

---

## Configuration Commands

---

### Generic Commands

#### shutdown

<b>Syntax</b>	<b>[no] shutdown</b>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>The <b>shutdown</b> command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the <b>no shutdown</b> command.</p> <p>The <b>shutdown</b> command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.</p> <p>Unlike other commands and parameters where the default state is not indicated in the configuration file, <b>shutdown</b> and <b>no shutdown</b> are always indicated in system generated configuration files.</p> <p>The <b>no</b> form of the command puts an entity into the administratively enabled state.</p>
<b>Default</b>	no shutdown

#### description

<b>Syntax</b>	<b>description</b> <i>description-string</i> <b>no description</b>
<b>Context</b>	config>router>if config>router>if>dhcp config>router>if>vrrp config>router>l2tp>group config>router>l2tp>group>tunnel
<b>Description</b>	<p>This command creates a text description stored in the configuration file for a configuration context.</p> <p>The <b>no</b> form of the command removes the description string from the context.</p>
<b>Default</b>	No description is associated with the configuration context.
<b>Parameters</b>	<i>description-string</i> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

---

## Router Global Commands

### router

<b>Syntax</b>	<b>router</b> <i>router-name</i>
<b>Context</b>	config
<b>Description</b>	This command enables the context to configure router parameters, and interfaces, route policies, and protocols.
<b>Parameters</b>	<i>router-name</i> — Specify the router-name. <b>Values</b> router-name: Base, management <b>Default</b> Base

### aggregate

<b>Syntax</b>	<b>aggregate</b> <i>ip-prefix/ip-prefix-length</i> [ <b>summary-only</b> ] [ <b>as-set</b> ] [ <b>aggregator</b> <i>as-number: ip-address</i> ] [ <b>community</b> <i>comm-id</i> ] [ <b>black-hole</b>   <b>indirect</b> <i>ip-address</i> ] <b>no aggregate</b> <i>ip-prefix/ip-prefix-length</i>
<b>Context</b>	config>router
<b>Description</b>	<p>This command creates an aggregate route.</p> <p>Use this command to automatically install an aggregate in the routing table when there are one or more component routes. A component route is any route used for forwarding that is a more-specific match of the aggregate.</p> <p>The use of aggregate routes can reduce the number of routes that need to be advertised to neighbor routers, leading to smaller routing table sizes.</p> <p>Overlapping aggregate routes may be configured; in this case a route becomes a component of only the one aggregate route with the longest prefix match. For example if one aggregate is configured as 10.0.0.0/16 and another as 10.0.0.0/24, then route 10.0.128/17 would be aggregated into 10.0.0.0/16, and route 10.0.0.128/25 would be aggregated into 10.0.0.0/24. If multiple entries are made with the same prefix and the same mask the previous entry is overwritten.</p> <p>A standard 4-byte BGP community may be associated with an aggregate route in order to facilitate route policy matching.</p> <p>By default aggregate routes are not installed in the forwarding table, however there are configuration options that allow an aggregate route to be installed with a black-hole next hop or with an indirect IP address as next hop.</p> <p>The <b>no</b> form of the command removes the aggregate.</p>
<b>Default</b>	No aggregate routes are defined.

**Parameters** *ip-prefix* — The destination address of the aggregate route in dotted decimal notation.

<b>Values</b>	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 — 32
	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 — FFFF]H
		d: [0 — 255]D
	ipv6-prefix-length	0 — 128

The mask associated with the network address expressed as a mask length.

**Values** 0 — 32

**summary-only** — This optional parameter suppresses advertisement of more specific component routes for the aggregate.

To remove the **summary-only** option, enter the same aggregate command without the **summary-only** parameter.

**as-set** — This optional parameter is only applicable to BGP and creates an aggregate where the path advertised for this route will be an AS\_SET consisting of all elements contained in all paths that are being summarized. Use this feature carefully as it can increase the amount of route churn due to best path changes.

**aggregator as-number:ip-address** — This optional parameter specifies the BGP aggregator path attribute to the aggregate route. When configuring the aggregator, a two-octet AS number used to form the aggregate route must be entered, followed by the IP address of the BGP system that created the aggregate route.

**community comm-id** — This configuration option associates a BGP community with the aggregate route. The community can be matched in route policies and is automatically added to BGP routes exported from the aggregate route.

<b>Values</b>	comm-id	asn:comm-val   well-known-comm
	asn	0 — 65535
	comm-val	0 — 65535
	well-known-comm	no-advertise, no-export, no-export-subconfed

**black-hole** — This optional parameter installs the aggregate route, when activated, in the FIB with a black-hole next-hop; where packets matching this route are discarded.

**indirect ip-address** — This configuration option specifies that the aggregate route should be installed in the FIB with a next-hop taken from the route used to forward packets to ip-address.

<b>Values</b>	ipv4-prefix	a.b.c.d
	ipv6-prefix	x:x:x:x:x:x:x
		x:x:x:x:x:d.d.d.d
		x: [0 — FFFF]H
		d: [0 — 255]D

## autonomous-system

**Syntax** **autonomous-system** *autonomous-system*  
**no autonomous-system**

<b>Context</b>	config>router
<b>Description</b>	<p>This command configures the autonomous system (AS) number for the router. A router can only belong to one AS. An AS number is a globally unique number with an AS. This number is used to exchange exterior routing information with neighboring ASs and as an identifier of the AS itself.</p> <p>If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted either by administratively disabling/enabling (<b>shutdown/no shutdown</b>) the BGP instance or rebooting the system with the new configuration.</p>
<b>Default</b>	No autonomous system number is defined.
<b>Parameters</b>	<i>autonomous-system</i> — The autonomous system number expressed as a decimal integer.
<b>Values</b>	1 — 4294967295

## confederation

<b>Syntax</b>	<b>confederation</b> <i>confed-as-num</i> <b>members</b> <i>as-number</i> [ <i>as-number...up to 15 max</i> ] <b>no confederation</b> [ <i>confed-as-num members as-number...up to 15 max</i> ]
<b>Context</b>	config>router
<b>Description</b>	<p>This command creates confederation autonomous systems within an AS.</p> <p>This technique is used to reduce the number of IBGP sessions required within an AS. Route reflection is another technique that is commonly deployed to reduce the number of IBGP sessions.</p> <p>The <b>no</b> form of the command deletes the specified member AS from the confederation.</p> <p>When no members are specified in the <b>no</b> statement, the entire list is removed and <b>confederation</b> is disabled.</p> <p>When the last member of the list is removed, <b>confederation</b> is disabled.</p>
<b>Default</b>	no confederation - no confederations are defined.
<b>Parameters</b>	<i>confed-as-num</i> — The confederation AS number expressed as a decimal integer.
<b>Values</b>	1 — 65535
<b>Parameters</b>	<b>members</b> <i>member-as-num</i> — The AS number(s) of members that are part of the confederation, expressed as a decimal integer. Up to 15 members per <i>confed-as-num</i> can be configured.
<b>Values</b>	1 — 65535

## ecmp

<b>Syntax</b>	<b>ecmp</b> <i>max-ecmp-routes</i> <b>no ecmp</b>
<b>Context</b>	config>router

<b>Description</b>	<p>This command enables ECMP and configures the number of routes for path sharing; for example, the value 2 means two equal cost routes will be used for cost sharing.</p> <p>ECMP can only be used for routes learned with the same preference and same protocol. See the discussion on preferences in the <b>static-route</b> command.</p> <p>When more ECMP routes are available at the best preference than configured in <i>max-ecmp-routes</i>, then the lowest next-hop IP address algorithm is used to select the number of routes configured in <i>max-ecmp-routes</i>.</p> <p>The <b>no</b> form of the command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, then the route with the lowest next-hop IP address is used.</p>
<b>Default</b>	no ecmp
<b>Parameters</b>	<p><i>max-ecmp-routes</i> — The maximum number of equal cost routes allowed on this routing table instance, expressed as a decimal integer. Setting ECMP <i>max-ecmp-routes</i> to 1 yields the same result as entering <b>no ecmp</b>.</p> <p><b>Values</b>      0 — 32</p>

## fib-priority

<b>Syntax</b>	<b>fib-priority {high   standard}</b>
<b>Context</b>	config>router
<b>Description</b>	This command specifies the FIB priority for VPRN.

## ignore-icmp-redirect

<b>Syntax</b>	<b>[no] ignore-icmp-redirect</b>
<b>Context</b>	config>router
<b>Description</b>	<p>This command drops ICMP redirects received on the management interface.</p> <p>The no form of the command accepts ICMP redirects received on the management interface.</p>

## ip-fast-reroute

<b>Syntax</b>	<b>[no] ip-fast-reroute</b>
<b>Context</b>	config>router
<b>Description</b>	<p>This command enables IP Fast-Reroute (FRR) feature on the system.</p> <p>This feature provides for the use of a Loop-Free Alternate (LFA) backup next-hop for forwarding in-transit and CPM generated IP packets when the primary next-hop is not available. IP FRR is supported on IPv4 and IPv6 OSPF/IS-IS prefixes forwarded in the base router instance to a network</p>

IP interface or to an IES SAP interface or spoke interface. It is also supported for VPRN VPN-IPv4 OSPF prefixes and VPN-IPv6 OSPF prefixes forwarded to a VPRN SAP interface or spoke interface.

IP FRR also provides a LFA backup next-hop for the destination prefix of a GRE tunnel used in an SDP or in VPRN auto-bind.

When any of the following events occurs, IGP instructs in the fast path on the IOMs to enable the LFA backup next-hop:

- a. OSPF/IS-IS interface goes operationally down: physical or local admin shutdown.
- b. Timeout of a BFD session to a next-hop when BFD is enabled on the OSPF/IS-IS interface

When the SPF computation determines there is more than one primary next-hop for a prefix, it will not program any LFA next-hop in RTM. Thus, the IP prefix will resolve to the multiple equal-cost primary next-hops that provide the required protection.

The **no** form of this command disables the IP FRR feature on the system

**Default** no ip-fast-reroute

## mc-maximum-routes

**Syntax** **mc-maximum-routes** *number* [**log-only**] [**threshold** *threshold*]  
**no mc-maximum-routes**

**Context** config>router

**Description** This command specifies the maximum number of multicast routes that can be held within a VPN routing/forwarding (VRF) context. When this limit is reached, a log and SNMP trap are sent. If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then no new joins will be processed.

The **no** form of the command disables the limit of multicast routes within a VRF context. Issue the **no** form of the command only when the VPRN instance is shutdown.

**Default** no mc-maximum-routes

**Parameters** *number* — Specifies the maximum number of routes to be held in a VRF context.

**Values** 1 — 2147483647

**log-only** — Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

**threshold** *threshold* — The percentage at which a warning log message and SNMP trap should be sent.

**Values** 0 — 100

**Default** 10

## mpls-labels

<b>Syntax</b>	<b>mpls-labels</b>
<b>Context</b>	config>router
<b>Description</b>	This command creates a context for the configuration of global parameters related to MPLS labels.

## static-label

<b>Syntax</b>	<b>static-label max-lsp-labels</b> <i>number</i> <b>static-svc-labels</b> <i>number</i> <b>no static-label</b>
<b>Context</b>	config>router>mpls-labels
<b>Description</b>	This command enables the range of MPLS static label values reserved for LSPs and for VCs (pseudowires) to be configured. For LSPs, these ranges only apply to static MPLS-TP paths configured under config>router>mpls>lsp.
<b>Default</b>	no static-label
<b>Parameters</b>	<p><b>max-lsp-labels</b> <i>number</i> — The number of static label values that are reserved for use by statically configured LSPs. The range is configured as follows: The minimum value of label is always 32. The maximum value in the range is then 32 + <i>number</i>. The allowed values of <i>number</i> are as follows for max-lsp-labels:</p> <p><b>Values</b> 0 — 131071 for chassis mode C (128k)</p> <p><b>Values</b> 0 — 261143 for chassis mode D (256k)</p> <p><b>Default</b> 992</p> <p><b>static-svc-labels</b> <i>number</i> — The number of static label values that are reserved for use by statically configured VCs (pseudowires). The range is configured as follows: The minimum value of static VC label is always [32 + max-lsp-labels + 1]. The maximum VC label value in the range is then [32 + max-lsp-labels + 1 + <i>number</i>]. The allowed values of <i>number</i> are as follows for static-svc-labels:</p> <p><b>Values</b> 0 — 131071 for chassis mode C (128k)</p> <p><b>Values</b> 0 — 261143 for chassis mode D (256k)</p> <p><b>Default</b> 16384</p>

## multicast-info

<b>Syntax</b>	<b>multicast-info-policy</b> <i>policy-name</i> <b>no multicast-info-policy</b>
<b>Context</b>	configure>router
<b>Description</b>	This command configures multicast information policy.

**Parameters** *policy-name* — Specifies the policy name.

**Values** 32 chars max

## network-domains

**Syntax** **network-domains**

**Context** config>router

**Description** This command opens context for defining network-domains. This command is applicable only in the base routing context.

## description

**Syntax** [**no**] **description** *string*

**Context** config>router>network-domains>network-domain

**Description** This command creates a text description stored in the configuration file for a configuration context. The **no** form of the command removes the description string from the context.

**Default** no description

**Parameters** *string* — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special character (#, \$, space, etc.), the entire string must be enclosed within double quotes.

## network-domain

**Syntax** **network-domain** *network-domain-name* [**create**]  
**no network-domain** *network-domain-name*

**Context** config>router>network-domains

**Description** This command creates network-domains that can be associated with individual interfaces and SDPs.

**Default** **network-domain** “default”

**Parameters** *network-domain-name* — Network domain name character string.

## router-id

**Syntax** **router-id** *ip-address*  
**no router-id**

<b>Context</b>	config>router
<b>Description</b>	<p>This command configures the router ID for the router instance.</p> <p>The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID.</p> <p>When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs.</p> <p>To force the new router ID to be used, issue the <b>shutdown</b> and <b>no shutdown</b> commands for each protocol that uses the router ID, or restart the entire router.</p> <p>The <b>no</b> form of the command to reverts to the default value.</p>
<b>Default</b>	<p>The system uses the system interface address (which is also the loopback address).</p> <p>If a system interface address is not configured, use the last 32 bits of the chassis MAC address.</p>
<b>Parameters</b>	<i>router-id</i> — The 32 bit router ID expressed in dotted decimal notation or as a decimal value.

## service-prefix

<b>Syntax</b>	<p><b>service-prefix</b> <i>ip-prefix/mask</i>   <i>ip-prefix netmask</i> [<b>exclusive</b>]</p> <p><b>no service-prefix</b> <i>ip-prefix/mask</i>   <i>ip-prefix netmask</i></p>
<b>Context</b>	config>router
<b>Description</b>	<p>This command creates an IP address range reserved for IES or VPLS services.</p> <p>The purpose of reserving IP addresses using <b>service-prefix</b> is to provide a mechanism to reserve one or more address ranges for services.</p> <p>When services are defined, the address must be in the range specified as a service prefix. If a service prefix is defined, then IP addresses assigned for services must be within one of the ranges defined in the <b>service-prefix</b> command. If the <b>service-prefix</b> command is not configured, then no limitations exist.</p> <p>Addresses in the range of a service prefix can be allocated to a network port unless the exclusive parameter is used. Then, the address range is exclusively reserved for services.</p> <p>When a range that is a superset of a previously defined service prefix is defined, the subset is replaced with the superset definition; for example, if a service prefix exists for 10.10.10.0/24, and a service prefix is configured as 10.10.0.0/16, then 10.10.10.0/24 is replaced by the new 10.10.0.0/16 configuration.</p> <p>When a range that is a subset of a previously defined service prefix is defined, the subset replaces the existing superset, providing addresses used by services are not affected; for example, if a service prefix exists for 10.10.0.0/16, and a service prefix is configured as 10.10.10.0/24, then the 10.10.0.0/16 entry is removed as long as no services are configured that use 10.10.x.x addresses other than 10.10.10.x.</p> <p>The <b>no</b> form of the command removes all address reservations. A service prefix cannot be removed while one or more service uses an address or addresses in the range.</p>
<b>Default</b>	no service-prefix - no IP addresses are reserved for services.

**Parameters** *ip-prefix/mask* — The IP address prefix to include in the service prefix allocation in dotted decimal notation.

**Values**

ipv4-prefix:	a.b.c.d (host bits must be 0)
ipv4-prefix-length:	0 — 32
ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 — FFFF]H
	d: [0 — 255]D
ipv6-prefix-length:	0 — 128

**Values** exclusive

When this option is specified, the addresses configured are exclusively used for services and cannot be assigned to network ports.

## sgt-qos

**Syntax** **sgt-qos**

**Context** config>router

**Description** This command configures DSCP/Dot1p re-marking for self-generated traffic.

## application

**Syntax** **application** *dscp-app-name* **dscp** {*dscp-value* | *dscp-name*}  
**application** *dot1p-app-name* **dot1p** *dot1p-priority*  
**no application** {*dscp-app-name*|*dot1p-app-name*}

**Context** config>router>sgt-qos

**Description** This command configures DSCP/Dot1p re-marking for applications.

**Parameters** *dscp-app-name* — Specifies the DSCP application name.

**Values** bgp, cflowd, dhcp, dns, ftp, icmp, igmp, igmp-reporter, l2tp, ldp, mld, msdp, ndis, ntp, ospf, pim, ptp, radius, rip, rsvp, snmp, snmp-notification, srrp, ssh, syslog, tacplus, telnet, tftp, traceroute, vrrp

*dscp-value* — Specifies the DSCP value

**Values** 0 — 63

*dscp-name* — Specifies the DSCP name.

none, be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

*dot1p-priority* — Specifies the Dot1p priority.

**Values** none, 0 — 7

*dot1p-app-name* — Specifies the Dot1p application name.

**Values** arp, isis, pppoe

## dscp

**Syntax** **dscp** *dscp-name* **fc** *fc-name*  
**no dscp** *dscp-name*

**Context** config>router>sgt-qos

**Description** This command configures DSCP name to FC mapping.

**Parameters** *dscp-name* — Specifies the DSCP name.

**Values** be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

*fc-name* — Specifies the forward class name.

**Values** be, l2, af, l1, h2, ef, h1, nc

## bfd-template

**Syntax** **bfd-template** *name* [**create**]  
**no bfd-template** *name*

**Context** config>router>bfd

**Description** This command creates or edits a BFD template. A BFD template defines the set of configurable parameters used by a BFD session. These include the transmit and receive timers used for BFD CC packets, the transmit timer interval used when the session is providing a CV function, the multiplier value, the echo-receive interval, and whether the BFD session terminates in the CPM network processor.

**Default** no bfd-template

**Parameters** *name* — Specifies a text string name for the template up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

## transmit-interval

**Syntax** **transmit-interval** *transmit-interval*  
**no transmit-interval**

<b>Context</b>	config>router>bfd>bfd-template
<b>Description</b>	This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.
<b>Default</b>	no transmit-interval
<b>Parameters</b>	<i>transmit-interval</i> — Specifies the transmit interval. Note that the minimum interval that can be configured is hardware dependent.
<b>Values</b>	10 ms — 100,000 ms in 1 ms intervals
<b>Default</b>	10 ms for CPM3 or higher; 1 second for other hardware

## receive-interval

<b>Syntax</b>	<b>receive-interval</b> <i>receive-interval</i> <b>no receive-interval</b>
<b>Context</b>	config>router>bfd>bfd-template
<b>Description</b>	This command specifies the receive timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.
<b>Default</b>	no receive-interval
<b>Parameters</b>	<i>receive-interval</i> — Specifies the receive interval. Note that the minimum interval that can be configured is hardware dependent.
<b>Values</b>	10 ms — 100,000 ms in 1 ms intervals
<b>Default</b>	10 ms for CPM3 or higher; 1 second for other hardware

## cv-tx

<b>Syntax</b>	<b>cv-tx</b> <i>transmit-interval</i> <b>no cv-tx</b>
<b>Context</b>	config>router>bfd>bfd-template
<b>Description</b>	This command specifies the transmit interval used by BFD packets used for MPLS-TP proactive CV.
<b>Default</b>	no cv-tx
<b>Parameters</b>	<i>transmit-interval</i> — Specifies the transmit interval. This parameter is only used if a BFD session is enabled with CV on an MPLS-TP LSP.
<b>Values</b>	1 sec to 30 sec in 1 second increments
<b>Default</b>	1 second

## echo-receive

<b>Syntax</b>	<b>echo-receive</b> <i>echo-interval</i> <b>no echo-receive</b>
<b>Context</b>	config>router>bfd>bfd-template
<b>Description</b>	This command sets the minimum echo receive interval, in milliseconds, for a session. This is not used by a BFD session for MPLS-TP.
<b>Default</b>	no echo-receive
<b>Parameters</b>	<i>echo-interval</i> — Specifies the echo receive interval.
	<b>Values</b> 100 ms — 100,000 ms in 1 ms increments
	<b>Default</b> 100

## multiplier

<b>Syntax</b>	<b>multiplier</b> <i>multiplier</i> <b>no multiplier</b>
<b>Context</b>	config>router>bfd>bfd-template
<b>Description</b>	This command specifies the detect multiplier used for a BFD session. If a BFD control packet is not received for a period of <i>multiplier x receive-interval</i> , then the session is declared down.
<b>Default</b>	3
<b>Parameters</b>	<i>multiplier</i> — Specifies the multiplier.
	<b>Values</b> 3 — 20, integers
	<b>Default</b> 3

## type

<b>Syntax</b>	<b>[no] type cpm-np</b>
<b>Context</b>	config>router>bfd>bfd-template
<b>Description</b>	This command selects the CPM network processor as the local termination point for the BFD session. This is enabled by default.
<b>Default</b>	type cpm-np

## triggered-policy

<b>Syntax</b>	<b>triggered-policy</b> <b>no triggered-policy</b>
---------------	---

**Context** config>router

**Description** This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It would be more effective to control changes on a peer-by-peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft inbound* option must be used; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up, and the change made to a route policy is applied only to that peer or group of peers.

## single-sfm-overload

**Syntax** **single-sfm-overload** [**holdoff-time** *holdoff-time*]  
**no single-sfm-overload**

**Context** config>router

**Description** This command, if enabled, will cause the OSPF for the service to enter an overload state when the node only has a single SFM functioning.

The **no** form of this command causes the overload state to be cleared.

**Default** no single-sfm-overload

**Parameters** *holdoff-time* — This parameter specifies the delay between the detection of a single SFM and enacting the overload state.

**Values** 1— 600 seconds

**Default** 0 seconds

## static-route

**Syntax** **[no] static-route** {*ip-prefix/prefix-length* | *ip-prefix netmask*} [**preference** *preference*]  
**[metric** *metric*] [**tag** *tag*] [**community** *comm-id*] [**enable** | **disable**] **next-hop** *ip-int-name* |  
*ip-address* [*mcast-family*] [**bfd-enable** | {**cpe-check** *cpe-ip-address* [**interval** *seconds*]}]  
**[drop-count** *count*] [**log**] {**prefix-list** *prefix-list-name* [**all** | **none**]} | {**fc** *fc-name* [**priority**

<b>Context</b>	config>router																																																					
<b>Description</b>	<p>This command creates static route entries for both the network and access routes. When configuring a static route, either <b>next-hop</b>, <b>indirect</b> or <b>black-hole</b> must be configured. The <b>no</b> form of the command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.</p> <p>If a CPE connectivity check target address is already being used as the target address in a different static route, then cpe-check parameters must match. If they do not, the new configuration command will be rejected.</p> <p>If a static-route command is issued with no cpe-check target but the destination prefix/netmask and next-hop matches a static route that did have an associated cpe-check, the cpe-check test will be removed from the associated static route.</p>																																																					
<b>Default</b>	No static routes are defined.																																																					
<b>Parameters</b>	<p><i>ip-prefix/prefix-length</i> — The destination address of the static route.</p> <table border="0"> <tr> <td style="vertical-align: top;"><b>Values</b></td> <td>ipv4-prefix</td> <td>a.b.c.d (host bits must be 0)</td> </tr> <tr> <td></td> <td>ipv4-prefix-length</td> <td>0 — 32</td> </tr> <tr> <td></td> <td>ipv6-prefix</td> <td>x:x:x:x:x:x:x (eight 16-bit pieces)</td> </tr> <tr> <td></td> <td></td> <td>x:x:x:x:x:d.d.d.d</td> </tr> <tr> <td></td> <td></td> <td>x [0 — FFFF]H</td> </tr> <tr> <td></td> <td></td> <td>d [0 — 255]D</td> </tr> <tr> <td></td> <td>ipv6-prefix-length</td> <td>0 — 128</td> </tr> </table> <p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-addr</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <table border="0"> <tr> <td style="vertical-align: top;"><b>Values</b></td> <td>ipv4-address</td> <td>a.b.c.d (host bits must be 0)</td> </tr> <tr> <td></td> <td>ipv6-address</td> <td>x:x:x:x:x:x:x[-interface]</td> </tr> <tr> <td></td> <td></td> <td>x:x:x:x:x:d.d.d.d[-interface]</td> </tr> <tr> <td></td> <td></td> <td>x: [0..FFFF]H</td> </tr> <tr> <td></td> <td></td> <td>d: [0..255]D</td> </tr> <tr> <td></td> <td></td> <td>interface: 32 characters maximum, mandatory for link local addresses</td> </tr> </table> <p><i>netmask</i> — The subnet mask in dotted decimal notation.</p> <table border="0"> <tr> <td style="vertical-align: top;"><b>Values</b></td> <td>0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)</td> </tr> </table> <p><b>community comm-id</b> — This configuration option associates a BGP community with the static route. The community can be matched in route policies and is automatically added to BGP routes exported from the static route.</p> <table border="0"> <tr> <td style="vertical-align: top;"><b>Values</b></td> <td>comm-id</td> <td>asn:comm-val   well-known-comm</td> </tr> <tr> <td></td> <td>asn</td> <td>0 — 65535</td> </tr> <tr> <td></td> <td>comm-val</td> <td>0 — 65535</td> </tr> <tr> <td></td> <td>well-known-comm</td> <td>no-advertise, no-export, no-export-subconfed</td> </tr> </table> <p><b>ldp-sync</b> — Extends the LDP synchronization feature to a static route. When an interface comes back up, it is possible that a preferred static route using the interface as next-hop for a given prefix is enabled before the LDP adjacency to the peer LSR comes up on this interface. In this case, traffic</p>	<b>Values</b>	ipv4-prefix	a.b.c.d (host bits must be 0)		ipv4-prefix-length	0 — 32		ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)			x:x:x:x:x:d.d.d.d			x [0 — FFFF]H			d [0 — 255]D		ipv6-prefix-length	0 — 128	<b>Values</b>	ipv4-address	a.b.c.d (host bits must be 0)		ipv6-address	x:x:x:x:x:x:x[-interface]			x:x:x:x:x:d.d.d.d[-interface]			x: [0..FFFF]H			d: [0..255]D			interface: 32 characters maximum, mandatory for link local addresses	<b>Values</b>	0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)	<b>Values</b>	comm-id	asn:comm-val   well-known-comm		asn	0 — 65535		comm-val	0 — 65535		well-known-comm	no-advertise, no-export, no-export-subconfed
<b>Values</b>	ipv4-prefix	a.b.c.d (host bits must be 0)																																																				
	ipv4-prefix-length	0 — 32																																																				
	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)																																																				
		x:x:x:x:x:d.d.d.d																																																				
		x [0 — FFFF]H																																																				
		d [0 — 255]D																																																				
	ipv6-prefix-length	0 — 128																																																				
<b>Values</b>	ipv4-address	a.b.c.d (host bits must be 0)																																																				
	ipv6-address	x:x:x:x:x:x:x[-interface]																																																				
		x:x:x:x:x:d.d.d.d[-interface]																																																				
		x: [0..FFFF]H																																																				
		d: [0..255]D																																																				
		interface: 32 characters maximum, mandatory for link local addresses																																																				
<b>Values</b>	0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)																																																					
<b>Values</b>	comm-id	asn:comm-val   well-known-comm																																																				
	asn	0 — 65535																																																				
	comm-val	0 — 65535																																																				
	well-known-comm	no-advertise, no-export, no-export-subconfed																																																				

on an SDP that uses the static route for the far-end address would be black-holed until the LDP session comes up and the FECs exchanged.

This option when enabled delays the activation of the static route until the LDP session comes up over the interface and the ldp-sync-timer configured on that interface has expired.

**preference** *preference* — The preference of this static route versus the routes from different sources such as BGP or OSPF, expressed as a decimal integer. When modifying the preference of an existing static route, the metric will not be changed unless specified.

Different protocols should not be configured with the same preference. If this occurs, the tiebreaker is according to the default preference table defined in Table 5 on page 123.

If multiple routes are learned with an identical preference using the same protocol, the lowest-cost route is used. If multiple routes are learned with an identical preference using the same protocol, and the costs (metrics) are equal, then the route to use is determined by the configuration of the **ecmp** command

**prefix-list** *prefix-list-name* [**all** | **none**] — Specifies the prefix-list to be considered.

**metric** *metric* — The cost metric for the static route, expressed as a decimal integer. This value is used when importing the static route into other protocols such as OSPF. When the metric is configured as 0 then the metric configured in OSPF, default-import-metric, applies. When modifying the metric of an existing static route, the preference will not change unless specified. This value is also used to determine which static route to install in the forwarding table:

- If there are multiple static routes with the same preference but different metrics then the lower cost (metric) route will be installed.
- If there are multiple static routes with equal preferences and metrics then ECMP rules apply .
- If there are multiple routes with different preferences then the lower preference route will be installed.

**Default** 1

**Values** 0 — 65535

**next-hop** [*ip-address* | *ip-int-name*] — Specifies the directly connected next hop IP address used to reach the destination. If the next hop is over an unnumbered interface or a point-to-point interface, the ip-int-name of the unnumbered or point-to-point interface (on this node) can be configured.

The **next-hop** keyword and the **indirect** or **black-hole** keywords are mutually exclusive. If an identical command is entered (with the exception of either the **indirect** or **black-hole** parameters), then this static route will be replaced with the newly entered command, and unless specified, the respective defaults for preference and metric will be applied.

The *ip-address* configured here can be either on the network side or the access side on this node. This address must be associated with a network directly connected to a network configured on this node.

<b>Values</b>	ip-int-name	32 chars max
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x[-interface]
		x:x:x:x:x:x.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface: 32 characters maximum, mandatory for link local addresses

**indirect** *ip-address* — Specifies that the route is indirect and specifies the next hop IP address used to reach the destination.

The configured *ip-addr* is not directly connected to a network configured on this node. The destination can be reachable via multiple paths. The indirect address can only be resolved from dynamic routing protocol. Another static route cannot be used to resolve the indirect address.

The **indirect** keyword and the **next-hop** or **black-hole** keywords are mutually exclusive. If an identical command is entered (with the exception of either the **next-hop** or **black-hole** parameters), then this static route will be replaced with the newly entered command and unless specified the respective defaults for preference and metric will be applied.

The *ip-addr* configured can be either on the network or the access side and is normally at least one hop away from this node.

**black-hole** — Specifies the route is a black hole route. If the destination address on a packet matches this static route, it will be silently discarded.

The **black-hole** keyword and the **next-hop** or **indirect** keywords are mutually exclusive. If an identical command is entered (with the exception of either the **next-hop** or **indirect** parameters), then this static route will be replaced with the newly entered command, and unless specified, the respective defaults for preference and metric will be applied.

**disallow-igp** — This value is valid only for indirect static routes. If set and if none of the defined tunneling mechanisms (RSVP-TE, LDP or IP) qualify as a next-hop, the normal IGP next-hop to the indirect next-hop address will not be used. If not set then the IGP next-hop to the indirect next-hop address can be used as the next-hop of the last resort.

**tag** — Adds a 32-bit integer tag to the static route. The tag is used in route policies to control distribution of the route into other protocols.

**Table 5: Default Route Preferences**

Label	Preference	Configurable
Direct attached	0	No
Static-route	5	Yes
OSPF Internal routes	10	Yes
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes
OSPF external	150	Yes
IS-IS level 1 external	160	Yes
IS-IS level 2 external	165	Yes
BGP	170	Yes

**Table 5: Default Route Preferences**

Label	Preference	Configurable
<b>Default</b>	5	
<b>Values</b>	1 — 255	
<p><b>enable</b> — Static routes can be administratively enabled or disabled. Use the <b>enable</b> parameter to re-enable a disabled static route. In order to enable a static route, it must be uniquely identified by the IP address, mask, and any other parameter that is required to identify the exact static route.</p> <p>The administrative state is maintained in the configuration file.</p> <p><b>Default</b>      enable</p>		
<p><b>disable</b> — Static routes can be administratively enabled or disabled. Use the <b>disable</b> parameter to disable a static route while maintaining the static route in the configuration. In order to enable a static route, it must be uniquely identified by the IP address, mask, and any other parameter that is required to identify the exact static route.</p> <p>The administrative state is maintained in the configuration file.</p> <p><b>Default</b>      enable</p>		
<p><b>bfd-enable</b> — Associates the state of the static route to a BFD session between the local system and the configured nexthop. This keyword cannot be configured if the <b>indirect</b> or <b>blackhole</b> keywords are specified. The remote end of the BFD session must also be configured to originate or accept the BFD session controlling the static-route state.</p>		
<p><i>mcast-family</i> — Enables submission of the IPv4 or IPv6 static route into IPv4 or IPv6 multicast RTM.</p> <p><b>Values</b>      <b>mcast-ipv4, mcast-ipv6</b></p>		
<p><b>rsvp-te</b> — This parameter allows the static route to be resolved via an RSVP-TE based LSP. The static route nexthop will be resolved via the best RSVP-TE based LSP to the associated indirect next hop. By default, if an RSVP-TE LSP is not available, the IGP route table will be used to resolve the associated nexthop. If the keyword “disallow-igp” is configured, the associated static route will not be resolved through the IPv4 route table if an RSVP-TE based LSP is not available.</p>		
<p><b>cpe-check</b> <i>target-ip-address</i> — This parameter specifies the IP address of the target CPE device. ICMP pings will be sent to this target IP address. This parameter must be configured to enable the CPE connectivity feature for the associated static route. The target-ip-address cannot be in the same subnet as the static route subnet itself to avoid possible circular references. This option is mutually exclusive with BFD support on a given static route.</p> <p><b>Default</b>      no cpe-check enabled</p>		
<p><b>interval</b> <i>seconds</i> — This optional parameter specifies the interval between ICMP pings to the target IP address.</p>		

**Values** 1 —255 seconds

**Default** 1 seconds

**drop-count** *count* — This optional parameter specifies the number of consecutive ping-replies that must be missed to declare the CPE down and to de-active the associated static route.

**Values** 1 —255

**Default** 3

**log** — This optional parameter enables the ability to log transitions between active and in-active based on the CPE connectivity check. Events should be sent to the system log, syslog and SNMP traps.

### Sample Output

```

## Router L2TP Commands

### l2tp

<b>Syntax</b>	<b>l2tp</b>
<b>Context</b>	config>router
<b>Description</b>	This command enables the context to configure L2TP parameters. L2TP extends the PPP model by allowing Layer 2 and PPP endpoints to reside on different devices interconnected by a packet-switched network.

### calling-number-format

<b>Syntax</b>	<b>calling-number-format</b> <i>ascii-spec</i> <b>no calling-number-format</b>																														
<b>Context</b>	config>router>l2tp																														
<b>Description</b>	This command what string to put in the Calling Number AVP, for L2TP control messages related to a session in this L2TP protocol instance.																														
<b>Parameters</b>	<i>ascii-spec</i> — Specifies the L2TP calling number AVP.																														
<b>Values</b>	<table> <tr> <td><i>ascii-spec</i></td> <td>char-specification</td> <td><i>ascii-spec</i></td> </tr> <tr> <td></td> <td>char-specification</td> <td><i>ascii-char</i>   <i>char-origin</i></td> </tr> <tr> <td></td> <td><i>ascii-char</i></td> <td>a printable ASCII character</td> </tr> <tr> <td></td> <td><i>char-origin</i></td> <td>%origin</td> </tr> <tr> <td></td> <td><i>origin</i></td> <td>S   c   r   s   l</td> </tr> <tr> <td></td> <td>S</td> <td>- system name, the value of TIMETRA-CHASSIS-MIB::tmnxChassisName</td> </tr> <tr> <td></td> <td>c</td> <td>- Agent Circuit Id</td> </tr> <tr> <td></td> <td>r</td> <td>- Agent Remote Id</td> </tr> <tr> <td></td> <td>s</td> <td>- SAP ID, formatted as a character string</td> </tr> <tr> <td></td> <td>l</td> <td>- Logical Line ID</td> </tr> </table>	<i>ascii-spec</i>	char-specification	<i>ascii-spec</i>		char-specification	<i>ascii-char</i>   <i>char-origin</i>		<i>ascii-char</i>	a printable ASCII character		<i>char-origin</i>	%origin		<i>origin</i>	S   c   r   s   l		S	- system name, the value of TIMETRA-CHASSIS-MIB::tmnxChassisName		c	- Agent Circuit Id		r	- Agent Remote Id		s	- SAP ID, formatted as a character string		l	- Logical Line ID
<i>ascii-spec</i>	char-specification	<i>ascii-spec</i>																													
	char-specification	<i>ascii-char</i>   <i>char-origin</i>																													
	<i>ascii-char</i>	a printable ASCII character																													
	<i>char-origin</i>	%origin																													
	<i>origin</i>	S   c   r   s   l																													
	S	- system name, the value of TIMETRA-CHASSIS-MIB::tmnxChassisName																													
	c	- Agent Circuit Id																													
	r	- Agent Remote Id																													
	s	- SAP ID, formatted as a character string																													
	l	- Logical Line ID																													

### exclude-avps

<b>Syntax</b>	<b>exclude-avps</b> <i>calling-number</i> <b>no exclude-avps</b>
<b>Context</b>	config>router>l2tp
<b>Description</b>	This command configures the L2TP AVPs to exclude.

## next-attempt

<b>Syntax</b>	<b>next-attempt</b> { <b>same-preference-level</b>   <b>next-preference-level</b> } <b>no next-attempt</b>
<b>Context</b>	configure>router>l2tp configure>service>vprn>l2tp
<b>Description</b>	This command enables tunnel selection algorithm based on the tunnel preference level.
<b>Parameters</b>	<b>same-preference-level</b> — In case that the tunnel-spec selection algorithm evaluates into a tunnel that is currently unavailable (for example tunnel in a blacklist) then the next elected tunnel, if available, will be chosen within the same preference-level as the last attempted tunnel. Only when all tunnels within the same preference level are exhausted, the tunnel selection algorithm will move to the next preference level.  In case that a new session setup request is received while all tunnels on the same preference level are blacklisted, the L2TP session will try to be established on blacklisted tunnels before the tunnel selection moves to the next preference level.  <b>next-preference-level</b> — In case that the tunnel-spec selection algorithm evaluates into a tunnel that is currently unavailable (for example tunnel in a blacklist) then the selection algorithm will try to select the tunnel from the next preference level, even though the tunnels on the same preference level might be available for selection.  <b>Default</b> next-preference-level

## replace-result-code

<b>Syntax</b>	<b>replace-result-code</b> <i>code</i> [code...(upto 3 max)] <b>no replace-result-code</b>
<b>Context</b>	configure>router>l2tp configure>service>vprn>l2tp
<b>Description</b>	This command will replace CDN Result-Code 4, 5 and 6 on LNS with the Result Code 2. This is needed for interoperability with some implementation of LAC which only take action based on CDN Result-Code 2, while ignore CDN Result-Code 4, 5 and 6.
<b>Default</b>	no replace-result-code
<b>Parameters</b>	<i>code</i> — Specifies the L2TP Result codes that need to be replaced.  <b>Values</b> cdn-tmp-no-facilities — CDN Result-Code 4 on LNS will be replaced with the result code 2 before it is sent to LAC. cdn-prem-no-facilities — CDN Result-Code 5 on LNS will be replaced with the result code 2 before it is sent to LAC. cdn-inv-dest — CDN Result-Code 6 on LNS will be replaced with the result code 2 before it is sent to LAC.

## tunnel-selection-blacklist

<b>Syntax</b>	<b>tunnel-selection-blacklist</b>
<b>Context</b>	config>router>l2tp
<b>Description</b>	This command enables the context to configure L2TP Tunnel Selection Blacklist parameters.

## add-tunnel

<b>Syntax</b>	<b>add-tunnel never</b> <b>add-tunnel on</b> <i>reason</i> [ <i>reason...</i> (upto 8 max)] <b>no add-tunnel</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist configure>service>vprn>l2tp>tunnel-selection-blacklist
<b>Description</b>	This command will force the tunnel to the blacklist and render it unavailable for new sessions for the duration of pre-configured time. Peers are always forced to the black list in case that they time out (failure to receive response to control packets). In addition to time outs, certain events can be used to trigger placement of the tunnel on the black list.
<b>Parameters</b>	<i>reason</i> — Specifies the return codes or events that determine which tunnels are added to the blacklist
<b>Values</b>	<p><b>cdn-err-code</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Code 2 ( Call disconnected for the reasons indicated in error code) is received.</p> <p><b>cdn-inv-dest</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Codes 6 ( Invalid destination) is received.</p> <p><b>cdn-tmp-no-facilities</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Code 4 is received ( Call failed due to lack of appropriate facilities being available - temporary condition) is received.</p> <p><b>cdn-perm-no-facilities</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Codes 5 ( Call failed due to lack of appropriate facilities being available - permanent condition) is received.</p> <p><b>tx-cdn-not-established-in-time</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Code 10 (Call was not established within time allotted by LAC) is sent from the LAC to the LNS.</p> <p><b>stop-ccn-err-code</b> — A tunnel will be forced to the blacklist in case that StopCCN message with the Result Code 2 (General error – Error Code indicates the problem) is sent or received.</p> <p><b>stop-ccn-other</b> — A tunnel will be forced to the blacklist in case that StopCCN message with the following Result Codes is received:</p> <ul style="list-style-type: none"> <li>(1) General request to clear control connection</li> <li>(4) Requestor is not authorized to establish a control channel</li> <li>(5) Protocol version not supported</li> <li>(6) Requestor is being shutdown</li> </ul> <p>Or in the case that the StopCCN with the following result codes is transmitted:</p> <ul style="list-style-type: none"> <li>(4) Requestor is not authorized to establish a control channel.</li> </ul>

(5) Protocol version not supported

The receipt of the following Result Codes will NEVER blacklist a tunnel:

(0) Reserved

(3) Control channel already exist

(7) Finite state machine error

(8) Undefined

Transmission of the following Result Codes will NEVER blacklist a tunnel:

(1) General request to clear control connection

(3) Control channel already exist

(6) Requestor is being shutdown

(7) Finite state machine error

**addr-change-timeout** — A timed-out tunnel for which the peer IP address has changed mid-session (from the one that is provided initially during configuration) will be forced to the blacklist. In absence of this configuration option, only the configured peer for the tunnel will be blacklisted, but not the tunnel itself which now has a different peer address than the one initially configured.

**never** — When specified, no tunnels will be placed on blacklist under any circumstance. This parameter will available to preserve backward compatibility.

## max-list-length

<b>Syntax</b>	<b>max-list-length unlimited</b> <b>max-list-length</b> <i>count</i> <b>no max-list-length</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist configure>service>vprn>l2tp>tunnel-selection-blacklist
<b>Description</b>	This command configured the maximum length of the peer/tunnel blacklist.  This command specifies how many items (tunnels or peers) can be in the tunnel-selection-blacklist. If a tunnel or peer needs to be added to the tunnel-selection-blacklist and the tunnel-selection-blacklist is full, the system will remove the item (tunnel or peer) from the blacklist that was in this blacklist for the longest time.
<b>Default</b>	unlimited
<b>Parameters</b>	<b>unlimited</b> — Specifies there is no limit. <b>count</b> — Specifies how many items (tunnels or peers) can be in the tunnel-selection-blacklist.
<b>Values</b>	1..65635

## max-time

**Syntax** **max-time** *minutes*

	<b>no max-time</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist configure>service>vpn>l2tp>tunnel-selection-blacklist
<b>Description</b>	This command configures time for which an entity (peer or a tunnel) are kept in the blacklist.
<b>Default</b>	5 minutes
<b>Parameters</b>	<i>minutes</i> — Specifies the maximum time a tunnel or peer may remain in the blacklist
	<b>Values</b> 1..60

## timeout-action

<b>Syntax</b>	<b>timeout-action</b> <i>action</i> <b>no timeout-action</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist configure>service>vpn>l2tp>tunnel-selection-blacklist
<b>Description</b>	This command defines an action that will be executed on the entity (peer/tunnel) in the blacklist once the entity becomes eligible for selection again.
<b>Default</b>	remove-from-blacklist
<b>Parameters</b>	<i>action</i> — Specifies the Action to be taken when a tunnel or peer has been in the blacklist for the max-period of time.
	<b>Values</b> remove-from-blacklist — The peer or tunnel in the blacklist will be removed completely from the blacklist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the blacklist. The first such session will try to setup the tunnel, while the other will be buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it will be placed in the blacklist again. Consequently all new sessions will have to be re-negotiated over an alternate tunnel. try-one-session — Once the max-time expired, the peer or tunnel in the blacklist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the blacklist is still unavailable.

## peer-address-change-policy

<b>Syntax</b>	<b>peer-address-change-policy</b> { <b>accept</b>   <b>ignore</b>   <b>reject</b> }
<b>Context</b>	config>router>l2tp
<b>Description</b>	This command specifies what to do in case the system receives a L2TP response from another address than the one the request was sent to.

- Parameters**
- accept** — Specifies that this system accepts any source IP address change of received L2TP control messages related to a locally originated tunnel in the state waitReply and rejects any peer address change for other tunnels; in case the new peer IP address is accepted, it is learned and used as destination address in subsequent L2TP messages.
  - ignore** — Specifies that this system ignores any source IP address change of received L2TP control messages, does not learn any new peer IP address and does not change the destination address in subsequent L2TP messages.
  - reject** — Specifies that this system rejects any source IP address change of received L2TP control messages and drops those messages.

## receive-window-size

- Syntax** **receive-window-size** [4..1024]  
**no receive-window-size**
- Context** config>router>l2tp
- Description** This command configures the L2TP receive window size.

## session-limit

- Syntax** **session-limit** *session-limit*  
**no session-limit**
- Context** config>router>l2tp
- Description** This command configures the L2TP session limit of this router.
- Parameters** *session-limit* — Specifies the session limit.
- Values** 1..131071

## group

- Syntax** **group** *tunnel-group-name* [**create**]  
**no group** *tunnel-group-name*
- Context** config>router>l2tp
- Description** This command configures an L2TP tunnel group.
- Parameters** *tunnel-group-name* — Specifies a name string to identify a L2TP group up to 63 characters in length.
- create** — This keyword is mandatory when creating a tunnel group name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## session-limit

<b>Syntax</b>	<b>session-limit</b> <i>session-limit</i> <b>no session-limit</b>
<b>Context</b>	config>router>l2tp
<b>Description</b>	This command configures the L2TP session limit for the router. L2TP is connection-oriented. The L2TP Network Server (LNS) and LAC maintain state for each call that is initiated or answered by an LAC. An L2TP session is created between the LAC and LNS when an end-to-end PPP connection is established between a remote system and the LNS. Datagrams related to the PPP connection are sent over the tunnel between the LAC and LNS. There is a one to one relationship between established L2TP sessions and their associated calls.
<b>Parameters</b>	<i>session-limit</i> — Specifies the number of sessions allowed.
	<b>Default</b> no session-limit
	<b>Values</b> 1 — 131071

## avp-hiding

<b>Syntax</b>	<b>avp-hiding</b> <i>sensitive</i>   <i>always</i> <b>no avp-hiding</b>
<b>Context</b>	config>router>l2tp>group
<b>Description</b>	This command configures Attribute Value Pair (AVP) hiding. This capability can be used to avoid the passing of sensitive data, such as user passwords, as cleartext in an AVP. The <b>no</b> form of the command returns the value to <b>never</b> allow AVP hiding.
<b>Parameters</b>	<i>avp-hiding</i> — Specifies the method to be used for the authentication of the tunnels in this L2TP group.
	<b>Default</b> no avp-hiding
	<b>Values</b> <i>sensitive</i> — AVP hiding is used only for sensitive information (such as username/password). <i>always</i> — AVP hiding is always used.

## challenge

<b>Syntax</b>	<b>challenge</b> <i>always</i> <b>no challenge</b>
<b>Context</b>	config>router>l2tp>group
<b>Description</b>	This command configures the use of challenge-response authentication. The <b>no</b> form of the command reverts to the default <b>never</b> value.
<b>Parameters</b>	<i>always</i> — Specifies that the challenge-response authentication is always used.

**Default** no challenge  
**Values** always

## destruct-timeout

**Syntax** **destruct-timeout** *destruct-timeout*  
**no destruct-timeout**

**Context** config>router>l2tp>group  
config>router>l2tp>group>tunnel

**Description** This command configures the period of time that the data of a disconnected tunnel will persist before being removed.  
The **no** form of the command removes the value from the configuration.

**Default** no destruct-timeout

**Parameters** *destruct-timeout* — [Specifies the automatic removal of dynamic L2TP sessions, in seconds, that are no longer active.

**Default** no destruct-timeout

**Values** 60 — 86400

## hello-interval

**Syntax** **hello-interval** *hello-interval*  
**no hello-interval**

**Context** config>router>l2tp>group

**Description** This command configures the time interval between two consecutive tunnel Hello messages. The Hello message is an L2TP control message sent by either peer of a LAC-LNS control connection. This control message is used as a keepalive for the tunnel.  
The **no** form of the command removes the interval from the configuration.

**Default** 60

**Parameters** *hello-interval* — Specifies the time interval, in seconds, between two consecutive tunnel Hello messages.

**Default** no hello-interval

**Values** 60 — 3600

## idle-timeout

**Syntax** **idle-timeout** *idle-timeout*

**no idle-timeout**

<b>Context</b>	config>router>l2tp>group
<b>Description</b>	This command configures the period of time that an established tunnel with no active sessions will persist before being disconnected.  Enter the <b>no</b> form of the command to maintain a persistent tunnel.  The <b>no</b> form of the command removes the idle timeout from the configuration.
<b>Default</b>	no idle-timeout
<b>Parameters</b>	<i>idle-timeout</i> — Specifies the idle timeout value, in seconds until the group is removed.
	<b>Default</b> no idle-timeout
	<b>Values</b> 0 — 3600

## Ins-group

<b>Syntax</b>	<b>Ins-group</b> <i>Ins-group-id</i> <b>no Ins-group</b>
<b>Context</b>	config>router>l2tp>group
<b>Description</b>	This command configures the ISA LNS group.
<b>Parameters</b>	<i>Ins-group-id</i> — Specifies the LNS group ID.
	<b>Values</b> 1 — 4

## load-balance-method

<b>Syntax</b>	<b>load-balance-method</b> { <i>per-session</i>   <i>per-tunnel</i> } <b>no load-balance-method</b>
<b>Context</b>	config>router>l2tp>group config>router>l2tp>group>tunnel
<b>Description</b>	This command describes how new sessions are assigned to an L2TP ISA MDA.
<b>Parameters</b>	<b>per-session</b> — Specifies that the lowest granularity for load-balancing is a session; each session can be assigned to a different ISA MDA.  <b>per-tunnel</b> — Specifies that the lowest granularity for load-balancing is a tunnel; all sessions associated with the same tunnel are assigned to the same ISA MDA; this may be useful or required in certain cases, for example: <ul style="list-style-type: none"> <li>• MLPPP with multiple links per bundle;</li> <li>• HPOl intermediate destination arbiters where the intermediate destination is an L2TP tunnel.</li> </ul>

## local-address

<b>Syntax</b>	<b>local-address</b> <i>ip-address</i> <b>no local-address</b>
<b>Context</b>	config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the local address.
<b>Parameters</b>	<i>ip-address</i> — Specifies the IP address used during L2TP authentication.

## local-name

<b>Syntax</b>	<b>local-name</b> <i>host-name</i> <b>no local-name</b>
<b>Context</b>	config>router>l2tp>group config>router>l2tp>group>tunnel
<b>Description</b>	This command creates the local host name used by this system for the tunnels in this L2TP group during the authentication phase of tunnel establishment. It can be used to distinguish tunnels.  The <b>no</b> form of the command removes the name from the configuration.
<b>Default</b>	local-name
<b>Parameters</b>	<i>host-name</i> — Specifies the host name, up to 64 characters in length, that the router will use to identify itself during L2TP authentication.  <b>Default</b> no local-name

## max-retries-estab

<b>Syntax</b>	<b>max-retries-estab</b> <i>max-retries</i> <b>no max-retries-estab</b>
<b>Context</b>	config>router>l2tp>group config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the number of retries allowed for this L2TP tunnel while it is established, before its control connection goes down.  The <b>no</b> form of the command removes the value from the configuration.
<b>Default</b>	no max-retries-estab
<b>Parameters</b>	<i>max-retries</i> — Specifies the maximum number of retries for an established tunnel.  <b>Default</b> no max-retries-estab <b>Values</b> 2 — 7

## max-retries-not-estab

<b>Syntax</b>	<b>max-retries-not-estab</b> <i>max-retries</i> <b>no max-retries-not-estab</b>
<b>Context</b>	config>router>l2tp>group config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the number of retries allowed for this L2TP tunnel while it is not established, before its control connection goes down.  The <b>no</b> form of the command removes the value from the configuration.
<b>Default</b>	no max-retries-not-estab
<b>Parameters</b>	<i>max-retries</i> — Specifies the maximum number of retries for non-established tunnels.  <b>Default</b> no max-retries-not-estab <b>Values</b> 2 — 7

## password

<b>Syntax</b>	<b>password</b> <i>password</i> [ <b>hash</b>   <b>hash2</b> ] <b>no password</b>
<b>Context</b>	config>router>l2tp>group config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the password between L2TP LAC and LNS  The no form of the command removes the password.
<b>Default</b>	no password
<b>Parameters</b>	<i>password</i> — Configures the password used for challenge/response calculation and AVP hiding. The maximum length can be up to 20 characters if unhashed, 32 characters if hashed, 54 characters if the hash2 keyword is specified.  <b>hash</b> — Specifies the key is entered in an encrypted form. If the <b>hash</b> parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted  <b>hash2</b> — Specifies the key is entered in a more complex encrypted form. If the <b>hash2</b> parameter is not used, the less encrypted <b>hash</b> form is assumed.  <b>Default</b> no password

## ppp

<b>Syntax</b>	<b>ppp</b>
<b>Context</b>	config>router>l2tp>group
<b>Description</b>	This command configures PPP for the L2TP tunnel group.

## authentication

<b>Syntax</b>	<b>authentication</b> { <b>chap</b>   <b>pap</b>   <b>pref-chap</b> }
<b>Context</b>	config>router>l2tp>group>ppp
<b>Description</b>	This command configures the PPP authentication protocol to negotiate.

## authentication-policy

<b>Syntax</b>	<b>authentication-policy</b> <i>auth-policy-name</i> <b>no authentication-policy</b>
<b>Context</b>	config>router>l2tp>group>ppp
<b>Description</b>	This command configures the authentication policy.
<b>Parameters</b>	<i>auth-policy-name</i> — Specifies the authentication policy name. <b>Values</b> 32 chars max

## default-group-interface

<b>Syntax</b>	<b>default-group-interface</b> <i>ip-int-name</i> <b>service-id</b> <i>service-id</i> <b>no default-group-interface</b>
<b>Context</b>	config>router>l2tp>group>ppp
<b>Description</b>	This command configures the default group interface.
<b>Parameters</b>	<i>ip-int-name</i> — Specifies the interface name. <b>Values</b> 32 chars max <i>service-id</i> — Specifies the service ID. <b>Values</b> 1..2147483648 <i>svc-name</i> — Specifies the service name (instead of service ID). <b>Values</b> 64 chars max

## keepalive

<b>Syntax</b>	<b>keepalive</b> <i>seconds</i> [ <b>hold-up-multiplier</b> <i>multiplier</i> ] <b>no keepalive</b>
<b>Context</b>	config>router>l2tp>group>ppp

**Description** This command configures the PPP keepalive interval and multiplier.

**Parameters** *seconds* — Specifies in seconds the interval.

**Values** 10 — 300

*multiplier* — Specifies the multiplier.

**Values** 1 — 5

## mtu

**Syntax** **mtu** *mtu-bytes*  
**no mtu**

**Context** config>router>l2tp>group>ppp

**Description** This command configures the maximum PPP MTU size.

**Parameters** *mtu-bytes* — Specifies, in bytes, the maximum PPP MTU size.

**Values** 512 — 9212

## proxy-authentication

**Syntax** [**no**] **proxy-authentication**

**Context** config>router>l2tp>group>ppp

**Description** This command configures the use of the authentication AVPs received from the LAC.

## proxy-lcp

**Syntax** [**no**] **proxy-lcp**

**Context** config>router>l2tp>group>ppp

**Description** This command configures the use of the proxy LCP AVPs received from the LAC.

## user-db

**Syntax** **user-db** *local-user-db-name*  
**no user-db**

**Context** config>router>l2tp>group>ppp

**Description** This command configures the local user database to use for PPP PAP/CHAP authentication.

**Parameters** *local-user-db-name* — Specifies the local user database name.

**Values** 32 chars max

## session-assign-method

**Syntax** **session-assign-method** *weighted*  
**no session-assign-method**

**Context** config>router>l2tp>group

**Description** This command specifies how new sessions are assigned to one of the set of suitable tunnels that are available or could be made available.

**Default** no session-assign-method

**Parameters** *weighted* — specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

**Default** no session-assign-method. All new sessions are placed by preference in existing tunnels.

**Values** *weighted* — Enables weighted preference to tunnels in the group.

## session-limit

**Syntax** **session-limit** *session-limit*  
**no session-limit**

**Context** config>router>l2tp>group  
config>router>l2tp>group>tunnel

**Description** This command configures the session limit. The value controls how many L2TP session will be allowed within a given context (system, group, tunnel).

The no form of the command removes the value from the configuration.

**Default** no session-limit

**Parameters** *session-limit* — Specifies the allowed number of sessions within the given context.

**Values** 1 — 131071

---

## Router L2TP Tunnel Commands

### tunnel

<b>Syntax</b>	<b>tunnel</b> <i>tunnel-name</i> [ <b>create</b> ] <b>no tunnel</b> <i>tunnel-name</i>
<b>Context</b>	config>router>l2tp>group
<b>Description</b>	This command configures an L2TP tunnel. A tunnel exists between a LAC-LNS pair and consists of a Control Connection and zero or more L2TP sessions. The tunnel carries encapsulated PPP datagrams and control messages between the LAC and the L2TP Network Server (LNS).
<b>Parameters</b>	<i>tunnel-name</i> — Specifies a valid string to identify a L2TP up to 32 characters in length. <b>create</b> — mandatory while creating a new tunnel

### auto-establish

<b>Syntax</b>	<b>[no] auto-establish</b>
<b>Context</b>	config>router>l2tp>group>tunnel
<b>Description</b>	This command specifies if this tunnel is to be automatically set up by the system. no auto-establish

### avp-hiding

<b>Syntax</b>	<b>avp-hiding {never   sensitive   always}</b> <b>no avp-hiding</b>
<b>Context</b>	config>router>l2tp>group>tunnel
<b>Description</b>	This command configures Attribute Value Pair (AVP) hiding. This capability can be used to avoid the passing of sensitive data, such as user passwords, as cleartext in an AVP. Note that it is recommended that sensitive information not be sent in clear text. The <b>no</b> form of the command removes the parameter of the configuration and indicates that the value on group level will be taken.
<b>Default</b>	no avp-hiding
<b>Parameters</b>	<i>avp-hiding</i> — Specifies the method to be used for the authentication of the tunnel. <b>Values</b> never — AVP hiding is not used. sensitive — AVP hiding is used only for sensitive information (such as username/password). always — AVP hiding is always used.

## challenge

<b>Syntax</b>	<b>challenge</b> <i>challenge-mode</i> <b>no challenge</b>
<b>Context</b>	config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the use of challenge-response authentication. The <b>no</b> form of the command removes the parameter from the configuration and indicates that the value on group level will be taken.
<b>Default</b>	no challenge
<b>Parameters</b>	<i>challenge-mode</i> — Specifies when challenge-response is to be used for the authentication of the tunnel. <b>Values</b> always — Always allows the use of challenge-response authentication. never — Never allows the use of challenge-response authentication.

## hello-interval

<b>Syntax</b>	<b>hello-interval</b> <i>hello-interval</i> <b>hello-interval infinite</b> <b>no hello-interval</b>
<b>Context</b>	config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the number of seconds between sending Hellos for a L2TP tunnel. The no form removes the parameter from the configuration and indicates that the value on group level will be taken.
<b>Parameters</b>	<i>hello-interval</i> — Specifies the time interval, in seconds, between two consecutive tunnel Hello messages. <b>Values</b> 60 — 3600 <b>infinite</b> — Specifies that no hello messages are sent.

## idle-timeout

<b>Syntax</b>	<b>idle-timeout</b> <i>idle-timeout</i> <b>idle-timeout infinite</b> <b>no idle-timeout</b>
<b>Context</b>	config>router>l2tp>group>tunnel
<b>Description</b>	This command configures the idle timeout to wait before being disconnect. The no form indicates that the parameter will be removed from the configuration and that the value specified on group level will be taken.

**Parameters** *idle-timeout* — Specifies the idle timeout, in seconds.  
**Values** 0 — 3600  
*infinite* — Specifies that the tunnel will not be closed when idle.

## peer

**Syntax** **peer** *ip-address*  
**no peer**

**Context** config>router>l2tp>group>tunnel

**Description** This command configures the peer address.  
The **no** form of the command removes the IP address from the tunnel configuration.

**Default** no peer

**Parameters** *ip-address* — Sets the LNS IP address for the tunnel.

## preference

**Syntax** **preference** *preference*  
**no preference**

**Context** config>router>l2tp>group>tunnel

**Description** This command configures a preference number that indicates the relative preference assigned to a tunnel when using a weighted session assignment.  
The **no** form of the command removes the preference value from the tunnel configuration.

**Default** no preference

**Parameters** *preference* — Specifies the tunnel preference number with its group. The value 0 corresponds to the highest preference.  
**Values** 0 — 16777215

## remote-name

**Syntax** **remote-name** *host-name*  
**no remote-name**

**Context** config>router>l2tp>group>tunnel

**Description** This command configures a string to be compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

**Parameters** *host-name* — Specifies a remote host name for the tunnel up to 64 characters in length.

## tunnel-selection-blacklist

<b>Syntax</b>	<b>tunnel-selection-blacklist</b>
<b>Context</b>	config>router>l2tp
<b>Description</b>	This command enables the context to configure L2TP Tunnel Selection Blacklist parameters.

## add-tunnel

<b>Syntax</b>	<b>add-tunnel never</b> <b>add-tunnel on reason [reason...(upto 8 max)]</b> <b>no add-tunnel</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist configure>service>vprn>l2tp>tunnel-selection-blacklist
<b>Description</b>	This command will force the tunnel to the blacklist and render it unavailable for new sessions for the duration of pre-configured time. Peers are always forced to the black list in case that they time out (failure to receive response to control packets). In addition to time outs, certain events can be used to trigger placement of the tunnel on the black list.
<b>Parameters</b>	<i>reason</i> — Specifies the return codes or events that determine which tunnels are added to the blacklist

<b>Values</b>	<b>cdn-err-code</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Code 2 ( Call disconnected for the reasons indicated in error code) is received. <b>cdn-inv-dest</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Codes 6 ( Invalid destination) is received. <b>cdn-tmp-no-facilities</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Code 4 is received ( Call failed due to lack of appropriate facilities being available - temporary condition) is received. <b>cdn-perm-no-facilities</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Codes 5 ( Call failed due to lack of appropriate facilities being available - permanent condition) is received. <b>tx-cdn-not-established-in-time</b> — A tunnel will be forced to the blacklist in case that CDN message with the Result Code 10 (Call was not established within time allotted by LAC) is sent from the LAC to the LNS. <b>stop-ccn-err-code</b> — A tunnel will be forced to the blacklist in case that StopCCN message with the Result Code 2 (General error – Error Code indicates the problem) is sent or received. <b>stop-ccn-other</b> — A tunnel will be forced to the blacklist in case that StopCCN message with the following Result Codes is received:  (1) General request to clear control connection (4) Requestor is not authorized to establish a control channel (5) Protocol version not supported (6) Requestor is being shutdown Or in the case that the StopCCN with the following result codes is transmitted: (4) Requestor is not authorized to establish a control channel.
---------------	---

(5) Protocol version not supported

The receipt of the following Result Codes will NEVER blacklist a tunnel:

(0) Reserved

(3) Control channel already exist

(7) Finite state machine error

(8) Undefined

Transmission of the following Result Codes will NEVER blacklist a tunnel:

(1) General request to clear control connection

(3) Control channel already exist

(6) Requestor is being shutdown

(7) Finite state machine error

**addr-change-timeout** — A timed-out tunnel for which the peer IP address has changed mid-session (from the one that is provided initially during configuration) will be forced to the blacklist. In absence of this configuration option, only the configured peer for the tunnel will be blacklisted, but not the tunnel itself which now has a different peer address than the one initially configured.

**never** — When specified, no tunnels will be placed on blacklist under any circumstance. This parameter will available to preserve backward compatibility.

## max-list-length

<b>Syntax</b>	<b>max-list-length unlimited</b> <b>max-list-length</b> <i>count</i> <b>no max-list-length</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist configure>service>vpn>l2tp>tunnel-selection-blacklist
<b>Description</b>	This command configured the maximum length of the peer/tunnel blacklist.  This command specifies how many items (tunnels or peers) can be in the tunnel-selection-blacklist. If a tunnel or peer needs to be added to the tunnel-selection-blacklist and the tunnel-selection-blacklist is full, the system will remove the item (tunnel or peer) from the blacklist that was in this blacklist for the longest time.
<b>Default</b>	unlimited
<b>Parameters</b>	<b>unlimited</b> — Specifies there is no limit. <b>count</b> — Specifies how many items (tunnels or peers) can be in the tunnel-selection-blacklist.
<b>Values</b>	1..65635

## max-time

<b>Syntax</b>	<b>max-time</b> <i>minutes</i> <b>no max-time</b>
<b>Context</b>	configure>router>l2tp>tunnel-selection-blacklist

configure>service>vprn>l2tp>tunnel-selection-blacklist

**Description** This command configures time for which an entity (peer or a tunnel) are kept in the blacklist.

**Default** 5 minutes

**Parameters** *minutes* — Specifies the maximum time a tunnel or peer may remain in the blacklist

**Values** 1..60

## timeout-action

**Syntax** **timeout-action** *action*  
**no timeout-action**

**Context** configure>router>l2tp>tunnel-selection-blacklist  
configure>service>vprn>l2tp>tunnel-selection-blacklist

**Description** This command defines an action that will be executed on the entity (peer/tunnel) in the blacklist once the entity becomes eligible for selection again.

**Default** remove-from-blacklist

**Parameters** *action* — Specifies the Action to be taken when a tunnel or peer has been in the blacklist for the max-period of time.

**Values** remove-from-blacklist — The peer or tunnel in the blacklist will be removed completely from the blacklist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the blacklist. The first such session will try to setup the tunnel, while the other will be buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it will be placed in the blacklist again. Consequently all new sessions will have to be re-negotiated over an alternate tunnel.  
try-one-session — Once the max-time expired, the peer or tunnel in the blacklist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the blacklist is still unavailable.

## Router Interface Commands

### interface

<b>Syntax</b>	[no] interface <i>ip-int-name</i> [unnumbered-mpls-tp]
<b>Context</b>	config>router
<b>Description</b>	<p>This command creates a logical IP routing or unnumbered MPLS-TP interface. Once created, attributes like IP address, port, or system can be associated with the IP interface.</p> <p>Interface names are case-sensitive and must be unique within the group of IP interfaces defined for <b>config router interface</b> and <b>config service ies interface</b>. Interface names must not be in the dotted decimal notation of an IP address.; for example, the name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it is confusing.</p> <p>When a new name is entered, a new logical router interface is created. When an existing interface name is entered, the user enters the router interface context for editing and configuration.</p> <p>Although not a keyword, the ip-int-name “<b>system</b>” is associated with the network entity (such as a specific 7450 ESS), not a specific interface. The system interface is also referred to as the loopback address.</p> <p>An unnumbered MPLS-TP interface is a special type of interface that is only intended for MPLS-TP LSPs. IP routing protocols are blocked on interfaces of this type. If an interface is configured as unnumbered-mpls-tp, then it can only be associated with an Ethernet port or VLAN, using the port command. then either a unicast, multicast or broadcast remote MAC address may be configured. Only static ARP is supported.</p> <p>The <b>no</b> form of the command removes the IP interface and all the associated configurations. The interface must be administratively shut down before issuing the <b>no interface</b> command.</p>
<b>Default</b>	No interfaces or names are defined within the system.
<b>Parameters</b>	<p><i>ip-int-name</i> — The name of the IP interface. Interface names must be unique within the group of defined IP interfaces for <b>config router interface</b> and <b>config service ies interface</b> commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.</p> <p><b>Values</b>      1 — 32 alphanumeric characters.</p> <p>If the <i>ip-int-name</i> already exists, the context is changed to maintain that IP interface. If <i>ip-int-name</i> already exists within another service ID or is an IP interface defined within the <b>config router</b> commands, an error will occur and the context will not be changed to that IP interface. If <i>ip-int-name</i> does not exist, the interface is created and the context is changed to that interface for further command processing.</p> <p><b>unnumbered-mpls-tp</b> — Specifies that an interface is of type Unnumbered MPLS-TP. An unnumbered MPLS-TP interface is a special type of interface that is only intended for MPLS-TP LSPs. IP routing protocols are blocked on interfaces of this type. If an interface is configured as</p>

**unnumbered-mpls-tp**, then it can only be associated with an Ethernet port or VLAN, using the **port** command. Either a unicast, multicast or broadcast remote MAC address may be configured using the **static-arp** command. Only static ARP is supported.

## address

<b>Syntax</b>	<b>address</b> { <i>ip-address/mask</i>   <i>ip-address netmask</i> } [ <b>broadcast</b> { <b>all-ones</b>   <b>host-ones</b> }] <b>no address</b>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>This command assigns an IP address, IP subnet, and broadcast address format to an IP interface. Only one IP address can be associated with an IP interface.</p> <p>An IP address must be assigned to each IP interface. An IP address and a mask combine to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interfaces in the same routing context within the router.</p> <p>The local subnet that the <b>address</b> command defines must not be part of the services address space within the routing context by use of the <b>config router service-prefix</b> command. Once a portion of the address space is allocated as a service prefix, that portion is not available to IP interfaces for network core connectivity.</p> <p>The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. <b>Show</b> commands display CIDR notation and are stored in configuration files.</p> <p>By default, no IP address or subnet association exists on an IP interface until it is explicitly created.</p> <p>The <b>no</b> form of the command removes the IP address assignment from the IP interface. Interface-specific configurations for IGP protocols like OSPF are also removed. The <b>no</b> form of this command can only be performed when the IP interface is administratively shut down. Shutting down the IP interface will operationally stop any protocol interfaces or MPLS LSPs that explicitly reference that IP address. When a new IP address is defined, the IP interface can be administratively enabled (<b>no shutdown</b>), which reinitializes the protocol interfaces and MPLS LSPs associated with that IP interface. If the <b>no</b> form of the command is executed then the <b>ptp-hw-assist</b> is disabled.</p> <p>If a new address is entered while another address is still active, the new address will be rejected.</p>
<b>Default</b>	No IP address is assigned to the IP interface.
<b>Parameters</b>	<p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-addr</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <p><b>Values</b> 1.0.0.0 — 223.255.255.255</p> <p><i>/</i> — The forward slash is a parameter delimiter that separates the <i>ip-addr</i> portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the <i>ip-addr</i>, the “<i>p</i>” and the <i>mask-length</i> parameter. If a forward slash does not ediate follow the <i>ip-addr</i>, a dotted decimal mask must follow the prefix.</p> <p><i>mask-length</i> — The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (<i>/</i>) separates the <i>ip-addr</i> from the <i>mask-length</i> parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1— 32. Note that a mask length of 32 is reserved for system IP addresses.</p> <p><b>Values</b> 1 — 32</p>

*mask* — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-addr* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical ‘AND’ function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

**Values** 128.0.0.0 — 255.255.255.255

*netmask* — The subnet mask in dotted decimal notation.

**Values** 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

**broadcast** {**all-ones** | **host-ones**} — The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones**, which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-addr* and the *mask-length* or *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

**Default** host-ones

**Values** all-ones, host-ones

## allow-directed-broadcasts

**Syntax** [no] **allow-directed-broadcasts**

**Context** config>router>interface

**Description** This command enables the forwarding of directed broadcasts out of the IP interface.

A directed broadcast is a packet received on a local router interface destined for the subnet broadcast address of another IP interface. The **allow-directed-broadcasts** command on an IP interface enables

or disables the transmission of packets destined to the subnet broadcast address of the egress IP interface.

When enabled, a frame destined to the local subnet on this IP interface is sent as a subnet broadcast out this interface. **NOTE:** Allowing directed broadcasts is a well-known mechanism used for denial-of-service attacks.

By default, directed broadcasts are not allowed and are discarded at this egress IP interface.

The **no** form of the command disables directed broadcasts forwarding out of the IP interface.

**Default** no allow-directed-broadcasts — Directed broadcasts are dropped.

## arp-timeout

**Syntax** **arp-timeout** *seconds*  
**no arp-timeout**

**Context** config>router>interface

**Description** This command configures the minimum time, in seconds, an ARP entry learned on the IP interface is stored in the ARP table. ARP entries are automatically refreshed when an ARP request or gratuitous ARP is seen from an IP host. Otherwise, the ARP entry is aged from the ARP table. If the **arp-timeout** value is set to 0 seconds, ARP aging is disabled.

The **no** form of the command reverts to the default value.

**Default** 14400 seconds (4 hours)

**Parameters** *seconds* — The minimum number of seconds a learned ARP entry is stored in the ARP table, expressed as a decimal integer. A value of 0 specifies that the timer is inoperative and learned ARP entries will not be aged.

**Values** 0 — 65535

## bfd

**Syntax** **bfd** *transmit-interval* [**receive** *receive-interval*] [**multiplier** *multiplier*] [**echo-receive** *echo-interval*] [**type** *cpm-np*]  
**no bfd**

**Context** config>router>interface  
config>router>interface>ipv6

**Description** This command specifies the bi-directional forwarding detection (BFD) parameters for the associated IP interface. If no parameters are defined the default values are used.

The multiplier specifies the number of consecutive BFD messages that must be missed from the peer before the BFD session state is changed to down and the upper level protocols (OSPF, IS-IS, BGP or PIM) is notified of the fault.

The **no** form of the command removes BFD from the router interface regardless of the IGP/RSVP.

**Important notes:** On the 7750-SR, the *transmit-interval* and **receive** *receive-interval* values can only

be modified to a value less than 100 ms when:

1. The **type cpm-np option** is explicitly configured.
2. The service is shut down (**shutdown**)
3. The interval is specified 10 — 100000.
4. The service is re-enabled (**no shutdown**)

To remove the **type cpm-np** option, re-issue the **bfd** command without specifying the **type** parameter.

**Default** no bfd

**Parameters** *transmit-interval* — Sets the transmit interval, in milliseconds, for the BFD session.

**Values** 10 — 100000  
10 — 100000 (see Important Notes above)

**Default** 100

*receive receive-interval* — Sets the receive interval, in milliseconds, for the BFD session.

**Values** 10 — 100000  
10 — 100000 (see Important Notes above)

**Default** 100

*multiplier multiplier* — Set the multiplier for the BFD session.

**Values** 3— 20

**Default** 3

*echo-receive echo-interval* — Sets the minimum echo receive interval, in milliseconds, for the session.

**Values** 100 — 100000

**Default** 0

**type cpm-np** — Selects the CPM network processor as the local termination point for the BFD session. See Important Notes, above.

## cflowd

**Syntax** **cflowd** {**acl** | **interface**} [direction]  
**no cflowd**

**Context** config>router>interface

**Description** This command enables cflowd to collect traffic flow samples through a router for analysis.

cflowd is used for network planning and traffic engineering, capacity planning, security, application and user profiling, performance monitoring, usage-based billing, and SLA measurement. When cflowd is enabled at the interface level, all packets forwarded by the interface are subjected to analysis according to the cflowd configuration.

If cflowd is enabled without either egress-only or both specified or with the ingress-only keyword specified, then only ingress sampling will be enabled on the associated IP interface.

<b>Default</b>	no cflowd
<b>Parameters</b>	<p><b>acl</b> — Specifies the policy associated with a filter.</p> <p><b>interface</b> — Specifies the policy associated with an IP interface.</p> <p><i>direction</i> — Specifies the direction to collect traffic flow samples.</p> <p><b>Values</b></p> <ul style="list-style-type: none"> <li>ingress-only — Enables ingress sampling only on the associated interface.</li> <li>egress-only — Enables egress sampling only on the associated interface.</li> <li>both — Enables both ingress and egress cflowd sampling.</li> </ul>

## cpu-protection

<b>Syntax</b>	<p><b>cpu-protection</b> <i>policy-id</i></p> <p><b>no cpu-protection</b></p>
<b>Context</b>	config>router>interface
<b>Description</b>	This command assigns an existing CPU protection policy for the interface. The CPU protection policies are configured in the <b>config&gt;sys&gt;security&gt;cpu-protection&gt;policy</b> <i>cpu-protection-policy-id</i> context.
<b>Parameters</b>	<p><i>policy-id</i> — Specifies an existing CPU protection policy.</p> <p><b>Values</b> 1 — 255</p>

## delayed-enable

<b>Syntax</b>	<p><b>delayed-enable</b> <i>seconds</i></p> <p><b>no delayed-enable</b></p>
<b>Context</b>	config>router>if
<b>Description</b>	This command creates a delay to make the interface operational by the specified number of <i>seconds</i> . The value is used whenever the system attempts to bring the interface operationally up.
<b>Parameters</b>	<p><i>seconds</i> — Specifies a delay, in seconds, to make the interface operational.</p> <p><b>Values</b> 1 — 1200</p>

## dist-cpu-protection

<b>Syntax</b>	<p><b>dist-cpu-protection</b> <i>policy-name</i></p> <p><b>no dist-cpu-protection</b></p>
<b>Context</b>	config>router>if

**Description** This command assigns a Distributed CPU protection policy for the interface.

## enable-ingress-stats

**Syntax** [no] enable-ingress-stats

**Context** config>router>interface  
config>service>ies >interface  
config>service>vprn>interface  
config>service>ies>sub-if>grp-if  
config>service>vprn>sub-if>grp-if

**Description** This command enables the collection of ingress interface IP stats. This command is only applicable to IP statistics, and not to uRPF statistics.

If enabled, then the following statistics are collected:

- IPv4 offered packets
- IPv4 offered octets
- IPv6 offered packets
- IPv6 offered octets

Note that octet statistics for IPv4 and IPv6 bytes at IP interfaces include the layer 2 frame overhead.

**Default** no enable-ingress-stats

## enable-mac-accounting

**Syntax** [no] enable-mac-accounting

**Context** config>router>interface

**Description** This command enables MAC Accounting functionality for the interface.

## if-attribute

**Syntax** if-attribute

**Context** config>router>interface

**Description** This command adds and removes interface attributes.

## if-admin-group

**Syntax** [no] if-admin-group *group-name* [*group-name...*(upto 5 max)]

<b>Context</b>	config>router>interface
<b>Description</b>	This command configures interface Admin Group memberships for this interface.

## if-srlg-group

<b>Syntax</b>	<b>[no] if-srlg-group</b> <i>group-name</i> [ <i>group-name...</i> (upto 5 max)]
<b>Context</b>	config>router>interface
<b>Description</b>	This command configures interface SRLG Group memberships for this interface

## local-proxy-arp

<b>Syntax</b>	<b>[no] local-proxy-arp</b>
<b>Context</b>	config>router>interface
<b>Description</b>	This command enables local proxy ARP on the interface.
<b>Default</b>	no local-proxy-arp

## lag-link-map-profile

<b>Syntax</b>	<b>lag-link-map-profile</b> <i>link-map-profile-id</i> <b>no lag-link-map-profile</b>
<b>Context</b>	config>router>if
<b>Description</b>	This command assigns a pre-configured lag link map profile to a SAP/network interface configured on a LAG or a PW port that exists on a LAG. Once assigned/de-assigned, the SAP/network interface egress traffic will be re-hashed over LAG as required by the new configuration.  The <b>no</b> form of this command reverts the SAP/network interface to use per-flow, service or link hash as configured for the service/LAG.
<b>Default</b>	<b>no lag-link-map-profile</b>
<b>Parameters</b>	<i>link-map-profile-id</i> — An integer from 1 to 32 that defines a unique lag link map profile on which the LAG the SAP/network interface exist.

## ldp-shortcut

<b>Syntax</b>	<b>[no] ldp-shortcut</b>
<b>Context</b>	config>router
<b>Description</b>	This command enables the resolution of IGP routes using LDP LSP across all network interfaces participating in the IS-IS and OSPF routing protocol in the system.

When LDP shortcut is enabled, LDP populates the routing table with next-hop entries corresponding to all prefixes for which it activated an LDP FEC. For a given prefix, two route entries are populated in the system routing table. One route corresponds to the LDP shortcut next-hop and has an owner of LDP. The other route is the regular IP next-hop. The LDP shortcut next-hop always has preference over the regular IP next-hop for forwarding user packets and specified control packets over a given outgoing interface to the route next-hop.

All user and specified control packets for which the longest prefix match in RTM yields the FEC prefix will be forwarded over the LDP LSP.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet by the ingress IOM will result in the packet being sent labeled with the label stack corresponding to the NHLFE of the LDP LSP when the preferred RTM entry corresponds to an LDP shortcut.

If the preferred RTM entry corresponds to an IP next-hop, the IPv4 packet is forwarded unlabelled.

When ECMP is enabled and multiple equal-cost next-hops exit for the IGP route, the ingress IOM will spray the packets for this route based on hashing routine currently supported for IPv4 packets. When the preferred RTM entry corresponds to an LDP shortcut route, spraying will be performed across the multiple next-hops for the LDP FEC. The FEC next-hops can either be direct link LDP neighbors or T-LDP neighbors reachable over RSVP LSPs in the case of LDP-over-RSVP but not both.

When the preferred RTM entry corresponds to a regular IP route, spraying will be performed across regular IP next-hops for the prefix..

The no form of this command disables the resolution of IGP routes using LDP shortcuts.

**Default** no ldp-shortcut

## ldp-sync-timer

**Syntax** **ldp-sync-timer** *seconds*  
**no ldp-sync-timer**

**Context** config>router>interface

**Description** This command enables synchronization of IGP and LDP. When a link is restored after a failure, IGP sets the link cost to infinity and advertises it. The actual value advertised in OSPF is 0xFFFF (65535). The actual value advertised in IS-IS regular metric is 0x3F (63) and in IS-IS wide-metric is 0xFFFFFE (16777214). This feature is not supported on RIP interfaces.

Note that if an interface belongs to both IS-IS and OSPF, a physical failure will cause both IGPs to advertise infinite metric and to follow the IGP-LDP synchronization procedures. If only one IGP bounced on this interface or on the system, then only the affected IGP advertises the infinite metric and follow the IGP-LDP synchronization procedures.

Next LDP hello adjacency is brought up with the neighbour. The LDP synchronization timer is started by IGP from the time the LDP session to the neighbor is UP over the interface. This is to allow time for the label-FEC bindings to be exchanged.

When the LDP synchronization timer expires, the link cost is restored and is re-advertised. IGP will announce a new best next-hop and LDP will use it if the label binding for the neighbor's FEC is available.

If the user changes the cost of an interface, the new value is advertised at the next flooding of link attributes by IGP. However, if the LDP synchronization timer is still running, the new cost value will only be advertised after the timer expired. Also, the new cost value will be advertised after the user executes any of the following commands if the currently advertised cost is different:

- `tools>perform>router>isis>ldp-sync-exit`
- `tools>perform>router>ospf>ldp-sync-exit`
- `config>router>interface>no ldp-sync-timer`
- `config>router>ospf>disable-ldp-sync`
- `router>isis>disable-ldp-sync`

If the user changes the value of the LDP synchronization timer parameter, the new value will take effect at the next synchronization event. In other words, if the timer is still running, it will continue using the previous value.

If parallel links exist to the same neighbor, then the bindings and services should remain UP as long as there is one interface that is UP. However, the user configured LDP synchronization timer still applies on the failed then restored interface. In this case, the router will only consider this interface for forwarding after IGP re-advertized its actual cost value.

Note that the LDP Sync Timer State is not always synched across to the standby CPM, so after an activity switch the timer state might not be same as it was on the previous active CPM.

The **no** form of this command disables IGP/LDP synchronization and deletes the configuration

<b>Default</b>	<code>no ldp-sync-timer</code>
<b>Parameters</b>	<i>seconds</i> — Specifies the time interval for the IGP-LDP synchronization timer in seconds.
<b>Values</b>	1 – 1800

## loopback

<b>Syntax</b>	<code>[no] loopback</code>
<b>Context</b>	<code>config&gt;router&gt;interface</code>
<b>Description</b>	This command configures the interface as a loopback interface.
<b>Default</b>	Not enabled

## lsr-load-balancing

<b>Syntax</b>	<code>lsr-load-balancing <i>hashing-algorithm</i></code> <code>no lsr-load-balancing</code>
<b>Context</b>	<code>config&gt;router&gt;if</code>

<b>Description</b>	This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per interface setting.
<b>Default</b>	no lsr-load-balancing
<b>Parameters</b>	<p><b>lbl-only</b> — Only the label is used in the hashing algorithm.</p> <p><b>lbl-ip</b> — The IP header is included in the hashing algorithm.</p> <p><b>ip-only</b> — the IP header is used exclusively in the hashing algorithm</p>

## mac

<b>Syntax</b>	<p><b>mac</b> <i>ieee-mac-addr</i></p> <p><b>no mac</b></p>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>This command assigns a specific MAC address to an IP interface. Only one MAC address can be assigned to an IP interface. When multiple <b>mac</b> commands are entered, the last command overwrites the previous command.</p> <p>The <b>no</b> form of the command returns the MAC address of the IP interface to the default value.</p>
<b>Default</b>	IP interface has a system-assigned MAC address.
<b>Parameters</b>	<i>ieee-mac-addr</i> — Specifies the 48-bit MAC address for the IP interface in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i> , where <i>aa</i> , <i>bb</i> , <i>cc</i> , <i>dd</i> , <i>ee</i> and <i>ff</i> are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

## multihoming

<b>Syntax</b>	<b>[no] multihoming primary secondary [hold-time holdover-time]</b>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>This command sets the associated loopback interface to be an anycast address used in multi-homing resiliency, as either the primary or a secondary (a primary address on the alternate router). The optional hold-time parameter is only applicable for the secondary context and specifies how long label information learned about the secondary anycast address should be kept after that peer is declared down. This timer should be set to a value large enough for the remainder of the network to detect the failure and complete the reconvergence process.</p> <p>The no form of the command disables this setting.</p>
<b>Default</b>	no multihoming
<b>Parameters</b>	<i>holdover-time</i> — Specifies the number of seconds the router should hold label information learned from the alternate router in its secondary table. This is to allow the reset of the network to

reconverge after a router failure before the anycase based label assignments are flushed from the forwarding plane.

**Values** 0 - 65535

**Default** 90

## network-domain

**Syntax** **network-domain** *network-domain-name*  
**no network-domain**

**Context** config>router>interface

**Description** This command assigns a given interface to a given network-domain. The network-domain is then taken into account during sap-ingress queue allocation for VPLS SAP.

The network-domain association can only be done in a base-routing context. Associating a network domain with an loop-back or system interface will be rejected. Associating a network-domain with an interface that has no physical port specified will be accepted, but will have no effect as long as a corresponding port, or LAG, is defined..

Single interfaces can be associated with multiple network-domains.

**Default** per default “default” network domain is assigned

## ntp-broadcast

**Syntax** [**no**] **ntp-broadcast**

**Context** config>router>interface

**Description** This command enables SNTP broadcasts received on the IP interface. This parameter is only valid when the SNTP **broadcast-client** global parameter is configured.

The **no** form of the command disables SNTP broadcast received on the IP interface.

**Default** no ntp-broadcast

## port

<b>Syntax</b>	<b>port</b> <i>port-name</i> <b>no port</b>																																												
<b>Context</b>	config>router>interface																																												
<b>Description</b>	<p>This command creates an association with a logical IP interface and a physical port.</p> <p>An interface can also be associated with the system (loopback address).</p> <p>The command returns an error if the interface is already associated with another port or the system. In this case, the association must be deleted before the command is re-attempted. The <i>port-id</i> can be in one of the following forms:</p> <ul style="list-style-type: none"><li>• Ethernet interfaces</li></ul> <p>If the card in the slot has MDAs, <i>port-id</i> is in the slot_number/MDA_number/port_number format; for example, <b>1/1/3</b> specifies port 3 of the MDA installed in MDA slot 1 on the card installed in chassis slot 1.</p> <ul style="list-style-type: none"><li>• SONET/SDH interfaces</li></ul> <p>When the <i>port-id</i> represents a POS interface, the <i>port-id</i> must include the <i>channel-id</i>. The POS interface must be configured as a <b>network</b> port.</p> <p>The <b>no</b> form of the command deletes the association with the port. The <b>no</b> form of this command can only be performed when the interface is administratively down.</p>																																												
<b>Default</b>	No port is associated with the IP interface.																																												
<b>Parameters</b>	<i>port-name</i> — The physical port identifier to associate with the IP interface.																																												
<b>Values</b>	<table><tr><td><i>port-name</i></td><td><i>port-id</i>[<i>:encap-val</i>]</td></tr><tr><td></td><td>encap-val</td></tr><tr><td></td><td>0 for null</td></tr><tr><td></td><td>0..4094 for dot1q</td></tr><tr><td></td><td>0..4094.* for qinq</td></tr><tr><td><i>port-id</i></td><td><i>slot/mda/port</i>[<i>.channel</i>]</td></tr><tr><td></td><td><i>bundle-id</i> - <i>bundle-type-slot/mda.bundle-num</i></td></tr><tr><td></td><td>bundle keyword</td></tr><tr><td></td><td>type ima, fr, ppp</td></tr><tr><td></td><td>bundle-num 1..336</td></tr><tr><td></td><td><i>bpgrp-id</i> <i>bpgrp-type-bpgrp-num</i></td></tr><tr><td></td><td>bpgrp keyword</td></tr><tr><td></td><td>type ima, ppp</td></tr><tr><td></td><td>bpgrp-num 1..2000</td></tr><tr><td></td><td><i>aps-id</i> <i>aps-group-id</i>[<i>.channel</i>]</td></tr><tr><td></td><td>aps keyword</td></tr><tr><td></td><td>group-id 1..64</td></tr><tr><td></td><td><i>ccag-id</i> <i>ccag-id.path-id</i>[<i>cc-type</i>]</td></tr><tr><td></td><td>ccag keyword</td></tr><tr><td></td><td>id 1..8</td></tr><tr><td></td><td>path-id a, b</td></tr><tr><td></td><td>cc-type .sap-net, .net-sap</td></tr></table>	<i>port-name</i>	<i>port-id</i> [ <i>:encap-val</i> ]		encap-val		0 for null		0..4094 for dot1q		0..4094.* for qinq	<i>port-id</i>	<i>slot/mda/port</i> [ <i>.channel</i> ]		<i>bundle-id</i> - <i>bundle-type-slot/mda.bundle-num</i>		bundle keyword		type ima, fr, ppp		bundle-num 1..336		<i>bpgrp-id</i> <i>bpgrp-type-bpgrp-num</i>		bpgrp keyword		type ima, ppp		bpgrp-num 1..2000		<i>aps-id</i> <i>aps-group-id</i> [ <i>.channel</i> ]		aps keyword		group-id 1..64		<i>ccag-id</i> <i>ccag-id.path-id</i> [ <i>cc-type</i> ]		ccag keyword		id 1..8		path-id a, b		cc-type .sap-net, .net-sap

## proxy-arp-policy

- Syntax** [no] proxy-arp-policy *policy-name* [*policy-name*...(up to 5 max)]
- Context** config>router>interface
- Description** This command enables and configure proxy ARP on the interface and specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a particular neighbor. The policy-name is configured in the **config>router>policy-options** context.
- Use proxy ARP so the router responds to ARP requests on behalf of another device. Static ARP is used when a 7750 SR needs to know about a device on an interface that cannot or does not respond to ARP requests. Thus, the 7750 SR OS configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address.
- Default** no proxy-arp-policy
- Parameters** *policy-name* — The export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. The specified policy name(s) must already be defined.

## ptp-hw-assist

- Syntax** [no] ptp-hw-assist
- Context** config>router>interface
- Description** This command configures the 1588 port based timestamping assist function for the interface. Various checks are performed to ensure that this feature can be enabled. If a check fails, either:
- The command is blocked/rejected with an appropriate error message.
  - The command is accepted, but a warning message is shown, and an alarm is raised, indicating that the ptp-hw-assist configuration is not functioning.
- Default** no ptp-hw-assist

## qos-route-lookup

- Syntax** qos-route-lookup [source | destination]  
no qos-route-lookup
- Context** config>router>interface  
config>router>interface>ipv6

**Description** This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. Subscriber management group interfaces also do not support the source QPPB option.

The **no** form of the command reverts to the default.

**Default** destination

**Parameters** **source** — Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

**destination** — Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

## qos

**Syntax** **qos** *network-policy-id* [**egress-port-redirect-group** *queue-group-name*] [**egress-instance** *instance-id*] [**ingress-fp-redirect-group** *queue-group-name* **ingress-instance** *instance-id*]  
**no qos**

**Context** config>router>interface

**Description** This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). (This is only applicable to interfaces on IOM3 and later cards.) The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.
- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of the command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

**Default** no qos

**Parameters** *network-policy-id* — An existing network policy ID to associate with the IP interface.

**Values** 1 — 65535

**egress-port-redirect-group** *queue-group-name* — This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

**egress-instance** *instance-id* — Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which particular instance to associate with this particular network IP interface.

**Values** 1 — 16384

**ingress-fp-redirect-group** *queue-group-name* — This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

**ingress-instance** *instance-id* — Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which particular instance to associate with this particular network IP interface.

**Values** 1 — 16384

## remote-proxy-arp

**Context** config>router>interface

**Description** This command enables remote proxy ARP on the interface.

**Default** no remote-proxy-arp

## secondary

**Syntax** **secondary** {[*ip-address/mask* | *ip-address netmask*]} [**broadcast** {**all-ones** | **host-ones**}]  
[**igp-inhibit**]  
**no secondary** *ip-addr*

**Context** config>router>interface

**Description** Use this command to assign up to 16 secondary IP addresses to the interface. Each address can be configured in an IP address, IP subnet or broadcast address format.

*ip-address* — The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

**Values** 1.0.0.0 — 223.255.255.255

*/* — The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-addr*, the “*/*” and the *mask-length* parameter. If a forward slash does not ediatly follow the *ip-addr*, a dotted decimal mask must follow the prefix.

*mask-length* — The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (*/*) separates the *ip-address* from the *mask-length* parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1— 32. Note that a mask length of 32 is reserved for system IP addresses.

**Values** 1 — 32

*mask* — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-addr* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical ‘AND’ function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

**Values** 128.0.0.0 — 255.255.255.255

**broadcast** {**all-ones** | **host-ones**} — The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones**, which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-addr* and the *mask-length* or *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

**igp-inhibit** — The secondary IP address should not be recognized as a local interface by the running IGP.

## static-arp

<b>Syntax</b>	<b>static-arp</b> <i>ip-addr ieee-mac-addr unnumbered</i> <b>no static-arp</b> <i>unnumbered</i>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.</p> <p>If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.</p> <p>The number of static-arp entries that can be configured on a single node is limited to 1000.</p> <p>Static ARP is used when a 7750 SR needs to know about a device on an interface that cannot or does not respond to ARP requests. Thus, the 7750 SR OS configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the 7750 SR responds to ARP requests on behalf of another device.</p> <p>The <b>no</b> form of the command removes a static ARP entry.</p>
<b>Default</b>	No static ARPs are defined.
<b>Parameters</b>	<p><i>unnumbered</i> — Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.</p> <p><i>ieee-mac-addr</i> — Specifies the 48-bit MAC address for the static ARP in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i>, where <i>aa</i>, <i>bb</i>, <i>cc</i>, <i>dd</i>, <i>ee</i> and <i>ff</i> are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p>

## strip-label

<b>Syntax</b>	<b>[no] strip-label</b>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.</p> <p>If the packets do not have an IP header immediately following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed.</p> <p>This command is only supported on:</p> <ul style="list-style-type: none"><li>• Optical ports</li><li>• IOM3-XP cards</li><li>• Null/Dot1q encaps</li><li>• Network ports</li><li>• IPv4</li></ul> <p>The <b>no</b> form of the command removes the strip-label command.</p> <p>In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.</p>
<b>Default</b>	no strip-label

## tos-marking-state

<b>Syntax</b>	<b>tos-marking-state {trusted   untrusted}</b> <b>no tos-marking-state</b>
<b>Context</b>	config>router>interface
<b>Description</b>	<p>This command is used on a network IP interface to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all IES and network IP interface as untrusted.</p> <p>When the ingress network IP interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.</p> <p>Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.</p> <p>The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the</p>

detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of the command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

**Default** trusted

**Parameters** **trusted** — The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set

**untrusted** — Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

## unnumbered

**Syntax** **unnumbered** [*ip-address* | *ip-int-name*]  
**no unnumbered**

**Context** config>router>interface

**Description** This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of the command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

**Parameters** *ip-addr* | *ip-int-name* — Optional. The IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a particular interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

**Default** no unnumbered

## qos-route-lookup

**Syntax** **qos-route-lookup** [**source** | **destination**]  
**no qos-route-lookup**

**Context** config>router>if  
config>router>if>ipv6

**Description** This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. Subscriber management group interfaces also do not support the source QPPB option.

The **no** form of the command reverts to the default.

**Default** destination

**Parameters** **source** — Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.  
**destination** — Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

## urpf-check

**Syntax** [no] urpf-check

**Context** config>router>if  
config>router>if>ipv6

**Description** This command enables unicast RPF (uRPF) Check on this interface.  
The **no** form of the command disables unicast RPF (uRPF) Check on this interface.

**Default** disabled

## mode

<b>Syntax</b>	<b>mode</b> { <b>strict</b>   <b>loose</b>   <b>strict-no-ecmp</b> } <b>no mode</b>
<b>Context</b>	config>router>if>urpf-check config>router>if>>ipv6>urpf-check
<b>Description</b>	This command specifies the mode of unicast RPF check. The <b>no</b> form of the command reverts to the default (strict) mode.
<b>Default</b>	strict
<b>Parameters</b>	<b>strict</b> — When specified, uRPF checks whether incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix. <b>loose</b> — In <b>loose</b> mode, uRPF checks whether incoming packet has source address with a corresponding prefix in the routing table. However, the loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. This object is valid only when <b>urpf-check</b> is enabled. <b>strict-no-ecmp</b> — When a packet is received on an interface in this mode and the SA matches an ECMP route the packet is dropped by uRPF.

## mh-primary-interface

<b>Syntax</b>	[no] <b>mh-primary-interface</b>
<b>Context</b>	config>router
<b>Description</b>	This command creates a loopback interface for use in multihoming resiliency. Once active, this interface can be used to advertise reachability information to the rest of the network using the primary address, which is backed up by the secondary. The reachability for this address is advertised via IGP and LDP protocols to allow the resolution of BGP routes advertised with this address. The no form of the command disables this setting.
<b>Default</b>	no multihoming

## address

<b>Syntax</b>	<b>address</b> { <i>ip-address/mask</i>   <i>ip-address netmask</i> } <b>no address</b>
<b>Context</b>	config>router>mh-primary-interface config>router>mh-secondary-interface
<b>Description</b>	This command assigns an IP address, IP subnet and broadcast address format to an IP interface. Only one IP address can be associated with an IP interface. An IP address must be assigned to each IP

interface for the interface to be active. An IP address and a mask combine to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interface in the same routing context within the router.

The local subnet that the address command defines must not be part of the services address space within the routing context by use of the `config>router>service-prefix` command. Once a portion of the address space is allocated as a service prefix, that portion is not available to IP interfaces for network core connectivity. The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. Show commands display CIDR notation and are stored in configuration files.

By default, no IP address or subnet association exists on an IP interface until it is explicitly created.

The `no` form of the command removes the IP address assignment from the IP interface. Interface specific configurations for IGP protocols like OSPF are also removed. The `no` form of this command can only be performed when the IP interface is administratively shut down. Shutting down the IP interface will operationally stop any protocol interfaces or MPLS LSPs that explicitly reference that IP address. When a new IP address is defined, the IP interface can be administratively enabled (no shutdown), which reinitializes the protocol interfaces and MPLS LSPs associated with that IP interface.

If a new address is entered while another address is still active, the new address will be rejected.

## Parameters

*ip-address* — The IP address of the IP interface. The `ip-addr` portion of the address command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

**Values** 1.0.0.0 - 223.255.255.255

*/* — The forward slash is a parameter delimiter that separates the `ip-addr` portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the `ip-addr`, the “/” and the `mask-length` parameter. If a forward slash does not immediately follow the `ip-addr`, a dotted decimal mask must follow the prefix.

*mask-length* — The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the `ip-addr` from the `mask-length` parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1-32. Note that a mask length of 32 is reserved for system IP addresses.

**Values** 1-32

*mask* — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the `ip-addr` from a traditional dotted decimal mask. The mask parameters indicates the complete mask that will be used in a logical ‘AND’ function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

**Values** 128.0.0.0 - 255.255.255.255

*netmask* — The subnet mask in dotted decimal notation.

**Values** 0.0.0.0 - 255.255.255.255 (network bits all 1 and host bits all 0).

## description

<b>Syntax</b>	<b>description</b> <i>description-string</i> <b>no description</b>
<b>Context</b>	config>router>mh-primary-interface config>router>mh-secondary-interface
<b>Description</b>	This command creates a text description stored in the configuration file for a configuration context. The no form of the command removes the description string from the context.
<b>Default</b>	no description
<b>Parameters</b>	<i>description-string</i> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special character (#, \$, space, etc.), the entire string must be enclosed within double quotes.

## shutdown

<b>Syntax</b>	<b>[no] shutdown</b>
<b>Context</b>	config>router>mh-primary-interface config>router>mh-secondary-interface
<b>Description</b>	The shutdown command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.  Unlike other commands and parameters where the default state is not indicated in the configuration file, shutdown and no shutdown are always indicated in system generated configuration files.  The no form of the command puts an entity into the administratively enabled state.
<b>Default</b>	no shutdown

## mh-secondary-interface

<b>Syntax</b>	<b>[no] mh-secondary-interface</b>
<b>Context</b>	config>router
<b>Description</b>	This command creates a loopback interface for use in multihoming resiliency. This address is considered the secondary multihoming address and is only used to resolve routes advertised by the primary router in the event that router becomes unavailable. For this purpose, the reachability for this address is advertised via IGP and LDP protocols to allow the resolution of BGP routes advertised with this address by the primary multihoming router.  The no form of the command disables this setting.
<b>Default</b>	no mh-secondary-interface

## hold-time

<b>Syntax</b>	<b>hold-time</b> <i>holdover-time</i> <b>no hold-time</b>				
<b>Context</b>	config>router>mh-secondary-interface				
<b>Description</b>	<p>The optional hold-time parameter is only applicable for the secondary context and specifies how long label information learned about the secondary anycast address should be kept after that peer is declared down. This timer should be set to a value large enough for the remainder of the network to detect the failure and complete the reconvergence process.</p> <p>The no form of the command resets the hold-time back to the default value.</p>				
<b>Default</b>	no hold-time				
<b>Parameters</b>	<p><i>holdover-time</i> — Specifies the number of seconds the router should hold label information learned from the alternate router in its secondary label table. This is to allow the reset of the network to reconverge after a router failure before the anycast based label assignments are flushed from the forwarding plane.</p> <table><tr><td><b>Values</b></td><td>0-65535</td></tr><tr><td><b>Default</b></td><td>90</td></tr></table>	<b>Values</b>	0-65535	<b>Default</b>	90
<b>Values</b>	0-65535				
<b>Default</b>	90				

---

## Router Interface Filter Commands

### egress

<b>Syntax</b>	<b>egress</b>
<b>Context</b>	config>router>interface
<b>Description</b>	This command enables access to the context to configure egress network filter policies for the IP interface. If an egress filter is not defined, no filtering is performed.

### ingress

<b>Syntax</b>	<b>ingress</b>
<b>Context</b>	config>router>interface
<b>Description</b>	This command enables access to the context to configure ingress network filter policies for the IP interface. If an ingress filter is not defined, no filtering is performed.

### flowspec

<b>Syntax</b>	<b>[no] flowspec</b>
<b>Context</b>	config>router>interface>ingress
<b>Description</b>	<p>This command enables IPv4 flowspec filtering on a network IP interface. Filtering is based on all of the IPv4 flowspec routes that have been received and accepted by the base router BGP instance. Ingress IPv4 traffic on an interface can be filtered by both a user-defined IPv4 filter and flowspec. Evaluation proceeds in this order:</p> <ol style="list-style-type: none"><li>1.user-defined IPv4 filter entries</li><li>2.flowspec-derived filter entries</li><li>3.user-defined IPv4 filter default-action</li></ol> <p>The <b>no</b> form of the command removes IPv4 flowspec filtering from the network IP interface.</p>
<b>Default</b>	No network interfaces have IPv4 flowspec enabled.

### flowspec-ipv6

<b>Syntax</b>	<b>[no] flowspec</b>
<b>Context</b>	config>router>interface>ingress

<b>Description</b>	This command enables IPv6 flowspec filtering on a network IP interface. Filtering is based on all of the IPv6 flowspec routes that have been received and accepted by the base router BGP instance. Ingress IPv6 traffic on an interface can be filtered by both a user-defined IPv4 filter and flowspec. Evaluation proceeds in this order: <ol style="list-style-type: none"> <li>1.user-defined IPv6 filter entries</li> <li>2.flowspec-derived filter entries</li> <li>3.user-defined IPv6 filter default-action</li> </ol> The <b>no</b> form of the command removes IPv6 flowspec filtering from the network IP interface.
<b>Default</b>	No network interfaces have IPv6 flowspec enabled.

## filter

<b>Syntax</b>	<b>filter ip</b> <i>ip-filter-id</i> <b>filter ipv6</b> <i>ipv6-filter-id</i> <b>no filter</b> [ <b>ip</b> <i>ip-filter-ip</i> ] [ <b>ipv6</b> <i>ipv6-filter-id</i> ]
<b>Context</b>	config>router>if>ingress config>router>if>egress
<b>Description</b>	This command associates an IP filter policy with an IP interface. Filter policies control packet forwarding and dropping based on IP match criteria. The <i>ip-filter-id</i> must have been pre-configured before this <b>filter</b> command is executed. If the filter ID does not exist, an error occurs. Only one filter ID can be specified. The <b>no</b> form of the command removes the filter policy association with the IP interface.
<b>Default</b>	No filter is specified.
<b>Parameters</b>	<b>ip</b> <i>ip-filter-id</i> — The filter name acts as the ID for the IP filter policy expressed as a decimal integer. The filter policy must already exist within the <b>config&gt;filter&gt;ip</b> context. <b>Values</b> 1 — 16384 <b>ipv6</b> <i>ipv6-filter-id</i> — The filter name acts as the ID for the IPv6 filter policy expressed as a decimal integer. The filter policy must already exist within the <b>config&gt;filter&gt;ipv6</b> context. <b>Values</b> 1 — 65535

---

## Router Interface ICMP Commands

### icmp

<b>Syntax</b>	<b>icmp</b>
<b>Context</b>	config>router>interface
<b>Description</b>	This command enables access to the context to configure Internet Control Message Protocol (ICMP) parameters on a network IP interface. ICMP is a message control and error reporting protocol that also provides information relevant to IP packet processing.

### mask-reply

<b>Syntax</b>	<b>[no] mask-reply</b>
<b>Context</b>	config>router>if>icmp
<b>Description</b>	<p>This command enables responses to ICMP mask requests on the router interface.</p> <p>If a local node sends an ICMP mask request to the router interface, the <b>mask-reply</b> command configures the router interface to reply to the request.</p> <p>The <b>no</b> form of the command disables replies to ICMP mask requests on the router interface.</p>
<b>Default</b>	mask-reply — Replies to ICMP mask requests.

### redirects

<b>Syntax</b>	<b>redirects</b> [ <i>number seconds</i> ] <b>no redirects</b>
<b>Context</b>	config>router>if>icmp
<b>Description</b>	<p>This command enables and configures the rate for ICMP redirect messages issued on the router interface.</p> <p>When routes are not optimal on this router, and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.</p> <p>The <b>redirects</b> command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects are issued can be controlled with the optional <i>number</i> and <i>time</i> parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.</p> <p>By default, generation of ICMP redirect messages is enabled at a maximum rate of 100 per 10 second time interval.</p> <p>The <b>no</b> form of the command disables the generation of ICMP redirects on the router interface.</p>
<b>Default</b>	redirects 100 10 — Maximum of 100 redirect messages in 10 seconds.

- Parameters** *number* — The maximum number of ICMP redirect messages to send, expressed as a decimal integer. This parameter must be specified with the *time* parameter.
- Values** 10 — 1000
- seconds* — The time frame, in seconds, used to limit the *number* of ICMP redirect messages that can be issued, expressed as a decimal integer.
- Values** 1 — 60

## tll-expired

- Syntax** **tll-expired** [*number seconds*]  
**no tll-expired**
- Context** config>router>if>icmp
- Description** This command configures the rate that Internet Control Message Protocol (ICMP) Time To Live (TTL) expired messages are issued by the IP interface.
- By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.
- The **no** form of the command disables the generation of TTL expired messages.
- Default** tll-expired 100 10 — Maximum of 100 TTL expired message in 10 seconds.
- Parameters** *number* — The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. The *seconds* parameter must also be specified.
- Values** 10 — 1000
- seconds* — The time frame, in seconds, used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.
- Values** 1 — 60

## unreachables

- Syntax** **unreachables** [*number seconds*]  
**no unreachables**
- Context** config>router>if>icmp
- Description** This command enables and configures the rate for ICMP host and network destination unreachable messages issued on the router interface.
- The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages that can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachable messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of the command disables the generation of ICMP destination unreachable on the router interface.

**Default** unreachable 100 10 — Maximum of 100 unreachable messages in 10 seconds.

**Parameters** *number* — The maximum number of ICMP unreachable messages to send, expressed as a decimal integer. The *seconds* parameter must also be specified.

**Values** 10 — 1000

*seconds* — The time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued, expressed as a decimal integer.

---

## Router Interface IPv6 Commands

### ipv6

<b>Syntax</b>	<b>[no] ipv6</b>
<b>Context</b>	config>router>interface
<b>Description</b>	This command configures IPv6 for a router interface. The <b>no</b> form of the command disables IPv6 on the interface.
<b>Default</b>	not enabled

### address

<b>Syntax</b>	<b>address {ipv6-address/prefix-length} [eui-64]</b> <b>no address {ipv6-address/prefix-length}</b>															
<b>Context</b>	config>router>if>ipv6															
<b>Description</b>	This command assigns an IPv6 address to the interface.															
<b>Default</b>	none															
<b>Parameters</b>	<i>ipv6-address/prefix-length</i> — Specify the IPv6 address on the interface. <table><tr><td><b>Values</b></td><td>ipv6-address/prefix: ipv6-address</td><td>x:x:x:x:x:x:x (eight 16-bit pieces)</td></tr><tr><td></td><td></td><td>x:x:x:x:x:d.d.d</td></tr><tr><td></td><td></td><td>x [0 — FFFF]H</td></tr><tr><td></td><td></td><td>d [0 — 255]D</td></tr><tr><td></td><td>prefix-length</td><td>1 — 128</td></tr></table> <b>eui-64</b> — When the <b>eui-64</b> keyword is specified, a complete IPv6 address from the supplied prefix and 64-bit interface identifier is formed. The 64-bit interface identifier is derived from MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, the Base MAC address of the chassis should be used.	<b>Values</b>	ipv6-address/prefix: ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)			x:x:x:x:x:d.d.d			x [0 — FFFF]H			d [0 — 255]D		prefix-length	1 — 128
<b>Values</b>	ipv6-address/prefix: ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)														
		x:x:x:x:x:d.d.d														
		x [0 — FFFF]H														
		d [0 — 255]D														
	prefix-length	1 — 128														

### icmp6

<b>Syntax</b>	<b>icmp6</b>
<b>Context</b>	config>router>if>ipv6
<b>Description</b>	This command enables the context to configure ICMPv6 parameters for the interface.

## packet-too-big

<b>Syntax</b>	<b>packet-too-big</b> [ <i>number seconds</i> ] <b>no packet-too-big</b>
<b>Context</b>	config>router>if>ipv6>icmp6
<b>Description</b>	This command configures the rate for ICMPv6 packet-too-big messages.
<b>Parameters</b>	<i>number</i> — Limits the number of packet-too-big messages issued per the time frame specified in the <i>seconds</i> parameter. <b>Values</b> 10 — 1000 <i>seconds</i> — Determines the time frame, in seconds, that is used to limit the number of packet-too-big messages issued per time frame. <b>Values</b> 1 — 60

## param-problem

<b>Syntax</b>	<b>param-problem</b> [ <i>number seconds</i> ] <b>no param-problem</b>
<b>Context</b>	config>router>if>ipv6>icmp6
<b>Description</b>	This command configures the rate for ICMPv6 param-problem messages.
<b>Parameters</b>	<i>number</i> — Limits the number of param-problem messages issued per the time frame specified in the <i>seconds</i> parameter. <b>Values</b> 10 — 1000 <i>seconds</i> — Determines the time frame, in seconds, that is used to limit the number of param-problem messages issued per time frame. <b>Values</b> 1 — 60

## redirects

<b>Syntax</b>	<b>redirects</b> [ <i>number seconds</i> ] <b>no redirects</b>
<b>Context</b>	config>router>if>ipv6>icmp6
<b>Description</b>	This command configures the rate for ICMPv6 redirect messages. When configured, ICMPv6 redirects are generated when routes are not optimal on the router and another router on the same subnetwork has a better route to alert that node that a better route is available. The <b>no</b> form of the command disables ICMPv6 redirects.
<b>Default</b>	100 10 (when IPv6 is enabled on the interface)

- Parameters** *number* — Limits the number of redirects issued per the time frame specified in *seconds* parameter.
- Values** 10 — 1000
- seconds* — Determines the time frame, in seconds, that is used to limit the number of redirects issued per time frame.
- Values** 1 — 60

## time-exceeded

- Syntax** **time-exceeded** [*number seconds*]  
**no time-exceeded**
- Context** config>router>if>ipv6>icmp6
- Description** This command configures rate for ICMPv6 time-exceeded messages.
- Parameters** *number* — Limits the number of time-exceeded messages issued per the time frame specified in *seconds* parameter.
- Values** 10 — 1000
- seconds* — Determines the time frame, in seconds, that is used to limit the number of time-exceeded messages issued per time frame.
- Values** 1 — 60

## unreachables

- Syntax** **unreachables** [*number seconds*]  
**no unreachables**
- Context** config>router>if>ipv6>icmp6
- Description** This command configures the rate for ICMPv6 unreachable messages. When enabled, ICMPv6 host and network unreachable messages are generated by this interface.
- The **no** form of the command disables the generation of ICMPv6 host and network unreachable messages by this interface.
- Default** 100 10 (when IPv6 is enabled on the interface)
- Parameters** *number* — Determines the number destination unreachable ICMPv6 messages to issue in the time frame specified in *seconds* parameter.
- Values** 10 — 1000
- seconds* — Sets the time frame, in seconds, to limit the number of destination unreachable ICMPv6 messages issued per time frame.
- Values** 1 — 60

## link-local-address

<b>Syntax</b>	<b>link-local-address</b> <i>ipv6-address</i> [preferred] <b>no link-local-address</b>
<b>Context</b>	config>router>if>ipv6
<b>Description</b>	This command configures the link local address.

## local-proxy-nd

<b>Syntax</b>	[no] <b>local-proxy-nd</b>
<b>Context</b>	config>router>if>ipv6
<b>Description</b>	This command enables local proxy neighbor discovery on the interface. The <b>no</b> form of the command disables local proxy neighbor discovery.

## proxy-nd-policy

<b>Syntax</b>	<b>proxy-nd-policy</b> <i>policy-name</i> [ <i>policy-name...</i> (up to 5 max)] <b>no proxy-nd-policy</b>
<b>Context</b>	config>router>if>ipv6
<b>Description</b>	This command configure a proxy neighbor discovery policy for the interface.
<b>Parameters</b>	<i>policy-name</i> — The neighbor discovery policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. The specified policy name(s) must already be defined.

## neighbor

<b>Syntax</b>	<b>neighbor</b> [ <i>ipv6-address</i> ] [ <i>mac-address</i> ] <b>no neighbor</b> [ <i>ipv6-address</i> ]
<b>Context</b>	config>router>if>ipv6
<b>Description</b>	This command configures an IPv6-to-MAC address mapping on the interface. Use this command if a directly attached IPv6 node does not support ICMPv6 neighbor discovery, or for some reason, a static address must be used. This command can only be used on Ethernet media.  The <i>ipv6-address</i> must be on the subnet that was configured from the IPv6 <b>address</b> command or a link-local address.

---

## Router Advertisement Commands

### router-advertisement

<b>Syntax</b>	<b>[no] router-advertisement</b>
<b>Context</b>	config>router
<b>Description</b>	<p>This command configures router advertisement properties. By default, it is disabled for all IPv6 enabled interfaces.</p> <p>The <b>no</b> form of the command disables all IPv6 interface. However, the <b>no interface</b> <i>interface-name</i> command disables a specific interface.</p>
<b>Default</b>	disabled

### interface

<b>Syntax</b>	<b>[no] interface</b> <i>ip-int-name</i>
<b>Context</b>	config>router>router-advertisement
<b>Description</b>	This command configures router advertisement properties on a specific interface. The interface must already exist in the <b>config&gt;router&gt;interface</b> context.
<b>Default</b>	No interfaces are configured by default.
<b>Parameters</b>	<i>ip-int-name</i> — Specify the interface name. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### current-hop-limit

<b>Syntax</b>	<b>current-hop-limit</b> <i>number</i> <b>no current-hop-limit</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command configures the current-hop-limit in the router advertisement messages. It informs the nodes on the subnet about the hop-limit when originating IPv6 packets.
<b>Default</b>	64
<b>Parameters</b>	<i>number</i> — Specifies the hop limit.
<b>Values</b>	0 — 255. A value of zero means there is an unspecified number of hops.

## managed-configuration

<b>Syntax</b>	<b>[no] managed-configuration</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command sets the managed address configuration flag. This flag indicates that DHCPv6 is available for address configuration in addition to any address autoconfigured using stateless address autoconfiguration. See RFC 3315, <i>Dynamic Host Configuration Protocol (DHCP) for IPv6</i> .
<b>Default</b>	no managed-configuration

## max-advertisement-interval

<b>Syntax</b>	<b>[no] max-advertisement-interval seconds</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command configures the maximum interval between sending router advertisement messages.
<b>Default</b>	600
<b>Parameters</b>	<i>seconds</i> — Specifies the maximum interval in seconds between sending router advertisement messages. <b>Values</b> 4 — 1800

## min-advertisement-interval

<b>Syntax</b>	<b>[no] min-advertisement-interval seconds</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command configures the minimum interval between sending ICMPv6 neighbor discovery router advertisement messages.
<b>Default</b>	200
<b>Parameters</b>	<i>seconds</i> — Specify the minimum interval in seconds between sending ICMPv6 neighbor discovery router advertisement messages. <b>Values</b> 3 — 1350

## mtu

<b>Syntax</b>	<b>[no] mtu mtu-bytes</b>
<b>Context</b>	config>router>router-advert>if

<b>Description</b>	This command configures the MTU for the nodes to use to send packets on the link.
<b>Default</b>	no mtu — The MTU option is not sent in the router advertisement messages.
<b>Parameters</b>	<i>mtu-bytes</i> — Specify the MTU for the nodes to use to send packets on the link.
<b>Values</b>	1280 — 9212

## other-stateful-configuration

<b>Syntax</b>	<b>[no] other-stateful-configuration</b>
<b>Description</b>	This command sets the "Other configuration" flag. This flag indicates that DHCPv6lite is available for autoconfiguration of other (non-address) information such as DNS-related information or information on other servers in the network. See RFC 3736, <i>Stateless Dynamic Host Configuration Protocol (DHCP) for IPv6</i>
<b>Default</b>	no other-stateful-configuration

## prefix

<b>Syntax</b>	<b>[no] prefix [ipv6-prefix/prefix-length]</b>														
<b>Context</b>	config>router>router-advert>if														
<b>Description</b>	This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.														
<b>Default</b>	none														
<b>Parameters</b>	<i>ip-prefix</i> — The IP prefix for prefix list entry in dotted decimal notation.														
<b>Values</b>	<table> <tr> <td>ipv4-prefix</td> <td>a.b.c.d (host bits must be 0)</td> </tr> <tr> <td>ipv4-prefix-length</td> <td>0 — 32</td> </tr> <tr> <td>ipv6-prefix</td> <td>x:x:x:x:x:x:x (eight 16-bit pieces)</td> </tr> <tr> <td></td> <td>x:x:x:x:x:d.d.d.d</td> </tr> <tr> <td></td> <td>x: [0 — FFFF]H</td> </tr> <tr> <td></td> <td>d: [0 — 255]D</td> </tr> <tr> <td>ipv6-prefix-length</td> <td>0 — 128</td> </tr> </table>	ipv4-prefix	a.b.c.d (host bits must be 0)	ipv4-prefix-length	0 — 32	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)		x:x:x:x:x:d.d.d.d		x: [0 — FFFF]H		d: [0 — 255]D	ipv6-prefix-length	0 — 128
ipv4-prefix	a.b.c.d (host bits must be 0)														
ipv4-prefix-length	0 — 32														
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)														
	x:x:x:x:x:d.d.d.d														
	x: [0 — FFFF]H														
	d: [0 — 255]D														
ipv6-prefix-length	0 — 128														
<b>prefix-length</b>	— Specifies a route must match the most significant bits and have a prefix length.														
<b>Values</b>	1 — 128														

## autonomous

<b>Syntax</b>	<b>[no] autonomous</b>
<b>Context</b>	config>router>router-advert>if>prefix

**Description** This command specifies whether the prefix can be used for stateless address autoconfiguration.  
**Default** enabled

## on-link

**Syntax** [no] on-link  
**Context** config>router>router-advert>if>prefix  
**Description** This command specifies whether the prefix can be used for onlink determination.  
**Default** enabled

## preferred-lifetime

**Syntax** [no] preferred-lifetime {seconds | infinite}  
**Context** config>router>router-advert>if  
**Description** This command configures the remaining length of time in seconds that this prefix will continue to be preferred, such as, time until deprecation. The address generated from a deprecated prefix should not be used as a source address in new communications, but packets received on such an interface are processed as expected.  
**Default** 604800  
**Parameters** *seconds* — Specifies the remaining length of time in seconds that this prefix will continue to be preferred.  
*infinite* — Specifies that the prefix will always be preferred. A value of 4,294,967,295 represents infinity.

## valid-lifetime

**Syntax** valid-lifetime {seconds | infinite}  
**Context** config>router>router-advert>if  
**Description** This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.  
The address generated from an invalidated prefix should not appear as the destination or source address of a packet.  
**Default** 2592000  
**Parameters** *seconds* — Specifies the remaining length of time in seconds that this prefix will continue to be valid.

**infinite** — Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

## reachable-time

<b>Syntax</b>	<b>reachable-time</b> <i>milli-seconds</i> <b>no reachable-time</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.
<b>Default</b>	no reachable-time
<b>Parameters</b>	<i>milli-seconds</i> — Specifies the length of time the router should be considered reachable. <b>Values</b> 0 — 3600000

## retransmit-time

<b>Syntax</b>	<b>retransmit-timer</b> <i>milli-seconds</i> <b>no retransmit-timer</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command configures the retransmission frequency of neighbor solicitation messages.
<b>Default</b>	no retransmit-time
<b>Parameters</b>	<i>milli-seconds</i> — Specifies how often the retransmission should occur. <b>Values</b> 0 — 1800000

## router-lifetime

<b>Syntax</b>	<b>router-lifetime</b> <i>seconds</i> <b>no router-lifetime</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	This command sets the router lifetime.
<b>Default</b>	1800
<b>Parameters</b>	<i>seconds</i> — The length of time, in seconds, (relative to the time the packet is sent) that the prefix is valid for route determination. <b>Values</b> 0, 4 — 9000 seconds. 0 means that the router is not a default router on this link.

## use-virtual-mac

<b>Syntax</b>	<b>[no] use-virtual-mac</b>
<b>Context</b>	config>router>router-advert>if
<b>Description</b>	<p>This command enables sending router advertisement messages using the VRRP virtual MAC address, provided that the virtual router is currently the master.</p> <p>If the virtual router is not the master, no router advertisement messages are sent.</p> <p>The <b>no</b> form of the command disables sending router advertisement messages.</p>
<b>Default</b>	no use-virtual-mac
