The components common (global) to all instances of cflowd include the following parameters:

- Active timeout
- Inactive timeout
- Cache size
- Overflow
- Rate
- Template retransmit

## Configuring Cflowd

Use the CLI syntax displayed below to perform the following tasks:

- [Enabling Cflowd on page 538](#)
  - [Configuring Global Cflowd Parameters on page 539](#)
  - [Configuring Cflowd Collectors on page 540](#)
  - [Enabling Cflowd on Interfaces and Filters on page 545](#)
- 

**CLI Syntax:** config>cflowd#  
active-timeout *minutes*  
cache-size *num-entries*  
inactive-timeout *seconds*  
template-retransmit *seconds*  
overflow *percent*  
rate *sample-rate*  
collector *ip-address[:port]* {version [5 | 8 | 9 |10]}

- aggregation
  - as-matrix
  - destination-prefix
  - protocol-port
  - raw
  - source-destination-prefix
  - source-prefix
- template-set {basic | mpls-ip}
- autonomous-system-type [*origin* | *peer*]
- description *description-string*
- no shutdown
- no shutdown

## Enabling Cflowd

Cflowd is disabled by default. Executing the command `configure cflowd` will enable cflowd, by default cflowd is not shutdown but must be configured including at least one collector to be active.

Use the following CLI syntax to enable cflowd:

**CLI Syntax:** `config# cflowd`  
`no shutdown`

The following example displays the default values when cflowd is initially enabled. No collectors or collector options are configured.

```
A:ALA-1>config# info detail
...
#-----
echo "Cflowd Configuration"
#-----
 cflowd
 active-timeout 30
 cache-size 65536
 inactive-timeout 15
 overflow 1
 rate 1000
 template-retransmit 600
 no shutdown
 exit
#-----
A:ALA-1>config#
```

## Configuring Global Cflowd Parameters

The following cflowd parameters apply to all instances where cflowd (traffic sampling) is enabled.

Use the following CLI commands to configure cflowd parameters:

**CLI Syntax:** config>cflowd#  
active-timeout *minutes*  
cache-size *num-entries*  
inactive-timeout *seconds*  
overflow *percent*  
rate *sample-rate*  
template-retransmit *seconds*  
no shutdown

The following example displays a common cflowd component configuration:

```
A:ALA-1>config>cflowd# info
#-----
 active-timeout 20
 inactive-timeout 10
 overflow 10
 rate 100
#-----
A:ALA-1>config>cflowd#
```

## Configuring Cflowd Collectors

To configure cflowd collector parameters, enter the following commands:

```
CLI Syntax: config>cflowd#
 collector ip-address[:port] [version version]
 aggregation
 as-matrix
 destination-prefix
 protocol-port
 raw
 source-destination-prefix
 source-prefix
 autonomous-system-type [origin | peer]
 description description-string
 no shutdown
 template-set {basic | mpls-ip}
```

The following example displays a basic cflowd configuration:

```
A:ALA-1>config>cflowd# info

active-timeout 20
 inactive-timeout 10
 overflow 10
 rate 100
 collector 10.10.10.1:2000 version 8
 aggregation
 as-matrix
 raw
 exit
 description "AS info collector"
 exit
 collector 10.10.10.2:5000 version 8
 aggregation
 protocol-port
 source-destination-prefix
 exit
 autonomous-system-type peer
 description "Neighbor collector"
 exit

A:ALA-1>config>cflowd#
```

Version 9 Collector example:

```
collector 10.10.10.9:2000 version 9
 description "v9collector"
 template-set mpls-ip
 no shutdown
```

```
exit
```

### Version 9 and Verison 10 Templates

If the collector is configured to use either version 9 or 10 formats, the flow data is sent to the designated collector using one of the pre-defined templates. The template used is based on the type of flow for which the data was collected (IPv4, IPv6, or MPLS), and the configuration of the template-set parameter. The following table indicates the relationship between these values and the corresponding template used to export the flow data.

**Table 13: Template-Set**

| Traffic type | Basic      | MPLS-IP   |
|--------------|------------|-----------|
| IPv4         | Basic IPv4 | MPLS-IPv4 |
| IPv6         | Basic IPv6 | MPLS-IPv6 |
| MPLS         | Basic MPLS | MPLS-IP   |

#### Basic IPv4 Template:

```
0 IPv4 Src Addr (8)
0 IPv4 Dest Addr (12)
0 IPv4 Nexthop (15)
0 BGP Nexthop (18)
0 Ingress Interface (10)
0 Egress Interface (14)
0 Packet Count (2)
0 Byte Count (1)
0 Start Time (22)
0 End Time (21)
0 Flow Start Milliseconds (152)
0 Flow End Milliseconds (153)
0 Src Port (7)
0 Dest Port (11)
0 TCP control Bits (Flags) (6)
0 IPv4 Protocol (4)
0 IPv4 TOS (5)
0 IP version (60)
0 ICMP Type & Code (32)
0 BGP Source ASN (16)
0 BGP Dest ASN (17)
0 Source IPv4 Prefix Length (9)
0 Dest IPv4 Prefix Length (13)
```

#### MPLS-IPv4 Template:

```
0 IPv4 Src Addr (8)
```

## Common Configuration Tasks

```
0 IPv4 Dest Addr (12)
0 IPv4 Nexthop (15)
0 BGP Nexthop (18)
0 Ingress Interface (10)
0 Egress Interface (14)
0 Packet Count (2)
0 Byte Count (1)
0 Start Time (22)
0 End Time (21)
0 Flow Start Milliseconds (152)
0 Flow End Milliseconds (153)
0 Src Port (7)
0 Dest Port (11)
0 TCP control Bits (Flags) (6)
0 IPv4 Protocol (4)
0 IPv4 TOS (5)
0 IP version (60)
0 ICMP Type & Code (32)
0 BGP Source ASN (16)
0 BGP Dest ASN (17)
0 Source IPv4 Prefix Length (9)
0 Dest IPv4 Prefix Length (13)
0 MPLS Label 1 (70)
0 MPLS Label 2 (71)
0 MPLS Label 3 (72)
0 MPLS Label 4 (73)
0 MPLS Label 5 (74)
0 MPLS Label 6 (75)
```

### Basic-IPv6 Template:

```
0 IPv6 Src Addr (27)
0 IPv6 Dest Addr (28)
0 IPv6 Nexthop (62)
0 IPv6 BGP Nexthop (63)
0 IPv4 Nexthop (15)
0 IPv4 BGP Nexthop (18)
0 Ingress Interface (10)
0 Egress Interface (14)
0 Packet Count (2)
0 Byte Count (1)
0 Start Time (22)
0 End Time (21)
0 Flow Start Milliseconds (152)
0 Flow End Milliseconds (153)
0 Src Port (7)
0 Dest Port (11)
0 TCP control Bits (Flags) (6)
0 Protocol (4)
0 IPv6 Options Hdr (64)
0 IPv6 Next Header (193)
0 IPv6 Flow Label (31)
0 TOS (5)
0 IP version (60)
0 IPv6 ICMP Type & Code (139)
0 BGP Source ASN (16)
0 BGP Dest ASN (17)
```

```
0 IPv6 Src Mask (29)
0 IPv6 Dest Mask (30)
```

### MPLS-IPv6 Template:

```
0 IPv6 Src Addr (27)
0 IPv6 Dest Addr (28)
0 IPv6 Nexthop (62)
0 IPv6 BGP Nexthop (63)
0 IPv4 Nexthop (15)
0 IPv4 BGP Nexthop (18)
0 Ingress Interface (10)
0 Egress Interface (14)
0 Packet Count (2)
0 Byte Count (1)
0 Start Time (22)
0 End Time (21)
0 Flow Start Milliseconds (152)
0 Flow End Milliseconds (153)
0 Src Port (7)
0 Dest Port (11)
0 TCP control Bits (Flags) (6)
0 Protocol (4)
0 IPv6 Option Hdr (64)
0 IPv6 Next Header (193)
0 IPv6 Flow Label (31)
0 TOS (5)
0 IP version (60)
0 IPv6 ICMP Type & Code (139)
0 BGP Source ASN (16)
0 BGP Dest ASN (17)
0 IPv6 Src Mask (29)
0 IPv6 Dest Mask (30)
0 MPLS Label 1 (70)
0 MPLS Label 2 (71)
0 MPLS Label 3 (72)
0 MPLS Label 4 (73)
0 MPLS Label 5 (74)
0 MPLS Label 6 (75)
```

### Basic MPLS:

```
0 Start Time (22)
0 End Time (21)
0 Flow Start Milliseconds (152)
0 Flow End Milliseconds (153)
0 Ingress Interface (10)
0 Egress Interface (14)
0 Packet Count (2)
0 Byte Count (1)
0 MPLS Label 1 (70)
0 MPLS Label 2 (71)
0 MPLS Label 3 (72)
0 MPLS Label 4 (73)
0 MPLS Label 5 (74)
0 MPLS Label 6 (75)
```

### **MPLS-IP flows:**

```
0 IPv4 Src Addr (8)
0 IPv4 Dest Addr (12)
0 IPv4 Nexthop (15)
0 IPv6 Src Addr (27)
0 IPv6 Dest Addr (28)
0 IPv6 Nexthop (62)
0 Ingress Interface (10)
0 Egress Interface (14)
0 Packet Count (2)
0 Byte Count (1)
0 Start Time (22)
0 End Time (21)
0 Flow Start Milliseconds (152)
0 Flow End Milliseconds (153)
0 Src Port (7)
0 Dest Port (11)
0 TCP control Bits (Flags) (6)
0 IPv4 Protocol (4)
0 IPv4 TOS (5)
0 IP version (60)
0 ICMP Type & Code (32)
0 MPLS Label 1 (70)
0 MPLS Label 2 (71)
0 MPLS Label 3 (72)
0 MPLS Label 4 (73)
0 MPLS Label 5 (74)
0 MPLS Label 6 (75)
```

## Enabling Cflowd on Interfaces and Filters

This section discusses the following cflowd configuration management tasks:

- [Dependencies on page 549](#)
- [Specifying Cflowd Options on an IP Interface on page 546](#)
  - [Interface Configurations on page 546](#)
  - [Service Interfaces on page 547](#)
- [Specifying Sampling Options in Filter Entries on page 548](#)
  - [Interface Configurations on page 546](#)

## Specifying Cflowd Options on an IP Interface

When cflowd is enabled on an interface, all packets forwarded by the interface are subject to analysis according to the global cflowd configuration and sorted according to the collector configuration(s).

Refer to [Table 14, Cflowd Configuration Dependencies, on page 550](#) for configuration combinations.

When the cflowd interface option is configured in the **config>router>interface** context, the following requirements must be met to enable traffic sampling on the specific interface:

1. Cflowd must be enabled.
2. At least one cflowd collector must be configured and enabled.
3. The **interface>cflowd interface** option must be selected. For configuration information, refer to the Filter Policy Overview section of the 7750 SR OS Router Configuration Guide.
4. To omit certain types of traffic from being sampled when the interface sampling is enabled, the **config>filter>ip-filter>entry>interface-disable-sample** option may be enabled via an ip-filter or ipv6-filter. The filter must be applied to the service or network interface on which the traffic to be omitted is to ingress the system.

---

## Interface Configurations

**CLI Syntax:**

```
config>router>if#
 cflowd {acl|interface}
 no cflowd
```

Depending on the option selected, either `acl` or `interface`, cflowd extracts traffic flow samples from an IP filter or an interface for analysis. All packets forwarded by the interface are analyzed according to the cflowd configuration.

The `acl` option must be selected in order to enable traffic sampling on an IP filter. Cflowd (`filter-sample`) must be enabled in at least one IP filter entry.

The `interface` option must be selected in order to enable traffic sampling on an interface. If cflowd is not enabled (`no cflowd`) then traffic sampling will not occur on the interface.

## Service Interfaces

**CLI Syntax:** `config>service>vpls service-id# interface ip-int-name  
cflowd {acl|interface}`

When enabled on a service interface, cflowd collects routed traffic flow samples through a router for analysis. Cflowd is supported on IES and VPRN services interfaces only. Layer 2 traffic is excluded. All packets forwarded by the interface are analyzed according to the cflowd configuration. On the interface level, cflowd can be associated with a filter (ACL) or an IP interface.

## Specifying Sampling Options in Filter Entries

Packets are matched against filter entries to determine acceptability. With cflowd, only the first packet of a flow is compared. If the first packet matches the filter criteria, then an entry is added to the cflowd cache. Subsequent packets in the same flow are also sampled based on the cache entry.

Since a filter can be applied to more than one interface (when configured with a **scope template**), the **interface-disable-sample** option is intended to enable or disable traffic sampling on an interface-by-interface basis. The command can be enabled or disabled as needed instead creating numerous filter versions.

To enable for filter traffic sampling, the following requirements must be met::

1. Cflowd must be enabled globally.
2. At least one cflowd collector must be configured and enabled.
3. On the IP interface being used, the **interface>cflowd acl** option must be selected. (See Interface Configuration) For configuration information, refer to the IP Router Configuration Overview section of the 7750 SR OS Router Configuration Guide.
4. On the IP filter being used, the **entry>filter-sample** option must be explicitly enabled for the entries matching the traffic that should be sampled. The default is **no filter-sample**. (See Filter Configuration for more information).
5. The filter must be applied to a service or a network interface. The service or port must be enabled and operational.

---

## Filter Configurations

**CLI Syntax:** `config>filter>ip-filter>entry#`  
`[no] filter-sample`  
`[no] interface-disable-sample`

When a filter policy is applied to a service or a network interface, sampling can be configured so that traffic matching the associated IP filter entry is sampled when the IP interface is set to cflowd ACL mode and the **filter-sample** command is enabled. If cflowd is either not enabled (**no filter-sample**) or set to the **cflowd interface** mode, then sampling does not occur.

When the **interface-disable-sample** command is enabled, then traffic matching the associated IP filter entry is not sampled if the IP interface is set to cflowd ACL mode.

## Dependencies

In order for cflowd to be operational, the following requirements must be met:

- Cflowd must be enabled on a global level. If cflowd is disabled, any traffic sampling instances are also disabled.
- At least one collector must be configured and enabled in order for traffic sampling to occur on an enabled entity.
- If a specific collector UDP port is not identified then, by default, flows are sent to port 2055.

Cflowd can also be dependent on the following entity configurations:

- [Interface Configurations on page 546](#)
- [Service Interfaces on page 547](#)
- [Filter Configurations on page 548](#)

Depending on the combination of interface and filter entry configurations determine if and when flow sampling occurs. [Table 14](#) displays the expected results when specific features are enabled and disabled.

**Table 14: Cflowd Configuration Dependencies**

| <b>Interface Setting</b>                                | <b>router&gt;interface<br/>cflowd [acl   interface]<br/>Setting</b> | <b>Command<br/>ip-filter entry</b> | <b>Expected Results</b>                                                                      |
|---------------------------------------------------------|---------------------------------------------------------------------|------------------------------------|----------------------------------------------------------------------------------------------|
| IP-filter mode                                          | ACL                                                                 | filter-sampled                     | Traffic matching is sampled at specified rate.                                               |
| IP-filter mode                                          | ACL                                                                 | no filter-sampled                  | No traffic is sampled on this interface.                                                     |
| IP-filter mode or<br>cflowd not enabled on<br>interface | ACL                                                                 | interface-<br>disable-sample       | Command is ignored. No sampling occurs.                                                      |
| Interface mode                                          | interface                                                           | interface-<br>disable-sample       | Traffic matching this IP filter entry is not sampled.                                        |
| Interface mode                                          | interface                                                           | none                               | All IP traffic ingressing the interface is subject to sampling.                              |
| Interface mode                                          | interface                                                           | filter sampled                     | Filter level action is ignored. All traffic ingressing the interface is subject to sampling. |

## Cflowd Configuration Management Tasks

This section discusses the following cflowd configuration management tasks:

- [Modifying Global Cflowd Components on page 551](#)
- [Modifying Cflowd Collector Parameters on page 552](#)

### Modifying Global Cflowd Components

Cflowd parameter modifications apply to all instances where cflowd or traffic sampling is enabled. Changes are applied immediately. Use the following cflowd commands to modify global cflowd parameters:

**CLI Syntax:**

```
config>cflowd#
 active-timeout minutes
 no active-timeout
 cache-size num-entries
 no cache-size
 inactive-timeout seconds
 no inactive-timeout
 overflow percent
 no overflow
 rate sample-rate
 no rate
 [no] shutdown
 template-retransmit seconds
 no template-retransmit
```

The following example displays the cflowd command usage to modify configuration parameters:

**Example:**

```
config>cflowd# active-timeout 60
config>cflowd# no inactive-timeout
config>cflowd# overflow 2
config>cflowd# rate 10
```

The following example displays the common cflowd component configuration:

```
A:ALA-1>config>cflowd# info
#-----
 active-timeout 60
 overflow 2
 rate 10
#-----
A:ALA-1>config>cflowd#
```

## Modifying Cflowd Collector Parameters

Use the following commands to modify cflowd collector and aggregation parameters:

```

CLI Syntax: config>cflowd#
 collector ip-address[:port] [version version]
 no collector ip-address[:port]
 [no] aggregation
 [no] as-matrix
 [no] destination-prefix
 [no] protocol-port
 [no] raw
 [no] source-destination-prefix
 [no] source-prefix
 [no] autonomous-system-type [origin | peer]
 [no] description description-string
 [no] shutdown
 template-set {basic | mpls-ip}

```

If a specific collector UDP port is not identified then, by default, flows are sent to port 2055.

The following displays basic cflowd modifications:

```

A:ALA-1>config>cflowd# info

 active-timeout 60
 overflow 2
 rate 10
 collector 10.10.10.1:2000 version 5
 description "AS info collector"
 exit
 collector 10.10.10.2:5000 version 8
 aggregation
 source-prefix
 raw
 exit
 description "Test collector"
 exit

A:ALA-1>config>cflowd#

```

---

## Command Hierarchies

### Configuration Commands

```

config
 — [no] cflowd
 — active-timeout minutes
 — no active-timeout
 — cache-size num-entries
 — no cache-size
 — collector ip-address[:port] [version {[5 | 8 | 9 |10]}]
 — no collector ip-address[:port]
 — [no] aggregation
 — [no] as-matrix
 — [no] destination-prefix
 — [no] protocol-port
 — [no] raw
 — [no] source-destination-prefix
 — [no] source-prefix
 — autonomous-system-type {origin | peer}
 — no autonomous-system-type
 — description description-string
 — no description
 — [no] shutdown
 — template-set {basic | mpls-ip}
 — inactive-timeout seconds
 — no inactive-timeout
 — overflow percent
 — no overflow
 — rate sample-rate
 — no rate
 — [no] shutdown
 — template-retransmit seconds
 — no template-retransmit

```

### Show Commands

```

show
 — cflowd
 — collector [ip-address[:port]] [detail]
 — interface [ip-int-name | ip-address]
 — status

```

### Clear Commands

```

clear
 — cflowd

```

---

## Cflowd Configuration Commands

---

### Global Commands

#### cflowd

|                    |                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] cflowd</b>                                                                                                                                                                                                                                  |
| <b>Context</b>     | <b>config&gt;cflowd</b>                                                                                                                                                                                                                             |
| <b>Description</b> | This command creates the context to configure cflowd.<br>The <b>no</b> form of this command removes all configuration under cflowd including the deletion of all configured collectors. This can only be executed if cflowd is in a shutdown state. |
| <b>Default</b>     | no cflowd                                                                                                                                                                                                                                           |

#### active-timeout

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>active-timeout</b> <i>minutes</i><br><b>no active-timeout</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Context</b>     | config>cflowd                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b> | This command configures the maximum amount of time before an active flow is aged out of the active cache. If an individual flow is active for this amount of time, the flow is aged out and a new flow will be created on the next packet sampled for that flow.<br><b>Note:</b> Existing flows do not inherit the new active-timeout value if this parameter is changed while cflowd is active. The active-timeout value for a flow is set when the flow is first created in the active cache table and does not change dynamically.<br>The <b>no</b> form of this command resets the inactive timeout back to the default value. |
| <b>Default</b>     | <b>30</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <i>minutes</i> — The value expressed in minutes before an active flow is exported.<br><b>Values</b> 1 — 600                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## cache-size

|                    |                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>cache-size</b> <i>num-entries</i><br><b>no cache-size</b>                                                                                                                                     |
| <b>Context</b>     | config>cflowd                                                                                                                                                                                    |
| <b>Description</b> | This command specifies the maximum number of active flows to maintain in the flow cache table. The <b>no</b> form of this command resets the number of active entries back to the default value. |
| <b>Default</b>     | <b>65536</b> (64K)                                                                                                                                                                               |
| <b>Parameters</b>  | <i>num-entries</i> — The number of entries maintained in the cflowd cache.<br><b>Values</b> 1000 — 250000 (SF/CPM3 and 7750 SR-c12/4)<br>1000 - 128k (all other platforms)                       |

## collector

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b> | This command defines a flow data collector for cflowd data. The IP address of the flow collector must be specified. The UDP port number is an optional parameter. If it is not set, the default of 2055 is used for all collector versions. To connect to a IPFIX (version 10) collector using the IPFIX default port, specify port 4739 when configuring the collector. The version must be specified. A maximum of 5 collectors can be configured.<br><br>The <b>no</b> form of this command removes the flow collector definition from the config and stops the export of data to the collector. The collector needs to be shutdown to be deleted. |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <i>ip-addr</i> — The IP address of the flow data collector in dotted decimal notation.<br><i>:port</i> — The UDP port of flow data collector.<br><b>Values</b> 1— 65535<br><b>Default</b> 2055<br><i>version</i> — The version of the flow data collector.<br><b>Values</b> 5, 8, 9, 10<br><b>Default</b> 5                                                                                                                                                                                                                                                                                                                                           |

## aggregation

- Syntax** `[no] aggregation`
- Context** `config>cflowd>collector`
- Description** This command configures the type of aggregation scheme to be exported. Specifies the type of data to be aggregated and to the collector. To configure aggregation, you must decide which type of aggregation scheme to configure: autonomous system, destination prefix, protocol port, raw, source destination, or source prefix. This can only be configured if the collector version is configured as V8. The **no** form of this command removes all aggregation types from the collector configuration.
- Default** `no aggregation`

## as-matrix

- Syntax** `[no] as-matrix`
- Context** `config>cflowd>collector>aggregation`
- Description** This command specifies that the aggregation data should be based on autonomous system (AS) information. An AS matrix contains packet and byte counters for traffic from either source-destination autonomous systems or last-peer to next-peer autonomous systems. The **no** form of this command removes this type of aggregation from the collector configuration.
- Default** `no as-matrix`

## destination-prefix

- Syntax** `[no] destination-prefix`
- Context** `config>cflowd>collector>aggregation`
- Description** This command specifies that the aggregation data is based on destination prefix information. The **no** form removes this type of aggregation from the collector configuration.
- Default** `none`

## protocol-port

- Syntax** `[no] protocol-port`
- Context** `config>cflowd>collector>aggregation`
- Description** This command specifies that flows be aggregated based on the IP protocol, source port number, and destination port number.

## Cflowd Configuration Commands

The **no** form of this command removes this type of aggregation from the collector configuration.

**Default** none

### raw

**Syntax** **[no] raw**

**Context** config>cflowd>collector>aggregation

**Description** This command configures raw (unaggregated) flow data to be sent in Version 5.  
The **no** form of this command removes this type of aggregation from the collector configuration.

**Default** none

### source-destination-prefix

**Syntax** **[no] source-destination-prefix**

**Context** config>cflowd>collector>aggregation

**Description** This command configures cflowd aggregation based on source and destination prefixes.  
The **no** form of this command removes this type of aggregation from the collector configuration.

**Default** none

### source-prefix

**Syntax** **[no] source-prefix**

**Context** config>cflowd>collector>aggregation

**Description** This command configures cflowd aggregation based on source prefix information.  
The **no** form of this command removes this type of aggregation from the collector configuration.

**Default** none

## autonomous-system-type

| <b>Description</b> | This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.<br><br>The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.<br><br>The <b>no</b> form of this command administratively enables an entity. |

Unlike other commands and parameters where the default state is not indicated in the configuration file. The **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

### template-set

|                    |                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>template-set</b> { <b>basic</b>   <b>mpls-ip</b> }                                                                         |
| <b>Context</b>     | config>cflowd>collector                                                                                                       |
| <b>Description</b> | This command specifies the set of templates sent to the collector when using cflowd Version 9 or Version 10.                  |
| <b>Default</b>     | <b>basic</b>                                                                                                                  |
| <b>Parameters</b>  | <b>basic</b> — Basic flow data is sent.<br><b>mpls-ip</b> — Extended flow data is sent that includes IP and MPLS information. |

### inactive-timeout

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>inactive-timeout</b> <i>seconds</i><br><b>no inactive-timeout</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Context</b>     | config>cflowd                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b> | This command specifies the amount of time, in seconds, that must elapse without a packet matching a flow in order for the flow to be considered inactive.<br><br>The <b>no</b> form of this command resets the inactive timeout back to the default of 15 seconds.<br><br><b>Note:</b> Existing flows will not inherit the new inactive-timeout value if this parameter is changed while cflowd is active. The inactive-timeout value for a flow is set when the flow is first created in the active cache table and does not change dynamically. |
| <b>Default</b>     | <b>15</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <i>seconds</i> — Specifies the amount of time, in seconds, that must elapse without a packet matching a flow in order for the flow to be considered inactive.<br><br><b>Values</b> 10 — 600                                                                                                                                                                                                                                                                                                                                                       |

|                    |                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>collector</b> [ <i>ip-addr[:port]</i> ] [ <b>detail</b> ]                                                                                                                                                                                                                                                                                                                               |
| <b>Context</b>     | show>cflowd                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command displays administrative and operational status of data collector configuration.                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <p><i>ip-addr</i> — Display only information about the specified collector IP address.</p> <p><b>Default</b> all collectors</p> <p><i>:port</i> — Display only information the collector on the specified UDP port.</p> <p><b>Default</b> all UDP ports</p> <p><b>Values</b> 1 — 65535</p> <p><b>detail</b> — Displays details about either all collectors or the specified collector.</p> |
| <b>Output</b>      | <b>cflowd Collector Output</b> — The following table describes the show cflowd collector output fields:                                                                                                                                                                                                                                                                                    |

**Table 15: Show Cflowd Collector Output Fields**

| Label        | Description                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Address | The IP address of a remote Cflowd collector host to receive the exported Cflowd data.                                                                                                                                                |
| Port         | The UDP port number on the remote Cflowd collector host to receive the exported Cflowd data.                                                                                                                                         |
| AS Type      | The style of AS reporting used in the exported flow data.<br><br><i>origin</i> — Reflects the endpoints of the AS path which the flow is following.<br><br><i>peer</i> — Reflects the AS of the previous and next hops for the flow. |
| Version      | Specifies the configured version for the associated collector.                                                                                                                                                                       |
| Admin        | The desired administrative state for this Cflowd remote collector host.                                                                                                                                                              |
| Oper         | The current operational status of this Cflowd remote collector host.                                                                                                                                                                 |
| Recs Sent    | The number of Cflowd records that have been transmitted to this remote collector host.                                                                                                                                               |
| Collectors   | The total number of collectors using this IP address.                                                                                                                                                                                |

**Sample Output**

```
A:R51-CfmA# show cflowd collector

**Table 16: Show Cflowd Collector Detailed Output Fields**

| Label         | Description                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address       | The IP address of a remote Cflowd collector host to receive the exported Cflowd data.                                                                                                                                  |
| Port          | The UDP port number on the remote Cflowd collector host to receive the exported Cflowd data.                                                                                                                           |
| Description   | A user-provided descriptive string for this Cflowd remote collector host.                                                                                                                                              |
| Version       | The version of the flow data sent to the collector.                                                                                                                                                                    |
| AS Type       | The style of AS reporting used in the exported flow data.<br><br>origin – Reflects the endpoints of the AS path which the flow is following.<br><br>peer – Reflects the AS of the previous and next hops for the flow. |
| Admin State   | The desired administrative state for this Cflowd remote collector host.                                                                                                                                                |
| Oper State    | The current operational status of this Cflowd remote collector host.                                                                                                                                                   |
| Records Sent  | The number of Cflowd records that have been transmitted to this remote collector host.                                                                                                                                 |
| Last Changed  | The time when this row entry was last changed.                                                                                                                                                                         |
| Last Pkt Sent | The time when the last Cflowd packet was sent to this remote collector host.                                                                                                                                           |

**Table 16: Show Cflowd Collector Detailed Output Fields (Continued)**

| Label            | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aggregation Type | The bit mask which specifies the aggregation scheme(s) used to aggregate multiple individual flows into an aggregated flow for export to this remote host collector.<br><br>none – No data will be exported for this remote collector host.<br><br>raw – Flow data is exported without aggregation in version 5 format.<br><br>All other aggregation types use version 8 format to export the flow data to this remote host collector. |
| Collectors       | The total number of collectors using this IP address.                                                                                                                                                                                                                                                                                                                                                                                  |

## interface

**Syntax** `interface [ip-addr | ip-int-name]`

**Context** show>cflowd

**Description** Displays the administrative and operational status of the interfaces with cflowd enabled.

**Parameters** *ip-addr* — Display only information for the IP interface with the specified IP address.

**Default** all interfaces with cflowd enabled.

*ip-int-name* — Display only information for the IP interface with the specified name.

**Default** all interfaces with cflowd enabled.

**Output** **cflowd Interface Output** — The following table describes the show cflowd interface output fields.

| Label      | Description                                         |
|------------|-----------------------------------------------------|
| Interface  | Displays the physical port identifier.              |
| IP Address | Displays the IP address.                            |
| Mode       | Displays the mode.                                  |
| Admin      | Displays the administrative state of the interface. |
| Oper       | Displays the operational state of the interface.    |

| <b>Output</b>      | <b>cflowd Status Output</b> — The following table describes the show cflowd status output fields:      |

**Table 17: Show Cflowd Status Output Fields**

| Label               | Description                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cflowd Admin Status | The desired administrative state for this Cflowd remote collector host.                                                                                                                  |
| Cflowd Oper Status  | The current operational status of this Cflowd remote collector host.                                                                                                                     |
| Active Timeout      | The maximum amount of time, in minutes, before an active flow will be exported. If an individual flow is active for this amount of time, the flow is exported and a new flow is created. |
| Inactive Timeout    | Inactive timeout in seconds.                                                                                                                                                             |
| Template Retransmit | The time in seconds before template definitions are sent.                                                                                                                                |
| Cache Size          | The maximum number of active flows to be maintained in the flow cache table.                                                                                                             |
| Overflow            | The percentage number of flows to be flushed when the flow cache size has been exceeded.                                                                                                 |
| Sample Rate         | The rate at which traffic is sampled and forwarded for Cflowd analysis.<br>one (1) — All packets are analyzed.<br>1000 (default) — Every 1000th packet is analyzed.                      |
| Active Flows        | The current number of active flows being collected.                                                                                                                                      |

**Table 17: Show Cflowd Status Output Fields (Continued)**

| Label              | Description                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| Total Pkts Rcvd    | The rate at which traffic is sampled and forwarded for Cflowd analysis.                                                  |
| Total Pkts Dropped | The total number of packets dropped.                                                                                     |
| Aggregation Info:  |                                                                                                                          |
| Type               | The type of data to be aggregated and to the collector.                                                                  |
| Status             | enabled – Specifies that the aggregation type is enabled.<br>disabled – Specifies that the aggregation type is disabled. |

**Sample Output**

### cflowd

|                    |                                                                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <code>cflowd</code>                                                                                                                                                                                                                                                                                                             |
| <b>Context</b>     | clear                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | Clears the raw and aggregation flow caches which are sending flow data to the configured collectors. This action will trigger all the flows to be discarded. The cache restarts flow data collection from a fresh state. This command also clears global stats collector stats listed in the <code>cflowd show</code> commands. |

# Common CLI Command Descriptions

---

## In This Chapter

This section provides information about common Command Line Interface (CLI) syntax and command usage.

Topics in this chapter include:

- [SAP syntax on page 572](#)

## Common Service Commands

### sap

**Syntax** [no] **sap** *sap-id*

**Description** This command specifies the physical port identifier portion of the SAP definition.

**Parameters** *sap-id* — Specifies the physical port identifier portion of the SAP definition.

The *sap-id* can be configured in one of the following formats:

| Type        | Syntax                                                                     | Example                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port-id     | <i>slot/mda/port[.channel]</i>                                             | 1/1/5                                                                                                                                                                                                          |

|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

*bundle-id* — Specifies the multilink bundle to be associated with this IP interface. The **bundle** keyword must be entered at the beginning of the parameter.

The command syntax must be configured as follows:

*bundle-id:* **bundle-type-slot-id/mda-slot.bundle-num**

*bundle-id* value range: 1 — 336

For example:

```
*A:ALA-12>config# port bundle-ppp-5/1.1
*A:ALA-12>config>port# multilink-bundle
```

*bggrp-id* — Specifies the bundle protection group ID to be associated with this IP interface. The **bggrp** keyword must be entered at the beginning of the parameter.

The command syntax must be configured as follows:

```
bggrp-id: bggrp-type-bggrp-num
type: ima
bggrp-num value range: 1 — 2000
```

For example:

```
*A:ALA-12>config# port bggrp-ima-1
*A:ALA-12>config>service>vpls$ sap bggrp-ima-1
```

*qtag1, qtag2* — Specifies the encapsulation value used to identify the SAP on the port or sub-port. If this parameter is not specifically defined, the default value is 0.

```
Values qtag1: * | 0 — 4094
 qtag2 : * | 0 — 4094
```

The values depends on the encapsulation type configured for the interface. The following table describes the allowed values for the port and encapsulation types.

| Port Type        | Encap-Type  | Allowed Values                                                 | Comments                                                                                                                                    |
|------------------|-------------|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet         | Null        | 0                                                              | The SAP is identified by the port.                                                                                                          |
| Ethernet         | Dot1q       | 0 — 4094                                                       | The SAP is identified by the 802.1Q tag on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port.             |
| Ethernet         | QinQ        | qtag1: 0 — 4094<br>qtag2: 0 — 4094                             | The SAP is identified by two 802.1Q tags on the port. Note that a 0 qtag1 value also accepts untagged packets on the Dot1q port.            |
| SONET/SDH        | IPCP        | -                                                              | The SAP is identified by the channel. No BCP is deployed and all traffic is IP.                                                             |
| SONET/SDH<br>TDM | BCP-Null    | 0                                                              | The SAP is identified with a single service on the channel. Tags are assumed to be part of the customer packet and not a service delimiter. |
| SONET/SDH<br>TDM | BCP-Dot1q   | 0 — 4094                                                       | The SAP is identified by the 802.1Q tag on the channel.                                                                                     |
| SONET/SDH<br>TDM | Frame Relay | 16 — 991                                                       | The SAP is identified by the data link connection identifier (DLCI).                                                                        |
| SONET/SDH<br>ATM | ATM         | vpi (NNI) 0 — 4095<br>vpi (UNI) 0 — 255<br>vci 1, 2, 5 — 65535 | The SAP is identified by port or by PVPC or PVCC identifier (vpi, vpi/vci, or vpi range)                                                    |

**sap ipsec-*id*.private|public:*tag*** — This parameter associates an IPsec group SAP with this interface. This is the public side for an IPsec tunnel. Tunnels referencing this IPsec group in the private side may be created if their local IP is in the subnet of the interface subnet and the routing context specified matches with the one of the interface.

This context will provide a SAP to the tunnel. The operator may associate an ingress and egress QoS policies as well as filters and virtual scheduling contexts. Internally this creates an Ethernet SAP that will be used to send and receive encrypted traffic to and from the MDA. Multiple tunnels can be associated with this SAP. The “tag” will be a dot1q value. The operator may see it as an identifier. The range is limited to 1 — 4095.

# Standards and Protocol Support

## Protocol Support

### OSPF

RFC 1765 OSPF Database Overflow  
RFC 2328 OSPF Version 2  
RFC 2370 Opaque LSA Support  
RFC 2740 OSPF for IPv6 (OSPFv3)  
draft-ietf-ospf-ospfv3-update-14.txt  
RFC 3101 OSPF NSSA Option  
RFC 3137 OSPF Stub Router Advertisement

RFC 3623 Graceful OSPF Restart – GR helper  
RFC 3630 Traffic Engineering (TE) Extensions to OSPF Version 2  
RFC 4203 - Shared Risk Link Group (SRLG) sub-TLV  
RFC 5185 OSPF Multi-Area Adjacency  
RFC 3623 Graceful OSPF Restart — GR helper  
RFC 3630 Traffic Engineering (TE) Extensions to OSPF Version 2  
RFC 4203 for Shared Risk Link Group (SRLG) sub-TLV

### BGP

RFC 1397 BGP Default Route Advertisement  
RFC 1772 Application of BGP in the Internet  
RFC 1965 Confederations for BGP  
RFC 1997 BGP Communities Attribute  
RFC 2385 Protection of BGP Sessions via MD5  
RFC 2439 BGP Route Flap Dampening  
RFC 2547bis BGP/MPLS VPNs  
RFC 2918 Route Refresh Capability for BGP-4  
RFC 3107 Carrying Label Information in BGP-4  
RFC 3392 Capabilities Advertisement with BGP4  
RFC 4271 BGP-4 (previously RFC 1771)  
RFC 4360 BGP Extended Communities Attribute  
RFC 4364 BGP/MPLS IP Virtual Private Networks (VPNs) (previously RFC 2547bis BGP/MPLS VPNs)  
RFC 4456 BGP Route Reflection: Alternative to Full-mesh IBGP (previously RFC 1966 & 2796)  
RFC 4486 Subcodes for BGP Cease Notification Message  
RFC 4577 OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)

RFC 4659 BGP/MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN  
RFC 4684 Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)  
RFC 4724 Graceful Restart Mechanism for BGP – GR helper  
RFC 4760 Multi-protocol Extensions for BGP  
RFC 4798 Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)  
RFC 4893 BGP Support for Four-octet AS Number Space  
RFC 5004 Avoid BGP Best Path Transitions from One External to Another  
RFC 5065 Confederations for BGP (obsoletes 3065)  
RFC 5291 Outbound Route Filtering Capability for BGP-4  
RFC 5575 Dissemination of Flow Specification Rules  
RFC 5668 4-Octet AS Specific BGP Extended Community  
draft-ietf-idr-add-paths  
draft-ietf-idr-best-external

### IS-IS

RFC 1142 OSI IS-IS Intra-domain Routing Protocol (ISO 10589)  
RFC 1195 Use of OSI IS-IS for routing in TCP/IP & dual environments  
RFC 2763 Dynamic Hostname Exchange for IS-IS  
RFC 2966 Domain-wide Prefix Distribution with Two-Level IS-IS  
RFC 2973 IS-IS Mesh Groups  
RFC 3373 Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies

## Standards and Protocols

RFC 3567 Intermediate System to Intermediate System (ISIS) Cryptographic Authentication  
RFC 3719 Recommendations for Interoperable Networks using IS-IS  
RFC 3784 Intermediate System to Intermediate System (IS-IS) Extensions for Traffic Engineering (TE)  
RFC 3787 Recommendations for Interoperable IP Networks  
RFC 3847 Restart Signaling for IS-IS – GR helper  
RFC 4205 for Shared Risk Link Group (SRLG) TLV  
draft-ietf-isis-igp-p2p-over-lan-05.txt

### IPSec

RFC 2401 Security Architecture for the Internet Protocol  
RFC 2409 The Internet Key Exchange (IKE)  
RFC 3706 IKE Dead Peer Detection  
RFC 3947 Negotiation of NAT-Traversal in the IKE  
RFC 3948 UDP Encapsulation of IPsec ESP Packets  
draft-ietf-ipsec-isakmp-xauth-06.txt – Extended Authentication within ISAKMP/Oakley (XAUTH)  
draft-ietf-ipsec-isakmp-modecfg-05.txt – The ISAKMP Configuration Method

### IPv6

RFC 1981 Path MTU Discovery for IPv6  
RFC 2375 IPv6 Multicast Address Assignments  
RFC 2460 Internet Protocol, Version 6 (IPv6) Specification  
RFC 2461 Neighbor Discovery for IPv6  
RFC 2462 IPv6 Stateless Address Auto configuration  
RFC 2463 Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 Specification  
RFC 2464 Transmission of IPv6 Packets over Ethernet Networks  
RFC 2529 Transmission of IPv6 over IPv4 Domains without Explicit Tunnels

RFC 2545 Use of BGP-4 Multiprotocol Extension for IPv6 Inter-Domain Routing  
RFC 2710 Multicast Listener Discovery (MLD) for IPv6  
RFC 2740 OSPF for IPv6  
RFC 3306 Unicast-Prefix-based IPv6 Multicast Addresses  
RFC 3315 Dynamic Host Configuration Protocol for IPv6  
RFC 3587 IPv6 Global Unicast Address Format  
RFC3590 Source Address Selection for the Multicast Listener Discovery (MLD) Protocol  
RFC 3810 Multicast Listener Discovery Version 2 (MLDv2) for IPv6  
RFC 4007 IPv6 Scoped Address Architecture  
RFC 4193 Unique Local IPv6 Unicast Addresses  
RFC 4291 IPv6 Addressing Architecture  
RFC 4552 Authentication/Confidentiality for OSPFv3  
RFC 4659 BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN  
RFC 5072 IP Version 6 over PPP  
RFC 5095 Deprecation of Type 0 Routing Headers in IPv6  
draft-ietf-isis-ipv6-05  
draft-ietf-isis-wg-multi-topology-xx.txt

### Multicast

RFC 1112 Host Extensions for IP Multicasting (Snooping)  
RFC 2236 Internet Group Management Protocol, (Snooping)  
RFC 3376 Internet Group Management Protocol, Version 3 (Snooping)  
RFC 2362 Protocol Independent Multicast-Sparse Mode (PIMSM)  
RFC 3618 Multicast Source Discovery Protocol (MSDP)  
RFC 3446 Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)  
RFC 4601 Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)

RFC 4604 Using IGMPv3 and MLDv2 for Source-Specific Multicast  
RFC 4607 Source-Specific Multicast for IP  
RFC 4608 Source-Specific Protocol Independent Multicast in 232/8  
RFC 4610 Anycast-RP Using Protocol Independent Multicast (PIM)  
RFC 5186, Internet Group Management Protocol Version 3 (IGMPv3)/ Multicast Listener Discovery Version 2 (MLDv2) and Multicast Routing Protocol Interaction  
draft-ietf-pim-sm-bsr-06.txt  
draft-rosen-vpn-mcast-15.txt Multicast in MPLS/BGP IP VPNs  
draft-ietf-mboned-msdp-mib-01.txt  
draft-ietf-l3vpn-2547bis-mcast-07: Multicast in MPLS/BGP IP VPNs  
draft-ietf-l3vpn-2547bis-mcast-bgp-05: BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs  
RFC 3956: Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address

### MPLS — General

RFC 2430 A Provider Architecture DiffServ & TE  
RFC 2474 Definition of the DS Field the IPv4 and IPv6 Headers (Rev)  
RFC 2597 Assured Forwarding PHB Group (rev3260)  
RFC 2598 An Expedited Forwarding PHB  
RFC 3031 MPLS Architecture  
RFC 3032 MPLS Label Stack Encoding  
RFC 3443 Time To Live (TTL) Processing in Multi-Protocol Label Switching (MPLS) Networks  
RFC 4182 Removing a Restriction on the use of MPLS Explicit NULL  
RFC 3140 Per-Hop Behavior Identification Codes  
RFC 4905, Encapsulation methods for transport of layer 2 frames over MPLS  
RFC 5332 MPLS Multicast Encapsulations

### MPLS — LDP

RFC 3037 LDP Applicability

RFC 3478 Graceful Restart Mechanism for LDP – GR helper  
 RFC 5036 LDP Specification  
 RFC 5283 LDP extension for Inter-Area LSP  
 RFC 5443 LDP IGP Synchronization  
 draft-ietf-mpls-ldp-p2mp-05 LDP Extensions for Point-to-Multipoint and Multipoint-to-Multipoint LSP  
 draft-ietf-mpls-mldp-in-band-signaling-05 Multipoint LDP in-band signaling for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths

### MPLS/RSVP-TE

RFC 2702 Requirements for Traffic Engineering over MPLS  
 RFC2747 RSVP Cryptographic Authentication  
 RFC3097 RSVP Cryptographic Authentication  
 RFC 3209 Extensions to RSVP for Tunnels  
 RFC 3564 Requirements for Diff-Serv-aware TE  
 RFC 3906 Calculating Interior Gateway Protocol (IGP) Routes Over Traffic Engineering Tunnels  
 RFC 4090 Fast reroute Extensions to RSVP-TE for LSP Tunnels  
 RFC 4124 Protocol Extensions for Support of Diffserv-aware MPLS Traffic Engineering  
 RFC 4125 Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering  
 RFC 4127 Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering  
 RFC 4561 Definition of a RRO Node-Id Sub-Object  
 RFC 4875 Extensions to Resource Reservation Protocol - Traffic Engineering (RSVP-TE) for Point-to-Multipoint TE Label Switched Paths (LSPs)  
 RFC 5151 Inter-domain MPLS and GMPLS Traffic Engineering – RSVP-TE Extensions  
 RFC 5712 MPLS Traffic Engineering Soft Preemption

draft-newton-mpls-te-dynamic-overbooking-00 A Diffserv-TE Implementation Model to dynamically change booking factors during failure events  
 RFC 5817 Graceful Shutdown in GMPLS Traffic Engineering Networks

### MPLS — OAM

RFC 4379 Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures  
 draft-ietf-mpls-p2mp-lsp-ping-06 Detecting Data Plane Failures in Point-to-Multipoint Multiprotocol Label Switching (MPLS) - Extensions to LSP Ping

### RIP

RFC 1058 RIP Version 1  
 RFC 2082 RIP-2 MD5 Authentication  
 RFC 2453 RIP Version 2

### TCP/IP

RFC 768 UDP  
 RFC 1350 The TFTP Protocol (Rev.  
 RFC 791 IP  
 RFC 792 ICMP  
 RFC 793 TCP  
 RFC 826 ARP  
 RFC 854 Telnet  
 RFC 951 BootP (rev)  
 RFC 1519 CIDR  
 RFC 1542 Clarifications and Extensions for the Bootstrap Protocol  
 RFC 1812 Requirements for IPv4 Routers  
 RFC 2347 TFTP option Extension  
 RFC 2328 TFTP Blocksize Option  
 RFC 2349 TFTP Timeout Interval and Transfer Size option  
 RFC 2401 Security Architecture for Internet Protocol  
 RFC 2428 FTP Extensions for IPv6 and NATs  
 RFC 3596 DNS Extensions to Support IP version 6  
 draft-ietf-bfd-mib-00.txtBidirectional Forwarding Detection Management Information Base  
 RFC 5880 Bidirectional Forwarding Detection

RFC 5881 BFD IPv4 and IPv6 (Single Hop)  
 RFC 5883 BFD for Multihop Paths

### VRRP

RFC 2787 Definitions of Managed Objects for the Virtual Router Redundancy Protocol  
 RFC 3768 Virtual Router Redundancy Protocol  
 RFC 5798, Virtual Router Redundancy Protocol Version 3 for IPv4 and IPv6

### PPP

RFC 1332 PPP IPCP  
 RFC 1377 PPP OSINLCP  
 RFC 1638/2878PPP BCP  
 RFC 1661 PPP (rev RFC2151)  
 RFC 1662 PPP in HDLC-like Framing  
 RFC 1877 PPP Internet Protocol Control Protocol Extensions for Name Server Addresses  
 RFC 1989 PPP Link Quality Monitoring  
 RFC 1990 The PPP Multilink Protocol (MP)  
 RFC 1994 PPP Challenge Handshake Authentication Protocol (CHAP)  
 RFC 2615 PPP over SONET/SDH  
 RFC 2516 A Method for Transmitting PPP Over Ethernet  
 RFC 2686 The Multi-Class Extension to Multi-Link PPP

### Frame Relay

FRF.1.2 - PVC User-to-Network Interface (UNI) Implementation Agreement  
 FRF.5 - Frame Relay/ATM PVC Network Interworking Implementation  
 ANSI T1.617 Annex D, DSS1 — Signalling Specification For Frame Relay Bearer Service.  
 FRF2.2 -PVC Network-to- Network Interface (NNI) Implementation Agreement.  
 FRF.12 Frame Relay Fragmentation Implementation Agreement  
 FRF.16.1 Multilink Frame Relay UNI/ NNI Implementation Agreement  
 ITU-T Q.933 Annex A- Additional procedures for Permanent Virtual Connection (PVC) status management

## Standards and Protocols

### ATM

- RFC 1626 Default IP MTU for use over ATM AAL5
- RFC 2514 Definitions of Textual Conventions and OBJECT\_IDENTITIES for ATM Management
- RFC 2515 Definition of Managed Objects for ATM Management RFC 2684 Multiprotocol Encapsulation over ATM Adaptation Layer 5
- AF-TM-0121.000 Traffic Management Specification Version 4.1
- ITU-T Recommendation I.610 - B-ISDN Operation and Maintenance Principles and Functions version 11/95
- ITU-T Recommendation I.432.1 – BISDN user-network interface – Physical layer specification: General characteristics
- GR-1248-CORE - Generic Requirements for Operations of ATM Network Elements (NEs). Issue 3
- GR-1113-CORE - Bellcore, Asynchronous Transfer Mode (ATM) and ATM Adaptation Layer (AAL) Protocols Generic Requirements, Issue 1
- AF-ILMI-0065.000 Integrated Local Management Interface (ILMI) Version 4.0
- AF-TM-0150.00 Addendum to Traffic Management v4.1 optional minimum desired cell rate indication for UBR
- AF-PHY-0086.001, Inverse Multiplexing for ATM (IMA) Specification Version 1.1

### DHCP

- RFC 2131 Dynamic Host Configuration Protocol (REV)
- RFC 3046 DHCP Relay Agent Information Option (Option 82)
- RFC 1534 Interoperation between DHCP and BOOTP

### VPLS

- RFC 4762 Virtual Private LAN Services Using LDP
- RFC5501: Requirements for Multicast Support in Virtual Private LAN

- Services (previously draft-ietf-l2vpn-vpls-mcast-reqts-04)
- draft-ietf-l2vpn-vpls-mcast-reqts-04
- draft-ietf-l2vpn-signaling-08

### PSEUDOWIRE

- RFC 3985 Pseudo Wire Emulation Edge-to-Edge (PWE3)
- RFC 4385 Pseudo Wire Emulation Edge-to-Edge (PWE3) Control Word for Use over an MPLS PSN
- RFC 3916 Requirements for Pseudo-Wire Emulation Edge-to-Edge (PWE3)
- RFC 4717 Encapsulation Methods for Transport ATM over MPLS Networks (draft-ietf-pwe3-atm-encap-10.txt)
- RFC 4816 PWE3 ATM Transparent Cell Transport Service (draft-ietf-pwe3-cell-transport-04.txt)
- RFC 4448 Encapsulation Methods for Transport of Ethernet over MPLS Networks (draft-ietf-pwe3-ethernet-encap-11.txt)
- RFC 4619 Encapsulation Methods for Transport of Frame Relay over MPLS Networks (draft-ietf-pwe3-frame-relay-07.txt)
- RFC 4446 IANA Allocations for PWE3
- RFC 4447 Pseudowire Setup and Maintenance Using LDP (draft-ietf-pwe3-control-protocol-17.txt)
- RFC 5085, Pseudowire Virtual Circuit Connectivity Verification (VCCV): A Control Channel for Pseudowires
- RFC 5659 An Architecture for Multi-Segment Pseudowire Emulation Edge-to-Edge
- draft-ietf-l2vpn-vpws-iw-oam-02.txt, OAM Procedures for VPWS Interworking
- RFC6310, Pseudowire (PW) OAM Message Mapping
- draft-ietf-l2vpn-arp-mediation-19.txt, ARP Mediation for IP Interworking of Layer 2 VPN
- RFC6073, Segmented Pseudowire (draft-ietf-pwe3-segmented-pw-18.txt)
- draft-ietf-pwe3-dynamic-ms-pw-14.txt, Dynamic Placement of Multi Segment Pseudo Wires

- draft-ietf-pwe3-redundancy-bit-06.txt, Pseudowire Preferential Forwarding Status bit definition
- draft-ietf-pwe3-redundancy-06.txt, Pseudowire (PW) Redundancy
- RFC6391 Flow Aware Transport of Pseudowires over an MPLS PSN
- MFA Forum 9.0.0 The Use of Virtual trunks for ATM/MPLS Control Plane Interworking
- MFA Forum 12.0.0 Multiservice Interworking - Ethernet over MPLS
- MFA forum 13.0.0 - Fault Management for Multiservice Interworking v1.0
- MFA Forum 16.0.0 – Multiservice Interworking - IP over MPLS

### ANCP/L2CP

- RFC5851 ANCP framework
- draft-ietf-ancp-protocol-02.txt ANCP Protocol

### Voice /Video Performance

- ITU-T G.107 The E Model- A computational model for use in planning.
- ETSI TS 101 329-5 Annex E extensions- QoS Measurement for VoIP - Method for determining an Equipment Impairment Factor using Passive Monitoring
- ITU-T Rec. P.564 - Conformance testing for voice over IP transmission quality assessment models
- ITU-T G.1020 - Appendix I - Performance Parameter Definitions for Quality of Speech and other Voiceband Applications Utilizing IP Networks- Mean Absolute Packet Delay Variation.& Markov Models.
- RFC 3550 Appendix A.8- RTP: A Transport Protocol for Real-Time Applications- Estimating the Interarrival Jitter

### CIRCUIT EMULATION

- RFC 4553 Structure-Agnostic Time Division Multiplexing (TDM) over Packet (SAToP)
- RFC 5086 Structure-Aware Time Division Multiplexed (TDM) Circuit Emulation Service over Packet Switched Network (CESoPSN)

MEF-8 Implementation Agreement for the Emulation of PDH Circuits over Metro Ethernet Networks, October 2004

RFC 5287 Control Protocol Extensions for the Setup of Time-Division Multiplexing (TDM) Pseudowires in MPLS Networks

### SONET/SDH

ITU-G.841 Telecommunication Standardization Section of ITU, Types and Characteristics of SDH Networks Protection Architecture, issued in October 1998 and as augmented by Corrigendum1 issued in July 2002

### RADIUS

RFC 2865 Remote Authentication Dial In User Service

RFC 2866 RADIUS Accounting

### SSH

RFC 4250 The Secure Shell (SSH) Protocol

draft-ietf-secsh-architecture.txt SSH Protocol Architecture

draft-ietf-secsh-userauth.txt SSH Authentication Protocol

draft-ietf-secsh-transport.txt SSH Transport Layer Protocol

draft-ietf-secsh-connection.txt SSH Connection Protocol

draft-ietf-secsh-newmodes.txt SSH Transport Layer Encryption Modes

### TACACS+

draft-grant-tacacs-02.txt

### Timing

GR-253-CORE SONET Transport Systems: Common Generic Criteria. Issue 3, September 2000

ITU-T G.781 Telecommunication Standardization Section of ITU, Synchronization layer functions, issued 09/2008

ITU-T G.813 Telecommunication Standardization Section of ITU, Timing characteristics of SDH equipment slave clocks (SEC), issued 03/2003.

GR-1244-CORE Clocks for the Synchronized Network: Common Generic Criteria, Issue 3, May 2005

ITU-T G.8261 Telecommunication Standardization Section of ITU, Timing and synchronization aspects in packet networks, issued 04/2008.

ITU-T G.8262 Telecommunication Standardization Section of ITU, Timing characteristics of synchronous Ethernet equipment slave clock (EEC), issued 08/2007.

ITU-T G.8264 Telecommunication Standardization Section of ITU, Distribution of timing information through packet networks, issued 10/2008.

### NETWORK MANAGEMENT

ITU-T X.721: Information technology-OSI-Structure of Management Information

ITU-T X.734: Information technology-OSI-Systems Management: Event Report Management Function

M.3100/3120 Equipment and Connection Models

TMF 509/613 Network Connectivity Model

RFC 1157 SNMPv1

RFC 1215 A Convention for Defining Traps for use with the SNMP

RFC 1657 BGP4-MIB

RFC 1724 RIPv2-MIB

RFC 1850 OSPF-MIB

RFC 1907 SNMPv2-MIB

RFC 2011 IP-MIB

RFC 2012 TCP-MIB

RFC 2013 UDP-MIB

RFC 2138 RADIUS

RFC 2206 RSVP-MIB

RFC 2452 IPv6 Management Information Base for the Transmission Control Protocol

RFC 2454 IPv6 Management Information Base for the User Datagram Protocol

RFC 2465 Management Information Base for IPv6: Textual Conventions and General Group

RFC 2558 SONET-MIB

RFC 2571 SNMP-Framework MIB

## C

### Cflowd

- overview 522
  - collectors 522
  - filter matching 527
  - operation 523
  - V5 and V8 flow processing 524
- configuring
  - basic 535
  - collectors 533, 540
  - enabling 538
  - global parameters 539
  - interfaces and filters 545
  - IP interfaces 546
  - overview 532
  - sampling options 548
  - management tasks 551
  - command reference 553

## F

### Filters

- overview 368
- applying filter
  - to network ports 388
  - to SAP 388
- entities 370
- entries 369
- filter entry ordering 386
- filter types
  - IP 368, 380
  - IPv6 368
  - MAC 368, 381, 389
- matching criteria
  - DSCP values 383
  - IP 380
  - IP option values 385
  - MAC 381
  - packets 380
- policies 369
- policy entries 369
- port-based filtering 368
- redirect policies 371

- scope 389
- services 370

### configuring

- basic 394
- IP filter policy 395, 400
- MAC filter policy 402
- redirect policy 413
- management tasks 417

## I

### IP Router

- overview 20
  - autonomous systems 37
  - confederations 38
  - interfaces 20
    - network 20
    - system 22
  - IP addresses
    - address range 24
  - Router ID 36
- configuring
  - autonomous systems 88
  - basic 61
  - command reference 93
  - confederations 87
  - interfaces 63
  - IP address range 82
  - network interface 60
  - overview 60
  - router ID 86
  - service management tasks 90
  - system interface 60
  - system name 62

## V

### VRRP

- overview 262
  - components 263
    - IP address owner 263
    - IP addresses 264
    - owner and non-owner 265
    - virtual router 263
